The Client calls the chunk data request callback to populate a chunk message going out to the Target nodes. The data request callback may be called out of order and multiple times for each offset, and cannot be used as an indication of progress.

Returning a non-zero status code on the chunk data request callback results in termination of the transfer.

Param io
BLOB stream.
Param xfer
BLOB transfer.
Param block
Block the chunk is part of.
Param chunk
Chunk to get the data of. The buffer pointer to by the data member should be filled by the callback.
Return
0 on success, or (negative) error code otherwise.

Device Firmware Update (DFU) Bluetooth Mesh supports the distribution of firmware images across a mesh network. The Bluetooth mesh DFU subsystem implements the Bluetooth Mesh Device Firmware Update Model specification version 1.0.

Bluetooth Mesh DFU implements a distribution mechanism for firmware images, and does not put any restrictions on the size, format or usage of the images. The primary design goal of the subsystem is to provide the qualifiable parts of the Bluetooth Mesh DFU specification, and leave the usage, firmware validation and deployment to the application.

The DFU specification is implemented in the Zephyr Bluetooth Mesh DFU subsystem as three separate models:

Firmware Update Server The Firmware Update Server model implements the Target node functionality of the *Device Firmware Update (DFU)* subsystem. It extends the *BLOB Transfer Server*, which it uses to receive the firmware image binary from the Distributor node.

Together with the extended BLOB Transfer Server model, the Firmware Update Server model implements all the required functionality for receiving firmware updates over the mesh network, but does not provide any functionality for storing, applying or verifying the images.

Firmware images The Firmware Update Server holds a list of all the updatable firmware images on the device. The full list shall be passed to the server through the `_imgs` parameter in `BT_MESH_DFU_SRV_INIT`, and must be populated before the Bluetooth Mesh subsystem is started. Each firmware image in the image list must be independently updatable, and should have its own firmware ID.

For instance, a device with an upgradable bootloader, an application and a peripheral chip with firmware update capabilities could have three entries in the firmware image list, each with their own separate firmware ID.

Receiving transfers The Firmware Update Server model uses a BLOB Transfer Server model on the same element to transfer the binary image. The interaction between the Firmware Update Server, BLOB Transfer Server and application is described below:

Transfer check The transfer check is an optional pre-transfer check the application can perform on incoming firmware image metadata. The Firmware Update Server performs the transfer check by calling the `check` callback.

The result of the transfer check is a pass/fail status return and the expected `bt_mesh_dfu_effect`. The DFU effect return parameter will be communicated back to the Distributor, and should indicate what effect the firmware update will have on the mesh state of the device.

Composition Data and Models Metadata If the transfer will cause the device to change its Composition Data or become unprovisioned, this should be communicated through the effect parameter of the metadata check.

When the transfer will cause the Composition Data to change, and the *Remote Provisioning Server* is supported, the Composition Data of the new firmware image will be represented by Composition Data Pages 128, 129, and 130. The Models Metadata of the new firmware image will be represented by Models Metadata Page 128. Composition Data Pages 0, 1 and 2, and Models Metadata Page 0, will represent the Composition Data and the Models Metadata of the old firmware image until the device is reprovisioned with Node Provisioning Protocol Interface (NPPI) procedures using the *Remote Provisioning Client*.

The application must call functions `bt_mesh_comp_change_prepare()` and `bt_mesh_models_metadata_change_prepare()` to store the existing Composition Data and Models Metadata pages before booting into the firmware with the updated Composition Data and Models Metadata. The old Composition Data will then be loaded into Composition Data Pages 0, 1 and 2, while the Composition Data in the new firmware will be loaded into Composition Data Pages 128, 129 and 130. The Models Metadata for the old image will be loaded into Models Metadata Page 0, and the Models Metadata for the new image will be loaded into Models Metadata Page 128.

Limitation:

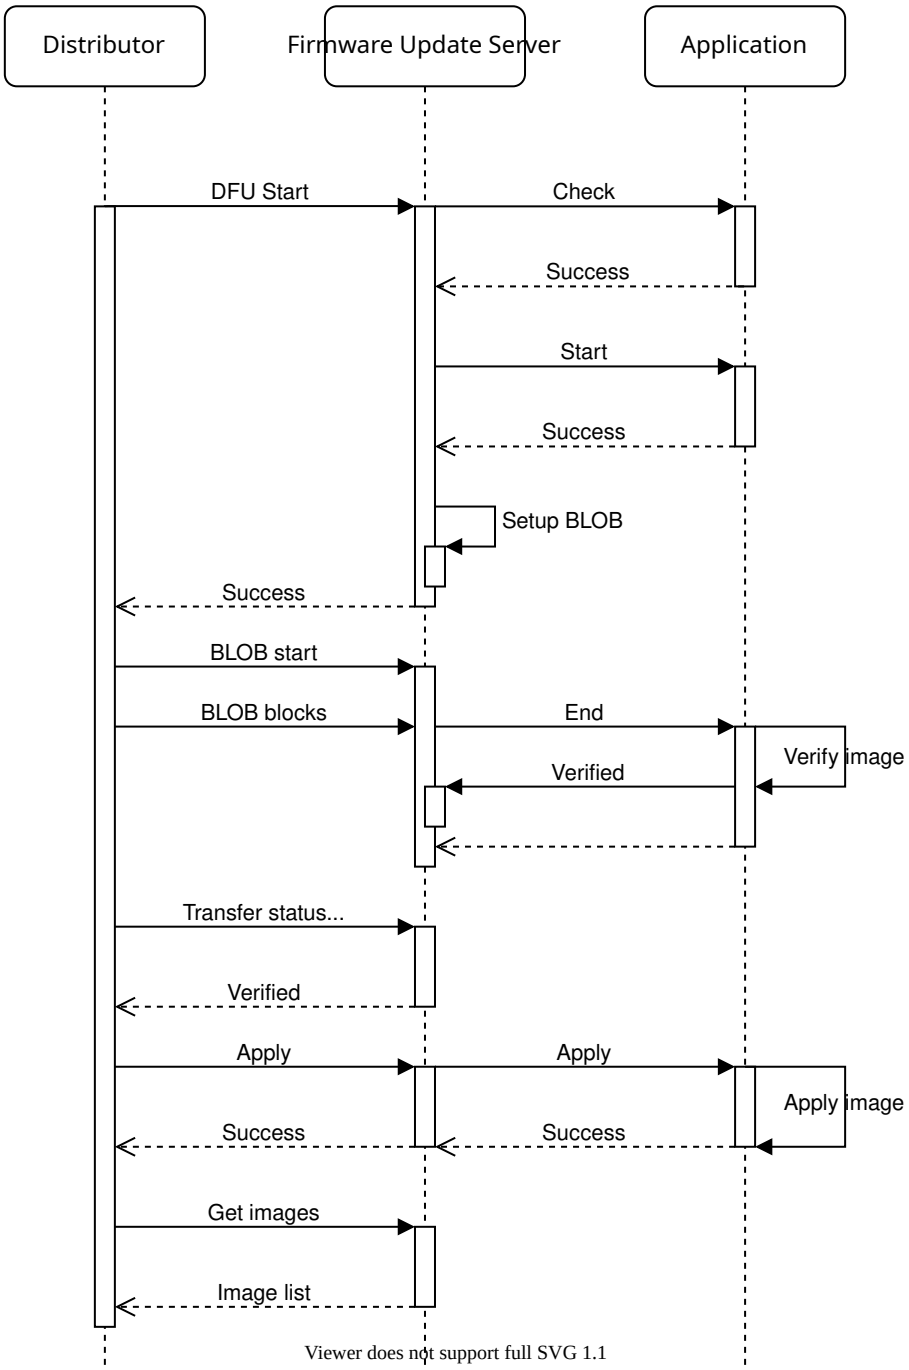

Fig. 9: Bluetooth Mesh Firmware Update Server transfer

- It is not possible to change the Composition Data of the device and keep the device provisioned and working with the old firmware after the new firmware image is applied.

Start The Start procedure prepares the application for the incoming transfer. It'll contain information about which image is being updated, as well as the update metadata.

The Firmware Update Server *start* callback must return a pointer to the BLOB Writer the BLOB Transfer Server will send the BLOB to.

BLOB transfer After the setup stage, the Firmware Update Server prepares the BLOB Transfer Server for the incoming transfer. The entire firmware image is transferred to the BLOB Transfer Server, which passes the image to its assigned BLOB Writer.

At the end of the BLOB transfer, the Firmware Update Server calls its *end* callback.

Image verification After the BLOB transfer has finished, the application should verify the image in any way it can to ensure that it is ready for being applied. Once the image has been verified, the application calls *bt_mesh_dfu_srv_verified()*.

If the image can't be verified, the application calls *bt_mesh_dfu_srv_rejected()*.

Applying the image Finally, if the image was verified, the Distributor may instruct the Firmware Update Server to apply the transfer. This is communicated to the application through the *apply* callback. The application should swap the image and start running with the new firmware. The firmware image table should be updated to reflect the new firmware ID of the updated image.

When the transfer applies to the mesh application itself, the device might have to reboot as part of the swap. This restart can be performed from inside the apply callback, or done asynchronously. After booting up with the new firmware, the firmware image table should be updated before the Bluetooth Mesh subsystem is started.

The Distributor will read out the firmware image table to confirm that the transfer was successfully applied. If the metadata check indicated that the device would become unprovisioned, the Target node is not required to respond to this check.

API reference

group `bt_mesh_dfu_srv`

API for the Bluetooth Mesh Firmware Update Server model.

Defines

`BT_MESH_DFU_SRV_INIT`(_handlers, _imgs, _img_count)

Initialization parameters for *Firmware Update Server model*.

Parameters

- **`_handlers`** – DFU handler function structure.
- **`_imgs`** – List of *bt_mesh_dfu_img* managed by this Server.
- **`_img_count`** – Number of DFU images managed by this Server.

BT_MESH_MODEL_DFU_SRV(_srv)

Firmware Update Server model entry.

Parameters

- **_srv** – Pointer to a *Firmware Update Server model* instance.

Functions

void **bt_mesh_dfu_srv_verified**(struct *bt_mesh_dfu_srv* *srv)

Accept the received DFU transfer.

Should be called at the end of a successful DFU transfer.

If the DFU transfer completes successfully, the application should verify the image validity (including any image authentication or integrity checks), and call this function if the image is ready to be applied.

Parameters

- **srv** – Firmware Update Server instance.

void **bt_mesh_dfu_srv_rejected**(struct *bt_mesh_dfu_srv* *srv)

Reject the received DFU transfer.

Should be called at the end of a successful DFU transfer.

If the DFU transfer completes successfully, the application should verify the image validity (including any image authentication or integrity checks), and call this function if one of the checks fail.

Parameters

- **srv** – Firmware Update Server instance.

void **bt_mesh_dfu_srv_cancel**(struct *bt_mesh_dfu_srv* *srv)

Cancel the ongoing DFU transfer.

Parameters

- **srv** – Firmware Update Server instance.

void **bt_mesh_dfu_srv_applied**(struct *bt_mesh_dfu_srv* *srv)

Confirm that the received DFU transfer was applied.

Should be called as a result of the *bt_mesh_dfu_srv_cb::apply* callback.

Parameters

- **srv** – Firmware Update Server instance.

bool **bt_mesh_dfu_srv_is_busy**(const struct *bt_mesh_dfu_srv* *srv)

Check if the Firmware Update Server is busy processing a transfer.

Parameters

- **srv** – Firmware Update Server instance.

Returns

true if a DFU procedure is in progress, false otherwise.

uint8_t **bt_mesh_dfu_srv_progress**(const struct *bt_mesh_dfu_srv* *srv)

Get the progress of the current DFU procedure, in percent.

Parameters

- **srv** – Firmware Update Server instance.

Returns
The current transfer progress in percent.

struct **bt_mesh_dfu_srv_cb**

#include <dfu_srv.h> Firmware Update Server event callbacks.

Public Members

int (***check**)(struct *bt_mesh_dfu_srv* *srv, const struct *bt_mesh_dfu_img* *img, struct *net_buf_simple* *metadata, enum *bt_mesh_dfu_effect* *effect)

Transfer check callback.

The transfer check can be used to validate the incoming transfer before it starts. The contents of the metadata is implementation specific, and should contain all the information the application needs to determine whether this image should be accepted, and what the effect of the transfer would be.

If applying the image will have an effect on the provisioning state of the mesh stack, this can be communicated through the `effect` return parameter.

The metadata check can be performed both as part of starting a new transfer and as a separate procedure.

This handler is optional.

Param srv
Firmware Update Server instance.

Param img
DFU image the metadata check is performed on.

Param metadata
Image metadata.

Param effect
Return parameter for the image effect on the provisioning state of the mesh stack.

Return
0 on success, or (negative) error code otherwise.

int (***start**)(struct *bt_mesh_dfu_srv* *srv, const struct *bt_mesh_dfu_img* *img, struct *net_buf_simple* *metadata, const struct *bt_mesh_blob_io* **io)

Transfer start callback.

Called when the Firmware Update Server is ready to start a new DFU transfer. The application must provide an initialized BLOB stream to be used during the DFU transfer.

The following error codes are treated specially, and should be used to communicate these issues:

- `-ENOMEM`: The device cannot fit this image.
- `-EBUSY`: The application is temporarily unable to accept the transfer.
- `-EALREADY`: The device has already received and verified this image, and there's no need to transfer it again. The Firmware Update model will skip the transfer phase, and mark the image as verified.

This handler is mandatory.

Param srv
Firmware Update Server instance.

Param img
DFU image being updated.

Param metadata
Image metadata.

Param io
BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.
Return
0 on success, or (negative) error code otherwise. Return codes `-ENOMEM`, `-EBUSY -EALREADY` will be passed to the updater, other error codes are reported as internal errors.

void (*`end`)(struct *bt_mesh_dfu_srv* *srv, const struct *bt_mesh_dfu_img* *img, bool success)

Transfer end callback.

This handler is optional.

If the transfer is successful, the application should verify the firmware image, and call either *bt_mesh_dfu_srv_verified* or *bt_mesh_dfu_srv_rejected* depending on the outcome.

If the transfer fails, the Firmware Update Server will be available for new transfers immediately after this function returns.
Param srv
Firmware Update Server instance.
Param img
DFU image that failed the update.
Param success
Whether the DFU transfer was successful.

int (*`recover`)(struct *bt_mesh_dfu_srv* *srv, const struct *bt_mesh_dfu_img* *img, const struct *bt_mesh_blob_io* **io)

Transfer recovery callback.

If the device reboots in the middle of a transfer, the Firmware Update Server calls this function when the Bluetooth Mesh subsystem is started.

This callback is optional, but transfers will not be recovered after a reboot without it.
Param srv
Firmware Update Server instance.
Param img
DFU image being updated.
Param io
BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.
Return
0 on success, or (negative) error code to abandon the transfer.

int (*`apply`)(struct *bt_mesh_dfu_srv* *srv, const struct *bt_mesh_dfu_img* *img)

Transfer apply callback.

Called after a transfer has been validated, and the updater sends an apply message to the Target nodes.

This handler is optional.
Param srv
Firmware Update Server instance.
Param img
DFU image that should be applied.
Return
0 on success, or (negative) error code otherwise.

struct **bt_mesh_dfu_srv**

#include <dfu_srv.h> Firmware Update Server instance.

Should be initialized with *BT_MESH_DFU_SRV_INIT*.

Public Members

struct *bt_mesh_blob_srv* **blob**

Underlying BLOB Transfer Server.

const struct *bt_mesh_dfu_srv_cb* ***cb**

Callback structure.

const struct *bt_mesh_dfu_img* ***imgs**

List of updatable images.

size_t **img_count**

Number of updatable images.

Firmware Update Client The Firmware Update Client is responsible for distributing firmware updates through the mesh network. The Firmware Update Client uses the *BLOB Transfer Client* as a transport for its transfers.

API reference

group **bt_mesh_dfu_cli**

API for the Bluetooth Mesh Firmware Update Client model.

Defines

BT_MESH_DFU_CLI_INIT(_handlers)

Initialization parameters for the *Firmware Uppdate Client model*.

See also

bt_mesh_dfu_cli_cb.

Parameters

- **_handlers** – Handler callback structure.

BT_MESH_MODEL_DFU_CLI(_cli)

Firmware Update Client model Composition Data entry.

Parameters

- **_cli** – Pointer to a *Firmware Uppdate Client model* instance.

Typedefs

typedef enum *bt_mesh_dfu_iter* (***bt_mesh_dfu_img_cb_t**)(struct *bt_mesh_dfu_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t idx, uint8_t total, const struct *bt_mesh_dfu_img* *img, void *cb_data)

DFU image callback.

The image callback is called for every DFU image on the Target node when calling *bt_mesh_dfu_cli_imgs_get*.

Param cli
Firmware Update Client model instance.

Param ctx
Message context of the received message.

Param idx
Image index.

Param total
Total number of images on the Target node.

Param img
Image information for the given image index.

Param cb_data
Callback data.

Retval BT_MESH_DFU_ITER_STOP
Stop iterating through the image list and return from *bt_mesh_dfu_cli_imgs_get*.

Retval BT_MESH_DFU_ITER_CONTINUE
Continue iterating through the image list if any images remain.

Functions

int **bt_mesh_dfu_cli_send**(struct *bt_mesh_dfu_cli* *cli, const struct *bt_mesh_blob_cli_inputs* *inputs, const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_dfu_cli_xfer* *xfer)

Start distributing a DFU.

Starts distribution of the firmware in the given slot to the list of DFU Target nodes in `ctx`. The transfer runs in the background, and its end is signalled through the *bt_mesh_dfu_cli_cb::ended* callback.

> **Note**
>
> The BLOB Transfer Client transfer inputs `targets` list must point to a list of *bt_mesh_dfu_target* nodes.

Parameters

- **`cli`** – Firmware Update Client model instance.
- **`inputs`** – BLOB Transfer Client transfer inputs.
- **`io`** – BLOB stream to read BLOB from.
- **`xfer`** – Firmware Update Client transfer parameters.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_suspend**(struct *bt_mesh_dfu_cli* *cli)

Suspend a DFU transfer.

Parameters

- **cli** – Firmware Update Client instance.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_resume**(struct *bt_mesh_dfu_cli* *cli)

Resume the suspended transfer.

Parameters

- **cli** – Firmware Update Client instance.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_cancel**(struct *bt_mesh_dfu_cli* *cli, struct *bt_mesh_msg_ctx* *ctx)

Cancel a DFU transfer.

Will cancel the ongoing DFU transfer, or the transfer on a specific Target node if `ctx` is valid.

Parameters

- **cli** – Firmware Update Client model instance.
- **ctx** – Message context, or NULL to cancel the ongoing DFU transfer.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_apply**(struct *bt_mesh_dfu_cli* *cli)

Apply the completed DFU transfer.

A transfer can only be applied after it has ended successfully. The Firmware Update Client's `applied` callback is called at the end of the apply procedure.

Parameters

- **cli** – Firmware Update Client model instance.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_confirm**(struct *bt_mesh_dfu_cli* *cli)

Confirm that the active transfer has been applied on the Target nodes.

A transfer can only be confirmed after it has been applied. The Firmware Update Client's `confirmed` callback is called at the end of the confirm procedure.

Target nodes that have reported the effect as *BT_MESH_DFU_EFFECT_UNPROV* are expected to not respond to the query, and will fail if they do.

Parameters

- **cli** – Firmware Update Client model instance.

Returns
0 on success, or (negative) error code otherwise.

uint8_t **bt_mesh_dfu_cli_progress**(struct *bt_mesh_dfu_cli* *cli)

Get progress as a percentage of completion.

Parameters

- **cli** – Firmware Update Client model instance.

Returns

The progress of the current transfer in percent, or 0 if no transfer is active.

bool **bt_mesh_dfu_cli_is_busy**(struct *bt_mesh_dfu_cli* *cli)

Check whether a DFU transfer is in progress.

Parameters

- **cli** – Firmware Update Client model instance.

Returns

true if the BLOB Transfer Client is currently participating in a transfer, false otherwise.

int **bt_mesh_dfu_cli_imgs_get**(struct *bt_mesh_dfu_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, *bt_mesh_dfu_img_cb_t* cb, void *cb_data, uint8_t max_count)

Perform a DFU image list request.

Requests the full list of DFU images on a Target node, and iterates through them, calling the cb for every image.

The DFU image list request can be used to determine which image index the Target node holds its different firmwares in.

Waits for a response until the procedure timeout expires.

Parameters

- **cli** – Firmware Update Client model instance.
- **ctx** – Message context.
- **cb** – Callback to call for each image index.
- **cb_data** – Callback data to pass to cb.
- **max_count** – Max number of images to return.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_metadata_check**(struct *bt_mesh_dfu_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t img_idx, const struct *bt_mesh_dfu_slot* *slot, struct *bt_mesh_dfu_metadata_status* *rsp)

Perform a metadata check for the given DFU image slot.

The metadata check procedure allows the Firmware Update Client to check if a Target node will accept a transfer of this DFU image slot, and what the effect would be.

Waits for a response until the procedure timeout expires.

Parameters

- **cli** – Firmware Update Client model instance.
- **ctx** – Message context.
- **img_idx** – Target node's image index to check.
- **slot** – DFU image slot to check for.
- **rsp** – Metadata status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_cli_status_get**(struct *bt_mesh_dfu_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, struct *bt_mesh_dfu_target_status* *rsp)

Get the status of a Target node.

Parameters

- **cli** – Firmware Update Client model instance.
- **ctx** – Message context.
- **rsp** – Response data buffer.

Returns
0 on success, or (negative) error code otherwise.

int32_t **bt_mesh_dfu_cli_timeout_get**(void)

Get the current procedure timeout value.

Returns
The configured procedure timeout.

void **bt_mesh_dfu_cli_timeout_set**(int32_t timeout)

Set the procedure timeout value.

Parameters

- **timeout** – The new procedure timeout.

struct **bt_mesh_dfu_target**

#include <dfu_cli.h> DFU Target node.

Public Members

struct *bt_mesh_blob_target* **blob**

BLOB Target node.

uint8_t **img_idx**

Image index on the Target node.

uint8_t **effect**

Expected DFU effect, see *bt_mesh_dfu_effect*.

uint8_t **status**

Current DFU status, see *bt_mesh_dfu_status*.

uint8_t **phase**

Current DFU phase, see *bt_mesh_dfu_phase*.

struct **bt_mesh_dfu_metadata_status**

#include <dfu_cli.h> Metadata status response.

Public Members

uint8_t **idx**
Image index.

enum *bt_mesh_dfu_status* **status**
Status code.

enum *bt_mesh_dfu_effect* **effect**
Effect of transfer.

struct **bt_mesh_dfu_target_status**
#include <dfu_cli.h> DFU Target node status parameters.

Public Members

enum *bt_mesh_dfu_status* **status**
Status of the previous operation.

enum *bt_mesh_dfu_phase* **phase**
Phase of the current DFU transfer.

enum *bt_mesh_dfu_effect* **effect**
The effect the update will have on the Target device's state.

uint64_t **blob_id**
BLOB ID used in the transfer.

uint8_t **img_idx**
Image index to transfer.

uint8_t **ttl**
TTL used in the transfer.

uint16_t **timeout_base**
Additional response time for the Target nodes, in 10-second increments.

The extra time can be used to give the Target nodes more time to respond to messages from the Client. The actual timeout will be calculated according to the following formula:

```
*  timeout = 20 seconds + (10 seconds * timeout_base) + (100 ms * TTL)
*
```

If a Target node fails to respond to a message from the Client within the configured transfer timeout, the Target node is dropped.

struct **bt_mesh_dfu_cli_cb**
#include <dfu_cli.h> Firmware Update Client event callbacks.

Public Members

void (*suspended)(struct *bt_mesh_dfu_cli* *cli)

BLOB transfer is suspended.

Called when the BLOB transfer is suspended due to response timeout from all Target nodes.

Param cli
Firmware Update Client model instance.

void (*ended)(struct *bt_mesh_dfu_cli* *cli, enum *bt_mesh_dfu_status* reason)

DFU ended.

Called when the DFU transfer ends, either because all Target nodes were lost or because the transfer was completed successfully.

Param cli
Firmware Update Client model instance.

Param reason
Reason for ending.

void (*applied)(struct *bt_mesh_dfu_cli* *cli)

DFU transfer applied on all active Target nodes.

Called at the end of the apply procedure started by *bt_mesh_dfu_cli_apply*.

Param cli
Firmware Update Client model instance.

void (*confirmed)(struct *bt_mesh_dfu_cli* *cli)

DFU transfer confirmed on all active Target nodes.

Called at the end of the apply procedure started by *bt_mesh_dfu_cli_confirm*.

Param cli
Firmware Update Client model instance.

void (*lost_target)(struct *bt_mesh_dfu_cli* *cli, struct *bt_mesh_dfu_target* *target)

DFU Target node was lost.

A DFU Target node was dropped from the receivers list. The Target node's `status` is set to reflect the reason for the failure.

Param cli
Firmware Update Client model instance.

Param target
DFU Target node that was lost.

struct **bt_mesh_dfu_cli**

#include <dfu_cli.h> Firmware Update Client model instance.

Should be initialized with *BT_MESH_DFU_CLI_INIT*.

Public Members

const struct *bt_mesh_dfu_cli_cb* *cb

Callback structure.

struct *bt_mesh_blob_cli* **blob**

Underlying BLOB Transfer Client.

struct **bt_mesh_dfu_cli_xfer_blob_params**

#include <*dfu_cli.h*> BLOB parameters for Firmware Update Client transfer:

Public Members

uint16_t **chunk_size**

Base chunk size.

May be smaller for the last chunk.

struct **bt_mesh_dfu_cli_xfer**

#include <*dfu_cli.h*> Firmware Update Client transfer parameters:

Public Members

uint64_t **blob_id**

BLOB ID to use for this transfer, or 0 to set it randomly.

const struct *bt_mesh_dfu_slot* ***slot**

DFU image slot to transfer.

enum *bt_mesh_blob_xfer_mode* **mode**

Transfer mode (Push (Push BLOB Transfer Mode) or Pull (Pull BLOB Transfer Mode))

const struct *bt_mesh_dfu_cli_xfer_blob_params* ***blob_params**

BLOB parameters to be used for the transfer, or NULL to retrieve Target nodes' capabilities before sending a firmware.

Firmware Distribution Server The Firmware Distribution Server model implements the Distributor role for the *Device Firmware Update (DFU)* subsystem. It extends the *BLOB Transfer Server*, which it uses to receive the firmware image binary from the Initiator node. It also instantiates a *Firmware Update Client*, which it uses to distribute firmware updates throughout the mesh network.

Note

Currently, the Firmware Distribution Server supports out-of-band (OOB) retrieval of firmware images over SMP service only.

The Firmware Distribution Server does not have an API of its own, but relies on a Firmware Distribution Client model on a different device to give it information and trigger image distribution and upload.

Firmware slots The Firmware Distribution Server is capable of storing multiple firmware images for distribution. Each slot contains a separate firmware image with metadata, and can be distributed to other mesh nodes in the network in any order. The contents, format and size of the firmware images are vendor specific, and may contain data from other vendors. The application should never attempt to execute or modify them.

The slots are managed remotely by a Firmware Distribution Client, which can both upload new slots and delete old ones. The application is notified of changes to the slots through the Firmware Distribution Server's callbacks (`bt_mesh_fd_srv_cb`). While the metadata for each firmware slot is stored internally, the application must provide a *BLOB streams* for reading and writing the firmware image.

API reference

group `bt_mesh_dfd_srv`

API for the Firmware Distribution Server model.

Defines

`CONFIG_BT_MESH_DFD_SRV_TARGETS_MAX`

`CONFIG_BT_MESH_DFD_SRV_SLOT_MAX_SIZE`

`CONFIG_BT_MESH_DFD_SRV_SLOT_SPACE`

`BT_MESH_DFD_SRV_INIT`(_cb)

Initialization parameters for the *Firmware Distribution Server model*.

Parameters

- `_cb` – **[in]** Pointer to a *bt_mesh_dfd_srv_cb* instance.

`BT_MESH_MODEL_DFD_SRV`(_srv)

Firmware Distribution Server model Composition Data entry.

Parameters

- `_srv` – Pointer to a *Firmware Distribution Server model* instance.

struct `bt_mesh_dfd_srv_cb`

#include <dfd_srv.h> Firmware Distribution Server callbacks:

Public Members

int (*`recv`)(struct *bt_mesh_dfd_srv* *srv, const struct *bt_mesh_dfu_slot* *slot, const struct *bt_mesh_blob_io* **io)

Slot receive callback.

Called at the start of an upload procedure. The callback must fill `io` with a pointer to a writable BLOB stream for the Firmware Distribution Server to write the firmware image to.

Param srv
Firmware Distribution Server model instance.

Param slot
DFU image slot being received.

Param io
BLOB stream response pointer.
Return
0 on success, or (negative) error code otherwise.

void (*del)(struct *bt_mesh_dfd_srv* *srv, const struct *bt_mesh_dfu_slot* *slot)

Slot delete callback.

Called when the Firmware Distribution Server is about to delete a DFU image slot. All allocated data associated with the firmware slot should be deleted.
Param srv
Firmware Update Server instance.
Param slot
DFU image slot being deleted.

int (*send)(struct *bt_mesh_dfd_srv* *srv, const struct *bt_mesh_dfu_slot* *slot, const struct *bt_mesh_blob_io* **io)

Slot send callback.

Called at the start of a distribution procedure. The callback must fill `io` with a pointer to a readable BLOB stream for the Firmware Distribution Server to read the firmware image from.
Param srv
Firmware Distribution Server model instance.
Param slot
DFU image slot being sent.
Param io
BLOB stream response pointer.
Return
0 on success, or (negative) error code otherwise.

void (*phase)(struct *bt_mesh_dfd_srv* *srv, enum *bt_mesh_dfd_phase* phase)

Phase change callback (Optional).

Called whenever the phase of the Firmware Distribution Server changes.
Param srv
Firmware Distribution Server model instance.
Param phase
New Firmware Distribution phase.

struct bt_mesh_dfd_srv

#include <dfd_srv.h> Firmware Distribution Server instance.

Overview

DFU roles The Bluetooth Mesh DFU subsystem defines three different roles the mesh nodes have to assume in the distribution of firmware images:

Target node
Target node is the receiver and user of the transferred firmware images. All its functionality is implemented by the *Firmware Update Server* model. A transfer may be targeting any number of Target nodes, and they will all be updated concurrently.

Distributor
The Distributor role serves two purposes in the DFU process. First, it's acting as the Target node in the Upload Firmware procedure, then it distributes the uploaded image to other

Target nodes as the Distributor. The Distributor does not select the parameters of the transfer, but relies on an Initiator to give it a list of Target nodes and transfer parameters. The Distributor functionality is implemented in two models, *Firmware Distribution Server* and *Firmware Update Client*. The *Firmware Distribution Server* is responsible for communicating with the Initiator, and the *Firmware Update Client* is responsible for distributing the image to the Target nodes.

Initiator

The Initiator role is typically implemented by the same device that implements the Bluetooth Mesh *Provisioner* and *Configurator* roles. The Initiator needs a full overview of the potential Target nodes and their firmware, and will control (and initiate) all firmware updates. The Initiator role is not implemented in the Zephyr Bluetooth Mesh DFU subsystem.

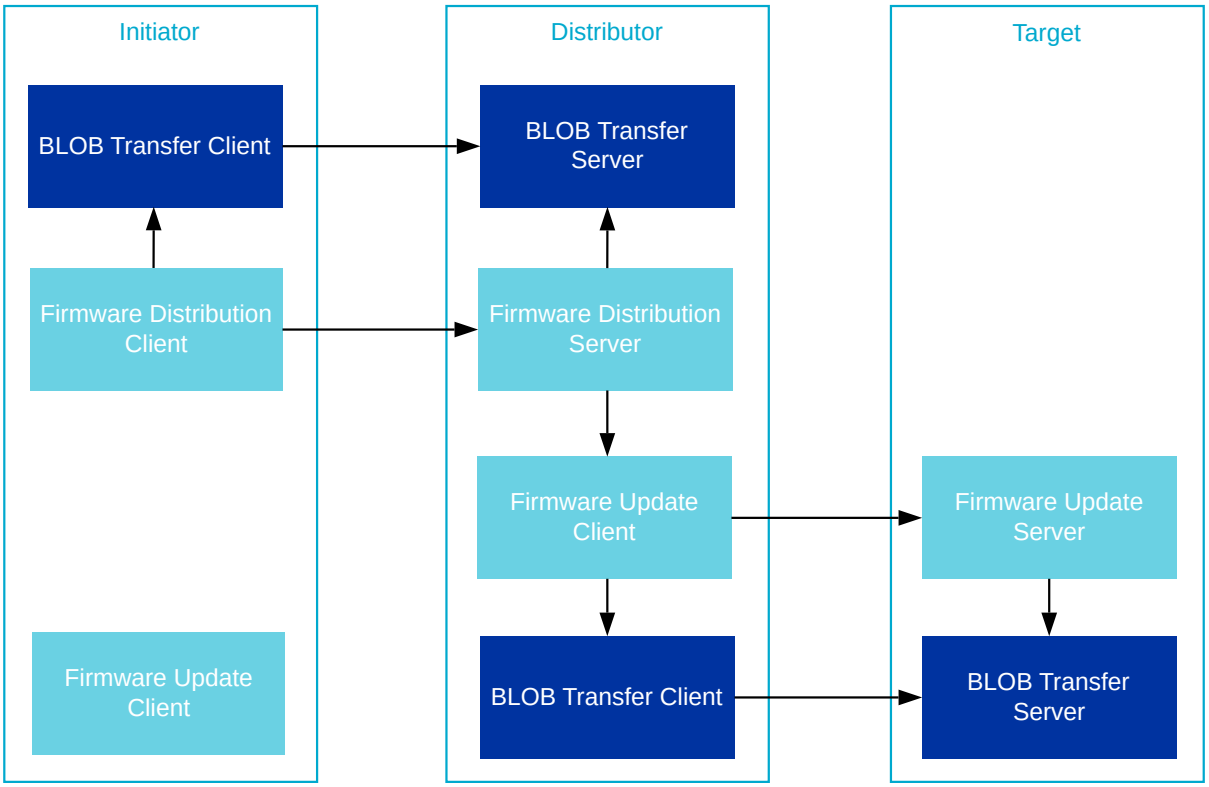

Fig. 10: DFU roles and the associated Bluetooth Mesh models

Bluetooth Mesh applications may combine the DFU roles in any way they'd like, and even take on multiple instances of the same role by instantiating the models on separate elements. For instance, the Distributor and Initiator role can be combined by instantiating the *Firmware Update Client* on the Initiator node and calling its API directly.

It's also possible to combine the Initiator and Distributor devices into a single device, and replace the Firmware Distribution Server model with a proprietary mechanism that will access the Firmware Update Client model directly, e.g. over a serial protocol.

Note

All DFU models instantiate one or more *BLOB Transfer models*, and may need to be spread over multiple elements for certain role combinations.

Stages The Bluetooth Mesh DFU process is designed to act in three stages:

Upload stage

First, the image is uploaded to a Distributor in a mesh network by an external entity, such as a phone or gateway (the Initiator). During the Upload stage, the Initiator transfers the firmware image and all its metadata to the Distributor node inside the mesh network. The Distributor stores the firmware image and its metadata persistently, and awaits further instructions from the Initiator. The time required to complete the upload process depends on the size of the image. After the upload completes, the Initiator can disconnect from the network during the much more time-consuming Distribution stage. Once the firmware has been uploaded to the Distributor, the Initiator may trigger the Distribution stage at any time.

Firmware Capability Check stage (optional)
Before starting the Distribution stage, the Initiator may optionally check if Target nodes can accept the new firmware. Nodes that do not respond, or respond that they can't receive the new firmware, are excluded from the firmware distribution process.

Distribution stage
Before the firmware image can be distributed, the Initiator transfers the list of Target nodes and their designated firmware image index to the Distributor. Next, it tells the Distributor to start the firmware distributon process, which runs in the background while the Initiator and the mesh network perform other duties. Once the firmware image has been transferred to the Target nodes, the Distributor may ask them to apply the firmware image immediately and report back with their status and new firmware IDs.

Firmware images All updatable parts of a mesh node's firmware should be represented as a firmware image. Each Target node holds a list of firmware images, each of which should be independently updatable and identifiable.

Firmware images are represented as a BLOB (the firmware itself) with the following additional information attached to it:

Firmware ID
The firmware ID is used to identify a firmware image. The Initiator node may ask the Target nodes for a list of its current firmware IDs to determine whether a newer version of the firmware is available. The format of the firmware ID is vendor specific, but generally, it should include enough information for an Initiator node with knowledge of the format to determine the type of image as well as its version. The firmware ID is optional, and its max length is determined by `CONFIG_BT_MESH_DFU_FWID_MAXLEN`.

Firmware metadata
The firmware metadata is used by the Target node to determine whether it should accept an incoming firmware update, and what the effect of the update would be. The metadata format is vendor specific, and should contain all information the Target node needs to verify the image, as well as any preparation the Target node has to make before the image is applied. Typical metadata information can be image signatures, changes to the node's Composition Data and the format of the BLOB. The Target node may perform a metadata check before accepting incoming transfers to determine whether the transfer should be started. The firmware metadata can be discarded by the Target node after the metadata check, as other nodes will never request the metadata from the Target node. The firmware metadata is optional, and its maximum length is determined by `CONFIG_BT_MESH_DFU_METADATA_MAXLEN`.

The Bluetooth Mesh DFU subsystem in Zephyr provides its own metadata format (*`bt_mesh_dfu_metadata`*) together with a set of related functions that can be used by an end product. The support for it is enabled using the `CONFIG_BT_MESH_DFU_METADATA` option. The format of the metadata is presented in the table below.

Field	Size (Bytes)	Description
New firmware version	8 B	1 B: Major version 1 B: Minor version 2 B: Revision 4 B: Build number
New firmware size	3 B	Size in bytes for a new firmware
New firmware core type	1 B	Bit field: Bit 0: Application core Bit 1: Network core Bit 2: Applications specific BLOB. Other bits: RFU
Hash of incoming composition data	4 B (Optional)	Lower 4 octets of AES-CMAC (app-specific-key, composition data). This field is present, if Bit 0 is set in the New firmware core type field.
New number of elements	2 B (Optional)	Number of elements on the node after firmware is applied. This field is present, if Bit 0 is set in the New firmware core type field.
Application-specific data for new firmware	<variable> (Optional)	Application-specific data to allow application to execute some vendor-specific behaviors using this data before it can respond with a status message.

> **Note**
>
> The AES-CMAC algorithm serves as a hashing function with a fixed key and is not used for encryption in Bluetooth Mesh DFU metadata. The resulting hash is not secure since the key is known.

Firmware URI

The firmware URI gives the Initiator information about where firmware updates for the image can be found. The URI points to an online resource the Initiator can interact with to get new versions of the firmware. This allows Initiators to perform updates for any node in the mesh network by interacting with the web server pointed to in the URI. The URI must point to a resource using the `http` or `https` schemes, and the targeted web server must behave according to the Firmware Check Over HTTPS procedure defined by the specification. The firmware URI is optional, and its max length is determined by `CONFIG_BT_MESH_DFU_URI_MAXLEN`.

> **Note**
>
> The out-of-band distribution mechanism is not supported.

Firmware effect A new image may have the Composition Data Page 0 different from the one allocated on a Target node. This may have an effect on the provisioning data of the node and how the Distributor finalizes the DFU. Depending on the availability of the Remote Provisioning Server model on the old and new image, the device may either boot up unprovisioned after applying the new firmware or require to be re-provisioned. The complete list of available options is defined in *`bt_mesh_dfu_effect`*:

`BT_MESH_DFU_EFFECT_NONE`
: The device stays provisioned after the new firmware is programmed. This effect is chosen if the composition data of the new firmware doesn't change.

`BT_MESH_DFU_EFFECT_COMP_CHANGE_NO_RPR`
: This effect is chosen when the composition data changes and the device doesn't support the remote provisioning. The new composition data takes place only after re-provisioning.

BT_MESH_DFU_EFFECT_COMP_CHANGE
: This effect is chosen when the composition data changes and the device supports the remote provisioning. In this case, the device stays provisioned and the new composition data takes place after re-provisioning using the Remote Provisioning models.

BT_MESH_DFU_EFFECT_UNPROV
: This effect is chosen if the composition data in the new firmware changes, the device doesn't support the remote provisioning, and the new composition data takes effect after applying the firmware.

When the Target node receives the Firmware Update Firmware Metadata Check message, the Firmware Update Server model calls the *bt_mesh_dfu_srv_cb.check* callback, the application can then process the metadata and provide the effect value. If the effect is *BT_MESH_DFU_EFFECT_COMP_CHANGE*, the application must call functions *bt_mesh_comp_change_prepare()* and *bt_mesh_models_metadata_change_prepare()* to prepare the Composition Data Page and Models Metadata Page contents before applying the new firmware image. See *Composition Data and Models Metadata* for more information.

DFU procedures The DFU protocol is implemented as a set of procedures that must be performed in a certain order.

The Initiator controls the Upload stage of the DFU protocol, and all Distributor side handling of the upload subprocedures is implemented in the *Firmware Distribution Server*.

The Distribution stage is controlled by the Distributor, as implemented by the *Firmware Update Client*. The Target node implements all handling of these procedures in the *Firmware Update Server*, and notifies the application through a set of callbacks.

Uploading the firmware The Upload Firmware procedure uses the *BLOB Transfer models* to transfer the firmware image from the Initiator to the Distributor. The Upload Firmware procedure works in two steps:

1. The Initiator generates a BLOB ID, and sends it to the Distributor's Firmware Distribution Server along with the firmware information and other input parameters of the BLOB transfer. The Firmware Distribution Server stores the information, and prepares its BLOB Transfer Server for the incoming transfer before it responds with a status message to the Initiator.
2. The Initiator's BLOB Transfer Client model transfers the firmware image to the Distributor's BLOB Transfer Server, which stores the image in a predetermined flash partition.

When the BLOB transfer finishes, the firmware image is ready for distribution. The Initiator may upload several firmware images to the Distributor, and ask it to distribute them in any order or at any time. Additional procedures are available for querying and deleting firmware images from the Distributor.

The following Distributor's capabilities related to firmware images can be configured using the configuration options:

- `CONFIG_BT_MESH_DFU_SLOT_CNT`: Amount of image slots available on the device.
- `CONFIG_BT_MESH_DFD_SRV_SLOT_MAX_SIZE`: Maximum allowed size for each image.
- `CONFIG_BT_MESH_DFD_SRV_SLOT_SPACE`: Available space for all images.

Populating the Distributor's receivers list Before the Distributor can start distributing the firmware image, it needs a list of Target nodes to send the image to. The Initiator gets the full list of Target nodes either by querying the potential targets directly, or through some external authority. The Initiator uses this information to populate the Distributor's receivers list with the address and relevant firmware image index of each Target node. The Initiator may send one or more Firmware Distribution Receivers Add messages to build the Distributor's receivers list, and a Firmware Distribution Receivers Delete All message to clear it.

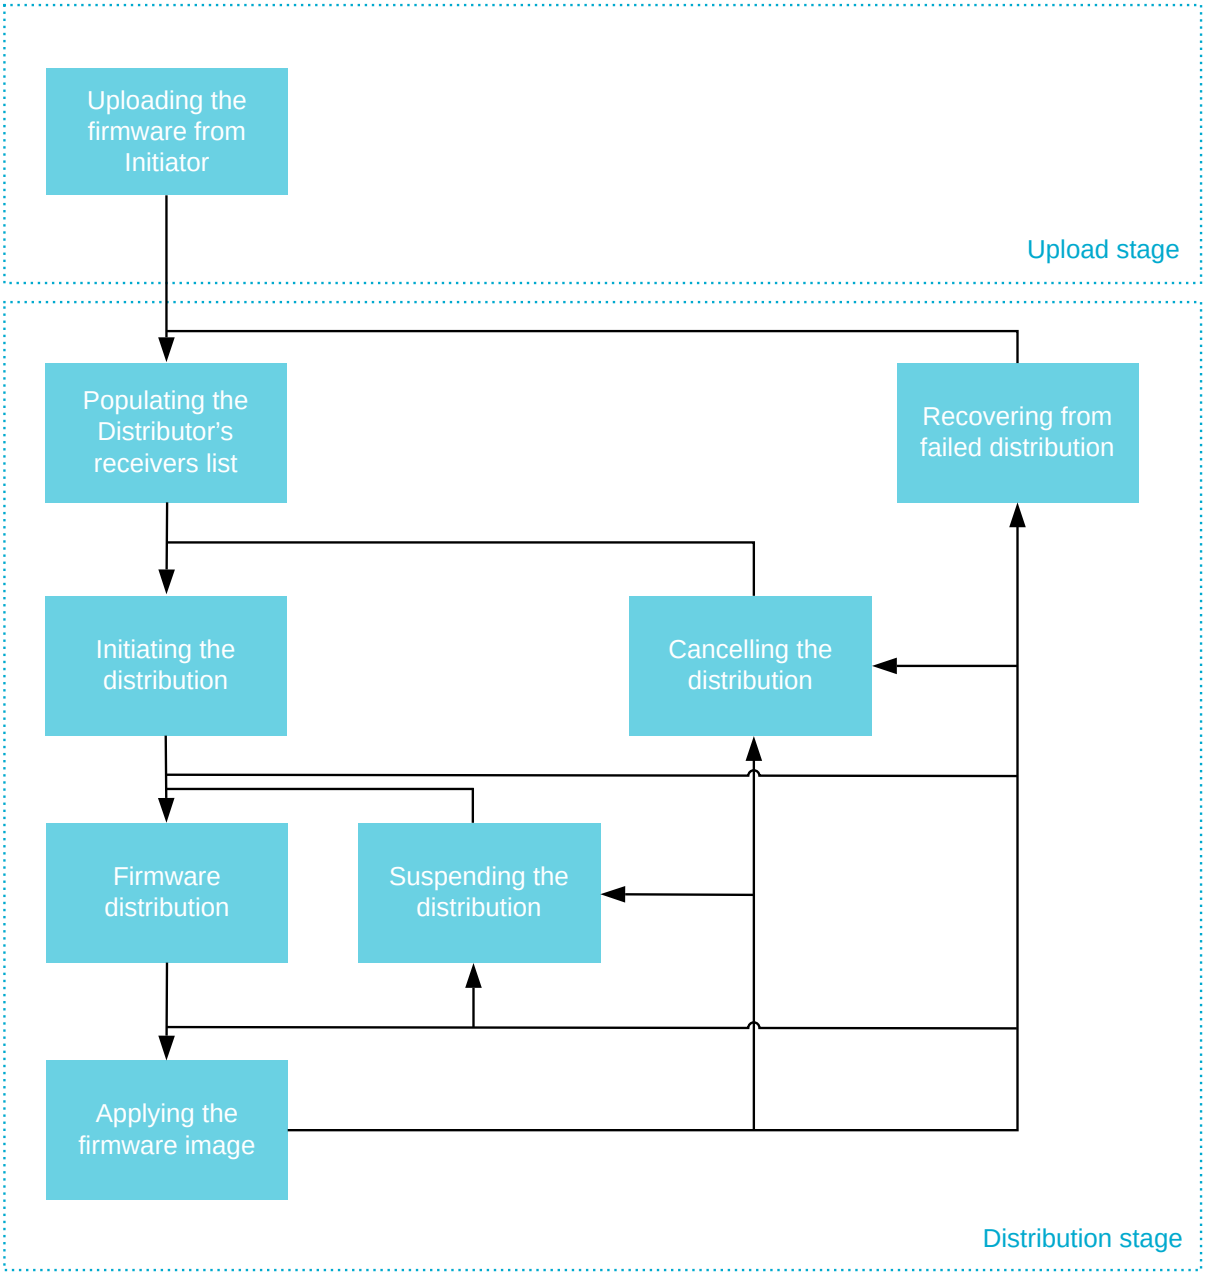

Fig. 11: DFU stages and procedures as seen from the Distributor

The maximum number of receivers that can be added to the Distributor is configured through the `CONFIG_BT_MESH_DFD_SRV_TARGETS_MAX` configuration option.

Initiating the distribution Once the Distributor has stored a firmware image and received a list of Target nodes, the Initiator may initiate the distribution procedure. The BLOB transfer parameters for the distribution are passed to the Distributor along with an update policy. The update policy decides whether the Distributor should request that the firmware is applied on the Target nodes or not. The Distributor stores the transfer parameters and starts distributing the firmware image to its list of Target nodes.

Firmware distribution The Distributor's Firmware Update Client model uses its BLOB Transfer Client model's broadcast subsystem to communicate with all Target nodes. The firmware distribution is performed with the following steps:

1. The Distributor's Firmware Update Client model generates a BLOB ID and sends it to each Target node's Firmware Update Server model, along with the other BLOB transfer parameters, the Target node firmware image index and the firmware image metadata. Each Target node performs a metadata check and prepares their BLOB Transfer Server model for the transfer, before sending a status response to the Firmware Update Client, indicating if the firmware update will have any effect on the Bluetooth Mesh state of the node.
2. The Distributor's BLOB Transfer Client model transfers the firmware image to all Target nodes.
3. Once the BLOB transfer has been received, the Target nodes' applications verify that the firmware is valid by performing checks such as signature verification or image checksums against the image metadata.
4. The Distributor's Firmware Update Client model queries all Target nodes to ensure that they've all verified the firmware image.

If the distribution procedure completed with at least one Target node reporting that the image has been received and verified, the distribution procedure is considered successful.

Note

The firmware distribution procedure only fails if *all* Target nodes are lost. It is up to the Initiator to request a list of failed Target nodes from the Distributor and initiate additional attempts to update the lost Target nodes after the current attempt is finished.

Suspending the distribution The Initiator can also request the Distributor to suspend the firmware distribution. In this case, the Distributor will stop sending any messages to Target nodes. When the firmware distribution is resumed, the Distributor will continue sending the firmware from the last successfully transferred block.

Applying the firmware image If the Initiator requested it, the Distributor can initiate the Apply Firmware on Target Node procedure on all Target nodes that successfully received and verified the firmware image. The Apply Firmware on Target Node procedure takes no parameters, and to avoid ambiguity, it should be performed before a new transfer is initiated. The Apply Firmware on Target Node procedure consists of the following steps:

1. The Distributor's Firmware Update Client model instructs all Target nodes that have verified the firmware image to apply it. The Target nodes' Firmware Update Server models respond with a status message before calling their application's `apply` callback.
2. The Target node's application performs any preparations needed before applying the transfer, such as storing a snapshot of the Composition Data or clearing its configuration.

3. The Target node's application swaps the current firmware with the new image and updates its firmware image list with the new firmware ID.
4. The Distributor's Firmware Update Client model requests the full list of firmware images from each Target node, and scans through the list to make sure that the new firmware ID has replaced the old.

> **Note**
>
> During the metadata check in the distribution procedure, the Target node may have reported that it will become unprovisioned after the firmware image is applied. In this case, the Distributor's Firmware Update Client model will send a request for the full firmware image list, and expect no response.

Cancelling the distribution The firmware distribution can be cancelled at any time by the Initiator. In this case, the Distributor starts the cancelling procedure by sending a cancelling message to all Target nodes. The Distributor waits for the response from all Target nodes. Once all Target nodes have replied, or the request has timed out, the distribution procedure is cancelled. After this the distribution procedure can be started again from the `Firmware distribution` section.

API reference This section lists the types common to the Device Firmware Update mesh models.

group `bt_mesh_dfd`

Enums

enum `bt_mesh_dfd_status`

Firmware distribution status.

Values:

enumerator `BT_MESH_DFD_SUCCESS`

The message was processed successfully.

enumerator `BT_MESH_DFD_ERR_INSUFFICIENT_RESOURCES`

Insufficient resources on the node.

enumerator `BT_MESH_DFD_ERR_WRONG_PHASE`

The operation cannot be performed while the Server is in the current phase.

enumerator `BT_MESH_DFD_ERR_INTERNAL`

An internal error occurred on the node.

enumerator `BT_MESH_DFD_ERR_FW_NOT_FOUND`

The requested firmware image is not stored on the Distributor.

enumerator `BT_MESH_DFD_ERR_INVALID_APPKEY_INDEX`

The AppKey identified by the AppKey Index is not known to the node.

enumerator BT_MESH_DFD_ERR_RECEIVERS_LIST_EMPTY
There are no Target nodes in the Distribution Receivers List state.

enumerator BT_MESH_DFD_ERR_BUSY_WITH_DISTRIBUTION
Another firmware image distribution is in progress.

enumerator BT_MESH_DFD_ERR_BUSY_WITH_UPLOAD
Another upload is in progress.

enumerator BT_MESH_DFD_ERR_URI_NOT_SUPPORTED
The URI scheme name indicated by the Update URI is not supported.

enumerator BT_MESH_DFD_ERR_URI_MALFORMED
The format of the Update URI is invalid.

enumerator BT_MESH_DFD_ERR_URI_UNREACHABLE
The URI is currently unreachable.

enumerator BT_MESH_DFD_ERR_NEW_FW_NOT_AVAILABLE
The Check Firmware OOB procedure did not find any new firmware.

enumerator BT_MESH_DFD_ERR_SUSPEND_FAILED
The suspension of the Distribute Firmware procedure failed.

enum bt_mesh_dfd_phase
Firmware distribution phases.
Values:

enumerator BT_MESH_DFD_PHASE_IDLE
No firmware distribution is in progress.

enumerator BT_MESH_DFD_PHASE_TRANSFER_ACTIVE
Firmware distribution is in progress.

enumerator BT_MESH_DFD_PHASE_TRANSFER_SUCCESS
The Transfer BLOB procedure has completed successfully.

enumerator BT_MESH_DFD_PHASE_APPLYING_UPDATE
The Apply Firmware on Target Nodes procedure is being executed.

enumerator BT_MESH_DFD_PHASE_COMPLETED
The Distribute Firmware procedure has completed successfully.

enumerator BT_MESH_DFD_PHASE_FAILED
The Distribute Firmware procedure has failed.

enumerator BT_MESH_DFD_PHASE_CANCELING_UPDATE
The Cancel Firmware Update procedure is being executed.

enumerator BT_MESH_DFD_PHASE_TRANSFER_SUSPENDED
The Transfer BLOB procedure is suspended.

enum bt_mesh_dfd_upload_phase
Firmware upload phases.
Values:

enumerator BT_MESH_DFD_UPLOAD_PHASE_IDLE
No firmware upload is in progress.

enumerator BT_MESH_DFD_UPLOAD_PHASE_TRANSFER_ACTIVE
The Store Firmware procedure is being executed.

enumerator BT_MESH_DFD_UPLOAD_PHASE_TRANSFER_ERROR
The Store Firmware procedure or Store Firmware OOB procedure failed.

enumerator BT_MESH_DFD_UPLOAD_PHASE_TRANSFER_SUCCESS
The Store Firmware procedure or the Store Firmware OOB procedure completed successfully.

group bt_mesh_dfu

Defines

CONFIG_BT_MESH_DFU_FWID_MAXLEN

CONFIG_BT_MESH_DFU_METADATA_MAXLEN

CONFIG_BT_MESH_DFU_URI_MAXLEN

CONFIG_BT_MESH_DFU_SLOT_CNT

Enums

enum bt_mesh_dfu_phase
DFU transfer phase.
Values:

enumerator BT_MESH_DFU_PHASE_IDLE
Ready to start a Receive Firmware procedure.

enumerator BT_MESH_DFU_PHASE_TRANSFER_ERR
The Transfer BLOB procedure failed.

enumerator BT_MESH_DFU_PHASE_TRANSFER_ACTIVE
The Receive Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_VERIFY
The Verify Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_VERIFY_OK
The Verify Firmware procedure completed successfully.

enumerator BT_MESH_DFU_PHASE_VERIFY_FAIL
The Verify Firmware procedure failed.

enumerator BT_MESH_DFU_PHASE_APPLYING
The Apply New Firmware procedure is being executed.

enumerator BT_MESH_DFU_PHASE_TRANSFER_CANCELED
Firmware transfer has been canceled.

enumerator BT_MESH_DFU_PHASE_APPLY_SUCCESS
Firmware applying succeeded.

enumerator BT_MESH_DFU_PHASE_APPLY_FAIL
Firmware applying failed.

enumerator BT_MESH_DFU_PHASE_UNKNOWN
Phase of a node was not yet retrieved.

enum bt_mesh_dfu_status
DFU status.
Values:

enumerator BT_MESH_DFU_SUCCESS
The message was processed successfully.

enumerator BT_MESH_DFU_ERR_RESOURCES
Insufficient resources on the node.

enumerator BT_MESH_DFU_ERR_WRONG_PHASE
The operation cannot be performed while the Server is in the current phase.

enumerator BT_MESH_DFU_ERR_INTERNAL
An internal error occurred on the node.

enumerator BT_MESH_DFU_ERR_FW_IDX
The message contains a firmware index value that is not expected.

enumerator BT_MESH_DFU_ERR_METADATA
The metadata check failed.

enumerator BT_MESH_DFU_ERR_TEMPORARILY_UNAVAILABLE

The Server cannot start a firmware update.

enumerator BT_MESH_DFU_ERR_BLOB_XFER_BUSY

Another BLOB transfer is in progress.

enum bt_mesh_dfu_effect

Expected effect of a DFU transfer.

Values:

enumerator BT_MESH_DFU_EFFECT_NONE

No changes to node Composition Data.

enumerator BT_MESH_DFU_EFFECT_COMP_CHANGE_NO_RPR

Node Composition Data changed and the node does not support remote provisioning.

enumerator BT_MESH_DFU_EFFECT_COMP_CHANGE

Node Composition Data changed, and remote provisioning is supported.

The node supports remote provisioning and Composition Data Page 0x80. Page 0x80 contains different Composition Data than Page 0x0.

enumerator BT_MESH_DFU_EFFECT_UNPROV

Node will be unprovisioned after the update.

enum bt_mesh_dfu_iter

Action for DFU iteration callbacks.

Values:

enumerator BT_MESH_DFU_ITER_STOP

Stop iterating.

enumerator BT_MESH_DFU_ITER_CONTINUE

Continue iterating.

struct bt_mesh_dfu_img

#include <dfu.h> DFU image instance.

Each DFU image represents a single updatable firmware image.

Public Members

const void *fwid

Firmware ID.

size_t fwid_len

Length of the firmware ID.

const char *uri
Update URI, or NULL.

struct bt_mesh_dfu_slot
#include <dfu.h> DFU image slot for DFU distribution.

Public Members

size_t size
Size of the firmware in bytes.

size_t fwid_len
Length of the firmware ID.

size_t metadata_len
Length of the metadata.

uint8_t fwid[0]
Firmware ID.

uint8_t metadata[0]
Metadata.

group bt_mesh_dfu_metadata
Common types and functions for the Bluetooth Mesh DFU metadata.

Enums

enum bt_mesh_dfu_metadata_fw_core_type
Firmware core type.
Values:

enumerator BT_MESH_DFU_FW_CORE_TYPE_APP = *BIT*(0)
Application core.

enumerator BT_MESH_DFU_FW_CORE_TYPE_NETWORK = *BIT*(1)
Network core.

enumerator BT_MESH_DFU_FW_CORE_TYPE_APP_SPECIFIC_BLOB = *BIT*(2)
Application-specific BLOB.

Functions

int **bt_mesh_dfu_metadata_decode**(struct *net_buf_simple* *buf, struct *bt_mesh_dfu_metadata* *metadata)

Decode a firmware metadata from a network buffer.

Parameters

- **buf** – Buffer containing a raw metadata to be decoded.
- **metadata** – Pointer to a metadata structure to be filled.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_metadata_encode**(const struct *bt_mesh_dfu_metadata* *metadata, struct *net_buf_simple* *buf)

Encode a firmware metadata into a network buffer.

Parameters

- **metadata** – Firmware metadata to be encoded.
- **buf** – Buffer to store the encoded metadata.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_metadata_comp_hash_get**(struct *net_buf_simple* *buf, uint8_t *key, uint32_t *hash)

Compute hash of the Composition Data state.

The format of the Composition Data is defined in MshPRTv1.1: 4.2.2.1.

Parameters

- **buf** – Pointer to buffer holding Composition Data.
- **key** – 128-bit key to be used in the hash computation.
- **hash** – Pointer to a memory location to which the hash will be stored.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_dfu_metadata_comp_hash_local_get**(uint8_t *key, uint32_t *hash)

Compute hash of the Composition Data Page 0 of this device.

Parameters

- **key** – 128-bit key to be used in the hash computation.
- **hash** – Pointer to a memory location to which the hash will be stored.

Returns
0 on success, or (negative) error code otherwise.

struct **bt_mesh_dfu_metadata_fw_ver**

#include <dfu_metadata.h> Firmware version.

Public Members

uint8_t **major**

Firmware major version.

uint8_t **minor**
Firmware minor version.

uint16_t **revision**
Firmware revision.

uint32_t **build_num**
Firmware build number.

struct **bt_mesh_dfu_metadata**
#include <dfu_metadata.h> Firmware metadata.

Public Members

struct *bt_mesh_dfu_metadata_fw_ver* **fw_ver**
New firmware version.

uint32_t **fw_size**
New firmware size.

enum *bt_mesh_dfu_metadata_fw_core_type* **fw_core_type**
New firmware core type.

uint32_t **comp_hash**
Hash of incoming Composition Data.

uint16_t **elems**
New number of node elements.

uint8_t ***user_data**
Application-specific data for new firmware.
This field is optional.

uint32_t **user_data_len**
Length of the application-specific field.

Message The Bluetooth Mesh message provides set of structures, macros and functions used for preparing message buffers, managing message and acknowledged message contexts.

API reference

group **bt_mesh_msg**
Message.

Defines

`BT_MESH_MIC_SHORT`

Length of a short Mesh MIC.

`BT_MESH_MIC_LONG`

Length of a long Mesh MIC.

`BT_MESH_MODEL_OP_LEN`(_op)

Helper to determine the length of an opcode.

Parameters

- `_op` – Opcode.

`BT_MESH_MODEL_BUF_LEN`(_op, _payload_len)

Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a short MIC.

Parameters

- `_op` – Opcode of the message.
- `_payload_len` – Length of the model payload.

`BT_MESH_MODEL_BUF_LEN_LONG_MIC`(_op, _payload_len)

Helper for model message buffer length.

Returns the length of a Mesh model message buffer, including the opcode length and a long MIC.

Parameters

- `_op` – Opcode of the message.
- `_payload_len` – Length of the model payload.

`BT_MESH_MODEL_BUF_DEFINE`(_buf, _op, _payload_len)

Define a Mesh model message buffer using *NET_BUF_SIMPLE_DEFINE*.

Parameters

- `_buf` – Buffer name.
- `_op` – Opcode of the message.
- `_payload_len` – Length of the model message payload.

`BT_MESH_MSG_CTX_INIT`(net_key_idx, app_key_idx, dst, ttl)

Helper for *bt_mesh_msg_ctx* structure initialization.

> **Note**
>
> If `dst` is a Virtual Address, Label UUID shall be initialized separately.

Parameters

- `net_key_idx` – NetKey Index of the subnet to send the message on. Only used if `app_key_idx` points to devkey.
- `app_key_idx` – AppKey Index to encrypt the message with.
- `dst` – Remote addr.

- **ttl** – Time To Live.

BT_MESH_MSG_CTX_INIT_APP(app_key_idx, dst)

Helper for *bt_mesh_msg_ctx* structure initialization secured with Application Key.

Parameters

- **app_key_idx** – AppKey Index to encrypt the message with.
- **dst** – Remote addr.

BT_MESH_MSG_CTX_INIT_DEV(net_key_idx, dst)

Helper for *bt_mesh_msg_ctx* structure initialization secured with Device Key of a remote device.

Parameters

- **net_key_idx** – NetKey Index of the subnet to send the message on.
- **dst** – Remote addr.

BT_MESH_MSG_CTX_INIT_PUB(pub)

Helper for *bt_mesh_msg_ctx* structure initialization using Model Publication context.

Parameters

- **pub** – Pointer to a model publication context.

Functions

void **bt_mesh_model_msg_init**(struct *net_buf_simple* *msg, uint32_t opcode)

Initialize a model message.

Clears the message buffer contents, and encodes the given opcode. The message buffer will be ready for filling in payload data.

Parameters

- **msg** – Message buffer.
- **opcode** – Opcode to encode.

static inline void **bt_mesh_msg_ack_ctx_init**(struct *bt_mesh_msg_ack_ctx* *ack)

Initialize an acknowledged message context.

Initializes semaphore used for synchronization between *bt_mesh_msg_ack_ctx_wait* and *bt_mesh_msg_ack_ctx_rx* calls. Call this function before using *bt_mesh_msg_ack_ctx*.

Parameters

- **ack** – Acknowledged message context to initialize.

static inline void **bt_mesh_msg_ack_ctx_reset**(struct *bt_mesh_msg_ack_ctx* *ack)

Reset the synchronization semaphore in an acknowledged message context.

This function aborts call to *bt_mesh_msg_ack_ctx_wait*.

Parameters

- **ack** – Acknowledged message context to be reset.

void **bt_mesh_msg_ack_ctx_clear**(struct *bt_mesh_msg_ack_ctx* *ack)

Clear parameters of an acknowledged message context.

This function clears the opcode, remote address and user data set by *bt_mesh_msg_ack_ctx_prepare*.

Parameters

- `ack` – Acknowledged message context to be cleared.

int `bt_mesh_msg_ack_ctx_prepare`(struct *bt_mesh_msg_ack_ctx* *ack, uint32_t op, uint16_t dst, void *user_data)

Prepare an acknowledged message context for the incoming message to wait.

This function sets the opcode, remote address of the incoming message and stores the user data. Use this function before calling *bt_mesh_msg_ack_ctx_wait*.

Parameters

- `ack` – Acknowledged message context to prepare.
- `op` – The message OpCode.
- `dst` – Destination address of the message.
- `user_data` – User data for the acknowledged message context.

Returns
0 on success, or (negative) error code on failure.

static inline bool `bt_mesh_msg_ack_ctx_busy`(struct *bt_mesh_msg_ack_ctx* *ack)

Check if the acknowledged message context is initialized with an opcode.

Parameters

- `ack` – Acknowledged message context.

Returns
true if the acknowledged message context is initialized with an opcode, false otherwise.

int `bt_mesh_msg_ack_ctx_wait`(struct *bt_mesh_msg_ack_ctx* *ack, *k_timeout_t* timeout)

Wait for a message acknowledge.

This function blocks execution until *bt_mesh_msg_ack_ctx_rx* is called or by timeout.

Parameters

- `ack` – Acknowledged message context of the message to wait for.
- `timeout` – Wait timeout.

Returns
0 on success, or (negative) error code on failure.

static inline void `bt_mesh_msg_ack_ctx_rx`(struct *bt_mesh_msg_ack_ctx* *ack)

Mark a message as acknowledged.

This function unblocks call to *bt_mesh_msg_ack_ctx_wait*.

Parameters

- `ack` – Context of a message to be acknowledged.

bool `bt_mesh_msg_ack_ctx_match`(const struct *bt_mesh_msg_ack_ctx* *ack, uint32_t op, uint16_t addr, void **user_data)

Check if an opcode and address of a message matches the expected one.

Parameters

- `ack` – Acknowledged message context to be checked.
- `op` – OpCode of the incoming message.
- `addr` – Source address of the incoming message.

- `user_data` – If not NULL, returns a user data stored in the acknowledged message context by *bt_mesh_msg_ack_ctx_prepare*.

Returns
true if the incoming message matches the expected one, false otherwise.

struct `bt_mesh_msg_ctx`

#include <msg.h> Message sending context.

Public Members

uint16_t `net_idx`

NetKey Index of the subnet to send the message on.

uint16_t `app_idx`

AppKey Index to encrypt the message with.

uint16_t `addr`

Remote address.

uint16_t `recv_dst`

Destination address of a received message.

Not used for sending.

const uint8_t *`uuid`

Label UUID if Remote address is Virtual address, or NULL otherwise.

int8_t `recv_rssi`

RSSI of received packet.

Not used for sending.

uint8_t `recv_ttl`

Received TTL value.

Not used for sending.

bool `send_rel`

Force sending reliably by using segment acknowledgment.

bool `rnd_delay`

Send message with a random delay according to the Access layer transmitting rules.

uint8_t `send_ttl`

TTL, or BT_MESH_TTL_DEFAULT for default TTL.

struct `bt_mesh_msg_ack_ctx`

#include <msg.h> Acknowledged message context for tracking the status of model messages pending a response.

Public Members

struct k_sem **sem**

Sync semaphore.

uint32_t **op**

Opcode we're waiting for.

uint16_t **dst**

Address of the node that should respond.

void ***user_data**

User specific parameter.

Segmentation and reassembly (SAR) Segmentation and reassembly (SAR) provides a way of handling larger upper transport layer messages in a mesh network, with a purpose of enhancing the Bluetooth Mesh throughput. The segmentation and reassembly mechanism is used by the lower transport layer.

The lower transport layer defines how the upper transport layer PDUs are segmented and reassembled into multiple Lower Transport PDUs, and sends them to the lower transport layer on a peer device. If the Upper Transport PDU fits, it is sent in a single Lower Transport PDU. For longer packets, which do not fit into a single Lower Transport PDU, the lower transport layer performs segmentation, splitting the Upper Transport PDU into multiple segments.

The lower transport layer on the receiving device reassembles the segments into a single Upper Transport PDU before passing it up the stack. Delivery of a segmented message is acknowledged by the lower transport layer of the receiving node, while an unsegmented message delivery is not acknowledged. However, an Upper Transport PDU that fits into one Lower Transport PDU can also be sent as a single-segment segmented message when acknowledgment by the lower transport layer is required. Set the `send rel` flag (see *bt_mesh_msg_ctx*) to use the reliable message transmission and acknowledge single-segment segmented messages.

The transport layer is able to transport up to 32 segments with its SAR mechanism, with a maximum message (PDU) size of 384 octets. To configure message size for the Bluetooth Mesh stack, use the following Kconfig options:

- `CONFIG_BT_MESH_RX_SEG_MAX` to set the maximum number of segments in an incoming message.
- `CONFIG_BT_MESH_TX_SEG_MAX` to set the maximum number of segments in an outgoing message.

The Kconfig options `CONFIG_BT_MESH_TX_SEG_MSG_COUNT` and `CONFIG_BT_MESH_RX_SEG_MSG_COUNT` define how many outgoing and incoming segmented messages can be processed simultaneously. When more than one segmented message is sent to the same destination, the messages are queued and sent one at a time.

Incoming and outgoing segmented messages share the same pool for allocation of their segments. This pool size is configured through the `CONFIG_BT_MESH_SEG_BUFS` Kconfig option. Both incoming and outgoing messages allocate segments at the start of the transaction. The outgoing segmented message releases its segments one by one as soon as they are acknowledged by the receiver, while the incoming message releases the segments first after the message is fully received. Keep this in mind when defining the size of the buffers.

SAR does not impose extra overhead on the access layer payload per segment.

Segmentation and reassembly (SAR) Configuration models With Bluetooth Mesh Protocol Specification version 1.1, it became possible to configure SAR behavior, such as intervals, timers and retransmission counters, over a mesh network using SAR Configuration models:

- *SAR Configuration Client*
- *SAR Configuration Server*

The following SAR behavior applies regardless of the presence of a SAR Configuration Server on a node.

Transmission of segments is separated by a segment transmission interval (see the *SAR Segment Interval Step* state). Other configurable time intervals and delays available for the segmentation and reassembly are:

- Interval between unicast retransmissions (see the states *SAR Unicast Retransmissions Interval Step* and *SAR Unicast Retransmissions Interval Increment*).
- Interval between multicast retransmissions (see the *SAR Multicast Retransmissions Interval Step* state).
- Segment reception interval (see the *SAR Receiver Segment Interval Step* state).
- Acknowledgment delay increment (see the *SAR Acknowledgment Delay Increment* state).

When the last segment marked as unacknowledged is transmitted, the lower transport layer starts a retransmissions timer. The initial value of the SAR Unicast Retransmissions timer depends on the value of the TTL field of the message. If the TTL field value is greater than `0`, the initial value for the timer is set according to the following formula:

$$unicast\ retransmissions\ interval\ step + unicast\ retransmissions\ interval\ increment \times (TTL - 1)$$

If the TTL field value is `0`, the initial value of the timer is set to the unicast retransmissions interval step.

The initial value of the SAR Multicast Retransmissions timer is set to the multicast retransmissions interval.

When the lower transport layer receives a message segment, it starts a SAR Discard timer. The discard timer tells how long the lower transport layer waits before discarding the segmented message the segment belongs to. The initial value of the SAR Discard timer is the discard timeout value indicated by the *SAR Discard Timeout* state.

SAR Acknowledgment timer holds the time before a Segment Acknowledgment message is sent for a received segment. The initial value of the SAR Acknowledgment timer is calculated using the following formula:

$$min(SegN + 0.5, acknowledgment\ delay\ increment) \times segment\ reception\ interval$$

The `SegN` field value identifies the total number of segments the Upper Transport PDU is segmented into.

Four counters are related to SAR behavior:

- Two unicast retransmissions counts (see *SAR Unicast Retransmissions Count* state and *SAR Unicast Retransmissions Without Progress Count* state)
- Multicast retransmissions count (see *SAR Multicast Retransmissions Count* state)
- Acknowledgment retransmissions count (see *SAR Acknowledgment Retransmissions Count* state)

If the number of segments in the transmission is higher than the value of the *SAR Segments Threshold* state, Segment Acknowledgment messages are retransmitted using the value of the *SAR Acknowledgment Retransmissions Count* state.

SAR states There are two states defined related to segmentation and reassembly:

- SAR Transmitter state
- SAR Receiver state

The SAR Transmitter state is a composite state that controls the number and timing of transmissions of segmented messages. It includes the following states:

- SAR Segment Interval Step
- SAR Unicast Retransmissions Count
- SAR Unicast Retransmissions Without Progress Count
- SAR Unicast Retransmissions Interval Step
- SAR Unicast Retransmissions Interval Increment
- SAR Multicast Retransmissions Count
- SAR Multicast Retransmissions Interval Step

The SAR Receiver state is a composite state that controls the number and timing of Segment Acknowledgment transmissions and the discarding of reassembly of a segmented message. It includes the following states:

- SAR Segments Threshold
- SAR Discard Timeout
- SAR Acknowledgment Delay Increment
- SAR Acknowledgment Retransmissions Count
- SAR Receiver Segment Interval Step

SAR Segment Interval Step SAR Segment Interval Step state holds a value that controls the interval between transmissions of segments of a segmented message. The interval is measured in milliseconds.

Use the `CONFIG_BT_MESH_SAR_TX_SEG_INT_STEP` Kconfig option to set the default value. Segment transmission interval is then calculated using the following formula:

$$(\texttt{CONFIG\_BT\_MESH\_SAR\_TX\_SEG\_INT\_STEP} + 1) \times 10 \text{ ms}$$

SAR Unicast Retransmissions Count SAR Unicast Retransmissions Count holds a value that defines the maximum number of retransmissions of a segmented message to a unicast destination. Use the `CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_COUNT` Kconfig option to set the default value for this state.

SAR Unicast Retransmissions Without Progress Count This state holds a value that defines the maximum number of retransmissions of a segmented message to a unicast address that will be sent if no acknowledgment was received during the timeout, or if an acknowledgment with already confirmed segments was received. Use the Kconfig option `CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_WITHOUT_PROG_COUNT` to set the maximum number of retransmissions.

SAR Unicast Retransmissions Interval Step The value of this state controls the interval step used for delaying the retransmissions of unacknowledged segments of a segmented message to a unicast address. The interval step is measured in milliseconds.

Use the CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_INT_STEP Kconfig option to set the default value. This value is then used to calculate the interval step using the following formula:

$$(\text{CONFIG\_BT\_MESH\_SAR\_TX\_UNICAST\_RETRANS\_INT\_STEP} + 1) \times 25 \text{ ms}$$

SAR Unicast Retransmissions Interval Increment SAR Unicast Retransmissions Interval Increment holds a value that controls the interval increment used for delaying the retransmissions of unacknowledged segments of a segmented message to a unicast address. The increment is measured in milliseconds.

Use the Kconfig option CONFIG_BT_MESH_SAR_TX_UNICAST_RETRANS_INT_INC to set the default value. The Kconfig option value is used to calculate the increment using the following formula:

$$(\text{CONFIG\_BT\_MESH\_SAR\_TX\_UNICAST\_RETRANS\_INT\_INC} + 1) \times 25 \text{ ms}$$

SAR Multicast Retransmissions Count The state holds a value that controls the total number of retransmissions of a segmented message to a multicast address. Use the Kconfig option CONFIG_BT_MESH_SAR_TX_MULTICAST_RETRANS_COUNT to set the total number of retransmissions.

SAR Multicast Retransmissions Interval Step This state holds a value that controls the interval between retransmissions of all segments in a segmented message to a multicast address. The interval is measured in milliseconds.

Use the Kconfig option CONFIG_BT_MESH_SAR_TX_MULTICAST_RETRANS_INT to set the default value that is used to calculate the interval using the following formula:

$$(\text{CONFIG\_BT\_MESH\_SAR\_TX\_MULTICAST\_RETRANS\_INT} + 1) \times 25 \text{ ms}$$

SAR Discard Timeout The value of this state defines the time in seconds that the lower transport layer waits after receiving segments of a segmented message before discarding that segmented message. Use the Kconfig option CONFIG_BT_MESH_SAR_RX_DISCARD_TIMEOUT to set the default value. The discard timeout will be calculated using the following formula:

$$(\text{CONFIG\_BT\_MESH\_SAR\_RX\_DISCARD\_TIMEOUT} + 1) \times 5 \text{ seconds}$$

SAR Acknowledgment Delay Increment This state holds a value that controls the delay increment of an interval used for delaying the transmission of an acknowledgment message after receiving a new segment. The increment is measured in segments.

Use the Kconfig option CONFIG_BT_MESH_SAR_RX_ACK_DELAY_INC to set the default value. The increment value is calculated to be CONFIG_BT_MESH_SAR_RX_ACK_DELAY_INC + 1.5.

SAR Segments Threshold SAR Segments Threshold state holds a value that defines a threshold in number of segments of a segmented message for acknowledgment retransmissions. Use the Kconfig option CONFIG_BT_MESH_SAR_RX_SEG_THRESHOLD to set the threshold.

When the number of segments of a segmented message is above this threshold, the stack will additionally retransmit every acknowledgment message the number of times given by the value of CONFIG_BT_MESH_SAR_RX_ACK_RETRANS_COUNT.

SAR Acknowledgment Retransmissions Count The SAR Acknowledgment Retransmissions Count state controls the number of retransmissions of Segment Acknowledgment messages sent by the lower transport layer. It gives the total number of retranmissions of an acknowledgment message that the stack will additionally send when the size of segments in a segmented message is above the `CONFIG_BT_MESH_SAR_RX_SEG_THRESHOLD` value.

Use the Kconfig option `CONFIG_BT_MESH_SAR_RX_ACK_RETRANS_COUNT` to set the default value for this state. The maximum number of transmissions of a Segment Acknowledgment message is `CONFIG_BT_MESH_SAR_RX_ACK_RETRANS_COUNT` + 1.

SAR Receiver Segment Interval Step The SAR Receiver Segment Interval Step defines the segments reception interval step used for delaying the transmission of an acknowledgment message after receiving a new segment. The interval is measured in milliseconds.

Use the Kconfig option `CONFIG_BT_MESH_SAR_RX_SEG_INT_STEP` to set the default value and calculate the interval using the following formula:

$$(\texttt{CONFIG\_BT\_MESH\_SAR\_RX\_SEG\_INT\_STEP} + 1) \times 10 \text{ ms}$$

Provisioning Provisioning is the process of adding devices to a mesh network. It requires two devices operating in the following roles:

- The *provisioner* represents the network owner, and is responsible for adding new nodes to the mesh network.
- The *provisionee* is the device that gets added to the network through the Provisioning process. Before the provisioning process starts, the provisionee is an *unprovisioned device*.

The Provisioning module in the Zephyr Bluetooth Mesh stack supports both the Advertising and GATT Provisioning bearers for the provisionee role, as well as the Advertising Provisioning bearer for the provisioner role.

The Provisioning process All Bluetooth Mesh nodes must be provisioned before they can participate in a Bluetooth Mesh network. The Provisioning API provides all the functionality necessary for a device to become a provisioned mesh node. Provisioning is a five-step process, involving the following steps:

- Beaconing
- Invitation
- Public key exchange
- Authentication
- Provisioning data transfer

Beaconing To start the provisioning process, the unprovisioned device must first start broadcasting the Unprovisioned Beacon. This makes it visible to nearby provisioners, which can initiate the provisioning. To indicate that the device needs to be provisioned, call *`bt_mesh_prov_enable()`*. The device starts broadcasting the Unprovisioned Beacon with the device UUID and the `OOB information` field, as specified in the `prov` parameter passed to *`bt_mesh_init()`*. Additionally, a Uniform Resource Identifier (URI) may be specified, which can point the provisioner to the location of some Out Of Band information, such as the device's public key or an authentication value database. The URI is advertised in a separate beacon, with a URI hash included in the unprovisioned beacon, to tie the two together.

Uniform Resource Identifier The Uniform Resource Identifier shall follow the format specified in the Bluetooth Core Specification Supplement. The URI must start with a URI scheme, encoded as a single utf-8 data point, or the special `none` scheme, encoded as `0x01`. The available schemes are listed on the Bluetooth website.

Examples of encoded URIs:

Table 28: URI encoding examples

URI	Encoded
`http://example.com`	`\x16//example.com`
`https://www.zephyrproject.org/`	`\x17//www.zephyrproject.org/`
`just a string`	`\x01just a string`

Provisioning invitation The provisioner initiates the Provisioning process by sending a Provisioning invitation. The invitations prompts the provisionee to call attention to itself using the Health Server *Attention state*, if available.

The Unprovisioned device automatically responds to the invite by presenting a list of its capabilities, including the supported Out of Band Authentication methods and algorithms.

Public key exchange Before the provisioning process can begin, the provisioner and the unprovisioned device exchange public keys, either in-band or Out of Band (OOB).

In-band public key exchange is a part of the provisioning process and always supported by the unprovisioned device and provisioner.

If the application wants to support public key exchange via OOB, it needs to provide public and private keys to the mesh stack. The unprovisioned device will reflect this in its capabilities. The provisioner obtains the public key via any available OOB mechanism (e.g. the device may advertise a packet containing the public key or it can be encoded in a QR code printed on the device packaging). Note that even if the unprovisioned device has specified the public key for the Out of Band exchange, the provisioner may choose to exchange the public key in-band if it can't retrieve the public key via OOB mechanism. In this case, a new key pair will be generated by the mesh stack for each Provisioning process.

To enable support of OOB public key on the unprovisioned device side, `CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY` needs to be enabled. The application must provide public and private keys before the Provisioning process is started by initializing pointers to *`bt_mesh_prov.public_key_be`* and *`bt_mesh_prov.private_key_be`*. The keys needs to be provided in big-endian bytes order.

To provide the device's public key obtained via OOB, call *`bt_mesh_prov_remote_pub_key_set()`* on the provisioner side.

Authentication After the initial exchange, the provisioner selects an Out of Band (OOB) Authentication method. This allows the user to confirm that the device the provisioner connected to is actually the device they intended, and not a malicious third party.

The Provisioning API supports the following authentication methods for the provisionee:

- **Static OOB:** An authentication value is assigned to the device in production, which the provisioner can query in some application specific way.
- **Input OOB:** The user inputs the authentication value. The available input actions are listed in *`bt_mesh_input_action_t`*.
- **Output OOB:** Show the user the authentication value. The available output actions are listed in *`bt_mesh_output_action_t`*.

The application must provide callbacks for the supported authentication methods in *bt_mesh_prov*, as well as enabling the supported actions in *bt_mesh_prov.output_actions* and *bt_mesh_prov.input_actions*.

When an Output OOB action is selected, the authentication value should be presented to the user when the output callback is called, and remain until the *bt_mesh_prov.input_complete* or *bt_mesh_prov.complete* callback is called. If the action is `blink`, `beep` or `vibrate`, the sequence should be repeated after a delay of three seconds or more.

When an Input OOB action is selected, the user should be prompted when the application receives the *bt_mesh_prov.input* callback. The user response should be fed back to the Provisioning API through *bt_mesh_input_string()* or *bt_mesh_input_number()*. If no user response is recorded within 60 seconds, the Provisioning process is aborted.

If Provisionee wants to mandate OOB authentication, it is mandatory to use the BT_MESH_ECDH_P256_HMAC_SHA256_AES_CCM algorithm.

Data transfer After the device has been successfully authenticated, the provisioner transfers the Provisioning data:

- Unicast address
- A network key
- IV index
- Network flags
  - Key refresh
  - IV update

Additionally, a device key is generated for the node. All this data is stored by the mesh stack, and the provisioning *bt_mesh_prov.complete* callback gets called.

Provisioning security Depending on the choice of public key exchange mechanism and authentication method, the provisioning process can be secure or insecure.

On May 24th 2021, ANSSI disclosed a set of vulnerabilities in the Bluetooth Mesh provisioning protocol that showcased how the low entropy provided by the Blink, Vibrate, Push, Twist and Input/Output numeric OOB methods could be exploited in impersonation and MITM attacks. In response, the Bluetooth SIG has reclassified these OOB methods as insecure in the Bluetooth Mesh Profile Specification v1.0.1 erratum 16350, as AuthValue may be brute forced in real time. To ensure secure provisioning, applications should use a static OOB value and OOB public key transfer.

API reference

group `bt_mesh_prov`

Provisioning.

Enums

Available authentication algorithms.

Values:

enumerator BT_MESH_PROV_AUTH_CMAC_AES128_AES_CCM

enumerator BT_MESH_PROV_AUTH_HMAC_SHA256_AES_CCM

OOB Type field values.

Values:

enumerator BT_MESH_STATIC_OOB_AVAILABLE = *BIT*(0)

Static OOB information available.

enumerator BT_MESH_OOB_AUTH_REQUIRED = *BIT*(1)

OOB authentication required.

enum bt_mesh_output_action_t

Available Provisioning output authentication actions.

Values:

enumerator BT_MESH_NO_OUTPUT = 0

enumerator BT_MESH_BLINK = *BIT*(0)

Blink.

enumerator BT_MESH_BEEP = *BIT*(1)

Beep.

enumerator BT_MESH_VIBRATE = *BIT*(2)

Vibrate.

enumerator BT_MESH_DISPLAY_NUMBER = *BIT*(3)

Output numeric.

enumerator BT_MESH_DISPLAY_STRING = *BIT*(4)

Output alphanumeric.

enum bt_mesh_input_action_t

Available Provisioning input authentication actions.

Values:

enumerator BT_MESH_NO_INPUT = 0

enumerator BT_MESH_PUSH = *BIT*(0)

Push.

enumerator BT_MESH_TWIST = *BIT*(1)

Twist.

enumerator BT_MESH_ENTER_NUMBER = *BIT*(2)
Input number.

enumerator BT_MESH_ENTER_STRING = *BIT*(3)
Input alphanumeric.

enum bt_mesh_prov_bearer_t
Available Provisioning bearers.
Values:

enumerator BT_MESH_PROV_ADV = *BIT*(0)
PB-ADV bearer.

enumerator BT_MESH_PROV_GATT = *BIT*(1)
PB-GATT bearer.

enumerator BT_MESH_PROV_REMOTE = *BIT*(2)
PB-Remote bearer.

enum bt_mesh_prov_oob_info_t
Out of Band information location.
Values:

enumerator BT_MESH_PROV_OOB_OTHER = *BIT*(0)
Other.

enumerator BT_MESH_PROV_OOB_URI = *BIT*(1)
Electronic / URI.

enumerator BT_MESH_PROV_OOB_2D_CODE = *BIT*(2)
2D machine-readable code

enumerator BT_MESH_PROV_OOB_BAR_CODE = *BIT*(3)
Bar Code.

enumerator BT_MESH_PROV_OOB_NFC = *BIT*(4)
Near Field Communication (NFC)

enumerator BT_MESH_PROV_OOB_NUMBER = *BIT*(5)
Number.

enumerator BT_MESH_PROV_OOB_STRING = *BIT*(6)
String.

enumerator BT_MESH_PROV_OOB_CERTIFICATE = *BIT*(7)
Support for certificate-based provisioning.

enumerator BT_MESH_PROV_OOB_RECORDS = *BIT*(8)
Support for provisioning records.

enumerator BT_MESH_PROV_OOB_ON_BOX = *BIT*(11)
On box.

Inside manual.

enumerator BT_MESH_PROV_OOB_ON_DEV = *BIT*(15)
On device.

Functions

int **bt_mesh_input_string**(const char *str)
Provide provisioning input OOB string.

This is intended to be called after the *bt_mesh_prov* input callback has been called with BT_MESH_ENTER_STRING as the action.

Parameters

- **str** – String.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_input_number**(uint32_t num)
Provide provisioning input OOB number.

This is intended to be called after the *bt_mesh_prov* input callback has been called with BT_MESH_ENTER_NUMBER as the action.

Parameters

- **num** – Number.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_prov_remote_pub_key_set**(const uint8_t public_key[64])
Provide Device public key.

Parameters

- **public_key** – Device public key in big-endian.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_auth_method_set_input**(*bt_mesh_input_action_t* action, uint8_t size)

Use Input OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Input OOB authentication action. When using *BT_MESH_PUSH*, *BT_MESH_TWIST* or *BT_MESH_ENTER_NUMBER*, the *bt_mesh_prov::output_number* callback is called with a random number that has to be entered on the unprovisioned device.

When using *BT_MESH_ENTER_STRING*, the *bt_mesh_prov::output_string* callback is called with a random string that has to be entered on the unprovisioned device.

Parameters

- **action** – Authentication action used by the unprovisioned device.
- **size** – Authentication size.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_auth_method_set_output**(*bt_mesh_output_action_t* action, uint8_t size)

Use Output OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use the specified Output OOB authentication action. The *bt_mesh_prov::input* callback will be called.

When using *BT_MESH_BLINK*, *BT_MESH_BEEP*, *BT_MESH_VIBRATE* or *BT_MESH_DISPLAY_NUMBER*, and the application has to call *bt_mesh_input_number* with the random number indicated by the unprovisioned device.

When using *BT_MESH_DISPLAY_STRING*, the application has to call *bt_mesh_input_string* with the random string displayed by the unprovisioned device.

Parameters

- **action** – Authentication action used by the unprovisioned device.
- **size** – Authentication size.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_auth_method_set_static**(const uint8_t *static_val, uint8_t size)

Use static OOB authentication.

Provisioner only.

Instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

Parameters

- **static_val** – Static OOB value.
- **size** – Static OOB value size.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_auth_method_set_none**(void)

Don't use OOB authentication.

Provisioner only.

Don't use any authentication when provisioning new devices. This is the default behavior.

Warning

Not using any authentication exposes the mesh network to impersonation attacks, where attackers can pretend to be the unprovisioned device to gain access to the network. Authentication is strongly encouraged.

Returns
Zero on success or (negative) error code otherwise.

int `bt_mesh_prov_enable`(*bt_mesh_prov_bearer_t* bearers)

Enable specific provisioning bearers.

Enable one or more provisioning bearers.

Parameters

- `bearers` – Bit-wise or of provisioning bearers.

Returns
Zero on success or (negative) error code otherwise.

int `bt_mesh_prov_disable`(*bt_mesh_prov_bearer_t* bearers)

Disable specific provisioning bearers.

Disable one or more provisioning bearers.

Parameters

- `bearers` – Bit-wise or of provisioning bearers.

Returns
Zero on success or (negative) error code otherwise.

int `bt_mesh_provision`(const uint8_t net_key[16], uint16_t net_idx, uint8_t flags, uint32_t iv_index, uint16_t addr, const uint8_t dev_key[16])

Provision the local Mesh Node.

This API should normally not be used directly by the application. The only exception is for testing purposes where manual provisioning is desired without an actual external provisioner.

Parameters

- `net_key` – Network Key
- `net_idx` – Network Key Index
- `flags` – Provisioning Flags
- `iv_index` – IV Index
- `addr` – Primary element address
- `dev_key` – Device Key

Returns
Zero on success or (negative) error code otherwise.

int `bt_mesh_provision_adv`(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)

Provision a Mesh Node using PB-ADV.

Parameters

- **uuid** – UUID
- **net_idx** – Network Key Index
- **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- **attention_duration** – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_provision_gatt**(const uint8_t uuid[16], uint16_t net_idx, uint16_t addr, uint8_t attention_duration)

Provision a Mesh Node using PB-GATT.

Parameters

- **uuid** – UUID
- **net_idx** – Network Key Index
- **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- **attention_duration** – The attention duration to be send to remote device

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_provision_remote**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint16_t net_idx, uint16_t addr)

Provision a Mesh Node using PB-Remote.

Parameters

- **cli** – Remote Provisioning Client Model to provision with.
- **srv** – Remote Provisioning Server that should be used to tunnel the provisioning.
- **uuid** – UUID of the unprovisioned node
- **net_idx** – Network Key Index to give to the unprovisioned node.
- **addr** – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_reprovision_remote**(struct *bt_mesh_rpr_cli* *cli, struct bt_mesh_rpr_node *srv, uint16_t addr, bool comp_change)

Reprovision a Mesh Node using PB-Remote.

Reprovisioning can be used to change the device key, unicast address and composition data of another device. The reprovisioning procedure uses the same protocol as normal provisioning, with the same level of security.

There are three tiers of reprovisioning:

a. Refreshing the device key

b. Refreshing the device key and node address. Composition data may change, including the number of elements.

c. Refreshing the device key and composition data, in case the composition data of the target node changed due to a firmware update or a similar procedure.

The target node indicates that its composition data changed by instantiating its composition data page 128. If the number of elements have changed, it may be necessary to move the unicast address of the target node as well, to avoid overlapping addresses.

Note

Changing the unicast addresses of the target node requires changes to all nodes that publish directly to any of the target node's models.

Parameters

- `cli` – Remote Provisioning Client Model to provision on
- `srv` – Remote Provisioning Server to reprovision
- `addr` – Address to assign to remote device. If addr is 0, the lowest available address will be chosen.
- `comp_change` – The target node has indicated that its composition data has changed. Note that the target node will reject the update if this isn't true.

Returns

Zero on success or (negative) error code otherwise.

bool **bt_mesh_is_provisioned**(void)

Check if the local node has been provisioned.

This API can be used to check if the local node has been provisioned or not. It can e.g. be helpful to determine if there was a stored network in flash, i.e. if the network was restored after calling *settings_load()*.

Returns

True if the node is provisioned. False otherwise.

struct **bt_mesh_dev_capabilities**

#include <*main.h*> Device Capabilities.

Public Members

uint8_t **elem_count**

Number of elements supported by the device.

uint16_t **algorithms**

Supported algorithms and other capabilities.

uint8_t **pub_key_type**

Supported public key types.

uint8_t **oob_type**

Supported OOB Types.

bt_mesh_output_action_t **output_actions**

Supported Output OOB Actions.

bt_mesh_input_action_t **input_actions**

Supported Input OOB Actions.

uint8_t **output_size**

Maximum size of Output OOB supported.

uint8_t **input_size**

Maximum size in octets of Input OOB supported.

struct **bt_mesh_prov**

#include <*main.h*> Provisioning properties & capabilities.

Public Members

const uint8_t ***uuid**

The UUID that's used when advertising as unprovisioned.

const char ***uri**

Optional URI.

This will be advertised separately from the unprovisioned beacon, however the unprovisioned beacon will contain a hash of it so the two can be associated by the provisioner.

bt_mesh_prov_oob_info_t **oob_info**

Out of Band information field.

const uint8_t ***public_key_be**

Pointer to Public Key in big-endian for OOB public key type support.

Remember to enable `CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY` when initializing this parameter.

Must be used together with *bt_mesh_prov::private_key_be*.

const uint8_t ***private_key_be**

Pointer to Private Key in big-endian for OOB public key type support.

Remember to enable `CONFIG_BT_MESH_PROV_OOB_PUBLIC_KEY` when initializing this parameter.

Must be used together with *bt_mesh_prov::public_key_be*.

const uint8_t ***static_val**

Static OOB value.

uint8_t **static_val_len**

Static OOB value length.

uint8_t **output_size**

Maximum size of Output OOB supported.

uint16_t **output_actions**

Supported Output OOB Actions.

uint8_t **input_size**

Maximum size of Input OOB supported.

uint16_t **input_actions**

Supported Input OOB Actions.

void (***capabilities**)(const struct *bt_mesh_dev_capabilities* *cap)

Provisioning Capabilities.

This callback notifies the application that the provisioning capabilities of the unprovisioned device has been received.

The application can consequently call bt_mesh_auth_method_set_<*> to select suitable provisioning oob authentication method.

When this callback returns, the provisioner will start authentication with the chosen method.

Param cap
capabilities supported by device.

int (***output_number**)(*bt_mesh_output_action_t* act, uint32_t num)

Output of a number is requested.

This callback notifies the application that it should output the given number using the given action.

Param act
Action for outputting the number.

Param num
Number to be outputted.

Return
Zero on success or negative error code otherwise

int (***output_string**)(const char *str)

Output of a string is requested.

This callback notifies the application that it should display the given string to the user.

Param str
String to be displayed.

Return
Zero on success or negative error code otherwise

int (***input**)(*bt_mesh_input_action_t* act, uint8_t size)

Input is requested.

This callback notifies the application that it should request input from the user using the given action. The requested input will either be a string or a number, and the application needs to consequently call the *bt_mesh_input_string()* or *bt_mesh_input_number()* functions once the data has been acquired from the user.

Param act
Action for inputting data.

Param num
Maximum size of the inputted data.

Return
Zero on success or negative error code otherwise

void (*`input_complete`)(void)

The other device finished their OOB input.

This callback notifies the application that it should stop displaying its output OOB value, as the other party finished their OOB input.

void (*`unprovisioned_beacon`)(uint8_t uuid[16], *bt_mesh_prov_oob_info_t* oob_info, uint32_t *uri_hash)

Unprovisioned beacon has been received.

This callback notifies the application that an unprovisioned beacon has been received.

Param uuid
UUID
Param oob_info
OOB Information
Param uri_hash
Pointer to URI Hash value. NULL if no hash was present in the beacon.

void (*`unprovisioned_beacon_gatt`)(uint8_t uuid[16], *bt_mesh_prov_oob_info_t* oob_info)

PB-GATT Unprovisioned Advertising has been received.

This callback notifies the application that an PB-GATT unprovisioned Advertising has been received.

Param uuid
UUID
Param oob_info
OOB Information

void (*`link_open`)(*bt_mesh_prov_bearer_t* bearer)

Provisioning link has been opened.

This callback notifies the application that a provisioning link has been opened on the given provisioning bearer.

Param bearer
Provisioning bearer.

void (*`link_close`)(*bt_mesh_prov_bearer_t* bearer)

Provisioning link has been closed.

This callback notifies the application that a provisioning link has been closed on the given provisioning bearer.

Param bearer
Provisioning bearer.

void (*`complete`)(uint16_t net_idx, uint16_t addr)

Provisioning is complete.

This callback notifies the application that provisioning has been successfully completed, and that the local node has been assigned the specified NetKeyIndex and primary element address.

Param net_idx
NetKeyIndex given during provisioning.

Param addr
Primary element address.

void (*reprovisioned)(uint16_t addr)

Local node has been reprovisioned.

This callback notifies the application that reprovisioning has been successfully completed.

Param addr
New primary element address.

void (*node_added)(uint16_t net_idx, uint8_t uuid[16], uint16_t addr, uint8_t num_elem)

A new node has been added to the provisioning database.

This callback notifies the application that provisioning has been successfully completed, and that a node has been assigned the specified NetKeyIndex and primary element address.

Param net_idx
NetKeyIndex given during provisioning.
Param uuid
UUID of the added node
Param addr
Primary element address.
Param num_elem
Number of elements that this node has.

void (*reset)(void)

Node has been reset.

This callback notifies the application that the local node has been reset and needs to be provisioned again. The node will not automatically advertise as unprovisioned, rather the *bt_mesh_prov_enable()* API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

Proxy The Proxy feature allows legacy devices like phones to access the Bluetooth Mesh network through GATT. The Proxy feature is only compiled in if the `CONFIG_BT_MESH_GATT_PROXY` option is set. The Proxy feature state is controlled by the *Configuration Server*, and the initial value can be set with `bt_mesh_cfg_srv.gatt_proxy`.

Nodes with the Proxy feature enabled can advertise with Network Identity and Node Identity, which is controlled by the *Configuration Client*.

The GATT Proxy state indicates if the Proxy feature is supported.

Private Proxy A node supporting the Proxy feature and the *Private Beacon Server* model can advertise with Private Network Identity and Private Node Identity types, which is controlled by the *Private Beacon Client*. By advertising with this set of identification types, the node allows the legacy device to connect to the network over GATT while maintaining the privacy of the network.

The Private GATT Proxy state indicates whether the Private Proxy functionality is supported.

Proxy Solicitation In the case where both GATT Proxy and Private GATT Proxy states are disabled on a node, a legacy device cannot connect to it. A node supporting the *On-Demand Private Proxy Server* may however be solicited to advertise connectable advertising events without enabling the Private GATT Proxy state. To solicit the node, the legacy device can send a Solicitation

PDU by calling the `bt_mesh_proxy_solicit()` function. To enable this feature, the device must to be compiled with the `CONFIG_BT_MESH_PROXY_SOLICITATION` option set.

Solicitation PDUs are non-mesh, non-connectable, undirected advertising messages containing Proxy Solicitation UUID, encrypted with the network key of the subnet that the legacy device wants to connect to. The PDU contains the source address of the legacy device and a sequence number. The sequence number is maintained by the legacy device and is incremented for every new Solicitation PDU sent.

Each node supporting the Solicitation PDU reception holds its own Solicitation Replay Protection List (SRPL). The SRPL protects the solicitation mechanism from replay attacks by storing solicitation sequence number (SSEQ) and solicitation source (SSRC) pairs of valid Solicitation PDUs processed by the node. The delay between updating the SRPL and storing the change to the persistent storage is defined by `CONFIG_BT_MESH_RPL_STORE_TIMEOUT`.

The Solicitation PDU RPL Configuration models, *Solicitation PDU RPL Configuration Client* and *Solicitation PDU RPL Configuration Server*, provide the functionality of saving and clearing SRPL entries. A node that supports the Solicitation PDU RPL Configuration Client model can clear a section of the SRPL on the target by calling the `bt_mesh_sol_pdu_rpl_clear()` function. Communication between the Solicitation PDU RPL Configuration Client and Server is encrypted using the application key, therefore, the Solicitation PDU RPL Configuration Client can be instantiated on any device in the network.

When the node receives the Solicitation PDU and successfully authenticates it, it will start advertising connectable advertisements with the Private Network Identity type. The duration of the advertisement can be configured by the On-Demand Private Proxy Client model.

API reference

group `bt_mesh_proxy`

Proxy.

Defines

`BT_MESH_PROXY_CB_DEFINE`(_name)

Register a callback structure for Proxy events.

Registers a structure with callback functions that gets called on various Proxy events.

Parameters

- `_name` – Name of callback structure.

Functions

int `bt_mesh_proxy_identity_enable`(void)

Enable advertising with Node Identity.

This API requires that GATT Proxy support has been enabled. Once called each subnet will start advertising using Node Identity for the next 60 seconds.

Returns

0 on success, or (negative) error code on failure.

int `bt_mesh_proxy_private_identity_enable`(void)

Enable advertising with Private Node Identity.

This API requires that GATT Proxy support has been enabled. Once called each subnet will start advertising using Private Node Identity for the next 60 seconds.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_proxy_connect**(uint16_t net_idx)

Allow Proxy Client to auto connect to a network.

This API allows a proxy client to auto-connect a given network.

Parameters

- **net_idx** – Network Key Index

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_proxy_disconnect**(uint16_t net_idx)

Disallow Proxy Client to auto connect to a network.

This API disallows a proxy client to connect a given network.

Parameters

- **net_idx** – Network Key Index

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_proxy_solicit**(uint16_t net_idx)

Schedule advertising of Solicitation PDUs.

Once called, the device will schedule advertising Solicitation PDUs for the amount of time defined by `adv_int` * (`CONFIG_BT_MESH_SOL_ADV_XMIT` + 1), where `adv_int` is 20ms for Bluetooth v5.0 or higher, or 100ms otherwise.

If the number of advertised Solicitation PDUs reached 0xFFFFFF, the advertisements will no longer be started until the node is reprovisioned.

Parameters

- **net_idx** – Network Key Index

Returns
0 on success, or (negative) error code on failure.

struct **bt_mesh_proxy_cb**

#include <proxy.h> Callbacks for the Proxy feature.

Should be instantiated with *BT_MESH_PROXY_CB_DEFINE*.

Public Members

void (***identity_enabled**)(uint16_t net_idx)

Started sending Node Identity beacons on the given subnet.
Param net_idx
Network index the Node Identity beacons are running on.

void (***identity_disabled**)(uint16_t net_idx)

Stopped sending Node Identity beacons on the given subnet.
Param net_idx
Network index the Node Identity beacons were running on.

Heartbeat The Heartbeat feature provides functionality for monitoring Bluetooth Mesh nodes and determining the distance between nodes.

The Heartbeat feature is configured through the *Configuration Server* model.

Heartbeat messages Heartbeat messages are sent as transport control packets through the network, and are only encrypted with a network key. Heartbeat messages contain the original Time To Live (TTL) value used to send the message and a bitfield of the active features on the node. Through this, a receiving node can determine how many relays the message had to go through to arrive at the receiver, and what features the node supports.

Available Heartbeat feature flags:

- *BT_MESH_FEAT_RELAY*
- *BT_MESH_FEAT_PROXY*
- *BT_MESH_FEAT_FRIEND*
- *BT_MESH_FEAT_LOW_POWER*

Heartbeat publication Heartbeat publication is controlled through the Configuration models, and can be triggered in two ways:

Periodic publication
: The node publishes a new Heartbeat message at regular intervals. The publication can be configured to stop after a certain number of messages, or continue indefinitely.

Triggered publication
: The node publishes a new Heartbeat message every time a feature changes. The set of features that can trigger the publication is configurable.

The two publication types can be combined.

Heartbeat subscription A node can be configured to subscribe to Heartbeat messages from one node at the time. To receive a Heartbeat message, both the source and destination must match the configured subscription parameters.

Heartbeat subscription is always time limited, and throughout the subscription period, the node keeps track of the number of received Heartbeats as well as the minimum and maximum received hop count.

All Heartbeats received with the configured subscription parameters are passed to the `bt_mesh_hb_cb::recv` event handler.

When the Heartbeat subscription period ends, the `bt_mesh_hb_cb::sub_end` callback gets called.

API reference

group `bt_mesh_heartbeat`

Heartbeat.

Defines

`BT_MESH_HB_CB_DEFINE`(_name)

Register a callback structure for Heartbeat events.

Registers a callback structure that will be called whenever Heartbeat events occur

Parameters

- **_name** – Name of callback structure.

Functions

void **bt_mesh_hb_pub_get**(struct *bt_mesh_hb_pub* *get)

Get the current Heartbeat publication parameters.

Parameters

- **get** – Heartbeat publication parameters return buffer.

void **bt_mesh_hb_sub_get**(struct *bt_mesh_hb_sub* *get)

Get the current Heartbeat subscription parameters.

Parameters

- **get** – Heartbeat subscription parameters return buffer.

struct **bt_mesh_hb_pub**

#include <heartbeat.h> Heartbeat Publication parameters.

Public Members

uint16_t **dst**

Destination address.

uint16_t **count**

Remaining publish count.

uint8_t **ttl**

Time To Live value.

uint16_t **feat**

Bitmap of features that trigger a Heartbeat publication if they change.

Legal values are *BT_MESH_FEAT_RELAY*, *BT_MESH_FEAT_PROXY*, *BT_MESH_FEAT_FRIEND* and *BT_MESH_FEAT_LOW_POWER*.

uint16_t **net_idx**

Network index used for publishing.

uint32_t **period**

Publication period in seconds.

struct **bt_mesh_hb_sub**

#include <heartbeat.h> Heartbeat Subscription parameters.

Public Members

uint32_t **period**

Subscription period in seconds.

uint32_t **remaining**

Remaining subscription time in seconds.

uint16_t **src**

Source address to receive Heartbeats from.

uint16_t **dst**

Destination address to received Heartbeats on.

uint16_t **count**

The number of received Heartbeat messages so far.

uint8_t **min_hops**

Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node.

A Heartbeat received from an immediate neighbor has hop count = 1.

uint8_t **max_hops**

Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node.

A Heartbeat received from an immediate neighbor has hop count = 1.

struct **bt_mesh_hb_cb**

#include <*heartbeat.h*> Heartbeat callback structure.

Public Members

void (***recv**)(const struct *bt_mesh_hb_sub* *sub, uint8_t hops, uint16_t feat)

Receive callback for heartbeats.

Gets called on every received Heartbeat that matches the current Heartbeat subscription parameters.

Param sub
Current Heartbeat subscription parameters.

Param hops
The number of hops the Heartbeat was received with.

Param feat
The feature set of the publishing node. The value is a bitmap of *BT_MESH_FEAT_RELAY*, *BT_MESH_FEAT_PROXY*, *BT_MESH_FEAT_FRIEND* and *BT_MESH_FEAT_LOW_POWER*.

void (***sub_end**)(const struct *bt_mesh_hb_sub* *sub)

Subscription end callback for heartbeats.

Gets called when the subscription period ends, providing a summary of the received heartbeat messages.

Param sub
Current Heartbeat subscription parameters.

void (*pub_sent)(const struct *bt_mesh_hb_pub* *pub)

Publication sent callback for heartbeats.

Gets called when the heartbeat is successfully published.

Param pub

Current Heartbeat publication parameters.

Runtime Configuration The runtime configuration API allows applications to change their runtime configuration directly, without going through the Configuration models.

Bluetooth Mesh nodes should generally be configured by a central network configurator device with a *Configuration Client* model. Each mesh node instantiates a *Configuration Server* model that the Configuration Client can communicate with to change the node configuration. In some cases, the mesh node can't rely on the Configuration Client to detect or determine local constraints, such as low battery power or changes in topology. For these scenarios, this API can be used to change the configuration locally.

Note

Runtime configuration changes before the node is provisioned will not be stored in the *persistent storage*.

Enums

enum bt_mesh_feat_state

Bluetooth Mesh feature states.

Values:

enumerator BT_MESH_FEATURE_DISABLED

Feature is supported, but disabled.

enumerator BT_MESH_FEATURE_ENABLED

Feature is supported and enabled.

enumerator BT_MESH_FEATURE_NOT_SUPPORTED

Feature is not supported, and cannot be enabled.

Functions

void **bt_mesh_beacon_set**(bool beacon)

Enable or disable sending of the Secure Network Beacon.

Parameters

- **beacon** – New Secure Network Beacon state.

bool **bt_mesh_beacon_enabled**(void)

Get the current Secure Network Beacon state.

Returns
Whether the Secure Network Beacon feature is enabled.

int **bt_mesh_priv_beacon_set**(enum *bt_mesh_feat_state* priv_beacon)

Enable or disable sending of the Mesh Private beacon.

Support for the Private beacon state must be enabled with CONFIG_BT_MESH_PRIV_BEACONS.

Parameters

- **priv_beacon** – New Mesh Private beacon state. Must be one of *BT_MESH_FEATURE_ENABLED* and *BT_MESH_FEATURE_DISABLED*.

Return values

- **0** – Successfully changed the Mesh Private beacon feature state.
- **-ENOTSUP** – The Mesh Private beacon feature is not supported.
- **-EINVAL** – Invalid parameter.
- **-EALREADY** – Already in the given state.

enum *bt_mesh_feat_state* **bt_mesh_priv_beacon_get**(void)

Get the current Mesh Private beacon state.

Returns
The Mesh Private beacon feature state.

void **bt_mesh_priv_beacon_update_interval_set**(uint8_t interval)

Set the current Mesh Private beacon update interval.

The Mesh Private beacon's randomization value is updated regularly to maintain the node's privacy. The update interval controls how often the beacon is updated, in 10 second increments.

Parameters

- **interval** – Private beacon update interval in 10 second steps, or 0 to update on every beacon transmission.

uint8_t **bt_mesh_priv_beacon_update_interval_get**(void)

Get the current Mesh Private beacon update interval.

The Mesh Private beacon's randomization value is updated regularly to maintain the node's privacy. The update interval controls how often the beacon is updated, in 10 second increments.

Returns
The Private beacon update interval in 10 second steps, or 0 if the beacon is updated every time it's transmitted.

int **bt_mesh_default_ttl_set**(uint8_t default_ttl)

Set the default TTL value.

The default TTL value is used when no explicit TTL value is set. Models will use the default TTL value when *bt_mesh_msg_ctx::send_ttl* is *BT_MESH_TTL_DEFAULT*.

Parameters

- `default_ttl` – The new default TTL value. Valid values are 0x00 and 0x02 to *BT_MESH_TTL_MAX*.

Return values

- `0` – Successfully set the default TTL value.
- `-EINVAL` – Invalid TTL value.

uint8_t **bt_mesh_default_ttl_get**(void)

Get the current default TTL value.

Returns
The current default TTL value.

int **bt_mesh_od_priv_proxy_get**(void)

Get the current Mesh On-Demand Private Proxy state.

Return values

- `0` – or positive value represents On-Demand Private Proxy feature state
- `-ENOTSUP` – The On-Demand Private Proxy feature is not supported.

int **bt_mesh_od_priv_proxy_set**(uint8_t on_demand_proxy)

Set state of Mesh On-Demand Private Proxy.

Support for the On-Demand Private Proxy state must be enabled with `BT_MESH_OD_PRIV_PROXY_SRV`.

Parameters

- `on_demand_proxy` – New Mesh On-Demand Private Proxy state. Value of 0x00 means that advertising with Private Network Identity cannot be enabled on demand. Values in range 0x01 - 0xFF set interval of this advertising after valid Solicitation PDU is received or client disconnects.

Return values

- `0` – Successfully changed the Mesh On-Demand Private Proxy feature state.
- `-ENOTSUP` – The On-Demand Private Proxy feature is not supported.
- `-EINVAL` – Invalid parameter.
- `-EALREADY` – Already in the given state.

void **bt_mesh_net_transmit_set**(uint8_t xmit)

Set the Network Transmit parameters.

The Network Transmit parameters determine the parameters local messages are transmitted with.

See also

BT_MESH_TRANSMIT

Parameters

- `xmit` – New Network Transmit parameters. Use *BT_MESH_TRANSMIT* for encoding.

uint8_t **bt_mesh_net_transmit_get**(void)

Get the current Network Transmit parameters.

The *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT* macros can be used to decode the Network Transmit parameters.

Returns
The current Network Transmit parameters.

int **bt_mesh_relay_set**(enum *bt_mesh_feat_state* relay, uint8_t xmit)

Configure the Relay feature.

Enable or disable the Relay feature, and configure the parameters to transmit relayed messages with.

Support for the Relay feature must be enabled through the `CONFIG_BT_MESH_RELAY` configuration option.

See also

BT_MESH_TRANSMIT

Parameters

- **relay** – New Relay feature state. Must be one of *BT_MESH_FEATURE_ENABLED* and *BT_MESH_FEATURE_DISABLED*.
- **xmit** – New Relay retransmit parameters. Use *BT_MESH_TRANSMIT* for encoding.

Return values

- **0** – Successfully changed the Relay configuration.
- **-ENOTSUP** – The Relay feature is not supported.
- **-EINVAL** – Invalid parameter.
- **-EALREADY** – Already using the given parameters.

enum *bt_mesh_feat_state* **bt_mesh_relay_get**(void)

Get the current Relay feature state.

Returns
The Relay feature state.

uint8_t **bt_mesh_relay_retransmit_get**(void)

Get the current Relay Retransmit parameters.

The *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT* macros can be used to decode the Relay Retransmit parameters.

Returns
The current Relay Retransmit parameters, or 0 if relay is not supported.

int **bt_mesh_gatt_proxy_set**(enum *bt_mesh_feat_state* gatt_proxy)

Enable or disable the GATT Proxy feature.

Support for the GATT Proxy feature must be enabled through the `CONFIG_BT_MESH_GATT_PROXY` configuration option.

> **Note**
>
> The GATT Proxy feature only controls a Proxy node's ability to relay messages to the mesh network. A node that supports GATT Proxy will still advertise Connectable Proxy beacons, even if the feature is disabled. The Proxy feature can only be fully disabled through compile time configuration.

Parameters

- `gatt_proxy` – New GATT Proxy state. Must be one of *BT_MESH_FEATURE_ENABLED* and *BT_MESH_FEATURE_DISABLED*.

Return values

- `0` – Successfully changed the GATT Proxy feature state.
- `-ENOTSUP` – The GATT Proxy feature is not supported.
- `-EINVAL` – Invalid parameter.
- `-EALREADY` – Already in the given state.

enum *bt_mesh_feat_state* **bt_mesh_gatt_proxy_get**(void)

Get the current GATT Proxy state.

Returns

The GATT Proxy feature state.

int **bt_mesh_priv_gatt_proxy_set**(enum *bt_mesh_feat_state* priv_gatt_proxy)

Enable or disable the Private GATT Proxy feature.

Support for the Private GATT Proxy feature must be enabled through the `CONFIG_BT_MESH_PRIV_BEACONS` and `CONFIG_BT_MESH_GATT_PROXY` configuration options.

Parameters

- `priv_gatt_proxy` – New Private GATT Proxy state. Must be one of *BT_MESH_FEATURE_ENABLED* and *BT_MESH_FEATURE_DISABLED*.

Return values

- `0` – Successfully changed the Private GATT Proxy feature state.
- `-ENOTSUP` – The Private GATT Proxy feature is not supported.
- `-EINVAL` – Invalid parameter.
- `-EALREADY` – Already in the given state.

enum *bt_mesh_feat_state* **bt_mesh_priv_gatt_proxy_get**(void)

Get the current Private GATT Proxy state.

Returns

The Private GATT Proxy feature state.

int **bt_mesh_friend_set**(enum *bt_mesh_feat_state* friendship)

Enable or disable the Friend feature.

Any active friendships will be terminated immediately if the Friend feature is disabled.

Support for the Friend feature must be enabled through the `CONFIG_BT_MESH_FRIEND` configuration option.

Parameters

- `friendship` – New Friend feature state. Must be one of *BT_MESH_FEATURE_ENABLED* and *BT_MESH_FEATURE_DISABLED*.

Return values

- `0` – Successfully changed the Friend feature state.
- `-ENOTSUP` – The Friend feature is not supported.
- `-EINVAL` – Invalid parameter.
- `-EALREADY` – Already in the given state.

enum *bt_mesh_feat_state* `bt_mesh_friend_get`(void)

Get the current Friend state.

Returns

The Friend feature state.

Frame statistic The frame statistic API allows monitoring the number of received frames over different interfaces, and the number of planned and succeeded transmission and relaying attempts.

The API helps the user to estimate the efficiency of the advertiser configuration parameters and the scanning ability of the device. The number of the monitored parameters can be easily extended by customer values.

An application can read out and clean up statistics at any time.

API reference

group `bt_mesh_stat`

Statistic.

Functions

void `bt_mesh_stat_get`(struct *bt_mesh_statistic* *st)

Get mesh frame handling statistic.

Parameters

- `st` – BLE mesh statistic.

void `bt_mesh_stat_reset`(void)

Reset mesh frame handling statistic.

struct `bt_mesh_statistic`

#include <*statistic.h*> The structure that keeps statistics of mesh frames handling.

Public Members

uint32_t `rx_adv`

All received frames passed basic validation and decryption.

Received frames over advertiser.

uint32_t `rx_loopback`

Received frames over loopback.

uint32_t `rx_proxy`
: Received frames over proxy.

uint32_t `rx_uknown`
: Received over unknown interface.

uint32_t `tx_adv_relay_planned`
: Counter of frames that were initiated to relay over advertiser bearer.

uint32_t `tx_adv_relay_succeeded`
: Counter of frames that succeeded relaying over advertiser bearer.

uint32_t `tx_local_planned`
: Counter of frames that were initiated to send over advertiser bearer locally.

uint32_t `tx_local_succeeded`
: Counter of frames that succeeded to send over advertiser bearer locally.

uint32_t `tx_friend_planned`
: Counter of frames that were initiated to send over friend bearer.

uint32_t `tx_friend_succeeded`
: Counter of frames that succeeded to send over friend bearer.

Bluetooth Mesh Shell The Bluetooth Mesh shell subsystem provides a set of Bluetooth Mesh shell commands for the *Shell* module. It allows for testing and exploring the Bluetooth Mesh API through an interactive interface, without having to write an application.

The Bluetooth Mesh shell interface provides access to most Bluetooth Mesh features, including provisioning, configuration, and message sending.

Prerequisites The Bluetooth Mesh shell subsystem depends on the application to create the composition data and do the mesh initialization.

Application The Bluetooth Mesh shell subsystem is most easily used through the Bluetooth Mesh shell application under `tests/bluetooth/mesh_shell`. See *Shell* for information on how to connect and interact with the Bluetooth Mesh shell application.

Basic usage The Bluetooth Mesh shell subsystem adds a single `mesh` command, which holds a set of sub-commands. Every time the device boots up, make sure to call `mesh init` before any of the other Bluetooth Mesh shell commands can be called:

```
uart:~$ mesh init
```

This is done to ensure that all available log will be printed to the shell output.

Provisioning The mesh node must be provisioned to become part of the network. This is only necessary the first time the device boots up, as the device will remember its provisioning data between reboots.

The simplest way to provision the device is through self-provisioning. To do this the user must provision the device with the default network key and address `0x0001`, execute:

```
uart:~$ mesh prov local 0 0x0001
```

Since all mesh nodes use the same values for the default network key, this can be done on multiple devices, as long as they're assigned non-overlapping unicast addresses. Alternatively, to provision the device into an existing network, the unprovisioned beacon can be enabled with `mesh prov pb-adv on` or `mesh prov pb-gatt on`. The beacons can be picked up by an external provisioner, which can provision the node into its network.

Once the mesh node is part of a network, its transmission parameters can be controlled by the general configuration commands:

- To set the destination address, call `mesh target dst <Addr>`.
- To set the network key index, call `mesh target net <NetKeyIdx>`.
- To set the application key index, call `mesh target app <AppKeyIdx>`.

By default, the transmission parameters are set to send messages to the provisioned address and network key.

Configuration By setting the destination address to the local unicast address (`0x0001` in the `mesh prov local` command above), we can perform self-configuration through any of the *Models* commands.

A good first step is to read out the node's own composition data:

```
uart:~$ mesh models cfg get-comp
```

This prints a list of the composition data of the node, including a list of its model IDs.

Next, since the device has no application keys by default, it's a good idea to add one:

```
uart:~$ mesh models cfg appkey add 0 0
```

Message sending With an application key added (see above), the mesh node's transition parameters are all valid, and the Bluetooth Mesh shell can send raw mesh messages through the network.

For example, to send a Generic OnOff Set message, call:

```
uart:~$ mesh test net-send 82020100
```

Note

All multibyte fields model messages are in little endian, except the opcode.

The message will be sent to the current destination address, using the current network and application key indexes. As the destination address points to the local unicast address by default, the device will only send packets to itself. To change the destination address to the All Nodes broadcast address, call:

```
uart:~$ mesh target dst 0xffff
```

With the destination address set to `0xffff`, any other mesh nodes in the network with the configured network and application keys will receive and process the messages we send.

Note

To change the configuration of the device, the destination address must be set back to the local unicast address before issuing any configuration commands.

Sending raw mesh packets is a good way to test model message handler implementations during development, as it can be done without having to implement the sending model. By default, only the reception of the model messages can be tested this way, as the Bluetooth Mesh shell only includes the foundation models. To receive a packet in the mesh node, you have to add a model with a valid opcode handler list to the composition data in `subsys/bluetooth/mesh/shell.c`, and print the incoming message to the shell in the handler callback.

Parameter formats The Bluetooth Mesh shell commands are parsed with a variety of formats:

Table 29: Parameter formats

Type	Description	Example
Integers	The default format unless something else is specified. Can be either decimal or hexadecimal.	`1234`, `0xabcd01234`
Hexstrings	For raw byte arrays, like UUIDs, key values and message payloads, the parameters should be formatted as an unbroken string of hexadecimal values without any prefix.	`deadbeef01234`
Booleans	Boolean values are denoted in the API documentation as `<val(off, on)>`.	`on`, `off`, `enabled`, `disabled`, `1`, `0`

Commands The Bluetooth Mesh shell implements a large set of commands. Some of the commands accept parameters, which are mentioned in brackets after the command name. For example, `mesh lpn set <value: off, on>`. Mandatory parameters are marked with angle brackets (e.g. `<NetKeyIdx>`), and optional parameters are marked with square brackets (e.g. `[DstAddr]`).

The Bluetooth Mesh shell commands are divided into the following groups:

- *General configuration*
- *Target*
- *Low Power Node*
- *Testing*
- *Provisioning*
- *Proxy*
- *Models*
- *Configuration database*
- *Frame statistic*

Note

Some commands depend on specific features being enabled in the compile time configuration of the application. Not all features are enabled by default. The list of available Bluetooth mesh shell commands can be shown in the shell by calling `mesh` without any arguments.

General configuration

`mesh init`

Initialize the mesh shell. This command must be run before any other mesh command.

`mesh reset-local`

Reset the local mesh node to its initial unprovisioned state. This command will also clear the Configuration Database (CDB) if present.

Target The target commands enables the user to monitor and set the target destination address, network index and application index for the shell. These parameters are used by several commands, like provisioning, Configuration Client, etc.

`mesh target dst [DstAddr]`

Get or set the message destination address. The destination address determines where mesh packets are sent with the shell, but has no effect on modules outside the shell's control.

- `DstAddr`: If present, sets the new 16-bit mesh destination address. If omitted, the current destination address is printed.

`mesh target net [NetKeyIdx]`

Get or set the message network index. The network index determines which network key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The network key must already be added to the device, either through provisioning or by a Configuration Client.

- `NetKeyIdx`: If present, sets the new network index. If omitted, the current network index is printed.

`mesh target app [AppKeyIdx]`

Get or set the message application index. The application index determines which application key is used to encrypt mesh packets that are sent with the shell, but has no effect on modules outside the shell's control. The application key must already be added to the device by a Configuration Client, and must be bound to the current network index.

- `AppKeyIdx`: If present, sets the new application index. If omitted, the current application index is printed.

Low Power Node

`mesh lpn set <Val(off, on)>`

Enable or disable Low Power operation. Once enabled, the device will turn off its radio and start polling for friend nodes.

- `Val`: Sets whether Low Power operation is enabled.

`mesh lpn poll`

Perform a poll to the friend node, to receive any pending messages. Only available when LPN is enabled.

Testing

`mesh test net-send <HexString>`

Send a raw mesh message with the current destination address, network and application index. The message opcode must be encoded manually.

- `HexString` Raw hexadecimal representation of the message to send.

`mesh test iv-update`

Force an IV update.

`mesh test iv-update-test <Val(off, on)>`

Set the IV update test mode. In test mode, the IV update timing requirements are bypassed.

- `Val`: Enable or disable the IV update test mode.

`mesh test rpl-clear`

Clear the replay protection list, forcing the node to forget all received messages.

Warning

Clearing the replay protection list breaks the security mechanisms of the mesh node, making it susceptible to message replay attacks. This should never be performed in a real deployment.

Health Server Test

`mesh test health-srv add-fault <FaultID>`

Register a new Health Server Fault for the Linux Foundation Company ID.

- `FaultID`: ID of the fault to register (`0x0001` to `0xFFFF`)

`mesh test health-srv del-fault [FaultID]`

Remove registered Health Server faults for the Linux Foundation Company ID.

- `FaultID`: If present, the given fault ID will be deleted. If omitted, all registered faults will be cleared.

Provisioning To allow a device to broadcast connectable unprovisioned beacons, the CONFIG_BT_MESH_PROVISIONEE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_GATT option.

`mesh prov pb-gatt <Val(off, on)>`

Start or stop advertising a connectable unprovisioned beacon. The connectable unprovisioned beacon allows the mesh node to be discovered by nearby GATT based provisioners, and provisioned through the GATT bearer.

- Val: Enable or disable provisioning with GATT

To allow a device to broadcast unprovisioned beacons, the CONFIG_BT_MESH_PROVISIONEE configuration option must be enabled, along with the CONFIG_BT_MESH_PB_ADV option.

`mesh prov pb-adv <Val(off, on)>`

Start or stop advertising the unprovisioned beacon. The unprovisioned beacon allows the mesh node to be discovered by nearby advertising-based provisioners, and provisioned through the advertising bearer.

- Val: Enable or disable provisioning with advertiser

To allow a device to provision devices, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_ADV configuration options must be enabled.

`mesh prov remote-adv <UUID(1-16 hex)> <NetKeyIdx> <Addr> <AttDur(s)>`

Provision a nearby device into the mesh. The mesh node starts scanning for unprovisioned beacons with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIdx.

- UUID: UUID of the unprovisioned device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- NetKeyIdx: Index of the network key to pass to the device.
- Addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.
- AttDur: The duration in seconds the unprovisioned device will identify itself for, if supported. See *Attention state* for details.

To allow a device to provision devices over GATT, the CONFIG_BT_MESH_PROVISIONER and CONFIG_BT_MESH_PB_GATT_CLIENT configuration options must be enabled.

`mesh prov remote-gatt <UUID(1-16 hex)> <NetKeyIdx> <Addr> <AttDur(s)>`

Provision a nearby device into the mesh. The mesh node starts scanning for connectable advertising for PB-GATT with the given UUID. Once found, the unprovisioned device will be added to the mesh network with the given unicast address, and given the network key indicated by NetKeyIdx.

- UUID: UUID of the unprovisioned device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- NetKeyIdx: Index of the network key to pass to the device.
- Addr: First unicast address to assign to the unprovisioned device. The device will occupy as many addresses as it has elements, and all must be available.

- `AttDur`: The duration in seconds the unprovisioned device will identify itself for, if supported. See *Attention state* for details.

`mesh prov uuid [UUID(1-16 hex)]`

Get or set the mesh node's UUID, used in the unprovisioned beacons.

- `UUID`: If present, new 128-bit UUID value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the current UUID will be printed. To enable this command, the `CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE` option must be enabled.

`mesh prov input-num <Number>`

Input a numeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input number must match the number presented by the other participant in the provisioning.

- `Number`: Decimal authentication number.

`mesh prov input-str <String>`

Input an alphanumeric OOB authentication value. Only valid when prompted by the shell during provisioning. The input string must match the string presented by the other participant in the provisioning.

- `String`: Unquoted alphanumeric authentication string.

`mesh prov static-oob [Val(1-32 hex)]`

Set or clear the static OOB authentication value. The static OOB authentication value must be set before provisioning starts to have any effect. The static OOB value must be same on both participants in the provisioning. To enable this command, the `CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE` option must be enabled.

- `Val`: If present, indicates the new hexadecimal value of the static OOB. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the static OOB value is cleared.

`mesh prov local <NetKeyIdx> <Addr> [IVI]`

Provision the mesh node itself. If the Configuration database is enabled, the network key must be created. Otherwise, the default key value is used.

- `NetKeyIdx`: Index of the network key to provision.
- `Addr`: First unicast address to assign to the device. The device will occupy as many addresses as it has elements, and all must be available.
- `IVI`: Indicates the current network IV index. Defaults to 0 if omitted.

`mesh prov beacon-listen <Val(off, on)>`

Enable or disable printing of incoming unprovisioned beacons. Allows a provisioner device to detect nearby unprovisioned devices and provision them. To enable this command, the `CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE` option must be enabled.

- `Val`: Whether to enable the unprovisioned beacon printing.

`mesh prov remote-pub-key <PubKey>`

Provide Device public key.

- `PubKey` - Device public key in big-endian.

`mesh prov auth-method input <Action> <Size>`

From the provisioner device, instruct the unprovisioned device to use the specified Input OOB authentication action.

- `Action` - Input action. Allowed values:
  - `0` - No input action.
  - `1` - Push action set.
  - `2` - Twist action set.
  - `4` - Enter number action set.
  - `8` - Enter String action set.
- `Size` - Authentication size.

`mesh prov auth-method output <Action> <Size>`

From the provisioner device, instruct the unprovisioned device to use the specified Output OOB authentication action.

- `Action` - Output action. Allowed values:
  - `0` - No output action.
  - `1` - Blink action set.
  - `2` - Vibrate action set.
  - `4` - Display number action set.
  - `8` - Display String action set.
- `Size` - Authentication size.

`mesh prov auth-method static <Val(1-16 hex)>`

From the provisioner device, instruct the unprovisioned device to use static OOB authentication, and use the given static authentication value when provisioning.

- `Val` - Static OOB value. Providing a hex-string shorter than 32 bytes will populate the N most significant bytes of the array and zero-pad the rest.

`mesh prov auth-method none`

From the provisioner device, don't use any authentication when provisioning new devices. This is the default behavior.

Proxy The Proxy Server module is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_GATT_PROXY` configuration option.

`mesh proxy identity-enable`

Enable the Proxy Node Identity beacon, allowing Proxy devices to connect explicitly to this device. The beacon will run for 60 seconds before the node returns to normal Proxy beacons.

The Proxy Client module is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_PROXY_CLIENT` configuration option.

`mesh proxy connect <NetKeyIdx>`

Auto-Connect a nearby proxy server into the mesh.

- `NetKeyIdx`: Index of the network key to connect.

`mesh proxy disconnect <NetKeyIdx>`

Disconnect the existing proxy connection.

- `NetKeyIdx`: Index of the network key to disconnect.

`mesh proxy solicit <NetKeyIdx>`

Begin Proxy Solicitation of a subnet. Support of this feature can be enabled through the `CONFIG_BT_MESH_PROXY_SOLICITATION` configuration option.

- `NetKeyIdx`: Index of the network key to send Solicitation PDUs to.

Models

Configuration Client The Configuration Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_CFG_CLI` configuration option. This is implemented as a separate module (`mesh models cfg`) inside the `mesh models` subcommand list. This module will work on any instance of the Configuration Client model if the mentioned shell configuration options is enabled, and as long as the Configuration Client model is present in the model composition of the application. This shell module can be used for configuring itself and other nodes in the mesh network.

The Configuration Client uses general message parameters set by `mesh target dst` and `mesh target net` to target specific nodes. When the Bluetooth Mesh shell node is provisioned, given that the `CONFIG_BT_MESH_SHELL_PROV_CTX_INSTANCE` option is enabled with the shell provisioning context initialized, the Configuration Client model targets itself by default. Similarly, when another node has been provisioned by the Bluetooth Mesh shell, the Configuration Client model targets the new node. In most common use-cases, the Configuration Client is depending on the provisioning features and the Configuration database to be fully functional. The Configuration Client always sends messages using the Device key bound to the destination address, so it will only be able to configure itself and the mesh nodes it provisioned. The following steps are an example of how you can set up a device to start using the Configuration Client commands:

- Initialize the client node (`mesh init`).
- Create the CDB (`mesh cdb create`).
- Provision the local device (`mesh prov local`).
- The shell module should now target itself.
- Monitor the composition data of the local node (`mesh models cfg get-comp`).
- Configure the local node as desired with the Configuration Client commands.

- Provision other devices (`mesh prov beacon-listen`) (`mesh prov remote-adv`) (`mesh prov remote-gatt`).
- The shell module should now target the newly added node.
- Monitor the newly provisioned nodes and their addresses (`mesh cdb show`).
- Monitor the composition data of the target device (`mesh models cfg get-comp`).
- Configure the node as desired with the Configuration Client commands.

`mesh models cfg target get`

Get the target Configuration server for the Configuration Client model.

`mesh models cfg help`

Print information for the Configuration Client shell module.

`mesh models cfg reset`

Reset the target device.

`mesh models cfg timeout [Timeout(s)]`

Get and set the Config Client model timeout used during message sending.

- `Timeout`: If present, set the Config Client model timeout in seconds. If omitted, the current timeout is printed.

`mesh models cfg get-comp [Page]`

Read a composition data page. The full composition data page will be printed. If the target does not have the given page, it will return the last page before it.

- `Page`: The composition data page to request. Defaults to 0 if omitted.

`mesh models cfg beacon [Val(off, on)]`

Get or set the network beacon transmission.

- `Val`: If present, enables or disables sending of the network beacon. If omitted, the current network beacon state is printed.

`mesh models cfg ttl [TTL]`

Get or set the default TTL value.

- `TTL`: If present, sets the new default TTL value. Legal TTL values are 0x00 and 0x02-0x7f. If omitted, the current default TTL value is printed.

`mesh models cfg friend [Val(off, on)]`

Get or set the Friend feature.

- `Val`: If present, enables or disables the Friend feature. If omitted, the current Friend feature state is printed:
  - `0x00`: The feature is supported, but disabled.
  - `0x01`: The feature is enabled.
  - `0x02`: The feature is not supported.

`mesh models cfg gatt-proxy [Val(off, on)]`

Get or set the GATT Proxy feature.

- `Val`: If present, enables or disables the GATT Proxy feature. If omitted, the current GATT Proxy feature state is printed:
  - `0x00`: The feature is supported, but disabled.
  - `0x01`: The feature is enabled.
  - `0x02`: The feature is not supported.

`mesh models cfg relay [<Val(off, on)> [<Count> [Int(ms)]]]`

Get or set the Relay feature and its parameters.

- `Val`: If present, enables or disables the Relay feature. If omitted, the current Relay feature state is printed:
  - `0x00`: The feature is supported, but disabled.
  - `0x01`: The feature is enabled.
  - `0x02`: The feature is not supported.
- `Count`: Sets the new relay retransmit count if `val` is `on`. Ignored if `val` is `off`. Legal retransmit count is 0-7. Defaults to `2` if omitted.
- `Int`: Sets the new relay retransmit interval in milliseconds if `val` is `on`. Legal interval range is 10-320 milliseconds. Ignored if `val` is `off`. Defaults to `20` if omitted.

`mesh models cfg node-id <NetKeyIdx> [Identity]`

Get or Set of current Node Identity state of a subnet.

- `NetKeyIdx`: The network key index to Get/Set.
- `Identity`: If present, sets the identity of Node Identity state.

`mesh models cfg polltimeout-get <LPNAddr>`

Get current value of the PollTimeout timer of the LPN within a Friend node.

- `LPNAddr` Address of Low Power node.

`mesh models cfg net-transmit-param [<Count> <Int(ms)>]`

Get or set the network transmit parameters.

- `Count`: Sets the number of additional network transmits for every sent message. Legal retransmit count is 0-7.
- `Int`: Sets the new network retransmit interval in milliseconds. Legal interval range is 10-320 milliseconds.

`mesh models cfg netkey add <NetKeyIdx> [Key(1-16 hex)]`

Add a network key to the target node. Adds the key to the Configuration Database if enabled.

- `NetKeyIdx`: The network key index to add.
- `Key`: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

`mesh models cfg netkey upd <NetKeyIdx> [Key(1-16 hex)]`

Update a network key to the target node.

- `NetKeyIdx`: The network key index to updated.
- `Key`: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the default key value is used.

`mesh models cfg netkey get`

Get a list of known network key indexes.

`mesh models cfg netkey del <NetKeyIdx>`

Delete a network key from the target node.

- `NetKeyIdx`: The network key index to delete.

`mesh models cfg appkey add <NetKeyIdx> <AppKeyIdx> [Key(1-16 hex)]`

Add an application key to the target node. Adds the key to the Configuration Database if enabled.

- `NetKeyIdx`: The network key index the application key is bound to.
- `AppKeyIdx`: The application key index to add.
- `Key`: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Only valid if the key does not already exist in the Configuration Database. If omitted, the default key value is used.

`mesh models cfg appkey upd <NetKeyIdx> <AppKeyIdx> [Key(1-16 hex)]`

Update an application key to the target node.

- `NetKeyIdx`: The network key index the application key is bound to.
- `AppKeyIdx`: The application key index to update.
- `Key`: If present, sets the key value as a 128-bit hexadecimal value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, the default key value is used.

`mesh models cfg appkey get <NetKeyIdx>`

Get a list of known application key indexes bound to the given network key index.

- `NetKeyIdx`: Network key indexes to get a list of application key indexes from.

`mesh models cfg appkey del <NetKeyIdx> <AppKeyIdx>`

Delete an application key from the target node.

- `NetKeyIdx`: The network key index the application key is bound to.
- `AppKeyIdx`: The application key index to delete.

`mesh models cfg model app-bind <Addr> <AppKeyIdx> <MID> [CID]`

Bind an application key to a model. Models can only encrypt and decrypt messages sent with application keys they are bound to.

- `Addr`: Address of the element the model is on.
- `AppKeyIdx`: The application key to bind to the model.
- `MID`: The model ID of the model to bind the key to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model app-unbind <Addr> <AppKeyIdx> <MID> [CID]`

Unbind an application key from a model.

- `Addr`: Address of the element the model is on.
- `AppKeyIdx`: The application key to unbind from the model.
- `MID`: The model ID of the model to unbind the key from.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model app-get <ElemAddr> <MID> [CID]`

Get a list of application keys bound to a model.

- `ElemAddr`: Address of the element the model is on.
- `MID`: The model ID of the model to get the bound keys of.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model pub <Addr> <MID> [CID] [<PubAddr> <AppKeyIdx> <Cred(off, on)> <TTL> <PerRes> <PerSteps> <Count> <Int(ms)>]`

Get or set the publication parameters of a model. If all publication parameters are included, they become the new publication parameters of the model. If all publication parameters are omitted, print the current publication parameters of the model.

- `Addr`: Address of the element the model is on.
- `MID`: The model ID of the model to get the bound keys of.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- `PubAddr`: The destination address to publish to.
- `AppKeyIdx`: The application key index to publish with.
- `Cred`: Whether to publish with Friendship credentials when acting as a Low Power Node.
- `TTL`: TTL value to publish with (`0x00` to `0x07f`).
- `PerRes`: Resolution of the publication period steps:
  - `0x00`: The Step Resolution is 100 milliseconds
  - `0x01`: The Step Resolution is 1 second
  - `0x02`: The Step Resolution is 10 seconds
  - `0x03`: The Step Resolution is 10 minutes
- `PerSteps`: Number of publication period steps, or 0 to disable periodic publication.
- `Count`: Number of retransmission for each published message (`0` to 7).
- `Int` The interval between each retransmission, in milliseconds. Must be a multiple of 50.

`mesh models cfg model pub-va <Addr> <UUID(1-16 hex)> <AppKeyIdx> <Cred(off, on)> <TTL> <PerRes> <PerSteps> <Count> <Int(ms)> <MID> [CID]`

Set the publication parameters of a model.

- `Addr`: Address of the element the model is on.
- `MID`: The model ID of the model to get the bound keys of.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

Publication parameters:

- `UUID`: The destination virtual address to publish to. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `AppKeyIdx`: The application key index to publish with.
- `Cred`: Whether to publish with Friendship credentials when acting as a Low Power Node.
- `TTL`: TTL value to publish with (`0x00` to `0x07f`).
- `PerRes`: Resolution of the publication period steps:
  - `0x00`: The Step Resolution is 100 milliseconds

  - `0x01`: The Step Resolution is 1 second
  - `0x02`: The Step Resolution is 10 seconds
  - `0x03`: The Step Resolution is 10 minutes
- `PerSteps`: Number of publication period steps, or 0 to disable periodic publication.
- `Count`: Number of retransmission for each published message (`0` to 7).
- `Int` The interval between each retransmission, in milliseconds. Must be a multiple of 50.

`mesh models cfg model sub-add <ElemAddr> <SubAddr> <MID> [CID]`

Subscription the model to a group address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- `ElemAddr`: Address of the element the model is on.
- `SubAddr`: 16-bit group address the model should subscribe to (`0xc000` to `0xFEFF`).
- `MID`: The model ID of the model to add the subscription to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-del <ElemAddr> <SubAddr> <MID> [CID]`

Unsubscribe a model from a group address.

- `ElemAddr`: Address of the element the model is on.
- `SubAddr`: 16-bit group address the model should remove from its subscription list (`0xc000` to `0xFEFF`).
- `MID`: The model ID of the model to add the subscription to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-add-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]`

Subscribe the model to a virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- `ElemAddr`: Address of the element the model is on.
- `LabelUUID`: 128-bit label UUID of the virtual address to subscribe to. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `MID`: The model ID of the model to add the subscription to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-del-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]`

Unsubscribe a model from a virtual address.

- `ElemAddr`: Address of the element the model is on.
- `LabelUUID`: 128-bit label UUID of the virtual address to remove the subscription of. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `MID`: The model ID of the model to add the subscription to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-ow <ElemAddr> <SubAddr> <MID> [CID]`

Overwrite all model subscriptions with a single new group address.

- `ElemAddr`: Address of the element the model is on.
- `SubAddr`: 16-bit group address the model should added to the subscription list (`0xc000` to `0xFEFF`).
- `MID`: The model ID of the model to add the subscription to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-ow-va <ElemAddr> <LabelUUID(1-16 hex)> <MID> [CID]`

Overwrite all model subscriptions with a single new virtual address. Models only receive messages sent to their unicast address or a group or virtual address they subscribe to. Models may subscribe to multiple group and virtual addresses.

- `ElemAddr`: Address of the element the model is on.
- `LabelUUID`: 128-bit label UUID of the virtual address as the new Address to be added to the subscription list. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `MID`: The model ID of the model to add the subscription to.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-del-all <ElemAddr> <MID> [CID]`

Remove all group and virtual address subscriptions from of a model.

- `ElemAddr`: Address of the element the model is on.
- `MID`: The model ID of the model to Unsubscribe all.
- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg model sub-get <ElemAddr> <MID> [CID]`

Get a list of addresses the model subscribes to.

- `ElemAddr`: Address of the element the model is on.
- `MID`: The model ID of the model to get the subscription list of.

- `CID`: If present, determines the Company ID of the model. If omitted, the model is a Bluetooth SIG defined model.

`mesh models cfg krp <NetKeyIdx> [Phase]`

Get or set the key refresh phase of a subnet.

- `NetKeyIdx`: The identified network key used to Get/Set the current Key Refresh Phase state.
- `Phase`: New Key Refresh Phase. Valid phases are:
  - `0x00`: Normal operation; Key Refresh procedure is not active
  - `0x01`: First phase of Key Refresh procedure
  - `0x02`: Second phase of Key Refresh procedure

`mesh models cfg hb-sub [<Src> <Dst> <Per>]`

Get or set the Heartbeat subscription parameters. A node only receives Heartbeat messages matching the Heartbeat subscription parameters. Sets the Heartbeat subscription parameters if present, or prints the current Heartbeat subscription parameters if called with no parameters.

- `Src`: Unicast source address to receive Heartbeat messages from.
- `Dst`: Destination address to receive Heartbeat messages on.
- `Per`: Logarithmic representation of the Heartbeat subscription period:
  - `0`: Heartbeat subscription will be disabled.
  - `1` to `17`: The node will subscribe to Heartbeat messages for $2^{(\text{period} - 1)}$ seconds.

`mesh models cfg hb-pub [<Dst> <Count> <Per> <TTL> <Features> <NetKeyIdx>]`

Get or set the Heartbeat publication parameters. Sets the Heartbeat publication parameters if present, or prints the current Heartbeat publication parameters if called with no parameters.

- `Dst`: Destination address to publish Heartbeat messages to.
- `Count`: Logarithmic representation of the number of Heartbeat messages to publish periodically:
  - `0`: Heartbeat messages are not published periodically.
  - `1` to `17`: The node will periodically publish $2^{(\text{count} - 1)}$ Heartbeat messages.
  - `255`: Heartbeat messages will be published periodically indefinitely.
- `Per`: Logarithmic representation of the Heartbeat publication period:
  - `0`: Heartbeat messages are not published periodically.
  - `1` to `17`: The node will publish Heartbeat messages every $2^{(\text{period} - 1)}$ seconds.
- `TTL`: The TTL value to publish Heartbeat messages with (`0x00` to `0x7f`).
- `Features`: Bitfield of features that should trigger a Heartbeat publication when changed:
  - `Bit 0`: Relay feature.
  - `Bit 1`: Proxy feature.
  - `Bit 2`: Friend feature.

  - Bit 3: Low Power feature.
- NetKeyIdx: Index of the network key to publish Heartbeat messages with.

Health Client The Health Client model is an optional mesh subsystem that can be enabled through the CONFIG_BT_MESH_HEALTH_CLI configuration option. This is implemented as a separate module (mesh models health) inside the mesh models subcommand list. This module will work on any instance of the Health Client model if the mentioned shell configuration options is enabled, and as long as one or more Health Client model(s) is present in the model composition of the application. This shell module can be used to trigger interaction between Health Clients and Servers on devices in a Mesh network.

By default, the module will choose the first Health Client instance in the model composition when using the Health Client commands. To choose a specific Health Client instance the user can utilize the commands mesh models health instance set and mesh models health instance get-all.

The Health Client may use the general messages parameters set by mesh target dst, mesh target net and mesh target app to target specific nodes. If the shell target destination address is set to zero, the targeted Health Client will attempt to publish messages using its configured publication parameters.

mesh models health instance set <ElemIdx>

Set the Health Client model instance to use.

- ElemIdx: Element index of Health Client model.

mesh models health instance get-all

Prints all available Health Client model instances on the device.

mesh models health fault-get <CID>

Get a list of registered faults for a Company ID.

- CID: Company ID to get faults for.

mesh models health fault-clear <CID>

Clear the list of faults for a Company ID.

- CID: Company ID to clear the faults for.

mesh models health fault-clear-unack <CID>

Clear the list of faults for a Company ID without requesting a response.

- CID: Company ID to clear the faults for.

mesh models health fault-test <CID> <TestID>

Invoke a self-test procedure, and show a list of triggered faults.

- CID: Company ID to perform self-tests for.
- TestID: Test to perform.

`mesh models health fault-test-unack <CID> <TestID>`

Invoke a self-test procedure without requesting a response.

- `CID`: Company ID to perform self-tests for.
- `TestID`: Test to perform.

`mesh models health period-get`

Get the current Health Server publish period divisor.

`mesh models health period-set <Divisor>`

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / 2^{divisor}.

- `Divisor`: The new Health Server publish period divisor.

`mesh models health period-set-unack <Divisor>`

Set the current Health Server publish period divisor. When a fault is detected, the Health Server will start publishing is fault status with a reduced interval. The reduced interval is determined by the Health Server publish period divisor: Fault publish period = Publish period / 2^{divisor}.

- `Divisor`: The new Health Server publish period divisor.

`mesh models health attention-get`

Get the current Health Server attention state.

`mesh models health attention-set <Time(s)>`

Enable the Health Server attention state for some time.

- `Time`: Duration of the attention state, in seconds (`0` to `255`)

`mesh models health attention-set-unack <Time(s)>`

Enable the Health Server attention state for some time without requesting a response.

- `Time`: Duration of the attention state, in seconds (`0` to `255`)

Binary Large Object (BLOB) Transfer Client model The *BLOB Transfer Client* can be added to the mesh shell by enabling the `CONFIG_BT_MESH_BLOB_CLI` option, and disabling the `CONFIG_BT_MESH_DFU_CLI` option.

`mesh models blob cli target <Addr>`

Add a Target node for the next BLOB transfer.

- `Addr`: Unicast address of the Target node's BLOB Transfer Server model.

`mesh models blob cli bounds [<Group>]`

Get the total boundary parameters of all Target nodes.

- `Group`: Optional group address to use when communicating with Target nodes. If omitted, the BLOB Transfer Client will address each Target node individually.

`mesh models blob cli tx <Id> <Size> <BlockSizeLog> <ChunkSize> [<Group> [<Mode(push, pull)>]]`

Perform a BLOB transfer to Target nodes. The BLOB Transfer Client will send a dummy BLOB to all Target nodes, then post a message when the transfer is completed. Note that all Target nodes must first be configured to receive the transfer using the `mesh models blob srv rx` command.

- `Id`: 64-bit BLOB transfer ID.
- `Size`: Size of the BLOB in bytes.
- `BlockSizeLog`: Logarithmic representation of the BLOB's block size. The final block size will be `1 << block size log` bytes.
- `ChunkSize`: Chunk size in bytes.
- `Group`: Optional group address to use when communicating with Target nodes. If omitted or set to 0, the BLOB Transfer Client will address each Target node individually.
- `Mode`: BLOB transfer mode to use. Must be either `push` (Push BLOB Transfer Mode) or `pull` (Pull BLOB Transfer Mode). If omitted, `push` will be used by default.

`mesh models blob cli tx-cancel`

Cancel an ongoing BLOB transfer.

`mesh models blob cli tx-get [Group]`

Determine the progress of a previously running BLOB transfer. Can be used when not performing a BLOB transfer.

- `Group`: Optional group address to use when communicating with Target nodes. If omitted or set to 0, the BLOB Transfer Client will address each Target node individually.

`mesh models blob cli tx-suspend`

Suspend the ongoing BLOB transfer.

`mesh models blob cli tx-resume`

Resume the suspended BLOB transfer.

`mesh models blob cli instance-set <ElemIdx>`

Use the BLOB Transfer Client model instance on the specified element when using the other BLOB Transfer Client model commands.

- `ElemIdx`: The element on which to find the BLOB Transfer Client model instance to use.

`mesh models blob cli instance-get-all`

Get a list of all BLOB Transfer Client model instances on the node.

BLOB Transfer Server model The *BLOB Transfer Server* can be added to the mesh shell by enabling the `CONFIG_BT_MESH_BLOB_SRV` option. The BLOB Transfer Server model is capable of receiving any BLOB data, but the implementation in the mesh shell will discard the incoming data.

`mesh models blob srv rx <ID> [<TimeoutBase(10s steps)>]`

Prepare to receive a BLOB transfer.

- `ID`: 64-bit BLOB transfer ID to receive.
- `TimeoutBase`: Optional additional time to wait for client messages, in 10-second increments.

`mesh models blob srv rx-cancel`

Cancel an ongoing BLOB transfer.

`mesh models blob srv instance-set <ElemIdx>`

Use the BLOB Transfer Server model instance on the specified element when using the other BLOB Transfer Server model commands.

- `ElemIdx`: The element on which to find the BLOB Transfer Server model instance to use.

`mesh models blob srv instance-get-all`

Get a list of all BLOB Transfer Server model instances on the node.

Firmware Update Client model The Firmware Update Client model can be added to the mesh shell by enabling configuration options `CONFIG_BT_MESH_BLOB_CLI` and `CONFIG_BT_MESH_DFU_CLI`. The Firmware Update Client demonstrates the firmware update Distributor role by transferring a dummy firmware update to a set of Target nodes.

`mesh models dfu slot add <Size> <FwID> [<Metadata>]`

Add a virtual DFU image slot that can be transferred as a DFU image. The image slot will be assigned an image slot index, which is printed as a response, and can be used to reference the slot in other commands. To update the image slot, remove it using the `mesh models dfu slot del` shell command and then add it again.

- `Size`: DFU image slot size in bytes.
- `FwID`: Firmware ID, formatted as a hexstring.
- `Metadata`: Optional firmware metadata, formatted as a hexstring.

`mesh models dfu slot del <SlotIdx>`

Delete the DFU image slot at the given index.

- `SlotIdx`: Index of the slot to delete.

`mesh models dfu slot get <SlotIdx>`

Get all available information about a DFU image slot.

- `SlotIdx`: Index of the slot to get.

`mesh models dfu cli target <Addr> <ImgIdx>`

Add a Target node.

- `Addr`: Unicast address of the Target node.
- `ImgIdx`: Image index to address on the Target node.

`mesh models dfu cli target-state`

Check the DFU Target state of the device at the configured destination address.

`mesh models dfu cli target-imgs [<MaxCount>]`

Get a list of DFU images on the device at the configured destination address.

- `MaxCount`: Optional maximum number of images to return. If omitted, there's no limit on the number of returned images.

`mesh models dfu cli target-check <SlotIdx> <TargetImgIdx>`

Check whether the device at the configured destination address will accept a DFU transfer from the given DFU image slot to the Target node's DFU image at the given index, and what the effect would be.

- `SlotIdx`: Index of the local DFU image slot to check.
- `TargetImgIdx`: Index of the Target node's DFU image to check.

`mesh models dfu cli send <SlotIdx> [<Group>]`

Start a DFU transfer to all added Target nodes.

- `SlotIdx`: Index of the local DFU image slot to send.
- `Group`: Optional group address to use when communicating with the Target nodes. If omitted, the Firmware Update Client will address each Target node individually.

`mesh models dfu cli cancel [<Addr>]`

Cancel the DFU procedure at any state on a specific Target node or on all Target nodes. When a Target node address is provided, the Firmware Update Client model will try to cancel the DFU procedure on the provided Target node. Otherwise, the Firmware Update Client model will try to cancel the ongoing DFU procedure on all Target nodes.

- `Addr`: Optional unicast address of a Target node on which to cancel the DFU procedure.

`mesh models dfu cli apply`

Apply the most recent DFU transfer on all Target nodes. Can only be called after a DFU transfer is completed.

`mesh models dfu cli confirm`

Confirm that the most recent DFU transfer was successfully applied on all Target nodes. Can only be called after a DFU transfer is completed and applied.

`mesh models dfu cli suspend`

Suspend the ongoing DFU transfer.

`mesh models dfu cli resume`

Resume the suspended DFU transfer.

`mesh models dfu cli progress`

Check the progress of the current transfer.

`mesh models dfu cli instance-set <ElemIdx>`

Use the Firmware Update Client model instance on the specified element when using the other Firmware Update Client model commands.

- `ElemIdx`: The element on which to find the Firmware Update Client model instance to use.

`mesh models dfu cli instance-get-all`

Get a list of all Firmware Update Client model instances on the node.

Firmware Update Server model The Firmware Update Server model can be added to the mesh shell by enabling configuration options `CONFIG_BT_MESH_BLOB_SRV` and `CONFIG_BT_MESH_DFU_SRV`. The Firmware Update Server demonstrates the firmware update Target role by accepting any firmware update. The mesh shell Firmware Update Server will discard the incoming firmware data, but otherwise behave as a proper firmware update Target node.

`mesh models dfu srv applied`

Mark the most recent DFU transfer as applied. Can only be called after a DFU transfer is completed, and the Distributor has requested that the transfer is applied.

As the mesh shell Firmware Update Server doesn't actually apply the incoming firmware image, this command can be used to emulate an applied status, to notify the Distributor that the transfer was successful.

`mesh models dfu srv progress`

Check the progress of the current transfer.

`mesh models dfu srv rx-cancel`

Cancel incoming DFU transfer.

`mesh models dfu srv instance-set <ElemIdx>`

Use the Firmware Update Server model instance on the specified element when using the other Firmware Update Server model commands.

- `ElemIdx`: The element on which to find the Firmware Update Server model instance to use.

`mesh models dfu srv instance-get-all`

Get a list of all Firmware Update Server model instances on the node.

Firmware Distribution Server model The Firmware Distribution Server model commands can be added to the mesh shell by enabling the `CONFIG_BT_MESH_DFD_SRV` configuration option. The shell commands for this model mirror the messages sent to the server by a Firmware Distribution Client model. To use these commands, a Firmware Distribution Server must be instantiated by the application.

`mesh models dfd receivers-add <Addr>,<FwIdx>[;<Addr>,<FwIdx>]...`

Add receivers to the Firmware Distribution Server. Supply receivers as a list of comma-separated addr,fw_idx pairs, separated by semicolons, for example, `0x0001,0;0x0002,0;0x0004,1`. Do not use spaces in the receiver list. Repeated calls to this command will continue populating the receivers list until `mesh models dfd receivers-delete-all` is called.

- `Addr`: Address of the receiving node(s).
- `FwIdx`: Index of the firmware slot to send to `Addr`.

`mesh models dfd receivers-delete-all`

Delete all receivers from the server.

`mesh models dfd receivers-get <First> <Count>`

Get a list of info about firmware receivers.

- `First`: Index of the first receiver to get from the receiver list.
- `Count`: The number of receivers for which to get info.

`mesh models dfd capabilities-get`

Get the capabilities of the server.

`mesh models dfd get`

Get information about the current distribution state, phase and the transfer parameters.

`mesh models dfd start <AppKeyIdx> <SlotIdx> [<Group> [<PolicyApply> [<TTL> [<TimeoutBase> [<XferMode>]]]]]`

Start the firmware distribution.

- `AppKeyIdx`: Application index to use for sending. The common application key should be bound to the Firmware Update and BLOB Transfer models on the Distributor and Target nodes.
- `SlotIdx`: Index of the local image slot to send.
- `Group`: Optional group address to use when communicating with the Target nodes. If omitted, the Firmware Distribution Server will address each Target node individually. To keep addressing each Target node individually while changing other arguments, set this argument value to 0.
- `PolicyApply`: Optional field that corresponds to the update policy. Setting this to `true` will make the Firmware Distribution Server apply the image immediately after the transfer is completed.
- `TTL`: Optional. TTL value to use when sending. Defaults to configured default TTL.
- `TimeoutBase`: Optional additional value used to calculate timeout values in the firmware distribution process, in 10-second increments.. See *Transfer timeout* for information about how `timeout_base` is used to calculate the transfer timeout. Defaults to 0.
- `XferMode`: Optional BLOB transfer mode. 1 = Push mode (Push BLOB Transfer Mode), 2 = Pull mode (Pull BLOB Transfer Mode). Defaults to Push mode.

`mesh models dfd suspend`

Suspends the ongoing distribution.

`mesh models dfd cancel`

Cancel the ongoing distribution.

`mesh models dfd apply`

Apply the distributed firmware.

`mesh models dfd fw-get <FwID>`

Get information about the firmware image uploaded to the server.

- `FwID`: Firmware ID of the image to get.

`mesh models dfd fw-get-by-idx <Idx>`

Get information about the firmware image uploaded to the server in a specific slot.

- `Idx`: Index of the slot to get the image from.

`mesh models dfd fw-delete <FwID>`

Delete a firmware image from the server.

- `FwID`: Firmware ID of the image to delete.

`mesh models dfd fw-delete-all`

Delete all firmware images from the server.

`mesh models dfd instance-set <ElemIdx>`

Use the Firmware Distribution Server model instance on the specified element when using the other Firmware Distribution Server model commands.

- `ElemIdx`: The element on which to find the Firmware Distribution Server model instance to use.

`mesh models dfd instance-get-all`

Get a list of all Firmware Distribution Server model instances on the node.

DFU metadata The DFU metadata commands allow generating metadata that can be used by a Target node to check the firmware before accepting it. The commands are enabled through the `CONFIG_BT_MESH_DFU_METADATA` configuration option.

`mesh models dfu metadata comp-clear`

Clear the stored composition data to be used for the Target node.

`mesh models dfu metadata comp-add <CID> <ProductID> <VendorID> <Crpl> <Features>`

Create a header of the Composition Data Page 0.

- `CID`: Company identifier assigned by Bluetooth SIG.
- `ProductID`: Vendor-assigned product identifier.
- `VendorID`: Vendor-assigned version identifier.
- `Crpl`: The size of the replay protection list.
- `Features`: Features supported by the node in bit field format:
  - `0`: Relay.
  - `1`: Proxy.
  - `2`: Friend.
  - `3`: Low Power.

`mesh models dfu metadata comp-elem-add <Loc> <NumS> <NumV> {<SigMID>|<VndCID> <VndMID>}...`

Add element description of the Target node.

- `Loc`: Element location.
- `NumS`: Number of SIG models instantiated on the element.
- `NumV`: Number of vendor models instantiated on the element.
- `SigMID`: SIG Model ID.
- `VndCID`: Vendor model company identifier.
- `VndMID`: Vendor model identifier.

`mesh models dfu metadata comp-hash-get [<Key(16 hex)>]`

Generate a hash of the stored Composition Data to be used in metadata.

- `Key`: Optional 128-bit key to be used to generate the hash. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.

`mesh models dfu metadata encode <Major> <Minor> <Rev> <BuildNum> <Size> <CoreType> <Hash> <Elems> [<UserData>]`

Encode metadata for the DFU.

- `Major`: Major version of the firmware.
- `Minor`: Minor version of the firmware.
- `Rev`: Revision number of the firmware.
- `BuildNum`: Build number.
- `Size`: Size of the signed bin file.
- `CoreType`: New firmware core type:
  - `1`: Application core.
  - `2`: Network core.
  - `4`: Applications specific BLOB.
- `Hash`: Hash of the composition data generated using `mesh models dfu metadata comp-hash-get` command.
- `Elems`: Number of elements on the new firmware.
- `UserData`: User data supplied with the metadata.

Segmentation and Reassembly (SAR) Configuration Client The SAR Configuration client is an optional mesh model that can be enabled through the `CONFIG_BT_MESH_SAR_CFG_CLI` configuration option. The SAR Configuration Client model is used to support the functionality of configuring the behavior of the lower transport layer of a node that supports the SAR Configuration Server model.

`mesh models sar tx-get`

Send SAR Configuration Transmitter Get message.

`mesh models sar tx-set <SegIntStep> <UniRetransCnt> <UniRetransWithoutProgCnt> <UniRetransIntStep> <UniRetransIntInc> <MultiRetransCnt> <MultiRetransInt>`

Send SAR Configuration Transmitter Set message.

- `SegIntStep`: SAR Segment Interval Step state.
- `UniRetransCnt`: SAR Unicast Retransmissions Count state.
- `UniRetransWithoutProgCnt`: SAR Unicast Retransmissions Without Progress Count state.
- `UniRetransIntStep`: SAR Unicast Retransmissions Interval Step state.
- `UniRetransIntInc`: SAR Unicast Retransmissions Interval Increment state.
- `MultiRetransCnt`: SAR Multicast Retransmissions Count state.
- `MultiRetransInt`: SAR Multicast Retransmissions Interval state.

`mesh models sar rx-get`

Send SAR Configuration Receiver Get message.

`mesh models sar rx-set <SegThresh> <AckDelayInc> <DiscardTimeout> <RxSegIntStep> <AckRetransCount>`

Send SAR Configuration Receiver Set message.

- `SegThresh`: SAR Segments Threshold state.
- `AckDelayInc`: SAR Acknowledgment Delay Increment state.
- `DiscardTimeout`: SAR Discard Timeout state.
- `RxSegIntStep`: SAR Receiver Segment Interval Step state.
- `AckRetransCount`: SAR Acknowledgment Retransmissions Count state.

Private Beacon Client The Private Beacon Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_PRIV_BEACON_CLI` configuration option.

`mesh models prb priv-beacon-get`

Get the target's Private Beacon state. Possible values:

- `0x00`: The node doesn't broadcast Private beacons.
- `0x01`: The node broadcasts Private beacons.

`mesh models prb priv-beacon-set <Val(off, on)> <RandInt(10s steps)>`

Set the target's Private Beacon state.

- `Val`: Control Private Beacon state.
- `RandInt`: Random refresh interval (in 10-second steps), or 0 to keep current value.

`mesh models prb priv-gatt-proxy-get`

Get the target's Private GATT Proxy state. Possible values:

- `0x00`: The Private Proxy functionality is supported, but disabled.
- `0x01`: The Private Proxy functionality is enabled.
- `0x02`: The Private Proxy functionality is not supported.

`mesh models prb priv-gatt-proxy-set <Val(off, on)>`

Set the target's Private GATT Proxy state.

- `Val`: New Private GATT Proxy value:
  - `0x00`: Disable the Private Proxy functionality.
  - `0x01`: Enable the Private Proxy functionality.

`mesh models prb priv-node-id-get <NetKeyIdx>`

Get the target's Private Node Identity state. Possible values:

- `0x00`: The node does not adverstise with the Private Node Identity.
- `0x01`: The node advertises with the Private Node Identity.
- `0x02`: The node doesn't support advertising with the Private Node Identity.
- `NetKeyIdx`: Network index to get the Private Node Identity state of.

`mesh models prb priv-node-id-set <NetKeyIdx> <State>`

Set the target's Private Node Identity state.

- `NetKeyIdx`: Network index to set the Private Node Identity state of.
- `State`: New Private Node Identity value:
  - `0x00`: Stop advertising with the Private Node Identity.
  - `0x01`: Start advertising with the Private Node Identity.

Opcodes Aggregator Client The Opcodes Aggregator client is an optional Bluetooth Mesh model that can be enabled through the `CONFIG_BT_MESH_OP_AGG_CLI` configuration option. The Opcodes Aggregator Client model is used to support the functionality of dispatching a sequence of access layer messages to nodes supporting the Opcodes Aggregator Server model.

`mesh models opagg seq-start <ElemAddr>`

Start the Opcodes Aggregator Sequence message. This command initiates the context for aggregating messages and sets the destination address for next shell commands to `elem_addr`.

- `ElemAddr`: Element address that will process the aggregated opcodes.

`mesh models opagg seq-send`

Send the Opcodes Aggregator Sequence message. This command completes the procedure, sends the aggregated sequence message to the target node and clears the context.

`mesh models opagg seq-abort`

Abort the Opcodes Aggregator Sequence message. This command clears the Opcodes Aggregator Client context.

Remote Provisioning Client The Remote Provisioning Client is an optional Bluetooth Mesh model enabled through the `CONFIG_BT_MESH_RPR_CLI` configuration option. The Remote Provisioning Client model provides support for remote provisioning of devices into a mesh network by using the Remote Provisioning Server model.

This shell module can be used to trigger interaction between Remote Provisioning Clients and Remote Provisioning Servers on devices in a mesh network.

`mesh models rpr scan <Timeout(s)> [<UUID(1-16 hex)>]`

Start scanning for unprovisioned devices.

- `Timeout`: Scan timeout in seconds. Must be at least 1 second.
- `UUID`: Device UUID to scan for. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, all devices will be reported.

`mesh models rpr scan-ext <Timeout(s)> <UUID(1-16 hex)> [<ADType> ... ]`

Start the extended scanning for unprovisioned devices.

- `Timeout`: Scan timeout in seconds. Valid values from `BT_MESH_RPR_EXT_SCAN_TIME_MIN` to `BT_MESH_RPR_EXT_SCAN_TIME_MAX`.
- `UUID`: Device UUID to start extended scanning for. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `ADType`: List of AD types to include in the scan report. Must contain 1 to `CONFIG_BT_MESH_RPR_AD_TYPES_MAX` entries.

`mesh models rpr scan-srv [<ADType> ... ]`

Start the extended scanning for the Remote Provisioning Server.

- `ADType`: List of AD types to include in the scan report. Must contain 1 to `CONFIG_BT_MESH_RPR_AD_TYPES_MAX` entries.

`mesh models rpr scan-caps`

Get the scanning capabilities of the Remote Provisioning Server.

`mesh models rpr scan-get`

Get the current scanning state of the Remote Provisioning Server.

`mesh models rpr scan-stop`

Stop any ongoing scanning on the Remote Provisioning Server.

`mesh models rpr link-get`

Get the current link status of the Remote Provisioning Server.

`mesh models rpr link-close`

Close any open links on the Remote Provisioning Server.

`mesh models rpr provision-remote <UUID(1-16 hex)> <NetKeyIdx> <Addr>`

Provision a mesh node using the PB-Remote provisioning bearer.

- `UUID`: UUID of the unprovisioned node. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `NetKeyIdx`: Network Key Index to give to the unprovisioned node.
- `Addr`: Address to assign to remote device. If `addr` is 0, the lowest available address will be chosen.

`mesh models rpr reprovision-remote <Addr> [<CompChanged(false, true)>]`

Reprovision a mesh node using the PB-Remote provisioning bearer.

- `Addr`: Address to assign to remote device. If `addr` is 0, the lowest available address will be chosen.
- `CompChanged`: The Target node has indicated that its Composition Data has changed. Defaults to false.

`mesh models rpr instance-set <ElemIdx>`

Use the Remote Provisioning Client model instance on the specified element when using the other Remote Provisioning Client model commands.

- `ElemIdx`: The element on which to find the Remote Provisioning Client model instance to use.

`mesh models rpr instance-get-all`

Get a list of all Remote Provisioning Client model instances on the node.

Large Composition Data Client The Large Composition Data Client is an optional Bluetooth Mesh model enabled through the `CONFIG_BT_MESH_LARGE_COMP_DATA_CLI` configuration option. The Large Composition Data Client model is used to support the functionality of reading pages of Composition Data that do not fit in a Config Composition Data Status message, and reading the metadata of the model instances.

`mesh models lcd large-comp-data-get <Page> <Offset>`

Send the Large Composition Data Get message to query a portion of the Composition Data state of a node.

- `Page`: Page number of the Composition Data.
- `Offset`: Offset within the page.

`mesh models lcd models-metadata-get <Page> <Offset>`

Send the Models Metadata Get message to query a portion of a page of the Models Metadata state.

- `Page`: Page number of the Models Metadata.
- `Offset`: Offset within the page.

Configuration database The Configuration database is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_CDB` configuration option. The Configuration database is only available on provisioner devices, and allows them to store all information about the mesh network. To avoid conflicts, there should only be one mesh node in the network with the Configuration database enabled. This node is the Configurator, and is responsible for adding new nodes to the network and configuring them.

`mesh cdb create [NetKey(1-16 hex)]`

Create a Configuration database.

- `NetKey`: Optional network key value of the primary network key (NetKeyIndex=0). Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. Defaults to the default key value if omitted.

`mesh cdb clear`

Clear all data from the Configuration database.

`mesh cdb show`

Show all data in the Configuration database.

`mesh cdb node-add <UUID(1-16 hex)> <Addr> <ElemCnt> <NetKeyIdx> [DevKey(1-16 hex)]`

Manually add a mesh node to the configuration database. Note that devices provisioned with `mesh provision` and `mesh provision-adv` will be added automatically if the Configuration Database is enabled and created.

- `UUID`: 128-bit hexadecimal UUID of the node. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest.
- `Addr`: Unicast address of the node, or 0 to automatically choose the lowest available address.
- `ElemCnt`: Number of elements on the node.
- `NetKeyIdx`: The network key the node was provisioned with.
- `DevKey`: Optional 128-bit device key value for the device. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

`mesh cdb node-del <Addr>`

Delete a mesh node from the Configuration database. If possible, the node should be reset with `mesh reset` before it is deleted from the Configuration database, to avoid unexpected behavior and uncontrolled access to the network.

- `Addr` Address of the node to delete.

`mesh cdb subnet-add <NetKeyIdx> [<NetKey(1-16 hex)>]`

Add a network key to the Configuration database. The network key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known network keys.

- `NetKeyIdx`: Key index of the network key to add.
- `NetKey`: Optional 128-bit network key value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

`mesh cdb subnet-del <NetKeyIdx>`

Delete a network key from the Configuration database.

- `NetKeyIdx`: Key index of the network key to delete.

`mesh cdb app-key-add <NetKeyIdx> <AppKeyIdx> [<AppKey(1-16 hex)>]`

Add an application key to the Configuration database. The application key can later be passed to mesh nodes in the network. Note that adding a key to the Configuration database does not automatically add it to the local node's list of known application keys.

- `NetKeyIdx`: Network key index the application key is bound to.
- `AppKeyIdx`: Key index of the application key to add.
- `AppKey`: Optional 128-bit application key value. Providing a hex-string shorter than 16 bytes will populate the N most significant bytes of the array and zero-pad the rest. If omitted, a random value will be generated.

`mesh cdb app-key-del <AppKeyIdx>`

Delete an application key from the Configuration database.

- `AppKeyIdx`: Key index of the application key to delete.

On-Demand Private GATT Proxy Client The On-Demand Private GATT Proxy Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_OD_PRIV_PROXY_CLI` configuration option.

`mesh models od_priv_proxy od-priv-gatt-proxy [Dur(s)]`

Set the On-Demand Private GATT Proxy state on active target, or fetch the value of this state from it.

- `Dur`: If given, set the state of On-Demand Private GATT Proxy to this value in seconds. Fetch this value otherwise.

Solicitation PDU RPL Client The Solicitation PDU RPL Client model is an optional mesh subsystem that can be enabled through the `CONFIG_BT_MESH_SOL_PDU_RPL_CLI` configuration option.

`mesh models sol_pdu_rpl sol-pdu-rpl-clear <RngStart> <Ackd> [RngLen]`

Clear active target's solicitation replay protection list (SRPL) in given range of solicitation source (SSRC) addresses.

- `RngStart`: Start address of the SSRC range.
- `Ackd`: This argument decides on whether an acknowledged or unacknowledged message will be sent.

- `RngLen`: Range length for the SSRC addresses to be cleared from the solicitiation RPL list. This parameter is optional; if absent, only a single SSRC address will be cleared.

Frame statistic

`mesh stat get`

Get the frame statistic. The command prints numbers of received frames, as well as numbers of planned and succeeded transmission attempts.

`mesh stat clear`

Clear all statistics collected before.

Core Host and drivers

Logical Link Control and Adaptation Protocol (L2CAP) L2CAP layer enables connection-oriented channels which can be enable with the configuration option: `CONFIG_BT_L2CAP_DYNAMIC_CHANNEL`. This channels support segmentation and reassembly transparently, they also support credit based flow control making it suitable for data streams.

Channels instances are represented by the *bt_l2cap_chan* struct which contains the callbacks in the *bt_l2cap_chan_ops* struct to inform when the channel has been connected, disconnected or when the encryption has changed. In addition to that it also contains the `recv` callback which is called whenever an incoming data has been received. Data received this way can be marked as processed by returning 0 or using *bt_l2cap_chan_recv_complete()* API if processing is asynchronous.

Note

The `recv` callback is called directly from RX Thread thus it is not recommended to block for long periods of time.

For sending data the *bt_l2cap_chan_send()* API can be used noting that it may block if no credits are available, and resuming as soon as more credits are available.

Servers can be registered using *bt_l2cap_server_register()* API passing the *bt_l2cap_server* struct which informs what `psm` it should listen to, the required security level `sec_level`, and the callback `accept` which is called to authorize incoming connection requests and allocate channel instances.

Client channels can be initiated with use of *bt_l2cap_chan_connect()* API and can be disconnected with the *bt_l2cap_chan_disconnect()* API. Note that the later can also disconnect channel instances created by servers.

API Reference

group `bt_l2cap`

L2CAP.

Defines

BT_L2CAP_HDR_SIZE

L2CAP PDU header size, used for buffer size calculations.

BT_L2CAP_TX_MTU

Maximum Transmission Unit (MTU) for an outgoing L2CAP PDU.

BT_L2CAP_RX_MTU

Maximum Transmission Unit (MTU) for an incoming L2CAP PDU.

BT_L2CAP_BUF_SIZE(mtu)

Helper to calculate needed buffer size for L2CAP PDUs.

Useful for creating buffer pools.

Parameters

- mtu – Needed L2CAP PDU MTU.

Returns

Needed buffer size to match the requested L2CAP PDU MTU.

BT_L2CAP_SDU_HDR_SIZE

L2CAP SDU header size, used for buffer size calculations.

BT_L2CAP_SDU_TX_MTU

Maximum Transmission Unit for an unsegmented outgoing L2CAP SDU.

The Maximum Transmission Unit for an outgoing L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for outgoing L2CAP SDUs with segmentation is defined by the size of the application buffer pool.

BT_L2CAP_SDU_RX_MTU

Maximum Transmission Unit for an unsegmented incoming L2CAP SDU.

The Maximum Transmission Unit for an incoming L2CAP SDU when sent without segmentation, i.e. a single L2CAP SDU will fit inside a single L2CAP PDU.

The MTU for incoming L2CAP SDUs with segmentation is defined by the size of the application buffer pool. The application will have to define an alloc_buf callback for the channel in order to support receiving segmented L2CAP SDUs.

BT_L2CAP_SDU_BUF_SIZE(mtu)

Helper to calculate needed buffer size for L2CAP SDUs.

Useful for creating buffer pools.

Parameters

- mtu – Required BT_L2CAP_*_SDU.

Returns

Needed buffer size to match the requested L2CAP SDU MTU.

BT_L2CAP_LE_CHAN(_ch)

Helper macro getting container object of type *bt_l2cap_le_chan* address having the same container chan member address as object in question.

Parameters

- **_ch** – Address of object of *bt_l2cap_chan* type

Returns
Address of in memory *bt_l2cap_le_chan* object type containing the address of in question object.

BT_L2CAP_CHAN_SEND_RESERVE

Headroom needed for outgoing L2CAP PDUs.

BT_L2CAP_SDU_CHAN_SEND_RESERVE

Headroom needed for outgoing L2CAP SDUs.

Typedefs

typedef void (***bt_l2cap_chan_destroy_t**)(struct *bt_l2cap_chan* *chan)

Channel destroy callback.

Param chan
Channel object.

typedef enum *bt_l2cap_chan_state* **bt_l2cap_chan_state_t**

Life-span states of L2CAP CoC channel.

Used only by internal APIs dealing with setting channel to proper state depending on operational context.

A channel enters the *BT_L2CAP_CONNECTING* state upon *bt_l2cap_chan_connect*, *bt_l2cap_ecred_chan_connect* or upon returning from *bt_l2cap_server::accept*.

When a channel leaves the *BT_L2CAP_CONNECTING* state, *bt_l2cap_chan_ops::connected* is called.

typedef enum *bt_l2cap_chan_status* **bt_l2cap_chan_status_t**

Status of L2CAP channel.

Enums

enum **bt_l2cap_chan_state**

Life-span states of L2CAP CoC channel.

Used only by internal APIs dealing with setting channel to proper state depending on operational context.

A channel enters the *BT_L2CAP_CONNECTING* state upon *bt_l2cap_chan_connect*, *bt_l2cap_ecred_chan_connect* or upon returning from *bt_l2cap_server::accept*.

When a channel leaves the *BT_L2CAP_CONNECTING* state, *bt_l2cap_chan_ops::connected* is called.

Values:

enumerator **BT_L2CAP_DISCONNECTED**

Channel disconnected.

enumerator BT_L2CAP_CONNECTING
Channel in connecting state.

enumerator BT_L2CAP_CONFIG
Channel in config state, BR/EDR specific.

enumerator BT_L2CAP_CONNECTED
Channel ready for upper layer traffic on it.

enumerator BT_L2CAP_DISCONNECTING
Channel in disconnecting state.

enum bt_l2cap_chan_status
Status of L2CAP channel.

Values:

enumerator BT_L2CAP_STATUS_OUT
Channel can send at least one PDU.

enumerator BT_L2CAP_STATUS_SHUTDOWN
Channel shutdown status.

```
Once this status is notified it means the channel will no longer be
able to transmit or receive data.
```

enumerator BT_L2CAP_STATUS_ENCRYPT_PENDING
Channel encryption pending status.

enumerator BT_L2CAP_NUM_STATUS

Functions

int bt_l2cap_server_register(struct *bt_l2cap_server* *server)
Register L2CAP server.

Register L2CAP server for a PSM, each new connection is authorized using the *accept()* callback which in case of success shall allocate the channel structure to be used by the new connection.

For fixed, SIG-assigned PSMs (in the range 0x0001-0x007f) the PSM should be assigned to server->psm before calling this API. For dynamic PSMs (in the range 0x0080-0x00ff) server->psm may be pre-set to a given value (this is however not recommended) or be left as 0, in which case upon return a newly allocated value will have been assigned to it. For dynamically allocated values the expectation is that it's exposed through a GATT service, and that's how L2CAP clients discover how to connect to the server.

Parameters

- server – Server structure.

Returns
0 in case of success or negative value in case of error.

int **bt_l2cap_br_server_register**(struct *bt_l2cap_server* *server)

Register L2CAP server on BR/EDR oriented connection.

Register L2CAP server for a PSM, each new connection is authorized using the *accept()* callback which in case of success shall allocate the channel structure to be used by the new connection.

Parameters

- **server** – Server structure.

Returns

0 in case of success or negative value in case of error.

int **bt_l2cap_ecred_chan_connect**(struct bt_conn *conn, struct *bt_l2cap_chan* **chans, uint16_t psm)

Connect Enhanced Credit Based L2CAP channels.

Connect up to 5 L2CAP channels by PSM, once the connection is completed each channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters

- **conn** – Connection object.
- **chans** – Array of channel objects.
- **psm** – Channel PSM to connect to.

Returns

0 in case of success or negative value in case of error.

int **bt_l2cap_ecred_chan_reconfigure**(struct *bt_l2cap_chan* **chans, uint16_t mtu)

Reconfigure Enhanced Credit Based L2CAP channels.

Reconfigure up to 5 L2CAP channels. Channels must be from the same bt_conn. Once reconfiguration is completed each channel reconfigured() callback will be called. MTU cannot be decreased on any of provided channels.

Parameters

- **chans** – Array of channel objects. Null-terminated. Elements after the first 5 are silently ignored.
- **mtu** – Channel MTU to reconfigure to.

Returns

0 in case of success or negative value in case of error.

int **bt_l2cap_chan_connect**(struct bt_conn *conn, struct *bt_l2cap_chan* *chan, uint16_t psm)

Connect L2CAP channel.

Connect L2CAP channel by PSM, once the connection is completed channel connected() callback will be called. If the connection is rejected disconnected() callback is called instead. Channel object passed (over an address of it) as second parameter shouldn't be instantiated in application as standalone. Instead of, application should create transport dedicated L2CAP objects, i.e. type of *bt_l2cap_le_chan* for LE and/or type of *bt_l2cap_br_chan* for BR/EDR. Then pass to this API the location (address) of *bt_l2cap_chan* type object which is a member of both transport dedicated objects.

Parameters

- **conn** – Connection object.
- **chan** – Channel object.

- **psm** – Channel PSM to connect to.

Returns
0 in case of success or negative value in case of error.

int **bt_l2cap_chan_disconnect**(struct *bt_l2cap_chan* *chan)

Disconnect L2CAP channel.

Disconnect L2CAP channel, if the connection is pending it will be canceled and as a result the channel disconnected() callback is called. Regarding to input parameter, to get details see reference description to *bt_l2cap_chan_connect()* API above.

Parameters

- **chan** – Channel object.

Returns
0 in case of success or negative value in case of error.

int **bt_l2cap_chan_send**(struct *bt_l2cap_chan* *chan, struct *net_buf* *buf)

Send data to L2CAP channel.

Send data from buffer to the channel. If credits are not available, buf will be queued and sent as and when credits are received from peer. Regarding to first input parameter, to get details see reference description to *bt_l2cap_chan_connect()* API above.

Network buffer fragments (ie `buf->frags`) are not supported.

When sending L2CAP data over an BR/EDR connection the application is sending L2CAP PDUs. The application is required to have reserved *BT_L2CAP_CHAN_SEND_RESERVE* bytes in the buffer before sending. The application should use the *BT_L2CAP_BUF_SIZE()* helper to correctly size the buffers for the for the outgoing buffer pool.

When sending L2CAP data over an LE connection the application is sending L2CAP SDUs. The application shall reserve *BT_L2CAP_SDU_CHAN_SEND_RESERVE* bytes in the buffer before sending.

The application can use the *BT_L2CAP_SDU_BUF_SIZE()* helper to correctly size the buffer to account for the reserved headroom.

When segmenting an L2CAP SDU into L2CAP PDUs the stack will first attempt to allocate buffers from the channel's `alloc_seg` callback and will fallback on the stack's global buffer pool (sized `CONFIG_BT_L2CAP_TX_BUF_COUNT`).

Note

Buffer ownership is transferred to the stack in case of success, in case of an error the caller retains the ownership of the buffer.

Returns
0 in case of success or negative value in case of error.

Returns
-EINVAL if `buf` or `chan` is NULL.

Returns
-EINVAL if `chan` is not either BR/EDR or LE credit-based.

Returns
-EINVAL if buffer doesn't have enough bytes reserved to fit header.

Returns
-EINVAL if buffer's reference counter != 1

Returns
-EMSGSIZE if buf is larger than chan's MTU.

Returns
-ENOTCONN if underlying conn is disconnected.

Returns
-ESHUTDOWN if L2CAP channel is disconnected.

Returns
-other (from lower layers) if chan is BR/EDR.

int **bt_l2cap_chan_give_credits**(struct *bt_l2cap_chan* *chan, uint16_t additional_credits)

Give credits to the remote.

Only available for channels using *bt_l2cap_chan_ops::seg_recv*. CONFIG_BT_L2CAP_SEG_RECV must be enabled to make this function available.

Each credit given allows the peer to send one segment.

This function depends on a valid chan object. Make sure to default-initialize or memset chan when allocating or reusing it for new connections.

Adding zero credits is not allowed.

Credits can be given before entering the *BT_L2CAP_CONNECTING* state. Doing so will adjust the 'initial credits' sent in the connection PDU.

Must not be called while the channel is in *BT_L2CAP_CONNECTING* state.

Returns
0 in case of success or negative value in case of error.

int **bt_l2cap_chan_recv_complete**(struct *bt_l2cap_chan* *chan, struct *net_buf* *buf)

Complete receiving L2CAP channel data.

Complete the reception of incoming data. This shall only be called if the channel recv callback has returned -EINPROGRESS to process some incoming data. The buffer shall contain the original user_data as that is used for storing the credits/segments used by the packet.

Parameters

- **chan** – Channel object.
- **buf** – Buffer containing the data.

Returns
0 in case of success or negative value in case of error.

struct **bt_l2cap_chan**

#include <l2cap.h> L2CAP Channel structure.

Public Members

struct bt_conn ***conn**

Channel connection reference.

const struct *bt_l2cap_chan_ops* ***ops**

Channel operations reference.

struct **bt_l2cap_le_endpoint**

#include <l2cap.h> LE L2CAP Endpoint structure.

Public Members

uint16_t **cid**

Endpoint Channel Identifier (CID)

uint16_t **mtu**

Endpoint Maximum Transmission Unit.

uint16_t **mps**

Endpoint Maximum PDU payload Size.

atomic_t **credits**

Endpoint credits.

struct **bt_l2cap_le_chan**

#include <l2cap.h> LE L2CAP Channel structure.

Public Members

struct *bt_l2cap_chan* **chan**

Common L2CAP channel reference object.

struct *bt_l2cap_le_endpoint* **rx**

Channel Receiving Endpoint.

If the application has set an alloc_buf channel callback for the channel to support receiving segmented L2CAP SDUs the application should initialize the MTU of the Receiving Endpoint. Otherwise the MTU of the receiving endpoint will be initialized to *BT_L2CAP_SDU_RX_MTU* by the stack.

This is the source of the MTU, MPS and credit values when sending L2CAP_LE_CREDIT_BASED_CONNECTION_REQ/RSP and L2CAP_CONFIGURATION_REQ.

uint16_t **pending_rx_mtu**

Pending RX MTU on ECFC reconfigure, used internally by stack.

struct *bt_l2cap_le_endpoint* **tx**

Channel Transmission Endpoint.

This is an image of the remote's rx.

The MTU and MPS is controlled by the remote by L2CAP_LE_CREDIT_BASED_CONNECTION_REQ/RSP or L2CAP_CONFIGURATION_REQ.

struct k_fifo **tx_queue**

Channel Transmission queue (for SDUs)

struct **bt_l2cap_br_endpoint**

#include <*l2cap.h*> BREDR L2CAP Endpoint structure.

Public Members

uint16_t **cid**

Endpoint Channel Identifier (CID)

uint16_t **mtu**

Endpoint Maximum Transmission Unit.

struct **bt_l2cap_br_chan**

#include <*l2cap.h*> BREDR L2CAP Channel structure.

Public Members

struct *bt_l2cap_chan* **chan**

Common L2CAP channel reference object.

struct *bt_l2cap_br_endpoint* **rx**

Channel Receiving Endpoint.

struct *bt_l2cap_br_endpoint* **tx**

Channel Transmission Endpoint.

uint16_t **psm**

Remote PSM to be connected.

uint8_t **ident**

Helps match request context during CoC.

struct **bt_l2cap_chan_ops**

#include <*l2cap.h*> L2CAP Channel operations structure.

Public Members

void (***connected**)(struct *bt_l2cap_chan* *chan)

Channel connected callback.

If this callback is provided it will be called whenever the connection completes.

Param chan

The channel that has been connected

void (*disconnected)(struct *bt_l2cap_chan* *chan)

Channel disconnected callback.

If this callback is provided it will be called whenever the channel is disconnected, including when a connection gets rejected.

Param chan
The channel that has been Disconnected

void (*encrypt_change)(struct *bt_l2cap_chan* *chan, uint8_t hci_status)

Channel encrypt_change callback.

If this callback is provided it will be called whenever the security level changed (indirectly link encryption done) or authentication procedure fails. In both cases security initiator and responder got the final status (HCI status) passed by related to encryption and authentication events from local host's controller.

Param chan
The channel which has made encryption status changed.

Param status
HCI status of performed security procedure caused by channel security requirements. The value is populated by HCI layer and set to 0 when success and to non-zero (reference to HCI Error Codes) when security/authentication failed.

struct *net_buf* *(*alloc_seg)(struct *bt_l2cap_chan* *chan)

Channel alloc_seg callback.

If this callback is provided the channel will use it to allocate buffers to store segments. This avoids wasting big SDU buffers with potentially much smaller PDUs. If this callback is supplied, it must return a valid buffer.

Param chan
The channel requesting a buffer.

Return
Allocated buffer.

struct *net_buf* *(*alloc_buf)(struct *bt_l2cap_chan* *chan)

Channel alloc_buf callback.

If this callback is provided the channel will use it to allocate buffers to store incoming data. Channels that requires segmentation must set this callback. If the application has not set a callback the L2CAP SDU MTU will be truncated to *BT_L2CAP_SDU_RX_MTU*.

Param chan
The channel requesting a buffer.

Return
Allocated buffer.

int (*recv)(struct *bt_l2cap_chan* *chan, struct *net_buf* *buf)

Channel recv callback.

Param chan
The channel receiving data.

Param buf
Buffer containing incoming data.

Return
0 in case of success or negative value in case of error.

Return
-EINPROGRESS in case where user has to confirm once the data has been processed by calling *bt_l2cap_chan_recv_complete* passing back the buffer

received with its original user_data which contains the number of segments/credits used by the packet.

void (*sent)(struct *bt_l2cap_chan* *chan)

Channel sent callback.

This callback will be called once the controller marks the SDU as completed. When the controller does so is implementation dependent. It could be after the SDU is enqueued for transmission, or after it is sent on air.

Param chan
The channel which has sent data.

void (*status)(struct *bt_l2cap_chan* *chan, atomic_t *status)

Channel status callback.

If this callback is provided it will be called whenever the channel status changes.

Param chan
The channel which status changed

Param status
The channel status

void (*reconfigured)(struct *bt_l2cap_chan* *chan)

Channel reconfigured callback.

If this callback is provided it will be called whenever peer or local device requested reconfiguration. Application may check updated MTU and MPS values by inspecting chan->le endpoints.

Param chan
The channel which was reconfigured

void (*seg_recv)(struct *bt_l2cap_chan* *chan, size_t sdu_len, off_t seg_offset, struct *net_buf_simple* *seg)

Handle L2CAP segments directly.

This is an alternative to *bt_l2cap_chan_ops::recv*. They cannot be used together.

This is called immediately for each received segment.

Unlike with *bt_l2cap_chan_ops::recv*, flow control is explicit. Each time this handler is invoked, the remote has permanently used up one credit. Use *bt_l2cap_chan_give_credits* to give credits.

The start of an SDU is marked by `seg_offset == 0`. The end of an SDU is marked by `seg_offset + seg->len == sdu_len`.

The stack guarantees that:
- The sender had the credit.
- The SDU length does not exceed MTU.
- The segment length does not exceed MPS.

Additionally, the L2CAP protocol is such that:
- Segments come in order.
- SDUs cannot be interleaved or aborted halfway.

Note

With this alternative API, the application is responsible for setting the RX MTU and MPS. The MPS must not exceed *BT_L2CAP_RX_MTU*.

Param chan
The receiving channel.

Param sdu_len
Byte length of the SDU this segment is part of.
Param seg_offset
The byte offset of this segment in the SDU.
Param seg
The segment payload.

struct **bt_l2cap_server**

#include <*l2cap.h*> L2CAP Server structure.

Public Members

uint16_t **psm**

Server PSM.

Possible values: 0 A dynamic value will be auto-allocated when *bt_l2cap_server_register()* is called.

0x0001-0x007f Standard, Bluetooth SIG-assigned fixed values.

0x0080-0x00ff Dynamically allocated. May be pre-set by the application before server registration (not recommended however), or auto-allocated by the stack if the app gave 0 as the value.

bt_security_t **sec_level**

Required minimum security level.

int (***accept**)(struct bt_conn *conn, struct *bt_l2cap_server* *server, struct *bt_l2cap_chan* **chan)

Server accept callback.

This callback is called whenever a new incoming connection requires authorization.
Param conn
The connection that is requesting authorization
Param server
Pointer to the server structure this callback relates to
Param chan
Pointer to received the allocated channel
Return
0 in case of success or negative value in case of error.
Return
-ENOMEM if no available space for new channel.
Return
-EACCES if application did not authorize the connection.
Return
-EPERM if encryption key size is too short.

Connection Management The Zephyr Bluetooth stack uses an abstraction called `bt_conn` to represent connections to other devices. The internals of this struct are not exposed to the application, but a limited amount of information (such as the remote address) can be acquired using the *bt_conn_get_info()* API. Connection objects are reference counted, and the application is expected to use the *bt_conn_ref()* API whenever storing a connection pointer for a longer period of time, since this ensures that the object remains valid (even if the connection would get disconnected). Similarly the *bt_conn_unref()* API is to be used when releasing a reference to a connection.

An application may track connections by registering a *bt_conn_cb* struct using the *bt_conn_cb_register()* or *BT_CONN_CB_DEFINE* APIs. This struct lets the application define callbacks for connection & disconnection events, as well as other events related to a connection such as a change in the security level or the connection parameters. When acting as a central the application will also get hold of the connection object through the return value of the *bt_conn_le_create()* API.

API Reference

group `bt_conn`

Connection management.

Defines

`BT_LE_CONN_PARAM_INIT`(int_min, int_max, lat, to)

Initialize connection parameters.

Parameters

- `int_min` – Minimum Connection Interval (N * 1.25 ms)
- `int_max` – Maximum Connection Interval (N * 1.25 ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout (N * 10 ms)

`BT_LE_CONN_PARAM`(int_min, int_max, lat, to)

Helper to declare connection parameters inline.

Parameters

- `int_min` – Minimum Connection Interval (N * 1.25 ms)
- `int_max` – Maximum Connection Interval (N * 1.25 ms)
- `lat` – Connection Latency
- `to` – Supervision Timeout (N * 10 ms)

`BT_LE_CONN_PARAM_DEFAULT`

Default LE connection parameters: Connection Interval: 30-50 ms Latency: 0 Timeout: 4 s.

`BT_CONN_LE_PHY_PARAM_INIT`(_pref_tx_phy, _pref_rx_phy)

Initialize PHY parameters.

Parameters

- `_pref_tx_phy` – Bitmask of preferred transmit PHYs.
- `_pref_rx_phy` – Bitmask of preferred receive PHYs.

`BT_CONN_LE_PHY_PARAM`(_pref_tx_phy, _pref_rx_phy)

Helper to declare PHY parameters inline.

Parameters

- `_pref_tx_phy` – Bitmask of preferred transmit PHYs.
- `_pref_rx_phy` – Bitmask of preferred receive PHYs.

BT_CONN_LE_PHY_PARAM_1M
: Only LE 1M PHY.

BT_CONN_LE_PHY_PARAM_2M
: Only LE 2M PHY.

BT_CONN_LE_PHY_PARAM_CODED
: Only LE Coded PHY.

BT_CONN_LE_PHY_PARAM_ALL
: All LE PHYs.

BT_CONN_LE_DATA_LEN_PARAM_INIT(_tx_max_len, _tx_max_time)
: Initialize transmit data length parameters.

  Parameters

  - **_tx_max_len** – Maximum Link Layer transmission payload size in bytes.
  - **_tx_max_time** – Maximum Link Layer transmission payload time in us.

BT_CONN_LE_DATA_LEN_PARAM(_tx_max_len, _tx_max_time)
: Helper to declare transmit data length parameters inline.

  Parameters

  - **_tx_max_len** – Maximum Link Layer transmission payload size in bytes.
  - **_tx_max_time** – Maximum Link Layer transmission payload time in us.

BT_LE_DATA_LEN_PARAM_DEFAULT
: Default LE data length parameters.

BT_LE_DATA_LEN_PARAM_MAX
: Maximum LE data length parameters.

BT_CONN_INTERVAL_TO_MS(interval)
: Convert connection interval to milliseconds.

  Multiply by 1.25 to get milliseconds.

  Note that this may be inaccurate, as something like 7.5 ms cannot be accurately presented with integers.

BT_CONN_INTERVAL_TO_US(interval)
: Convert connection interval to microseconds.

  Multiply by 1250 to get microseconds.

BT_CONN_LE_CREATE_PARAM_INIT(_options, _interval, _window)
: Initialize create connection parameters.

  Parameters

  - **_options** – Create connection options.
  - **_interval** – Create connection scan interval (N * 0.625 ms).
  - **_window** – Create connection scan window (N * 0.625 ms).

BT_CONN_LE_CREATE_PARAM(_options, _interval, _window)
Helper to declare create connection parameters inline.

Parameters

- **_options** – Create connection options.
- **_interval** – Create connection scan interval (N * 0.625 ms).
- **_window** – Create connection scan window (N * 0.625 ms).

BT_CONN_LE_CREATE_CONN
Default LE create connection parameters.

Scan continuously by setting scan interval equal to scan window.

BT_CONN_LE_CREATE_CONN_AUTO
Default LE create connection using filter accept list parameters.

Scan window: 30 ms. Scan interval: 60 ms.

BT_CONN_CB_DEFINE(_name)
Register a callback structure for connection events.

Parameters

- **_name** – Name of callback structure.

BT_PASSKEY_INVALID
Special passkey value that can be used to disable a previously set fixed passkey.

BT_BR_CONN_PARAM_INIT(role_switch)
Initialize BR/EDR connection parameters.

Parameters

- **role_switch** – True if role switch is allowed

BT_BR_CONN_PARAM(role_switch)
Helper to declare BR/EDR connection parameters inline.

Parameters

- **role_switch** – True if role switch is allowed

BT_BR_CONN_PARAM_DEFAULT
Default BR/EDR connection parameters: Role switch allowed.

Enums

Connection PHY options.

Values:

enumerator BT_CONN_LE_PHY_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_CONN_LE_PHY_OPT_CODED_S2 = *BIT*(0)
LE Coded using S=2 coding preferred when transmitting.

enumerator BT_CONN_LE_PHY_OPT_CODED_S8 = *BIT*(1)

LE Coded using S=8 coding preferred when transmitting.

enum bt_conn_type

Connection Type.

Values:

enumerator BT_CONN_TYPE_LE = *BIT*(0)

LE Connection Type.

enumerator BT_CONN_TYPE_BR = *BIT*(1)

BR/EDR Connection Type.

enumerator BT_CONN_TYPE_SCO = *BIT*(2)

SCO Connection Type.

enumerator BT_CONN_TYPE_ISO = *BIT*(3)

ISO Connection Type.

enumerator BT_CONN_TYPE_ALL = *BT_CONN_TYPE_LE* | *BT_CONN_TYPE_BR* | *BT_CONN_TYPE_SCO* | *BT_CONN_TYPE_ISO*

All Connection Type.

Values:

enumerator BT_CONN_ROLE_CENTRAL = 0

enumerator BT_CONN_ROLE_PERIPHERAL = 1

enum bt_conn_state

Values:

enumerator BT_CONN_STATE_DISCONNECTED

Channel disconnected.

enumerator BT_CONN_STATE_CONNECTING

Channel in connecting state.

enumerator BT_CONN_STATE_CONNECTED

Channel connected and ready for upper layer traffic on it.

enumerator BT_CONN_STATE_DISCONNECTING

Channel in disconnecting state.

enum bt_security_t

Security level.

Values:

enumerator BT_SECURITY_L0
Level 0: Only for BR/EDR special cases, like SDP.

enumerator BT_SECURITY_L1
Level 1: No encryption and no authentication.

enumerator BT_SECURITY_L2
Level 2: Encryption and no authentication (no MITM).

enumerator BT_SECURITY_L3
Level 3: Encryption and authentication (MITM).

enumerator BT_SECURITY_L4
Level 4: Authenticated Secure Connections and 128-bit key.

enumerator BT_SECURITY_FORCE_PAIR = *BIT*(7)
Bit to force new pairing procedure, bit-wise OR with requested security level.

enum bt_security_flag
Security Info Flags.
Values:

enumerator BT_SECURITY_FLAG_SC = *BIT*(0)
Paired with Secure Connections.

enumerator BT_SECURITY_FLAG_OOB = *BIT*(1)
Paired with Out of Band method.

enum bt_conn_le_tx_power_phy
Values:

enumerator BT_CONN_LE_TX_POWER_PHY_NONE
Convenience macro for when no PHY is set.

enumerator BT_CONN_LE_TX_POWER_PHY_1M
LE 1M PHY.

enumerator BT_CONN_LE_TX_POWER_PHY_2M
LE 2M PHY.

enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S8
LE Coded PHY using S=8 coding.

enumerator BT_CONN_LE_TX_POWER_PHY_CODED_S2
LE Coded PHY using S=2 coding.

enum `bt_conn_le_path_loss_zone`

Path Loss zone that has been entered.

The path loss zone that has been entered in the most recent LE Path Loss Monitoring Threshold Change event as documented in Core Spec. Version 5.4 Vol.4, Part E, 7.7.65.32.

> **Note**
>
> BT_CONN_LE_PATH_LOSS_ZONE_UNAVAILABLE has been added to notify when path loss becomes unavailable.

Values:

enumerator `BT_CONN_LE_PATH_LOSS_ZONE_ENTERED_LOW`

Low path loss zone entered.

enumerator `BT_CONN_LE_PATH_LOSS_ZONE_ENTERED_MIDDLE`

Middle path loss zone entered.

enumerator `BT_CONN_LE_PATH_LOSS_ZONE_ENTERED_HIGH`

High path loss zone entered.

enumerator `BT_CONN_LE_PATH_LOSS_ZONE_UNAVAILABLE`

Path loss has become unavailable.

enum `bt_conn_auth_keypress`

Passkey Keypress Notification type.

The numeric values are the same as in the Core specification for Pairing Keypress Notification PDU.

Values:

enumerator `BT_CONN_AUTH_KEYPRESS_ENTRY_STARTED` = 0x00

enumerator `BT_CONN_AUTH_KEYPRESS_DIGIT_ENTERED` = 0x01

enumerator `BT_CONN_AUTH_KEYPRESS_DIGIT_ERASED` = 0x02

enumerator `BT_CONN_AUTH_KEYPRESS_CLEARED` = 0x03

enumerator `BT_CONN_AUTH_KEYPRESS_ENTRY_COMPLETED` = 0x04

Values:

enumerator `BT_CONN_LE_OPT_NONE` = 0

Convenience value when no options are specified.

enumerator **BT_CONN_LE_OPT_CODED** = *BIT*(0)

Enable LE Coded PHY.

```
Enable scanning on the LE Coded PHY.
```

enumerator **BT_CONN_LE_OPT_NO_1M** = *BIT*(1)

Disable LE 1M PHY.

```
Disable scanning on the LE 1M PHY.

@note Requires @ref BT_CONN_LE_OPT_CODED.
```

enum **bt_security_err**

Values:

enumerator **BT_SECURITY_ERR_SUCCESS**

Security procedure successful.

enumerator **BT_SECURITY_ERR_AUTH_FAIL**

Authentication failed.

enumerator **BT_SECURITY_ERR_PIN_OR_KEY_MISSING**

PIN or encryption key is missing.

enumerator **BT_SECURITY_ERR_OOB_NOT_AVAILABLE**

OOB data is not available.

enumerator **BT_SECURITY_ERR_AUTH_REQUIREMENT**

The requested security level could not be reached.

enumerator **BT_SECURITY_ERR_PAIR_NOT_SUPPORTED**

Pairing is not supported.

enumerator **BT_SECURITY_ERR_PAIR_NOT_ALLOWED**

Pairing is not allowed.

enumerator **BT_SECURITY_ERR_INVALID_PARAM**

Invalid parameters.

enumerator **BT_SECURITY_ERR_KEY_REJECTED**

Distributed Key Rejected.

enumerator **BT_SECURITY_ERR_UNSPECIFIED**

Pairing failed but the exact reason could not be specified.

Functions

struct bt_conn *bt_conn_ref(struct bt_conn *conn)

Increment a connection's reference count.

Increment the reference count of a connection object.

> **Note**
>
> Will return NULL if the reference count is zero.

Parameters

- conn – Connection object.

Returns

Connection object with incremented reference count, or NULL if the reference count is zero.

void bt_conn_unref(struct bt_conn *conn)

Decrement a connection's reference count.

Decrement the reference count of a connection object.

Parameters

- conn – Connection object.

void bt_conn_foreach(enum *bt_conn_type* type, void (*func)(struct bt_conn *conn, void *data), void *data)

Iterate through all bt_conn objects.

Iterates through all bt_conn objects that are alive in the Host allocator.

To find established connections, combine this with *bt_conn_get_info*. Check that *bt_conn_info::state* is *BT_CONN_STATE_CONNECTED*.

Thread safety: This API is thread safe, but it does not guarantee a sequentially-consistent view for objects allocated during the current invocation of this API. E.g. If preempted while allocations A then B then C happen then results may include A and C but miss B.

Parameters

- type – Connection Type
- func – Function to call for each connection.
- data – Data to pass to the callback function.

struct bt_conn *bt_conn_lookup_addr_le(uint8_t id, const *bt_addr_le_t* *peer)

Look up an existing connection by address.

Look up an existing connection based on the remote address.

The caller gets a new reference to the connection object which must be released with *bt_conn_unref()* once done using the object.

Parameters

- id – Local identity (in most cases BT_ID_DEFAULT).
- peer – Remote address.

Returns

Connection object or NULL if not found.

const *bt_addr_le_t* ***bt_conn_get_dst**(const struct bt_conn *conn)

Get destination (peer) address of a connection.

Parameters

- **conn** – Connection object.

Returns

Destination address.

uint8_t **bt_conn_index**(const struct bt_conn *conn)

Get array index of a connection.

This function is used to map bt_conn to index of an array of connections. The array has CONFIG_BT_MAX_CONN elements.

Parameters

- **conn** – Connection object.

Returns

Index of the connection object. The range of the returned value is 0..CONFIG_BT_MAX_CONN-1

int **bt_conn_get_info**(const struct bt_conn *conn, struct *bt_conn_info* *info)

Get connection info.

Parameters

- **conn** – Connection object.
- **info** – Connection info object.

Returns

Zero on success or (negative) error code on failure.

int **bt_conn_get_remote_info**(struct bt_conn *conn, struct *bt_conn_remote_info* *remote_info)

Get connection info for the remote device.

Note

In order to retrieve the remote version (version, manufacturer and subversion) CONFIG_BT_REMOTE_VERSION must be enabled

Note

The remote information is exchanged directly after the connection has been established. The application can be notified about when the remote information is available through the remote_info_available callback.

Parameters

- **conn** – Connection object.
- **remote_info** – Connection remote info object.

Returns

Zero on success or (negative) error code on failure.

Returns

-EBUSY The remote information is not yet available.

int **bt_conn_le_get_tx_power_level**(struct bt_conn *conn, struct *bt_conn_le_tx_power* *tx_power_level)

Get connection transmit power level.

Parameters

- **conn** – Connection object.
- **tx_power_level** – Transmit power level descriptor.

Returns
Zero on success or (negative) error code on failure.

Returns
-ENOBUFS HCI command buffer is not available.

int **bt_conn_le_enhanced_get_tx_power_level**(struct bt_conn *conn, struct *bt_conn_le_tx_power* *tx_power)

Get local enhanced connection transmit power level.

Parameters

- **conn** – Connection object.
- **tx_power** – Transmit power level descriptor.

Return values
-ENOBUFS – HCI command buffer is not available.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_get_remote_tx_power_level**(struct bt_conn *conn, enum *bt_conn_le_tx_power_phy* phy)

Get remote (peer) transmit power level.

Parameters

- **conn** – Connection object.
- **phy** – PHY information.

Return values
-ENOBUFS – HCI command buffer is not available.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_set_tx_power_report_enable**(struct bt_conn *conn, bool local_enable, bool remote_enable)

Enable transmit power reporting.

Parameters

- **conn** – Connection object.
- **local_enable** – Enable/disable reporting for local.
- **remote_enable** – Enable/disable reporting for remote.

Return values
-ENOBUFS – HCI command buffer is not available.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_set_path_loss_mon_param**(struct bt_conn *conn, const struct *bt_conn_le_path_loss_reporting_param* *param)

Set Path Loss Monitoring Parameters.

Change the configuration for path loss threshold change events for a given conn handle.

> **Note**
>
> To use this API CONFIG_BT_PATH_LOSS_MONITORING must be set.

Parameters

- **conn** – Connection object.
- **param** – Path Loss Monitoring parameters

Returns

Zero on success or (negative) error code on failure.

int **bt_conn_le_set_path_loss_mon_enable**(struct bt_conn *conn, bool enable)

Enable or Disable Path Loss Monitoring.

Enable or disable Path Loss Monitoring, which will decide whether Path Loss Threshold events are sent from the controller to the host.

> **Note**
>
> To use this API CONFIG_BT_PATH_LOSS_MONITORING must be set.

Parameters

- **conn** – Connection Object.
- **enable** – Enable/disable path loss reporting.

Returns

Zero on success or (negative) error code on failure.

int **bt_conn_le_param_update**(struct bt_conn *conn, const struct *bt_le_conn_param* *param)

Update the connection parameters.

If the local device is in the peripheral role then updating the connection parameters will be delayed. This delay can be configured by through the CONFIG_BT_CONN_PARAM_UPDATE_TIMEOUT option.

Parameters

- **conn** – Connection object.
- **param** – Updated connection parameters.

Returns

Zero on success or (negative) error code on failure.

int **bt_conn_le_data_len_update**(struct bt_conn *conn, const struct *bt_conn_le_data_len_param* *param)

Update the connection transmit data length parameters.

Parameters

- **conn** – Connection object.
- **param** – Updated data length parameters.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_phy_update**(struct bt_conn *conn, const struct *bt_conn_le_phy_param* *param)

Update the connection PHY parameters.

Update the preferred transmit and receive PHYs of the connection. Use *BT_GAP_LE_PHY_NONE* to indicate no preference.

Parameters

- **conn** – Connection object.
- **param** – Updated connection parameters.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_disconnect**(struct bt_conn *conn, uint8_t reason)

Disconnect from a remote device or cancel pending connection.

Disconnect an active connection with the specified reason code or cancel pending outgoing connection.

The disconnect reason for a normal disconnect should be: BT_HCI_ERR_REMOTE_USER_TERM_CONN.

The following disconnect reasons are accepted:

- BT_HCI_ERR_AUTH_FAIL
- BT_HCI_ERR_REMOTE_USER_TERM_CONN
- BT_HCI_ERR_REMOTE_LOW_RESOURCES
- BT_HCI_ERR_REMOTE_POWER_OFF
- BT_HCI_ERR_UNSUPP_REMOTE_FEATURE
- BT_HCI_ERR_PAIRING_NOT_SUPPORTED
- BT_HCI_ERR_UNACCEPT_CONN_PARAM

Parameters

- **conn** – Connection to disconnect.
- **reason** – Reason code for the disconnection.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_create**(const *bt_addr_le_t* *peer, const struct *bt_conn_le_create_param* *create_param, const struct *bt_le_conn_param* *conn_param, struct bt_conn **conn)

Initiate an LE connection to a remote device.

Allows initiate new LE link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with *bt_conn_unref()* once done using the object.

This uses the General Connection Establishment procedure.

The application must disable explicit scanning before initiating a new LE connection if CONFIG_BT_SCAN_AND_INITIATE_IN_PARALLEL is not enabled.

Parameters

- **peer** – **[in]** Remote address.
- **create_param** – **[in]** Create connection parameters.
- **conn_param** – **[in]** Initial connection parameters.
- **conn** – **[out]** Valid connection object on success.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_create_synced**(const struct bt_le_ext_adv *adv, const struct *bt_conn_le_create_synced_param* *synced_param, const struct *bt_le_conn_param* *conn_param, struct bt_conn **conn)

Create a connection to a synced device.

Initiate a connection to a synced device from a Periodic Advertising with Responses (PAwR) train.

The caller gets a new reference to the connection object which must be released with *bt_conn_unref()* once done using the object.

This uses the Periodic Advertising Connection Procedure.

Parameters

- **adv** – **[in]** The adverting set the PAwR advertiser belongs to.
- **synced_param** – **[in]** Create connection parameters.
- **conn_param** – **[in]** Initial connection parameters.
- **conn** – **[out]** Valid connection object on success.

Returns
Zero on success or (negative) error code on failure.

int **bt_conn_le_create_auto**(const struct *bt_conn_le_create_param* *create_param, const struct *bt_le_conn_param* *conn_param)

Automatically connect to remote devices in the filter accept list.

This uses the Auto Connection Establishment procedure. The procedure will continue until a single connection is established or the procedure is stopped through *bt_conn_create_auto_stop*. To establish connections to all devices in the filter accept list the procedure should be started again in the connected callback after a new connection has been established.

Parameters

- **create_param** – Create connection parameters
- **conn_param** – Initial connection parameters.

Returns
Zero on success or (negative) error code on failure.

Returns
-ENOMEM No free connection object available.

int **bt_conn_create_auto_stop**(void)

Stop automatic connect creation.

Returns
Zero on success or (negative) error code on failure.

int **bt_le_set_auto_conn**(const *bt_addr_le_t* *addr, const struct *bt_le_conn_param* *param)

Automatically connect to remote device if it's in range.

This function enables/disables automatic connection initiation. Every time the device loses the connection with peer, this connection will be re-established if connectable advertisement from peer is received.

Note

Auto connect is disabled during explicit scanning.

Parameters

- `addr` – Remote Bluetooth address.
- `param` – If non-NULL, auto connect is enabled with the given parameters. If NULL, auto connect is disabled.

Returns

Zero on success or error code otherwise.

int **bt_conn_set_security**(struct bt_conn *conn, *bt_security_t* sec)

Set security level for a connection.

This function enable security (encryption) for a connection. If the device has bond information for the peer with sufficiently strong key encryption will be enabled. If the connection is already encrypted with sufficiently strong key this function does nothing.

If the device has no bond information for the peer and is not already paired then the pairing procedure will be initiated. Note that `sec` has no effect on the security level selected for the pairing process. The selection is instead controlled by the values of the registered *bt_conn_auth_cb*. If the device has bond information or is already paired and the keys are too weak then the pairing procedure will be initiated.

This function may return an error if the required level of security defined using `sec` is not possible to achieve due to local or remote device limitation (e.g., input output capabilities), or if the maximum number of paired devices has been reached.

This function may return an error if the pairing procedure has already been initiated by the local device or the peer device.

Note

When `CONFIG_BT_SMP_SC_ONLY` is enabled then the security level will always be level 4.

Note

When `CONFIG_BT_SMP_OOB_LEGACY_PAIR_ONLY` is enabled then the security level will always be level 3.

Note

When *BT_SECURITY_FORCE_PAIR* within `sec` is enabled then the pairing procedure will always be initiated.

Parameters

- **conn** – Connection object.
- **sec** – Requested minimum security level.

Returns
0 on success or negative error

bt_security_t **bt_conn_get_security**(const struct bt_conn *conn)

Get security level for a connection.

Returns
Connection security level

uint8_t **bt_conn_enc_key_size**(const struct bt_conn *conn)

Get encryption key size.

This function gets encryption key size. If there is no security (encryption) enabled 0 will be returned.

Parameters

- **conn** – Existing connection object.

Returns
Encryption key size.

int **bt_conn_cb_register**(struct *bt_conn_cb* *cb)

Register connection callbacks.

Register callbacks to monitor the state of connections.

Parameters

- **cb** – Callback struct. Must point to memory that remains valid.

Return values

- **0** – Success.
- **-EEXIST** – if cb was already registered.

int **bt_conn_cb_unregister**(struct *bt_conn_cb* *cb)

Unregister connection callbacks.

Unregister the state of connections callbacks.

Parameters

- **cb** – Callback struct point to memory that remains valid.

Return values

- **0** – Success
- **-EINVAL** – If cb is NULL
- **-ENOENT** – if cb was not registered

static inline const char ***bt_security_err_to_str**(enum *bt_security_err* err)

Converts a security error to string.

Returns
The string representation of the security error code. If CONFIG_BT_SECURITY_ERR_TO_STR is not enabled, this just returns the empty string

void **bt_set_bondable**(bool enable)

Enable/disable bonding.

Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data. The initial value of this flag depends on BT_BONDABLE Kconfig setting. For the vast majority of applications calling this function shouldn't be needed.

Parameters

- **enable** – Value allowing/disallowing to be bondable.

int **bt_conn_set_bondable**(struct bt_conn *conn, bool enable)

Set/clear the bonding flag for a given connection.

Set/clear the Bonding flag in the Authentication Requirements of SMP Pairing Request/Response data for a given connection.

The bonding flag for a given connection cannot be set/cleared if security procedures in the SMP module have already started. This function can be called only once per connection.

If the bonding flag is not set/cleared for a given connection, the value will depend on global configuration which is set using bt_set_bondable. The default value of the global configuration is defined using CONFIG_BT_BONDABLE Kconfig option.

Parameters

- **conn** – Connection object.
- **enable** – Value allowing/disallowing to be bondable.

void **bt_le_oob_set_sc_flag**(bool enable)

Allow/disallow remote LE SC OOB data to be used for pairing.

Set/clear the OOB data flag for LE SC SMP Pairing Request/Response data.

Parameters

- **enable** – Value allowing/disallowing remote LE SC OOB data.

void **bt_le_oob_set_legacy_flag**(bool enable)

Allow/disallow remote legacy OOB data to be used for pairing.

Set/clear the OOB data flag for legacy SMP Pairing Request/Response data.

Parameters

- **enable** – Value allowing/disallowing remote legacy OOB data.

int **bt_le_oob_set_legacy_tk**(struct bt_conn *conn, const uint8_t *tk)

Set OOB Temporary Key to be used for pairing.

This function allows to set OOB data for the LE legacy pairing procedure. The function should only be called in response to the oob_data_request() callback provided that the legacy method is user pairing.

Parameters

- **conn** – Connection object
- **tk** – Pointer to 16 byte long TK array

Returns

Zero on success or -EINVAL if NULL

int **bt_le_oob_set_sc_data**(struct bt_conn *conn, const struct *bt_le_oob_sc_data* *oobd_local, const struct *bt_le_oob_sc_data* *oobd_remote)

Set OOB data during LE Secure Connections (SC) pairing procedure.

This function allows to set OOB data during the LE SC pairing procedure. The function should only be called in response to the oob_data_request() callback provided that LE SC method is used for pairing.

The user should submit OOB data according to the information received in the callback. This may yield three different configurations: with only local OOB data present, with only remote OOB data present or with both local and remote OOB data present.

Parameters

- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not present
- `oobd_remote` – Remote OOB data or NULL if not present

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int `bt_le_oob_get_sc_data`(struct bt_conn *conn, const struct *bt_le_oob_sc_data* **oobd_local, const struct *bt_le_oob_sc_data* **oobd_remote)

Get OOB data used for LE Secure Connections (SC) pairing procedure.

This function allows to get OOB data during the LE SC pairing procedure that were set by the *bt_le_oob_set_sc_data()* API.

Note

The OOB data will only be available as long as the connection object associated with it is valid.

Parameters

- `conn` – Connection object
- `oobd_local` – Local OOB data or NULL if not set
- `oobd_remote` – Remote OOB data or NULL if not set

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int `bt_passkey_set`(unsigned int passkey)

Set a fixed passkey to be used for pairing.

This API is only available when the CONFIG_BT_FIXED_PASSKEY configuration option has been enabled.

Sets a fixed passkey to be used for pairing. If set, the pairing_confirm() callback will be called for all incoming pairings.

Parameters

- `passkey` – A valid passkey (0 - 999999) or BT_PASSKEY_INVALID to disable a previously set fixed passkey.

Returns

0 on success or a negative error code on failure.

int **bt_conn_auth_cb_register**(const struct *bt_conn_auth_cb* *cb)

Register authentication callbacks.

Register callbacks to handle authenticated pairing. Passing NULL unregisters a previous callbacks structure.

Parameters

- **cb** – Callback struct.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_cb_overlay**(struct bt_conn *conn, const struct *bt_conn_auth_cb* *cb)

Overlay authentication callbacks used for a given connection.

This function can be used only for Bluetooth LE connections. The CONFIG_BT_SMP must be enabled for this function.

The authentication callbacks for a given connection cannot be overlaid if security procedures in the SMP module have already started. This function can be called only once per connection.

Parameters

- **conn** – Connection object.
- **cb** – Callback struct.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_info_cb_register**(struct *bt_conn_auth_info_cb* *cb)

Register authentication information callbacks.

Register callbacks to get authenticated pairing information. Multiple registrations can be done.

Parameters

- **cb** – Callback struct.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_info_cb_unregister**(struct *bt_conn_auth_info_cb* *cb)

Unregister authentication information callbacks.

Unregister callbacks to stop getting authenticated pairing information.

Parameters

- **cb** – Callback struct.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_passkey_entry**(struct bt_conn *conn, unsigned int passkey)

Reply with entered passkey.

This function should be called only after passkey_entry callback from *bt_conn_auth_cb* structure was called.

Parameters

- **conn** – Connection object.
- **passkey** – Entered passkey.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_keypress_notify**(struct bt_conn *conn, enum *bt_conn_auth_keypress* type)

Send Passkey Keypress Notification during pairing.

This function may be called only after passkey_entry callback from *bt_conn_auth_cb* structure was called.

Requires `CONFIG_BT_PASSKEY_KEYPRESS`.

See also

bt_conn_auth_keypress.

Parameters

- **conn** – Destination for the notification.
- **type** – What keypress event type to send.

Return values

- **0** – Success
- **-EINVAL** – Improper use of the API.
- **-ENOMEM** – Failed to allocate.
- **-ENOBUFS** – Failed to allocate.

int **bt_conn_auth_cancel**(struct bt_conn *conn)

Cancel ongoing authenticated pairing.

This function allows to cancel ongoing authenticated pairing.

Parameters

- **conn** – Connection object.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_passkey_confirm**(struct bt_conn *conn)

Reply if passkey was confirmed to match by user.

This function should be called only after passkey_confirm callback from *bt_conn_auth_cb* structure was called.

Parameters

- **conn** – Connection object.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_pairing_confirm**(struct bt_conn *conn)

Reply if incoming pairing was confirmed by user.

This function should be called only after pairing_confirm callback from *bt_conn_auth_cb* structure was called if user confirmed incoming pairing.

Parameters

- **conn** – Connection object.

Returns
Zero on success or negative error code otherwise

int **bt_conn_auth_pincode_entry**(struct bt_conn *conn, const char *pin)

Reply with entered PIN code.

This function should be called only after PIN code callback from *bt_conn_auth_cb* structure was called. It's for legacy 2.0 devices.

Parameters

- **conn** – Connection object.
- **pin** – Entered PIN code.

Returns
Zero on success or negative error code otherwise

struct bt_conn *__bt_conn_create_br__(const *bt_addr_t* *peer, const struct *bt_br_conn_param* *param)

Initiate an BR/EDR connection to a remote device.

Allows initiate new BR/EDR link to remote peer using its address.

The caller gets a new reference to the connection object which must be released with *bt_conn_unref()* once done using the object.

Parameters

- **peer** – Remote address.
- **param** – Initial connection parameters.

Returns
Valid connection object on success or NULL otherwise.

struct **bt_le_conn_param**

#include <*conn.h*> Connection parameters for LE connections.

struct **bt_conn_le_phy_info**

#include <*conn.h*> Connection PHY information for LE connections.

Public Members

uint8_t **rx_phy**

Connection transmit PHY.

struct **bt_conn_le_phy_param**

#include <*conn.h*> Preferred PHY parameters for LE connections.

Public Members

uint16_t **options**

Connection PHY options.

uint8_t **pref_tx_phy**

Bitmask of preferred transmit PHYs.

uint8_t **pref_rx_phy**

Bitmask of preferred receive PHYs.

struct **bt_conn_le_data_len_info**

#include <*conn.h*> Connection data length information for LE connections.

Public Members

uint16_t **tx_max_len**

Maximum Link Layer transmission payload size in bytes.

uint16_t **tx_max_time**

Maximum Link Layer transmission payload time in us.

uint16_t **rx_max_len**

Maximum Link Layer reception payload size in bytes.

uint16_t **rx_max_time**

Maximum Link Layer reception payload time in us.

struct **bt_conn_le_data_len_param**

#include <*conn.h*> Connection data length parameters for LE connections.

Public Members

uint16_t **tx_max_len**

Maximum Link Layer transmission payload size in bytes.

uint16_t **tx_max_time**

Maximum Link Layer transmission payload time in us.

struct **bt_conn_le_info**

#include <*conn.h*> LE Connection Info Structure.

Public Members

const *bt_addr_le_t* ***src**

Source (Local) Identity Address.

const *bt_addr_le_t* ***dst**

Destination (Remote) Identity Address or remote Resolvable Private Address (RPA) before identity has been resolved.

const *bt_addr_le_t* ***local**

Local device address used during connection setup.

const *bt_addr_le_t* ***remote**
Remote device address used during connection setup.

uint16_t **interval**
Connection interval.

uint16_t **latency**
Connection peripheral latency.

uint16_t **timeout**
Connection supervision timeout.

struct **bt_conn_br_info**
#include <*conn.h*> BR/EDR Connection Info Structure.

Public Members

const *bt_addr_t* ***dst**
Destination (Remote) BR/EDR address.

struct **bt_security_info**
#include <*conn.h*> Security Info Structure.

Public Members

bt_security_t **level**
Security Level.

uint8_t **enc_key_size**
Encryption Key Size.

enum *bt_security_flag* **flags**
Flags.

struct **bt_conn_info**
#include <*conn.h*> Connection Info Structure.

Public Members

enum *bt_conn_type* **type**
Connection Type.

uint8_t **role**
Connection Role.

uint8_t **id**
: Which local identity the connection was created with.

struct *bt_conn_le_info* **le**
: LE Connection specific Info.

struct *bt_conn_br_info* **br**
: BR/EDR Connection specific Info.

union bt_conn_info
: Connection Type specific Info.

enum *bt_conn_state* **state**
: Connection state.

struct *bt_security_info* **security**
: Security specific info.

struct **bt_conn_le_remote_info**
#include <*conn.h*> LE Connection Remote Info Structure.

Public Members

const uint8_t ***features**
: Remote LE feature set (bitmask).

struct **bt_conn_br_remote_info**
#include <*conn.h*> BR/EDR Connection Remote Info structure.

Public Members

const uint8_t ***features**
: Remote feature set (pages of bitmasks).

uint8_t **num_pages**
: Number of pages in the remote feature set.

struct **bt_conn_remote_info**
#include <*conn.h*> Connection Remote Info Structure.

> **Note**
>
> The version, manufacturer and subversion fields will only contain valid data if `CONFIG_BT_REMOTE_VERSION` is enabled.

Public Members

uint8_t **type**
Connection Type.

uint8_t **version**
Remote Link Layer version.

uint16_t **manufacturer**
Remote manufacturer identifier.

uint16_t **subversion**
Per-manufacturer unique revision.

struct *bt_conn_le_remote_info* **le**
LE connection remote info.

struct *bt_conn_br_remote_info* **br**
BR/EDR connection remote info.

struct **bt_conn_le_tx_power**
#include <*conn.h*> LE Transmit Power Level Structure.

Public Members

uint8_t **phy**
Input: 1M, 2M, Coded S2 or Coded S8.

int8_t **current_level**
Output: current transmit power level.

int8_t **max_level**
Output: maximum transmit power level.

struct **bt_conn_le_tx_power_report**
#include <*conn.h*> LE Transmit Power Reporting Structure.

Public Members

uint8_t **reason**
Reason for Transmit power reporting, as documented in Core Spec.
Version 5.4 Vol. 4, Part E, 7.7.65.33.

enum *bt_conn_le_tx_power_phy* **phy**
Phy of Transmit power reporting.

int8_t **tx_power_level**

Transmit power level.

- 0xXX - Transmit power level
  - Range: -127 to 20
  - Units: dBm
- 0x7E - Remote device is not managing power levels on this PHY.
- 0x7F - Transmit power level is not available

uint8_t **tx_power_level_flag**

Bit 0: Transmit power level is at minimum level.

Bit 1: Transmit power level is at maximum level.

int8_t **delta**

Change in transmit power level.

- 0xXX - Change in transmit power level (positive indicates increased power, negative indicates decreased power, zero indicates unchanged) Units: dB
- 0x7F - Change is not available or is out of range.

struct **bt_conn_le_path_loss_threshold_report**

#include <*conn.h*> LE Path Loss Monitoring Threshold Change Report Structure.

Public Members

enum *bt_conn_le_path_loss_zone* **zone**

Path Loss zone as documented in Core Spec.

Version 5.4 Vol.4, Part E, 7.7.65.32.

uint8_t **path_loss**

Current path loss (dB).

struct **bt_conn_le_path_loss_reporting_param**

#include <*conn.h*> LE Path Loss Monitoring Parameters Structure as defined in Core Spec.

Version 5.4 Vol.4, Part E, 7.8.119 LE Set Path Loss Reporting Parameters command.

Public Members

uint8_t **high_threshold**

High threshold for the path loss (dB).

uint8_t **high_hysteresis**

Hysteresis value for the high threshold (dB).

uint8_t **low_threshold**

Low threshold for the path loss (dB).

uint8_t **low_hysteresis**

Hysteresis value for the low threshold (dB).

uint16_t **min_time_spent**

Minimum time in number of connection events to be observed once the path loss crosses the threshold before an event is generated.

struct **bt_conn_le_create_param**

#include <conn.h>

Public Members

uint32_t **options**

Bit-field of create connection options.

uint16_t **interval**

Scan interval (N * 0.625 ms)

uint16_t **window**

Scan window (N * 0.625 ms)

uint16_t **interval_coded**

Scan interval LE Coded PHY (N * 0.625 MS)

Set zero to use same as LE 1M PHY scan interval

uint16_t **window_coded**

Scan window LE Coded PHY (N * 0.625 MS)

Set zero to use same as LE 1M PHY scan window.

uint16_t **timeout**

Connection initiation timeout (N * 10 MS)

Set zero to use the default `CONFIG_BT_CREATE_CONN_TIMEOUT` timeout.

> **Note**
>
> Unused in *bt_conn_le_create_auto*

struct **bt_conn_le_create_synced_param**

#include <conn.h>

Public Members

const *bt_addr_le_t* ***peer**

Remote address.

The peer must be synchronized to the PAwR train.

uint8_t **subevent**

The subevent where the connection will be initiated.

struct **bt_conn_cb**

#include <conn.h> Connection callback structure.

This structure is used for tracking the state of a connection. It is registered with the help of the *bt_conn_cb_register()* API. It's permissible to register multiple instances of this *bt_conn_cb* type, in case different modules of an application are interested in tracking the connection state. If a callback is not of interest for an instance, it may be set to NULL and will as a consequence not be used for that instance.

Public Members

void (***connected**)(struct bt_conn *conn, uint8_t err)

A new connection has been established.

This callback notifies the application of a new connection. In case the err parameter is non-zero it means that the connection establishment failed.

`err` can mean either of the following:

- BT_HCI_ERR_UNKNOWN_CONN_ID Creating the connection started by *bt_conn_le_create* was canceled either by the user through *bt_conn_disconnect* or by the timeout in the host through *bt_conn_le_create_param* timeout parameter, which defaults to `CONFIG_BT_CREATE_CONN_TIMEOUT` seconds.
- `BT_HCI_ERR_ADV_TIMEOUT` High duty cycle directed connectable advertiser started by *bt_le_adv_start* failed to be connected within the timeout.

Note

If the connection was established from an advertising set then the advertising set cannot be restarted directly from this callback. Instead use the connected callback of the advertising set.

Param conn
New connection object.
Param err
HCI error. Zero for success, non-zero otherwise.

void (***disconnected**)(struct bt_conn *conn, uint8_t reason)

A connection has been disconnected.

This callback notifies the application that a connection has been disconnected.

When this callback is called the stack still has one reference to the connection object. If the application in this callback tries to start either a connectable advertiser or create a new connection this might fail because there are no free connection objects available. To avoid this issue it is recommended to either start connectable advertise or create a new connection using *k_work_submit* or increase `CONFIG_BT_MAX_CONN` .

Param conn
Connection object.
Param reason
BT_HCI_ERR_* reason for the disconnection.

void (*`recycled`)(void)

A connection object has been returned to the pool.

This callback notifies the application that it might be able to allocate a connection object. No guarantee, first come, first serve.

Use this to e.g. re-start connectable advertising or scanning.

Treat this callback as an ISR, as it originates from *bt_conn_unref* which is used by the BT stack. Making Bluetooth API calls in this context is error-prone and strongly discouraged.

bool (*`le_param_req`)(struct bt_conn *conn, struct *bt_le_conn_param* *param)

LE connection parameter update request.

This callback notifies the application that a remote device is requesting to update the connection parameters. The application accepts the parameters by returning true, or rejects them by returning false. Before accepting, the application may also adjust the parameters to better suit its needs.

It is recommended for an application to have just one of these callbacks for simplicity. However, if an application registers multiple it needs to manage the potentially different requirements for each callback. Each callback gets the parameters as returned by previous callbacks, i.e. they are not necessarily the same ones as the remote originally sent.

If the application does not have this callback then the default is to accept the parameters.
Param conn
Connection object.
Param param
Proposed connection parameters.
Return
true to accept the parameters, or false to reject them.

void (*`le_param_updated`)(struct bt_conn *conn, uint16_t interval, uint16_t latency, uint16_t timeout)

The parameters for an LE connection have been updated.

This callback notifies the application that the connection parameters for an LE connection have been updated.
Param conn
Connection object.
Param interval
Connection interval.
Param latency
Connection latency.
Param timeout
Connection supervision timeout.

void (*`identity_resolved`)(struct bt_conn *conn, const *bt_addr_le_t* *rpa, const *bt_addr_le_t* *identity)

Remote Identity Address has been resolved.

This callback notifies the application that a remote Identity Address has been resolved

Param conn
Connection object.

Param rpa
Resolvable Private Address.

Param identity
Identity Address.

void (*`security_changed`)(struct bt_conn *conn, *bt_security_t* level, enum *bt_security_err* err)

The security level of a connection has changed.

This callback notifies the application that the security of a connection has changed.

The security level of the connection can either have been increased or remain unchanged. An increased security level means that the pairing procedure has been performed or the bond information from a previous connection has been applied. If the security level remains unchanged this means that the encryption key has been refreshed for the connection.

Param conn
Connection object.

Param level
New security level of the connection.

Param err
Security error. Zero for success, non-zero otherwise.

void (*`remote_info_available`)(struct bt_conn *conn, struct *bt_conn_remote_info* *remote_info)

Remote information procedures has completed.

This callback notifies the application that the remote information has been retrieved from the remote peer.

Param conn
Connection object.

Param remote_info
Connection information of remote device.

void (*`le_phy_updated`)(struct bt_conn *conn, struct *bt_conn_le_phy_info* *param)

The PHY of the connection has changed.

This callback notifies the application that the PHY of the connection has changed.

Param conn
Connection object.

Param info
Connection LE PHY information.

void (*`le_data_len_updated`)(struct bt_conn *conn, struct *bt_conn_le_data_len_info* *info)

The data length parameters of the connection has changed.

This callback notifies the application that the maximum Link Layer payload length or transmission time has changed.

Param conn
Connection object.

Param info
Connection data length information.

struct **bt_conn_oob_info**

#include <conn.h> Info Structure for OOB pairing.

Public Types

Type of OOB pairing method.

Values:

enumerator **BT_CONN_OOB_LE_LEGACY**

LE legacy pairing.

enumerator **BT_CONN_OOB_LE_SC**

LE SC pairing.

Public Members

enum *bt_conn_oob_info* **type**

Type of OOB pairing method.

enum *bt_conn_oob_info* **oob_config**

OOB data configuration.

struct *bt_conn_oob_info* **lesc**

LE Secure Connections OOB pairing parameters.

struct **bt_conn_pairing_feat**

#include <conn.h> Pairing request and pairing response info structure.

This structure is the same for both smp_pairing_req and smp_pairing_rsp and a subset of the packet data, except for the initial Code octet. It is documented in Core Spec. Vol. 3, Part H, 3.5.1 and 3.5.2.

Public Members

uint8_t **io_capability**

IO Capability, Core Spec.

Vol 3, Part H, 3.5.1, Table 3.4

uint8_t **oob_data_flag**

OOB data flag, Core Spec.

Vol 3, Part H, 3.5.1, Table 3.5

uint8_t **auth_req**

AuthReq, Core Spec.

Vol 3, Part H, 3.5.1, Fig. 3.3

uint8_t **max_enc_key_size**

Maximum Encryption Key Size, Core Spec.

Vol 3, Part H, 3.5.1

uint8_t **init_key_dist**

Initiator Key Distribution/Generation, Core Spec.

Vol 3, Part H, 3.6.1, Fig. 3.11

uint8_t **resp_key_dist**

Responder Key Distribution/Generation, Core Spec.

Vol 3, Part H 3.6.1, Fig. 3.11

struct **bt_conn_auth_cb**

#include <conn.h> Authenticated pairing callback structure.

Public Members

enum *bt_security_err* (***pairing_accept**)(struct bt_conn *conn, const struct *bt_conn_pairing_feat* *const feat)

Query to proceed incoming pairing or not.

On any incoming pairing req/rsp this callback will be called for the application to decide whether to allow for the pairing to continue.

The pairing info received from the peer is passed to assist making the decision.

As this callback is synchronous the application should return a response value immediately. Otherwise it may affect the timing during pairing. Hence, this information should not be conveyed to the user to take action.

The remaining callbacks are not affected by this, but do notice that other callbacks can be called during the pairing. Eg. if pairing_confirm is registered both will be called for Just-Works pairings.

This callback may be unregistered in which case pairing continues as if the Kconfig flag was not set.

This callback is not called for BR/EDR Secure Simple Pairing (SSP).

Param conn
Connection where pairing is initiated.

Param feat
Pairing req/resp info.

void (***passkey_display**)(struct bt_conn *conn, unsigned int passkey)

Display a passkey to the user.

When called the application is expected to display the given passkey to the user, with the expectation that the passkey will then be entered on the peer device. The passkey will be in the range of 0 - 999999, and is expected to be padded with zeroes so that six digits are always shown. E.g. the value 37 should be shown as 000037.

This callback may be set to NULL, which means that the local device lacks the ability do display a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop displaying the passkey.

Param conn
Connection where pairing is currently active.
Param passkey
Passkey to show to the user.

void (*`passkey_entry`)(struct bt_conn *conn)

Request the user to enter a passkey.

When called the user is expected to enter a passkey. The passkey must be in the range of 0 - 999999, and should be expected to be zero-padded, as that's how the peer device will typically be showing it (e.g. 37 would be shown as 000037).

Once the user has entered the passkey its value should be given to the stack using the *bt_conn_auth_passkey_entry()* API.

This callback may be set to NULL, which means that the local device lacks the ability to enter a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to enter a passkey.
Param conn
Connection where pairing is currently active.

void (*`passkey_confirm`)(struct bt_conn *conn, unsigned int passkey)

Request the user to confirm a passkey.

When called the user is expected to confirm that the given passkey is also shown on the peer device.. The passkey will be in the range of 0 - 999999, and should be zero-padded to always be six digits (e.g. 37 would be shown as 000037).

Once the user has confirmed the passkey to match, the *bt_conn_auth_passkey_confirm()* API should be called. If the user concluded that the passkey doesn't match the *bt_conn_auth_cancel()* API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a passkey. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a passkey.
Param conn
Connection where pairing is currently active.
Param passkey
Passkey to be confirmed.

void (*`oob_data_request`)(struct bt_conn *conn, struct *bt_conn_oob_info* *info)

Request the user to provide Out of Band (OOB) data.

When called the user is expected to provide OOB data. The required data are indicated by the information structure.

For LE Secure Connections OOB pairing, the user should provide local OOB data, remote OOB data or both depending on their availability. Their value should be given to the stack using the *bt_le_oob_set_sc_data()* API.

This callback must be set to non-NULL in order to support OOB pairing.
Param conn
Connection where pairing is currently active.
Param info
OOB pairing information.

void (*`cancel`)(struct bt_conn *conn)

Cancel the ongoing user request.

This callback will be called to notify the application that it should cancel any previous user request (passkey display, entry or confirmation).

This may be set to NULL, but must always be provided whenever the passkey_display, passkey_entry passkey_confirm or pairing_confirm callback has been provided.

Param conn
Connection where pairing is currently active.

void (*`pairing_confirm`)(struct bt_conn *conn)

Request confirmation for an incoming pairing.

This callback will be called to confirm an incoming pairing request where none of the other user callbacks is applicable.

If the user decides to accept the pairing the *bt_conn_auth_pairing_confirm()* API should be called. If the user decides to reject the pairing the *bt_conn_auth_cancel()* API should be called.

This callback may be set to NULL, which means that the local device lacks the ability to confirm a pairing request. If set to non-NULL the cancel callback must also be provided, since this is the only way the application can find out that it should stop requesting the user to confirm a pairing request.

Param conn
Connection where pairing is currently active.

void (*`pincode_entry`)(struct bt_conn *conn, bool highsec)

Request the user to enter a passkey.

This callback will be called for a BR/EDR (Bluetooth Classic) connection where pairing is being performed. Once called the user is expected to enter a PIN code with a length between 1 and 16 digits. If the *highsec* parameter is set to true the PIN code must be 16 digits long.

Once entered, the PIN code should be given to the stack using the *bt_conn_auth_pincode_entry()* API.

This callback may be set to NULL, however in that case pairing over BR/EDR will not be possible. If provided, the cancel callback must be provided as well.

Param conn
Connection where pairing is currently active.

Param highsec
true if 16 digit PIN is required.

struct `bt_conn_auth_info_cb`

#include <conn.h> Authenticated pairing information callback structure.

Public Members

void (*`pairing_complete`)(struct bt_conn *conn, bool bonded)

notify that pairing procedure was complete.

This callback notifies the application that the pairing procedure has been completed.

Param conn
Connection object.

Param bonded
Bond information has been distributed during the pairing procedure.

void (*pairing_failed)(struct bt_conn *conn, enum *bt_security_err* reason)

notify that pairing process has failed.

Param conn
Connection object.

Param reason
Pairing failed reason

void (*bond_deleted)(uint8_t id, const *bt_addr_le_t* *peer)

Notify that bond has been deleted.

This callback notifies the application that the bond information for the remote peer has been deleted

Param id
Which local identity had the bond.

Param peer
Remote address.

sys_snode_t node

Internally used field for list handling.

struct bt_br_conn_param

#include <conn.h> Connection parameters for BR/EDR connections.

Data Buffers

API Reference

group bt_buf

Data buffers.

Defines

BT_BUF_RESERVE

BT_BUF_SIZE(size)

Helper to include reserved HCI data in buffer calculations.

BT_BUF_ACL_SIZE(size)

Helper to calculate needed buffer size for HCI ACL packets.

BT_BUF_EVT_SIZE(size)

Helper to calculate needed buffer size for HCI Event packets.

BT_BUF_CMD_SIZE(size)

Helper to calculate needed buffer size for HCI Command packets.

BT_BUF_ISO_SIZE(size)

Helper to calculate needed buffer size for HCI ISO packets.

BT_BUF_ACL_RX_SIZE

Data size needed for HCI ACL RX buffers.

BT_BUF_EVT_RX_SIZE
: Data size needed for HCI Event RX buffers.

BT_BUF_ISO_RX_SIZE

BT_BUF_ISO_RX_COUNT

BT_BUF_RX_SIZE
: Data size needed for HCI ACL, HCI ISO or Event RX buffers.

BT_BUF_RX_COUNT
: Buffer count needed for HCI ACL, HCI ISO or Event RX buffers.

BT_BUF_CMD_TX_SIZE
: Data size needed for HCI Command buffers.

Enums

enum bt_buf_type
: Possible types of buffers passed around the Bluetooth stack.

Values:

enumerator BT_BUF_CMD
: HCI command.

enumerator BT_BUF_EVT
: HCI event.

enumerator BT_BUF_ACL_OUT
: Outgoing ACL data.

enumerator BT_BUF_ACL_IN
: Incoming ACL data.

enumerator BT_BUF_ISO_OUT
: Outgoing ISO data.

enumerator BT_BUF_ISO_IN
: Incoming ISO data.

enumerator BT_BUF_H4
: H:4 data.

Functions

struct *net_buf* ***bt_buf_get_rx**(enum *bt_buf_type* type, *k_timeout_t* timeout)

Allocate a buffer for incoming data.

This will set the buffer type so *bt_buf_set_type()* does not need to be explicitly called.

Parameters

- **type** – Type of buffer. Only BT_BUF_EVT, BT_BUF_ACL_IN and BT_BUF_ISO_IN are allowed.
- **timeout** – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

struct *net_buf* ***bt_buf_get_tx**(enum *bt_buf_type* type, *k_timeout_t* timeout, const void *data, size_t size)

Allocate a buffer for outgoing data.

This will set the buffer type so *bt_buf_set_type()* does not need to be explicitly called.

Parameters

- **type** – Type of buffer. Only BT_BUF_CMD, BT_BUF_ACL_OUT or BT_BUF_H4, when operating on H:4 mode, are allowed.
- **timeout** – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.
- **data** – Initial data to append to buffer.
- **size** – Initial data size.

Returns
A new buffer.

struct *net_buf* ***bt_buf_get_evt**(uint8_t evt, bool discardable, *k_timeout_t* timeout)

Allocate a buffer for an HCI Event.

This will set the buffer type so *bt_buf_set_type()* does not need to be explicitly called.

Parameters

- **evt** – HCI event code
- **discardable** – Whether the driver considers the event discardable.
- **timeout** – Non-negative waiting period to obtain a buffer or one of the special values K_NO_WAIT and K_FOREVER.

Returns
A new buffer.

static inline void **bt_buf_set_type**(struct *net_buf* *buf, enum *bt_buf_type* type)

Set the buffer type.

Parameters

- **buf** – Bluetooth buffer
- **type** – The BT_* type to set the buffer to

static inline enum *bt_buf_type* **bt_buf_get_type**(struct *net_buf* *buf)

Get the buffer type.

Parameters

- **buf** – Bluetooth buffer

Returns
The BT_* type to of the buffer

struct **bt_buf_data**
#include <*buf.h*> This is a base type for bt_buf user data.

HCI Drivers

API Reference

group **bt_hci_driver**
HCI drivers.

Deprecated:
This is the old HCI driver API. Drivers should use Bluetooth HCI APIs instead.

Enums

Values:

enumerator **BT_QUIRK_NO_RESET** = *BIT*(0)

enumerator **BT_QUIRK_NO_AUTO_DLE** = *BIT*(1)

enum **bt_hci_driver_bus**
Possible values for the 'bus' member of the *bt_hci_driver* struct.

Values:

enumerator **BT_HCI_DRIVER_BUS_VIRTUAL** = 0

enumerator **BT_HCI_DRIVER_BUS_USB** = 1

enumerator **BT_HCI_DRIVER_BUS_PCCARD** = 2

enumerator **BT_HCI_DRIVER_BUS_UART** = 3

enumerator **BT_HCI_DRIVER_BUS_RS232** = 4

enumerator **BT_HCI_DRIVER_BUS_PCI** = 5

enumerator **BT_HCI_DRIVER_BUS_SDIO** = 6

enumerator **BT_HCI_DRIVER_BUS_SPI** = 7

enumerator **BT_HCI_DRIVER_BUS_I2C** = 8

enumerator BT_HCI_DRIVER_BUS_IPM = 9

Functions

int bt_recv(struct *net_buf* *buf)

Receive data from the controller/HCI driver.

This is the main function through which the HCI driver provides the host with data from the controller. The buffer needs to have its type set with the help of *bt_buf_set_type()* before calling this API.

Deprecated:

Use the new HCI driver interface instead: Bluetooth HCI APIs

Parameters

- buf – Network buffer containing data from the controller.

Returns

0 on success or negative error number on failure.

int bt_hci_driver_register(const struct *bt_hci_driver* *drv)

Register a new HCI driver to the Bluetooth stack.

This needs to be called before any application code runs. The *bt_enable()* API will fail if there is no driver registered.

Deprecated:

Use the new HCI driver interface instead: Bluetooth HCI APIs

Parameters

- drv – A *bt_hci_driver* struct representing the driver.

Returns

0 on success or negative error number on failure.

int bt_hci_transport_setup(const struct *device* *dev)

Setup the HCI transport, which usually means to reset the Bluetooth IC.

Note

A weak version of this function is included in the H4 driver, so defining it is optional per board.

Parameters

- dev – The device structure for the bus connecting to the IC

Returns

0 on success, negative error value on failure

int **bt_hci_transport_teardown**(const struct *device* *dev)

Teardown the HCI transport.

> **Note**
>
> A weak version of this function is included in the IPC driver, so defining it is optional. NRF5340 includes support to put network core in reset state.

Parameters

- **dev** – The device structure for the bus connecting to the IC

Returns

0 on success, negative error value on failure

struct *net_buf* ***bt_hci_evt_create**(uint8_t evt, uint8_t len)

Allocate an HCI event buffer.

This function allocates a new buffer for an HCI event. It is given the event code and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters

- **evt** – Event OpCode.
- **len** – Length of event parameters.

Returns

Newly allocated buffer.

struct *net_buf* ***bt_hci_cmd_complete_create**(uint16_t op, uint8_t plen)

Allocate an HCI Command Complete event buffer.

This function allocates a new buffer for HCI Command Complete event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the total length of the parameters. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters

- **op** – Command OpCode.
- **plen** – Length of command parameters.

Returns

Newly allocated buffer.

struct *net_buf* ***bt_hci_cmd_status_create**(uint16_t op, uint8_t status)

Allocate an HCI Command Status event buffer.

This function allocates a new buffer for HCI Command Status event. It is given the OpCode (encoded e.g. using the BT_OP macro) and the status code. Upon successful return the buffer is ready to have the parameters encoded into it.

Parameters

- **op** – Command OpCode.
- **status** – Status code.

Returns

Newly allocated buffer.

struct **bt_hci_setup_params**

#include <bluetooth.h>

Public Members

bt_addr_t **public_addr**

The public identity address to give to the controller.

This field is used when the driver selects CONFIG_BT_HCI_SET_PUBLIC_ADDR to indicate that it supports setting the controller's public address.

struct **bt_hci_driver**

#include <hci_driver.h> Abstraction which represents the HCI transport to the controller.

This struct is used to represent the HCI transport to the Bluetooth controller.

Public Members

const char ***name**

Name of the driver.

enum *bt_hci_driver_bus* **bus**

Bus of the transport (BT_HCI_DRIVER_BUS_*)

uint32_t **quirks**

Specific controller quirks.

These are set by the HCI driver and acted upon by the host. They can either be statically set at buildtime, or set at runtime before the HCI driver's *open()* callback returns.

int (***open**)(void)

Open the HCI transport.

Opens the HCI transport for operation. This function must not return until the transport is ready for operation, meaning it is safe to start calling the *send()* handler.

Return

0 on success or negative error number on failure.

int (***close**)(void)

Close the HCI transport.

Closes the HCI transport. This function must not return until the transport is closed.

Return

0 on success or negative error number on failure.

int (***send**)(struct *net_buf* *buf)

Send HCI buffer to controller.

Send an HCI command or ACL data to the controller. The exact type of the data can be checked with the help of *bt_buf_get_type()*.

Note

This function must only be called from a cooperative thread.

Param buf
Buffer containing data to be sent to the controller.
Return
0 on success or negative error number on failure.

int (***setup**)(const struct *bt_hci_setup_params* *params)

HCI vendor-specific setup.

Executes vendor-specific commands sequence to initialize BT Controller before BT Host executes Reset sequence.

Note

`CONFIG_BT_HCI_SETUP` must be selected for this field to be available.

Return
0 on success or negative error number on failure.

HCI RAW channel

Overview HCI RAW channel API is intended to expose HCI interface to the remote entity. The local Bluetooth controller gets owned by the remote entity and host Bluetooth stack is not used. RAW API provides direct access to packets which are sent and received by the Bluetooth HCI driver.

API Reference

group `hci_raw`

HCI RAW channel.

Defines

`BT_HCI_ERR_EXT_HANDLED`

`BT_HCI_RAW_CMD_EXT`(_op, _min_len, _func)

Helper macro to define a command extension.

Parameters

- **`_op`** – Opcode of the command.
- **`_min_len`** – Minimal length of the command.
- **`_func`** – Handler function to be called.

Enums

Values:

enumerator **BT_HCI_RAW_MODE_PASSTHROUGH** = 0x00

Passthrough mode.

```
While in this mode the buffers are passed as is between the stack
and the driver.
```

enumerator **BT_HCI_RAW_MODE_H4** = 0x01

H:4 mode.

```
While in this mode H:4 headers will added into the buffers
according to the buffer type when coming from the stack and will be
removed and used to set the buffer type.
```

Functions

int **bt_send**(struct *net_buf* *buf)

Send packet to the Bluetooth controller.

Send packet to the Bluetooth controller. Caller needs to implement netbuf pool.

Parameters

- **buf** – netbuf packet to be send

Returns

Zero on success or (negative) error code otherwise.

int **bt_hci_raw_set_mode**(uint8_t mode)

Set Bluetooth RAW channel mode.

Set access mode of Bluetooth RAW channel.

Parameters

- **mode** – Access mode.

Returns

Zero on success or (negative) error code otherwise.

uint8_t **bt_hci_raw_get_mode**(void)

Get Bluetooth RAW channel mode.

Get access mode of Bluetooth RAW channel.

Returns

Access mode.

void **bt_hci_raw_cmd_ext_register**(struct *bt_hci_raw_cmd_ext* *cmds, size_t size)

Register Bluetooth RAW command extension table.

Register Bluetooth RAW channel command extension table, opcodes in this table are intercepted to sent to the handler function.

Parameters

- **cmds** – Pointer to the command extension table.
- **size** – Size of the command extension table.

int **bt_enable_raw**(struct k_fifo *rx_queue)

Enable Bluetooth RAW channel:

Enable Bluetooth RAW HCI channel.

Parameters

- **rx_queue** – netbuf queue where HCI packets received from the Bluetooth controller are to be queued. The queue is defined in the caller while the available buffers pools are handled in the stack.

Returns

Zero on success or (negative) error code otherwise.

struct **bt_hci_raw_cmd_ext**

#include <hci_raw.h>

Public Members

uint16_t **op**

Opcode of the command.

size_t **min_len**

Minimal length of the command.

uint8_t (***func**)(struct *net_buf* *buf)

Handler function.

Handler function to be called when a command is intercepted.

Param buf

Buffer containing the command.

Return

HCI Status code or BT_HCI_ERR_EXT_HANDLED if command has been handled already and a response has been sent as oppose to BT_HCI_ERR_SUCCESS which just indicates that the command can be sent to the controller to be processed.

Cryptography

API Reference

group **bt_crypto**

Cryptography.

Functions

int **bt_rand**(void *buf, size_t len)

Generate random data.

A random number generation helper which utilizes the Bluetooth controller's own RNG.

Parameters

- **buf** – Buffer to insert the random data

- **len** – Length of random data to generate

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

int **bt_encrypt_le**(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])

AES encrypt little-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

Parameters

- **key** – 128 bit LS byte first key for the encryption of the plaintext
- **plaintext** – 128 bit LS byte first plaintext data block to be encrypted
- **enc_data** – 128 bit LS byte first encrypted data block

Returns
Zero on success or error code otherwise.

int **bt_encrypt_be**(const uint8_t key[16], const uint8_t plaintext[16], uint8_t enc_data[16])

AES encrypt big-endian data.

An AES encrypt helper is used to request the Bluetooth controller's own hardware to encrypt the plaintext using the key and returns the encrypted data.

Parameters

- **key** – 128 bit MS byte first key for the encryption of the plaintext
- **plaintext** – 128 bit MS byte first plaintext data block to be encrypted
- **enc_data** – 128 bit MS byte first encrypted data block

Returns
Zero on success or error code otherwise.

int **bt_ccm_decrypt**(const uint8_t key[16], uint8_t nonce[13], const uint8_t *enc_data, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *plaintext, size_t mic_size)

Decrypt big-endian data with AES-CCM.

Decrypts and authorizes enc_data with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.

Assumes that the MIC follows directly after the encrypted data.

Parameters

- **key** – 128 bit MS byte first key
- **nonce** – 13 byte MS byte first nonce
- **enc_data** – Encrypted data
- **len** – Length of the encrypted data
- **aad** – Additional authenticated data
- **aad_len** – Additional authenticated data length
- **plaintext** – Plaintext buffer to place result in
- **mic_size** – Size of the trailing MIC (in bytes)

Return values

- **0** – Successfully decrypted the data.

- `-EINVAL` – Invalid parameters.
- `-EBADMSG` – Authentication failed.

int **bt_ccm_encrypt**(const uint8_t key[16], uint8_t nonce[13], const uint8_t *plaintext, size_t len, const uint8_t *aad, size_t aad_len, uint8_t *enc_data, size_t mic_size)

Encrypt big-endian data with AES-CCM.

Encrypts and generates a MIC from `plaintext` with AES-CCM, as described in https://tools.ietf.org/html/rfc3610.

Places the MIC directly after the encrypted data.

Parameters

- `key` – 128 bit MS byte first key
- `nonce` – 13 byte MS byte first nonce
- `plaintext` – Plaintext buffer to encrypt
- `len` – Length of the encrypted data
- `aad` – Additional authenticated data
- `aad_len` – Additional authenticated data length
- `enc_data` – Buffer to place encrypted data in
- `mic_size` – Size of the trailing MIC (in bytes)

Return values

- `0` – Successfully encrypted the data.
- `-EINVAL` – Invalid parameters.

Other

Bluetooth Controller

API Reference

group `bt_ctrl`

Bluetooth Controller.

Functions

void **bt_ctlr_set_public_addr**(const uint8_t *addr)

Set public address for controller.

Should be called before *bt_enable()*.

Parameters

- `addr` – Public address

Universal Unique Identifiers (UUIDs)

API Reference

group `bt_uuid`

UUIDs.

Defines

`BT_UUID_SIZE_16`

Size in octets of a 16-bit UUID.

`BT_UUID_SIZE_32`

Size in octets of a 32-bit UUID.

`BT_UUID_SIZE_128`

Size in octets of a 128-bit UUID.

`BT_UUID_INIT_16`(value)

Initialize a 16-bit UUID.

Parameters

- `value` – 16-bit UUID value in host endianness.

`BT_UUID_INIT_32`(value)

Initialize a 32-bit UUID.

Parameters

- `value` – 32-bit UUID value in host endianness.

`BT_UUID_INIT_128`(value...)

Initialize a 128-bit UUID.

Parameters

- `value` – 128-bit UUID array values in little-endian format. Can be combined with *BT_UUID_128_ENCODE* to initialize a UUID from the readable form of UUIDs.

`BT_UUID_DECLARE_16`(value)

Helper to declare a 16-bit UUID inline.

Parameters

- `value` – 16-bit UUID value in host endianness.

Returns

Pointer to a generic UUID.

`BT_UUID_DECLARE_32`(value)

Helper to declare a 32-bit UUID inline.

Parameters

- `value` – 32-bit UUID value in host endianness.

Returns

Pointer to a generic UUID.

BT_UUID_DECLARE_128(value...)

Helper to declare a 128-bit UUID inline.

Parameters

- value – 128-bit UUID array values in little-endian format. Can be combined with *BT_UUID_128_ENCODE* to declare a UUID from the readable form of UUIDs.

Returns

Pointer to a generic UUID.

BT_UUID_16(__u)

Helper macro to access the 16-bit UUID from a generic UUID.

BT_UUID_32(__u)

Helper macro to access the 32-bit UUID from a generic UUID.

BT_UUID_128(__u)

Helper macro to access the 128-bit UUID from a generic UUID.

BT_UUID_128_ENCODE(w32, w1, w2, w3, w48)

Encode 128 bit UUID into array values in little-endian format.

Helper macro to initialize a 128-bit UUID array value from the readable form of UUIDs, or encode 128-bit UUID values into advertising data Can be combined with BT_UUID_DECLARE_128 to declare a 128-bit UUID.

Example of how to declare the UUID `6E400001-B5A3-F393-E0A9-E50E24DCCA9E`

```
BT_UUID_DECLARE_128(
     BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Example of how to encode the UUID `6E400001-B5A3-F393-E0A9-E50E24DCCA9E` into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID128_ALL,
     BT_UUID_128_ENCODE(0x6E400001, 0xB5A3, 0xF393, 0xE0A9, 0xE50E24DCCA9E))
```

Just replace the hyphen by the comma and add `0x` prefixes.

Parameters

- w32 – First part of the UUID (32 bits)
- w1 – Second part of the UUID (16 bits)
- w2 – Third part of the UUID (16 bits)
- w3 – Fourth part of the UUID (16 bits)
- w48 – Fifth part of the UUID (48 bits)

Returns

The comma separated values for UUID 128 initializer that may be used directly as an argument for *BT_UUID_INIT_128* or *BT_UUID_DECLARE_128*

BT_UUID_16_ENCODE(w16)

Encode 16-bit UUID into array values in little-endian format.

Helper macro to encode 16-bit UUID values into advertising data.

Example of how to encode the UUID `0x180a` into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID16_ALL, BT_UUID_16_ENCODE(0x180a))
```

Parameters

- `w16` – UUID value (16-bits)

Returns
The comma separated values for UUID 16 value that may be used directly as an argument for *BT_DATA_BYTES*.

`BT_UUID_32_ENCODE`(w32)

Encode 32-bit UUID into array values in little-endian format.

Helper macro to encode 32-bit UUID values into advertising data.

Example of how to encode the UUID `0x180a01af` into advertising data.

```
BT_DATA_BYTES(BT_DATA_UUID32_ALL, BT_UUID_32_ENCODE(0x180a01af))
```

Parameters

- `w32` – UUID value (32-bits)

Returns
The comma separated values for UUID 32 value that may be used directly as an argument for *BT_DATA_BYTES*.

`BT_UUID_STR_LEN`

Recommended length of user string buffer for Bluetooth UUID.

The recommended length guarantee the output of UUID conversion will not lose valuable information about the UUID being processed. If the length of the UUID is known the string can be shorter.

`BT_UUID_GAP_VAL`

Generic Access UUID value.

`BT_UUID_GAP`

Generic Access.

`BT_UUID_GATT_VAL`

Generic attribute UUID value.

`BT_UUID_GATT`

Generic Attribute.

`BT_UUID_IAS_VAL`

Immediate Alert Service UUID value.

`BT_UUID_IAS`

Immediate Alert Service.

`BT_UUID_LLS_VAL`

Link Loss Service UUID value.

`BT_UUID_LLS`

Link Loss Service.

BT_UUID_TPS_VAL
: Tx Power Service UUID value.

BT_UUID_TPS
: Tx Power Service.

BT_UUID_CTS_VAL
: Current Time Service UUID value.

BT_UUID_CTS
: Current Time Service.

BT_UUID_RTUS_VAL
: Reference Time Update Service UUID value.

BT_UUID_RTUS
: Reference Time Update Service.

BT_UUID_NDSTS_VAL
: Next DST Change Service UUID value.

BT_UUID_NDSTS
: Next DST Change Service.

BT_UUID_GS_VAL
: Glucose Service UUID value.

BT_UUID_GS
: Glucose Service.

BT_UUID_HTS_VAL
: Health Thermometer Service UUID value.

BT_UUID_HTS
: Health Thermometer Service.

BT_UUID_DIS_VAL
: Device Information Service UUID value.

BT_UUID_DIS
: Device Information Service.

BT_UUID_NAS_VAL
: Network Availability Service UUID value.

BT_UUID_NAS
: Network Availability Service.

`BT_UUID_WDS_VAL`
: Watchdog Service UUID value.

`BT_UUID_WDS`
: Watchdog Service.

`BT_UUID_HRS_VAL`
: Heart Rate Service UUID value.

`BT_UUID_HRS`
: Heart Rate Service.

`BT_UUID_PAS_VAL`
: Phone Alert Service UUID value.

`BT_UUID_PAS`
: Phone Alert Service.

`BT_UUID_BAS_VAL`
: Battery Service UUID value.

`BT_UUID_BAS`
: Battery Service.

`BT_UUID_BPS_VAL`
: Blood Pressure Service UUID value.

`BT_UUID_BPS`
: Blood Pressure Service.

`BT_UUID_ANS_VAL`
: Alert Notification Service UUID value.

`BT_UUID_ANS`
: Alert Notification Service.

`BT_UUID_HIDS_VAL`
: HID Service UUID value.

`BT_UUID_HIDS`
: HID Service.

`BT_UUID_SPS_VAL`
: Scan Parameters Service UUID value.

`BT_UUID_SPS`
: Scan Parameters Service.

BT_UUID_RSCS_VAL
: Running Speed and Cadence Service UUID value.

BT_UUID_RSCS
: Running Speed and Cadence Service.

BT_UUID_AIOS_VAL
: Automation IO Service UUID value.

BT_UUID_AIOS
: Automation IO Service.

BT_UUID_CSC_VAL
: Cycling Speed and Cadence Service UUID value.

BT_UUID_CSC
: Cycling Speed and Cadence Service.

BT_UUID_CPS_VAL
: Cycling Power Service UUID value.

BT_UUID_CPS
: Cycling Power Service.

BT_UUID_LNS_VAL
: Location and Navigation Service UUID value.

BT_UUID_LNS
: Location and Navigation Service.

BT_UUID_ESS_VAL
: Environmental Sensing Service UUID value.

BT_UUID_ESS
: Environmental Sensing Service.

BT_UUID_BCS_VAL
: Body Composition Service UUID value.

BT_UUID_BCS
: Body Composition Service.

BT_UUID_UDS_VAL
: User Data Service UUID value.

BT_UUID_UDS
: User Data Service.

`BT_UUID_WSS_VAL`
: Weight Scale Service UUID value.

`BT_UUID_WSS`
: Weight Scale Service.

`BT_UUID_BMS_VAL`
: Bond Management Service UUID value.

`BT_UUID_BMS`
: Bond Management Service.

`BT_UUID_CGMS_VAL`
: Continuous Glucose Monitoring Service UUID value.

`BT_UUID_CGMS`
: Continuous Glucose Monitoring Service.

`BT_UUID_IPSS_VAL`
: IP Support Service UUID value.

`BT_UUID_IPSS`
: IP Support Service.

`BT_UUID_IPS_VAL`
: Indoor Positioning Service UUID value.

`BT_UUID_IPS`
: Indoor Positioning Service.

`BT_UUID_POS_VAL`
: Pulse Oximeter Service UUID value.

`BT_UUID_POS`
: Pulse Oximeter Service.

`BT_UUID_HPS_VAL`
: HTTP Proxy Service UUID value.

`BT_UUID_HPS`
: HTTP Proxy Service.

`BT_UUID_TDS_VAL`
: Transport Discovery Service UUID value.

`BT_UUID_TDS`
: Transport Discovery Service.

`BT_UUID_OTS_VAL`
: Object Transfer Service UUID value.

`BT_UUID_OTS`
: Object Transfer Service.

`BT_UUID_FMS_VAL`
: Fitness Machine Service UUID value.

`BT_UUID_FMS`
: Fitness Machine Service.

`BT_UUID_MESH_PROV_VAL`
: Mesh Provisioning Service UUID value.

`BT_UUID_MESH_PROV`
: Mesh Provisioning Service.

`BT_UUID_MESH_PROXY_VAL`
: Mesh Proxy Service UUID value.

`BT_UUID_MESH_PROXY`
: Mesh Proxy Service.

`BT_UUID_MESH_PROXY_SOLICITATION_VAL`
: Proxy Solicitation UUID value.

`BT_UUID_RCSRV_VAL`
: Reconnection Configuration Service UUID value.

`BT_UUID_RCSRV`
: Reconnection Configuration Service.

`BT_UUID_IDS_VAL`
: Insulin Delivery Service UUID value.

`BT_UUID_IDS`
: Insulin Delivery Service.

`BT_UUID_BSS_VAL`
: Binary Sensor Service UUID value.

`BT_UUID_BSS`
: Binary Sensor Service.

`BT_UUID_ECS_VAL`
: Emergency Configuration Service UUID value.

BT_UUID_ECS
: Emergency Configuration Service.

BT_UUID_ACLS_VAL
: Authorization Control Service UUID value.

BT_UUID_ACLS
: Authorization Control Service.

BT_UUID_PAMS_VAL
: Physical Activity Monitor Service UUID value.

BT_UUID_PAMS
: Physical Activity Monitor Service.

BT_UUID_AICS_VAL
: Audio Input Control Service UUID value.

BT_UUID_AICS
: Audio Input Control Service.

BT_UUID_VCS_VAL
: Volume Control Service UUID value.

BT_UUID_VCS
: Volume Control Service.

BT_UUID_VOCS_VAL
: Volume Offset Control Service UUID value.

BT_UUID_VOCS
: Volume Offset Control Service.

BT_UUID_CSIS_VAL
: Coordinated Set Identification Service UUID value.

BT_UUID_CSIS
: Coordinated Set Identification Service.

BT_UUID_DTS_VAL
: Device Time Service UUID value.

BT_UUID_DTS
: Device Time Service.

BT_UUID_MCS_VAL
: Media Control Service UUID value.

BT_UUID_MCS
: Media Control Service.

BT_UUID_GMCS_VAL
: Generic Media Control Service UUID value.

BT_UUID_GMCS
: Generic Media Control Service.

BT_UUID_CTES_VAL
: Constant Tone Extension Service UUID value.

BT_UUID_CTES
: Constant Tone Extension Service.

BT_UUID_TBS_VAL
: Telephone Bearer Service UUID value.

BT_UUID_TBS
: Telephone Bearer Service.

BT_UUID_GTBS_VAL
: Generic Telephone Bearer Service UUID value.

BT_UUID_GTBS
: Generic Telephone Bearer Service.

BT_UUID_MICS_VAL
: Microphone Control Service UUID value.

BT_UUID_MICS
: Microphone Control Service.

BT_UUID_ASCS_VAL
: Audio Stream Control Service UUID value.

BT_UUID_ASCS
: Audio Stream Control Service.

BT_UUID_BASS_VAL
: Broadcast Audio Scan Service UUID value.

BT_UUID_BASS
: Broadcast Audio Scan Service.

BT_UUID_PACS_VAL
: Published Audio Capabilities Service UUID value.

BT_UUID_PACS
: Published Audio Capabilities Service.

BT_UUID_BASIC_AUDIO_VAL
: Basic Audio Announcement Service UUID value.

BT_UUID_BASIC_AUDIO
: Basic Audio Announcement Service.

BT_UUID_BROADCAST_AUDIO_VAL
: Broadcast Audio Announcement Service UUID value.

BT_UUID_BROADCAST_AUDIO
: Broadcast Audio Announcement Service.

BT_UUID_CAS_VAL
: Common Audio Service UUID value.

BT_UUID_CAS
: Common Audio Service.

BT_UUID_HAS_VAL
: Hearing Access Service UUID value.

BT_UUID_HAS
: Hearing Access Service.

BT_UUID_TMAS_VAL
: Telephony and Media Audio Service UUID value.

BT_UUID_TMAS
: Telephony and Media Audio Service.

BT_UUID_PBA_VAL
: Public Broadcast Announcement Service UUID value.

BT_UUID_PBA
: Public Broadcast Announcement Service.

BT_UUID_GATT_PRIMARY_VAL
: GATT Primary Service UUID value.

BT_UUID_GATT_PRIMARY
: GATT Primary Service.

BT_UUID_GATT_SECONDARY_VAL
: GATT Secondary Service UUID value.

BT_UUID_GATT_SECONDARY
: GATT Secondary Service.

BT_UUID_GATT_INCLUDE_VAL
: GATT Include Service UUID value.

BT_UUID_GATT_INCLUDE
: GATT Include Service.

BT_UUID_GATT_CHRC_VAL
: GATT Characteristic UUID value.

BT_UUID_GATT_CHRC
: GATT Characteristic.

BT_UUID_GATT_CEP_VAL
: GATT Characteristic Extended Properties UUID value.

BT_UUID_GATT_CEP
: GATT Characteristic Extended Properties.

BT_UUID_GATT_CUD_VAL
: GATT Characteristic User Description UUID value.

BT_UUID_GATT_CUD
: GATT Characteristic User Description.

BT_UUID_GATT_CCC_VAL
: GATT Client Characteristic Configuration UUID value.

BT_UUID_GATT_CCC
: GATT Client Characteristic Configuration.

BT_UUID_GATT_SCC_VAL
: GATT Server Characteristic Configuration UUID value.

BT_UUID_GATT_SCC
: GATT Server Characteristic Configuration.

BT_UUID_GATT_CPF_VAL
: GATT Characteristic Presentation Format UUID value.

BT_UUID_GATT_CPF
: GATT Characteristic Presentation Format.

BT_UUID_GATT_CAF_VAL
: GATT Characteristic Aggregated Format UUID value.

BT_UUID_GATT_CAF
: GATT Characteristic Aggregated Format.

BT_UUID_VALID_RANGE_VAL
: Valid Range Descriptor UUID value.

BT_UUID_VALID_RANGE
: Valid Range Descriptor.

BT_UUID_HIDS_EXT_REPORT_VAL
: HID External Report Descriptor UUID value.

BT_UUID_HIDS_EXT_REPORT
: HID External Report Descriptor.

BT_UUID_HIDS_REPORT_REF_VAL
: HID Report Reference Descriptor UUID value.

BT_UUID_HIDS_REPORT_REF
: HID Report Reference Descriptor.

BT_UUID_VAL_TRIGGER_SETTING_VAL
: Value Trigger Setting Descriptor UUID value.

BT_UUID_VAL_TRIGGER_SETTING
: Value Trigger Setting Descriptor.

BT_UUID_ES_CONFIGURATION_VAL
: Environmental Sensing Configuration Descriptor UUID value.

BT_UUID_ES_CONFIGURATION
: Environmental Sensing Configuration Descriptor.

BT_UUID_ES_MEASUREMENT_VAL
: Environmental Sensing Measurement Descriptor UUID value.

BT_UUID_ES_MEASUREMENT

BT_UUID_GAP_PPF_VAL
: GAP Characteristic Peripheral Privacy Flag UUID value.

BT_UUID_GAP_PPF
: GAP Characteristic Peripheral Privacy Flag.

BT_UUID_GAP_RA_VAL
: GAP Characteristic Reconnection Address UUID value.

BT_UUID_GAP_RA
: GAP Characteristic Reconnection Address.

BT_UUID_GAP_PPCP_VAL
: GAP Characteristic Peripheral Preferred Connection Parameters UUID value.

BT_UUID_GAP_PPCP
: GAP Characteristic Peripheral Preferred Connection Parameters.

BT_UUID_GATT_SC_VAL
: GATT Characteristic Service Changed UUID value.

BT_UUID_GATT_SC
: GATT Characteristic Service Changed.

BT_UUID_ALERT_LEVEL_VAL
: GATT Characteristic Alert Level UUID value.

BT_UUID_ALERT_LEVEL
: GATT Characteristic Alert Level.

BT_UUID_TPS_TX_POWER_LEVEL_VAL
: TPS Characteristic Tx Power Level UUID value.

BT_UUID_TPS_TX_POWER_LEVEL
: TPS Characteristic Tx Power Level.

BT_UUID_GATT_DT_VAL
: GATT Characteristic Date Time UUID value.

BT_UUID_GATT_DT
: GATT Characteristic Date Time.

BT_UUID_GATT_DW_VAL
: GATT Characteristic Day of Week UUID value.

BT_UUID_GATT_DW
: GATT Characteristic Day of Week.

BT_UUID_GATT_DDT_VAL
: GATT Characteristic Day Date Time UUID value.

BT_UUID_GATT_DDT
: GATT Characteristic Day Date Time.

BT_UUID_GATT_ET256_VAL
: GATT Characteristic Exact Time 256 UUID value.

BT_UUID_GATT_ET256
: GATT Characteristic Exact Time 256.

BT_UUID_GATT_DST_VAL
: GATT Characteristic DST Offset UUID value.

BT_UUID_GATT_DST
: GATT Characteristic DST Offset.

BT_UUID_GATT_TZ_VAL
: GATT Characteristic Time Zone UUID value.

BT_UUID_GATT_TZ
: GATT Characteristic Time Zone.

BT_UUID_GATT_LTI_VAL
: GATT Characteristic Local Time Information UUID value.

BT_UUID_GATT_LTI
: GATT Characteristic Local Time Information.

BT_UUID_GATT_TDST_VAL
: GATT Characteristic Time with DST UUID value.

BT_UUID_GATT_TDST
: GATT Characteristic Time with DST.

BT_UUID_GATT_TA_VAL
: GATT Characteristic Time Accuracy UUID value.

BT_UUID_GATT_TA
: GATT Characteristic Time Accuracy.

BT_UUID_GATT_TS_VAL
: GATT Characteristic Time Source UUID value.

BT_UUID_GATT_TS
: GATT Characteristic Time Source.

BT_UUID_GATT_RTI_VAL
: GATT Characteristic Reference Time Information UUID value.

BT_UUID_GATT_RTI
: GATT Characteristic Reference Time Information.

BT_UUID_GATT_TUCP_VAL
: GATT Characteristic Time Update Control Point UUID value.

BT_UUID_GATT_TUCP
: GATT Characteristic Time Update Control Point.

BT_UUID_GATT_TUS_VAL
: GATT Characteristic Time Update State UUID value.

BT_UUID_GATT_TUS
: GATT Characteristic Time Update State.

BT_UUID_GATT_GM_VAL
: GATT Characteristic Glucose Measurement UUID value.

BT_UUID_GATT_GM
: GATT Characteristic Glucose Measurement.

BT_UUID_BAS_BATTERY_LEVEL_VAL
: BAS Characteristic Battery Level UUID value.

BT_UUID_BAS_BATTERY_LEVEL
: BAS Characteristic Battery Level.

BT_UUID_BAS_BATTERY_POWER_STATE_VAL
: BAS Characteristic Battery Power State UUID value.

`BT_UUID_BAS_BATTERY_POWER_STATE`
: BAS Characteristic Battery Power State.

`BT_UUID_BAS_BATTERY_LEVEL_STATE_VAL`
: BAS Characteristic Battery Level StateUUID value.

`BT_UUID_BAS_BATTERY_LEVEL_STATE`
: BAS Characteristic Battery Level State.

`BT_UUID_HTS_MEASUREMENT_VAL`
: HTS Characteristic Temperature Measurement UUID value.

`BT_UUID_HTS_MEASUREMENT`
: HTS Characteristic Temperature Measurement Value.

`BT_UUID_HTS_TEMP_TYP_VAL`
: HTS Characteristic Temperature Type UUID value.

`BT_UUID_HTS_TEMP_TYP`
: HTS Characteristic Temperature Type.

`BT_UUID_HTS_TEMP_INT_VAL`
: HTS Characteristic Intermediate Temperature UUID value.

`BT_UUID_HTS_TEMP_INT`
: HTS Characteristic Intermediate Temperature.

`BT_UUID_HTS_TEMP_C_VAL`
: HTS Characteristic Temperature Celsius UUID value.

`BT_UUID_HTS_TEMP_C`
: HTS Characteristic Temperature Celsius.

`BT_UUID_HTS_TEMP_F_VAL`
: HTS Characteristic Temperature Fahrenheit UUID value.

`BT_UUID_HTS_TEMP_F`
: HTS Characteristic Temperature Fahrenheit.

`BT_UUID_HTS_INTERVAL_VAL`
: HTS Characteristic Measurement Interval UUID value.

`BT_UUID_HTS_INTERVAL`
: HTS Characteristic Measurement Interval.

`BT_UUID_HIDS_BOOT_KB_IN_REPORT_VAL`
: HID Characteristic Boot Keyboard Input Report UUID value.

`BT_UUID_HIDS_BOOT_KB_IN_REPORT`
: HID Characteristic Boot Keyboard Input Report.

`BT_UUID_DIS_SYSTEM_ID_VAL`
: DIS Characteristic System ID UUID value.

`BT_UUID_DIS_SYSTEM_ID`
: DIS Characteristic System ID.

`BT_UUID_DIS_MODEL_NUMBER_VAL`
: DIS Characteristic Model Number String UUID value.

`BT_UUID_DIS_MODEL_NUMBER`
: DIS Characteristic Model Number String.

`BT_UUID_DIS_SERIAL_NUMBER_VAL`
: DIS Characteristic Serial Number String UUID value.

`BT_UUID_DIS_SERIAL_NUMBER`
: DIS Characteristic Serial Number String.

`BT_UUID_DIS_FIRMWARE_REVISION_VAL`
: DIS Characteristic Firmware Revision String UUID value.

`BT_UUID_DIS_FIRMWARE_REVISION`
: DIS Characteristic Firmware Revision String.

`BT_UUID_DIS_HARDWARE_REVISION_VAL`
: DIS Characteristic Hardware Revision String UUID value.

`BT_UUID_DIS_HARDWARE_REVISION`
: DIS Characteristic Hardware Revision String.

`BT_UUID_DIS_SOFTWARE_REVISION_VAL`
: DIS Characteristic Software Revision String UUID value.

`BT_UUID_DIS_SOFTWARE_REVISION`
: DIS Characteristic Software Revision String.

`BT_UUID_DIS_MANUFACTURER_NAME_VAL`
: DIS Characteristic Manufacturer Name String UUID Value.

`BT_UUID_DIS_MANUFACTURER_NAME`
: DIS Characteristic Manufacturer Name String.

`BT_UUID_GATT_IEEE_RCDL_VAL`
: GATT Characteristic IEEE Regulatory Certification Data List UUID Value.

BT_UUID_GATT_IEEE_RCDL
: GATT Characteristic IEEE Regulatory Certification Data List.

BT_UUID_CTS_CURRENT_TIME_VAL
: CTS Characteristic Current Time UUID value.

BT_UUID_CTS_CURRENT_TIME
: CTS Characteristic Current Time.

BT_UUID_MAGN_DECLINATION_VAL
: Magnetic Declination Characteristic UUID value.

BT_UUID_MAGN_DECLINATION
: Magnetic Declination Characteristic.

BT_UUID_GATT_LLAT_VAL
: GATT Characteristic Legacy Latitude UUID Value.

BT_UUID_GATT_LLAT
: GATT Characteristic Legacy Latitude.

BT_UUID_GATT_LLON_VAL
: GATT Characteristic Legacy Longitude UUID Value.

BT_UUID_GATT_LLON
: GATT Characteristic Legacy Longitude.

BT_UUID_GATT_POS_2D_VAL
: GATT Characteristic Position 2D UUID Value.

BT_UUID_GATT_POS_2D
: GATT Characteristic Position 2D.

BT_UUID_GATT_POS_3D_VAL
: GATT Characteristic Position 3D UUID Value.

BT_UUID_GATT_POS_3D
: GATT Characteristic Position 3D.

BT_UUID_GATT_SR_VAL
: GATT Characteristic Scan Refresh UUID Value.

BT_UUID_GATT_SR
: GATT Characteristic Scan Refresh.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT_VAL
: HID Boot Keyboard Output Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_KB_OUT_REPORT
: HID Boot Keyboard Output Report Characteristic.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT_VAL
: HID Boot Mouse Input Report Characteristic UUID value.

BT_UUID_HIDS_BOOT_MOUSE_IN_REPORT
: HID Boot Mouse Input Report Characteristic.

BT_UUID_GATT_GMC_VAL
: GATT Characteristic Glucose Measurement Context UUID Value.

BT_UUID_GATT_GMC
: GATT Characteristic Glucose Measurement Context.

BT_UUID_GATT_BPM_VAL
: GATT Characteristic Blood Pressure Measurement UUID Value.

BT_UUID_GATT_BPM
: GATT Characteristic Blood Pressure Measurement.

BT_UUID_GATT_ICP_VAL
: GATT Characteristic Intermediate Cuff Pressure UUID Value.

BT_UUID_GATT_ICP
: GATT Characteristic Intermediate Cuff Pressure.

BT_UUID_HRS_MEASUREMENT_VAL
: HRS Characteristic Measurement Interval UUID value.

BT_UUID_HRS_MEASUREMENT
: HRS Characteristic Measurement Interval.

BT_UUID_HRS_BODY_SENSOR_VAL
: HRS Characteristic Body Sensor Location.

BT_UUID_HRS_BODY_SENSOR
: HRS Characteristic Control Point.

BT_UUID_HRS_CONTROL_POINT_VAL
: HRS Characteristic Control Point UUID value.

BT_UUID_HRS_CONTROL_POINT
: HRS Characteristic Control Point.

BT_UUID_GATT_REM_VAL
: GATT Characteristic Removable UUID Value.

BT_UUID_GATT_REM
: GATT Characteristic Removable.

BT_UUID_GATT_SRVREQ_VAL
: GATT Characteristic Service Required UUID Value.

BT_UUID_GATT_SRVREQ
: GATT Characteristic Service Required.

BT_UUID_GATT_SC_TEMP_C_VAL
: GATT Characteristic Scientific Temperature in Celsius UUID Value.

BT_UUID_GATT_SC_TEMP_C
: GATT Characteristic Scientific Temperature in Celsius.

BT_UUID_GATT_STRING_VAL
: GATT Characteristic String UUID Value.

BT_UUID_GATT_STRING
: GATT Characteristic String.

BT_UUID_GATT_NETA_VAL
: GATT Characteristic Network Availability UUID Value.

BT_UUID_GATT_NETA
: GATT Characteristic Network Availability.

BT_UUID_GATT_ALRTS_VAL
: GATT Characteristic Alert Status UUID Value.

BT_UUID_GATT_ALRTS
: GATT Characteristic Alert Status.

BT_UUID_GATT_RCP_VAL
: GATT Characteristic Ringer Control Point UUID Value.

BT_UUID_GATT_RCP
: GATT Characteristic Ringer Control Point.

BT_UUID_GATT_RS_VAL
: GATT Characteristic Ringer Setting UUID Value.

BT_UUID_GATT_RS
: GATT Characteristic Ringer Setting.

BT_UUID_GATT_ALRTCID_MASK_VAL
: GATT Characteristic Alert Category ID Bit Mask UUID Value.

BT_UUID_GATT_ALRTCID_MASK
: GATT Characteristic Alert Category ID Bit Mask.

BT_UUID_GATT_ALRTCID_VAL
: GATT Characteristic Alert Category ID UUID Value.

BT_UUID_GATT_ALRTCID
: GATT Characteristic Alert Category ID.

BT_UUID_GATT_ALRTNCP_VAL
: GATT Characteristic Alert Notification Control Point Value.

BT_UUID_GATT_ALRTNCP
: GATT Characteristic Alert Notification Control Point.

BT_UUID_GATT_UALRTS_VAL
: GATT Characteristic Unread Alert Status UUID Value.

BT_UUID_GATT_UALRTS
: GATT Characteristic Unread Alert Status.

BT_UUID_GATT_NALRT_VAL
: GATT Characteristic New Alert UUID Value.

BT_UUID_GATT_NALRT
: GATT Characteristic New Alert.

BT_UUID_GATT_SNALRTC_VAL
: GATT Characteristic Supported New Alert Category UUID Value.

BT_UUID_GATT_SNALRTC
: GATT Characteristic Supported New Alert Category.

BT_UUID_GATT_SUALRTC_VAL
: GATT Characteristic Supported Unread Alert Category UUID Value.

BT_UUID_GATT_SUALRTC
: GATT Characteristic Supported Unread Alert Category.

BT_UUID_GATT_BPF_VAL
: GATT Characteristic Blood Pressure Feature UUID Value.

BT_UUID_GATT_BPF
: GATT Characteristic Blood Pressure Feature.

BT_UUID_HIDS_INFO_VAL
: HID Information Characteristic UUID value.

`BT_UUID_HIDS_INFO`
: HID Information Characteristic.

`BT_UUID_HIDS_REPORT_MAP_VAL`
: HID Report Map Characteristic UUID value.

`BT_UUID_HIDS_REPORT_MAP`
: HID Report Map Characteristic.

`BT_UUID_HIDS_CTRL_POINT_VAL`
: HID Control Point Characteristic UUID value.

`BT_UUID_HIDS_CTRL_POINT`
: HID Control Point Characteristic.

`BT_UUID_HIDS_REPORT_VAL`
: HID Report Characteristic UUID value.

`BT_UUID_HIDS_REPORT`
: HID Report Characteristic.

`BT_UUID_HIDS_PROTOCOL_MODE_VAL`
: HID Protocol Mode Characteristic UUID value.

`BT_UUID_HIDS_PROTOCOL_MODE`
: HID Protocol Mode Characteristic.

`BT_UUID_GATT_SIW_VAL`
: GATT Characteristic Scan Interval Windows UUID Value.

`BT_UUID_GATT_SIW`
: GATT Characteristic Scan Interval Windows.

`BT_UUID_DIS_PNP_ID_VAL`
: DIS Characteristic PnP ID UUID value.

`BT_UUID_DIS_PNP_ID`
: DIS Characteristic PnP ID.

`BT_UUID_GATT_GF_VAL`
: GATT Characteristic Glucose Feature UUID Value.

`BT_UUID_GATT_GF`
: GATT Characteristic Glucose Feature.

`BT_UUID_RECORD_ACCESS_CONTROL_POINT_VAL`
: Record Access Control Point Characteristic value.

`BT_UUID_RECORD_ACCESS_CONTROL_POINT`
: Record Access Control Point.

`BT_UUID_RSC_MEASUREMENT_VAL`
: RSC Measurement Characteristic UUID value.

`BT_UUID_RSC_MEASUREMENT`
: RSC Measurement Characteristic.

`BT_UUID_RSC_FEATURE_VAL`
: RSC Feature Characteristic UUID value.

`BT_UUID_RSC_FEATURE`
: RSC Feature Characteristic.

`BT_UUID_SC_CONTROL_POINT_VAL`
: SC Control Point Characteristic UUID value.

`BT_UUID_SC_CONTROL_POINT`
: SC Control Point Characteristic.

`BT_UUID_GATT_DI_VAL`
: GATT Characteristic Digital Input UUID Value.

`BT_UUID_GATT_DI`
: GATT Characteristic Digital Input.

`BT_UUID_GATT_DO_VAL`
: GATT Characteristic Digital Output UUID Value.

`BT_UUID_GATT_DO`
: GATT Characteristic Digital Output.

`BT_UUID_GATT_AI_VAL`
: GATT Characteristic Analog Input UUID Value.

`BT_UUID_GATT_AI`
: GATT Characteristic Analog Input.

`BT_UUID_GATT_AO_VAL`
: GATT Characteristic Analog Output UUID Value.

`BT_UUID_GATT_AO`
: GATT Characteristic Analog Output.

`BT_UUID_GATT_AGGR_VAL`
: GATT Characteristic Aggregate UUID Value.

BT_UUID_GATT_AGGR
: GATT Characteristic Aggregate.

BT_UUID_CSC_MEASUREMENT_VAL
: CSC Measurement Characteristic UUID value.

BT_UUID_CSC_MEASUREMENT
: CSC Measurement Characteristic.

BT_UUID_CSC_FEATURE_VAL
: CSC Feature Characteristic UUID value.

BT_UUID_CSC_FEATURE
: CSC Feature Characteristic.

BT_UUID_SENSOR_LOCATION_VAL
: Sensor Location Characteristic UUID value.

BT_UUID_SENSOR_LOCATION
: Sensor Location Characteristic.

BT_UUID_GATT_PLX_SCM_VAL
: GATT Characteristic PLX Spot-Check Measurement UUID Value.

BT_UUID_GATT_PLX_SCM
: GATT Characteristic PLX Spot-Check Measurement.

BT_UUID_GATT_PLX_CM_VAL
: GATT Characteristic PLX Continuous Measurement UUID Value.

BT_UUID_GATT_PLX_CM
: GATT Characteristic PLX Continuous Measurement.

BT_UUID_GATT_PLX_F_VAL
: GATT Characteristic PLX Features UUID Value.

BT_UUID_GATT_PLX_F
: GATT Characteristic PLX Features.

BT_UUID_GATT_POPE_VAL
: GATT Characteristic Pulse Oximetry Pulastile Event UUID Value.

BT_UUID_GATT_POPE
: GATT Characteristic Pulse Oximetry Pulsatile Event.

BT_UUID_GATT_POCP_VAL
: GATT Characteristic Pulse Oximetry Control Point UUID Value.

BT_UUID_GATT_POCP
: GATT Characteristic Pulse Oximetry Control Point.

BT_UUID_GATT_CPS_CPM_VAL
: GATT Characteristic Cycling Power Measurement UUID Value.

BT_UUID_GATT_CPS_CPM
: GATT Characteristic Cycling Power Measurement.

BT_UUID_GATT_CPS_CPV_VAL
: GATT Characteristic Cycling Power Vector UUID Value.

BT_UUID_GATT_CPS_CPV
: GATT Characteristic Cycling Power Vector.

BT_UUID_GATT_CPS_CPF_VAL
: GATT Characteristic Cycling Power Feature UUID Value.

BT_UUID_GATT_CPS_CPF
: GATT Characteristic Cycling Power Feature.

BT_UUID_GATT_CPS_CPCP_VAL
: GATT Characteristic Cycling Power Control Point UUID Value.

BT_UUID_GATT_CPS_CPCP
: GATT Characteristic Cycling Power Control Point.

BT_UUID_GATT_LOC_SPD_VAL
: GATT Characteristic Location and Speed UUID Value.

BT_UUID_GATT_LOC_SPD
: GATT Characteristic Location and Speed.

BT_UUID_GATT_NAV_VAL
: GATT Characteristic Navigation UUID Value.

BT_UUID_GATT_NAV
: GATT Characteristic Navigation.

BT_UUID_GATT_PQ_VAL
: GATT Characteristic Position Quality UUID Value.

BT_UUID_GATT_PQ
: GATT Characteristic Position Quality.

BT_UUID_GATT_LNF_VAL
: GATT Characteristic LN Feature UUID Value.

BT_UUID_GATT_LNF
: GATT Characteristic LN Feature.

BT_UUID_GATT_LNCP_VAL
: GATT Characteristic LN Control Point UUID Value.

BT_UUID_GATT_LNCP
: GATT Characteristic LN Control Point.

BT_UUID_ELEVATION_VAL
: Elevation Characteristic UUID value.

BT_UUID_ELEVATION
: Elevation Characteristic.

BT_UUID_PRESSURE_VAL
: Pressure Characteristic UUID value.

BT_UUID_PRESSURE
: Pressure Characteristic.

BT_UUID_TEMPERATURE_VAL
: Temperature Characteristic UUID value.

BT_UUID_TEMPERATURE
: Temperature Characteristic.

BT_UUID_HUMIDITY_VAL
: Humidity Characteristic UUID value.

BT_UUID_HUMIDITY
: Humidity Characteristic.

BT_UUID_TRUE_WIND_SPEED_VAL
: True Wind Speed Characteristic UUID value.

BT_UUID_TRUE_WIND_SPEED
: True Wind Speed Characteristic.

BT_UUID_TRUE_WIND_DIR_VAL
: True Wind Direction Characteristic UUID value.

BT_UUID_TRUE_WIND_DIR
: True Wind Direction Characteristic.

BT_UUID_APPARENT_WIND_SPEED_VAL
: Apparent Wind Speed Characteristic UUID value.

BT_UUID_APPARENT_WIND_SPEED
: Apparent Wind Speed Characteristic.

BT_UUID_APPARENT_WIND_DIR_VAL
: Apparent Wind Direction Characteristic UUID value.

BT_UUID_APPARENT_WIND_DIR
: Apparent Wind Direction Characteristic.

BT_UUID_GUST_FACTOR_VAL
: Gust Factor Characteristic UUID value.

BT_UUID_GUST_FACTOR
: Gust Factor Characteristic.

BT_UUID_POLLEN_CONCENTRATION_VAL
: Pollen Concentration Characteristic UUID value.

BT_UUID_POLLEN_CONCENTRATION
: Pollen Concentration Characteristic.

BT_UUID_UV_INDEX_VAL
: UV Index Characteristic UUID value.

BT_UUID_UV_INDEX
: UV Index Characteristic.

BT_UUID_IRRADIANCE_VAL
: Irradiance Characteristic UUID value.

BT_UUID_IRRADIANCE
: Irradiance Characteristic.

BT_UUID_RAINFALL_VAL
: Rainfall Characteristic UUID value.

BT_UUID_RAINFALL
: Rainfall Characteristic.

BT_UUID_WIND_CHILL_VAL
: Wind Chill Characteristic UUID value.

BT_UUID_WIND_CHILL
: Wind Chill Characteristic.

BT_UUID_HEAT_INDEX_VAL
: Heat Index Characteristic UUID value.

BT_UUID_HEAT_INDEX
: Heat Index Characteristic.

BT_UUID_DEW_POINT_VAL
: Dew Point Characteristic UUID value.

BT_UUID_DEW_POINT
: Dew Point Characteristic.

BT_UUID_GATT_TREND_VAL
: GATT Characteristic Trend UUID Value.

BT_UUID_GATT_TREND
: GATT Characteristic Trend.

BT_UUID_DESC_VALUE_CHANGED_VAL
: Descriptor Value Changed Characteristic UUID value.

BT_UUID_DESC_VALUE_CHANGED
: Descriptor Value Changed Characteristic.

BT_UUID_GATT_AEHRLL_VAL
: GATT Characteristic Aerobic Heart Rate Low Limit UUID Value.

BT_UUID_GATT_AEHRLL
: GATT Characteristic Aerobic Heart Rate Lower Limit.

BT_UUID_GATT_AETHR_VAL
: GATT Characteristic Aerobic Threshold UUID Value.

BT_UUID_GATT_AETHR
: GATT Characteristic Aerobic Threshold.

BT_UUID_GATT_AGE_VAL
: GATT Characteristic Age UUID Value.

BT_UUID_GATT_AGE
: GATT Characteristic Age.

BT_UUID_GATT_ANHRLL_VAL
: GATT Characteristic Anaerobic Heart Rate Lower Limit UUID Value.

BT_UUID_GATT_ANHRLL
: GATT Characteristic Anaerobic Heart Rate Lower Limit.

BT_UUID_GATT_ANHRUL_VAL
: GATT Characteristic Anaerobic Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_ANHRUL
: GATT Characteristic Anaerobic Heart Rate Upper Limit.

BT_UUID_GATT_ANTHR_VAL
: GATT Characteristic Anaerobic Threshold UUID Value.

BT_UUID_GATT_ANTHR
: GATT Characteristic Anaerobic Threshold.

BT_UUID_GATT_AEHRUL_VAL
: GATT Characteristic Aerobic Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_AEHRUL
: GATT Characteristic Aerobic Heart Rate Upper Limit.

BT_UUID_GATT_DATE_BIRTH_VAL
: GATT Characteristic Date of Birth UUID Value.

BT_UUID_GATT_DATE_BIRTH
: GATT Characteristic Date of Birth.

BT_UUID_GATT_DATE_THRASS_VAL
: GATT Characteristic Date of Threshold Assessment UUID Value.

BT_UUID_GATT_DATE_THRASS
: GATT Characteristic Date of Threshold Assessment.

BT_UUID_GATT_EMAIL_VAL
: GATT Characteristic Email Address UUID Value.

BT_UUID_GATT_EMAIL
: GATT Characteristic Email Address.

BT_UUID_GATT_FBHRLL_VAL
: GATT Characteristic Fat Burn Heart Rate Lower Limit UUID Value.

BT_UUID_GATT_FBHRLL
: GATT Characteristic Fat Burn Heart Rate Lower Limit.

BT_UUID_GATT_FBHRUL_VAL
: GATT Characteristic Fat Burn Heart Rate Upper Limit UUID Value.

BT_UUID_GATT_FBHRUL
: GATT Characteristic Fat Burn Heart Rate Upper Limit.

BT_UUID_GATT_FIRST_NAME_VAL
: GATT Characteristic First Name UUID Value.

BT_UUID_GATT_FIRST_NAME
: GATT Characteristic First Name.

BT_UUID_GATT_5ZHRL_VAL
: GATT Characteristic Five Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_5ZHRL
: GATT Characteristic Five Zone Heart Rate Limits.

BT_UUID_GATT_GENDER_VAL
: GATT Characteristic Gender UUID Value.

BT_UUID_GATT_GENDER
: GATT Characteristic Gender.

BT_UUID_GATT_HR_MAX_VAL
: GATT Characteristic Heart Rate Max UUID Value.

BT_UUID_GATT_HR_MAX
: GATT Characteristic Heart Rate Max.

BT_UUID_GATT_HEIGHT_VAL
: GATT Characteristic Height UUID Value.

BT_UUID_GATT_HEIGHT
: GATT Characteristic Height.

BT_UUID_GATT_HC_VAL
: GATT Characteristic Hip Circumference UUID Value.

BT_UUID_GATT_HC
: GATT Characteristic Hip Circumference.

BT_UUID_GATT_LAST_NAME_VAL
: GATT Characteristic Last Name UUID Value.

BT_UUID_GATT_LAST_NAME
: GATT Characteristic Last Name.

BT_UUID_GATT_MRHR_VAL
: GATT Characteristic Maximum Recommended Heart Rate> UUID Value.

BT_UUID_GATT_MRHR
: GATT Characteristic Maximum Recommended Heart Rate.

BT_UUID_GATT_RHR_VAL
: GATT Characteristic Resting Heart Rate UUID Value.

BT_UUID_GATT_RHR
: GATT Characteristic Resting Heart Rate.

BT_UUID_GATT_AEANTHR_VAL
: GATT Characteristic Sport Type for Aerobic and Anaerobic Thresholds UUID Value.

BT_UUID_GATT_AEANTHR
: GATT Characteristic Sport Type for Aerobic and Anaerobic Threshold.

BT_UUID_GATT_3ZHRL_VAL
: GATT Characteristic Three Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_3ZHRL
: GATT Characteristic Three Zone Heart Rate Limits.

BT_UUID_GATT_2ZHRL_VAL
: GATT Characteristic Two Zone Heart Rate Limits UUID Value.

BT_UUID_GATT_2ZHRL
: GATT Characteristic Two Zone Heart Rate Limits.

BT_UUID_GATT_VO2_MAX_VAL
: GATT Characteristic VO2 Max UUID Value.

BT_UUID_GATT_VO2_MAX
: GATT Characteristic VO2 Max.

BT_UUID_GATT_WC_VAL
: GATT Characteristic Waist Circumference UUID Value.

BT_UUID_GATT_WC
: GATT Characteristic Waist Circumference.

BT_UUID_GATT_WEIGHT_VAL
: GATT Characteristic Weight UUID Value.

BT_UUID_GATT_WEIGHT
: GATT Characteristic Weight.

BT_UUID_GATT_DBCHINC_VAL
: GATT Characteristic Database Change Increment UUID Value.

BT_UUID_GATT_DBCHINC
: GATT Characteristic Database Change Increment.

BT_UUID_GATT_USRIDX_VAL
: GATT Characteristic User Index UUID Value.

BT_UUID_GATT_USRIDX
: GATT Characteristic User Index.

BT_UUID_GATT_BCF_VAL
: GATT Characteristic Body Composition Feature UUID Value.

BT_UUID_GATT_BCF
: GATT Characteristic Body Composition Feature.

BT_UUID_GATT_BCM_VAL
: GATT Characteristic Body Composition Measurement UUID Value.

BT_UUID_GATT_BCM
: GATT Characteristic Body Composition Measurement.

BT_UUID_GATT_WM_VAL
: GATT Characteristic Weight Measurement UUID Value.

BT_UUID_GATT_WM
: GATT Characteristic Weight Measurement.

BT_UUID_GATT_WSF_VAL
: GATT Characteristic Weight Scale Feature UUID Value.

BT_UUID_GATT_WSF
: GATT Characteristic Weight Scale Feature.

BT_UUID_GATT_USRCP_VAL
: GATT Characteristic User Control Point UUID Value.

BT_UUID_GATT_USRCP
: GATT Characteristic User Control Point.

BT_UUID_MAGN_FLUX_DENSITY_2D_VAL
: Magnetic Flux Density - 2D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_2D
: Magnetic Flux Density - 2D Characteristic.

BT_UUID_MAGN_FLUX_DENSITY_3D_VAL
: Magnetic Flux Density - 3D Characteristic UUID value.

BT_UUID_MAGN_FLUX_DENSITY_3D
: Magnetic Flux Density - 3D Characteristic.

BT_UUID_GATT_LANG_VAL
: GATT Characteristic Language UUID Value.

BT_UUID_GATT_LANG
: GATT Characteristic Language.

BT_UUID_BAR_PRESSURE_TREND_VAL
: Barometric Pressure Trend Characteristic UUID value.

BT_UUID_BAR_PRESSURE_TREND
: Barometric Pressure Trend Characteristic.

BT_UUID_BMS_CONTROL_POINT_VAL
: Bond Management Control Point UUID value.

BT_UUID_BMS_CONTROL_POINT
: Bond Management Control Point.

BT_UUID_BMS_FEATURE_VAL
: Bond Management Feature UUID value.

BT_UUID_BMS_FEATURE
: Bond Management Feature.

BT_UUID_CENTRAL_ADDR_RES_VAL
: Central Address Resolution Characteristic UUID value.

BT_UUID_CENTRAL_ADDR_RES
: Central Address Resolution Characteristic.

BT_UUID_CGM_MEASUREMENT_VAL
: CGM Measurement Characteristic value.

BT_UUID_CGM_MEASUREMENT
: CGM Measurement Characteristic.

BT_UUID_CGM_FEATURE_VAL
: CGM Feature Characteristic value.

BT_UUID_CGM_FEATURE
: CGM Feature Characteristic.

BT_UUID_CGM_STATUS_VAL
: CGM Status Characteristic value.

BT_UUID_CGM_STATUS
: CGM Status Characteristic.

BT_UUID_CGM_SESSION_START_TIME_VAL
: CGM Session Start Time Characteristic value.

BT_UUID_CGM_SESSION_START_TIME
: CGM Session Start Time.

BT_UUID_CGM_SESSION_RUN_TIME_VAL
: CGM Session Run Time Characteristic value.

BT_UUID_CGM_SESSION_RUN_TIME
: CGM Session Run Time.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT_VAL
: CGM Specific Ops Control Point Characteristic value.

BT_UUID_CGM_SPECIFIC_OPS_CONTROL_POINT
: CGM Specific Ops Control Point.

BT_UUID_GATT_IPC_VAL
: GATT Characteristic Indoor Positioning Configuration UUID Value.

BT_UUID_GATT_IPC
: GATT Characteristic Indoor Positioning Configuration.

BT_UUID_GATT_LAT_VAL
: GATT Characteristic Latitude UUID Value.

BT_UUID_GATT_LAT
: GATT Characteristic Latitude.

BT_UUID_GATT_LON_VAL
: GATT Characteristic Longitude UUID Value.

BT_UUID_GATT_LON
: GATT Characteristic Longitude.

BT_UUID_GATT_LNCOORD_VAL
: GATT Characteristic Local North Coordinate UUID Value.

BT_UUID_GATT_LNCOORD
: GATT Characteristic Local North Coordinate.

BT_UUID_GATT_LECOORD_VAL
: GATT Characteristic Local East Coordinate UUID Value.

BT_UUID_GATT_LECOORD
: GATT Characteristic Local East Coordinate.

BT_UUID_GATT_FN_VAL
: GATT Characteristic Floor Number UUID Value.

BT_UUID_GATT_FN
: GATT Characteristic Floor Number.

BT_UUID_GATT_ALT_VAL
: GATT Characteristic Altitude UUID Value.

BT_UUID_GATT_ALT
: GATT Characteristic Altitude.

BT_UUID_GATT_UNCERTAINTY_VAL
: GATT Characteristic Uncertainty UUID Value.

BT_UUID_GATT_UNCERTAINTY
: GATT Characteristic Uncertainty.

BT_UUID_GATT_LOC_NAME_VAL
: GATT Characteristic Location Name UUID Value.

BT_UUID_GATT_LOC_NAME
: GATT Characteristic Location Name.

BT_UUID_URI_VAL
: URI UUID value.

BT_UUID_URI
: URI.

BT_UUID_HTTP_HEADERS_VAL
: HTTP Headers UUID value.

BT_UUID_HTTP_HEADERS
: HTTP Headers.

BT_UUID_HTTP_STATUS_CODE_VAL
: HTTP Status Code UUID value.

BT_UUID_HTTP_STATUS_CODE
: HTTP Status Code.

BT_UUID_HTTP_ENTITY_BODY_VAL
: HTTP Entity Body UUID value.

BT_UUID_HTTP_ENTITY_BODY
: HTTP Entity Body.

BT_UUID_HTTP_CONTROL_POINT_VAL
: HTTP Control Point UUID value.

BT_UUID_HTTP_CONTROL_POINT
: HTTP Control Point.

BT_UUID_HTTPS_SECURITY_VAL
: HTTPS Security UUID value.

BT_UUID_HTTPS_SECURITY
: HTTPS Security.

BT_UUID_GATT_TDS_CP_VAL
: GATT Characteristic TDS Control Point UUID Value.

BT_UUID_GATT_TDS_CP
: GATT Characteristic TDS Control Point.

BT_UUID_OTS_FEATURE_VAL
: OTS Feature Characteristic UUID value.

BT_UUID_OTS_FEATURE
: OTS Feature Characteristic.

BT_UUID_OTS_NAME_VAL
: OTS Object Name Characteristic UUID value.

BT_UUID_OTS_NAME
: OTS Object Name Characteristic.

BT_UUID_OTS_TYPE_VAL
: OTS Object Type Characteristic UUID value.

BT_UUID_OTS_TYPE
: OTS Object Type Characteristic.

BT_UUID_OTS_SIZE_VAL
: OTS Object Size Characteristic UUID value.

BT_UUID_OTS_SIZE
: OTS Object Size Characteristic.

BT_UUID_OTS_FIRST_CREATED_VAL
: OTS Object First-Created Characteristic UUID value.

BT_UUID_OTS_FIRST_CREATED
: OTS Object First-Created Characteristic.

BT_UUID_OTS_LAST_MODIFIED_VAL
: OTS Object Last-Modified Characteristic UUI value.

BT_UUID_OTS_LAST_MODIFIED
: OTS Object Last-Modified Characteristic.

BT_UUID_OTS_ID_VAL
: OTS Object ID Characteristic UUID value.

BT_UUID_OTS_ID
: OTS Object ID Characteristic.

BT_UUID_OTS_PROPERTIES_VAL
: OTS Object Properties Characteristic UUID value.

BT_UUID_OTS_PROPERTIES
: OTS Object Properties Characteristic.

BT_UUID_OTS_ACTION_CP_VAL
: OTS Object Action Control Point Characteristic UUID value.

BT_UUID_OTS_ACTION_CP
: OTS Object Action Control Point Characteristic.

BT_UUID_OTS_LIST_CP_VAL
: OTS Object List Control Point Characteristic UUID value.

BT_UUID_OTS_LIST_CP
: OTS Object List Control Point Characteristic.

BT_UUID_OTS_LIST_FILTER_VAL
: OTS Object List Filter Characteristic UUID value.

BT_UUID_OTS_LIST_FILTER
: OTS Object List Filter Characteristic.

BT_UUID_OTS_CHANGED_VAL
: OTS Object Changed Characteristic UUID value.

BT_UUID_OTS_CHANGED
: OTS Object Changed Characteristic.

BT_UUID_GATT_RPAO_VAL
: GATT Characteristic Resolvable Private Address Only UUID Value.

BT_UUID_GATT_RPAO
: GATT Characteristic Resolvable Private Address Only.

BT_UUID_OTS_TYPE_UNSPECIFIED_VAL
: OTS Unspecified Object Type UUID value.

`BT_UUID_OTS_TYPE_UNSPECIFIED`
OTS Unspecified Object Type.

`BT_UUID_OTS_DIRECTORY_LISTING_VAL`
OTS Directory Listing UUID value.

`BT_UUID_OTS_DIRECTORY_LISTING`
OTS Directory Listing.

`BT_UUID_GATT_FMF_VAL`
GATT Characteristic Fitness Machine Feature UUID Value.

`BT_UUID_GATT_FMF`
GATT Characteristic Fitness Machine Feature.

`BT_UUID_GATT_TD_VAL`
GATT Characteristic Treadmill Data UUID Value.

`BT_UUID_GATT_TD`
GATT Characteristic Treadmill Data.

`BT_UUID_GATT_CTD_VAL`
GATT Characteristic Cross Trainer Data UUID Value.

`BT_UUID_GATT_CTD`
GATT Characteristic Cross Trainer Data.

`BT_UUID_GATT_STPCD_VAL`
GATT Characteristic Step Climber Data UUID Value.

`BT_UUID_GATT_STPCD`
GATT Characteristic Step Climber Data.

`BT_UUID_GATT_STRCD_VAL`
GATT Characteristic Stair Climber Data UUID Value.

`BT_UUID_GATT_STRCD`
GATT Characteristic Stair Climber Data.

`BT_UUID_GATT_RD_VAL`
GATT Characteristic Rower Data UUID Value.

`BT_UUID_GATT_RD`
GATT Characteristic Rower Data.

`BT_UUID_GATT_IBD_VAL`
GATT Characteristic Indoor Bike Data UUID Value.

BT_UUID_GATT_IBD
: GATT Characteristic Indoor Bike Data.

BT_UUID_GATT_TRSTAT_VAL
: GATT Characteristic Training Status UUID Value.

BT_UUID_GATT_TRSTAT
: GATT Characteristic Training Status.

BT_UUID_GATT_SSR_VAL
: GATT Characteristic Supported Speed Range UUID Value.

BT_UUID_GATT_SSR
: GATT Characteristic Supported Speed Range.

BT_UUID_GATT_SIR_VAL
: GATT Characteristic Supported Inclination Range UUID Value.

BT_UUID_GATT_SIR
: GATT Characteristic Supported Inclination Range.

BT_UUID_GATT_SRLR_VAL
: GATT Characteristic Supported Resistance Level Range UUID Value.

BT_UUID_GATT_SRLR
: GATT Characteristic Supported Resistance Level Range.

BT_UUID_GATT_SHRR_VAL
: GATT Characteristic Supported Heart Rate Range UUID Value.

BT_UUID_GATT_SHRR
: GATT Characteristic Supported Heart Rate Range.

BT_UUID_GATT_SPR_VAL
: GATT Characteristic Supported Power Range UUID Value.

BT_UUID_GATT_SPR
: GATT Characteristic Supported Power Range.

BT_UUID_GATT_FMCP_VAL
: GATT Characteristic Fitness Machine Control Point UUID Value.

BT_UUID_GATT_FMCP
: GATT Characteristic Fitness Machine Control Point.

BT_UUID_GATT_FMS_VAL
: GATT Characteristic Fitness Machine Status UUID Value.

BT_UUID_GATT_FMS
: GATT Characteristic Fitness Machine Status.

BT_UUID_MESH_PROV_DATA_IN_VAL
: Mesh Provisioning Data In UUID value.

BT_UUID_MESH_PROV_DATA_IN
: Mesh Provisioning Data In.

BT_UUID_MESH_PROV_DATA_OUT_VAL
: Mesh Provisioning Data Out UUID value.

BT_UUID_MESH_PROV_DATA_OUT
: Mesh Provisioning Data Out.

BT_UUID_MESH_PROXY_DATA_IN_VAL
: Mesh Proxy Data In UUID value.

BT_UUID_MESH_PROXY_DATA_IN
: Mesh Proxy Data In.

BT_UUID_MESH_PROXY_DATA_OUT_VAL
: Mesh Proxy Data Out UUID value.

BT_UUID_MESH_PROXY_DATA_OUT
: Mesh Proxy Data Out.

BT_UUID_GATT_NNN_VAL
: GATT Characteristic New Number Needed UUID Value.

BT_UUID_GATT_NNN
: GATT Characteristic New Number Needed.

BT_UUID_GATT_AC_VAL
: GATT Characteristic Average Current UUID Value.

BT_UUID_GATT_AC
: GATT Characteristic Average Current.

BT_UUID_GATT_AV_VAL
: GATT Characteristic Average Voltage UUID Value.

BT_UUID_GATT_AV
: GATT Characteristic Average Voltage.

BT_UUID_GATT_BOOLEAN_VAL
: GATT Characteristic Boolean UUID Value.

BT_UUID_GATT_BOOLEAN
: GATT Characteristic Boolean.

BT_UUID_GATT_CRDFP_VAL
: GATT Characteristic Chromatic Distance From Planckian UUID Value.

BT_UUID_GATT_CRDFP
: GATT Characteristic Chromatic Distance From Planckian.

BT_UUID_GATT_CRCOORDS_VAL
: GATT Characteristic Chromaticity Coordinates UUID Value.

BT_UUID_GATT_CRCOORDS
: GATT Characteristic Chromaticity Coordinates.

BT_UUID_GATT_CRCCT_VAL
: GATT Characteristic Chromaticity In CCT And Duv Values UUID Value.

BT_UUID_GATT_CRCCT
: GATT Characteristic Chromaticity In CCT And Duv Values.

BT_UUID_GATT_CRT_VAL
: GATT Characteristic Chromaticity Tolerance UUID Value.

BT_UUID_GATT_CRT
: GATT Characteristic Chromaticity Tolerance.

BT_UUID_GATT_CIEIDX_VAL
: GATT Characteristic CIE 13.3-1995 Color Rendering Index UUID Value.

BT_UUID_GATT_CIEIDX
: GATT Characteristic CIE 13.3-1995 Color Rendering Index.

BT_UUID_GATT_COEFFICIENT_VAL
: GATT Characteristic Coefficient UUID Value.

BT_UUID_GATT_COEFFICIENT
: GATT Characteristic Coefficient.

BT_UUID_GATT_CCTEMP_VAL
: GATT Characteristic Correlated Color Temperature UUID Value.

BT_UUID_GATT_CCTEMP
: GATT Characteristic Correlated Color Temperature.

BT_UUID_GATT_COUNT16_VAL
: GATT Characteristic Count 16 UUID Value.

BT_UUID_GATT_COUNT16
: GATT Characteristic Count 16.

BT_UUID_GATT_COUNT24_VAL
: GATT Characteristic Count 24 UUID Value.

BT_UUID_GATT_COUNT24
: GATT Characteristic Count 24.

BT_UUID_GATT_CNTRCODE_VAL
: GATT Characteristic Country Code UUID Value.

BT_UUID_GATT_CNTRCODE
: GATT Characteristic Country Code.

BT_UUID_GATT_DATEUTC_VAL
: GATT Characteristic Date UTC UUID Value.

BT_UUID_GATT_DATEUTC
: GATT Characteristic Date UTC.

BT_UUID_GATT_EC_VAL
: GATT Characteristic Electric Current UUID Value.

BT_UUID_GATT_EC
: GATT Characteristic Electric Current.

BT_UUID_GATT_ECR_VAL
: GATT Characteristic Electric Current Range UUID Value.

BT_UUID_GATT_ECR
: GATT Characteristic Electric Current Range.

BT_UUID_GATT_ECSPEC_VAL
: GATT Characteristic Electric Current Specification UUID Value.

BT_UUID_GATT_ECSPEC
: GATT Characteristic Electric Current Specification.

BT_UUID_GATT_ECSTAT_VAL
: GATT Characteristic Electric Current Statistics UUID Value.

BT_UUID_GATT_ECSTAT
: GATT Characteristic Electric Current Statistics.

BT_UUID_GATT_ENERGY_VAL
: GATT Characteristic Energy UUID Value.

BT_UUID_GATT_ENERGY
: GATT Characteristic Energy.

BT_UUID_GATT_EPOD_VAL
: GATT Characteristic Energy In A Period Of Day UUID Value.

BT_UUID_GATT_EPOD
: GATT Characteristic Energy In A Period Of Day.

BT_UUID_GATT_EVTSTAT_VAL
: GATT Characteristic Event Statistics UUID Value.

BT_UUID_GATT_EVTSTAT
: GATT Characteristic Event Statistics.

BT_UUID_GATT_FSTR16_VAL
: GATT Characteristic Fixed String 16 UUID Value.

BT_UUID_GATT_FSTR16
: GATT Characteristic Fixed String 16.

BT_UUID_GATT_FSTR24_VAL
: GATT Characteristic Fixed String 24 UUID Value.

BT_UUID_GATT_FSTR24
: GATT Characteristic Fixed String 24.

BT_UUID_GATT_FSTR36_VAL
: GATT Characteristic Fixed String 36 UUID Value.

BT_UUID_GATT_FSTR36
: GATT Characteristic Fixed String 36.

BT_UUID_GATT_FSTR8_VAL
: GATT Characteristic Fixed String 8 UUID Value.

BT_UUID_GATT_FSTR8
: GATT Characteristic Fixed String 8.

BT_UUID_GATT_GENLVL_VAL
: GATT Characteristic Generic Level UUID Value.

BT_UUID_GATT_GENLVL
: GATT Characteristic Generic Level.

BT_UUID_GATT_GTIN_VAL
: GATT Characteristic Global Trade Item Number UUID Value.

BT_UUID_GATT_GTIN
: GATT Characteristic Global Trade Item Number.

BT_UUID_GATT_ILLUM_VAL
: GATT Characteristic Illuminance UUID Value.

BT_UUID_GATT_ILLUM
: GATT Characteristic Illuminance.

BT_UUID_GATT_LUMEFF_VAL
: GATT Characteristic Luminous Efficacy UUID Value.

BT_UUID_GATT_LUMEFF
: GATT Characteristic Luminous Efficacy.

BT_UUID_GATT_LUMNRG_VAL
: GATT Characteristic Luminous Energy UUID Value.

BT_UUID_GATT_LUMNRG
: GATT Characteristic Luminous Energy.

BT_UUID_GATT_LUMEXP_VAL
: GATT Characteristic Luminous Exposure UUID Value.

BT_UUID_GATT_LUMEXP
: GATT Characteristic Luminous Exposure.

BT_UUID_GATT_LUMFLX_VAL
: GATT Characteristic Luminous Flux UUID Value.

BT_UUID_GATT_LUMFLX
: GATT Characteristic Luminous Flux.

BT_UUID_GATT_LUMFLXR_VAL
: GATT Characteristic Luminous Flux Range UUID Value.

BT_UUID_GATT_LUMFLXR
: GATT Characteristic Luminous Flux Range.

BT_UUID_GATT_LUMINT_VAL
: GATT Characteristic Luminous Intensity UUID Value.

BT_UUID_GATT_LUMINT
: GATT Characteristic Luminous Intensity.

BT_UUID_GATT_MASSFLOW_VAL
: GATT Characteristic Mass Flow UUID Value.

BT_UUID_GATT_MASSFLOW
: GATT Characteristic Mass Flow.

BT_UUID_GATT_PERLGHT_VAL
: GATT Characteristic Perceived Lightness UUID Value.

BT_UUID_GATT_PERLGHT
: GATT Characteristic Perceived Lightness.

BT_UUID_GATT_PER8_VAL
: GATT Characteristic Percentage 8 UUID Value.

BT_UUID_GATT_PER8
: GATT Characteristic Percentage 8.

BT_UUID_GATT_PWR_VAL
: GATT Characteristic Power UUID Value.

BT_UUID_GATT_PWR
: GATT Characteristic Power.

BT_UUID_GATT_PWRSPEC_VAL
: GATT Characteristic Power Specification UUID Value.

BT_UUID_GATT_PWRSPEC
: GATT Characteristic Power Specification.

BT_UUID_GATT_RRICR_VAL
: GATT Characteristic Relative Runtime In A Current Range UUID Value.

BT_UUID_GATT_RRICR
: GATT Characteristic Relative Runtime In A Current Range.

BT_UUID_GATT_RRIGLR_VAL
: GATT Characteristic Relative Runtime In A Generic Level Range UUID Value.

BT_UUID_GATT_RRIGLR
: GATT Characteristic Relative Runtime In A Generic Level Range.

BT_UUID_GATT_RVIVR_VAL
: GATT Characteristic Relative Value In A Voltage Range UUID Value.

BT_UUID_GATT_RVIVR
: GATT Characteristic Relative Value In A Voltage Range.

BT_UUID_GATT_RVIIR_VAL
: GATT Characteristic Relative Value In A Illuminance Range UUID Value.

BT_UUID_GATT_RVIIR
: GATT Characteristic Relative Value In A Illuminance Range.

BT_UUID_GATT_RVIPOD_VAL
: GATT Characteristic Relative Value In A Period Of Day UUID Value.

BT_UUID_GATT_RVIPOD
: GATT Characteristic Relative Value In A Period Of Day.

BT_UUID_GATT_RVITR_VAL
: GATT Characteristic Relative Value In A Temperature Range UUID Value.

BT_UUID_GATT_RVITR
: GATT Characteristic Relative Value In A Temperature Range.

BT_UUID_GATT_TEMP8_VAL
: GATT Characteristic Temperature 8 UUID Value.

BT_UUID_GATT_TEMP8
: GATT Characteristic Temperature 8.

BT_UUID_GATT_TEMP8_IPOD_VAL
: GATT Characteristic Temperature 8 In A Period Of Day UUID Value.

BT_UUID_GATT_TEMP8_IPOD
: GATT Characteristic Temperature 8 In A Period Of Day.

BT_UUID_GATT_TEMP8_STAT_VAL
: GATT Characteristic Temperature 8 Statistics UUID Value.

BT_UUID_GATT_TEMP8_STAT
: GATT Characteristic Temperature 8 Statistics.

BT_UUID_GATT_TEMP_RNG_VAL
: GATT Characteristic Temperature Range UUID Value.

BT_UUID_GATT_TEMP_RNG
: GATT Characteristic Temperature Range.

BT_UUID_GATT_TEMP_STAT_VAL
: GATT Characteristic Temperature Statistics UUID Value.

BT_UUID_GATT_TEMP_STAT
: GATT Characteristic Temperature Statistics.

BT_UUID_GATT_TIM_DC8_VAL
: GATT Characteristic Time Decihour 8 UUID Value.

`BT_UUID_GATT_TIM_DC8`
GATT Characteristic Time Decihour 8.

`BT_UUID_GATT_TIM_EXP8_VAL`
GATT Characteristic Time Exponential 8 UUID Value.

`BT_UUID_GATT_TIM_EXP8`
GATT Characteristic Time Exponential 8.

`BT_UUID_GATT_TIM_H24_VAL`
GATT Characteristic Time Hour 24 UUID Value.

`BT_UUID_GATT_TIM_H24`
GATT Characteristic Time Hour 24.

`BT_UUID_GATT_TIM_MS24_VAL`
GATT Characteristic Time Millisecond 24 UUID Value.

`BT_UUID_GATT_TIM_MS24`
GATT Characteristic Time Millisecond 24.

`BT_UUID_GATT_TIM_S16_VAL`
GATT Characteristic Time Second 16 UUID Value.

`BT_UUID_GATT_TIM_S16`
GATT Characteristic Time Second 16.

`BT_UUID_GATT_TIM_S8_VAL`
GATT Characteristic Time Second 8 UUID Value.

`BT_UUID_GATT_TIM_S8`
GATT Characteristic Time Second 8.

`BT_UUID_GATT_V_VAL`
GATT Characteristic Voltage UUID Value.

`BT_UUID_GATT_V`
GATT Characteristic Voltage.

`BT_UUID_GATT_V_SPEC_VAL`
GATT Characteristic Voltage Specification UUID Value.

`BT_UUID_GATT_V_SPEC`
GATT Characteristic Voltage Specification.

`BT_UUID_GATT_V_STAT_VAL`
GATT Characteristic Voltage Statistics UUID Value.

BT_UUID_GATT_V_STAT
: GATT Characteristic Voltage Statistics.

BT_UUID_GATT_VOLF_VAL
: GATT Characteristic Volume Flow UUID Value.

BT_UUID_GATT_VOLF
: GATT Characteristic Volume Flow.

BT_UUID_GATT_CRCOORD_VAL
: GATT Characteristic Chromaticity Coordinate (not Coordinates) UUID Value.

BT_UUID_GATT_CRCOORD
: GATT Characteristic Chromaticity Coordinate (not Coordinates)

BT_UUID_GATT_RCF_VAL
: GATT Characteristic RC Feature UUID Value.

BT_UUID_GATT_RCF
: GATT Characteristic RC Feature.

BT_UUID_GATT_RCSET_VAL
: GATT Characteristic RC Settings UUID Value.

BT_UUID_GATT_RCSET
: GATT Characteristic RC Settings.

BT_UUID_GATT_RCCP_VAL
: GATT Characteristic Reconnection Configuration Control Point UUID Value.

BT_UUID_GATT_RCCP
: GATT Characteristic Reconnection Configuration Control Point.

BT_UUID_GATT_IDD_SC_VAL
: GATT Characteristic IDD Status Changed UUID Value.

BT_UUID_GATT_IDD_SC
: GATT Characteristic IDD Status Changed.

BT_UUID_GATT_IDD_S_VAL
: GATT Characteristic IDD Status UUID Value.

BT_UUID_GATT_IDD_S
: GATT Characteristic IDD Status.

BT_UUID_GATT_IDD_AS_VAL
: GATT Characteristic IDD Annunciation Status UUID Value.

BT_UUID_GATT_IDD_AS
: GATT Characteristic IDD Annunciation Status.

BT_UUID_GATT_IDD_F_VAL
: GATT Characteristic IDD Features UUID Value.

BT_UUID_GATT_IDD_F
: GATT Characteristic IDD Features.

BT_UUID_GATT_IDD_SRCP_VAL
: GATT Characteristic IDD Status Reader Control Point UUID Value.

BT_UUID_GATT_IDD_SRCP
: GATT Characteristic IDD Status Reader Control Point.

BT_UUID_GATT_IDD_CCP_VAL
: GATT Characteristic IDD Command Control Point UUID Value.

BT_UUID_GATT_IDD_CCP
: GATT Characteristic IDD Command Control Point.

BT_UUID_GATT_IDD_CD_VAL
: GATT Characteristic IDD Command Data UUID Value.

BT_UUID_GATT_IDD_CD
: GATT Characteristic IDD Command Data.

BT_UUID_GATT_IDD_RACP_VAL
: GATT Characteristic IDD Record Access Control Point UUID Value.

BT_UUID_GATT_IDD_RACP
: GATT Characteristic IDD Record Access Control Point.

BT_UUID_GATT_IDD_HD_VAL
: GATT Characteristic IDD History Data UUID Value.

BT_UUID_GATT_IDD_HD
: GATT Characteristic IDD History Data.

BT_UUID_GATT_CLIENT_FEATURES_VAL
: GATT Characteristic Client Supported Features UUID value.

BT_UUID_GATT_CLIENT_FEATURES
: GATT Characteristic Client Supported Features.

BT_UUID_GATT_DB_HASH_VAL
: GATT Characteristic Database Hash UUID value.

BT_UUID_GATT_DB_HASH
: GATT Characteristic Database Hash.

BT_UUID_GATT_BSS_CP_VAL
: GATT Characteristic BSS Control Point UUID Value.

BT_UUID_GATT_BSS_CP
: GATT Characteristic BSS Control Point.

BT_UUID_GATT_BSS_R_VAL
: GATT Characteristic BSS Response UUID Value.

BT_UUID_GATT_BSS_R
: GATT Characteristic BSS Response.

BT_UUID_GATT_EMG_ID_VAL
: GATT Characteristic Emergency ID UUID Value.

BT_UUID_GATT_EMG_ID
: GATT Characteristic Emergency ID.

BT_UUID_GATT_EMG_TXT_VAL
: GATT Characteristic Emergency Text UUID Value.

BT_UUID_GATT_EMG_TXT
: GATT Characteristic Emergency Text.

BT_UUID_GATT_ACS_S_VAL
: GATT Characteristic ACS Status UUID Value.

BT_UUID_GATT_ACS_S
: GATT Characteristic ACS Status.

BT_UUID_GATT_ACS_DI_VAL
: GATT Characteristic ACS Data In UUID Value.

BT_UUID_GATT_ACS_DI
: GATT Characteristic ACS Data In.

BT_UUID_GATT_ACS_DON_VAL
: GATT Characteristic ACS Data Out Notify UUID Value.

BT_UUID_GATT_ACS_DON
: GATT Characteristic ACS Data Out Notify.

BT_UUID_GATT_ACS_DOI_VAL
: GATT Characteristic ACS Data Out Indicate UUID Value.

BT_UUID_GATT_ACS_DOI
: GATT Characteristic ACS Data Out Indicate.

BT_UUID_GATT_ACS_CP_VAL
: GATT Characteristic ACS Control Point UUID Value.

BT_UUID_GATT_ACS_CP
: GATT Characteristic ACS Control Point.

BT_UUID_GATT_EBPM_VAL
: GATT Characteristic Enhanced Blood Pressure Measurement UUID Value.

BT_UUID_GATT_EBPM
: GATT Characteristic Enhanced Blood Pressure Measurement.

BT_UUID_GATT_EICP_VAL
: GATT Characteristic Enhanced Intermediate Cuff Pressure UUID Value.

BT_UUID_GATT_EICP
: GATT Characteristic Enhanced Intermediate Cuff Pressure.

BT_UUID_GATT_BPR_VAL
: GATT Characteristic Blood Pressure Record UUID Value.

BT_UUID_GATT_BPR
: GATT Characteristic Blood Pressure Record.

BT_UUID_GATT_RU_VAL
: GATT Characteristic Registered User UUID Value.

BT_UUID_GATT_RU
: GATT Characteristic Registered User.

BT_UUID_GATT_BR_EDR_HD_VAL
: GATT Characteristic BR-EDR Handover Data UUID Value.

BT_UUID_GATT_BR_EDR_HD
: GATT Characteristic BR-EDR Handover Data.

BT_UUID_GATT_BT_SIG_D_VAL
: GATT Characteristic Bluetooth SIG Data UUID Value.

BT_UUID_GATT_BT_SIG_D
: GATT Characteristic Bluetooth SIG Data.

BT_UUID_GATT_SERVER_FEATURES_VAL
: GATT Characteristic Server Supported Features UUID value.

BT_UUID_GATT_SERVER_FEATURES
: GATT Characteristic Server Supported Features.

BT_UUID_GATT_PHY_AMF_VAL
: GATT Characteristic Physical Activity Monitor Features UUID Value.

BT_UUID_GATT_PHY_AMF
: GATT Characteristic Physical Activity Monitor Features.

BT_UUID_GATT_GEN_AID_VAL
: GATT Characteristic General Activity Instantaneous Data UUID Value.

BT_UUID_GATT_GEN_AID
: GATT Characteristic General Activity Instantaneous Data.

BT_UUID_GATT_GEN_ASD_VAL
: GATT Characteristic General Activity Summary Data UUID Value.

BT_UUID_GATT_GEN_ASD
: GATT Characteristic General Activity Summary Data.

BT_UUID_GATT_CR_AID_VAL
: GATT Characteristic CardioRespiratory Activity Instantaneous Data UUID Value.

BT_UUID_GATT_CR_AID
: GATT Characteristic CardioRespiratory Activity Instantaneous Data.

BT_UUID_GATT_CR_ASD_VAL
: GATT Characteristic CardioRespiratory Activity Summary Data UUID Value.

BT_UUID_GATT_CR_ASD
: GATT Characteristic CardioRespiratory Activity Summary Data.

BT_UUID_GATT_SC_ASD_VAL
: GATT Characteristic Step Counter Activity Summary Data UUID Value.

BT_UUID_GATT_SC_ASD
: GATT Characteristic Step Counter Activity Summary Data.

BT_UUID_GATT_SLP_AID_VAL
: GATT Characteristic Sleep Activity Instantaneous Data UUID Value.

BT_UUID_GATT_SLP_AID
: GATT Characteristic Sleep Activity Instantaneous Data.

BT_UUID_GATT_SLP_ASD_VAL
: GATT Characteristic Sleep Activity Summary Data UUID Value.

BT_UUID_GATT_SLP_ASD
: GATT Characteristic Sleep Activity Summary Data.

BT_UUID_GATT_PHY_AMCP_VAL
: GATT Characteristic Physical Activity Monitor Control Point UUID Value.

BT_UUID_GATT_PHY_AMCP
: GATT Characteristic Physical Activity Monitor Control Point.

BT_UUID_GATT_ACS_VAL
: GATT Characteristic Activity Current Session UUID Value.

BT_UUID_GATT_ACS
: GATT Characteristic Activity Current Session.

BT_UUID_GATT_PHY_ASDESC_VAL
: GATT Characteristic Physical Activity Session Descriptor UUID Value.

BT_UUID_GATT_PHY_ASDESC
: GATT Characteristic Physical Activity Session Descriptor.

BT_UUID_GATT_PREF_U_VAL
: GATT Characteristic Preferred Units UUID Value.

BT_UUID_GATT_PREF_U
: GATT Characteristic Preferred Units.

BT_UUID_GATT_HRES_H_VAL
: GATT Characteristic High Resolution Height UUID Value.

BT_UUID_GATT_HRES_H
: GATT Characteristic High Resolution Height.

BT_UUID_GATT_MID_NAME_VAL
: GATT Characteristic Middle Name UUID Value.

BT_UUID_GATT_MID_NAME
: GATT Characteristic Middle Name.

BT_UUID_GATT_STRDLEN_VAL
: GATT Characteristic Stride Length UUID Value.

BT_UUID_GATT_STRDLEN
: GATT Characteristic Stride Length.

BT_UUID_GATT_HANDEDNESS_VAL
: GATT Characteristic Handedness UUID Value.

BT_UUID_GATT_HANDEDNESS
: GATT Characteristic Handedness.

BT_UUID_GATT_DEVICE_WP_VAL
: GATT Characteristic Device Wearing Position UUID Value.

BT_UUID_GATT_DEVICE_WP
: GATT Characteristic Device Wearing Position.

BT_UUID_GATT_4ZHRL_VAL
: GATT Characteristic Four Zone Heart Rate Limit UUID Value.

BT_UUID_GATT_4ZHRL
: GATT Characteristic Four Zone Heart Rate Limit.

BT_UUID_GATT_HIET_VAL
: GATT Characteristic High Intensity Exercise Threshold UUID Value.

BT_UUID_GATT_HIET
: GATT Characteristic High Intensity Exercise Threshold.

BT_UUID_GATT_AG_VAL
: GATT Characteristic Activity Goal UUID Value.

BT_UUID_GATT_AG
: GATT Characteristic Activity Goal.

BT_UUID_GATT_SIN_VAL
: GATT Characteristic Sedentary Interval Notification UUID Value.

BT_UUID_GATT_SIN
: GATT Characteristic Sedentary Interval Notification.

BT_UUID_GATT_CI_VAL
: GATT Characteristic Caloric Intake UUID Value.

BT_UUID_GATT_CI
: GATT Characteristic Caloric Intake.

BT_UUID_GATT_TMAPR_VAL
: GATT Characteristic TMAP Role UUID Value.

BT_UUID_GATT_TMAPR
: GATT Characteristic TMAP Role.

BT_UUID_AICS_STATE_VAL
: Audio Input Control Service State value.

`BT_UUID_AICS_STATE`
: Audio Input Control Service State.

`BT_UUID_AICS_GAIN_SETTINGS_VAL`
: Audio Input Control Service Gain Settings Properties value.

`BT_UUID_AICS_GAIN_SETTINGS`
: Audio Input Control Service Gain Settings Properties.

`BT_UUID_AICS_INPUT_TYPE_VAL`
: Audio Input Control Service Input Type value.

`BT_UUID_AICS_INPUT_TYPE`
: Audio Input Control Service Input Type.

`BT_UUID_AICS_INPUT_STATUS_VAL`
: Audio Input Control Service Input Status value.

`BT_UUID_AICS_INPUT_STATUS`
: Audio Input Control Service Input Status.

`BT_UUID_AICS_CONTROL_VAL`
: Audio Input Control Service Control Point value.

`BT_UUID_AICS_CONTROL`
: Audio Input Control Service Control Point.

`BT_UUID_AICS_DESCRIPTION_VAL`
: Audio Input Control Service Input Description value.

`BT_UUID_AICS_DESCRIPTION`
: Audio Input Control Service Input Description.

`BT_UUID_VCS_STATE_VAL`
: Volume Control Setting value.

`BT_UUID_VCS_STATE`
: Volume Control Setting.

`BT_UUID_VCS_CONTROL_VAL`
: Volume Control Control point value.

`BT_UUID_VCS_CONTROL`
: Volume Control Control point.

`BT_UUID_VCS_FLAGS_VAL`
: Volume Control Flags value.

BT_UUID_VCS_FLAGS
: Volume Control Flags.

BT_UUID_VOCS_STATE_VAL
: Volume Offset State value.

BT_UUID_VOCS_STATE
: Volume Offset State.

BT_UUID_VOCS_LOCATION_VAL
: Audio Location value.

BT_UUID_VOCS_LOCATION
: Audio Location.

BT_UUID_VOCS_CONTROL_VAL
: Volume Offset Control Point value.

BT_UUID_VOCS_CONTROL
: Volume Offset Control Point.

BT_UUID_VOCS_DESCRIPTION_VAL
: Volume Offset Audio Output Description value.

BT_UUID_VOCS_DESCRIPTION
: Volume Offset Audio Output Description.

BT_UUID_CSIS_SIRK_VAL
: Set Identity Resolving Key value.

BT_UUID_CSIS_SIRK
: Set Identity Resolving Key.

BT_UUID_CSIS_SET_SIZE_VAL
: Set size value.

BT_UUID_CSIS_SET_SIZE
: Set size.

BT_UUID_CSIS_SET_LOCK_VAL
: Set lock value.

BT_UUID_CSIS_SET_LOCK
: Set lock.

BT_UUID_CSIS_RANK_VAL
: Rank value.

BT_UUID_CSIS_RANK
: Rank.

BT_UUID_GATT_EDKM_VAL
: GATT Characteristic Encrypted Data Key Material UUID Value.

BT_UUID_GATT_EDKM
: GATT Characteristic Encrypted Data Key Material.

BT_UUID_GATT_AE32_VAL
: GATT Characteristic Apparent Energy 32 UUID Value.

BT_UUID_GATT_AE32
: GATT Characteristic Apparent Energy 32.

BT_UUID_GATT_AP_VAL
: GATT Characteristic Apparent Power UUID Value.

BT_UUID_GATT_AP
: GATT Characteristic Apparent Power.

BT_UUID_GATT_CO2CONC_VAL
: GATT Characteristic CO2 Concentration UUID Value.

BT_UUID_GATT_CO2CONC
: GATT Characteristic CO2 Concentration.

BT_UUID_GATT_COS_VAL
: GATT Characteristic Cosine of the Angle UUID Value.

BT_UUID_GATT_COS
: GATT Characteristic Cosine of the Angle.

BT_UUID_GATT_DEVTF_VAL
: GATT Characteristic Device Time Feature UUID Value.

BT_UUID_GATT_DEVTF
: GATT Characteristic Device Time Feature.

BT_UUID_GATT_DEVTP_VAL
: GATT Characteristic Device Time Parameters UUID Value.

BT_UUID_GATT_DEVTP
: GATT Characteristic Device Time Parameters.

BT_UUID_GATT_DEVT_VAL
: GATT Characteristic Device Time UUID Value.

BT_UUID_GATT_DEVT
: GATT Characteristic String.

BT_UUID_GATT_DEVTCP_VAL
: GATT Characteristic Device Time Control Point UUID Value.

BT_UUID_GATT_DEVTCP
: GATT Characteristic Device Time Control Point.

BT_UUID_GATT_TCLD_VAL
: GATT Characteristic Time Change Log Data UUID Value.

BT_UUID_GATT_TCLD
: GATT Characteristic Time Change Log Data.

BT_UUID_MCS_PLAYER_NAME_VAL
: Media player name value.

BT_UUID_MCS_PLAYER_NAME
: Media player name.

BT_UUID_MCS_ICON_OBJ_ID_VAL
: Media Icon Object ID value.

BT_UUID_MCS_ICON_OBJ_ID
: Media Icon Object ID.

BT_UUID_MCS_ICON_URL_VAL
: Media Icon URL value.

BT_UUID_MCS_ICON_URL
: Media Icon URL.

BT_UUID_MCS_TRACK_CHANGED_VAL
: Track Changed value.

BT_UUID_MCS_TRACK_CHANGED
: Track Changed.

BT_UUID_MCS_TRACK_TITLE_VAL
: Track Title value.

BT_UUID_MCS_TRACK_TITLE
: Track Title.

BT_UUID_MCS_TRACK_DURATION_VAL
: Track Duration value.

BT_UUID_MCS_TRACK_DURATION
: Track Duration.

BT_UUID_MCS_TRACK_POSITION_VAL
: Track Position value.

BT_UUID_MCS_TRACK_POSITION
: Track Position.

BT_UUID_MCS_PLAYBACK_SPEED_VAL
: Playback Speed value.

BT_UUID_MCS_PLAYBACK_SPEED
: Playback Speed.

BT_UUID_MCS_SEEKING_SPEED_VAL
: Seeking Speed value.

BT_UUID_MCS_SEEKING_SPEED
: Seeking Speed.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID_VAL
: Track Segments Object ID value.

BT_UUID_MCS_TRACK_SEGMENTS_OBJ_ID
: Track Segments Object ID.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID_VAL
: Current Track Object ID value.

BT_UUID_MCS_CURRENT_TRACK_OBJ_ID
: Current Track Object ID.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID_VAL
: Next Track Object ID value.

BT_UUID_MCS_NEXT_TRACK_OBJ_ID
: Next Track Object ID.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID_VAL
: Parent Group Object ID value.

BT_UUID_MCS_PARENT_GROUP_OBJ_ID
: Parent Group Object ID.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID_VAL
: Group Object ID value.

BT_UUID_MCS_CURRENT_GROUP_OBJ_ID
: Group Object ID.

BT_UUID_MCS_PLAYING_ORDER_VAL
: Playing Order value.

BT_UUID_MCS_PLAYING_ORDER
: Playing Order.

BT_UUID_MCS_PLAYING_ORDERS_VAL
: Playing Orders supported value.

BT_UUID_MCS_PLAYING_ORDERS
: Playing Orders supported.

BT_UUID_MCS_MEDIA_STATE_VAL
: Media State value.

BT_UUID_MCS_MEDIA_STATE
: Media State.

BT_UUID_MCS_MEDIA_CONTROL_POINT_VAL
: Media Control Point value.

BT_UUID_MCS_MEDIA_CONTROL_POINT
: Media Control Point.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES_VAL
: Media control opcodes supported value.

BT_UUID_MCS_MEDIA_CONTROL_OPCODES
: Media control opcodes supported.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID_VAL
: Search result object ID value.

BT_UUID_MCS_SEARCH_RESULTS_OBJ_ID
: Search result object ID.

BT_UUID_MCS_SEARCH_CONTROL_POINT_VAL
: Search control point value.

BT_UUID_MCS_SEARCH_CONTROL_POINT
: Search control point.

BT_UUID_GATT_E32_VAL
: GATT Characteristic Energy 32 UUID Value.

BT_UUID_GATT_E32
: GATT Characteristic Energy 32.

BT_UUID_OTS_TYPE_MPL_ICON_VAL
: Media Player Icon Object Type value.

BT_UUID_OTS_TYPE_MPL_ICON
: Media Player Icon Object Type.

BT_UUID_OTS_TYPE_TRACK_SEGMENT_VAL
: Track Segments Object Type value.

BT_UUID_OTS_TYPE_TRACK_SEGMENT
: Track Segments Object Type.

BT_UUID_OTS_TYPE_TRACK_VAL
: Track Object Type value.

BT_UUID_OTS_TYPE_TRACK
: Track Object Type.

BT_UUID_OTS_TYPE_GROUP_VAL
: Group Object Type value.

BT_UUID_OTS_TYPE_GROUP
: Group Object Type.

BT_UUID_GATT_CTEE_VAL
: GATT Characteristic Constant Tone Extension Enable UUID Value.

BT_UUID_GATT_CTEE
: GATT Characteristic Constant Tone Extension Enable.

BT_UUID_GATT_ACTEML_VAL
: GATT Characteristic Advertising Constant Tone Extension Minimum Length UUID Value.

BT_UUID_GATT_ACTEML
: GATT Characteristic Advertising Constant Tone Extension Minimum Length.

Enums

Bluetooth UUID types.

Values:

enumerator **BT_UUID_TYPE_16**
UUID type 16-bit.

enumerator **BT_UUID_TYPE_32**
UUID type 32-bit.

enumerator **BT_UUID_TYPE_128**
UUID type 128-bit.

Functions

int **bt_uuid_cmp**(const struct *bt_uuid* *u1, const struct *bt_uuid* *u2)
Compare Bluetooth UUIDs.

Compares 2 Bluetooth UUIDs, if the types are different both UUIDs are first converted to 128 bits format before comparing.

Parameters

- **u1** – First Bluetooth UUID to compare
- **u2** – Second Bluetooth UUID to compare

Returns
negative value if *u1* < *u2*, 0 if *u1* == *u2*, else positive

bool **bt_uuid_create**(struct *bt_uuid* *uuid, const uint8_t *data, uint8_t data_len)
Create a *bt_uuid* from a little-endian data buffer.

Create a *bt_uuid* from a little-endian data buffer. The data_len parameter is used to determine whether the UUID is in 16, 32 or 128 bit format (length 2, 4 or 16). Note: 32 bit format is not allowed over the air.

Parameters

- **uuid** – Pointer to the *bt_uuid* variable
- **data** – pointer to UUID stored in little-endian data buffer
- **data_len** – length of the UUID in the data buffer

Returns
true if the data was valid and the UUID was successfully created.

void **bt_uuid_to_str**(const struct *bt_uuid* *uuid, char *str, size_t len)
Convert Bluetooth UUID to string.

Converts Bluetooth UUID to string. UUID can be in any format, 16-bit, 32-bit or 128-bit.

Parameters

- **uuid** – Bluetooth UUID
- **str** – pointer where to put converted string
- **len** – length of str

struct **bt_uuid**

#include <uuid.h> This is a 'tentative' type and should be used as a pointer only.

struct **bt_uuid_16**

#include <uuid.h>

Public Members

struct *bt_uuid* **uuid**

UUID generic type.

uint16_t **val**

UUID value, 16-bit in host endianness.

struct **bt_uuid_32**

#include <uuid.h>

Public Members

struct *bt_uuid* **uuid**

UUID generic type.

uint32_t **val**

UUID value, 32-bit in host endianness.

struct **bt_uuid_128**

#include <uuid.h>

Public Members

struct *bt_uuid* **uuid**

UUID generic type.

uint8_t **val**[16]

UUID value, 128-bit in little-endian format.

6.1.10 Tools

This page lists and describes tools that can be used to assist during Bluetooth stack or application development in order to help, simplify and speed up the development process.

- *Mobile applications*
- *Using BlueZ with Zephyr*

- *Running on QEMU or native_sim*
  - *Using the Host System Bluetooth Controller*
  - *Using a Zephyr-based BLE Controller*
  - *HCI Tracing*
- *Running on a Virtual Controller and native_sim*
  - *Android Emulator*
- *Using Zephyr-based Controllers with BlueZ*

Mobile applications

It is often useful to make use of existing mobile applications to interact with hardware running Zephyr, to test functionality without having to write any additional code or requiring extra hardware.

The recommended mobile applications for interacting with Zephyr are:

- Android:
  - nRF Connect for Android
  - nRF Mesh for Android
  - LightBlue for Android
- iOS:
  - nRF Connect for iOS
  - nRF Mesh for iOS
  - LightBlue for iOS

Using BlueZ with Zephyr

The Linux Bluetooth Protocol Stack, BlueZ, comes with a very useful set of tools that can be used to debug and interact with Zephyr's BLE Host and Controller. In order to benefit from these tools you will need to make sure that you are running a recent version of the Linux Kernel and BlueZ:

- Linux Kernel 4.10+
- BlueZ 4.45+

Additionally, some of the BlueZ tools might not be bundled by default by your Linux distribution. If you need to build BlueZ from scratch to update to a recent version or to obtain all of its tools you can follow the steps below:

```
git clone git://git.kernel.org/pub/scm/bluetooth/bluez.git
cd bluez
./bootstrap-configure --disable-android --disable-midi
make
```

You can then find `btattach`, `btmgt` and `btproxy` in the `tools/` folder and `btmon` in the `monitor/` folder.

You'll need to enable BlueZ's experimental features so you can access its most recent BLE functionality. Do this by editing the file `/lib/systemd/system/bluetooth.service` and making sure to include the `-E` option in the daemon's execution start line:

```
ExecStart=/usr/libexec/bluetooth/bluetoothd -E
```

Finally, reload and restart the daemon:

```
sudo systemctl daemon-reload
sudo systemctl restart bluetooth
```

Running on QEMU or native_sim

It's possible to run Bluetooth applications using either the *QEMU emulator* or native_sim.

In either case, a Bluetooth controller needs to be exported from the host OS (Linux) to the emulator. For this purpose you will need some tools described in the *Using BlueZ with Zephyr* section.

Using the Host System Bluetooth Controller The host OS's Bluetooth controller is connected in the following manner:

- To the second QEMU serial line using a UNIX socket. This socket gets used with the help of the QEMU option `-serial unix:/tmp/bt-server-bredr`. This option gets passed to QEMU through `QEMU_EXTRA_FLAGS` automatically whenever an application has enabled Bluetooth support.
- To native_sim's BT User Channel driver through the use of a command-line option passed to the native_sim executable: `--bt-dev=hci0`

On the host side, BlueZ allows you to export its Bluetooth controller through a so-called user channel for QEMU and native_sim to use.

Note

You only need to run `btproxy` when using QEMU. native_sim handles the UNIX socket proxying automatically

If you are using QEMU, in order to make the Controller available you will need one additional step using `btproxy`:

1. Make sure that the Bluetooth controller is down
2. Use the btproxy tool to open the listening UNIX socket, type:

   ```
   sudo tools/btproxy -u -i 0
   Listening on /tmp/bt-server-bredr
   ```

   You might need to replace `-i 0` with the index of the Controller you wish to proxy.

   If you see `Received unknown host packet type 0x00` when running QEMU, then add `-z` to the `btproxy` command line to ignore any null bytes transmitted at startup.

Once the hardware is connected and ready to use, you can then proceed to building and running a sample:

- Choose one of the Bluetooth sample applications located in `samples/bluetooth`.
- To run a Bluetooth application in QEMU, type:

  ```
  west build -b qemu_x86 samples/bluetooth/<sample>
  west build -t run
  ```

  Running QEMU now results in a connection with the second serial line to the `bt-server-bredr` UNIX socket, letting the application access the Bluetooth controller.

- To run a Bluetooth application in native_sim, first build it:

```
west build -b native_sim samples/bluetooth/<sample>
```

And then run it with:

```
$ sudo ./build/zephyr/zephyr.exe --bt-dev=hci0
```

Using a Zephyr-based BLE Controller Depending on which hardware you have available, you can choose between two transports when building a single-mode, Zephyr-based BLE Controller:

- UART: Use the hci_uart sample and follow the instructions in bluetooth-hci-uart-qemu-posix.
- USB: Use the hci_usb sample and then treat it as a Host System Bluetooth Controller (see previous section)

HCI Tracing When running the Host on a computer connected to an external Controller, it is very useful to be able to see the full log of exchanges between the two, in the format of a *Host Controller Interface* log. In order to see those logs, you can use the built-in `btmon` tool from BlueZ:

```
$ btmon
```

The output looks like this:

```
= New Index: 00:00:00:00:00:00 (Primary,Virtual,Control)                    0.274200
= Open Index: 00:00:00:00:00:00                                             0.274500
< HCI Command: Reset (0x03|0x0003) plen 0                                #1 0.274600
> HCI Event: Command Complete (0x0e) plen 4                              #2 0.274700
      Reset (0x03|0x0003) ncmd 1
      Status: Success (0x00)
< HCI Command: Read Local Supported Features (0x04|0x0003) plen 0         #3 0.274800
> HCI Event: Command Complete (0x0e) plen 12                             #4 0.274900
      Read Local Supported Features (0x04|0x0003) ncmd 1
      Status: Success (0x00)
      Features: 0x00 0x00 0x00 0x00 0x60 0x00 0x00 0x00
         BR/EDR Not Supported
         LE Supported (Controller)
```

Embedded HCI tracing When running both Host and Controller in actual Integrated Circuits, you will only see normal log messages on the console by default, without any way of accessing the HCI traffic between the Host and the Controller. However, there is a special Bluetooth logging mode that converts the console to use a binary protocol that interleaves both normal log messages as well as the HCI traffic.

Set the following Kconfig options to enable this protocol before building your application:

```
CONFIG_BT_DEBUG_MONITOR_UART=y
CONFIG_UART_CONSOLE=n
```

- Setting `CONFIG_BT_DEBUG_MONITOR_UART` activates the formatting
- Clearing `CONFIG_UART_CONSOLE` makes the UART unavailable for the system console. E.g. for `printk` and the `boot banner`

To decode the binary protocol that will now be sent to the console UART you need to use the btmon tool from *BlueZ*:

```
$ btmon --tty <console TTY> --tty-speed 115200
```

If UART is not available (or you still want non-binary logs), you can set CONFIG_BT_DEBUG_MONITOR_RTT instead, which will use Segger RTT. For example, if trying to connect to a nRF52840DK with S/N 683578642:

```
$ btmon --jlink nRF52840_xxAA,683578642
```

Running on a Virtual Controller and native_sim

An alternative to a Bluetooth physical controller is the use of a virtual controller. This controller can be connected over an HCI TCP server. This TCP server must support the HCI H4 protocol. In comparison to the physical controller variant, the virtual controller allows to test a Zephyr application running on the native boards without a physical Bluetooth controller.

The main use case for a virtual controller is to do Bluetooth connectivity tests without the need of Bluetooth hardware. This allows to automate Bluetooth integration tests with external applications such as a Bluetooth gateway or a mobile application.

To demonstrate this functionality an example is given to interact with a virtual controller. For this purpose, the experimental python module Bumble from Google is used as it allows to create a TCP Bluetooth virtual controller and connect with the Zephyr Bluetooth host. To install bumble follow the Bumble Getting Started Guide.

> **Note**
>
> If your Zephyr application requires the use of the HCI LE Set extended commands, install the branch `controller-extended-advertising` from Bumble.

Android Emulator You can test the virtual controller by connecting a Bluetooth Zephyr application to the Android Emulator.

To connect your application to the Android Emulator follow the next steps:

1. Build your Zephyr application and disable the HCI ACL flow control (i.e. CONFIG_BT_HCI_ACL_FLOW_CONTROL=n) as the virtual controller from android does not support it at the moment.
2. Install Android Emulator version >= 33.1.4.0. The easiest way to do this is by installing the latest Android Studio Preview version.
3. Create a new Android Virtual Device (AVD) with the Android Device Manager. The AVD should use at least SDK API 34.
4. Run the Android Emulator via terminal as follows:

   ```
   emulator avd YOUR_AVD -packet-streamer-endpoint default
   ```

5. Create a Bluetooth bridge between the Zephyr application and the virtual controller from Android Emulator with the Bumble utility `hci-bridge`.

   ```
   bumble-hci-bridge tcp-server:_:1234 android-netsim
   ```

   This command will create a TCP server bridge on the local host IP address `127.0.0.1` and port number `1234`.

6. Run the Zephyr application and connect to the TCP server created in the last step.

   ```
   ./zephyr.exe --bt-dev=127.0.0.1:1234
   ```

After following these steps the Zephyr application will be available to the Android Emulator over the virtual Bluetooth controller that was bridged with Bumble. You can verify that the Zephyr application can communicate over Bluetooth by opening the Bluetooth settings in your AVD and

scanning for your Zephyr application device. To test this you can build the Bluetooth peripheral samples such as Peripheral HR or Peripheral DIS

Using Zephyr-based Controllers with BlueZ

If you want to test a Zephyr-powered BLE Controller using BlueZ's Bluetooth Host, you will need a few tools described in the *Using BlueZ with Zephyr* section. Once you have installed the tools you can then use them to interact with your Zephyr-based controller:

```
sudo tools/btmgmt --index 0
[hci0]# auto-power
[hci0]# find -l
```

You might need to replace `--index 0` with the index of the Controller you wish to manage. Additional information about `btmgmt` can be found in its manual pages.

6.1.11 Shell

The Bluetooth Shell is an application based on the *Shell* module. It offer a collection of commands made to easily interact with the Bluetooth stack.

Bluetooth Shell Setup and Usage

First you need to build and flash your board with the Bluetooth shell. For how to do that, see the *Getting Started Guide*. The Bluetooth shell itself is located in tests/bluetooth/shell/.

When it's done, connect to the CLI using your favorite serial terminal application. You should see the following prompt:

```
uart:~$
```

For more details on general usage of the shell, see *Shell*.

The first step is enabling Bluetooth. To do so, use the `bt init` command. The following message is printed to confirm Bluetooth has been initialized.

```
uart:~$ bt init
Bluetooth initialized

Identities

Identities are a Zephyr host concept, allowing a single physical device to behave like multiple logical Bluetooth devices.

The shell allows the creation of multiple identities, to a maximum that is set by the Kconfig symbol `CONFIG_BT_ID_MAX`. To create a new identity, use `bt id-create` command. You can then use it by selecting it with its ID `bt id-select <id>`. Finally, you can list all the available identities with `id-show`.

Scan for devices

Start scanning by using the `bt scan on` command. Depending on the environment you're in, you may see a lot of lines printed on the shell. To stop the scan, run `bt scan off`, the scrolling should stop.

Here is an example of what you can expect:

```
uart:~$ bt scan on
Bluetooth active scan enabled
[DEVICE]: CB:01:1A:2D:6E:AE (random), AD evt type 0, RSSI -78  C:1 S:1 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 20:C2:EE:59:85:5B (random), AD evt type 3, RSSI -62  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: E3:72:76:87:2F:E8 (random), AD evt type 3, RSSI -74  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 1E:19:25:8A:CB:84 (random), AD evt type 3, RSSI -67  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 26:42:F3:D5:A0:86 (random), AD evt type 3, RSSI -73  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 0C:61:D1:B9:5D:9E (random), AD evt type 3, RSSI -87  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 20:C2:EE:59:85:5B (random), AD evt type 3, RSSI -66  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
[DEVICE]: 25:3F:7A:EE:0F:55 (random), AD evt type 3, RSSI -83  C:0 S:0 D:0 SR:0 E:0 Prim:␣
↪LE 1M, Secn: No packets, Interval: 0x0000 (0 us), SID: 0xff
uart:~$ bt scan off
Scan successfully stopped
```

As you can see, this can lead to a high number of results. To reduce that number and easily find a specific device, you can enable scan filters. There are four types of filters: by name, by RSSI, by address and by periodic advertising interval. To apply a filter, use the `bt scan-set-filter` command followed by the type of filters. You can add multiple filters by using the commands again.

For example, if you want to look only for devices with the name *test shell*:

```
uart:~$ bt scan-filter-set name "test shell"
```

Or if you want to look for devices at a very close range:

```
uart:~$ bt scan-filter-set rssi -40
RSSI cutoff set at -40 dB
```

Finally, if you want to remove all filters:

```
uart:~$ bt scan-filter-clear all
```

You can use the command `bt scan on` to create an *active* scanner, meaning that the scanner will ask the advertisers for more information by sending a *scan request* packet. Alternatively, you can create a *passive scanner* by using the `bt scan passive` command, so the scanner will not ask the advertiser for more information.

Connecting to a device

To connect to a device, you need to know its address and type of address and use the `bt connect` command with the address and the type as arguments.

Here is an example:

```
uart:~$ bt connect 52:84:F6:BD:CE:48 random
Connection pending
Connected: 52:84:F6:BD:CE:48 (random)
Remote LMP version 5.3 (0x0c) subversion 0xffff manufacturer 0x05f1
LE Features: 0x000000000001412f
LE PHY updated: TX PHY LE 2M, RX PHY LE 2M
LE conn  param req: int (0x0018, 0x0028) lat 0 to 42
LE conn param updated: int 0x0028 lat 0 to 42
```

You can list the active connections of the shell using the `bt connections` command. The shell maximum number of connections is defined by `CONFIG_BT_MAX_CONN`. You can disconnect from a connection with the `bt disconnect <address: XX:XX:XX:XX:XX:XX> <type: (public|random)>` command.

Note

If you were scanning just before, you can connect to the last scanned device by simply running the `bt connect` command.

Alternatively, you can use the `bt connect-name <name>` command to automatically enable scanning with a name filter and connect to the first match.

Advertising

Begin advertising by using the `bt advertise on` command. This will use the default parameters and advertise a resolvable private address with the name of the device. You can choose to use the identity address instead by running the `bt advertise on identity` command. To stop advertising use the `bt advertise off` command.

To enable more advanced features of advertising, you should create an advertiser using the `bt adv-create` command. Parameters for the advertiser can be passed either at the creation of it or by using the `bt adv-param` command. To begin advertising with this newly created advertiser, use the `bt adv-start` command, and then the `bt adv-stop` command to stop advertising.

When using the custom advertisers, you can choose if it will be connectable or scannable. This leads to four options: `conn-scan`, `conn-nscan`, `nconn-scan` and `nconn-nscan`. Those parameters are mandatory when creating an advertiser or updating its parameters.

For example, if you want to create a connectable and scannable advertiser and start it:

```
uart:~$ bt adv-create conn-scan
Created adv id: 0, adv: 0x200022f0
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```

You may notice that with this, the custom advertiser does not advertise the device name; you need to add it. Continuing from the previous example:

```
uart:~$ bt adv-stop
Advertiser set stopped
uart:~$ bt adv-data dev-name
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```

You should now see the name of the device in the advertising data. You can also set a custom name by using `name <custom name>` instead of `dev-name`. It is also possible to set the advertising data manually with the `bt adv-data` command. The following example shows how to set the advertiser name with it using raw advertising data:

```
uart:~$ bt adv-create conn-scan
Created adv id: 0, adv: 0x20002348
uart:~$ bt adv-data 1009426C7565746F6F74682D5368656C6C
uart:~$ bt adv-start
Advertiser[0] 0x20002348 set started
```

The data must be formatted according to the Bluetooth Core Specification (see version 5.3, vol. 3, part C, 11). In this example, the first octet is the size of the data (the data and one octet for the data type), the second one is the type of data, `0x09` is the Complete Local Name and the remaining data are the name in ASCII. So, on the other device you should see the name *Bluetooth-Shell*.

When advertising, if others devices use an *active* scanner, you may receive *scan request* packets. To visualize those packets, you can add `scan-reports` to the parameters of your advertiser.

Directed Advertising It is possible to use directed advertising on the shell if you want to reconnect to a device. The following example demonstrates how to create a directed advertiser with the address specified right after the parameter `directed`. The `low` parameter indicates that we want to use the low duty cycle mode, and the `dir-rpa` parameter is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement.

```
uart:~$ bt adv-create conn-scan directed D7:54:03:CE:F3:B4 random low dir-rpa
Created adv id: 0, adv: 0x20002348
```

After that, you can start the advertiser and then the target device will be able to reconnect.

Extended Advertising Let's now have a look at some extended advertising features. To enable extended advertising, use the *ext-adv* parameter.

```
uart:~$ bt adv-create conn-nscan ext-adv name-ad
Created adv id: 0, adv: 0x200022f0
uart:~$ bt adv-start
Advertiser[0] 0x200022f0 set started
```

This will create an extended advertiser, that is connectable and non-scannable.

Encrypted Advertising Data Zephyr has support for the Encrypted Advertising Data feature. The `bt encrypted-ad` sub-commands allow managing the advertising data of a given advertiser.

To encrypt the advertising data, key materials need to be provided, that can be done with `bt encrypted-ad set-keys <session key> <init vector>`. The session key is 16 bytes long and the initialisation vector is 8 bytes long.

You can add advertising data by using `bt encrypted-ad add-ad` and `bt encrypted-ad add-ead`. The former will take add one advertising data structure (as defined in the Core Specification), when the later will read the given data, encrypt them and then add the generated encrypted advertising data structure. It's possible to mix encrypted and non-encrypted data, when done adding advertising data, `bt encrypted-ad commit-ad` can be used to apply the change to the data to the selected advertiser. After that the advertiser can be started as described previously. It's possible to clear the advertising data by using `bt encrypted-ad clear-ad`.

On the Central side, it's possible to decrypt the received encrypted advertising data by setting the correct keys material as described earlier and then enabling the decrypting of the data with `bt encrypted-ad decrypt-scan on`.

Note

To see the advertising data in the scan report `bt scan-verbose-output` need to be enabled.

Note

It's possible to increase the length of the advertising data by increasing the value of `CONFIG_BT_CTLR_ADV_DATA_LEN_MAX` and `CONFIG_BT_CTLR_SCAN_DATA_LEN_MAX`.

Here is a simple example demonstrating the usage of EAD:

Peripheral

```
uart:~$ bt init
...
uart:~$ bt adv-create conn-nscan ext-adv
Created adv id: 0, adv: 0x81769a0
uart:~$ bt encrypted-ad set-keys 9ba22d3824efc70feb800c80294cba38 2e83f3d4d47695b6
session key set to:
00000000: 9b a2 2d 38 24 ef c7 0f  eb 80 0c 80 29 4c ba 38 |..-8$... ....)L.8|
initialisation vector set to:
00000000: 2e 83 f3 d4 d4 76 95 b6                          |.....v..         |
uart:~$ bt encrypted-ad add-ad 06097368656C6C
uart:~$ bt encrypted-ad add-ead 03ffdead03ffbeef
uart:~$ bt encrypted-ad commit-ad
Advertising data for Advertiser[0] 0x81769a0 updated.
uart:~$ bt adv-start
Advertiser[0] 0x81769a0 set started
```

Central

```
uart:~$ bt init
...
uart:~$ bt scan-verbose-output on
uart:~$ bt encrypted-ad set-keys 9ba22d3824efc70feb800c80294cba38 2e83f3d4d47695b6
session key set to:
00000000: 9b a2 2d 38 24 ef c7 0f  eb 80 0c 80 29 4c ba 38 |..-8$... ....)L.8|
initialisation vector set to:
00000000: 2e 83 f3 d4 d4 76 95 b6                          |.....v..         |
uart:~$ bt encrypted-ad decrypt-scan on
Received encrypted advertising data will now be decrypted using provided key materials.
uart:~$ bt scan on
Bluetooth active scan enabled
[DEVICE]: 68:49:30:68:49:30 (random), AD evt type 5, RSSI -59   shell C:1 S:0 D:0 SR:0 E:1␣
↪Prim: LE 1M, Secn: LE 2M, Interval: 0x0000 (0 us), SID: 0x0
        [SCAN DATA START - EXT_ADV]
        Type 0x09:    shell
        Type 0x31: Encrypted Advertising Data: 0xe2, 0x17, 0xed, 0x04, 0xe7, 0x02, 0x1d,␣
↪0xc9, 0x40, 0x07, uart:~0x18, 0x90, 0x6c, 0x4b, 0xfe, 0x34, 0xad

        Type 0xff: 0xde, 0xad
        Type 0xff: 0xbe, 0xef
        [END DECRYPTED DATA]
        [SCAN DATA END]
...
```

Filter Accept List

It's possible to create a list of allowed addresses that can be used to connect to those addresses automatically. Here is how to do it:

```
uart:~$ bt fal-add 47:38:76:EA:29:36 random
uart:~$ bt fal-add 66:C8:80:2A:05:73 random
uart:~$ bt fal-connect on
```

The shell will then connect to the first available device. In the example, if both devices are advertising at the same time, we will connect to the first address added to the list.

The Filter Accept List can also be used for scanning or advertising by using the option `fal`. For example, if we want to scan for a bunch of selected addresses, we can set up a Filter Accept List:

```
uart:~$ bt fal-add 65:4B:9E:83:AF:73 random
uart:~$ bt fal-add 73:72:82:B4:8F:B9 random
uart:~$ bt fal-add 5D:85:50:1C:72:64 random
uart:~$ bt scan on fal
```

You should see only those three addresses reported by the scanner.

Enabling security

When connected to a device, you can enable multiple levels of security, here is the list for Bluetooth LE:

- **1** No encryption and no authentication;
- **2** Encryption and no authentication;
- **3** Encryption and authentication;
- **4** Bluetooth LE Secure Connection.

To enable security, use the `bt security <level>` command. For levels requiring authentication (level 3 and above), you must first set the authentication method. To do it, you can use the `bt auth all` command. After that, when you will set the security level, you will be asked to confirm the passkey on both devices. On the shell side, do it with the command `bt auth-passkey-confirm`.

Pairing Enabling authentication requires the devices to be bondable. By default the shell is bondable. You can make the shell not bondable using `bt bondable off`. You can list all the devices you are paired with using the command `bt bonds`.

The maximum number of paired devices is set using `CONFIG_BT_MAX_PAIRED`. You can remove a paired device using `bt clear <address: XX:XX:XX:XX:XX:XX> <type: (public|random)>` or remove all paired devices with the command `bt clear all`.

GATT

The following examples assume that you have two devices already connected.

To perform service discovery on the client side, use the `gatt discover` command. This should print all the services that are available on the GATT server.

On the server side, you can register pre-defined test services using the `gatt register` command. When done, you should see the newly added services on the client side when running the discovery command.

You can now subscribe to those new services on the client side. Here is an example on how to subscribe to the test service:

```
uart:~$ gatt subscribe 26 25
Subscribed
```

The server can now notify the client with the command `gatt notify`.

Another option available through the GATT command is initiating the MTU exchange. To do it, use the `gatt exchange-mtu` command. To update the shell maximum MTU, you need to update Kconfig symbols in the configuration file of the shell. For more details, see bluetooth_mtu_update_sample.

L2CAP

The `l2cap` command exposes parts of the L2CAP API. The following example shows how to register a LE PSM, connect to it from another device and send 3 packets of 14 octets each.

The example assumes that the two devices are already connected.

On device A, register the LE PSM:

```
uart:~$ l2cap register 29
L2CAP psm 41 sec_level 1 registered
```

On device B, connect to the registered LE PSM and send data:

```
uart:~$ l2cap connect 29
Chan sec: 1
L2CAP connection pending
Channel 0x20000210 connected
Channel 0x20000210 status 1
uart:~$ l2cap send 3 14
Rem 2
Rem 1
Rem 0
Outgoing data channel 0x20000210 transmitted
Outgoing data channel 0x20000210 transmitted
Outgoing data channel 0x20000210 transmitted
```

On device A, you should have received the data:

```
Incoming conn 0x20002398
Channel 0x20000210 status 1
Channel 0x20000210 connected
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff  ff ff ff ff ff ff       |........ ......  |
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff  ff ff ff ff ff ff       |........ ......  |
Channel 0x20000210 requires buffer
Incoming data channel 0x20000210 len 14
00000000: ff ff ff ff ff ff ff ff  ff ff ff ff ff ff       |........ ......  |
```

A2DP

The `a2dp` command exposes parts of the A2DP API.

The following examples assume that you have two devices already connected.

Here is a example connecting two devices:

- Source and Sink sides register a2dp callbacks. using `a2dp register_cb`.

- Source and Sink sides register stream endpoints. using `a2dp register_ep source sbc` and `a2dp register_ep sink sbc`.
- Source establish A2dp connection. It will create the AVDTP Signaling and Media L2CAP channels. using `a2dp connect`.
- Source and Sink side can discover remote device's stream endpoints. using `a2dp discover_peer_eps`
- Source or Sink configure the stream to create the stream after discover remote's endpoints. using `a2dp configure`.
- Source or Sink establish the stream. using `a2dp establish`.
- Source or Sink start the media. using `a2dp start`.
- Source test the media sending. using `a2dp send_media` to send one test packet data.

Device A (Audio Source Side)

```
uart:~$ a2dp register_cb
success
uart:~$ a2dp register_ep source sbc
SBC source endpoint is registered
uart:~$ a2dp connect
Bonded with XX:XX:XX:XX:XX:XX
Security changed: XX:XX:XX:XX:XX:XX level 2
a2dp connected
uart:~$ a2dp discover_peer_eps
endpoint id: 1, (sink), (idle):
  codec type: SBC
  sample frequency:
          44100
          48000
  channel mode:
          Mono
          Stereo
          Joint-Stereo
  Block Length:
          16
  Subbands:
          8
  Allocation Method:
          Loudness
  Bitpool Range: 18 - 35
uart:~$ a2dp configure
success to configure
stream configured
uart:~$ a2dp establish
success to establish
stream established
uart:~$ a2dp start
success to start
stream started
uart:~$ a2dp send_media
frames num: 1, data length: 160
data: 1, 2, 3, 4, 5, 6 ......
```

Device B (Audio Sink Side)

```
uart:~$ a2dp register_cb
success
uart:~$ a2dp register_ep sink sbc
SBC sink endpoint is registered
<after a2dp connect>
```

(continues on next page)

(continued from previous page)

```
Connected: XX:XX:XX:XX:XX:XX
Bonded with XX:XX:XX:XX:XX:XX
Security changed: XX:XX:XX:XX:XX:XX level 2
a2dp connected
<after a2dp configure of source side>
receive requesting config and accept
SBC configure success
sample rate 44100Hz
stream configured
<after a2dp establish of source side>
receive requesting establishment and accept
stream established
<after a2dp start of source side>
receive requesting start and accept
stream started
<after a2dp send_media of source side>
received, num of frames: 1, data length: 160
data: 1, 2, 3, 4, 5, 6 ......
...
```

Logging

You can configure the logging level per module at runtime. This depends on the maximum logging level that is compiled in. To configure, use the `log` command. Here are some examples:

- List the available modules and their current logging level

```
uart:~$ log status
```

- Disable logging for *bt_hci_core*

```
uart:~$ log disable bt_hci_core
```

- Enable error logs for *bt_att* and *bt_smp*

```
uart:~$ log enable err bt_att bt_smp
```

- Disable logging for all modules

```
uart:~$ log disable
```

- Enable warning logs for all modules

```
uart:~$ log enable wrn
```

6.2 Controller Area Network (CAN) Bus Protocols

6.2.1 ISO-TP Transport Protocol

- *Overview*
- *API Reference*

Overview

ISO-TP is a transport protocol defined in the ISO-Standard ISO15765-2 Road vehicles - Diagnostic communication over Controller Area Network (DoCAN). Part2: Transport protocol and network layer services. As its name already implies, it is originally designed, and still used in road vehicle diagnostic over Controller Area Networks. Nevertheless, it's not limited to applications in road vehicles or the automotive domain.

This transport protocol extends the limited payload data size for classical CAN (8 bytes) and CAN FD (64 bytes) to theoretically four gigabytes. Additionally, it adds a flow control mechanism to influence the sender's behavior. ISO-TP segments packets into small fragments depending on the payload size of the CAN frame. The header of those segments is called Protocol Control Information (PCI).

Packets smaller or equal to seven bytes on Classical CAN are called single-frames (SF). They don't need to fragment and do not have any flow-control.

Packets larger than that are segmented into a first-frame (FF) and as many consecutive-frames (CF) as required. The FF contains information about the length of the entire payload data and additionally, the first few bytes of payload data. The receiving peer sends back a flow-control-frame (FC) to either deny, postpone, or accept the following consecutive frames. The FC also defines the conditions of sending, namely the block-size (BS) and the minimum separation time between frames (STmin). The block size defines how many CF the sender is allowed to send, before he has to wait for another FC.

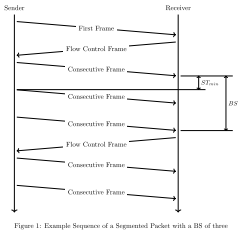

Figure 1: Example Sequence of a Segmented Packet with a BS of three

API Reference

Related code samples

ISO-TP library
Use ISO-TP library to exchange messages between two boards.

group `can_isotp`

CAN ISO-TP Protocol.

ISO-TP message ID flags

`ISOTP_MSG_EXT_ADDR`

Message uses ISO-TP extended addressing (first payload byte of CAN frame)

`ISOTP_MSG_FIXED_ADDR`

Message uses ISO-TP fixed addressing (according to SAE J1939).

Only valid in combination with `ISOTP_MSG_IDE`.

ISOTP_MSG_IDE
: Message uses extended (29-bit) CAN ID.

ISOTP_MSG_FDF
: Message uses CAN FD format (FDF)

ISOTP_MSG_BRS
: Message uses CAN FD Baud Rate Switch (BRS).

  Only valid in combination with `ISOTP_MSG_FDF`.

Defines

ISOTP_N_OK
: Completed successfully.

ISOTP_N_TIMEOUT_A
: Ar/As has timed out.

ISOTP_N_TIMEOUT_BS
: Reception of next FC has timed out.

ISOTP_N_TIMEOUT_CR
: Cr has timed out.

ISOTP_N_WRONG_SN
: Unexpected sequence number.

ISOTP_N_INVALID_FS
: Invalid flow status received.

ISOTP_N_UNEXP_PDU
: Unexpected PDU received.

ISOTP_N_WFT_OVRN
: Maximum number of WAIT flowStatus PDUs exceeded.

ISOTP_N_BUFFER_OVERFLW
: FlowStatus OVFLW PDU was received.

ISOTP_N_ERROR
: General error.

ISOTP_NO_FREE_FILTER
: Implementation specific errors.

  Can't bind or send because the CAN device has no filter left

ISOTP_NO_NET_BUF_LEFT
: No net buffer left to allocate.

ISOTP_NO_BUF_DATA_LEFT
: Not sufficient space in the buffer left for the data.

ISOTP_NO_CTX_LEFT
: No context buffer left to allocate.

ISOTP_RECV_TIMEOUT
: Timeout for recv.

ISOTP_FIXED_ADDR_SA_POS
: Position of fixed source address (SA)

ISOTP_FIXED_ADDR_SA_MASK
: Mask to obtain fixed source address (SA)

ISOTP_FIXED_ADDR_TA_POS
: Position of fixed target address (TA)

ISOTP_FIXED_ADDR_TA_MASK
: Mask to obtain fixed target address (TA)

ISOTP_FIXED_ADDR_PRIO_POS
: Position of priority in fixed addressing mode.

ISOTP_FIXED_ADDR_PRIO_MASK
: Mask for priority in fixed addressing mode.

ISOTP_FIXED_ADDR_RX_MASK
: CAN filter RX mask to match any priority and source address (SA)

Typedefs

typedef void (*isotp_tx_callback_t)(int error_nr, void *arg)

Transmission callback.

This callback is called when a transmission is completed.

Param error_nr
: ISOTP_N_OK on success, ISOTP_N_* on error

Param arg
: Callback argument passed to the send function

Functions

int **isotp_bind**(struct isotp_recv_ctx *rctx, const struct *device* *can_dev, const struct *isotp_msg_id* *rx_addr, const struct *isotp_msg_id* *tx_addr, const struct *isotp_fc_opts* *opts, *k_timeout_t* timeout)

Bind an address to a receiving context.

This function binds an RX and TX address combination to an RX context. When data arrives from the specified address, it is buffered and can be read by calling isotp_recv. When calling this routine, a filter is applied in the CAN device, and the context is initialized. The context must be valid until calling unbind.

Parameters

- **rctx** – Context to store the internal states.
- **can_dev** – The CAN device to be used for sending and receiving.
- **rx_addr** – Identifier for incoming data.
- **tx_addr** – Identifier for FC frames.
- **opts** – Flow control options.
- **timeout** – Timeout for FF SF buffer allocation.

Return values

- **ISOTP_N_OK** – on success
- **ISOTP_NO_FREE_FILTER** – if CAN device has no filters left.

void **isotp_unbind**(struct isotp_recv_ctx *rctx)

Unbind a context from the interface.

This function removes the binding from isotp_bind. The filter is detached from the CAN device, and if a transmission is ongoing, buffers are freed. The context can be discarded safely after calling this function.

Parameters

- **rctx** – Context that should be unbound.

int **isotp_recv**(struct isotp_recv_ctx *rctx, uint8_t *data, size_t len, *k_timeout_t* timeout)

Read out received data from fifo.

This function reads the data from the receive FIFO of the context. It blocks if the FIFO is empty. If an error occurs, the function returns a negative number and leaves the data buffer unchanged.

Parameters

- **rctx** – Context that is already bound.
- **data** – Pointer to a buffer where the data is copied to.
- **len** – Size of the buffer.
- **timeout** – Timeout for incoming data.

Return values

- **Number** – of bytes copied on success
- **ISOTP_RECV_TIMEOUT** – when “timeout” timed out
- **ISOTP_N_*** – on error

int **isotp_recv_net**(struct isotp_recv_ctx *rctx, struct *net_buf* **buffer, *k_timeout_t* timeout)

Get the net buffer on data reception.

This function reads incoming data into net-buffers. It blocks until the entire packet is received, BS is reached, or an error occurred. If BS was zero, the data is in a single *net_buf*. Otherwise, the data is fragmented in chunks of BS size. The net-buffers are referenced and must be freed with net_buf_unref after the data is processed.

Parameters

- `rctx` – Context that is already bound.
- `buffer` – Pointer where the *net_buf* pointer is written to.
- `timeout` – Timeout for incoming data.

Return values

- `Remaining` – data length for this transfer if BS > 0, 0 for BS = 0
- `ISOTP_RECV_TIMEOUT` – when "timeout" timed out
- `ISOTP_N_*` – on error

int `isotp_send`(struct isotp_send_ctx *sctx, const struct *device* *can_dev, const uint8_t *data, size_t len, const struct *isotp_msg_id* *tx_addr, const struct *isotp_msg_id* *rx_addr, *isotp_tx_callback_t* complete_cb, void *cb_arg)

Send data.

This function is used to send data to a peer that listens to the tx_addr. An internal work-queue is used to transfer the segmented data. Data and context must be valid until the transmission has finished. If a complete_cb is given, this function is non-blocking, and the callback is called on completion with the return value as a parameter.

Parameters

- `sctx` – Context to store the internal states.
- `can_dev` – The CAN device to be used for sending and receiving.
- `data` – Data to be sent.
- `len` – Length of the data to be sent.
- `rx_addr` – Identifier for FC frames.
- `tx_addr` – Identifier for outgoing frames the receiver listens on.
- `complete_cb` – Function called on completion or NULL.
- `cb_arg` – Argument passed to the complete callback.

Return values

- `ISOTP_N_OK` – on success
- `ISOTP_N_*` – on error

struct `isotp_msg_id`

#include <*isotp.h*> ISO-TP message id struct.

Used to pass addresses to the bind and send functions.

Public Members

union **isotp_msg_id**

CAN identifier.

If ISO-TP fixed addressing is used, isotp_bind ignores SA and priority sections and modifies TA section in flow control frames.

uint8_t **ext_addr**

ISO-TP extended address (if used)

uint8_t **dl**

ISO-TP frame data length (TX_DL for TX address or RX_DL for RX address).

Valid values are 8 for classical CAN or 8, 12, 16, 20, 24, 32, 48 and 64 for CAN FD.

0 will be interpreted as 8 or 64 (if ISOTP_MSG_FDF is set).

The value for incoming transmissions (RX_DL) is determined automatically based on the received first frame and does not need to be set during initialization.

uint8_t **flags**

Flags.

See also

ISOTP_MSG_FLAGS.

struct **isotp_fc_opts**

#include <*isotp.h*> ISO-TP frame control options struct.

Used to pass the options to the bind and send functions.

Public Members

uint8_t **bs**

Block size.

Number of CF PDUs before next CF is sent

uint8_t **stmin**

Minimum separation time.

Min time between frames

6.3 Networking

The networking section contains information regarding the network stack of the Zephyr kernel. Use the information to understand the principles behind the operation of the stacks and how they were implemented.

6.3.1 Overview

- *Supported Features*
- *Source Tree Layout*

Supported Features

The networking IP stack is modular and highly configurable via build-time configuration options. You can minimize system memory consumption by enabling only those network features required by your application. Almost all features can be disabled if not needed.

- **IPv6** The support for IPv6 is enabled by default. Various IPv6 sub-options can be enabled or disabled depending on networking needs.
  - Developer can set the number of unicast and multicast IPv6 addresses that are active at the same time.
  - The IPv6 address for the device can be set either statically or dynamically using SLAAC (Stateless Address Auto Configuration) (RFC 4862).
  - The system also supports multiple IPv6 prefixes and the maximum IPv6 prefix count can be configured at build time.
  - The IPv6 neighbor cache can be disabled if not needed, and its size can be configured at build time.
  - The IPv6 neighbor discovery support (RFC 4861) is enabled by default.
  - Multicast Listener Discovery v2 support (RFC 3810) is enabled by default.
  - IPv6 header compression (6lo) is available for IPv6 connectivity for IEEE 802.15.4 networks (RFC 4944).
- **IPv4** The legacy IPv4 is supported by the networking stack. It cannot be used by IEEE 802.15.4 as this network technology supports only IPv6. IPv4 can be used in Ethernet based networks. By default IPv4 support is disabled.
  - DHCP (Dynamic Host Configuration Protocol) client is supported (RFC 2131).
  - The IPv4 address can also be configured manually. Static IPv4 addresses are supported by default.
- **Dual stack support.** The networking stack allows a developer to configure the system to use both IPv6 and IPv4 at the same time.
- **UDP** User Datagram Protocol (RFC 768) is supported. The developer can send UDP datagrams (client side support) or create a listener to receive UDP packets destined to certain port (server side support).
- **TCP** Transmission Control Protocol (RFC 793) is supported. Both server and client roles can be used the application. The amount of TCP sockets that are available to applications can be configured at build time.
- **BSD Sockets API** Support for a subset of a *BSD sockets compatible API* is implemented. Both blocking and non-blocking datagram (UDP) and stream (TCP) sockets are supported.
- **Secure Sockets API** Experimental support for TLS/DTLS secure protocols and configuration options for sockets API. Secure functions for the implementation are provided by mbedTLS library.
- **MQTT** Message Queue Telemetry Transport (ISO/IEC PRF 20922) is supported. A sample mqtt-publisher client application for MQTT v3.1.1 is implemented.

- **CoAP** Constrained Application Protocol (RFC 7252) is supported. Both coap-client and coap-server sample applications are implemented.
- **LWM2M** OMA Lightweight Machine-to-Machine Protocol (LwM2M specification 1.0.2) is supported via the "Bootstrap", "Client Registration", "Device Management & Service Enablement" and "Information Reporting" interfaces. The required core LwM2M objects are implemented as well as several IPSO Smart Objects. (LwM2M specification 1.1.1) is supported in similar manner when enabled with a Kconfig option. lwm2m-client sample implements the library as an example.
- **HTTP** Hypertext Transfer Protocol client and server are supported. *HTTP Client* library supports HTTP/1.1 (RFC 2616). *HTTP Server* library supports HTTP/1.1 (RFC 2616) and HTTP/2 (RFC 9113). sockets-http-client and sockets-http-server samples are provided.
- **DNS** Domain Name Service (RFC 1035) client functionality is supported. Applications can use the DNS API to query domain name information or IP addresses from the DNS server. Both IPv4 (A) and IPv6 (AAAA) records can be queried. Both multicast DNS (mDNS) (RFC 6762) and link-local multicast name resolution (LLMNR) (RFC 4795) are supported.
- **Network Management API.** Applications can use network management API to listen management events generated by core stack when for example IP address is added to the device, or network interface is coming up etc.
- **Wi-Fi Management API.** Applications can use Wi-Fi management API to manage the interface, in example to connect to Wi-Fi network and to scan available Wi-Fi networks.
- **Wi-Fi Network Manager API.** Wi-Fi Network Managers can now register themselves to the Wi-Fi stack. The Network Managers can then implement the Wi-Fi Management API and manage the Wi-Fi interface.
- **Multiple Network Technologies.** The Zephyr OS can be configured to support multiple network technologies at the same time simply by enabling them in Kconfig: for example, Ethernet, Wi-Fi and 802.15.4 support. Note that no automatic IP routing functionality is provided between these technologies. Applications can send data according to their needs to desired network interface.
- **Minimal Copy Network Buffer Management.** It is possible to have minimal copy network data path. This means that the system tries to avoid copying application data when it is sent to the network.
- **Virtual LAN support.** Virtual LANs (VLANs) allow partitioning of physical ethernet networks into logical networks. See *VLAN support* for more details.
- **Network traffic classification.** The sent and received network packets can be prioritized depending on application needs. See *traffic classification* for more details.
- **Time Sensitive Networking.** The gPTP (generalized Precision Time Protocol) is supported. See *gPTP support* for more details.
- **Network shell.** The network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. The net-shell is useful when developing network software. See *network shell* for more details.

Additionally these network technologies (link layers) are supported in Zephyr OS v1.7 and later:

- IEEE 802.15.4
- Bluetooth
- Ethernet
- SLIP (IP over serial line). Used for testing with QEMU. It provides ethernet interface to host system (like Linux) and test applications can be run in Linux host and send network data to Zephyr OS device.

Source Tree Layout

The networking stack source code tree is organized as follows:

`subsys/net/ip/`
: This is where the IP stack code is located.

`subsys/net/l2/`
: This is where the IP stack layer 2 code is located. This includes generic support for Ethernet, IEEE 802.15.4 and Wi-Fi.

`subsys/net/lib/`
: Application-level protocols (DNS, MQTT, etc.) and additional stack components (BSD Sockets, etc.).

`include/net/`
: Public API header files. These are the header files applications need to include to use IP networking functionality.

`samples/net/`
: Sample networking code. This is a good reference to get started with network application development.

`tests/net/`
: Test applications. These applications are used to verify the functionality of the IP stack, but are not the best source for sample code (see `samples/net` instead).

6.3.2 Network Stack Architecture

Network Packet Processing Statistics

This page describes how to get information about network packet processing statistics inside network stack.

Network stack contains infrastructure to figure out how long the network packet processing takes either in sending or receiving path. There are two Kconfig options that control this. For transmit (TX) path the option is called `CONFIG_NET_PKT_TXTIME_STATS` and for receive (RX) path the options is called `CONFIG_NET_PKT_RXTIME_STATS`. Note that for TX, all kind of network packet statistics is collected. For RX, only UDP, TCP or raw packet type network packet statistics is collected.

After enabling these options, the *net stats* network shell command will show this information:

```
Avg TX net_pkt (11484) time 67 us
Avg RX net_pkt (11474) time 43 us
```

Note

The values above and below are from emulated qemu_x86 board and UDP traffic

The TX time tells how long it took for network packet from its creation to when it was sent to the network. The RX time tells the time from its creation to when it was passed to the application. The values are in microseconds. The statistics will be collected per traffic class if there are more than one transmit or receive queues defined in the system. These are controlled by `CONFIG_NET_TC_TX_COUNT` and `CONFIG_NET_TC_RX_COUNT` options.

If you enable `CONFIG_NET_PKT_TXTIME_STATS_DETAIL` or `CONFIG_NET_PKT_RXTIME_STATS_DETAIL` options, then additional information for TX or RX network packets are collected when the network packet traverses the IP stack.

After enabling these options, the *net stats* will show this information:

```
Avg TX net_pkt (18902) time 63 us    [0->22->15->23=60 us]
Avg RX net_pkt (18892) time 42 us    [0->9->6->11->13=39 us]
```

The numbers inside the brackets contain information how many microseconds it took for a network packet to go from previous state to next.

In the TX example above, the values are averages over **18902** packets and contain this information:

- Packet was created by application so the time is **0**.
- Packet is about to be placed to transmit queue. The time it took from network packet creation to this state, is **22** microseconds in this example.
- The correct TX thread is invoked, and the packet is read from the transmit queue. It took **15** microseconds from previous state.
- The network packet was just sent and the network stack is about to free the network packet. It took **23** microseconds from previous state.
- In total it took on average **60** microseconds to get the network packet sent. The value **63** tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

In the RX example above, the values are averages over **18892** packets and contain this information:

- Packet was created network device driver so the time is **0**.
- Packet is about to be placed to receive queue. The time it took from network packet creation to this state, is **9** microseconds in this example.
- The correct RX thread is invoked, and the packet is read from the receive queue. It took **6** microseconds from previous state.
- The network packet is then processed and placed to correct socket queue. It took **11** microseconds from previous state.
- The last value tells how long it took from there to the application. Here the value is **13** microseconds.
- In total it took on average **39** microseconds to get the network packet sent. The value **42** tells also the same information, but is calculated differently so there is slight difference because of rounding errors.

The Zephyr network stack is a native network stack specifically designed for Zephyr OS. It consists of layers, each meant to provide certain services to other layers. Network stack functionality is highly configurable via Kconfig options.

- *High level overview of the network stack*
- *Network data flow*
  - *Data receiving (RX)*
  - *Data sending (TX)*
- *Network packet processing statistics*

High level overview of the network stack

The network stack is layered and consists of the following parts:

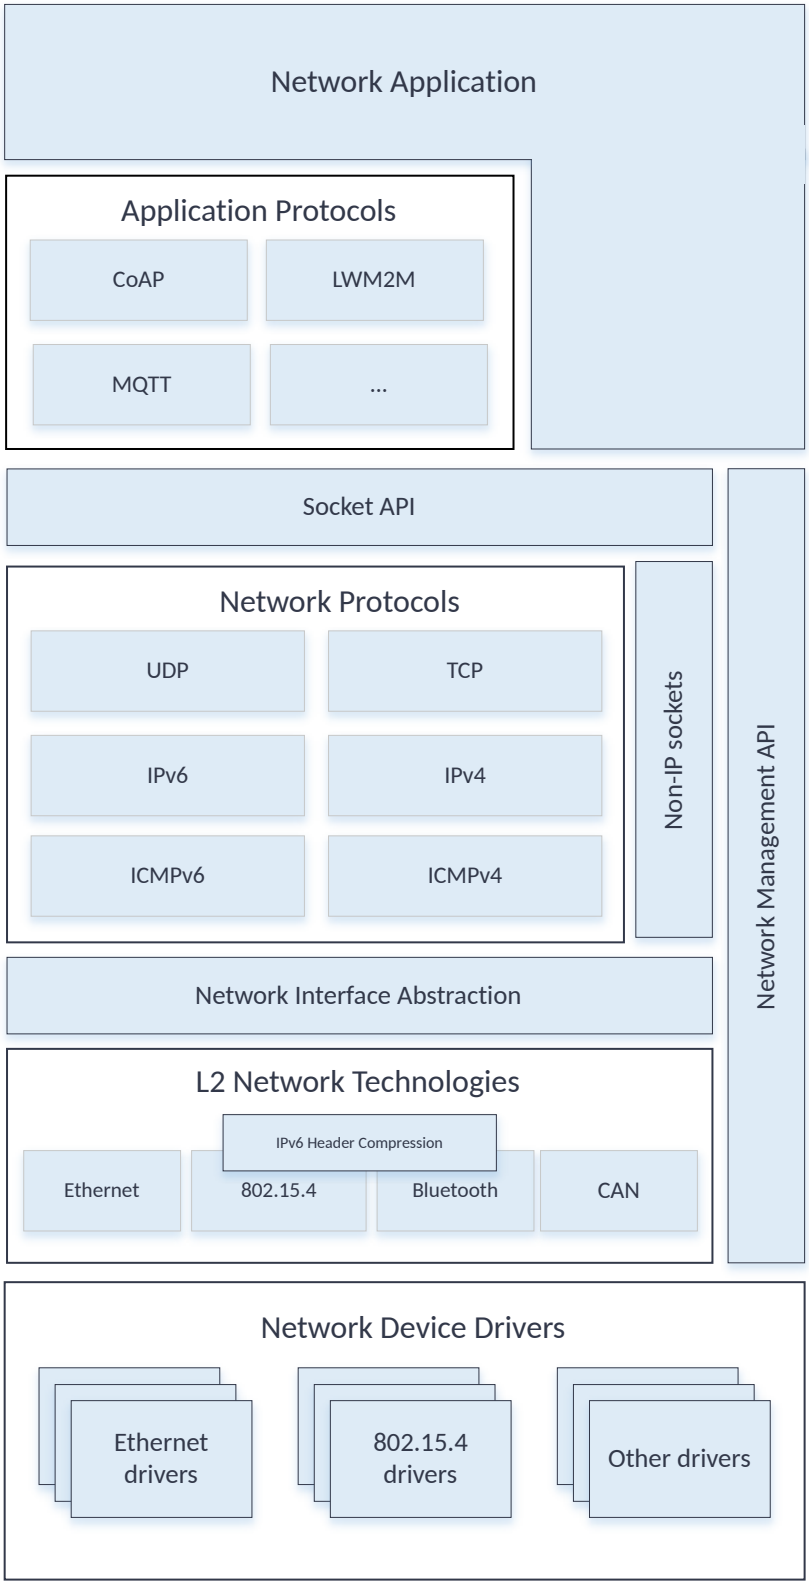

Fig. 12: Network stack overview

- **Network Application.** The network application can either use the provided application-level protocol libraries or access the *BSD socket API* directly to create a network connection, send or receive data, and close a connection. The application can also use the *network management API* to configure the network and set related parameters such as network link options, starting a scan (when applicable), listen network configuration events, etc. The *network interface API* can be used to set IP address to a network interface, taking the network interface down, etc.
- **Network Protocols.** This provides implementations for various protocols such as
  - Application-level network protocols like CoAP, LWM2M, and MQTT. See *application protocols chapter* for information about them.
  - Core network protocols like IPv6, IPv4, UDP, TCP, ICMPv4, and ICMPv6. You access these protocols by using the *BSD socket API*.
- **Network Interface Abstraction.** This provides functionality that is common in all the network interfaces, such as setting network interface down, etc. There can be multiple network interfaces in the system. See *network interface overview* for more details.
- **L2 Network Technologies.** This provides a common API for sending and receiving data to and from an actual network device. See *L2 overview* for more details. These network technologies include *Ethernet*, *IEEE 802.15.4*, *Bluetooth*, *CANBUS*, etc. Some of these technologies support IPv6 header compression (6Lo), see RFC 6282 for details. For example ARP for IPv4 is done by the *Ethernet component*.
- **Network Device Drivers.** The actual low-level device drivers handle the physical sending or receiving of network packets.

Network data flow

An application typically consists of one or more *threads* that execute the application logic. When using the *BSD socket API*, the following things will happen.

Data receiving (RX)

1. A network data packet is received by a device driver.
2. The device driver allocates enough network buffers to store the received data. The network packet is placed in the proper RX queue (implemented by *k_fifo*). By default there is only one receive queue in the system, but it is possible to have up to 8 receive queues. These queues will process incoming packets with different priority. See *Traffic Classification* for more details. The receive queues also act as a way to separate the data processing pipeline (bottom-half) as the device driver is running in an interrupt context and it must do its processing as fast as possible.
3. The network packet is then passed to the correct L2 driver. The L2 driver can check if the packet is proper and modify it if needed, e.g. strip L2 header and frame check sequence, etc.
4. The packet is processed by a network interface. The network statistics are collected if enabled by `CONFIG_NET_STATISTICS`.
5. The packet is then passed to L3 processing. If the packet is IP based, then the L3 layer checks if the packet is a proper IPv6 or IPv4 packet.
6. A socket handler then finds an active socket to which the network packet belongs and puts it in a queue for that socket, in order to separate the networking code from the application. Typically the application is run in userspace context and the network stack is run in kernel context.
7. The application will then receive the data and can process it as needed. The application should have used the *BSD socket API* to create a socket that will receive the data.

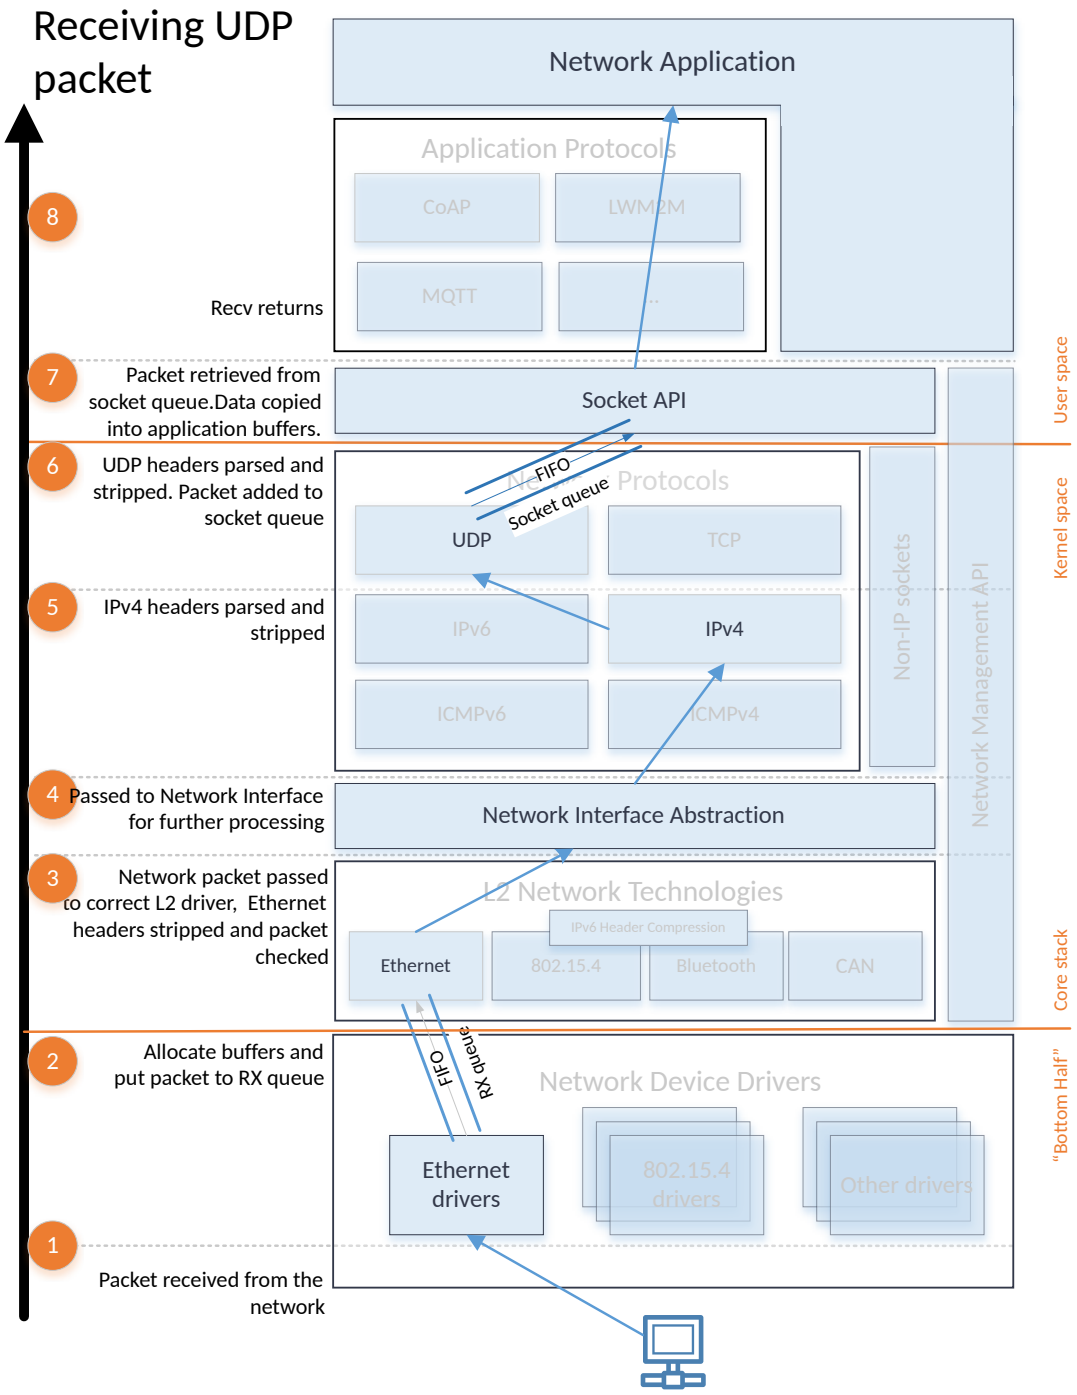

Fig. 13: Network RX data flow

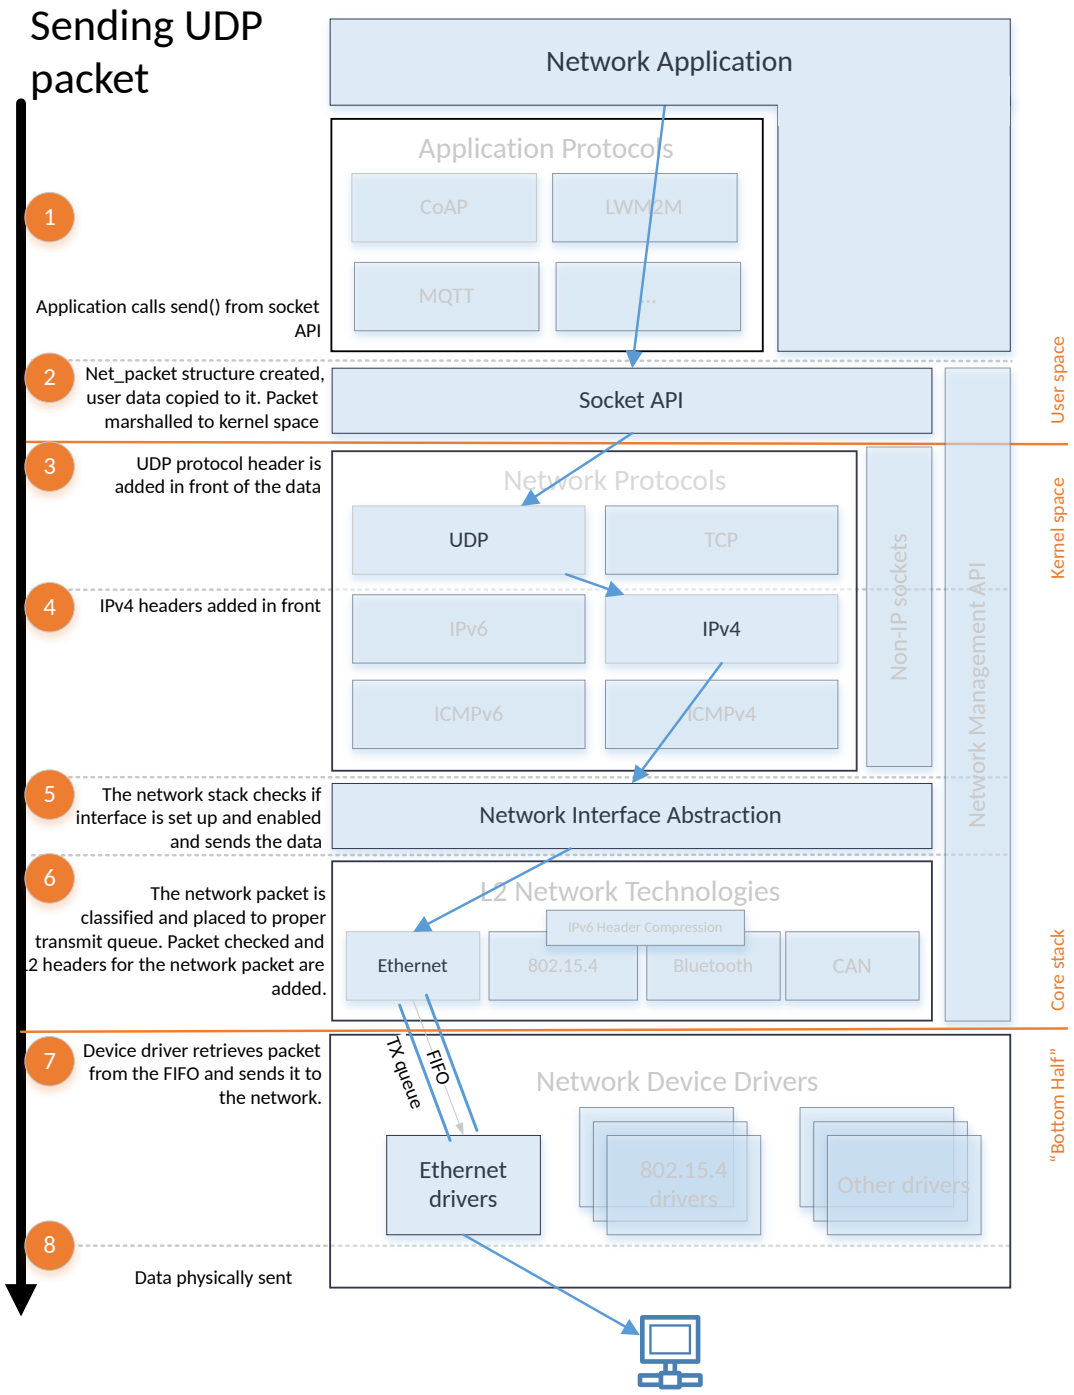

Fig. 14: Network TX data flow

Data sending (TX)

1. The application should use the *BSD socket API* when sending the data.
2. The application data is prepared for sending to kernel space and then copied to internal net_buf structures.
3. Depending on the socket type, a protocol header is added in front of the data. For example, if the socket is a UDP socket, then a UDP header is constructed and placed in front of the data.
4. An IP header is added to the network packet for a UDP or TCP packet.
5. The network stack will check that the network interface is properly set for the network packet, and also will make sure that the network interface is enabled before the data is queued to be sent.
6. The network packet is then classified and placed to the proper transmit queue (implemented by *k_fifo*). By default there is only one transmit queue in the system, but it is possible to have up to 8 transmit queues. These queues will process the sent packets with different priority. See *Traffic Classification* for more details. After the transmit packet classification, the packet is checked by the correct L2 layer module. The L2 module will do additional checks for the data and it will also create any L2 headers for the network packet. If everything is ok, the data is given to the network device driver to be sent out.
7. The device driver will send the packet to the network.

Note that in both the TX and RX data paths, the queues (*k_fifo's*) form separation points where data is passed from one *thread* to another. These *threads* might run in different contexts (*kernel* vs. *userspace*) and with different *priorities*.

Network packet processing statistics

See information about network processing statistics *here*.

6.3.3 Network Configuration Guide

- *Network Buffer Configuration Options*
- *Connection Options*
- *Socket Options*
- *TLS Options*
- *IPv4/6 Options*
- *TCP Options*
- *Traffic Class Options*
- *Stack Size Options*

This document describes how various network configuration options can be set according to available resources in the system.

Network Buffer Configuration Options

The network buffer configuration options control how much data we are able to either send or receive at the same time.

CONFIG_NET_PKT_RX_COUNT
: Maximum amount of network packets we can receive at the same time.

CONFIG_NET_PKT_TX_COUNT
: Maximum amount of network packet sends pending at the same time.

CONFIG_NET_BUF_RX_COUNT
: How many network buffers are allocated for receiving data. Each net_buf contains a small header and either a fixed or variable length data buffer. The CONFIG_NET_BUF_DATA_SIZE is used when CONFIG_NET_BUF_FIXED_DATA_SIZE is set. This is the default setting. The default size of the buffer is 128 bytes.

  The CONFIG_NET_BUF_VARIABLE_DATA_SIZE is an experimental setting. There each net_buf data portion is allocated from a memory pool and can be the amount of data we have received from the network. When data is received from the network, it is placed into net_buf data portion. Depending on device resources and desired network usage, user can tweak the size of the fixed buffer by setting CONFIG_NET_BUF_DATA_SIZE, and the size of the data pool size by setting CONFIG_NET_PKT_BUF_RX_DATA_POOL_SIZE and CONFIG_NET_PKT_BUF_TX_DATA_POOL_SIZE if variable size buffers are used.

  When using the fixed size data buffers, the memory consumption of network buffers can be tweaked by selecting the size of the data part according to what kind of network data we are receiving. If one sets the data size to 256, but only receives packets that are 32 bytes long, then we are "wasting" 224 bytes for each packet because we cannot utilize the remaining data. One should not set the data size too low because there is some overhead involved for each net_buf. For these reasons the default network buffer size is set to 128 bytes.

  The variable size data buffer feature is marked as experimental as it has not received as much testing as the fixed size buffers. Using variable size data buffers tries to improve memory utilization by allocating minimum amount of data we need for the network data. The extra cost here is the amount of time that is needed when dynamically allocating the buffer from the memory pool.

  For example, in Ethernet the maximum transmission unit (MTU) size is 1500 bytes. If one wants to receive two full frames, then the net_pkt RX count should be set to 2, and net_buf RX count to (1500 / 128) * 2 which is 24. If TCP is being used, then these values need to be higher because we can queue the packets internally before delivering to the application.

CONFIG_NET_BUF_TX_COUNT
: How many network buffers are allocated for sending data. This is similar setting as the receive buffer count but for sending.

Connection Options

CONFIG_NET_MAX_CONN
: This option tells how many network connection endpoints are supported. For example each TCP connection requires one connection endpoint. Similarly each listening UDP connection requires one connection endpoint. Also various system services like DHCP and DNS need connection endpoints to work. The network shell command **net conn** can be used at runtime to see the network connection information.

CONFIG_NET_MAX_CONTEXTS
: Number of network contexts to allocate. Each network context describes a network 5-tuple that is used when listening or sending network traffic. Each BSD socket in the system uses one network context.

Socket Options

CONFIG_NET_SOCKETS_POLL_MAX
: Maximum number of supported poll() entries. One needs to select proper value here de-

pending on how many BSD sockets are polled in the system.

CONFIG_ZVFS_OPEN_MAX
: Maximum number of open file descriptors, this includes files, sockets, special devices, etc. One needs to select proper value here depending on how many BSD sockets are created in the system.

CONFIG_NET_SOCKETPAIR_BUFFER_SIZE
: This option is used by socketpair() function. It sets the size of the internal intermediate buffer, in bytes. This sets the limit how large messages can be passed between two socketpair endpoints.

TLS Options

CONFIG_NET_SOCKETS_TLS_MAX_CONTEXTS
: Maximum number of TLS/DTLS contexts. Each TLS/DTLS connection needs one context.

CONFIG_NET_SOCKETS_TLS_MAX_CREDENTIALS
: This variable sets maximum number of TLS/DTLS credentials that can be used with a specific socket.

CONFIG_NET_SOCKETS_TLS_MAX_CIPHERSUITES
: Maximum number of TLS/DTLS ciphersuites per socket. This variable sets maximum number of TLS/DTLS ciphersuites that can be used with specific socket, if set explicitly by socket option. By default, all ciphersuites that are available in the system are available to the socket.

CONFIG_NET_SOCKETS_TLS_MAX_APP_PROTOCOLS
: Maximum number of supported application layer protocols. This variable sets maximum number of supported application layer protocols over TLS/DTLS that can be set explicitly by a socket option. By default, no supported application layer protocol is set.

CONFIG_NET_SOCKETS_TLS_MAX_CLIENT_SESSION_COUNT
: This variable specifies maximum number of stored TLS/DTLS sessions, used for TLS/DTLS session resumption.

CONFIG_TLS_MAX_CREDENTIALS_NUMBER
: Maximum number of TLS credentials that can be registered. Make sure that this value is high enough so that all the certificates can be loaded to the store.

IPv4/6 Options

CONFIG_NET_IF_MAX_IPV4_COUNT
: Maximum number of IPv4 network interfaces in the system. This tells how many network interfaces there will be in the system that will have IPv4 enabled. For example if you have two network interfaces, but only one of them can use IPv4 addresses, then this value can be set to 1. If both network interface could use IPv4, then the setting should be set to 2.

CONFIG_NET_IF_MAX_IPV6_COUNT
: Maximum number of IPv6 network interfaces in the system. This is similar setting as the IPv4 count option but for IPv6.

TCP Options

CONFIG_NET_TCP_TIME_WAIT_DELAY
: How long to wait in TCP *TIME_WAIT* state (in milliseconds). To avoid a (low-probability) issue when delayed packets from previous connection get delivered to next connection

reusing the same local/remote ports, RFC 793 (TCP) suggests to keep an old, closed connection in a special *TIME_WAIT* state for the duration of 2*MSL (Maximum Segment Lifetime). The RFC suggests to use MSL of 2 minutes, but notes

This is an engineering choice, and may be changed if experience indicates it is desirable to do so.

For low-resource systems, having large MSL may lead to quick resource exhaustion (and related DoS attacks). At the same time, the issue of packet misdelivery is largely alleviated in the modern TCP stacks by using random, non-repeating port numbers and initial sequence numbers. Due to this, Zephyr uses much lower value of 1500ms by default. Value of 0 disables *TIME_WAIT* state completely.

`CONFIG_NET_TCP_RETRY_COUNT`
Maximum number of TCP segment retransmissions. The following formula can be used to determine the time (in ms) that a segment will be buffered awaiting retransmission:

$$\sum_{n=0}^{\texttt{NET\_TCP\_RETRY\_COUNT}} \left(1 \ll n\right) \times \texttt{NET\_TCP\_INIT\_RETRANSMISSION\_TIMEOUT}$$

With the default value of 9, the IP stack will try to retransmit for up to 1:42 minutes. This is as close as possible to the minimum value recommended by RFC 1122 (1:40 minutes). Only 5 bits are dedicated for the retransmission count, so accepted values are in the 0-31 range. It's highly recommended to not go below 9, though.

Should a retransmission timeout occur, the receive callback is called with `-ETIMEDOUT` error code and the context is dereferenced.

`CONFIG_NET_TCP_MAX_SEND_WINDOW_SIZE`
Maximum sending window size to use. This value affects how the TCP selects the maximum sending window size. The default value 0 lets the TCP stack select the value according to amount of network buffers configured in the system. Note that if there are multiple active TCP connections in the system, then this value might require finetuning (lowering), otherwise multiple TCP connections could easily exhaust net_buf pool for the queued TX data.

`CONFIG_NET_TCP_MAX_RECV_WINDOW_SIZE`
Maximum receive window size to use. This value defines the maximum TCP receive window size. Increasing this value can improve connection throughput, but requires more receive buffers available in the system for efficient operation. The default value 0 lets the TCP stack select the value according to amount of network buffers configured in the system.

`CONFIG_NET_TCP_RECV_QUEUE_TIMEOUT`
How long to queue received data (in ms). If we receive out-of-order TCP data, we queue it. This value tells how long the data is kept before it is discarded if we have not been able to pass the data to the application. If set to 0, then receive queueing is not enabled. The value is in milliseconds.

Note that we only queue data sequentially in current version i.e., there should be no holes in the queue. For example, if we receive SEQs 5,4,3,6 and are waiting SEQ 2, the data in segments 3,4,5,6 is queued (in this order), and then given to application when we receive SEQ 2. But if we receive SEQs 5,4,3,7 then the SEQ 7 is discarded because the list would not be sequential as number 6 is be missing.

Traffic Class Options

It is possible to configure multiple traffic classes (queues) when receiving or sending network data. Each traffic class queue is implemented as a thread with different priority. This means that higher priority network packet can be placed to a higher priority network queue in order to send or receive it faster or slower. Because of thread scheduling latencies, in practice the fastest way to send a packet out, is to directly send the packet without using a dedicated traffic class

thread. This is why by default the CONFIG_NET_TC_TX_COUNT option is set to 0 if userspace is not enabled. If userspace is enabled, then the minimum TX traffic class count is 1. Reason for this is that the userspace application does not have enough permissions to deliver the message directly.

In receiving side, it is recommended to have at least one receiving traffic class queue. Reason is that typically the network device driver is running in IRQ context when it receives the packet, in which case it should not try to deliver the network packet directly to the upper layers, but to place the packet to the traffic class queue. If the network device driver is not running in IRQ context when it gets the packet, then the RX traffic class option CONFIG_NET_TC_RX_COUNT could be set to 0.

Stack Size Options

There several network specific threads in a network enabled system. Some of the threads might depend on a configure option which can be used to enable or disable a feature. Each thread stack size is optimized to allow normal network operations.

The network management API is using a dedicated thread by default. The thread is responsible to deliver network management events to the event listeners that are setup in the system if the CONFIG_NET_MGMT and CONFIG_NET_MGMT_EVENT options are enabled. If the options are enabled, the user is able to register a callback function that the net_mgmt thread is calling for each network management event. By default the net_mgmt event thread stack size is rather small. The idea is that the callback function does minimal things so that new events can be delivered to listeners as fast as possible and they are not lost. The net_mgmt event thread stack size is controlled by CONFIG_NET_MGMT_EVENT_QUEUE_SIZE option. It is recommended to not do any blocking operations in the callback function.

The network thread stack utilization can be monitored from kernel shell by the **kernel threads** command.

6.3.4 Networking with the host system

Networking with native_sim board

- *Using virtual/TAP Ethernet driver*
  - *Prerequisites*
  - *Basic Setup*
- *Using offloaded sockets*
  - *Step 1 - Start app in native_sim board*
  - *Step 2 - run echo-client from net-tools*
- *Setting interface name from command line*

Using virtual/TAP Ethernet driver This paragraph describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a native_sim board.

In this example, the sockets-echo-server sample application from the Zephyr source distribution is run in native_sim board. The Zephyr native_sim board instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

Prerequisites On the Linux Host, fetch the Zephyr `net-tools` project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

Basic Setup For the steps below, you will need three terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (`cd net-tools`)
- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminal #3 is the console to the running Zephyr native_sim instance (optional).

Step 1 - Create Ethernet interface Before starting native_sim with network emulation, a network interface should be created.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the net-setup.sh script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

Step 2 - Start app in native_sim board Build and start the `echo_server` sample application.

In terminal #2, type:

```
west build -b native_sim samples/net/sockets/echo_server
west build -t run
```

Step 3 - Connect to console (optional) The console window should be launched automatically when the Zephyr instance is started but if it does not show up, you can manually connect to the console. The native_sim board will print a string like this when it starts:

```
UART connected to pseudotty: /dev/pts/5
```

You can manually connect to it like this:

```
screen /dev/pts/5
```

Using offloaded sockets The main advantage over *Using virtual/TAP Ethernet driver* is not needing to setup a virtual network interface on the host machine. This means that no leveraged (root) privileges are needed.

Step 1 - Start app in native_sim board Build and start the `echo_server` sample application:

```
west build -b native_sim samples/net/sockets/echo_server -- -DEXTRA_CONF_FILE=overlay-nsos.
↪conf
west build -t run
```

Step 2 - run echo-client from net-tools On the Linux Host, fetch the Zephyr `net-tools` project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

> **Note**
>
> Native Simulator with the offloaded sockets network driver is using the same network interface/namespace as any other (Linux) application that uses BSD sockets API. This means that sockets-echo-server and `echo-client` applications will communicate over localhost/loopback interface (address `127.0.0.1`).

To run UDP test, type:

```
./echo-client 127.0.0.1
```

For TCP test, type:

```
./echo-client -t 127.0.0.1
```

Setting interface name from command line By default the Ethernet interface name used by native_sim is determined by `CONFIG_ETH_NATIVE_POSIX_DRV_NAME`, but is also possible to set it from the command line using `--eth-if=<interface_name>`. This can be useful if the application has to be run in multiple instances and recompiling it for each instance would be troublesome.

```
./zephyr.exe --eth-if=zeth2
```

Networking with QEMU Ethernet

- *Prerequisites*
- *Basic Setup*
  - *Step 1 - Create Ethernet interface*
  - *Step 2 - Start app in QEMU board*

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in QEMU.

In this example, the sockets-echo-server sample application from the Zephyr source distribution is run in QEMU. The Zephyr instance is connected to a Linux host using a tuntap device which is modeled in Linux as an Ethernet network interface.

Prerequisites On the Linux Host, fetch the Zephyr `net-tools` project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

Basic Setup For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with net-tools being the current directory (`cd net-tools`)

- Terminal #2 is your usual Zephyr development terminal, with the Zephyr environment initialized.

When configuring the Zephyr instance, you must select the correct Ethernet driver for QEMU connectivity:

- For `qemu_x86`, select `Intel(R) PRO/1000 Gigabit Ethernet driver` Ethernet driver. Driver is called `e1000` in Zephyr source tree.
- For `qemu_cortex_m3`, select `TI Stellaris MCU family ethernet driver` Ethernet driver. Driver is called `stellaris` in Zephyr source tree.
- For `mps2_an385`, select `SMSC911x/9220 Ethernet driver` Ethernet driver. Driver is called `smsc911x` in Zephyr source tree.
- For `qemu_cortex_a53`, `Intel(R) PRO/1000 Gigabit Ethernet driver` Ethernet driver is selected by default.

Step 1 - Create Ethernet interface Before starting QEMU with network connectivity, a network interface should be created in the host system.

In terminal #1, type:

```
./net-setup.sh
```

You can tweak the behavior of the `net-setup.sh` script. See various options by running `net-setup.sh` like this:

```
./net-setup.sh --help
```

Step 2 - Start app in QEMU board Build and start the sockets-echo-server sample application. In this example, the qemu_x86 board is used.

In terminal #2, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server -- -DEXTRA_CONF_FILE=overlay-e1000.
↪conf
west build -t run
```

Exit QEMU by pressing `CTRL+A x`.

Networking with QEMU

- *Prerequisites*
- *Basic Setup*
  - *Step 1 - Create helper socket*
  - *Step 2 - Start TAP device routing daemon*
  - *Step 3 - Start app in QEMU*
  - *Step 4 - Run apps on host*
  - *Step 5 - Stop supporting daemons*
- *Setting up Zephyr and NAT/masquerading on host to access Internet*
- *Network connection between two QEMU VMs*

- *Terminal #1:*
- *Terminal #2:*

- *Running multiple QEMU VMs of the same sample*
  - *Terminal #1:*
  - *Terminal #2:*

This page describes how to set up a virtual network between a (Linux) host and a Zephyr application running in a QEMU virtual machine (built for Zephyr targets such as qemu_x86 and qemu_cortex_m3). Some virtual ARM boards (such as qemu_cortex_a53) only support a single UART, in this case QEMU Ethernet is preferred, see *Networking with QEMU Ethernet* for details.

In this example, the sockets-echo-server sample application from the Zephyr source distribution is run in QEMU. The QEMU instance is connected to a Linux host using a serial port, and SLIP is used to transfer data between the Zephyr application and Linux (over a chain of virtual connections).

Prerequisites On the Linux Host, fetch the Zephyr `net-tools` project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
cd net-tools
make
```

Note

If you get an error about AX_CHECK_COMPILE_FLAG, install package `autoconf-archive` package on Debian/Ubuntu.

Basic Setup For the steps below, you will need at least 4 terminal windows:

- Terminal #1 is your usual Zephyr development terminal, with the Zephyr environment initialized.
- Terminals #2, #3, and #4 are terminal windows with net-tools being the current directory (`cd net-tools`)

Step 1 - Create helper socket Before starting QEMU with network emulation, a Unix socket for the emulation should be created.

In terminal #2, type:

```
./loop-socat.sh
```

Step 2 - Start TAP device routing daemon In terminal #3, type:

```
sudo ./loop-slip-tap.sh
```

For applications requiring DNS, you may need to restart the host's DNS server at this point, as described in *Setting up Zephyr and NAT/masquerading on host to access Internet*.

Step 3 - Start app in QEMU Build and start the `echo_server` sample application.

In terminal #1, type:

```
west build -b qemu_x86 samples/net/sockets/echo_server
west build -t run
```

If you see an error from QEMU about unix:/tmp/slip.sock, it means you missed Step 1 above.

Step 4 - Run apps on host Now in terminal #4, you can run various tools to communicate with the application running in QEMU.

You can start with pings:

```
ping 192.0.2.1
ping6 2001:db8::1
```

You can use the netcat ("nc") utility, connecting using UDP:

```
echo foobar | nc -6 -u 2001:db8::1 4242
foobar
```

```
echo foobar | nc -u 192.0.2.1 4242
foobar
```

If echo_server is compiled with TCP support (now enabled by default for the echo_server sample, CONFIG_NET_TCP=y):

```
echo foobar | nc -6 -q2 2001:db8::1 4242
foobar
```

Note

Use Ctrl+C to exit.

You can also use the telnet command to achieve the above.

Step 5 - Stop supporting daemons When you are finished with network testing using QEMU, you should stop any daemons or helpers started in the initial steps, to avoid possible networking or routing problems such as address conflicts in local network interfaces. For example, stop them if you switch from testing networking with QEMU to using real hardware, or to return your host laptop to normal Wi-Fi use.

To stop the daemons, press Ctrl+C in the corresponding terminal windows (you need to stop both `loop-slip-tap.sh` and `loop-socat.sh`).

Exit QEMU by pressing `CTRL+A x`.

Setting up Zephyr and NAT/masquerading on host to access Internet To access the internet from a Zephyr application, some additional setup on the host may be required. This setup is common for both application running in QEMU and on real hardware, assuming that a development board is connected to the development host. If a board is connected to a dedicated router, it should not be needed.

To access the internet from a Zephyr application using IPv4, a gateway should be set via DHCP or configured manually. For applications using the "Settings" facility (with the config option `CONFIG_NET_CONFIG_SETTINGS` enabled), set the `CONFIG_NET_CONFIG_MY_IPV4_GW` option to the IP

address of the gateway. For apps not using the "Settings" facility, set up the gateway by calling the *net_if_ipv4_set_gw()* at runtime. For example: CONFIG_NET_CONFIG_MY_IPV4_GW="192.0.2.2"

To access the internet from a custom application running in QEMU, NAT (masquerading) should be set up for QEMU's source address. Assuming 192.0.2.1 is used and the Zephyr network interface is zeth, the following command should be run as root:

```
iptables -t nat -A POSTROUTING -j MASQUERADE -s 192.0.2.1/24
iptables -I FORWARD 1 -i zeth -j ACCEPT
iptables -I FORWARD 1 -o zeth -m state --state RELATED,ESTABLISHED -j ACCEPT
```

Additionally, IPv4 forwarding should be enabled on the host, and you may need to check that other firewall (iptables) rules don't interfere with masquerading. To enable IPv4 forwarding the following command should be run as root:

```
sysctl -w net.ipv4.ip_forward=1
```

Some applications may also require a DNS server. A number of Zephyr-provided samples assume by default that the DNS server is available on the host (IP 192.0.2.2), which, in modern Linux distributions, usually runs at least a DNS proxy. When running with QEMU, it may be required to restart the host's DNS, so it can serve requests on the newly created TAP interface. For example, on Debian-based systems:

```
service dnsmasq restart
```

An alternative to relying on the host's DNS server is to use one in the network. For example, 8.8.8.8 is a publicly available DNS server. You can configure it using CONFIG_DNS_SERVER1 option.

Network connection between two QEMU VMs Unlike the VM-to-Host setup described above, VM-to-VM setup is automatic. For sample applications that support this mode (such as the echo_server and echo_client samples), you will need two terminal windows, set up for Zephyr development.

Terminal #1:

```
west build -b qemu_x86 samples/net/sockets/echo_server
```

This will start QEMU, waiting for a connection from a client QEMU.

Terminal #2:

```
west build -b qemu_x86 samples/net/sockets/echo_client
```

This will start a second QEMU instance, where you should see logging of data sent and received in both.

Running multiple QEMU VMs of the same sample If you find yourself wanting to run multiple instances of the same Zephyr sample application, which do not need to talk to each other, use the QEMU_INSTANCE argument.

Start socat and tunslip6 manually (instead of using the loop-xxx.sh scripts) for as many instances as you want. Use the following as a guide, replacing MAIN or OTHER.

Terminal #1:

```
socat PTY,link=/tmp/slip.devMAIN UNIX-LISTEN:/tmp/slip.sockMAIN
$ZEPHYR_BASE/../net-tools/tunslip6 -t tapMAIN -T -s /tmp/slip.devMAIN \
     2001:db8::1/64
# Now run Zephyr
make -Cbuild run QEMU_INSTANCE=MAIN
```

Terminal #2:

```
socat PTY,link=/tmp/slip.devOTHER UNIX-LISTEN:/tmp/slip.sockOTHER
$ZEPHYR_BASE/../net-tools/tunslip6 -t tapOTHER -T -s /tmp/slip.devOTHER \
     2001:db8::1/64
make -Cbuild run QEMU_INSTANCE=OTHER
```

USB Device Networking

- *Basic Setup*
  - *Choosing IP addresses*
  - *Setting IPv4 address and routing*
  - *Setting IPv6 address and routing*
- *Testing connection*

This page describes how to set up networking between a Linux host and a Zephyr application running on USB supported devices.

The board is connected to Linux host using USB cable and provides an Ethernet interface to the host. The sockets-echo-server application from the Zephyr source distribution is run on supported board. The board is connected to a Linux host using a USB cable providing an Ethernet interface to the host.

Basic Setup To communicate with the Zephyr application over a newly created Ethernet interface, we need to assign IP addresses and set up a routing table for the Linux host. After plugging a USB cable from the board to the Linux host, the `cdc_ether` driver registers a new Ethernet device with a provided MAC address.

You can check that network device is created and MAC address assigned by running dmesg from the Linux host.

```
cdc_ether 1-2.7:1.0 eth0: register 'cdc_ether' at usb-0000:00:01.2-2.7, CDC Ethernet Device,
↪ 00:00:5e:00:53:01
```

We need to set it up and assign IP addresses as explained in the following section.

Choosing IP addresses To establish network connection to the board we need to choose IP address for the interface on the Linux host.

It make sense to choose addresses in the same subnet we have in Zephyr application. IP addresses usually set in the project configuration files and may be checked also from the shell with following commands. Connect a serial console program (such as puTTY) to the board, and enter this command to the Zephyr shell:

```
shell> net iface

Interface 0xa800e580 (Ethernet)
===============================
Link addr : 00:00:5E:00:53:00
MTU       : 1500
IPv6 unicast addresses (max 2):
        fe80::200:5eff:fe00:5300 autoconf preferred infinite
        2001:db8::1 manual preferred infinite
...
IPv4 unicast addresses (max 1):
        192.0.2.1 manual preferred infinite
```

This command shows that one IPv4 address and two IPv6 addresses have been assigned to the board. We can use either IPv4 or IPv6 for network connection depending on the board network configuration.

Next step is to assign IP addresses to the new Linux host interface, in the following steps `enx00005e005301` is the name of the interface on my Linux system.

Setting IPv4 address and routing

```
# ip address add dev enx00005e005301 192.0.2.2
# ip link set enx00005e005301 up
# ip route add 192.0.2.0/24 dev enx00005e005301
```

Setting IPv6 address and routing

```
# ip address add dev enx00005e005301 2001:db8::2
# ip link set enx00005e005301 up
# ip -6 route add 2001:db8::/64 dev enx00005e005301
```

Testing connection From the host we can test the connection by pinging Zephyr IP address of the board with:

```
$ ping 192.0.2.1
PING 192.0.2.1 (192.0.2.1) 56(84) bytes of data.
64 bytes from 192.0.2.1: icmp_seq=1 ttl=64 time=2.30 ms
64 bytes from 192.0.2.1: icmp_seq=2 ttl=64 time=1.43 ms
64 bytes from 192.0.2.1: icmp_seq=3 ttl=64 time=2.45 ms
...
```

Networking with QEMU User

- *Introduction*
- *Using SLIRP with Zephyr*
- *Limitations*

This page is intended to serve as a starting point for anyone interested in using QEMU SLIRP with Zephyr.

Introduction SLIRP is a network backend which provides the complete TCP/IP stack within QEMU and uses that stack to implement a virtual NAT'd network. As there are no dependencies on the host, SLIRP is simple to setup.

By default, QEMU uses the `10.0.2.X/24` network and runs a gateway at `10.0.2.2`. All traffic intended for the host network has to travel through this gateway, which will filter out packets based on the QEMU command line parameters. This gateway also functions as a DHCP server for all GOS, allowing them to be automatically assigned with an IP address starting from `10.0.2.15`.

More details about User Networking can be obtained from here: https://wiki.qemu.org/Documentation/Networking#User_Networking_.28SLIRP.29

Using SLIRP with Zephyr In order to use SLIRP with Zephyr, the user has to set the Kconfig option to enable User Networking.

```
CONFIG_NET_QEMU_USER=y
```

Once this configuration option is enabled, all QEMU launches will use SLIRP. In the default configuration, Zephyr only enables User Networking, and does not pass any arguments to it. This means that the Guest will only be able to communicate to the QEMU gateway, and any data intended for the host machine will be dropped by QEMU.

In general, QEMU User Networking can take in a lot of arguments including,

- Information about host/guest port forwarding. This must be provided to create a communication channel between the guest and host.
- Information about network to use. This may be valuable if the user does not want to use the default `10.0.2.X` network.
- Tell QEMU to start DHCP server at user-defined IP address.
- ID and other information.

As this information varies with every use case, it is difficult to come up with good defaults that work for all. Therefore, Zephyr Implementation offloads this to the user, and expects that they will provide arguments based on requirements. For this, there is a Kconfig string which can be populated by the user.

```
CONFIG_NET_QEMU_USER_EXTRA_ARGS="net=192.168.0.0/24,hostfwd=tcp::8080-:8080"
```

This option is appended as-is to the QEMU command line. Therefore, any problems with this command line will be reported by QEMU only. Here's what this particular example will do,

- Make QEMU use the `192.168.0.0/24` network instead of the default.
- Enable forwarding of any TCP data received from port 8080 of host to port 8080 of guest, and vice versa.

Limitations If the user does not have any specific networking requirements other than the ability to access a web page from the guest, user networking (slirp) is a good choice. However, it has several limitations

- There is a lot of overhead so the performance is poor.
- The guest is not directly accessible from the host or the external network.
- In general, ICMP traffic does not work (so you cannot use ping within a guest).
- As port mappings need to be defined before launching qemu, clients which use dynamically generated ports cannot communicate with external network.
- There is a bug in the SLIRP implementation which filters out all IPv6 packets from the guest. See https://bugs.launchpad.net/qemu/+bug/1724590 for details. Therefore, IPv6 will not work with User Networking.

Networking with multiple Zephyr instances

- *Prerequisites*
- *Basic Setup*
  - *Step 1 - Create configuration files*
  - *Step 2 - Create Ethernet interfaces*
  - *Step 3 - Setup network bridging*
  - *Step 4 - Start Zephyr instances*

This page describes how to set up a virtual network between multiple Zephyr instances. The Zephyr instances could be running inside QEMU or could be native_sim board processes. The Linux host can be used to route network traffic between these systems.

Prerequisites On the Linux Host, fetch the Zephyr `net-tools` project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

Basic Setup For the steps below, you will need five terminal windows:

- Terminal #1 and #2 are terminal windows with net-tools being the current directory (`cd net-tools`)
- Terminal #3, where you setup bridging in Linux host
- Terminal #4 and #5 are your usual Zephyr development terminal, with the Zephyr environment initialized.

As there are multiple ways to setup the Zephyr network, the example below uses `qemu_x86` board with `e1000` Ethernet controller and native_sim board to simplify the setup instructions. You can use other QEMU boards and drivers if needed, see *Networking with QEMU Ethernet* for details. You can also use two or more native_sim board Zephyr instances and connect them together.

Step 1 - Create configuration files Before starting QEMU with network connectivity, a network interfaces for each Zephyr instance should be created in the host system. The default setup for creating network interface cannot be used here as that is for connecting one Zephyr instance to Linux host.

For Zephyr instance #1, create file called `zephyr1.conf` to `net-tools` project, or to some other suitable directory.

```
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:11"
IPV6_ADDR_1="2001:db8:100::2"
IPV6_ROUTE_1="2001:db8:100::/64"
IPV4_ADDR_1="198.51.100.2/24"
IPV4_ROUTE_1="198.51.100.0/24"
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
```

(continues on next page)

(continued from previous page)

```
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

For Zephyr instance #2, create file called `zephyr2.conf` to `net-tools` project, or to some other suitable directory.

```
# Configuration file for setting IP addresses for a network interface.
INTERFACE="$1"
HWADDR="00:00:5e:00:53:22"
IPV6_ADDR_1="2001:db8:200::2"
IPV6_ROUTE_1="2001:db8:200::/64"
IPV4_ADDR_1="203.0.113.2/24"
IPV4_ROUTE_1="203.0.113.0/24"
ip link set dev $INTERFACE up
ip link set dev $INTERFACE address $HWADDR
ip -6 address add $IPV6_ADDR_1 dev $INTERFACE nodad
ip -6 route add $IPV6_ROUTE_1 dev $INTERFACE
ip address add $IPV4_ADDR_1 dev $INTERFACE
ip route add $IPV4_ROUTE_1 dev $INTERFACE > /dev/null 2>&1
```

Step 2 - Create Ethernet interfaces The following `net-setup.sh` commands should be typed in net-tools directory (`cd net-tools`).

In terminal #1, type:

```
./net-setup.sh -c zephyr1.conf -i zeth.1
```

In terminal #2, type:

```
./net-setup.sh -c zephyr2.conf -i zeth.2
```

Step 3 - Setup network bridging In terminal #3, type:

```
sudo brctl addbr zeth-br
sudo brctl addif zeth-br zeth.1
sudo brctl addif zeth-br zeth.2
sudo ifconfig zeth-br up
```

Step 4 - Start Zephyr instances In this example we start sockets-echo-server and sockets-echo-client sample applications. You can use other applications too as needed.

In terminal #4, if you are using QEMU, type this:

```
west build -d build/server -b qemu_x86 -t run \
   samples/net/sockets/echo_server -- \
   -DEXTRA_CONF_FILE=overlay-e1000.conf \
   -DCONFIG_NET_CONFIG_MY_IPV4_ADDR=\"198.51.100.1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR=\"203.0.113.1\" \
   -DCONFIG_NET_CONFIG_MY_IPV6_ADDR=\"2001:db8:100::1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR=\"2001:db8:200::1\" \
   -DCONFIG_NET_CONFIG_MY_IPV4_GW=\"203.0.113.1\" \
   -DCONFIG_ETH_QEMU_IFACE_NAME=\"zeth.1\" \
   -DCONFIG_ETH_QEMU_EXTRA_ARGS=\"mac=00:00:5e:00:53:01\"
```

or if you want to use native_sim board, type this:

```
west build -d build/server -b native_sim -t run \
   samples/net/sockets/echo_server -- \
   -DCONFIG_NET_CONFIG_MY_IPV4_ADDR=\"198.51.100.1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR=\"203.0.113.1\" \
   -DCONFIG_NET_CONFIG_MY_IPV6_ADDR=\"2001:db8:100::1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR=\"2001:db8:200::1\" \
   -DCONFIG_NET_CONFIG_MY_IPV4_GW=\"203.0.113.1\" \
   -DCONFIG_ETH_NATIVE_POSIX_DRV_NAME=\"zeth.1\" \
   -DCONFIG_ETH_NATIVE_POSIX_MAC_ADDR=\"00:00:5e:00:53:01\" \
   -DCONFIG_ETH_NATIVE_POSIX_RANDOM_MAC=n
```

In terminal #5, if you are using QEMU, type this:

```
west build -d build/client -b qemu_x86 -t run \
   samples/net/sockets/echo_client -- \
   -DEXTRA_CONF_FILE=overlay-e1000.conf \
   -DCONFIG_NET_CONFIG_MY_IPV4_ADDR=\"203.0.113.1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR=\"198.51.100.1\" \
   -DCONFIG_NET_CONFIG_MY_IPV6_ADDR=\"2001:db8:200::1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR=\"2001:db8:100::1\" \
   -DCONFIG_NET_CONFIG_MY_IPV4_GW=\"198.51.100.1\" \
   -DCONFIG_ETH_QEMU_IFACE_NAME=\"zeth.2\" \
   -DCONFIG_ETH_QEMU_EXTRA_ARGS=\"mac=00:00:5e:00:53:02\"
```

or if you want to use native_sim board, type this:

```
west build -d build/client -b native_sim -t run \
   samples/net/sockets/echo_client -- \
   -DCONFIG_NET_CONFIG_MY_IPV4_ADDR=\"203.0.113.1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV4_ADDR=\"198.51.100.1\" \
   -DCONFIG_NET_CONFIG_MY_IPV6_ADDR=\"2001:db8:200::1\" \
   -DCONFIG_NET_CONFIG_PEER_IPV6_ADDR=\"2001:db8:100::1\" \
   -DCONFIG_NET_CONFIG_MY_IPV4_GW=\"198.51.100.1\" \
   -DCONFIG_ETH_NATIVE_POSIX_DRV_NAME=\"zeth.2\" \
   -DCONFIG_ETH_NATIVE_POSIX_MAC_ADDR=\"00:00:5e:00:53:02\" \
   -DCONFIG_ETH_NATIVE_POSIX_RANDOM_MAC=n
```

Also if you have firewall enabled in your host, you need to allow traffic between `zeth.1`, `zeth.2` and `zeth-br` interfaces.

Networking with QEMU and IEEE 802.15.4

- *Basic Setup*
  - *Step 1 - Compile and start echo-server*
  - *Step 2 - Compile and start echo-client*

This page describes how to set up a virtual network between two QEMUs that are connected together via UART and are running IEEE 802.15.4 link layer between them. Note that this only works in Linux host.

Basic Setup For the steps below, you will need two terminal windows:

- Terminal #1 is terminal window with `echo-server` Zephyr sample application.
- Terminal #2 is terminal window with `echo-client` Zephyr sample application.

If you want to capture the transferred network data, you must compile the `monitor_15_4` program in `net-tools` directory.

Open a terminal window and type:

```
cd $ZEPHYR_BASE/../net-tools
make monitor_15_4
```

Step 1 - Compile and start echo-server In terminal #1, type:

```
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -DEXTRA_CONF_
↪FILE=overlay-qemu_802154.conf
west build -t server -d build/server
```

If you want to capture the network traffic between the two QEMUs, type:

```
west build -b qemu_x86 -d build/server samples/net/sockets/echo_server -- -G'Unix Makefiles
↪' -DEXTRA_CONF_FILE=overlay-qemu_802154.conf -DPCAP=capture.pcap
west build -t server -d build/server
```

Note that the `make` must be used for `server` target if packet capture option is set in command line. The `build/server/capture.pcap` file will contain the transferred data.

Step 2 - Compile and start echo-client In terminal #2, type:

```
west build -b qemu_x86 -d build/client samples/net/sockets/echo_client -- -DEXTRA_CONF_
↪FILE=overlay-qemu_802154.conf
west build -t client -d build/client
```

You should see data passed between the two QEMUs. Exit QEMU by pressing `CTRL+A x`.

Networking with Arm FVP User Mode

- *Introduction*
- *Using Arm FVP User Mode Networking with Zephyr*
- *Limitations*

This page is intended to serve as a starting point for anyone interested in using Arm FVP user mode networking with Zephyr.

Introduction User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running.

By default, Arm FVP uses the `172.20.51.0/24` network and runs a gateway at `172.20.51.254`. This gateway also functions as a DHCP server for the GOS, allowing it to be automatically assigned with an IP address `172.20.51.1`.

More details about Arm FVP user mode networking can be obtained from here: https://developer.arm.com/documentation/100964/latest/Introduction-to-Fast-Models/User-mode-networking

Using Arm FVP User Mode Networking with Zephyr Arm FVP user mode networking can be enabled in any applications and it doesn't need any configurations on the host system. This feature has been enabled in DHCPv4 client sample. See dhcpv4-client sample application.

Limitations

- You can use TCP and UDP over IP, but not ICMP (ping).
- User mode networking does not support forwarding UDP ports on the host to the model.
- You can only use DHCP within the private network.
- You can only make inward connections by mapping TCP ports on the host to the model. This is common to all implementations that provide host connectivity using NAT.
- Operations that require privileged source ports, for example NFS in its default configuration, do not work.
- If setup fails, or the parameter syntax is incorrect, there is no error reporting.

While developing networking software, it is usually necessary to connect and exchange data with the host system like a Linux desktop computer. Depending on what board is used for development, the following options are possible:

- QEMU using SLIP (Serial Line Internet Protocol).
  - Here IP packets are exchanged between Zephyr and the host system via serial port. This is the legacy way of transferring data. It is also quite slow so use it only when necessary. See *Networking with QEMU* for details.
- QEMU using built-in Ethernet driver.
  - Here IP packets are exchanged between Zephyr and the host system via QEMU's built-in Ethernet driver. Not all QEMU boards support built-in Ethernet so in some cases, you might need to use the SLIP method for host connectivity. See *Networking with QEMU Ethernet* for details.
- QEMU using SLIRP (Qemu User Networking).
  - QEMU User Networking is implemented using "slirp", which provides a full TCP/IP stack within QEMU and uses that stack to implement a virtual NAT'd network. As this support is built into QEMU, it can be used with any model and requires no admin privileges on the host machine, unlike TAP. However, it has several limitations including performance which makes it less valuable for practical purposes. See *Networking with QEMU User* for details.
- Arm FVP (User Mode Networking).
  - User mode networking emulates a built-in IP router and DHCP server, and routes TCP and UDP traffic between the guest and host. It uses the user mode socket layer of the host to communicate with other hosts. This allows the use of a significant number of IP network services without requiring administrative privileges, or the installation of a separate driver on the host on which the model is running. See *Networking with Arm FVP User Mode* for details.
- native_sim board.
  - The Zephyr instance can be executed as a user space process in the host system. This is the most convenient way to debug the Zephyr system as one can attach host debugger directly to the running Zephyr instance. This requires that there is an adaptation driver in Zephyr for interfacing with the host system. Two possible network drivers can be used for this purpose, a TAP virtual Ethernet driver and an offloaded sockets driver. See *Networking with native_sim board* for details.
- USB device networking.

  - Here, the Zephyr instance is run on a real board and the connectivity to the host system is done via USB. See *USB Device Networking* for details.
- Connecting multiple Zephyr instances together.
  - If you have multiple Zephyr instances, either QEMU or native_sim ones, and want to create a connection between them, see *Networking with multiple Zephyr instances* for details.
- Simulating IEEE 802.15.4 network between two QEMUs.
  - Here, two Zephyr instances are running and there is IEEE 802.15.4 link layer run over an UART between them. See *Networking with QEMU and IEEE 802.15.4* for details.

6.3.5 Monitor Network Traffic

- *Host Configuration*
- *Zephyr Configuration*
- *Wireshark Configuration*

It is useful to be able to monitor the network traffic especially when debugging a connectivity issues or when developing new protocol support in Zephyr. This page describes how to set up a way to capture network traffic so that user is able to use Wireshark or similar tool in remote host to see the network packets sent or received by a Zephyr device.

See also the net-capture sample application from the Zephyr source distribution for configuration options that need to be enabled.

Host Configuration

The instructions here describe how to setup a Linux host to capture Zephyr network RX and TX traffic. Similar instructions should work also in other operating systems. On the Linux Host, fetch the Zephyr `net-tools` project, which is located in a separate Git repository:

```
git clone https://github.com/zephyrproject-rtos/net-tools
```

The `net-tools` project provides a configure file to setup IP-to-IP tunnel interface so that we can transfer monitoring data from Zephyr to host.

In terminal #1, type:

```
./net-setup.sh -c zeth-tunnel.conf
```

This script will create following IPIP tunnel interfaces:

Interface name	Description
`zeth-ip6ip`	IPv6-over-IPv4 tunnel
`zeth-ipip`	IPv4-over-IPv4 tunnel
`zeth-ipip6`	IPv4-over-IPv6 tunnel
`zeth-ip6ip6`	IPv6-over-IPv6 tunnel

Zephyr will send captured network packets to one of these interfaces. The actual interface will depend on how the capturing is configured. You can then use Wireshark to monitor the proper network interface.

After the tunneling interfaces have been created, you can use for example `net-capture.py` script from `net-tools` project to print or save the captured network packets. The `net-capture.py` provides an UDP listener, it can print the captured data to screen and optionally can also save the data to a pcap file.

```
$ ./net-capture.py -i zeth-ip6ip -w capture.pcap
[20210408Z14:33:08.959589] Ether / IP / ICMP 192.0.2.1 > 192.0.2.2 echo-request 0 / Raw
[20210408Z14:33:08.976178] Ether / IP / ICMP 192.0.2.2 > 192.0.2.1 echo-reply 0 / Raw
[20210408Z14:33:16.176303] Ether / IPv6 / ICMPv6 Echo Request (id: 0x9feb seq: 0x0)
[20210408Z14:33:16.195326] Ether / IPv6 / ICMPv6 Echo Reply (id: 0x9feb seq: 0x0)
[20210408Z14:33:21.194979] Ether / IPv6 / ICMPv6ND_NS / ICMPv6 Neighbor Discovery Option -␣
↪Source Link-Layer Address 02:00:5e:00:53:3b
[20210408Z14:33:21.217528] Ether / IPv6 / ICMPv6ND_NA / ICMPv6 Neighbor Discovery Option -␣
↪Destination Link-Layer Address 00:00:5e:00:53:ff
[20210408Z14:34:10.245408] Ether / IPv6 / UDP 2001:db8::2:47319 > 2001:db8::1:4242 / Raw
[20210408Z14:34:10.266542] Ether / IPv6 / UDP 2001:db8::1:4242 > 2001:db8::2:47319 / Raw
```

The `net-capture.py` has following command line options:

```
Listen captured network data from Zephyr and save it optionally to pcap file.
./net-capture.py \
     -i | --interface <network interface>
             Listen this interface for the data
     [-p | --port <UDP port>]
             UDP port (default is 4242) where the capture data is received
     [-q | --quiet]
             Do not print packet information
     [-t | --type <L2 type of the data>]
             Scapy L2 type name of the UDP payload, default is Ether
     [-w | --write <pcap file name>]
             Write the received data to file in PCAP format
```

Instead of the `net-capture.py` script, you can for example use `netcat` to provide an UDP listener so that the host will not send port unreachable message to Zephyr:

```
nc -l -u 2001:db8:200::2 4242 > /dev/null
```

The IP address above is the inner tunnel endpoint, and can be changed and it depends on how the Zephyr is configured. Zephyr will send UDP packets containing the captured network packets to the configured IP tunnel, so we need to terminate the network connection like this.

Zephyr Configuration

In this example, we use the `native_sim` board. You can also use any other board that supports networking.

In terminal #3, type:

```
west build -b native_sim samples/net/capture -- -DCONFIG_NATIVE_UART_AUTOATTACH_DEFAULT_
↪CMD=\""gnome-terminal -- screen %s"\"
```

To see the Zephyr console and shell, start Zephyr instance like this:

```
build/zephyr/zephyr.exe -attach_uart
```

Any other application can be used too, just make sure that suitable configuration options are enabled (see `samples/net/capture/prj.conf` file for examples).

The network capture can be configured automatically if needed, but currently the `capture` sample application does not do that. User has to use `net-shell` to setup and enable the monitoring.

The network packet monitoring needs to be setup first. The `net-shell` has `net capture setup` command for doing that. The command syntax is

```
net capture setup <remote-ip-addr> <local-ip-addr> <peer-ip-addr>
     <remote> is the (outer) endpoint IP address
     <local> is the (inner) local IP address
     <peer> is the (inner) peer IP address
     Local and Peer IP addresses can have UDP port number in them (optional)
     like 198.0.51.2:9000 or [2001:db8:100::2]:4242
```

In Zephyr console, type:

```
net capture setup 192.0.2.2 2001:db8:200::1 2001:db8:200::2
```

This command will create the tunneling interface. The `192.0.2.2` is the remote host where the tunnel is terminated. The address is used to select the local network interface where the tunneling interface is attached to. The `2001:db8:200::1` tells the local IP address for the tunnel, the `2001:db8:200::2` is the peer IP address where the captured network packets are sent. The port numbers for UDP packet can be given in the setup command like this for IPv6-over-IPv4 tunnel

```
net capture setup 192.0.2.2 [2001:db8:200::1]:9999 [2001:db8:200::2]:9998
```

and like this for IPv4-over-IPv4 tunnel

```
net capture setup 192.0.2.2 198.51.100.1:9999 198.51.100.2:9998
```

If the port number is omitted, then `4242` UDP port is used as a default.

The current monitoring configuration can be checked like this:

```
uart:~$ net capture
Network packet capture disabled
                Capture  Tunnel
Device          iface    iface   Local                   Peer
NET_CAPTURE0    -        1      [2001:db8:200::1]:4242  [2001:db8:200::2]:4242
```

which will print the current configuration. As we have not yet enabled monitoring, the `Capture iface` is not set.

Then we need to enable the network packet monitoring like this:

```
net capture enable 2
```

The `2` tells the network interface which traffic we want to capture. In this example, the `2` is the `native_sim` board Ethernet interface. Note that we send the network traffic to the same interface that we are monitoring in this example. The monitoring system avoids to capture already captured network traffic as that would lead to recursion. You can use `net iface` command to see what network interfaces are available. Note that you cannot capture traffic from the tunnel interface as that would cause recursion loop. The captured network traffic can be sent to some other network interface if configured so. Just set the `<remote-ip-addr>` option properly in `net capture setup` so that the IP tunnel is attached to desired network interface. The capture status can be checked again like this:

```
uart:~$ net capture
Network packet capture enabled
                Capture  Tunnel
Device          iface    iface   Local                   Peer
NET_CAPTURE0    2        1      [2001:db8:200::1]:4242  [2001:db8:200::2]:4242
```

After enabling the monitoring, the system will send captured (either received or sent) network packets to the tunnel interface for further processing.

The monitoring can be disabled like this:

```
net capture disable
```

which will turn currently running monitoring off. The monitoring setup can be cleared like this:

```
net capture cleanup
```

It is not necessary to use `net-shell` for configuring the monitoring. The *network capture API* functions can be called by the application if needed.

Wireshark Configuration

The Wireshark tool can be used to monitor the captured network traffic in a useful way.

You can monitor either the tunnel interfaces or the `zeth` interface. In order to see the actual captured data inside an UDP packet, see Wireshark decapsulate UDP document for instructions.

6.3.6 Networking APIs

Zephyr provides support for the standard BSD socket APIs (defined in include/zephyr/net/socket.h) for the applications to use. See *BSD socket API* for more details.

Apart of the standard API, Zephyr provides a set of custom networking APIs and libraries for the application to use. See the list below for details.

Note

The legacy connectivity API in include/zephyr/net/net_context.h should not be used by applications.

Network APIs

BSD Sockets

- *Overview*
- *Secure Sockets*
  - *TLS credentials subsystem*
  - *Secure Socket Creation*
  - *Secure Sockets options*
- *Socket offloading*
  - *Offloaded socket creation*
  - *Dealing with multiple offloaded interfaces*
- *API Reference*
  - *BSD Sockets*
  - *TLS Credentials*

Overview Zephyr offers an implementation of a subset of the BSD Sockets API (a part of the POSIX standard). This API allows to reuse existing programming experience and port existing simple networking applications to Zephyr.

Here are the key requirements and concepts which governed BSD Sockets compatible API implementation for Zephyr:

- Has minimal overhead, similar to the requirement for other Zephyr subsystems.
- Is namespaced by default, to avoid name conflicts with well-known names like `close()`, which may be part of libc or other POSIX compatibility libraries. If enabled by `CONFIG_POSIX_API`, it will also expose native POSIX names.

BSD Sockets compatible API is enabled using `CONFIG_NET_SOCKETS` config option and implements the following operations: `socket()`, `close()`, `recv()`, `recvfrom()`, `send()`, `sendto()`, `connect()`, `bind()`, `listen()`, `accept()`, `fcntl()` (to set non-blocking mode), `getsockopt()`, `setsockopt()`, `poll()`, `select()`, `getaddrinfo()`, `getnameinfo()`.

Based on the namespacing requirements above, these operations are by default exposed as functions with `zsock_` prefix, e.g. *`zsock_socket()`* and *`zsock_close()`*. If the config option `CONFIG_POSIX_API` is defined, all the functions will be also exposed as aliases without the prefix. This includes the functions like `close()` and `fcntl()` (which may conflict with functions in libc or other libraries, for example, with the filesystem libraries).

Another entailment of the design requirements above is that the Zephyr API aggressively employs the short-read/short-write property of the POSIX API whenever possible (to minimize complexity and overheads). POSIX allows for calls like `recv()` and `send()` to actually process (receive or send) less data than requested by the user (on `SOCK_STREAM` type sockets). For example, a call `recv(sock, 1000, 0)` may return 100, meaning that only 100 bytes were read (short read), and the application needs to retry call(s) to receive the remaining 900 bytes.

The BSD Sockets API uses file descriptors to represent sockets. File descriptors are small integers, consecutively assigned from zero, shared among sockets, files, special devices (like stdin/stdout), etc. Internally, there is a table mapping file descriptors to internal object pointers. The file descriptor table is used by the BSD Sockets API even if the rest of the POSIX subsystem (filesystem, stdin/stdout) is not enabled.

See sockets-echo-server and sockets-echo-client sample applications to learn how to create a simple server or client BSD socket based application.

Secure Sockets Zephyr provides an extension of standard POSIX socket API, allowing to create and configure sockets with TLS protocol types, facilitating secure communication. Secure functions for the implementation are provided by mbedTLS library. Secure sockets implementation allows use of both TLS and DTLS protocols with standard socket calls. See *`net_ip_protocol_secure`* type for supported secure protocol versions.

To enable secure sockets, set the `CONFIG_NET_SOCKETS_SOCKOPT_TLS` option. To enable DTLS support, use `CONFIG_NET_SOCKETS_ENABLE_DTLS` option.

TLS credentials subsystem TLS credentials must be registered in the system before they can be used with secure sockets. See *`tls_credential_add()`* for more information.

When a specific TLS credential is registered in the system, it is assigned with numeric value of type *`sec_tag_t`*, called a tag. This value can be used later on to reference the credential during secure socket configuration with socket options.

The following TLS credential types can be registered in the system:

- `TLS_CREDENTIAL_CA_CERTIFICATE`
- `TLS_CREDENTIAL_SERVER_CERTIFICATE`
- `TLS_CREDENTIAL_PRIVATE_KEY`

- TLS_CREDENTIAL_PSK
- TLS_CREDENTIAL_PSK_ID

An example registration of CA certificate (provided in ca_certificate array) looks like this:

```
ret = tls_credential_add(CA_CERTIFICATE_TAG, TLS_CREDENTIAL_CA_CERTIFICATE,
                         ca_certificate, sizeof(ca_certificate));
```

By default certificates in DER format are supported. PEM support can be enabled in mbedTLS settings.

Secure Socket Creation A secure socket can be created by specifying secure protocol type, for instance:

```
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);
```

Once created, it can be configured with socket options. For instance, the CA certificate and hostname can be set:

```
sec_tag_t sec_tag_opt[] = {
        CA_CERTIFICATE_TAG,
};

ret = setsockopt(sock, SOL_TLS, TLS_SEC_TAG_LIST,
                 sec_tag_opt, sizeof(sec_tag_opt));
```

```
char host[] = "google.com";

ret = setsockopt(sock, SOL_TLS, TLS_HOSTNAME, host, sizeof(host));
```

Once configured, socket can be used just like a regular TCP socket.

Several samples in Zephyr use secure sockets for communication. For a sample use see e.g. echo-server sample application or HTTP GET sample application.

Secure Sockets options Secure sockets offer the following options for socket management:

Related code samples

HTTP Client
Implement an HTTP(S) client that issues a variety of HTTP requests.

HTTP GET using plain sockets
Implement an HTTP(S) client using plain BSD sockets.

Socket options for TLS

`SOL_TLS`

Protocol level for TLS.

Here, the same socket protocol level for TLS as in Linux was used.

`TLS_SEC_TAG_LIST`

Socket option to select TLS credentials to use.

It accepts and returns an array of sec_tag_t that indicate which TLS credentials should be used with specific socket.

`TLS_HOSTNAME`

Write-only socket option to set hostname.

It accepts a string containing the hostname (may be NULL to disable hostname verification). By default, hostname check is enforced for TLS clients.

`TLS_CIPHERSUITE_LIST`

Socket option to select ciphersuites to use.

It accepts and returns an array of integers with IANA assigned ciphersuite identifiers. If not set, socket will allow all ciphersuites available in the system (mbedTLS default behavior).

`TLS_CIPHERSUITE_USED`

Read-only socket option to read a ciphersuite chosen during TLS handshake.

It returns an integer containing an IANA assigned ciphersuite identifier of chosen ciphersuite.

`TLS_PEER_VERIFY`

Write-only socket option to set peer verification level for TLS connection.

This option accepts an integer with a peer verification level, compatible with mbedTLS values:

- 0 - none
- 1 - optional
- 2 - required

If not set, socket will use mbedTLS defaults (none for servers, required for clients).

`TLS_DTLS_ROLE`

Write-only socket option to set role for DTLS connection.

This option is irrelevant for TLS connections, as for them role is selected based on *connect()*/listen() usage. By default, DTLS will assume client role. This option accepts an integer with a TLS role, compatible with mbedTLS values:

- 0 - client
- 1 - server

`TLS_ALPN_LIST`

Socket option for setting the supported Application Layer Protocols.

It accepts and returns a const char array of NULL terminated strings representing the supported application layer protocols listed during the TLS handshake.

`TLS_DTLS_HANDSHAKE_TIMEOUT_MIN`

Socket option to set DTLS min handshake timeout.

The timeout starts at min, and upon retransmission the timeout is doubled util max is reached. Min and max arguments are separate options. The time unit is ms.

`TLS_DTLS_HANDSHAKE_TIMEOUT_MAX`

Socket option to set DTLS max handshake timeout.

The timeout starts at min, and upon retransmission the timeout is doubled util max is reached. Min and max arguments are separate options. The time unit is ms.

`TLS_CERT_NOCOPY`

Socket option for preventing certificates from being copied to the mbedTLS heap if possible.

The option is only effective for DER certificates and is ignored for PEM certificates.

`TLS_NATIVE`

TLS socket option to use with offloading.

The option instructs the network stack only to offload underlying TCP/UDP communication. The TLS/DTLS operation is handled by a native TLS/DTLS socket implementation from Zephyr.

Note, that this option is only applicable if socket dispatcher is used (CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER is enabled). In such case, it should be the first socket option set on a newly created socket. After that, the application may use SO_BINDTODEVICE to choose the dedicated network interface for the underlying TCP/UDP socket.

`TLS_SESSION_CACHE`

Socket option to control TLS session caching on a socket.

Accepted values:

- 0 - Disabled.
- 1 - Enabled.

`TLS_SESSION_CACHE_PURGE`

Write-only socket option to purge session cache immediately.

This option accepts any value.

`TLS_DTLS_CID`

Write-only socket option to control DTLS CID.

The option accepts an integer, indicating the setting. Accepted values for the option are: 0, 1 and 2. Effective when set before connecting to the socket.

- 0 - DTLS CID will be disabled.
- 1 - DTLS CID will be enabled, and a 0 length CID value to be sent to the peer.
- 2 - DTLS CID will be enabled, and the most recent value set with TLS_DTLS_CID_VALUE will be sent to the peer. Otherwise, a random value will be used.

`TLS_DTLS_CID_STATUS`
: Read-only socket option to get DTLS CID status.

  The option accepts a pointer to an integer, indicating the setting upon return. Returned values for the option are:

  - 0 - DTLS CID is disabled.
  - 1 - DTLS CID is received on the downlink.
  - 2 - DTLS CID is sent to the uplink.
  - 3 - DTLS CID is used in both directions.

`TLS_DTLS_CID_VALUE`
: Socket option to set or get the value of the DTLS connection ID to be used for the DTLS session.

  The option accepts a byte array, holding the CID value.

`TLS_DTLS_PEER_CID_VALUE`
: Read-only socket option to get the value of the DTLS connection ID received from the peer.

  The option accepts a pointer to a byte array, holding the CID value upon return. The optlen returned will be 0 if the peer did not provide a connection ID, otherwise will contain the length of the CID value.

`TLS_DTLS_HANDSHAKE_ON_CONNECT`
: Socket option to configure DTLS socket behavior on *connect()*.

  If set, DTLS *connect()* will execute the handshake with the configured peer. This is the default behavior. Otherwise, DTLS *connect()* will only configure peer address (as with regular UDP socket) and will not attempt to execute DTLS handshake. The handshake will take place in consecutive *send()*/recv() call.

`TLS_PEER_VERIFY_NONE`
: Peer verification disabled.

`TLS_PEER_VERIFY_OPTIONAL`
: Peer verification optional.

`TLS_PEER_VERIFY_REQUIRED`
: Peer verification required.

`TLS_DTLS_ROLE_CLIENT`
: Client role in a DTLS session.

`TLS_DTLS_ROLE_SERVER`
: Server role in a DTLS session.

`TLS_CERT_NOCOPY_NONE`
: Cert duplicated in heap.

`TLS_CERT_NOCOPY_OPTIONAL`
: Cert not copied in heap if DER.

`TLS_SESSION_CACHE_DISABLED`
: Disable TLS session caching.

`TLS_SESSION_CACHE_ENABLED`
: Enable TLS session caching.

`TLS_DTLS_CID_DISABLED`
: CID is disabled

`TLS_DTLS_CID_SUPPORTED`
: CID is supported.

`TLS_DTLS_CID_ENABLED`
: CID is enabled

`TLS_DTLS_CID_STATUS_DISABLED`
: CID is disabled.

`TLS_DTLS_CID_STATUS_DOWNLINK`
: CID is in use by us.

`TLS_DTLS_CID_STATUS_UPLINK`
: CID is in use by peer.

`TLS_DTLS_CID_STATUS_BIDIRECTIONAL`
: CID is in use by us and peer.

Socket offloading Zephyr allows to register custom socket implementations (called offloaded sockets). This allows for seamless integration for devices which provide an external IP stack and expose socket-like API.

Socket offloading can be enabled with `CONFIG_NET_SOCKETS_OFFLOAD` option. A network driver that wants to register a new socket implementation should use `NET_SOCKET_OFFLOAD_REGISTER` macro. The macro accepts the following parameters:

- `socket_name`
  An arbitrary name for the socket implementation.
- `prio`
  Socket implementation's priority. The higher the priority, the earlier this particular implementation will be processed when creating a new socket. Lower numeric value indicates higher priority.
- `_family`
  Socket family implemented by the offloaded socket. `AF_UNSPEC` indicates any family.
- `_is_supported`
  A filtering function, used to verify whether a particular socket family, type and protocol are supported by the offloaded socket implementation.
- `_handler`
  A function compatible with *`socket()`* API, used to create an offloaded socket.

Every offloaded socket implementation should also implement a set of socket APIs, specified in `socket_op_vtable` struct.

The function registered for socket creation should allocate a new file descriptor using `zvfs_reserve_fd()` function. Any additional actions, specific to the creation of a particular offloaded socket implementation, should take place after the file descriptor is allocated. As a final step, if the offloaded socket was created successfully, the file descriptor should be finalized with `zvfs_finalize_typed_fd()`, or `zvfs_finalize_fd()` functions. The finalize function allows to register a `socket_op_vtable` structure implementing socket APIs for an offloaded socket along with an optional socket context data pointer.

Finally, when an offloaded network interface is initialized, it should indicate that the interface is offloaded with *net_if_socket_offload_set()* function. The function registers the function used to create an offloaded socket (the same as the one provided in `NET_SOCKET_OFFLOAD_REGISTER`) at the network interface.

Offloaded socket creation When application creates a new socket with *socket()* function, the network stack iterates over all registered socket implementations (native and offloaded). Higher priority socket implementations are processed first. For each registered socket implementation, an address family is verified, and if it matches (or the socket was registered as `AF_UNSPEC`), the corresponding `_is_supported` function is called to verify the remaining socket parameters. The first implementation that fulfills the socket requirements (i. e. `_is_supported` returns true) will create a new socket with its `_handler` function.

The above indicates the importance of the socket priority. If multiple socket implementations support the same set of socket family/type/protocol, the first implementation processed by the system will create a socket. Therefore it's important to give the highest priority to the implementation that should be the system default.

The socket priority for native socket implementation is configured with Kconfig. Use `CONFIG_NET_SOCKETS_TLS_PRIORITY` to set the priority for the native TLS sockets. Use `CONFIG_NET_SOCKETS_PRIORITY_DEFAULT` to set the priority for the remaining native sockets.

Dealing with multiple offloaded interfaces As the *socket()* function does not allow to specify which network interface should be used by a socket, it's not possible to choose a specific implementation in case multiple offloaded socket implementations, supporting the same type of sockets, are available. The same problem arises when both native and offloaded sockets are available in the system.

To address this problem, a special socket implementation (called socket dispatcher) was introduced. The sole reason for this module is to postpone the socket creation for until the first operation on a socket is performed. This leaves an opening to use `SO_BINDTODEVICE` socket option, to bind a socket to a particular network interface (and thus offloaded socket implementation). The socket dispatcher can be enabled with `CONFIG_NET_SOCKETS_OFFLOAD_DISPATCHER` Kconfig option.

When enabled, the application can specify the network interface to use with *setsockopt()* function:

```
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_DGRAM, IPPROTO_UDP);

struct ifreq ifreq = {
   .ifr_name = "SimpleLink"
};

/* The socket is "dispatched" to a particular network interface
 * (offloaded or not).
 */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

Similarly, if TLS is supported by both native and offloaded sockets, `TLS_NATIVE` socket option can be used to indicate that a native TLS socket should be created. The underlying socket can then

be bound to a particular network interface:

```
/* A "dispatcher" socket is created */
sock = socket(AF_INET, SOCK_STREAM, IPPROTO_TLS_1_2);

int tls_native = 1;

/* The socket is "dispatched" to a native TLS socket implmeentation.
 * The underlying socket is a "dispatcher" socket now.
 */
setsockopt(sock, SOL_TLS, TLS_NATIVE, &tls_native, sizeof(tls_native));

struct ifreq ifreq = {
   .ifr_name = "SimpleLink"
};

/* The underlying socket is "dispatched" to a particular network interface
 * (offloaded or not).
 */
setsockopt(sock, SOL_SOCKET, SO_BINDTODEVICE, &ifreq, sizeof(ifreq));
```

In case no `SO_BINDTODEVICE` socket option is used on a socket, the socket will be dispatched according to the default priority and filtering rules on a first socket API call.

API Reference

Related code samples

AWS IoT Core MQTT
: Connect to AWS IoT Core and publish messages using MQTT.

Asynchronous echo server using poll()
: Implement an asynchronous IPv4/IPv6 TCP echo server using BSD sockets and poll()

Asynchronous echo server using select()
: Implement an asynchronous IPv4/IPv6 TCP echo server using BSD sockets and select()

Dumb HTTP server
: Implement a simple, portable, HTTP server using BSD sockets.

Dumb HTTP server (multi-threaded)
: Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

Echo client (advanced)
: Implement a client that sends IP packets, waits for data to be sent back, and verifies it.

Echo server (advanced)
: Implement a UDP/TCP server that sends received packets back to the sender.

Echo server (service)
: Implements a simple IPv4/IPv6 TCP echo server using BSD sockets and socket service API.

Echo server (simple)
: Implements a simple IPv4/IPv6 TCP echo server using BSD sockets.

HTTP Client
: Implement an HTTP(S) client that issues a variety of HTTP requests.

HTTP GET using plain sockets
Implement an HTTP(S) client using plain BSD sockets.

Large HTTP download
Download a large file from a web server using BSD sockets.

Microsoft Azure IoT Hub MQTT
Connect to Azure IoT Hub and publish messages using MQTT.

Modbus TCP server
Implement a Modbus TCP server exposing Modbus commands to control LEDs.

Modbus TCP-to-serial gateway
Implement a gateway between an Ethernet TCP-IP network and a Modbus serial line.

Network management socket
Listen to network management events using a network management socket.

Packet socket
Use raw packet sockets over Ethernet.

SNTP client
Use SNTP to get the current time from the host.

SocketCAN
Send and receive raw CAN frames using BSD sockets API.

Socketpair
Implement communication between threads using socket pairs.

TCP sample for TTCN-3 based sanity check
Use TTCN-3 to validate the functionality of the TCP stack.

TagoIO HTTP Post
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.

UDP sender using SO_TXTIME
Control the transmission time of a packet using SO_TXTIME socket option.

Video TCP server sink
Capture video frames and send them over the network to a TCP client.

WebSocket Client
Implement a Websocket client that connects to a Websocket server.

mDNS responder
Listen and respond to mDNS queries.

BSD Sockets

group `bsd_sockets`

BSD Sockets compatible API.

Since
1.9

Version
1.0.0

Socket APIs available if CONFIG_NET_SOCKETS_POSIX_NAMES is enabled

static inline int **socket**(int family, int type, int proto)

POSIX wrapper for *zsock_socket*.

static inline int **socketpair**(int family, int type, int proto, int sv[2])
POSIX wrapper for *zsock_socketpair*.

static inline int **close**(int sock)
POSIX wrapper for *zsock_close*.

static inline int **shutdown**(int sock, int how)
POSIX wrapper for *zsock_shutdown*.

static inline int **bind**(int sock, const struct *sockaddr* *addr, *socklen_t* addrlen)
POSIX wrapper for *zsock_bind*.

static inline int **connect**(int sock, const struct *sockaddr* *addr, *socklen_t* addrlen)
POSIX wrapper for *zsock_connect*.

static inline int **listen**(int sock, int backlog)
POSIX wrapper for *zsock_listen*.

static inline int **accept**(int sock, struct *sockaddr* *addr, *socklen_t* *addrlen)
POSIX wrapper for *zsock_accept*.

static inline ssize_t **send**(int sock, const void *buf, size_t len, int flags)
POSIX wrapper for *zsock_send*.

static inline ssize_t **recv**(int sock, void *buf, size_t max_len, int flags)
POSIX wrapper for *zsock_recv*.

static inline ssize_t **sendto**(int sock, const void *buf, size_t len, int flags, const struct *sockaddr* *dest_addr, *socklen_t* addrlen)
POSIX wrapper for *zsock_sendto*.

static inline ssize_t **sendmsg**(int sock, const struct *msghdr* *message, int flags)
POSIX wrapper for *zsock_sendmsg*.

static inline ssize_t **recvfrom**(int sock, void *buf, size_t max_len, int flags, struct *sockaddr* *src_addr, *socklen_t* *addrlen)
POSIX wrapper for *zsock_recvfrom*.

static inline ssize_t **recvmsg**(int sock, struct *msghdr* *msg, int flags)
POSIX wrapper for *zsock_recvmsg*.

static inline int **poll**(struct *zsock_pollfd* *fds, int nfds, int timeout)
POSIX wrapper for *zsock_poll*.

static inline int **getsockopt**(int sock, int level, int optname, void *optval, *socklen_t* *optlen)
POSIX wrapper for *zsock_getsockopt*.

static inline int **setsockopt**(int sock, int level, int optname, const void *optval, *socklen_t* optlen)
POSIX wrapper for *zsock_setsockopt*.

static inline int **getpeername**(int sock, struct *sockaddr* *addr, *socklen_t* *addrlen)
POSIX wrapper for *zsock_getpeername*.

static inline int **getsockname**(int sock, struct *sockaddr* *addr, *socklen_t* *addrlen)
POSIX wrapper for *zsock_getsockname*.

static inline int **getaddrinfo**(const char *host, const char *service, const struct *zsock_addrinfo* *hints, struct *zsock_addrinfo* **res)
POSIX wrapper for *zsock_getaddrinfo*.

static inline void **freeaddrinfo**(struct *zsock_addrinfo* *ai)
POSIX wrapper for *zsock_freeaddrinfo*.

static inline const char ***gai_strerror**(int errcode)
POSIX wrapper for *zsock_gai_strerror*.

static inline int **getnameinfo**(const struct *sockaddr* *addr, *socklen_t* addrlen, char *host, *socklen_t* hostlen, char *serv, *socklen_t* servlen, int flags)
POSIX wrapper for *zsock_getnameinfo*.

static inline int **gethostname**(char *buf, size_t len)
POSIX wrapper for *zsock_gethostname*.

static inline int **inet_pton**(*sa_family_t* family, const char *src, void *dst)
POSIX wrapper for *zsock_inet_pton*.

static inline char ***inet_ntop**(*sa_family_t* family, const void *src, char *dst, size_t size)
POSIX wrapper for *zsock_inet_ntop*.

pollfd
POSIX wrapper for *zsock_pollfd*.

addrinfo
POSIX wrapper for *zsock_addrinfo*.

POLLIN
POSIX wrapper for *ZSOCK_POLLIN*.

POLLOUT
POSIX wrapper for *ZSOCK_POLLOUT*.

POLLERR
POSIX wrapper for *ZSOCK_POLLERR*.

POLLHUP
POSIX wrapper for *ZSOCK_POLLHUP*.

POLLNVAL
POSIX wrapper for *ZSOCK_POLLNVAL*.

MSG_PEEK
POSIX wrapper for *ZSOCK_MSG_PEEK*.

MSG_CTRUNC
POSIX wrapper for *ZSOCK_MSG_CTRUNC*.

MSG_TRUNC
POSIX wrapper for *ZSOCK_MSG_TRUNC*.

MSG_DONTWAIT
POSIX wrapper for *ZSOCK_MSG_DONTWAIT*.

`MSG_WAITALL`
: POSIX wrapper for *ZSOCK_MSG_WAITALL*.

`SHUT_RD`
: POSIX wrapper for *ZSOCK_SHUT_RD*.

`SHUT_WR`
: POSIX wrapper for *ZSOCK_SHUT_WR*.

`SHUT_RDWR`
: POSIX wrapper for *ZSOCK_SHUT_RDWR*.

`EAI_BADFLAGS`
: POSIX wrapper for *DNS_EAI_BADFLAGS*.

`EAI_NONAME`
: POSIX wrapper for *DNS_EAI_NONAME*.

`EAI_AGAIN`
: POSIX wrapper for *DNS_EAI_AGAIN*.

`EAI_FAIL`
: POSIX wrapper for *DNS_EAI_FAIL*.

`EAI_NODATA`
: POSIX wrapper for *DNS_EAI_NODATA*.

`EAI_MEMORY`
: POSIX wrapper for *DNS_EAI_MEMORY*.

`EAI_SYSTEM`
: POSIX wrapper for *DNS_EAI_SYSTEM*.

`EAI_SERVICE`
: POSIX wrapper for *DNS_EAI_SERVICE*.

`EAI_SOCKTYPE`
: POSIX wrapper for *DNS_EAI_SOCKTYPE*.

`EAI_FAMILY`
: POSIX wrapper for *DNS_EAI_FAMILY*.

Options for poll()

`ZSOCK_POLLIN`
: zsock_poll: Poll for readability

ZSOCK_POLLPRI
: zsock_poll: Poll for exceptional condition

ZSOCK_POLLOUT
: zsock_poll: Poll for writability

ZSOCK_POLLERR
: zsock_poll: Poll results in error condition (output value only)

ZSOCK_POLLHUP
: zsock_poll: Poll detected closed connection (output value only)

ZSOCK_POLLNVAL
: zsock_poll: Invalid socket (output value only)

Options for sending and receiving data

ZSOCK_MSG_PEEK
: zsock_recv: Read data without removing it from socket input queue

ZSOCK_MSG_CTRUNC
: zsock_recvmsg: Control data buffer too small.

ZSOCK_MSG_TRUNC
: zsock_recv: return the real length of the datagram, even when it was longer than the passed buffer

ZSOCK_MSG_DONTWAIT
: zsock_recv/zsock_send: Override operation to non-blocking

ZSOCK_MSG_WAITALL
: zsock_recv: block until the full amount of data can be returned

Options for shutdown() function

ZSOCK_SHUT_RD
: zsock_shutdown: Shut down for reading

ZSOCK_SHUT_WR
: zsock_shutdown: Shut down for writing

ZSOCK_SHUT_RDWR
: zsock_shutdown: Shut down for both reading and writing

Flags for getaddrinfo() hints

`AI_PASSIVE`
: Address for *bind()* (vs for *connect()*)

`AI_CANONNAME`
: Fill in ai_canonname.

`AI_NUMERICHOST`
: Assume host address is in numeric notation, don't DNS lookup.

`AI_V4MAPPED`
: May return IPv4 mapped address for IPv6

`AI_ALL`
: May return both native IPv6 and mapped IPv4 address for IPv6.

`AI_ADDRCONFIG`
: IPv4/IPv6 support depends on local system config.

`AI_NUMERICSERV`
: Assume service (port) is numeric.

`AI_EXTFLAGS`
: Extra flags present (see RFC 5014)

Flags for getnameinfo()

`NI_NUMERICHOST`
: *zsock_getnameinfo()*: Resolve to numeric address.

`NI_NUMERICSERV`
: *zsock_getnameinfo()*: Resolve to numeric port number.

`NI_NOFQDN`
: *zsock_getnameinfo()*: Return only hostname instead of FQDN

`NI_NAMEREQD`
: *zsock_getnameinfo()*: Dummy option for compatibility

`NI_DGRAM`
: *zsock_getnameinfo()*: Dummy option for compatibility

`NI_MAXHOST`
: *zsock_getnameinfo()*: Max supported hostname length

Network interface name description

`IFNAMSIZ`
: Network interface name length.

Socket level options (SOL_SOCKET)

`SOL_SOCKET`
: Socket-level option.

`SO_DEBUG`
: Recording debugging information (ignored, for compatibility)

`SO_REUSEADDR`
: address reuse

`SO_TYPE`
: Type of the socket.

`SO_ERROR`
: Async error.

`SO_DONTROUTE`
: Bypass normal routing and send directly to host (ignored, for compatibility)

`SO_BROADCAST`
: Transmission of broadcast messages is supported (ignored, for compatibility)

`SO_SNDBUF`
: Size of socket send buffer.

`SO_RCVBUF`
: Size of socket recv buffer.

`SO_KEEPALIVE`
: Enable sending keep-alive messages on connections.

`SO_OOBINLINE`
: Place out-of-band data into receive stream (ignored, for compatibility)

`SO_PRIORITY`
: Socket priority.

`SO_LINGER`
: Socket lingers on close (ignored, for compatibility)

`SO_REUSEPORT`
: Allow multiple sockets to reuse a single port.

`SO_RCVLOWAT`
: Receive low watermark (ignored, for compatibility)

`SO_SNDLOWAT`
: Send low watermark (ignored, for compatibility)

`SO_RCVTIMEO`
: Receive timeout Applies to receive functions like *recv()*, but not to *connect()*

`SO_SNDTIMEO`
: Send timeout.

`SO_BINDTODEVICE`
: Bind a socket to an interface.

`SO_ACCEPTCONN`
: Socket accepts incoming connections (ignored, for compatibility)

`SO_TIMESTAMPING`
: Timestamp TX RX or both packets.

  Supports multiple timestamp sources.

`SO_PROTOCOL`
: Protocol used with the socket.

`SO_DOMAIN`
: Domain used with SOCKET.

`SO_SOCKS5`
: Enable SOCKS5 for Socket.

`SO_TXTIME`
: Socket TX time (when the data should be sent)

`SCM_TXTIME`
: Socket TX time (same as SO_TXTIME)

`SOF_TIMESTAMPING_RX_HARDWARE`
: Timestamp generation flags.

  Request RX timestamps generated by network adapter.

`SOF_TIMESTAMPING_TX_HARDWARE`
: Request TX timestamps generated by network adapter.

  This can be enabled via socket option or control messages.

TCP level options (IPPROTO_TCP)

`TCP_NODELAY`
: Disable TCP buffering (ignored, for compatibility)

`TCP_KEEPIDLE`
: Start keepalives after this period (seconds)

`TCP_KEEPINTVL`
: Interval between keepalives (seconds)

`TCP_KEEPCNT`
: Number of keepalives before dropping connection.

IPv4 level options (IPPROTO_IP)

`IP_TOS`
: Set or receive the Type-Of-Service value for an outgoing packet.

`IP_TTL`
: Set or receive the Time-To-Live value for an outgoing packet.

`IP_PKTINFO`
: Pass an IP_PKTINFO ancillary message that contains a pktinfo structure that supplies some information about the incoming packet.

`IP_MULTICAST_TTL`
: Set IPv4 multicast TTL value.

`IP_ADD_MEMBERSHIP`
: Join IPv4 multicast group.

`IP_DROP_MEMBERSHIP`
: Leave IPv4 multicast group.

IPv6 level options (IPPROTO_IPV6)

`IPV6_UNICAST_HOPS`
: Set the unicast hop limit for the socket.

`IPV6_MULTICAST_HOPS`
: Set the multicast hop limit for the socket.

`IPV6_ADD_MEMBERSHIP`
: Join IPv6 multicast group.

`IPV6_DROP_MEMBERSHIP`
: Leave IPv6 multicast group.

`IPV6_V6ONLY`
: Don't support IPv4 access.

`IPV6_RECVPKTINFO`
: Pass an IPV6_RECVPKTINFO ancillary message that contains a *in6_pktinfo* structure that supplies some information about the incoming packet.

  See RFC 3542.

`IPV6_ADDR_PREFERENCES`
: RFC5014: Source address selection.

`IPV6_PREFER_SRC_TMP`
: Prefer temporary address as source.

`IPV6_PREFER_SRC_PUBLIC`
: Prefer public address as source.

`IPV6_PREFER_SRC_PUBTMP_DEFAULT`
: Either public or temporary address is selected as a default source depending on the output interface configuration (this is the default value).

  This is Linux specific option not found in the RFC.

`IPV6_PREFER_SRC_COA`
: Prefer Care-of address as source.

  Ignored in Zephyr.

`IPV6_PREFER_SRC_HOME`
: Prefer Home address as source.

  Ignored in Zephyr.

`IPV6_PREFER_SRC_CGA`
: Prefer CGA (Cryptographically Generated Address) address as source.

  Ignored in Zephyr.

`IPV6_PREFER_SRC_NONCGA`
: Prefer non-CGA address as source.

  Ignored in Zephyr.

`IPV6_TCLASS`
: Set or receive the traffic class value for an outgoing packet.

Backlog size for listen()

`SOMAXCONN`
: listen: The maximum backlog queue length

Defines

ZSOCK_FD_SETSIZE

Number of file descriptors which can be added to *zsock_fd_set*.

Typedefs

typedef struct *zsock_fd_set* **zsock_fd_set**

Socket file descriptor set.

Functions

void ***zsock_get_context_object**(int sock)

Obtain a file descriptor's associated net context.

With CONFIG_USERSPACE enabled, the kernel's object permission system must apply to socket file descriptors. When a socket is opened, by default only the caller has permission, access by other threads will fail unless they have been specifically granted permission.

This is achieved by tagging data structure definitions that implement the underlying object associated with a network socket file descriptor with '__net_socket'. All pointers to instances of these will be known to the kernel as kernel objects with type K_OBJ_NET_SOCKET.

This API is intended for threads that need to grant access to the object associated with a particular file descriptor to another thread. The returned pointer represents the underlying K_OBJ_NET_SOCKET and may be passed to APIs like *k_object_access_grant()*.

In a system like Linux which has the notion of threads running in processes in a shared virtual address space, this sort of management is unnecessary as the scope of file descriptors is implemented at the process level.

However in Zephyr the file descriptor scope is global, and MPU-based systems are not able to implement a process-like model due to the lack of memory virtualization hardware. They use discrete object permissions and memory domains instead to define thread access scope.

User threads will have no direct access to the returned object and will fault if they try to access its memory; the pointer can only be used to make permission assignment calls, which follow exactly the rules for other kernel objects like device drivers and IPC.

Parameters

- **sock** – file descriptor

Returns

pointer to associated network socket object, or NULL if the file descriptor wasn't valid or the caller had no access permission

int **zsock_socket**(int family, int type, int proto)

Create a network socket.

See POSIX.1-2017 article for normative description. This function is also exposed as `socket()` if `CONFIG_POSIX_API` is defined.

If CONFIG_USERSPACE is enabled, the caller will be granted access to the context object associated with the returned file descriptor.

See also

zsock_get_context_object()

int **zsock_socketpair**(int family, int type, int proto, int *sv)

Create an unnamed pair of connected sockets.

See POSIX.1-2017 article for normative description. This function is also exposed as `socketpair()` if `CONFIG_POSIX_API` is defined.

int **zsock_close**(int sock)

Close a network socket.

Close a network socket. This function is also exposed as `close()` if `CONFIG_POSIX_API` is defined (in which case it may conflict with generic POSIX `close()` function).

int **zsock_shutdown**(int sock, int how)

Shutdown socket send/receive operations.

See POSIX.1-2017 article for normative description, but currently this function has no effect in Zephyr and provided solely for compatibility with existing code. This function is also exposed as `shutdown()` if `CONFIG_POSIX_API` is defined.

int **zsock_bind**(int sock, const struct *sockaddr* *addr, *socklen_t* addrlen)

Bind a socket to a local network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `bind()` if `CONFIG_POSIX_API` is defined.

int **zsock_connect**(int sock, const struct *sockaddr* *addr, *socklen_t* addrlen)

Connect a socket to a peer network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `connect()` if `CONFIG_POSIX_API` is defined.

int **zsock_listen**(int sock, int backlog)

Set up a STREAM socket to accept peer connections.

See POSIX.1-2017 article for normative description. This function is also exposed as `listen()` if `CONFIG_POSIX_API` is defined.

int **zsock_accept**(int sock, struct *sockaddr* *addr, *socklen_t* *addrlen)

Accept a connection on listening socket.

See POSIX.1-2017 article for normative description. This function is also exposed as `accept()` if `CONFIG_POSIX_API` is defined.

ssize_t **zsock_sendto**(int sock, const void *buf, size_t len, int flags, const struct *sockaddr* *dest_addr, *socklen_t* addrlen)

Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `sendto()` if `CONFIG_POSIX_API` is defined.

static inline ssize_t **zsock_send**(int sock, const void *buf, size_t len, int flags)

Send data to a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as `send()` if `CONFIG_POSIX_API` is defined.

ssize_t **zsock_sendmsg**(int sock, const struct *msghdr* *msg, int flags)

Send data to an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `sendmsg()` if `CONFIG_POSIX_API` is defined.

ssize_t **zsock_recvfrom**(int sock, void *buf, size_t max_len, int flags, struct *sockaddr* *src_addr, *socklen_t* *addrlen)

Receive data from an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `recvfrom()` if `CONFIG_POSIX_API` is defined.

ssize_t **zsock_recvmsg**(int sock, struct *msghdr* *msg, int flags)

Receive a message from an arbitrary network address.

See POSIX.1-2017 article for normative description. This function is also exposed as `recvmsg()` if `CONFIG_POSIX_API` is defined.

static inline ssize_t **zsock_recv**(int sock, void *buf, size_t max_len, int flags)

Receive data from a connected peer.

See POSIX.1-2017 article for normative description. This function is also exposed as `recv()` if `CONFIG_POSIX_API` is defined.

int **zsock_fcntl_impl**(int sock, int cmd, int flags)

Control blocking/non-blocking mode of a socket.

This functions allow to (only) configure a socket for blocking or non-blocking operation (O_NONBLOCK). This function is also exposed as `fcntl()` if `CONFIG_POSIX_API` is defined (in which case it may conflict with generic POSIX `fcntl()` function).

int **zsock_ioctl_impl**(int sock, unsigned long request, va_list ap)

Control underlying socket parameters.

See POSIX.1-2017 article for normative description. This function enables querying or manipulating underlying socket parameters. Currently supported @p request values include `ZFD_IOCTL_FIONBIO`, and `ZFD_IOCTL_FIONREAD`, to set non-blocking mode, and query the number of bytes available to read, respectively. This function is also exposed as `ioctl()` if `CONFIG_POSIX_API` is defined (in which case it may conflict with generic POSIX `ioctl()` function).

int **zsock_poll**(struct *zsock_pollfd* *fds, int nfds, int timeout)

Efficiently poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is also exposed as `poll()` if `CONFIG_POSIX_API` is defined (in which case it may conflict with generic POSIX `poll()` function).

int **zsock_getsockopt**(int sock, int level, int optname, void *optval, *socklen_t* *optlen)

Get various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as `getsockopt()` if `CONFIG_POSIX_API` is defined.

int **zsock_setsockopt**(int sock, int level, int optname, const void *optval, *socklen_t* optlen)

Set various socket options.

See POSIX.1-2017 article for normative description. In Zephyr this function supports a subset of socket options described by POSIX, but also some additional options available in Linux (some options are dummy and provided to ease porting of existing code). This function is also exposed as `setsockopt()` if `CONFIG_POSIX_API` is defined.

int **zsock_getpeername**(int sock, struct *sockaddr* *addr, *socklen_t* *addrlen)

Get peer name.

See POSIX.1-2017 article for normative description. This function is also exposed as `getpeername()` if `CONFIG_POSIX_API` is defined.

int **zsock_getsockname**(int sock, struct *sockaddr* *addr, *socklen_t* *addrlen)

Get socket name.

See POSIX.1-2017 article for normative description. This function is also exposed as `getsockname()` if `CONFIG_POSIX_API` is defined.

int **zsock_gethostname**(char *buf, size_t len)

Get local host name.

See POSIX.1-2017 article for normative description. This function is also exposed as `gethostname()` if `CONFIG_POSIX_API` is defined.

static inline char *__zsock_inet_ntop__(*sa_family_t* family, const void *src, char *dst, size_t size)

Convert network address from internal to numeric ASCII form.

See POSIX.1-2017 article for normative description. This function is also exposed as `inet_ntop()` if `CONFIG_POSIX_API` is defined.

int **zsock_inet_pton**(*sa_family_t* family, const char *src, void *dst)

Convert network address from numeric ASCII form to internal representation.

See POSIX.1-2017 article for normative description. This function is also exposed as `inet_pton()` if `CONFIG_POSIX_API` is defined.

int **zsock_getaddrinfo**(const char *host, const char *service, const struct *zsock_addrinfo* *hints, struct *zsock_addrinfo* **res)

Resolve a domain name to one or more network addresses.

See POSIX.1-2017 article for normative description. This function is also exposed as `getaddrinfo()` if `CONFIG_POSIX_API` is defined.

void **zsock_freeaddrinfo**(struct *zsock_addrinfo* *ai)

Free results returned by *zsock_getaddrinfo()*

See POSIX.1-2017 article for normative description. This function is also exposed as `freeaddrinfo()` if `CONFIG_POSIX_API` is defined.

const char *__zsock_gai_strerror__(int errcode)

Convert *zsock_getaddrinfo()* error code to textual message.

See POSIX.1-2017 article for normative description. This function is also exposed as `gai_strerror()` if `CONFIG_POSIX_API` is defined.

int **zsock_getnameinfo**(const struct *sockaddr* *addr, *socklen_t* addrlen, char *host, *socklen_t* hostlen, char *serv, *socklen_t* servlen, int flags)

Resolve a network address to a domain name or ASCII address.

See POSIX.1-2017 article for normative description. This function is also exposed as `getnameinfo()` if `CONFIG_POSIX_API` is defined.

int **zsock_select**(int nfds, *zsock_fd_set* *readfds, *zsock_fd_set* *writefds, *zsock_fd_set* *exceptfds, struct zsock_timeval *timeout)

Legacy function to poll multiple sockets for events.

See POSIX.1-2017 article for normative description. This function is provided to ease porting of existing code and not recommended for usage due to its inefficiency, use zsock_poll() instead. In Zephyr this function works only with sockets, not arbitrary file descriptors. This function is also exposed as `select()` if `CONFIG_POSIX_API` is defined (in which case it may conflict with generic POSIX `select()` function).

void **ZSOCK_FD_ZERO**(*zsock_fd_set* *set)

Initialize (clear) fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as `FD_ZERO()` if `CONFIG_POSIX_API` is defined.

int **ZSOCK_FD_ISSET**(int fd, *zsock_fd_set* *set)

Check whether socket is a member of fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as `FD_ISSET()` if `CONFIG_POSIX_API` is defined.

void **ZSOCK_FD_CLR**(int fd, *zsock_fd_set* *set)

Remove socket from fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as `FD_CLR()` if `CONFIG_POSIX_API` is defined.

void **ZSOCK_FD_SET**(int fd, *zsock_fd_set* *set)

Add socket to fd_set.

See POSIX.1-2017 article for normative description. This function is also exposed as `FD_SET()` if `CONFIG_POSIX_API` is defined.

struct **zsock_addrinfo**

#include <socket.h> Definition used when querying address information.

A linked list of these descriptors is returned by *getaddrinfo()*. The struct is also passed as hints when calling the *getaddrinfo()* function.

Public Members

struct *zsock_addrinfo* ***ai_next**

Pointer to next address entry.

int **ai_flags**

Additional options.

int **ai_family**

Address family of the returned addresses.

int **ai_socktype**

Socket type, for example SOCK_STREAM or SOCK_DGRAM.

int **ai_protocol**

Protocol for addresses, 0 means any protocol.

int **ai_eflags**

Extended flags for special usage.

socklen_t **ai_addrlen**

Length of the socket address.

struct *sockaddr* ***ai_addr**

Pointer to the address.

char *ai_canonname
Optional official name of the host.

struct ifreq
#include <*socket.h*> Interface description structure.

Public Members

char ifr_name[Z_DEVICE_MAX_NAME_LEN]
Network interface name.

struct in_pktinfo
#include <*socket.h*> Incoming IPv4 packet information.
Used as ancillary data when calling *recvmsg()* and IP_PKTINFO socket option is set.

Public Members

unsigned int ipi_ifindex
Network interface index.

struct *in_addr* ipi_spec_dst
Local address.

struct *in_addr* ipi_addr
Header Destination address.

struct ip_mreqn
#include <*socket.h*> Struct used when joining or leaving a IPv4 multicast group.

Public Members

struct *in_addr* imr_multiaddr
IP multicast group address.

struct *in_addr* imr_address
IP address of local interface.

int imr_ifindex
Network interface index.

struct ipv6_mreq
#include <*socket.h*> Struct used when joining or leaving a IPv6 multicast group.

Public Members

struct *in6_addr* **ipv6mr_multiaddr**

IPv6 multicast address of group.

int **ipv6mr_ifindex**

Network interface index of the local IPv6 address.

struct **in6_pktinfo**

#include <*socket.h*> Incoming IPv6 packet information.

Used as ancillary data when calling *recvmsg()* and IPV6_RECVPKTINFO socket option is set.

Public Members

struct *in6_addr* **ipi6_addr**

Destination IPv6 address.

unsigned int **ipi6_ifindex**

Receive interface index.

struct **zsock_pollfd**

#include <*socket_poll.h*> Definition of the monitored socket/file descriptor.

An array of these descriptors is passed as an argument to *poll()*.

Public Members

int **fd**

Socket descriptor.

short **events**

Requested events.

short **revents**

Returned events.

struct **zsock_fd_set**

#include <*socket_select.h*> Socket file descriptor set.

Related code samples

AWS IoT Core MQTT

Connect to AWS IoT Core and publish messages using MQTT.

Dumb HTTP server (multi-threaded)
Implement a simple HTTP server supporting simultaneous connections using BSD sockets.

Echo client (advanced)
Implement a client that sends IP packets, waits for data to be sent back, and verifies it.

Echo server (advanced)
Implement a UDP/TCP server that sends received packets back to the sender.

HTTP Client
Implement an HTTP(S) client that issues a variety of HTTP requests.

HTTP GET using plain sockets
Implement an HTTP(S) client using plain BSD sockets.

HTTP Server
Implement an HTTP(s) Server demonstrating various resource types.

Large HTTP download
Download a large file from a web server using BSD sockets.

Microsoft Azure IoT Hub MQTT
Connect to Azure IoT Hub and publish messages using MQTT.

TagoIO HTTP Post
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.

TLS Credentials

group `tls_credentials`

TLS credentials management.

Since
1.13

Version
0.8.0

Typedefs

typedef int `sec_tag_t`

Secure tag, a reference to TLS credential.

Secure tag can be used to reference credential after it was registered in the system.

> **Note**
>
> Some TLS credentials come in pairs:
>
> - TLS_CREDENTIAL_SERVER_CERTIFICATE with TLS_CREDENTIAL_PRIVATE_KEY,
> - TLS_CREDENTIAL_PSK with TLS_CREDENTIAL_PSK_ID. Such pairs of credentials must be assigned the same secure tag to be correctly handled in the system.

> **Note**
>
> Negative values are reserved for internal use.

Enums

enum `tls_credential_type`

TLS credential types.

Values:

enumerator `TLS_CREDENTIAL_NONE`

Unspecified credential.

enumerator `TLS_CREDENTIAL_CA_CERTIFICATE`

A trusted CA certificate.

Use this to authenticate remote servers. Used with certificate-based ciphersuites.

enumerator `TLS_CREDENTIAL_SERVER_CERTIFICATE`

A public server certificate.

Use this to register your own server certificate. Should be registered together with a corresponding private key. Used with certificate-based ciphersuites.

enumerator `TLS_CREDENTIAL_PRIVATE_KEY`

Private key.

Should be registered together with a corresponding public certificate. Used with certificate-based ciphersuites.

enumerator `TLS_CREDENTIAL_PSK`

Pre-shared key.

Should be registered together with a corresponding PSK identity. Used with PSK-based ciphersuites.

enumerator `TLS_CREDENTIAL_PSK_ID`

Pre-shared key identity.

Should be registered together with a corresponding PSK. Used with PSK-based ciphersuites.

Functions

int `tls_credential_add`(*sec_tag_t* tag, enum *tls_credential_type* type, const void *cred, size_t credlen)

Add a TLS credential.

This function adds a TLS credential, that can be used by TLS/DTLS for authentication.

Parameters

- `tag` – A security tag that credential will be referenced with.

- **type** – A TLS/DTLS credential type.
- **cred** – A TLS/DTLS credential.
- **credlen** – A TLS/DTLS credential length.

Return values

- **0** – TLS credential successfully added.
- **-EACCES** – Access to the TLS credential subsystem was denied.
- **-ENOMEM** – Not enough memory to add new TLS credential.
- **-EEXIST** – TLS credential of specific tag and type already exists.

int **tls_credential_get**(*sec_tag_t* tag, enum *tls_credential_type* type, void *cred, size_t *credlen)

Get a TLS credential.

This function gets an already registered TLS credential, referenced by `tag` secure tag of `type`.

Parameters

- **tag** – A security tag of requested credential.
- **type** – A TLS/DTLS credential type of requested credential.
- **cred** – A buffer for TLS/DTLS credential.
- **credlen** – A buffer size on input. TLS/DTLS credential length on output.

Return values

- **0** – TLS credential successfully obtained.
- **-EACCES** – Access to the TLS credential subsystem was denied.
- **-ENOENT** – Requested TLS credential was not found.
- **-EFBIG** – Requested TLS credential does not fit in the buffer provided.

int **tls_credential_delete**(*sec_tag_t* tag, enum *tls_credential_type* type)

Delete a TLS credential.

This function removes a TLS credential, referenced by `tag` secure tag of `type`.

Parameters

- **tag** – A security tag corresponding to removed credential.
- **type** – A TLS/DTLS credential type of removed credential.

Return values

- **0** – TLS credential successfully deleted.
- **-EACCES** – Access to the TLS credential subsystem was denied.
- **-ENOENT** – Requested TLS credential was not found.

IPv4/IPv6 Primitives and Helpers

- *Overview*
- *API Reference*

Overview Miscellaneous defines and helper functions for IP addresses and IP protocols.

API Reference

group `ip_4_6`

IPv4/IPv6 primitives and helpers.

Since
1.0

Version
1.0.0

Defines

`PF_UNSPEC`
Unspecified protocol family.

`PF_INET`
IP protocol family version 4.

`PF_INET6`
IP protocol family version 6.

`PF_PACKET`
Packet family.

`PF_CAN`
Controller Area Network.

`PF_NET_MGMT`
Network management info.

`PF_LOCAL`
Inter-process communication

`PF_UNIX`
Inter-process communication

`AF_UNSPEC`
Unspecified address family.

`AF_INET`
IP protocol family version 4.

`AF_INET6`
IP protocol family version 6.

AF_PACKET
: Packet family.

AF_CAN
: Controller Area Network.

AF_NET_MGMT
: Network management info.

AF_LOCAL
: Inter-process communication

AF_UNIX
: Inter-process communication

ntohs(x)
: Convert 16-bit value from network to host byte order.

  Parameters

  - x – The network byte order value to convert.

  Returns
  Host byte order value.

ntohl(x)
: Convert 32-bit value from network to host byte order.

  Parameters

  - x – The network byte order value to convert.

  Returns
  Host byte order value.

ntohll(x)
: Convert 64-bit value from network to host byte order.

  Parameters

  - x – The network byte order value to convert.

  Returns
  Host byte order value.

htons(x)
: Convert 16-bit value from host to network byte order.

  Parameters

  - x – The host byte order value to convert.

  Returns
  Network byte order value.

htonl(x)
: Convert 32-bit value from host to network byte order.

  Parameters

  - x – The host byte order value to convert.

  Returns
  Network byte order value.

htonll(x)

Convert 64-bit value from host to network byte order.

Parameters

- x – The host byte order value to convert.

Returns

Network byte order value.

NET_IPV6_ADDR_SIZE

Binary size of the IPv6 address.

NET_IPV4_ADDR_SIZE

Binary size of the IPv4 address.

CMSG_FIRSTHDR(msghdr)

Returns a pointer to the first cmsghdr in the ancillary data buffer associated with the passed msghdr.

It returns NULL if there isn't enough space for a cmsghdr in the buffer.

CMSG_NXTHDR(msghdr, cmsg)

Returns the next valid cmsghdr after the passed cmsghdr.

It returns NULL when there isn't enough space left in the buffer.

CMSG_DATA(cmsg)

Returns a pointer to the data portion of a cmsghdr.

The pointer returned cannot be assumed to be suitably aligned for accessing arbitrary payload data types. Applications should not cast it to a pointer type matching the payload, but should instead use memcpy(3) to copy data to or from a suitably declared object.

CMSG_SPACE(length)

Returns the number of bytes an ancillary element with payload of the passed data length occupies.

CMSG_LEN(length)

Returns the value to store in the cmsg_len member of the cmsghdr structure, taking into account any necessary alignment.

It takes the data length as an argument.

IN6ADDR_ANY_INIT

IPv6 address initializer.

IN6ADDR_LOOPBACK_INIT

IPv6 loopback address initializer.

INADDR_ANY

IPv4 any address.

INADDR_ANY_INIT

IPv4 address initializer.

INADDR_LOOPBACK_INIT

IPv6 loopback address initializer.

INET_ADDRSTRLEN
: Max length of the IPv4 address as a string.

  Defined by POSIX.

INET6_ADDRSTRLEN
: Max length of the IPv6 address as a string.

  Takes into account possible mapped IPv4 addresses.

NET_MAX_PRIORITIES
: How many priority values there are.

net_ipaddr_copy(dest, src)
: Copy an IPv4 or IPv6 address.

  Parameters

  - dest – Destination IP address.
  - src – Source IP address.

  Returns
  Destination address.

Typedefs

typedef unsigned short int sa_family_t
: Socket address family type.

typedef size_t socklen_t
: Length of a socket address.

Enums

enum net_ip_protocol
: Protocol numbers from IANA/BSD.

  Values:

  enumerator IPPROTO_IP = 0
  : IP protocol (pseudo-val for *setsockopt()*

  enumerator IPPROTO_ICMP = 1
  : ICMP protocol

  enumerator IPPROTO_IGMP = 2
  : IGMP protocol

  enumerator IPPROTO_IPIP = 4
  : IPIP tunnels

enumerator IPPROTO_TCP = 6
TCP protocol

enumerator IPPROTO_UDP = 17
UDP protocol

enumerator IPPROTO_IPV6 = 41
IPv6 protocol

enumerator IPPROTO_ICMPV6 = 58
ICMPv6 protocol.

enumerator IPPROTO_RAW = 255
RAW IP packets

enum net_ip_protocol_secure
Protocol numbers for TLS protocols.
Values:

enumerator IPPROTO_TLS_1_0 = 256
TLS 1.0 protocol.

enumerator IPPROTO_TLS_1_1 = 257
TLS 1.1 protocol.

enumerator IPPROTO_TLS_1_2 = 258
TLS 1.2 protocol.

enumerator IPPROTO_DTLS_1_0 = 272
DTLS 1.0 protocol.

enumerator IPPROTO_DTLS_1_2 = 273
DTLS 1.2 protocol.

enum net_sock_type
Socket type.
Values:

enumerator SOCK_STREAM = 1
Stream socket type

enumerator SOCK_DGRAM
Datagram socket type.

enumerator SOCK_RAW
RAW socket type

enum net_ip_mtu

IP Maximum Transfer Unit.

Values:

enumerator NET_IPV6_MTU = 1280

IPv6 MTU length.

We must be able to receive this size IPv6 packet without fragmentation.

enumerator NET_IPV4_MTU = 576

IPv4 MTU length.

We must be able to receive this size IPv4 packet without fragmentation.

enum net_priority

Network packet priority settings described in IEEE 802.1Q Annex I.1.

Values:

enumerator NET_PRIORITY_BK = 1

Background (lowest)

enumerator NET_PRIORITY_BE = 0

Best effort (default)

enumerator NET_PRIORITY_EE = 2

Excellent effort

enumerator NET_PRIORITY_CA = 3

Critical applications

enumerator NET_PRIORITY_VI = 4

Video, < 100 ms latency and jitter.

enumerator NET_PRIORITY_VO = 5

Voice, < 10 ms latency and jitter

enumerator NET_PRIORITY_IC = 6

Internetwork control

enumerator NET_PRIORITY_NC = 7

Network control (highest)

enum net_addr_state

What is the current state of the network address.

Values:

enumerator NET_ADDR_ANY_STATE = -1

Default (invalid) address type.

enumerator NET_ADDR_TENTATIVE = 0
Tentative address

enumerator NET_ADDR_PREFERRED
Preferred address

enumerator NET_ADDR_DEPRECATED
Deprecated address

enum net_addr_type
How the network address is assigned to network interface.

Values:

enumerator NET_ADDR_ANY = 0
Default value.

This is not a valid value.

enumerator NET_ADDR_AUTOCONF
Auto configured address.

enumerator NET_ADDR_DHCP
Address is from DHCP.

enumerator NET_ADDR_MANUAL
Manually set address.

enumerator NET_ADDR_OVERRIDABLE
Manually set address which is overridable by DHCP.

Functions

static inline bool net_ipv6_is_addr_loopback(struct *in6_addr* *addr)
Check if the IPv6 address is a loopback address (::1).

Parameters

- addr – IPv6 address

Returns
True if address is a loopback address, False otherwise.

static inline bool net_ipv6_is_addr_mcast(const struct *in6_addr* *addr)
Check if the IPv6 address is a multicast address.

Parameters

- addr – IPv6 address

Returns
True if address is multicast address, False otherwise.

struct *net_if_addr* *net_if_ipv6_addr_lookup(const struct *in6_addr* *addr, struct *net_if* **iface)

static inline bool **net_ipv6_is_my_addr**(struct *in6_addr* *addr)

Check if IPv6 address is found in one of the network interfaces.

Parameters

- **addr** – IPv6 address

Returns

True if address was found, False otherwise.

struct *net_if_mcast_addr* ***net_if_ipv6_maddr_lookup**(const struct *in6_addr* *addr, struct *net_if* **iface)

static inline bool **net_ipv6_is_my_maddr**(struct *in6_addr* *maddr)

Check if IPv6 multicast address is found in one of the network interfaces.

Parameters

- **maddr** – Multicast IPv6 address

Returns

True if address was found, False otherwise.

static inline bool **net_ipv6_is_prefix**(const uint8_t *addr1, const uint8_t *addr2, uint8_t length)

Check if two IPv6 addresses are same when compared after prefix mask.

Parameters

- **addr1** – First IPv6 address.
- **addr2** – Second IPv6 address.
- **length** – Prefix length (max length is 128).

Returns

True if IPv6 prefixes are the same, False otherwise.

static inline bool **net_ipv4_is_addr_loopback**(struct *in_addr* *addr)

Check if the IPv4 address is a loopback address (127.0.0.0/8).

Parameters

- **addr** – IPv4 address

Returns

True if address is a loopback address, False otherwise.

static inline bool **net_ipv4_is_addr_unspecified**(const struct *in_addr* *addr)

Check if the IPv4 address is unspecified (all bits zero)

Parameters

- **addr** – IPv4 address.

Returns

True if the address is unspecified, false otherwise.

static inline bool **net_ipv4_is_addr_mcast**(const struct *in_addr* *addr)

Check if the IPv4 address is a multicast address.

Parameters

- **addr** – IPv4 address

Returns

True if address is multicast address, False otherwise.

static inline bool **net_ipv4_is_ll_addr**(const struct *in_addr* *addr)

Check if the given IPv4 address is a link local address.

Parameters

- **addr** – A valid pointer on an IPv4 address

Returns

True if it is, false otherwise.

static inline bool **net_ipv4_is_private_addr**(const struct *in_addr* *addr)

Check if the given IPv4 address is from a private address range.

See https://en.wikipedia.org/wiki/Reserved_IP_addresses for details.

Parameters

- **addr** – A valid pointer on an IPv4 address

Returns

True if it is, false otherwise.

static inline void **net_ipv4_addr_copy_raw**(uint8_t *dest, const uint8_t *src)

Copy an IPv4 address raw buffer.

Parameters

- **dest** – Destination IP address.
- **src** – Source IP address.

static inline void **net_ipv6_addr_copy_raw**(uint8_t *dest, const uint8_t *src)

Copy an IPv6 address raw buffer.

Parameters

- **dest** – Destination IP address.
- **src** – Source IP address.

static inline bool **net_ipv4_addr_cmp**(const struct *in_addr* *addr1, const struct *in_addr* *addr2)

Compare two IPv4 addresses.

Parameters

- **addr1** – Pointer to IPv4 address.
- **addr2** – Pointer to IPv4 address.

Returns

True if the addresses are the same, false otherwise.

static inline bool **net_ipv4_addr_cmp_raw**(const uint8_t *addr1, const uint8_t *addr2)

Compare two raw IPv4 address buffers.

Parameters

- **addr1** – Pointer to IPv4 address buffer.
- **addr2** – Pointer to IPv4 address buffer.

Returns

True if the addresses are the same, false otherwise.

static inline bool **net_ipv6_addr_cmp**(const struct *in6_addr* *addr1, const struct *in6_addr* *addr2)

Compare two IPv6 addresses.

Parameters

- **addr1** – Pointer to IPv6 address.
- **addr2** – Pointer to IPv6 address.

Returns
True if the addresses are the same, false otherwise.

static inline bool **net_ipv6_addr_cmp_raw**(const uint8_t *addr1, const uint8_t *addr2)
Compare two raw IPv6 address buffers.

Parameters

- **addr1** – Pointer to IPv6 address buffer.
- **addr2** – Pointer to IPv6 address buffer.

Returns
True if the addresses are the same, false otherwise.

static inline bool **net_ipv6_is_ll_addr**(const struct *in6_addr* *addr)
Check if the given IPv6 address is a link local address.

Parameters

- **addr** – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

static inline bool **net_ipv6_is_sl_addr**(const struct *in6_addr* *addr)
Check if the given IPv6 address is a site local address.

Parameters

- **addr** – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

static inline bool **net_ipv6_is_ula_addr**(const struct *in6_addr* *addr)
Check if the given IPv6 address is a unique local address.

Parameters

- **addr** – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

static inline bool **net_ipv6_is_global_addr**(const struct *in6_addr* *addr)
Check if the given IPv6 address is a global address.

Parameters

- **addr** – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

static inline bool **net_ipv6_is_private_addr**(const struct *in6_addr* *addr)
Check if the given IPv6 address is from a private/local address range.

See https://en.wikipedia.org/wiki/Reserved_IP_addresses for details.

Parameters

- **addr** – A valid pointer on an IPv6 address

Returns
True if it is, false otherwise.

const struct *in6_addr* *net_ipv6_unspecified_address(void)

Return pointer to any (all bits zeros) IPv6 address.

Returns
Any IPv6 address.

const struct *in_addr* *net_ipv4_unspecified_address(void)

Return pointer to any (all bits zeros) IPv4 address.

Returns
Any IPv4 address.

const struct *in_addr* *net_ipv4_broadcast_address(void)

Return pointer to broadcast (all bits ones) IPv4 address.

Returns
Broadcast IPv4 address.

bool net_if_ipv4_addr_mask_cmp(struct *net_if* *iface, const struct *in_addr* *addr)

static inline bool net_ipv4_addr_mask_cmp(struct *net_if* *iface, const struct *in_addr* *addr)

Check if the given address belongs to same subnet that has been configured for the interface.

Parameters

- iface – A valid pointer on an interface
- addr – IPv4 address

Returns
True if address is in same subnet, false otherwise.

bool net_if_ipv4_is_addr_bcast(struct *net_if* *iface, const struct *in_addr* *addr)

static inline bool net_ipv4_is_addr_bcast(struct *net_if* *iface, const struct *in_addr* *addr)

Check if the given IPv4 address is a broadcast address.

Parameters

- iface – Interface to use. Must be a valid pointer to an interface.
- addr – IPv4 address

Returns
True if address is a broadcast address, false otherwise.

struct *net_if_addr* *net_if_ipv4_addr_lookup(const struct *in_addr* *addr, struct *net_if* **iface)

static inline bool net_ipv4_is_my_addr(const struct *in_addr* *addr)

Check if the IPv4 address is assigned to any network interface in the system.

Parameters

- addr – A valid pointer on an IPv4 address

Returns
True if IPv4 address is found in one of the network interfaces, False otherwise.

static inline bool net_ipv6_is_addr_unspecified(const struct *in6_addr* *addr)

Check if the IPv6 address is unspecified (all bits zero)

Parameters

- addr – IPv6 address.

Returns
True if the address is unspecified, false otherwise.

static inline bool **net_ipv6_is_addr_solicited_node**(const struct *in6_addr* *addr)
Check if the IPv6 address is solicited node multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters
- **addr** – IPv6 address.

Returns
True if the address is solicited node address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_scope**(const struct *in6_addr* *addr, int scope)
Check if the IPv6 address is a given scope multicast address (FFyx::).

Parameters
- **addr** – IPv6 address
- **scope** – Scope to check

Returns
True if the address is in given scope multicast address, false otherwise.

static inline bool **net_ipv6_is_same_mcast_scope**(const struct *in6_addr* *addr_1, const struct *in6_addr* *addr_2)
Check if the IPv6 addresses have the same multicast scope (FFyx::).

Parameters
- **addr_1** – IPv6 address 1
- **addr_2** – IPv6 address 2

Returns
True if both addresses have same multicast scope, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_global**(const struct *in6_addr* *addr)
Check if the IPv6 address is a global multicast address (FFxE::/16).

Parameters
- **addr** – IPv6 address.

Returns
True if the address is global multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_iface**(const struct *in6_addr* *addr)
Check if the IPv6 address is a interface scope multicast address (FFx1::).

Parameters
- **addr** – IPv6 address.

Returns
True if the address is a interface scope multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_link**(const struct *in6_addr* *addr)
Check if the IPv6 address is a link local scope multicast address (FFx2::).

Parameters
- **addr** – IPv6 address.

Returns
True if the address is a link local scope multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_mesh**(const struct *in6_addr* *addr)

Check if the IPv6 address is a mesh-local scope multicast address (FFx3::).

Parameters

- **addr** – IPv6 address.

Returns
True if the address is a mesh-local scope multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_site**(const struct *in6_addr* *addr)

Check if the IPv6 address is a site scope multicast address (FFx5::).

Parameters

- **addr** – IPv6 address.

Returns
True if the address is a site scope multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_org**(const struct *in6_addr* *addr)

Check if the IPv6 address is an organization scope multicast address (FFx8::).

Parameters

- **addr** – IPv6 address.

Returns
True if the address is an organization scope multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_group**(const struct *in6_addr* *addr, const struct *in6_addr* *group)

Check if the IPv6 address belongs to certain multicast group.

Parameters

- **addr** – IPv6 address.
- **group** – Group id IPv6 address, the values must be in network byte order

Returns
True if the IPv6 multicast address belongs to given multicast group, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_all_nodes_group**(const struct *in6_addr* *addr)

Check if the IPv6 address belongs to the all nodes multicast group.

Parameters

- **addr** – IPv6 address

Returns
True if the IPv6 multicast address belongs to the all nodes multicast group, false otherwise

static inline bool **net_ipv6_is_addr_mcast_iface_all_nodes**(const struct *in6_addr* *addr)

Check if the IPv6 address is a interface scope all nodes multicast address (FF01::1).

Parameters

- **addr** – IPv6 address.

Returns
True if the address is a interface scope all nodes multicast address, false otherwise.

static inline bool **net_ipv6_is_addr_mcast_link_all_nodes**(const struct *in6_addr* *addr)

Check if the IPv6 address is a link local scope all nodes multicast address (FF02::1).

Parameters

- **addr** – IPv6 address.

Returns

True if the address is a link local scope all nodes multicast address, false otherwise.

static inline void **net_ipv6_addr_create_solicited_node**(const struct *in6_addr* *src, struct *in6_addr* *dst)

Create solicited node IPv6 multicast address FF02:0:0:0:0:1:FFXX:XXXX defined in RFC 3513.

Parameters

- **src** – IPv6 address.
- **dst** – IPv6 address.

static inline void **net_ipv6_addr_create**(struct *in6_addr* *addr, uint16_t addr0, uint16_t addr1, uint16_t addr2, uint16_t addr3, uint16_t addr4, uint16_t addr5, uint16_t addr6, uint16_t addr7)

Construct an IPv6 address from eight 16-bit words.

Parameters

- **addr** – IPv6 address
- **addr0** – 16-bit word which is part of the address
- **addr1** – 16-bit word which is part of the address
- **addr2** – 16-bit word which is part of the address
- **addr3** – 16-bit word which is part of the address
- **addr4** – 16-bit word which is part of the address
- **addr5** – 16-bit word which is part of the address
- **addr6** – 16-bit word which is part of the address
- **addr7** – 16-bit word which is part of the address

static inline void **net_ipv6_addr_create_ll_allnodes_mcast**(struct *in6_addr* *addr)

Create link local allnodes multicast IPv6 address.

Parameters

- **addr** – IPv6 address

static inline void **net_ipv6_addr_create_ll_allrouters_mcast**(struct *in6_addr* *addr)

Create link local allrouters multicast IPv6 address.

Parameters

- **addr** – IPv6 address

static inline void **net_ipv6_addr_create_v4_mapped**(const struct *in_addr* *addr4, struct *in6_addr* *addr6)

Create IPv4 mapped IPv6 address.

Parameters

- **addr4** – IPv4 address

- **addr6** – IPv6 address to be created

static inline bool **net_ipv6_addr_is_v4_mapped**(const struct *in6_addr* *addr)

Is the IPv6 address an IPv4 mapped one.

The v4 mapped addresses look like ::ffff:a.b.c.d

Parameters

- **addr** – IPv6 address

Returns

True if IPv6 address is a IPv4 mapped address, False otherwise.

static inline void **net_ipv6_addr_create_iid**(struct *in6_addr* *addr, struct *net_linkaddr* *lladdr)

Create IPv6 address interface identifier.

Parameters

- **addr** – IPv6 address
- **lladdr** – Link local address

static inline bool **net_ipv6_addr_based_on_ll**(const struct *in6_addr* *addr, const struct *net_linkaddr* *lladdr)

Check if given address is based on link layer address.

Returns

True if it is, False otherwise

static inline struct *sockaddr_in6* ***net_sin6**(const struct *sockaddr* *addr)

Get *sockaddr_in6* from sockaddr.

This is a helper so that the code calling this function can be made shorter.

Parameters

- **addr** – Socket address

Returns

Pointer to IPv6 socket address

static inline struct *sockaddr_in* ***net_sin**(const struct *sockaddr* *addr)

Get *sockaddr_in* from sockaddr.

This is a helper so that the code calling this function can be made shorter.

Parameters

- **addr** – Socket address

Returns

Pointer to IPv4 socket address

static inline struct sockaddr_in6_ptr ***net_sin6_ptr**(const struct sockaddr_ptr *addr)

Get sockaddr_in6_ptr from sockaddr_ptr.

This is a helper so that the code calling this function can be made shorter.

Parameters

- **addr** – Socket address

Returns

Pointer to IPv6 socket address

static inline struct sockaddr_in_ptr *net_sin_ptr(const struct sockaddr_ptr *addr)

Get sockaddr_in_ptr from sockaddr_ptr.

This is a helper so that the code calling this function can be made shorter.

Parameters

- addr – Socket address

Returns

Pointer to IPv4 socket address

static inline struct sockaddr_ll_ptr *net_sll_ptr(const struct sockaddr_ptr *addr)

Get sockaddr_ll_ptr from sockaddr_ptr.

This is a helper so that the code calling this function can be made shorter.

Parameters

- addr – Socket address

Returns

Pointer to linklayer socket address

static inline struct sockaddr_can_ptr *net_can_ptr(const struct sockaddr_ptr *addr)

Get sockaddr_can_ptr from sockaddr_ptr.

This is a helper so that the code needing this functionality can be made shorter.

Parameters

- addr – Socket address

Returns

Pointer to CAN socket address

int net_addr_pton(*sa_family_t* family, const char *src, void *dst)

Convert a string to IP address.

> **Note**
>
> This function doesn't do precise error checking, do not use for untrusted strings.

Parameters

- family – IP address family (AF_INET or AF_INET6)
- src – IP address in a null terminated string
- dst – Pointer to struct *in_addr* if family is AF_INET or pointer to struct *in6_addr* if family is AF_INET6

Returns

0 if ok, < 0 if error

char *net_addr_ntop(*sa_family_t* family, const void *src, char *dst, size_t size)

Convert IP address to string form.

Parameters

- family – IP address family (AF_INET or AF_INET6)
- src – Pointer to struct *in_addr* if family is AF_INET or pointer to struct *in6_addr* if family is AF_INET6
- dst – Buffer for IP address as a null terminated string
- size – Number of bytes available in the buffer

Returns
dst pointer if ok, NULL if error

bool **net_ipaddr_parse**(const char *str, size_t str_len, struct *sockaddr* *addr)

Parse a string that contains either IPv4 or IPv6 address and optional port, and store the information in user supplied sockaddr struct.

Syntax of the IP address string: 192.0.2.1:80 192.0.2.42

[2001:db8::2] 2001:db::42 Note that the str_len parameter is used to restrict the amount of characters that are checked. If the string does not contain port number, then the port number in sockaddr is not modified.

Parameters

- **str** – String that contains the IP address.
- **str_len** – Length of the string to be parsed.
- **addr** – Pointer to user supplied struct sockaddr.

Returns
True if parsing could be done, false otherwise.

int **net_port_set_default**(struct *sockaddr* *addr, uint16_t default_port)

Set the default port in the sockaddr structure.

If the port is already set, then do nothing.

Parameters

- **addr** – Pointer to user supplied struct sockaddr.
- **default_port** – Default port number to set.

Returns
0 if ok, <0 if error

static inline int32_t **net_tcp_seq_cmp**(uint32_t seq1, uint32_t seq2)

Compare TCP sequence numbers.

This function compares TCP sequence numbers, accounting for wraparound effects.

Parameters

- **seq1** – First sequence number
- **seq2** – Seconds sequence number

Returns
< 0 if seq1 < seq2, 0 if seq1 == seq2, > 0 if seq > seq2

static inline bool **net_tcp_seq_greater**(uint32_t seq1, uint32_t seq2)

Check that one TCP sequence number is greater.

This is convenience function on top of *net_tcp_seq_cmp()*.

Parameters

- **seq1** – First sequence number
- **seq2** – Seconds sequence number

Returns
True if seq > seq2

int **net_bytes_from_str**(uint8_t *buf, int buf_len, const char *src)

Convert a string of hex values to array of bytes.

The syntax of the string is “ab:02:98:fa:42:01”

Parameters

- `buf` – Pointer to memory where the bytes are written.
- `buf_len` – Length of the memory area.
- `src` – String of bytes.

Returns
0 if ok, <0 if error

int `net_tx_priority2tc`(enum *net_priority* prio)

Convert Tx network packet priority to traffic class so we can place the packet into correct Tx queue.

Parameters

- `prio` – Network priority

Returns
Tx traffic class that handles that priority network traffic.

int `net_rx_priority2tc`(enum *net_priority* prio)

Convert Rx network packet priority to traffic class so we can place the packet into correct Rx queue.

Parameters

- `prio` – Network priority

Returns
Rx traffic class that handles that priority network traffic.

static inline enum *net_priority* `net_vlan2priority`(uint8_t priority)

Convert network packet VLAN priority to network packet priority so we can place the packet into correct queue.

Parameters

- `priority` – VLAN priority

Returns
Network priority

static inline uint8_t `net_priority2vlan`(enum *net_priority* priority)

Convert network packet priority to network packet VLAN priority.

Parameters

- `priority` – Packet priority

Returns
VLAN priority (PCP)

const char *`net_family2str`(*sa_family_t* family)

Return network address family value as a string.

This is only usable for debugging.

Parameters

- `family` – Network address family code

Returns
Network address family as a string, or NULL if family is unknown.

static inline int `net_ipv6_pe_add_filter`(struct *in6_addr* *addr, bool is_denylist)

Add IPv6 prefix as a privacy extension filter.

Note that the filters can either allow or deny listing.

Parameters

- `addr` – IPv6 prefix
- `is_denylist` – Tells if this filter is for allowing or denying listing.

Returns
0 if ok, <0 if error

static inline int `net_ipv6_pe_del_filter`(struct *in6_addr* *addr)

Delete IPv6 prefix from privacy extension filter list.

Parameters

- `addr` – IPv6 prefix

Returns
0 if ok, <0 if error

struct `in6_addr`

#include <net_ip.h> IPv6 address struct.

Public Members

uint8_t `s6_addr`[16]

IPv6 address buffer.

uint16_t `s6_addr16`[8]

In big endian.

uint32_t `s6_addr32`[4]

In big endian.

struct `in_addr`

#include <net_ip.h> IPv4 address struct.

Public Members

uint8_t `s4_addr`[4]

IPv4 address buffer.

uint16_t `s4_addr16`[2]

In big endian.

uint32_t `s4_addr32`[1]

In big endian.

uint32_t `s_addr`

In big endian, for POSIX compatibility.

struct `sockaddr_in6`

#include <net_ip.h> Socket address struct for IPv6.

Public Members

sa_family_t **sin6_family**
AF_INET6

uint16_t **sin6_port**
Port number

struct *in6_addr* **sin6_addr**
IPv6 address

uint8_t **sin6_scope_id**
Interfaces for a scope.

struct **sockaddr_in**
#include <*net_ip.h*> Socket address struct for IPv4.

Public Members

sa_family_t **sin_family**
AF_INET

uint16_t **sin_port**
Port number

struct *in_addr* **sin_addr**
IPv4 address.

struct **sockaddr_ll**
#include <*net_ip.h*> Socket address struct for packet socket.

Public Members

sa_family_t **sll_family**
Always AF_PACKET

uint16_t **sll_protocol**
Physical-layer protocol

int **sll_ifindex**
Interface number

uint16_t **sll_hatype**
ARP hardware type

uint8_t **sll_pkttype**
Packet type

uint8_t **sll_halen**
Length of address

uint8_t **sll_addr**[8]
Physical-layer address, big endian.

struct **iovec**
#include <*net_ip.h*> IO vector array element.

Public Members

void ***iov_base**
Pointer to data.

size_t **iov_len**
Length of the data.

struct **msghdr**
#include <*net_ip.h*> Message struct.

Public Members

void ***msg_name**
Optional socket address, big endian.

socklen_t **msg_namelen**
Size of socket address.

struct *iovec* ***msg_iov**
Scatter/gather array.

size_t **msg_iovlen**
Number of elements in msg_iov.

void ***msg_control**
Ancillary data.

size_t **msg_controllen**
Ancillary data buffer len.

int **msg_flags**
Flags on received message.

struct **cmsghdr**
#include <*net_ip.h*> Control message ancillary data.

Public Members

socklen_t **cmsg_len**
Number of bytes, including header.

int **cmsg_level**
Originating protocol.

int **cmsg_type**
Protocol-specific type.

z_max_align_t **cmsg_data**[]
Flexible array member to force alignment of cmsghdr.

struct **sockaddr**
#include <*net_ip.h*> Generic sockaddr struct.

Must be cast to proper type.

Public Members

sa_family_t **sa_family**
Address family.

struct **net_tuple**
#include <*net_ip.h*> IPv6/IPv4 network connection tuple.

Public Members

struct net_addr ***remote_addr**
IPv6/IPv4 remote address.

struct net_addr ***local_addr**
IPv6/IPv4 local address

uint16_t **remote_port**
UDP/TCP remote port

uint16_t **local_port**
UDP/TCP local port

enum *net_ip_protocol* **ip_proto**
IP protocol

DNS Resolve

- *Overview*
- *Sample usage*
- *API Reference*

Overview The DNS resolver implements a basic DNS resolver according to IETF RFC1035 on Domain Implementation and Specification. Supported DNS answers are IPv4/IPv6 addresses and CNAME.

If a CNAME is received, the DNS resolver will create another DNS query. The number of additional queries is controlled by the `CONFIG_DNS_RESOLVER_ADDITIONAL_QUERIES` Kconfig variable.

The multicast DNS (mDNS) client resolver support can be enabled by setting `CONFIG_MDNS_RESOLVER` Kconfig option. See IETF RFC6762 for more details about mDNS.

The link-local multicast name resolution (LLMNR) client resolver support can be enabled by setting the `CONFIG_LLMNR_RESOLVER` Kconfig variable. See IETF RFC4795 for more details about LLMNR.

For more information about DNS configuration variables, see: subsys/net/lib/dns/Kconfig. The DNS resolver API can be found at include/zephyr/net/dns_resolve.h.

Sample usage See dns-resolve sample application for details.

Related code samples

AWS IoT Core MQTT
Connect to AWS IoT Core and publish messages using MQTT.

DNS resolve
Resolve an IP address for a given hostname.

TagoIO HTTP Post
Send random temperature values to TagoIO IoT Cloud Platform using HTTP.

API Reference

group `dns_resolve`

DNS resolving library.

Since
1.8

Version
0.8.0

Defines

DNS_MAX_NAME_SIZE

Max size of the resolved name.

Typedefs

typedef void (*dns_resolve_cb_t)(enum *dns_resolve_status* status, struct *dns_addrinfo* *info, void *user_data)

DNS resolve callback.

The DNS resolve callback is called after a successful DNS resolving. The resolver can call this callback multiple times, one for each resolved address.

Param status
The status of the query: DNS_EAI_INPROGRESS returned for each resolved address DNS_EAI_ALLDONE mark end of the resolving, info is set to NULL in this case DNS_EAI_CANCELED if the query was canceled manually or timeout happened DNS_EAI_FAIL if the name cannot be resolved by the server DNS_EAI_NODATA if there is no such name other values means that an error happened.

Param info
Query results are stored here.

Param user_data
The user data given in *dns_resolve_name()* call.

Enums

enum dns_query_type

DNS query type enum.

Values:

enumerator DNS_QUERY_TYPE_A = 1

IPv4 query.

enumerator DNS_QUERY_TYPE_AAAA = 28

IPv6 query.

enum dns_resolve_status

Status values for the callback.

Values:

enumerator DNS_EAI_BADFLAGS = -1

Invalid value for ai_flags field.

enumerator DNS_EAI_NONAME = -2

NAME or SERVICE is unknown.

enumerator DNS_EAI_AGAIN = -3

Temporary failure in name resolution.

enumerator DNS_EAI_FAIL = -4
Non-recoverable failure in name res.

enumerator DNS_EAI_NODATA = -5
No address associated with NAME.

enumerator DNS_EAI_FAMILY = -6
ai_family not supported

enumerator DNS_EAI_SOCKTYPE = -7
ai_socktype not supported

enumerator DNS_EAI_SERVICE = -8
SRV not supported for ai_socktype.

enumerator DNS_EAI_ADDRFAMILY = -9
Address family for NAME not supported.

enumerator DNS_EAI_MEMORY = -10
Memory allocation failure.

enumerator DNS_EAI_SYSTEM = -11
System error returned in errno.

enumerator DNS_EAI_OVERFLOW = -12
Argument buffer overflow.

enumerator DNS_EAI_INPROGRESS = -100
Processing request in progress.

enumerator DNS_EAI_CANCELED = -101
Request canceled.

enumerator DNS_EAI_NOTCANCELED = -102
Request not canceled.

enumerator DNS_EAI_ALLDONE = -103
All requests done.

enumerator DNS_EAI_IDN_ENCODE = -105
IDN encoding failed.

Functions

int dns_resolve_init(struct *dns_resolve_context* *ctx, const char *dns_servers_str[], const struct *sockaddr* *dns_servers_sa[])
Init DNS resolving context.

This function sets the DNS server address and initializes the DNS context that is used by the actual resolver. DNS server addresses can be specified either in textual form, or as

struct sockaddr (or both). Note that the recommended way to resolve DNS names is to use the *dns_get_addr_info()* API. In that case user does not need to call *dns_resolve_init()* as the DNS servers are already setup by the system.

Parameters

- `ctx` – DNS context. If the context variable is allocated from the stack, then the variable needs to be valid for the whole duration of the resolving. Caller does not need to fill the variable beforehand or edit the context afterwards.
- `dns_servers_str` – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:5353
- `dns_servers_sa` – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
0 if ok, <0 if error.

int `dns_resolve_init_default`(struct *dns_resolve_context* *ctx)

Init DNS resolving context with default Kconfig options.

Parameters

- `ctx` – DNS context.

Returns
0 if ok, <0 if error.

int `dns_resolve_close`(struct *dns_resolve_context* *ctx)

Close DNS resolving context.

This releases DNS resolving context and marks the context unusable. Caller must call the *dns_resolve_init()* again to make context usable.

Parameters

- `ctx` – DNS context

Returns
0 if ok, <0 if error.

int `dns_resolve_reconfigure`(struct *dns_resolve_context* *ctx, const char *servers_str[], const struct *sockaddr* *servers_sa[])

Reconfigure DNS resolving context.

Reconfigures DNS context with new server list.

Parameters

- `ctx` – DNS context
- `servers_str` – DNS server addresses using textual strings. The array is NULL terminated. The port number can be given in the string. Syntax for the server addresses with or without port numbers: IPv4 : 10.0.9.1 IPv4 + port : 10.0.9.1:5353 IPv6 : 2001:db8::22:42 IPv6 + port : [2001:db8::22:42]:5353
- `servers_sa` – DNS server addresses as struct sockaddr. The array is NULL terminated. Port numbers are optional in struct sockaddr, the default will be used if set to 0.

Returns
0 if ok, <0 if error.

int `dns_resolve_cancel`(struct *dns_resolve_context* *ctx, uint16_t dns_id)

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

Parameters

- `ctx` – DNS context
- `dns_id` – DNS id of the pending query

Returns
0 if ok, <0 if error.

int `dns_resolve_cancel_with_name`(struct *dns_resolve_context* *ctx, uint16_t dns_id, const char *query_name, enum *dns_query_type* query_type)

Cancel a pending DNS query using id, name and type.

This releases DNS resources used by a pending query.

Parameters

- `ctx` – DNS context
- `dns_id` – DNS id of the pending query
- `query_name` – Name of the resource we are trying to query (hostname)
- `query_type` – Type of the query (A or AAAA)

Returns
0 if ok, <0 if error.

int `dns_resolve_name`(struct *dns_resolve_context* *ctx, const char *query, enum *dns_query_type* type, uint16_t *dns_id, *dns_resolve_cb_t* cb, void *user_data, int32_t timeout)

Resolve DNS name.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response.

Parameters

- `ctx` – DNS context
- `query` – What the caller wants to resolve.
- `type` – What kind of data the caller wants to get.
- `dns_id` – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
- `cb` – Callback to call after the resolving has finished or timeout has happened.
- `user_data` – The user data.
- `timeout` – The timeout value for the query. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

Returns
0 if resolving was started ok, < 0 otherwise

struct *dns_resolve_context* *dns_resolve_get_default(void)

Get default DNS context.

The system level DNS context uses DNS servers that are defined in project config file. If no DNS servers are defined by the user, then resolving DNS names using default DNS context will do nothing. The configuration options are described in subsys/net/lib/dns/Kconfig file.

Returns
Default DNS context.

static inline int dns_get_addr_info(const char *query, enum *dns_query_type* type, uint16_t *dns_id, *dns_resolve_cb_t* cb, void *user_data, int32_t timeout)

Get IP address info from DNS.

This function can be used to resolve e.g., IPv4 or IPv6 address. Note that this is asynchronous call, the function will return immediately and system will call the callback after resolving has finished or timeout has occurred. We might send the query to multiple servers (if there are more than one server configured), but we only use the result of the first received response. This variant uses system wide DNS servers.

Parameters

- `query` – What the caller wants to resolve.
- `type` – What kind of data the caller wants to get.
- `dns_id` – DNS id is returned to the caller. This is needed if one wishes to cancel the query. This can be set to NULL if there is no need to cancel the query.
- `cb` – Callback to call after the resolving has finished or timeout has happened.
- `user_data` – The user data.
- `timeout` – The timeout value for the connection. Possible values: SYS_FOREVER_MS: the query is tried forever, user needs to cancel it manually if it takes too long time to finish >0: start the query and let the system timeout it after specified ms

Returns
0 if resolving was started ok, < 0 otherwise

static inline int dns_cancel_addr_info(uint16_t dns_id)

Cancel a pending DNS query.

This releases DNS resources used by a pending query.

Parameters

- `dns_id` – DNS id of the pending query

Returns
0 if ok, <0 if error.

struct dns_addrinfo

#include <dns_resolve.h> Address info struct is passed to callback that gets all the results.

Public Members

struct *sockaddr* **ai_addr**
IP address information.

socklen_t **ai_addrlen**
Length of the ai_addr field.

uint8_t **ai_family**
Address family of the address information.

char **ai_canonname**[20 + 1]
Canonical name of the address.

struct **dns_resolve_context**
#include <*dns_resolve.h*> DNS resolve context structure.

Public Members

struct *k_mutex* **lock**
Prevent concurrent access.

k_timeout_t **buf_timeout**
This timeout is also used when a buffer is required from the buffer pools.

enum dns_resolve_context_state **state**
Is this context in use.

struct **dns_pending_query**
#include <*dns_resolve.h*> Result callbacks.

We have multiple callbacks here so that it is possible to do multiple queries at the same time.

Contents of this structure can be inspected and changed only when the lock is held.

Public Members

struct *k_work_delayable* **timer**
Timeout timer.

struct *dns_resolve_context* ***ctx**
Back pointer to ctx, needed in timeout handler.

dns_resolve_cb_t **cb**
Result callback.

A null value indicates the slot is not in use.

void *user_data

User data.

k_timeout_t timeout

TX timeout.

const char *query

String containing the thing to resolve like www.example.com.

This is set to a non-null value when the query is started, and is not used thereafter.

If the query completed at a point where the work item was still pending the pointer is cleared to indicate that the query is complete, but release of the query slot will be deferred until a request for a slot determines that the work item has been released.

enum *dns_query_type* query_type

Query type.

uint16_t id

DNS id of this query.

uint16_t query_hash

Hash of the DNS name + query type we are querying.

This hash is calculated so we can match the response that we are receiving. This is needed mainly for mDNS which is setting the DNS id to 0, which means that the id alone cannot be used to find correct pending query.

struct dns_server

#include <*dns_resolve.h*> List of configured DNS servers.

Public Members

struct *sockaddr* dns_server

DNS server information.

int sock

Connection to the DNS server.

uint8_t is_mdns

Is this server mDNS one.

uint8_t is_llmnr

Is this server LLMNR one.

Network Management

- *Overview*
- *Requesting a defined procedure*
- *Listening to network events*
- *Defining a network management procedure*
- *Signaling a network event*
- *API Reference*

Overview The Network Management APIs allow applications, as well as network layer code itself, to call defined network routines at any level in the IP stack, or receive notifications on relevant network events. For example, by using these APIs, application code can request a scan be done on a Wi-Fi- or Bluetooth-based network interface, or request notification if a network interface IP address changes.

The Network Management API implementation is designed to save memory by eliminating code at build time for management routines that are not used. Distinct and statically defined APIs for network management procedures are not used. Instead, defined procedure handlers are registered by using a *NET_MGMT_REGISTER_REQUEST_HANDLER* macro. Procedure requests are done through a single *net_mgmt()* API that invokes the registered handler for the corresponding request.

The current implementation is experimental and may change and improve in future releases.

Requesting a defined procedure All network management requests are of the form `net_mgmt(mgmt_request, ...)`. The `mgmt_request` parameter is a bit mask that tells which stack layer is targeted, if a `net_if` object is implied, and the specific management procedure being requested. The available procedure requests depend on what has been implemented in the stack.

To avoid extra cost, all *net_mgmt()* calls are direct. Though this may change in a future release, it will not affect the users of this function.

Listening to network events You can receive notifications on network events by registering a callback function and specifying a set of events used to filter when your callback is invoked. The callback will have to be unique for a pair of layer and code, whereas on the command part it will be a mask of events.

At runtime two functions are available, *net_mgmt_add_event_callback()* for registering the callback function, and *net_mgmt_del_event_callback()* for unregistering a callback. A helper function, *net_mgmt_init_event_callback()*, can be used to ease the initialization of the callback structure.

Additionally *NET_MGMT_REGISTER_EVENT_HANDLER* can be used to register a callback handler at compile time.

When an event occurs that matches a callback's event set, the associated callback function is invoked with the actual event code. This makes it possible for different events to be handled by the same callback function, if desired.

Warning

Event set filtering allows false positives for events that have the same layer and layer code. A callback handler function **must** check the event code (passed as an argument) against the specific network events it will handle, **regardless** of how many events were in the set passed to *net_mgmt_init_event_callback()*.

Note that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened. The callback handler function can be shared between different layer events.

(False positives can occur for events which have the same layer and layer code.)

An example follows.

```
/*
 * Set of events to handle.
 * See e.g. include/net/net_event.h for some NET_EVENT_xxx values.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

struct net_mgmt_event_callback iface_callback;
struct net_mgmt_event_callback ipv4_callback;

void callback_handler(struct net_mgmt_event_callback *cb,
                      uint32_t mgmt_event,
                      struct net_if *iface)
{
        if (mgmt_event == NET_EVENT_IF_xxx) {
                /* Handle NET_EVENT_IF_xxx */
        } else if (mgmt_event == NET_EVENT_IF_yyy) {
                /* Handle NET_EVENT_IF_yyy */
        } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
                /* Handle NET_EVENT_IPV4_xxx */
        } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
                /* Handle NET_EVENT_IPV4_yyy */
        } else {
                /* Spurious (false positive) invocation. */
        }
}

void register_cb(void)
{
        net_mgmt_init_event_callback(&iface_callback, callback_handler,
                                     EVENT_IFACE_SET);
        net_mgmt_init_event_callback(&ipv4_callback, callback_handler,
                                     EVENT_IPV4_SET);
        net_mgmt_add_event_callback(&iface_callback);
        net_mgmt_add_event_callback(&ipv4_callback);
}
```

Or similarly using *NET_MGMT_REGISTER_EVENT_HANDLER*.

Note

The `info` and `info_length` arguments are only usable if `CONFIG_NET_MGMT_EVENT_INFO` is enabled. Otherwise these are `NULL` and zero.

```
/*
 * Set of events to handle.
 */
#define EVENT_IFACE_SET (NET_EVENT_IF_xxx | NET_EVENT_IF_yyy)
#define EVENT_IPV4_SET (NET_EVENT_IPV4_xxx | NET_EVENT_IPV4_yyy)

static void event_handler(uint32_t mgmt_event, struct net_if *iface,
```

(continues on next page)

(continued from previous page)

```
                        void *info, size_t info_length,
                        void *user_data)
{
        if (mgmt_event == NET_EVENT_IF_xxx) {
                /* Handle NET_EVENT_IF_xxx */
        } else if (mgmt_event == NET_EVENT_IF_yyy) {
                /* Handle NET_EVENT_IF_yyy */
        } else if (mgmt_event == NET_EVENT_IPV4_xxx) {
                /* Handle NET_EVENT_IPV4_xxx */
        } else if (mgmt_event == NET_EVENT_IPV4_yyy) {
                /* Handle NET_EVENT_IPV4_yyy */
        } else {
                /* Spurious (false positive) invocation. */
        }
}

NET_MGMT_REGISTER_EVENT_HANDLER(iface_event_handler, EVENT_IFACE_SET,
                                event_handler, NULL);
NET_MGMT_REGISTER_EVENT_HANDLER(ipv4_event_handler, EVENT_IPV4_SET,
                                event_handler, NULL);
```

See include/zephyr/net/net_event.h for available generic core events that can be listened to.

Defining a network management procedure You can provide additional management procedures specific to your stack implementation by defining a handler and registering it with an associated mgmt_request code.

Management request code are defined in relevant places depending on the targeted layer or eventually, if l2 is the layer, on the technology as well. For instance, all IP layer management request code will be found in the include/zephyr/net/net_event.h header file. But in case of an L2 technology, let's say Ethernet, these would be found in include/zephyr/net/ethernet.h

You define your handler modeled with this signature:

```
static int your_handler(uint32_t mgmt_event, struct net_if *iface,
                        void *data, size_t len);
```

and then register it with an associated mgmt_request code:

```
NET_MGMT_REGISTER_REQUEST_HANDLER(<mgmt_request code>, your_handler);
```

This new management procedure could then be called by using:

```
net_mgmt(<mgmt_request code>, ...);
```

Signaling a network event You can signal a specific network event using the *net_mgmt_event_notify()* function and provide the network event code. See include/zephyr/net/net_mgmt.h for details. As for the management request code, event code can be also found on specific L2 technology mgmt headers, for example include/zephyr/net/ieee802154_mgmt.h would be the right place if 802.15.4 L2 is the technology one wants to listen to events.

Related code samples

DHCPv4 client
Start a DHCPv4 client to obtain an IPv4 address from a DHCPv4 server.

DNS resolve
Resolve an IP address for a given hostname.

IPv4 autoconf client
Perform IPv4 autoconfiguration and self-assign a random IPv4 address

Telnet console
Access Zephyr shell over telnet.

API Reference

group `net_mgmt`

Network Management.

Since
1.7

Version
1.0.0

Defines

`NET_EVENT_IF_DOWN`
Event emitted when the network interface goes down.

`NET_EVENT_IF_UP`
Event emitted when the network interface goes up.

`NET_EVENT_IF_ADMIN_DOWN`
Event emitted when the network interface is taken down manually.

`NET_EVENT_IF_ADMIN_UP`
Event emitted when the network interface goes up manually.

`NET_EVENT_IPV6_ADDR_ADD`
Event emitted when an IPv6 address is added to the system.

`NET_EVENT_IPV6_ADDR_DEL`
Event emitted when an IPv6 address is removed from the system.

`NET_EVENT_IPV6_MADDR_ADD`
Event emitted when an IPv6 multicast address is added to the system.

`NET_EVENT_IPV6_MADDR_DEL`
Event emitted when an IPv6 multicast address is removed from the system.

`NET_EVENT_IPV6_PREFIX_ADD`
Event emitted when an IPv6 prefix is added to the system.

NET_EVENT_IPV6_PREFIX_DEL
: Event emitted when an IPv6 prefix is removed from the system.

NET_EVENT_IPV6_MCAST_JOIN
: Event emitted when an IPv6 multicast group is joined.

NET_EVENT_IPV6_MCAST_LEAVE
: Event emitted when an IPv6 multicast group is left.

NET_EVENT_IPV6_ROUTER_ADD
: Event emitted when an IPv6 router is added to the system.

NET_EVENT_IPV6_ROUTER_DEL
: Event emitted when an IPv6 router is removed from the system.

NET_EVENT_IPV6_ROUTE_ADD
: Event emitted when an IPv6 route is added to the system.

NET_EVENT_IPV6_ROUTE_DEL
: Event emitted when an IPv6 route is removed from the system.

NET_EVENT_IPV6_DAD_SUCCEED
: Event emitted when an IPv6 duplicate address detection succeeds.

NET_EVENT_IPV6_DAD_FAILED
: Event emitted when an IPv6 duplicate address detection fails.

NET_EVENT_IPV6_NBR_ADD
: Event emitted when an IPv6 neighbor is added to the system.

NET_EVENT_IPV6_NBR_DEL
: Event emitted when an IPv6 neighbor is removed from the system.

NET_EVENT_IPV6_DHCP_START
: Event emitted when an IPv6 DHCP client starts.

NET_EVENT_IPV6_DHCP_BOUND
: Event emitted when an IPv6 DHCP client address is bound.

NET_EVENT_IPV6_DHCP_STOP
: Event emitted when an IPv6 DHCP client is stopped.

NET_EVENT_IPV6_ADDR_DEPRECATED
: IPv6 address is deprecated.

NET_EVENT_IPV6_PE_ENABLED
: IPv6 Privacy extension is enabled.

`NET_EVENT_IPV6_PE_DISABLED`
IPv6 Privacy extension is disabled.

`NET_EVENT_IPV6_PE_FILTER_ADD`
IPv6 Privacy extension filter is added.

`NET_EVENT_IPV6_PE_FILTER_DEL`
IPv6 Privacy extension filter is removed.

`NET_EVENT_IPV4_ADDR_ADD`
Event emitted when an IPv4 address is added to the system.

`NET_EVENT_IPV4_ADDR_DEL`
Event emitted when an IPv4 address is removed from the system.

`NET_EVENT_IPV4_MADDR_ADD`
Event emitted when an IPv4 multicast address is added to the system.

`NET_EVENT_IPV4_MADDR_DEL`
Event emitted when an IPv4 multicast address is removed from the system.

`NET_EVENT_IPV4_ROUTER_ADD`
Event emitted when an IPv4 router is added to the system.

`NET_EVENT_IPV4_ROUTER_DEL`
Event emitted when an IPv4 router is removed from the system.

`NET_EVENT_IPV4_DHCP_START`
Event emitted when an IPv4 DHCP client is started.

`NET_EVENT_IPV4_DHCP_BOUND`
Event emitted when an IPv4 DHCP client address is bound.

`NET_EVENT_IPV4_DHCP_STOP`
Event emitted when an IPv4 DHCP client is stopped.

`NET_EVENT_IPV4_MCAST_JOIN`
Event emitted when an IPv4 multicast group is joined.

`NET_EVENT_IPV4_MCAST_LEAVE`
Event emitted when an IPv4 multicast group is left.

`NET_EVENT_IPV4_ACD_SUCCEED`
Event emitted when an IPv4 address conflict detection succeeds.

`NET_EVENT_IPV4_ACD_FAILED`
Event emitted when an IPv4 address conflict detection fails.

NET_EVENT_IPV4_ACD_CONFLICT

Event emitted when an IPv4 address conflict was detected after the address was confirmed as safe to use.

It's up to the application to determine on how to act in such case.

NET_EVENT_L4_CONNECTED

Event emitted when the system is considered to be connected.

The connected in this context means that the network interface is up, and the interface has either IPv4 or IPv6 address assigned to it.

NET_EVENT_L4_DISCONNECTED

Event emitted when the system is no longer connected.

Typically this means that network connectivity is lost either by the network interface is going down, or the interface has no longer an IP address etc.

NET_EVENT_L4_IPV4_CONNECTED

Event raised when IPv4 network connectivity is available.

NET_EVENT_L4_IPV4_DISCONNECTED

Event emitted when IPv4 network connectivity is lost.

NET_EVENT_L4_IPV6_CONNECTED

Event emitted when IPv6 network connectivity is available.

NET_EVENT_L4_IPV6_DISCONNECTED

Event emitted when IPv6 network connectivity is lost.

NET_EVENT_DNS_SERVER_ADD

Event emitted when a DNS server is added to the system.

NET_EVENT_DNS_SERVER_DEL

Event emitted when a DNS server is removed from the system.

NET_EVENT_HOSTNAME_CHANGED

Event emitted when the system hostname is changed.

NET_EVENT_CAPTURE_STARTED

Network packet capture is started.

NET_EVENT_CAPTURE_STOPPED

Network packet capture is stopped.

net_mgmt(_mgmt_request, _iface, _data, _len)

Generate a network management event.

Parameters

- **_mgmt_request** – Management event identifier
- **_iface** – Network interface
- **_data** – Any additional data for the event

- **_len** – Length of the additional data.

NET_MGMT_DEFINE_REQUEST_HANDLER(_mgmt_request)

Declare a request handler function for the given network event.

Parameters

- **_mgmt_request** – Management event identifier

NET_MGMT_REGISTER_REQUEST_HANDLER(_mgmt_request, _func)

Create a request handler function for the given network event.

Parameters

- **_mgmt_request** – Management event identifier
- **_func** – Function for handling this event

NET_MGMT_REGISTER_EVENT_HANDLER(_name, _event_mask, _func, _user_data)

Define a static network event handler.

Parameters

- **_name** – Name of the event handler.
- **_event_mask** – A mask of network events on which the passed handler should be called in case those events come. Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.
- **_func** – The function to be called upon network events being emitted.
- **_user_data** – User data passed to the handler being called on network events.

Typedefs

typedef int (***net_mgmt_request_handler_t**)(uint32_t mgmt_request, struct *net_if* *iface, void *data, size_t len)

Signature which all Net MGMT request handler need to follow.

Param mgmt_request
The exact request value the handler is being called through

Param iface
A valid pointer on struct *net_if* if the request is meant to be tied to a network interface. NULL otherwise.

Param data
A valid pointer on a data understood by the handler. NULL otherwise.

Param len
Length in byte of the memory pointed by data.

typedef void (***net_mgmt_event_handler_t**)(struct *net_mgmt_event_callback* *cb, uint32_t mgmt_event, struct *net_if* *iface)

Define the user's callback handler function signature.

Param cb
Original struct *net_mgmt_event_callback* owning this handler.

Param mgmt_event
The network event being notified.

Param iface
A pointer on a struct *net_if* to which the event belongs to, if it's an event on an iface. NULL otherwise.

typedef void (***net_mgmt_event_static_handler_t**)(uint32_t mgmt_event, struct *net_if* *iface, void *info, size_t info_length, void *user_data)

Define the user's callback handler function signature.

Param mgmt_event
The network event being notified.

Param iface
A pointer on a struct *net_if* to which the event belongs to, if it's an event on an iface. NULL otherwise.

Param info
A valid pointer on a data understood by the handler. NULL otherwise.

Param info_length
Length in bytes of the memory pointed by `info`.

Param user_data
Data provided by the user to the handler.

Functions

static inline void **net_mgmt_init_event_callback**(struct *net_mgmt_event_callback* *cb, *net_mgmt_event_handler_t* handler, uint32_t mgmt_event_mask)

Helper to initialize a struct *net_mgmt_event_callback* properly.

Parameters

- **cb** – A valid application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **mgmt_event_mask** – A mask of relevant events for the handler

void **net_mgmt_add_event_callback**(struct *net_mgmt_event_callback* *cb)

Add a user callback.

Parameters

- **cb** – A valid pointer on user's callback to add.

void **net_mgmt_del_event_callback**(struct *net_mgmt_event_callback* *cb)

Delete a user callback.

Parameters

- **cb** – A valid pointer on user's callback to delete.

void **net_mgmt_event_notify_with_info**(uint32_t mgmt_event, struct *net_if* *iface, const void *info, size_t length)

Used by the system to notify an event.

Note: info and length are disabled if CONFIG_NET_MGMT_EVENT_INFO is not defined.

Parameters

- **mgmt_event** – The actual network event code to notify
- **iface** – a valid pointer on a struct *net_if* if only the event is based on an iface. NULL otherwise.
- **info** – A valid pointer on the information you want to pass along with the event. NULL otherwise. Note the data pointed there is normalized by the related event.
- **length** – size of the data pointed by info pointer.

static inline void **net_mgmt_event_notify**(uint32_t mgmt_event, struct *net_if* *iface)

Used by the system to notify an event without any additional information.

Parameters

- **mgmt_event** – The actual network event code to notify
- **iface** – A valid pointer on a struct *net_if* if only the event is based on an iface. NULL otherwise.

int **net_mgmt_event_wait**(uint32_t mgmt_event_mask, uint32_t *raised_event, struct *net_if* **iface, const void **info, size_t *info_length, *k_timeout_t* timeout)

Used to wait synchronously on an event mask.

Parameters

- **mgmt_event_mask** – A mask of relevant events to wait on.
- **raised_event** – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.
- **iface** – a pointer on a place holder for the iface on which the event has originated from. This is valid if only the event mask has bit NET_MGMT_IFACE_BIT set relevantly, depending on events the caller wants to listen to.
- **info** – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
- **info_length** – tells how long the info memory area is. Only valid if the info is not NULL.
- **timeout** – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns

0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

int **net_mgmt_event_wait_on_iface**(struct *net_if* *iface, uint32_t mgmt_event_mask, uint32_t *raised_event, const void **info, size_t *info_length, *k_timeout_t* timeout)

Used to wait synchronously on an event mask for a specific iface.

Parameters

- **iface** – a pointer on a valid network interface to listen event to
- **mgmt_event_mask** – A mask of relevant events to wait on. Listened to events should be relevant to iface events and thus have the bit NET_MGMT_IFACE_BIT set.
- **raised_event** – a pointer on a uint32_t to get which event from the mask generated the event. Can be NULL if the caller is not interested in that information.

- `info` – a valid pointer if user wants to get the information the event might bring along. NULL otherwise.
- `info_length` – tells how long the info memory area is. Only valid if the info is not NULL.
- `timeout` – A timeout delay. K_FOREVER can be used to wait indefinitely.

Returns
0 on success, a negative error code otherwise. -ETIMEDOUT will be specifically returned if the timeout kick-in instead of an actual event.

void `net_mgmt_event_init`(void)
Used by the core of the network stack to initialize the network event processing.

struct `net_event_ipv6_addr`
#include <*net_event.h*> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_ADDR_ADD, NET_EVENT_IPV6_ADDR_DEL, NET_EVENT_IPV6_MADDR_ADD and NET_EVENT_IPV6_MADDR_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

Public Members

struct *in6_addr* `addr`
IPv6 address related to this event.

struct `net_event_ipv6_nbr`
#include <*net_event.h*> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_NBR_ADD and NET_EVENT_IPV6_NBR_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

Note
: idx will be '-1' in case of NET_EVENT_IPV6_NBR_DEL event.

Public Members

struct *in6_addr* `addr`
Neighbor IPv6 address.

int `idx`
Neighbor index in cache.

struct `net_event_ipv6_route`
#include <*net_event.h*> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_ROUTE_ADD and NET_EVENT_IPV6_ROUTE_DEL when CONFIG_NET_MGMT_EVENT_INFO enabled and event generator pass the information.

Public Members

struct *in6_addr* **nexthop**

IPv6 address of the next hop.

struct *in6_addr* **addr**

IPv6 address or prefix of the route.

uint8_t **prefix_len**

IPv6 prefix length.

struct **net_event_ipv6_prefix**

#include <*net_event.h*> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_PREFIX_ADD and NET_EVENT_IPV6_PREFIX_DEL when CONFIG_NET_MGMT_EVENT_INFO is enabled and event generator pass the information.

Public Members

struct *in6_addr* **addr**

IPv6 prefix.

uint8_t **len**

IPv6 prefix length.

uint32_t **lifetime**

IPv6 prefix lifetime in seconds.

struct **net_event_l4_hostname**

#include <*net_event.h*> Network Management event information structure Used to pass information on NET_EVENT_HOSTNAME_CHANGED event when CONFIG_NET_MGMT_EVENT_INFO is enabled and event generator pass the information.

Public Members

char **hostname**[NET_HOSTNAME_SIZE]

New hostname.

struct **net_event_ipv6_pe_filter**

#include <*net_event.h*> Network Management event information structure Used to pass information on network events like NET_EVENT_IPV6_PE_FILTER_ADD and NET_EVENT_IPV6_PE_FILTER_DEL when CONFIG_NET_MGMT_EVENT_INFO is enabled and event generator pass the information.

This is only available if CONFIG_NET_IPV6_PE_FILTER_PREFIX_COUNT is >0.

Public Members

struct *in6_addr* **prefix**

IPv6 address of privacy extension filter.

bool **is_deny_list**

IPv6 filter deny or allow list.

struct **net_mgmt_event_callback**

#include <*net_mgmt.h*> Network Management event callback structure Used to register a callback into the network management event part, in order to let the owner of this struct to get network event notification based on given event mask.

Public Members

sys_snode_t **node**

Meant to be used internally, to insert the callback into a list.

So nobody should mess with it.

net_mgmt_event_handler_t **handler**

Actual callback function being used to notify the owner.

struct k_sem ***sync_call**

Semaphore meant to be used internally for the synchronous *net_mgmt_event_wait()* function.

uint32_t **event_mask**

A mask of network events on which the above handler should be called in case those events come.

Note that only the command part is treated as a mask, matching one to several commands. Layer and layer code will be made of an exact match. This means that in order to receive events from multiple layers, one must have multiple listeners registered, one for each layer being listened.

uint32_t **raised_event**

Internal place holder when a synchronous event wait is successfully unlocked on a event.

union net_mgmt_event_callback

A mask of network events on which the above handler should be called in case those events come.

Such mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not.

Network Statistics

- *Overview*
- *API Reference*

Overview Network statistics are collected if `CONFIG_NET_STATISTICS` is set. Individual component statistics for IPv4 or IPv6 can be turned off if those statistics are not needed. See various options in subsys/net/ip/Kconfig.stats file for details.

By default, the system collects network statistics per network interface. This can be controlled by `CONFIG_NET_STATISTICS_PER_INTERFACE` option.

The `CONFIG_NET_STATISTICS_USER_API` option can be set if the application wants to collect statistics for further processing. The network management interface API is used for that. See *Network Management* for details.

The `CONFIG_NET_STATISTICS_ETHERNET` option can be set to collect generic Ethernet statistics. If the `CONFIG_NET_STATISTICS_ETHERNET_VENDOR` option is set, then Ethernet device driver can collect Ethernet device specific statistics. These statistics can then be transferred to application for processing.

If the `CONFIG_NET_SHELL` option is set, then network shell can show statistics information with `net stats` command.

Related code samples

Number of packets received.

struct **net_stats_ip**
#include <net_stats.h> IP layer statistics.

Public Members

net_stats_t **recv**
Number of received packets at the IP layer.

net_stats_t **sent**
Number of sent packets at the IP layer.

net_stats_t **forwarded**
Number of forwarded packets at the IP layer.

net_stats_t **drop**
Number of dropped packets at the IP layer.

struct **net_stats_ip_errors**
#include <net_stats.h> IP layer error statistics.

Public Members

net_stats_t **vhlerr**
Number of packets dropped due to wrong IP version or header length.

net_stats_t **hblenerr**
Number of packets dropped due to wrong IP length, high byte.

net_stats_t **lblenerr**
Number of packets dropped due to wrong IP length, low byte.

net_stats_t **fragerr**
Number of packets dropped because they were IP fragments.

net_stats_t **chkerr**
Number of packets dropped due to IP checksum errors.

net_stats_t **protoerr**
Number of packets dropped because they were neither ICMP, UDP nor TCP.

struct **net_stats_icmp**
#include <net_stats.h> ICMP statistics.

Public Members

net_stats_t **recv**
Number of received ICMP packets.

net_stats_t **sent**
Number of sent ICMP packets.

net_stats_t **drop**
Number of dropped ICMP packets.

net_stats_t **typeerr**
Number of ICMP packets with a wrong type.

net_stats_t **chkerr**
Number of ICMP packets with a bad checksum.

struct **net_stats_tcp**
#include <net_stats.h> TCP statistics.

Public Members

struct *net_stats_bytes* **bytes**
Amount of received and sent TCP application data.

net_stats_t **resent**
Amount of retransmitted data.

net_stats_t **drop**
Number of dropped packets at the TCP layer.

net_stats_t **recv**
Number of received TCP segments.

net_stats_t **sent**
Number of sent TCP segments.

net_stats_t **seg_drop**
Number of dropped TCP segments.

net_stats_t **chkerr**
Number of TCP segments with a bad checksum.

net_stats_t **ackerr**
Number of received TCP segments with a bad ACK number.

net_stats_t **rsterr**
Number of received bad TCP RST (reset) segments.

net_stats_t **rst**
Number of received TCP RST (reset) segments.

net_stats_t **rexmit**
Number of retransmitted TCP segments.

net_stats_t **conndrop**
Number of dropped connection attempts because too few connections were available.

net_stats_t **connrst**
Number of connection attempts for closed ports, triggering a RST.

struct **net_stats_udp**
#include <net_stats.h> UDP statistics.

Public Members

net_stats_t **drop**
Number of dropped UDP segments.

net_stats_t **recv**
Number of received UDP segments.

net_stats_t **sent**
Number of sent UDP segments.

net_stats_t **chkerr**
Number of UDP segments with a bad checksum.

struct **net_stats_ipv6_nd**

#include <*net_stats.h*> IPv6 neighbor discovery statistics.

Public Members

net_stats_t **drop**

Number of dropped IPv6 neighbor discovery packets.

net_stats_t **recv**

Number of received IPv6 neighbor discovery packets.

net_stats_t **sent**

Number of sent IPv6 neighbor discovery packets.

struct **net_stats_ipv6_mld**

#include <*net_stats.h*> IPv6 multicast listener daemon statistics.

Public Members

net_stats_t **recv**

Number of received IPv6 MLD queries.

net_stats_t **sent**

Number of sent IPv6 MLD reports.

net_stats_t **drop**

Number of dropped IPv6 MLD packets.

struct **net_stats_ipv4_igmp**

#include <*net_stats.h*> IPv4 IGMP daemon statistics.

Public Members

net_stats_t **recv**

Number of received IPv4 IGMP queries.

net_stats_t **sent**

Number of sent IPv4 IGMP reports.

net_stats_t **drop**

Number of dropped IPv4 IGMP packets.

struct **net_stats_tx_time**

#include <*net_stats.h*> Network packet transfer times for calculating average TX time.

Public Members

uint64_t **sum**

Sum of network packet transfer times.

net_stats_t **count**

Number of network packets transferred.

struct **net_stats_rx_time**

#include <*net_stats.h*> Network packet receive times for calculating average RX time.

Public Members

uint64_t **sum**

Sum of network packet receive times.

net_stats_t **count**

Number of network packets received.

struct **net_stats_tc**

#include <*net_stats.h*> Traffic class statistics.

Public Members

struct *net_stats_tx_time* **tx_time**

Helper for calculating average TX time statistics.

net_stats_t **pkts**

Number of packets sent for this traffic class.

Number of packets received for this traffic class.

net_stats_t **bytes**

Number of bytes sent for this traffic class.

Number of bytes received for this traffic class.

uint8_t **priority**

Priority of this traffic class.

struct *net_stats_tc* **sent**[NET_TC_TX_STATS_COUNT]

TX statistics for each traffic class.

struct *net_stats_rx_time* **rx_time**

Helper for calculating average RX time statistics.

struct *net_stats_tc* **recv**[NET_TC_RX_STATS_COUNT]

RX statistics for each traffic class.

struct **net_stats_pm**

#include <*net_stats.h*> Power management statistics.

Public Members

uint64_t **overall_suspend_time**

Total suspend time.

net_stats_t **suspend_count**

How many times we were suspended.

uint32_t **last_suspend_time**

How long the last suspend took.

uint32_t **start_time**

Network interface last suspend start time.

struct **net_stats**

#include <*net_stats.h*> All network statistics in one struct.

Public Members

net_stats_t **processing_error**

Count of malformed packets or packets we do not have handler for.

struct *net_stats_bytes* **bytes**

This calculates amount of data transferred through all the network interfaces.

struct *net_stats_ip_errors* **ip_errors**

IP layer errors.

struct **net_stats_eth_errors**

#include <*net_stats.h*> Ethernet error statistics.

Public Members

net_stats_t **rx_length_errors**

Number of RX length errors.

net_stats_t **rx_over_errors**

Number of RX overrun errors.

net_stats_t **rx_crc_errors**

Number of RX CRC errors.

net_stats_t **rx_frame_errors**
Number of RX frame errors.

net_stats_t **rx_no_buffer_count**
Number of RX *net_pkt* allocation errors.

net_stats_t **rx_missed_errors**
Number of RX missed errors.

net_stats_t **rx_long_length_errors**
Number of RX long length errors.

net_stats_t **rx_short_length_errors**
Number of RX short length errors.

net_stats_t **rx_align_errors**
Number of RX buffer align errors.

net_stats_t **rx_dma_failed**
Number of RX DMA failed errors.

net_stats_t **rx_buf_alloc_failed**
Number of RX *net_buf* allocation errors.

net_stats_t **tx_aborted_errors**
Number of TX aborted errors.

net_stats_t **tx_carrier_errors**
Number of TX carrier errors.

net_stats_t **tx_fifo_errors**
Number of TX FIFO errors.

net_stats_t **tx_heartbeat_errors**
Number of TX heartbeat errors.

net_stats_t **tx_window_errors**
Number of TX window errors.

net_stats_t **tx_dma_failed**
Number of TX DMA failed errors.

net_stats_t **uncorr_ecc_errors**
Number of uncorrected ECC errors.

net_stats_t **corr_ecc_errors**
Number of corrected ECC errors.

struct **net_stats_eth_flow**
#include <net_stats.h> Ethernet flow control statistics.

Public Members

net_stats_t **rx_flow_control_xon**
Number of RX XON flow control.

net_stats_t **rx_flow_control_xoff**
Number of RX XOFF flow control.

net_stats_t **tx_flow_control_xon**
Number of TX XON flow control.

net_stats_t **tx_flow_control_xoff**
Number of TX XOFF flow control.

struct **net_stats_eth_csum**
#include <net_stats.h> Ethernet checksum statistics.

Public Members

net_stats_t **rx_csum_offload_good**
Number of good RX checksum offloading.

net_stats_t **rx_csum_offload_errors**
Number of failed RX checksum offloading.

struct **net_stats_eth_hw_timestamp**
#include <net_stats.h> Ethernet hardware timestamp statistics.

Public Members

net_stats_t **rx_hwtstamp_cleared**
Number of RX hardware timestamp cleared.

net_stats_t **tx_hwtstamp_timeouts**
Number of RX hardware timestamp timeout.

net_stats_t **tx_hwtstamp_skipped**
Number of RX hardware timestamp skipped.

struct **net_stats_eth**
#include <net_stats.h> All Ethernet specific statistics.

Public Members

struct *net_stats_bytes* **bytes**
Total number of bytes received and sent.

struct *net_stats_pkts* **pkts**
Total number of packets received and sent.

struct *net_stats_pkts* **broadcast**
Total number of broadcast packets received and sent.

struct *net_stats_pkts* **multicast**
Total number of multicast packets received and sent.

struct *net_stats_pkts* **errors**
Total number of errors in RX and TX.

struct *net_stats_eth_errors* **error_details**
Total number of errors in RX and TX.

struct *net_stats_eth_flow* **flow_control**
Total number of flow control errors in RX and TX.

struct *net_stats_eth_csum* **csum**
Total number of checksum errors in RX and TX.

struct *net_stats_eth_hw_timestamp* **hw_timestamp**
Total number of hardware timestamp errors in RX and TX.

net_stats_t **collisions**
Total number of collisions.

net_stats_t **tx_dropped**
Total number of dropped TX packets.

net_stats_t **tx_timeout_count**
Total number of TX timeout errors.

net_stats_t **tx_restart_queue**
Total number of TX queue restarts.

net_stats_t **unknown_protocol**
Total number of RX unknown protocol packets.

struct **net_stats_ppp**
#include <net_stats.h> All PPP specific statistics.

Public Members

struct *net_stats_bytes* **bytes**
Total number of bytes received and sent.

struct *net_stats_pkts* **pkts**
Total number of packets received and sent.

net_stats_t **drop**
Number of received and dropped PPP frames.

net_stats_t **chkerr**
Number of received PPP frames with a bad checksum.

struct **net_stats_sta_mgmt**
#include <net_stats.h> All Wi-Fi management statistics.

Public Members

net_stats_t **beacons_rx**
Number of received beacons.

net_stats_t **beacons_miss**
Number of missed beacons.

struct **net_stats_wifi**
#include <net_stats.h> All Wi-Fi specific statistics.

Public Members

struct *net_stats_sta_mgmt* **sta_mgmt**
Total number of beacon errors.

struct *net_stats_bytes* **bytes**
Total number of bytes received and sent.

struct *net_stats_pkts* **pkts**
Total number of packets received and sent.

struct *net_stats_pkts* **broadcast**
Total number of broadcast packets received and sent.

struct *net_stats_pkts* **multicast**
Total number of multicast packets received and sent.

struct *net_stats_pkts* **errors**
Total number of errors in RX and TX.

struct *net_stats_pkts* **unicast**
Total number of unicast packets received and sent.

Network Timeout

- *Overview*
- *Use*
- *API Reference*

Overview Zephyr's network infrastructure mostly uses the millisecond-resolution uptime clock to track timeouts, with both deadlines and durations measured with 32-bit unsigned values. The 32-bit value rolls over at 49 days 17 hours 2 minutes 47.296 seconds.

Timeout processing is often affected by latency, so that the time at which the timeout is checked may be some time after it should have expired. Handling this correctly without arbitrary expectations of maximum latency requires that the maximum delay that can be directly represented be a 31-bit non-negative number (`INT32_MAX`), which overflows at 24 days 20 hours 31 minutes 23.648 seconds.

Most network timeouts are shorter than the delay rollover, but a few protocols allow for delays that are represented as unsigned 32-bit values counting seconds, which corresponds to a 42-bit millisecond count.

The net_timeout API provides a generic timeout mechanism to correctly track the remaining time for these extended-duration timeouts.

Use The simplest use of this API is:

1. Configure a network timeout using *`net_timeout_set()`*.
2. Use *`net_timeout_evaluate()`* to determine how long it is until the timeout occurs. Schedule a timeout to occur after this delay.
3. When the timeout callback is invoked, use *`net_timeout_evaluate()`* again to determine whether the timeout has completed, or whether there is additional time remaining. If the latter, reschedule the callback.
4. While the timeout is running, use *`net_timeout_remaining()`* to get the number of seconds until the timeout expires. This may be used to explicitly update the timeout, which should be done by canceling any pending callback and restarting from step 1 with the new timeout.

The *`net_timeout`* contains a `sys_snode_t` that allows multiple timeout instances to be aggregated to share a single kernel timer element. The application must use *`net_timeout_evaluate()`* on all instances to determine the next timeout event to occur.

`net_timeout_deadline()` may be used to reconstruct the full-precision deadline of the timeout. This exists primarily for testing but may have use in some applications, as it does allow a millisecond-resolution calculation of remaining time.

API Reference

group `net_timeout`

Network long timeout primitives and helpers.

Since
1.14

Version
0.8.0

Defines

NET_TIMEOUT_MAX_VALUE

Divisor used to support ms resolution timeouts.

Because delays are processed in work queues which are not invoked synchronously with clock changes we need to be able to detect timeouts after they occur, which requires comparing "deadline" to "now" with enough "slop" to handle any observable latency due to "now" advancing past "deadline".

The simplest solution is to use the native conversion of the well-defined 32-bit unsigned difference to a 32-bit signed difference, which caps the maximum delay at INT32_MAX. This is compatible with the standard mechanism for detecting completion of deadlines that do not overflow their representation.

Functions

void **net_timeout_set**(struct *net_timeout* *timeout, uint32_t lifetime, uint32_t now)

Configure a network timeout structure.

Parameters

- **timeout** – a pointer to the timeout state.
- **lifetime** – the duration of the timeout in seconds.
- **now** – the time at which the timeout started counting down, in milliseconds. This is generally a captured value of *k_uptime_get_32()*.

int64_t **net_timeout_deadline**(const struct *net_timeout* *timeout, int64_t now)

Return the 64-bit system time at which the timeout will complete.

> **Note**
>
> Correct behavior requires invocation of *net_timeout_evaluate()* at its specified intervals.

Parameters

- **timeout** – state a pointer to the timeout state, initialized by *net_timeout_set()* and maintained by *net_timeout_evaluate()*.
- **now** – the full-precision value of *k_uptime_get()* relative to which the deadline will be calculated.

Returns

the value of *k_uptime_get()* at which the timeout will expire.

uint32_t **net_timeout_remaining**(const struct *net_timeout* *timeout, uint32_t now)

Calculate the remaining time to the timeout in whole seconds.

> **Note**
>
> This function rounds the remaining time down, i.e. if the timeout will occur in 3500 milliseconds the value 3 will be returned.

Note

Correct behavior requires invocation of *net_timeout_evaluate()* at its specified intervals.

Parameters

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from *k_uptime_get_32()*.

Return values

- `0` – if the timeout has completed.
- `positive` – the remaining duration of the timeout, in seconds.

uint32_t **net_timeout_evaluate**(struct *net_timeout* *timeout, uint32_t now)

Update state to reflect elapsed time and get new delay.

This function must be invoked periodically to (1) apply the effect of elapsed time on what remains of a total delay that exceeded the maximum representable delay, and (2) determine that either the timeout has completed or that the infrastructure must wait a certain period before checking again for completion.

Parameters

- `timeout` – a pointer to the timeout state
- `now` – the time relative to which the estimate of remaining time should be calculated. This should be recently captured value from *k_uptime_get_32()*.

Return values

- `0` – if the timeout has completed
- `positive` – the maximum delay until the state of this timeout should be re-evaluated, in milliseconds.

struct **net_timeout**

#include <net_timeout.h> Generic struct for handling network timeouts.

Except for the linking node, all access to state from these objects must go through the defined API.

Public Members

sys_snode_t node

Used to link multiple timeouts that share a common timer infrastructure.

For examples a set of related timers may use a single delayed work structure, which is always scheduled at the shortest time to a timeout event.

uint32_t **timer_start**

Time at which the timer was last set.

This usually corresponds to the low 32 bits of *k_uptime_get()*.

uint32_t **timer_timeout**

Portion of remaining timeout that does not exceed NET_TIMEOUT_MAX_VALUE.

This value is updated in parallel with timer_start and wrap_counter by *net_timeout_evaluate()*.

uint32_t **wrap_counter**

Timer wrap count.

This tracks multiples of NET_TIMEOUT_MAX_VALUE milliseconds that have yet to pass. It is also updated along with timer_start and wrap_counter by *net_timeout_evaluate()*.

Networking Context The net_context API is not meant for application use. Application should use *BSD Sockets* API instead.

Promiscuous Mode

- *Overview*
- *Sample usage*
- *API Reference*

Overview Promiscuous mode is a mode for a network interface controller that causes it to pass all traffic it receives to the application rather than passing only the frames that the controller is specifically programmed to receive. This mode is normally used for packet sniffing as used to diagnose network connectivity issues by showing an application all the data being transferred over the network. (See the Wikipedia article on promiscuous mode for more information.)

The network promiscuous APIs are used to enable and disable this mode, and to wait for and receive a network data to arrive. Not all network technologies or network device drivers support promiscuous mode.

Sample usage First the promiscuous mode needs to be turned ON by the application like this:

```
ret = net_promisc_mode_on(iface);
if (ret < 0) {
        if (ret == -EALREADY) {
                printf("Promiscuous mode already enabled\n");
        } else {
                printf("Cannot enable promiscuous mode for "
                       "interface %p (%d)\n", iface, ret);
        }
}
```

If there is no error, then the application can start to wait for network data:

```
while (true) {
        pkt = net_promisc_mode_wait_data(K_FOREVER);
        if (pkt) {
                print_info(pkt);
        }
```

(continues on next page)

(continued from previous page)

```
        net_pkt_unref(pkt);
}
```

Finally the promiscuous mode can be turned OFF by the application like this:

```
ret = net_promisc_mode_off(iface);
if (ret < 0) {
        if (ret == -EALREADY) {
                printf("Promiscuous mode already disabled\n");
        } else {
                printf("Cannot disable promiscuous mode for "
                       "interface %p (%d)\n", iface, ret);
        }
}
```

See net-promiscuous-mode for a more comprehensive example.

Related code samples

Promiscuous mode
Enable promiscuous mode on all interfaces and print information about incoming packets.

Version
0.8.0

Functions

static inline struct *net_pkt* ***net_promisc_mode_wait_data**(*k_timeout_t* timeout)

Start to wait received network packets.

Parameters

- **timeout** – How long to wait before returning.

Returns
Received *net_pkt*, NULL if not received any packet.

static inline int **net_promisc_mode_on**(struct *net_if* *iface)

Enable promiscuous mode for a given network interface.

Parameters

- **iface** – Network interface

Returns
0 if ok, <0 if error

static inline int **net_promisc_mode_off**(struct *net_if* *iface)

Disable promiscuous mode for a given network interface.

Parameters

- **iface** – Network interface

Returns

0 if ok, <0 if error

Simple Network Time Protocol Library

- *Overview*
- *API Reference*

Overview The SNTP library implements IETF RFC4330 (Simple Network Time Protocol v4). SNTP provides a way to synchronize clocks in computer networks.

Related code samples

AWS IoT Core MQTT

Connect to AWS IoT Core and publish messages using MQTT.

SNTP client

Use SNTP to get the current time from the host.

API Reference

group **sntp**

Simple Network Time Protocol API.

Since

1.10

Version

0.8.0

Functions

int **sntp_init**(struct *sntp_ctx* *ctx, struct *sockaddr* *addr, *socklen_t* addr_len)

Initialize SNTP context.

Parameters

- **ctx** – Address of sntp context.
- **addr** – IP address of NTP/SNTP server.
- **addr_len** – IP address length of NTP/SNTP server.

Returns
0 if ok, <0 if error.

int **sntp_query**(struct *sntp_ctx* *ctx, uint32_t timeout, struct *sntp_time* *time)

Perform SNTP query.

Parameters

- **ctx** – Address of sntp context.
- **timeout** – Timeout of waiting for sntp response (in milliseconds).
- **time** – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns
0 if ok, <0 if error (-ETIMEDOUT if timeout).

void **sntp_close**(struct *sntp_ctx* *ctx)

Release SNTP context.

Parameters

- **ctx** – Address of sntp context.

int **sntp_simple**(const char *server, uint32_t timeout, struct *sntp_time* *ts)

Convenience function to query SNTP in one-shot fashion.

Convenience wrapper which calls *getaddrinfo()*, *sntp_init()*, *sntp_query()*, and *sntp_close()*.

Parameters

- **server** – Address of server in format addr[:port]
- **timeout** – Query timeout
- **ts** – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns
0 if ok, <0 if error (-ETIMEDOUT if timeout).

int **sntp_simple_addr**(struct *sockaddr* *addr, *socklen_t* addr_len, uint32_t timeout, struct *sntp_time* *ts)

Convenience function to query SNTP in one-shot fashion using a pre-initialized address struct.

Convenience wrapper which calls *sntp_init()*, *sntp_query()* and *sntp_close()*.

Parameters

- **addr** – IP address of NTP/SNTP server.
- **addr_len** – IP address length of NTP/SNTP server.
- **timeout** – Query timeout
- **ts** – Timestamp including integer and fractional seconds since 1 Jan 1970 (output).

Returns
0 if ok, <0 if error (-ETIMEDOUT if timeout).

struct **sntp_time**

#include <*sntp.h*> Time as returned by SNTP API, fractional seconds since 1 Jan 1970.

Public Members

uint64_t **seconds**
Second value.

uint32_t **fraction**
Fractional seconds value.

struct **sntp_ctx**
#include <*sntp.h*> SNTP context.

Public Members

struct *sntp_time* **expected_orig_ts**
Timestamp when the request was sent from client to server.

This is used to check if the originated timestamp in the server reply matches the one in client request.

SOCKS5 Proxy Support

- *Overview*
- *SOCKS5 API*
- *SOCKS5 Proxy Usage in MQTT*

Overview The SOCKS library implements SOCKS5 support, which allows Zephyr to connect to peer devices via a network proxy.

See this SOCKS5 Wikipedia article for a detailed overview of how SOCKS5 works.

For more information about the protocol itself, see IETF RFC1928 SOCKS Protocol Version 5.

SOCKS5 API The SOCKS5 support is enabled by `CONFIG_SOCKS` Kconfig variable. Application wanting to use the SOCKS5 must set the SOCKS5 proxy host address by calling *`setsockopt()`* like this:

```
static int set_proxy(int sock, const struct sockaddr *proxy_addr,
                     socklen_t proxy_addrlen)
{
    int ret;

    ret = setsockopt(sock, SOL_SOCKET, SO_SOCKS5,
                     proxy_addr, proxy_addrlen);
    if (ret < 0) {
            return -errno;
    }

    return 0;
}
```

SOCKS5 Proxy Usage in MQTT For MQTT client, there is `mqtt_client_set_proxy()` API that the application can call to setup SOCKS5 proxy. See mqtt-publisher sample application for usage example.

Trickle Timer Library

- *Overview*
- *API Reference*

Overview The Trickle timer library implements IETF RFC6206 (Trickle Algorithm).

The Trickle algorithm allows nodes in a lossy shared medium (e.g., low-power and lossy networks) to exchange information in a highly robust, energy efficient, simple, and scalable manner.

API Reference

group `trickle`

Trickle algorithm library.

Since
1.7

Version
0.8.0

Typedefs

typedef void (***net_trickle_cb_t**)(struct *net_trickle* *trickle, bool do_suppress, void *user_data)

Trickle timer callback.

The callback is called after Trickle timeout expires.

Param trickle
The trickle context to use.

Param do_suppress
Is TX allowed (true) or not (false).

Param user_data
The user data given in *net_trickle_start()* call.

Functions

int **net_trickle_create**(struct *net_trickle* *trickle, uint32_t Imin, uint8_t Imax, uint8_t k)

Create a Trickle timer.

Parameters

- **trickle** – Pointer to Trickle struct.

- `Imin` – Imin configuration parameter in ms.
- `Imax` – Max number of doublings.
- `k` – Redundancy constant parameter. See RFC 6206 for details.

Returns
Return 0 if ok and <0 if error.

int `net_trickle_start`(struct *net_trickle* *trickle, *net_trickle_cb_t* cb, void *user_data)

Start a Trickle timer.

Parameters

- `trickle` – Pointer to Trickle struct.
- `cb` – User callback to call at time T within the current trickle interval
- `user_data` – User pointer that is passed to callback.

Returns
Return 0 if ok and <0 if error.

int `net_trickle_stop`(struct *net_trickle* *trickle)

Stop a Trickle timer.

Parameters

- `trickle` – Pointer to Trickle struct.

Returns
Return 0 if ok and <0 if error.

void `net_trickle_consistency`(struct *net_trickle* *trickle)

To be called by the protocol handler when it hears a consistent network transmission.

Parameters

- `trickle` – Pointer to Trickle struct.

void `net_trickle_inconsistency`(struct *net_trickle* *trickle)

To be called by the protocol handler when it hears an inconsistent network transmission.

Parameters

- `trickle` – Pointer to Trickle struct.

static inline bool `net_trickle_is_running`(struct *net_trickle* *trickle)

Check if the Trickle timer is running or not.

Parameters

- `trickle` – Pointer to Trickle struct.

Returns
Return True if timer is running and False if not.

struct `net_trickle`

#include <trickle.h> The variable names are taken directly from RFC 6206 when applicable.

Note that the struct members should not be accessed directly but only via the Trickle API.

Public Members

uint32_t **I**
Current interval size.

uint32_t **Imin**
Min interval size in ms.

uint32_t **Istart**
Start of the interval in ms.

uint32_t **Imax_abs**
Max interval size in ms (not doublings)

uint8_t **Imax**
Max number of doublings.

uint8_t **k**
Redundancy constant.

uint8_t **c**
Consistency counter.

bool **double_to**
Flag telling if the internval is doubled.

struct *k_work_delayable* **timer**
Internal timer struct.

net_trickle_cb_t **cb**
Callback to be called when timer expires.

void ***user_data**
User specific opaque data.

Websocket Client API

- *Overview*
- *Websocket Transport*
- *API Reference*

Overview The Websocket client library allows Zephyr to connect to a Websocket server. The Websocket client API can be used directly by application to establish a Websocket connection to server, or it can be used as a transport for other network protocols like MQTT.

See this Websocket Wikipedia article for a detailed overview of how Websocket works.

For more information about the protocol itself, see IETF RFC6455 The WebSocket Protocol.

Websocket Transport The Websocket API allows it to be used as a transport for other high level protocols like MQTT. The Zephyr MQTT client library can be configured to use Websocket transport by enabling `CONFIG_MQTT_LIB_WEBSOCKET` and `CONFIG_WEBSOCKET_CLIENT` Kconfig options.

First a socket needs to be created and connected to the Websocket server:

```
sock = socket(family, SOCK_STREAM, IPPROTO_TCP);
...
ret = connect(sock, addr, addr_len);
...
```

The Websocket transport socket is then created like this:

```
ws_sock = websocket_connect(sock, &config, timeout, user_data);
```

The Websocket socket can then be used to send or receive data, and the Websocket client API will encapsulate the sent or received data to/from Websocket packet payload. Both the `websocket_xxx()` API or normal BSD socket API functions can be used to send and receive application data.

```
ret = websocket_send_msg(ws_sock, buf_to_send, buf_len,
                         WEBSOCKET_OPCODE_DATA_BINARY, true, true,
                         K_FOREVER);
...
ret = send(ws_sock, buf_to_send, buf_len, 0);
```

If normal BSD socket functions are used, then currently only TEXT data is supported. In order to send BINARY data, the *websocket_send_msg()* must be used.

When done, the Websocket transport socket must be closed. User should handle the lifecycle(close/reuse) of tcp socket after websocket_disconnect.

```
ret = close(ws_sock);
or
ret = websocket_disconnect(ws_sock);
```

Related code samples

Implement a Websocket client that connects to a Websocket server.

API Reference

group `websocket`

Websocket API.

Since
1.12

Version
0.1.0

Defines

WEBSOCKET_FLAG_FINAL
: Message type values.

  Returned in *websocket_recv_msg()* Final frame

WEBSOCKET_FLAG_TEXT
: Textual data

WEBSOCKET_FLAG_BINARY
: Binary data

WEBSOCKET_FLAG_CLOSE
: Closing connection.

WEBSOCKET_FLAG_PING
: Ping message

WEBSOCKET_FLAG_PONG
: Pong message

Typedefs

typedef int (*websocket_connect_cb_t)(int ws_sock, struct *http_request* *req, void *user_data)

Callback called after Websocket connection is established.

Param ws_sock
: Websocket id

Param req
: HTTP handshake request

Param user_data
: A valid pointer on some user data or NULL

Return
: 0 if ok, <0 if there is an error and connection should be aborted

Enums

enum websocket_opcode

Websocket option codes.

Values:

enumerator WEBSOCKET_OPCODE_CONTINUE = 0x00

Message continues.

enumerator WEBSOCKET_OPCODE_DATA_TEXT = 0x01

Textual data.

enumerator **WEBSOCKET_OPCODE_DATA_BINARY** = 0x02

Binary data.

enumerator **WEBSOCKET_OPCODE_CLOSE** = 0x08

Closing connection.

enumerator **WEBSOCKET_OPCODE_PING** = 0x09

Ping message.

enumerator **WEBSOCKET_OPCODE_PONG** = 0x0A

Pong message.

Functions

int **websocket_connect**(int http_sock, struct *websocket_request* *req, int32_t timeout, void *user_data)

Connect to a server that provides Websocket service.

The callback is called after connection is established. The returned value is a new socket descriptor that can be used to send / receive data using the BSD socket API.

Parameters

- **http_sock** – Socket id to the server. Note that this socket is used to do HTTP handshakes etc. The actual Websocket connectivity is done via the returned websocket id. Note that the http_sock must not be closed after this function returns as it is used to deliver the Websocket packets to the Websocket server.
- **req** – Websocket request. User should allocate and fill the request data.
- **timeout** – Max timeout to wait for the connection. The timeout value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.
- **user_data** – User specified data that is passed to the callback.

Returns

Websocket id to be used when sending/receiving Websocket data.

int **websocket_send_msg**(int ws_sock, const uint8_t *payload, size_t payload_len, enum *websocket_opcode* opcode, bool mask, bool final, int32_t timeout)

Send websocket msg to peer.

The function will automatically add websocket header to the message.

Parameters

- **ws_sock** – Websocket id returned by *websocket_connect()*.
- **payload** – Websocket data to send.
- **payload_len** – Length of the data to be sent.
- **opcode** – Operation code (text, binary, ping, pong, close)
- **mask** – Mask the data, see RFC 6455 for details
- **final** – Is this final message for this message send. If final == false, then the first message must have valid opcode and subsequent messages must have opcode WEBSOCKET_OPCODE_CONTINUE. If final == true and this is the only message, then opcode should have proper opcode (text or binary) set.

- **timeout** – How long to try to send the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

Returns
<0 if error, >=0 amount of bytes sent

int **websocket_recv_msg**(int ws_sock, uint8_t *buf, size_t buf_len, uint32_t *message_type, uint64_t *remaining, int32_t timeout)

Receive websocket msg from peer.

The function will automatically remove websocket header from the message.

Parameters

- **ws_sock** – Websocket id returned by *websocket_connect()*.
- **buf** – Buffer where websocket data is read.
- **buf_len** – Length of the data buffer.
- **message_type** – Type of the message.
- **remaining** – How much there is data left in the message after this read.
- **timeout** – How long to try to receive the message. The value is in milliseconds. Value SYS_FOREVER_MS means to wait forever.

Return values

- **>=0** – amount of bytes received.
- **-EAGAIN** – on timeout.
- **-ENOTCONN** – on socket close.
- **-errno** – other negative errno value in case of failure.

int **websocket_disconnect**(int ws_sock)

Close websocket.

One must call *websocket_connect()* after this call to re-establish the connection.

Parameters

- **ws_sock** – Websocket id returned by *websocket_connect()*.

Returns
<0 if error, 0 the connection was closed successfully

int **websocket_register**(int http_sock, uint8_t *recv_buf, size_t recv_buf_len)

Register a socket as websocket.

This is called by HTTP server when a connection is upgraded to a websocket connection.

Parameters

- **http_sock** – Underlying socket connection socket.
- **recv_buf** – Temporary receive buffer for websocket parsing. This must point to a memory area that is valid for the duration of the whole websocket session.
- **recv_buf_len** – Length of the temporary receive buffer.

Returns
<0 if error, >=0 the actual websocket to be used by application

int **websocket_unregister**(int ws_sock)

Unregister a websocket.

This is called when we no longer need the underlying "real" socket. This will close first the websocket and then the original socket.

Parameters

- **ws_sock** – Websocket connection socket.

Returns

<0 if error, 0 the websocket connection is now fully closed

struct **websocket_request**

#include <*websocket.h*> Websocket client connection request.

This contains all the data that is needed when doing a Websocket connection request.

Public Members

const char ***host**

Host of the Websocket server when doing HTTP handshakes.

const char ***url**

URL of the Websocket.

http_header_cb_t **optional_headers_cb**

User supplied callback function to call when optional headers need to be sent.

This can be NULL, in which case the optional_headers field in *http_request* is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

const char ****optional_headers**

A NULL terminated list of any optional headers that should be added to the HTTP request.

May be NULL. If the optional_headers_cb is specified, then this field is ignored.

websocket_connect_cb_t **cb**

User supplied callback function to call when a connection is established.

const struct http_parser_settings ***http_cb**

User supplied list of callback functions if the calling application wants to know the parsing status or the HTTP fields during the handshake.

This is optional parameter and normally not needed but is useful if the caller wants to know something about the fields that the server is sending.

uint8_t ***tmp_buf**

User supplied buffer where HTTP connection data is stored.

size_t **tmp_buf_len**

Length of the user supplied temp buffer.

Network Packet Capture

- *Overview*
- *Cooked Mode Capture*
- *Sample usage*
- *API Reference*

Overview The `net_capture` API allows user to monitor the network traffic in one of the Zephyr network interfaces and send that traffic to external system for analysis. The monitoring can be setup either manually using `net-shell` or automatically by using the `net_capture` API.

Cooked Mode Capture If capturing is enabled and configured, the system will automatically capture network traffic for a given network interface. If you would like to capture network data when there is no network interface involved, then you need to use the cooked mode capture API.

In cooked mode capture, arbitrary network packets can be captured and there does not need to be network interface involved. For example low level HDLC packets in PPP can be captured, as the HDLC L2 layer data is stripped away when using the normal network interface based capture. Also CANBUS or Bluetooth network data could be captured although currently there is no support in the network stack to capture those.

The cooked mode capture works like this:

- An `any` network interface is created. It acts as a sink where the cooked mode captured packets are written by the cooked mode capture API.
- A `cooked` virtual network interface is attached on top of this `any` interface.
- The `cooked` interface must be configured to capture certain L2 packet types using the network interface configuration API.
- When cooked mode capture API is used, the caller must specify what is the layer 2 protocol type of the captured data. The cooked mode capture API is then able to determine what to capture when receiving such a L2 packet.
- The network packet capturing infrastructure is then setup so that the `cooked` interface is marked as captured network interface. The packets received by the `cooked` interface via the `any` interface are then automatically placed to the capture IP tunnel and sent to remote host for analysis.

For example, in the sample capture application, these network interfaces are created:

```
Interface any (0x808ab3c) (Dummy) [1]
================================
Virtual interfaces attached to this : 2
Device    : NET_ANY (0x80849a4)

Interface cooked (0x808ac94) (Virtual) [2]
================================
Virtual name : Cooked mode capture
Attached  : 1 (Dummy / 0x808ab3c)
Device    : NET_COOKED (0x808497c)

Interface eth0 (0x808adec) (Ethernet) [3]
================================
Virtual interfaces attached to this : 4
Device    : zeth0 (0x80849b8)
```

(continues on next page)

(continued from previous page)

```
IPv6 unicast addresses (max 4):
     fe80::5eff:fe00:53e6 autoconf preferred infinite
     2001:db8::1 manual preferred infinite
IPv4 unicast addresses (max 2):
     192.0.2.1/255.255.255.0 overridable preferred infinite

Interface net0 (0x808af44) (Virtual) [4]
================================
Virtual name : Capture tunnel
Attached  : 3 (Ethernet / 0x808adec)
Device    : IP_TUNNEL0 (0x8084990)
IPv6 unicast addresses (max 4):
     2001:db8:200::1 manual preferred infinite
     fe80::efed:6dff:fef2:b1df autoconf preferred infinite
     fe80::56da:1eff:fe5e:bc02 autoconf preferred infinite
```

In this example, the `192.0.2.2` is the address of the outer end point of the host that terminates the tunnel. Zephyr uses this address to select the internal interface to use for the tunnel. In this example it is interface 3.

The interface 2 is a virtual interface that runs on top of interface 1. The cooked capture packets are written by the capture API to sink interface 1. The packets propagate to interface 2 because it is linked to the first interface. The `net capture enable 2` net-shell command will cause the packets sent to interface 2 to be written to capture interface 4, which in turn then capsulates the packets and tunnels them to peer via the Ethernet interface 3.

The above IP addresses might change if you change the addresses in the sample samples/net/capture/overlay-tunnel.conf file.

Sample usage See net-capture sample application and *Monitor Network Traffic* for details.

Related code samples

Network packet capture
Capture network packets and send them to a remote host via IPIP tunnel.

API Reference

group `net_capture`

Network packet capture support functions.

Since
2.6

Version
0.8.0

Functions

int `net_capture_setup`(const char *remote_addr, const char *my_local_addr, const char *peer_addr, const struct *device* **dev)

Setup network packet capturing support.

Parameters

- `remote_addr` – The value tells the tunnel remote/outer endpoint IP address. The IP address can be either IPv4 or IPv6 address. This address is used to select the network interface where the tunnel is created.
- `my_local_addr` – The local/inner IP address of the tunnel. Can contain also port number which is used as UDP source port.
- `peer_addr` – The peer/inner IP address of the tunnel. Can contain also port number which is used as UDP destination port.
- `dev` – Network capture device. This is returned to the caller.

Returns

0 if ok, <0 if network packet capture setup failed

static inline int **net_capture_cleanup**(const struct *device* *dev)

Cleanup network packet capturing support.

This should be called after the capturing is done and resources can be released.

Parameters

- `dev` – Network capture device. User must allocate using the *net_capture_setup()* function.

Returns

0 if ok, <0 if network packet capture cleanup failed

static inline int **net_capture_enable**(const struct *device* *dev, struct *net_if* *iface)

Enable network packet capturing support.

This creates tunnel network interface where all the captured packets are pushed. The captured network packets are placed in UDP packets that are sent to tunnel peer.

Parameters

- `dev` – Network capture device
- `iface` – Network interface we are starting to capture packets.

Returns

0 if ok, <0 if network packet capture enable failed

static inline bool **net_capture_is_enabled**(const struct *device* *dev)

Is network packet capture enabled or disabled.

Parameters

- `dev` – Network capture device. If set to NULL, then the default capture device is used.

Returns

True if enabled, False if network capture is disabled.

static inline int **net_capture_disable**(const struct *device* *dev)

Disable network packet capturing support.

Parameters

- `dev` – Network capture device

Returns

0 if ok, <0 if network packet capture disable failed

Network Buffer Management

Network Buffer

- *Overview*
- *Creating buffers*
- *Common Operations*
- *Reference Counting*
- *API Reference*

Overview Network buffers are a core concept of how the networking stack (as well as the Bluetooth stack) pass data around. The API for them is defined in include/zephyr/net/buf.h:.

Creating buffers Network buffers are created by first defining a pool of them:

```
NET_BUF_POOL_DEFINE(pool_name, buf_count, buf_size, user_data_size, NULL);
```

The pool is a static variable, so if it's needed to be exported to another module a separate pointer is needed.

Once the pool has been defined, buffers can be allocated from it with:

```
buf = net_buf_alloc(&pool_name, timeout);
```

There is no explicit initialization function for the pool or its buffers, rather this is done implicitly as *net_buf_alloc()* gets called.

If there is a need to reserve space in the buffer for protocol headers to be prepended later, it's possible to reserve this headroom with:

```
net_buf_reserve(buf, headroom);
```

In addition to actual protocol data and generic parsing context, network buffers may also contain protocol-specific context, known as user data. Both the maximum data and user data capacity of the buffers is compile-time defined when declaring the buffer pool.

The buffers have native support for being passed through k_fifo kernel objects. This is a very practical feature when the buffers need to be passed from one thread to another. However, since a net_buf may have a fragment chain attached to it, instead of using the *k_fifo_put()* and *k_fifo_get()* APIs, special *net_buf_put()* and *net_buf_get()* APIs must be used when passing buffers through FIFOs. These APIs ensure that the buffer chains stay intact. The same applies for passing buffers through a singly linked list, in which case the *net_buf_slist_put()* and *net_buf_slist_get()* functions must be used instead of *sys_slist_append()* and *sys_slist_get()*.

Common Operations The network buffer API provides some useful helpers for encoding and decoding data in the buffers. To fully understand these helpers it's good to understand the basic names of operations used with them:

Add
: Add data to the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Requires that there is enough tailroom in the buffer. Some examples of APIs for adding data:

```
void *net_buf_add(struct net_buf *buf, size_t len);
void *net_buf_add_mem(struct net_buf *buf, const void *mem, size_t len);
uint8_t *net_buf_add_u8(struct net_buf *buf, uint8_t value);
void net_buf_add_le16(struct net_buf *buf, uint16_t value);
void net_buf_add_le32(struct net_buf *buf, uint32_t value);
```

Remove
Remove data from the end of the buffer. Modifies the data length value while leaving the actual data pointer intact. Some examples of APIs for removing data:

```
void *net_buf_remove_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_remove_u8(struct net_buf *buf);
uint16_t net_buf_remove_le16(struct net_buf *buf);
uint32_t net_buf_remove_le32(struct net_buf *buf);
```

Push
Prepend data to the beginning of the buffer. Modifies both the data length value as well as the data pointer. Requires that there is enough headroom in the buffer. Some examples of APIs for pushing data:

```
void *net_buf_push(struct net_buf *buf, size_t len);
void *net_buf_push_mem(struct net_buf *buf, const void *mem, size_t len);
void net_buf_push_u8(struct net_buf *buf, uint8_t value);
void net_buf_push_le16(struct net_buf *buf, uint16_t value);
```

Pull
Remove data from the beginning of the buffer. Modifies both the data length value as well as the data pointer. Some examples of APIs for pulling data:

```
void *net_buf_pull(struct net_buf *buf, size_t len);
void *net_buf_pull_mem(struct net_buf *buf, size_t len);
uint8_t net_buf_pull_u8(struct net_buf *buf);
uint16_t net_buf_pull_le16(struct net_buf *buf);
uint32_t net_buf_pull_le32(struct net_buf *buf);
```

The Add and Push operations are used when encoding data into the buffer, whereas the Remove and Pull operations are used when decoding data from a buffer.

Reference Counting Each network buffer is reference counted. The buffer is initially acquired from a free buffers pool by calling *net_buf_alloc()*, resulting in a buffer with reference count 1. The reference count can be incremented with *net_buf_ref()* or decremented with *net_buf_unref()*. When the count drops to zero the buffer is automatically placed back to the free buffers pool.

group net_buf
Network buffer library.

Since
1.0

Version
1.0.0

Defines

NET_BUF_SIMPLE_DEFINE(_name, _size)

Define a *net_buf_simple* stack variable.

This is a helper macro which is used to define a *net_buf_simple* object on the stack.

Parameters

- **_name** – Name of the *net_buf_simple* object.
- **_size** – Maximum data storage for the buffer.

NET_BUF_SIMPLE_DEFINE_STATIC(_name, _size)

Define a static *net_buf_simple* variable.

This is a helper macro which is used to define a static *net_buf_simple* object.

Parameters

- **_name** – Name of the *net_buf_simple* object.
- **_size** – Maximum data storage for the buffer.

NET_BUF_SIMPLE(_size)

Define a *net_buf_simple* stack variable and get a pointer to it.

This is a helper macro which is used to define a *net_buf_simple* object on the stack and the get a pointer to it as follows:

struct *net_buf_simple* *my_buf = *NET_BUF_SIMPLE(10)*;

After creating the object it needs to be initialized by calling *net_buf_simple_init()*.

Parameters

- **_size** – Maximum data storage for the buffer.

Returns

Pointer to stack-allocated *net_buf_simple* object.

NET_BUF_EXTERNAL_DATA

Flag indicating that the buffer's associated data pointer, points to externally allocated memory.

Therefore once ref goes down to zero, the pointed data will not need to be deallocated. This never needs to be explicitly set or unset by the *net_buf* API user. Such *net_buf* is exclusively instantiated via *net_buf_alloc_with_data()* function. Reference count mechanism however will behave the same way, and ref count going to 0 will free the *net_buf* but no the data pointer in it.

NET_BUF_POOL_HEAP_DEFINE(_name, _count, _ud_size, _destroy)

Define a new pool for buffers using the heap for the data.

Defines a *net_buf_pool* struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from the heap using k_malloc, so CONFIG_HEAP_MEM_POOL_SIZE must be set to a positive value. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling *net_buf_destroy()* to complete the process of returning the buffer to the pool.

Parameters

- **_name** – Name of the pool variable.
- **_count** – Number of buffers in the pool.
- **_ud_size** – User data space to reserve per buffer.
- **_destroy** – Optional destroy callback when buffer is freed.

NET_BUF_POOL_FIXED_DEFINE(_name, _count, _data_size, _ud_size, _destroy)

Define a new pool for buffers based on fixed-size data.

Defines a *net_buf_pool* struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be allocated from a byte array of fixed sized chunks. This kind of pool does not support blocking on the data allocation, so the timeout passed to net_buf_alloc will be always treated as K_NO_WAIT when trying to allocate the data. This means that allocation failures, i.e. NULL returns, must always be handled cleanly.

If provided with a custom destroy callback, this callback is responsible for eventually calling *net_buf_destroy()* to complete the process of returning the buffer to the pool.

Parameters

- **_name** – Name of the pool variable.
- **_count** – Number of buffers in the pool.
- **_data_size** – Maximum data payload per buffer.
- **_ud_size** – User data space to reserve per buffer.
- **_destroy** – Optional destroy callback when buffer is freed.

NET_BUF_POOL_VAR_DEFINE(_name, _count, _data_size, _ud_size, _destroy)

Define a new pool for buffers with variable size payloads.

Defines a *net_buf_pool* struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this, the buffers can be accessed from the pool through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

The data payload of the buffers will be based on a memory pool from which variable size payloads may be allocated.

If provided with a custom destroy callback, this callback is responsible for eventually calling *net_buf_destroy()* to complete the process of returning the buffer to the pool.

Parameters

- **_name** – Name of the pool variable.
- **_count** – Number of buffers in the pool.
- **_data_size** – Total amount of memory available for data payloads.
- **_ud_size** – User data space to reserve per buffer.
- **_destroy** – Optional destroy callback when buffer is freed.

NET_BUF_POOL_DEFINE(_name, _count, _size, _ud_size, _destroy)

Define a new pool for buffers.

Defines a *net_buf_pool* struct and the necessary memory storage (array of structs) for the needed amount of buffers. After this,the buffers can be accessed from the pool

through net_buf_alloc. The pool is defined as a static variable, so if it needs to be exported outside the current module this needs to happen with the help of a separate pointer rather than an extern declaration.

If provided with a custom destroy callback this callback is responsible for eventually calling *net_buf_destroy()* to complete the process of returning the buffer to the pool.

Parameters

- **_name** – Name of the pool variable.
- **_count** – Number of buffers in the pool.
- **_size** – Maximum data size for each buffer.
- **_ud_size** – Amount of user data space to reserve.
- **_destroy** – Optional destroy callback when buffer is freed.

Typedefs

typedef struct *net_buf* *(***net_buf_allocator_cb**)(*k_timeout_t* timeout, void *user_data)

Network buffer allocator callback.

The allocator callback is called when net_buf_append_bytes needs to allocate a new *net_buf*.

Param timeout
Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Param user_data
The user data given in net_buf_append_bytes call.

Return
pointer to allocated *net_buf* or NULL on error.

Functions

static inline void **net_buf_simple_init**(struct *net_buf_simple* *buf, size_t reserve_head)

Initialize a *net_buf_simple* object.

This needs to be called after creating a *net_buf_simple* object using the NET_BUF_SIMPLE macro.

Parameters

- **buf** – Buffer to initialize.
- **reserve_head** – Headroom to reserve.

void **net_buf_simple_init_with_data**(struct *net_buf_simple* *buf, void *data, size_t size)

Initialize a *net_buf_simple* object with data.

Initialized buffer object with external data.

Parameters

- **buf** – Buffer to initialize.
- **data** – External data pointer
- **size** – Amount of data the pointed data buffer if able to fit.

static inline void **net_buf_simple_reset**(struct *net_buf_simple* *buf)

Reset buffer.

Reset buffer data so it can be reused for other purposes.

Parameters

- **buf** – Buffer to reset.

void **net_buf_simple_clone**(const struct *net_buf_simple* *original, struct *net_buf_simple* *clone)

Clone buffer state, using the same data buffer.

Initializes a buffer to point to the same data as an existing buffer. Allows operations on the same data without altering the length and offset of the original.

Parameters

- **original** – Buffer to clone.
- **clone** – The new clone.

void *__net_buf_simple_add__(struct *net_buf_simple* *buf, size_t len)

Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

Parameters

- **buf** – Buffer to update.
- **len** – Number of bytes to increment the length with.

Returns

The original tail of the buffer.

void *__net_buf_simple_add_mem__(struct *net_buf_simple* *buf, const void *mem, size_t len)

Copy given number of bytes from memory to the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

Parameters

- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added

Returns

The original tail of the buffer.

uint8_t *__net_buf_simple_add_u8__(struct *net_buf_simple* *buf, uint8_t val)

Add (8-bit) byte at the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

Parameters

- **buf** – Buffer to update.
- **val** – byte value to be added.

Returns

Pointer to the value added

void **net_buf_simple_add_le16**(struct *net_buf_simple* *buf, uint16_t val)

Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

void `net_buf_simple_add_be16`(struct *net_buf_simple* *buf, uint16_t val)

Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

void `net_buf_simple_add_le24`(struct *net_buf_simple* *buf, uint32_t val)

Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

void `net_buf_simple_add_be24`(struct *net_buf_simple* *buf, uint32_t val)

Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

void `net_buf_simple_add_le32`(struct *net_buf_simple* *buf, uint32_t val)

Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be added.

void `net_buf_simple_add_be32`(struct *net_buf_simple* *buf, uint32_t val)

Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be added.

void `net_buf_simple_add_le40`(struct *net_buf_simple* *buf, uint64_t val)

Add 40-bit value at the end of the buffer.

Adds 40-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be added.

void **net_buf_simple_add_be40**(struct *net_buf_simple* *buf, uint64_t val)

Add 40-bit value at the end of the buffer.

Adds 40-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be added.

void **net_buf_simple_add_le48**(struct *net_buf_simple* *buf, uint64_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be added.

void **net_buf_simple_add_be48**(struct *net_buf_simple* *buf, uint64_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be added.

void **net_buf_simple_add_le64**(struct *net_buf_simple* *buf, uint64_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be added.

void **net_buf_simple_add_be64**(struct *net_buf_simple* *buf, uint64_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be added.

void ***net_buf_simple_remove_mem**(struct *net_buf_simple* *buf, size_t len)

Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

Parameters

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

Returns
New end of the buffer data.

uint8_t `net_buf_simple_remove_u8`(struct *net_buf_simple* *buf)

Remove a 8-bit value from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 8-bit values.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
The 8-bit removed value

uint16_t `net_buf_simple_remove_le16`(struct *net_buf_simple* *buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 16-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

uint16_t `net_buf_simple_remove_be16`(struct *net_buf_simple* *buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 16-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

uint32_t `net_buf_simple_remove_le24`(struct *net_buf_simple* *buf)

Remove and convert 24 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 24-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

uint32_t `net_buf_simple_remove_be24`(struct *net_buf_simple* *buf)

Remove and convert 24 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 24-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

uint32_t **net_buf_simple_remove_le32**(struct *net_buf_simple* *buf)

Remove and convert 32 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 32-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

uint32_t **net_buf_simple_remove_be32**(struct *net_buf_simple* *buf)

Remove and convert 32 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 32-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t **net_buf_simple_remove_le40**(struct *net_buf_simple* *buf)

Remove and convert 40 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 40-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
40-bit value converted from little endian to host endian.

uint64_t **net_buf_simple_remove_be40**(struct *net_buf_simple* *buf)

Remove and convert 40 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 40-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
40-bit value converted from big endian to host endian.

uint64_t **net_buf_simple_remove_le48**(struct *net_buf_simple* *buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 48-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t **net_buf_simple_remove_be48**(struct *net_buf_simple* *buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 48-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

uint64_t **net_buf_simple_remove_le64**(struct *net_buf_simple* *buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 64-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t **net_buf_simple_remove_be64**(struct *net_buf_simple* *buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with *net_buf_simple_remove_mem()*, but a helper for operating on 64-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

void *__net_buf_simple_push__(struct *net_buf_simple* *buf, size_t len)

Prepare data to be added to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **len** – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.

void *__net_buf_simple_push_mem__(struct *net_buf_simple* *buf, const void *mem, size_t len)

Copy given number of bytes from memory to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added.

Returns
The new beginning of the buffer data.

void **net_buf_simple_push_le16**(struct *net_buf_simple* *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 16-bit value to be pushed to the buffer.

void **net_buf_simple_push_be16**(struct *net_buf_simple* *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 16-bit value to be pushed to the buffer.

void **net_buf_simple_push_u8**(struct *net_buf_simple* *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.

Adds 8-bit value the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 8-bit value to be pushed to the buffer.

void **net_buf_simple_push_le24**(struct *net_buf_simple* *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 24-bit value to be pushed to the buffer.

void **net_buf_simple_push_be24**(struct *net_buf_simple* *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 24-bit value to be pushed to the buffer.

void **net_buf_simple_push_le32**(struct *net_buf_simple* *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **val** – 32-bit value to be pushed to the buffer.

void **net_buf_simple_push_be32**(struct *net_buf_simple* *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

void **net_buf_simple_push_le40**(struct *net_buf_simple* *buf, uint64_t val)

Push 40-bit value to the beginning of the buffer.

Adds 40-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be pushed to the buffer.

void **net_buf_simple_push_be40**(struct *net_buf_simple* *buf, uint64_t val)

Push 40-bit value to the beginning of the buffer.

Adds 40-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be pushed to the buffer.

void **net_buf_simple_push_le48**(struct *net_buf_simple* *buf, uint64_t val)

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

void **net_buf_simple_push_be48**(struct *net_buf_simple* *buf, uint64_t val)

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

void **net_buf_simple_push_le64**(struct *net_buf_simple* *buf, uint64_t val)

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

void **net_buf_simple_push_be64**(struct *net_buf_simple* *buf, uint64_t val)

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

void *net_buf_simple_pull(struct *net_buf_simple* *buf, size_t len)

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters

- buf – Buffer to update.
- len – Number of bytes to remove.

Returns

New beginning of the buffer data.

void *net_buf_simple_pull_mem(struct *net_buf_simple* *buf, size_t len)

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters

- buf – Buffer to update.
- len – Number of bytes to remove.

Returns

Pointer to the old location of the buffer data.

uint8_t net_buf_simple_pull_u8(struct *net_buf_simple* *buf)

Remove a 8-bit value from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 8-bit values.

Parameters

- buf – A valid pointer on a buffer.

Returns

The 8-bit removed value

uint16_t net_buf_simple_pull_le16(struct *net_buf_simple* *buf)

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 16-bit little endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

16-bit value converted from little endian to host endian.

uint16_t net_buf_simple_pull_be16(struct *net_buf_simple* *buf)

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 16-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns

16-bit value converted from big endian to host endian.

uint32_t **net_buf_simple_pull_le24**(struct *net_buf_simple* *buf)

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 24-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

uint32_t **net_buf_simple_pull_be24**(struct *net_buf_simple* *buf)

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 24-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

uint32_t **net_buf_simple_pull_le32**(struct *net_buf_simple* *buf)

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 32-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

uint32_t **net_buf_simple_pull_be32**(struct *net_buf_simple* *buf)

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 32-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
32-bit value converted from big endian to host endian.

uint64_t **net_buf_simple_pull_le40**(struct *net_buf_simple* *buf)

Remove and convert 40 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 40-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
40-bit value converted from little endian to host endian.

uint64_t **net_buf_simple_pull_be40**(struct *net_buf_simple* *buf)

Remove and convert 40 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 40-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
40-bit value converted from big endian to host endian.

uint64_t `net_buf_simple_pull_le48`(struct *net_buf_simple* *buf)

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 48-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

uint64_t `net_buf_simple_pull_be48`(struct *net_buf_simple* *buf)

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 48-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
48-bit value converted from big endian to host endian.

uint64_t `net_buf_simple_pull_le64`(struct *net_buf_simple* *buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 64-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

uint64_t `net_buf_simple_pull_be64`(struct *net_buf_simple* *buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net_buf_simple_pull()*, but a helper for operating on 64-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
64-bit value converted from big endian to host endian.

static inline uint8_t *`net_buf_simple_tail`(const struct *net_buf_simple* *buf)

Get the tail pointer for a buffer.

Get a pointer to the end of the data in a buffer.

Parameters

- `buf` – Buffer.

Returns
Tail pointer for the buffer.

size_t **net_buf_simple_headroom**(const struct *net_buf_simple* *buf)

Check buffer headroom.

Check how much free space there is in the beginning of the buffer.

buf A valid pointer on a buffer

Returns
Number of bytes available in the beginning of the buffer.

size_t **net_buf_simple_tailroom**(const struct *net_buf_simple* *buf)

Check buffer tailroom.

Check how much free space there is at the end of the buffer.

Parameters

- **buf** – A valid pointer on a buffer

Returns
Number of bytes available at the end of the buffer.

uint16_t **net_buf_simple_max_len**(const struct *net_buf_simple* *buf)

Check maximum *net_buf_simple::len* value.

This value is depending on the number of bytes being reserved as headroom.

Parameters

- **buf** – A valid pointer on a buffer

Returns
Number of bytes usable behind the *net_buf_simple::data* pointer.

static inline void **net_buf_simple_save**(const struct *net_buf_simple* *buf, struct *net_buf_simple_state* *state)

Save the parsing state of a buffer.

Saves the parsing state of a buffer so it can be restored later.

Parameters

- **buf** – Buffer from which the state should be saved.
- **state** – Storage for the state.

static inline void **net_buf_simple_restore**(struct *net_buf_simple* *buf, struct *net_buf_simple_state* *state)

Restore the parsing state of a buffer.

Restores the parsing state of a buffer from a state previously stored by *net_buf_simple_save()*.

Parameters

- **buf** – Buffer to which the state should be restored.
- **state** – Stored state.

struct *net_buf_pool* ***net_buf_pool_get**(int id)

Looks up a pool based on its ID.

Parameters

- **id** – Pool ID (e.g. from buf->pool_id).

Returns
Pointer to pool.

int **net_buf_id**(const struct *net_buf* *buf)

Get a zero-based index for a buffer.

This function will translate a buffer into a zero-based index, based on its placement in its buffer pool. This can be useful if you want to associate an external array of metadata contexts with the buffers of a pool.

Parameters

- **buf** – Network buffer.

Returns

Zero-based index for the buffer.

struct *net_buf* ***net_buf_alloc_fixed**(struct *net_buf_pool* *pool, *k_timeout_t* timeout)

Allocate a new fixed buffer from a pool.

Note

Some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for *net_buf_alloc()* to fail (return NULL) even if it was given K_FOREVER.

Note

The timeout value will be overridden to K_NO_WAIT if called from the system workqueue.

Parameters

- **pool** – Which pool to allocate the buffer from.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns

New buffer or NULL if out of buffers.

static inline struct *net_buf* ***net_buf_alloc**(struct *net_buf_pool* *pool, *k_timeout_t* timeout)

Note

Some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for *net_buf_alloc()* to fail (return NULL) even if it was given K_FOREVER.

Note

The timeout value will be overridden to K_NO_WAIT if called from the system workqueue.

Parameters

- **pool** – Which pool to allocate the buffer from.

- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
New buffer or NULL if out of buffers.

struct *net_buf* ***net_buf_alloc_len**(struct *net_buf_pool* *pool, size_t size, *k_timeout_t* timeout)

Allocate a new variable length buffer from a pool.

Note

Some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for *net_buf_alloc()* to fail (return NULL) even if it was given K_FOREVER.

Note

The timeout value will be overridden to K_NO_WAIT if called from the system workqueue.

Parameters

- **pool** – Which pool to allocate the buffer from.
- **size** – Amount of data the buffer must be able to fit.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
New buffer or NULL if out of buffers.

struct *net_buf* ***net_buf_alloc_with_data**(struct *net_buf_pool* *pool, void *data, size_t size, *k_timeout_t* timeout)

Allocate a new buffer from a pool but with external data pointer.

Allocate a new buffer from a pool, where the data pointer comes from the user and not from the pool.

Note

Some types of data allocators do not support blocking (such as the HEAP type). In this case it's still possible for *net_buf_alloc()* to fail (return NULL) even if it was given K_FOREVER.

Note

The timeout value will be overridden to K_NO_WAIT if called from the system workqueue.

Parameters

- **pool** – Which pool to allocate the buffer from.

- **data** – External data pointer
- **size** – Amount of data the pointed data buffer if able to fit.
- **timeout** – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
New buffer or NULL if out of buffers.

struct *net_buf* ***net_buf_get**(struct k_fifo *fifo, *k_timeout_t* timeout)

Get a buffer from a FIFO.

This function is NOT thread-safe if the buffers in the FIFO contain fragments.

Parameters

- **fifo** – Which FIFO to take the buffer from.
- **timeout** – Affects the action taken should the FIFO be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns
New buffer or NULL if the FIFO is empty.

static inline void **net_buf_destroy**(struct *net_buf* *buf)

Destroy buffer from custom destroy callback.

This helper is only intended to be used from custom destroy callbacks. If no custom destroy callback is given to NET_BUF_POOL_*_DEFINE() then there is no need to use this API.

Parameters

- **buf** – Buffer to destroy.

void **net_buf_reset**(struct *net_buf* *buf)

Reset buffer.

Reset buffer data and flags so it can be reused for other purposes.

Parameters

- **buf** – Buffer to reset.

void **net_buf_simple_reserve**(struct *net_buf_simple* *buf, size_t reserve)

Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

Parameters

- **buf** – Buffer to initialize.
- **reserve** – How much headroom to reserve.

void **net_buf_slist_put**(*sys_slist_t* *list, struct *net_buf* *buf)

Put a buffer into a list.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the list.

Parameters

- **list** – Which list to append the buffer to.
- **buf** – Buffer.

struct *net_buf* *net_buf_slist_get(*sys_slist_t* *list)

Get a buffer from a list.

If the buffer had any fragments, these will automatically be recovered from the list as well and be placed to the buffer's fragment list.

Parameters

- `list` – Which list to take the buffer from.

Returns

New buffer or NULL if the FIFO is empty.

void net_buf_put(struct k_fifo *fifo, struct *net_buf* *buf)

Put a buffer to the end of a FIFO.

If the buffer contains follow-up fragments this function will take care of inserting them as well into the FIFO.

Parameters

- `fifo` – Which FIFO to put the buffer to.
- `buf` – Buffer.

void net_buf_unref(struct *net_buf* *buf)

Decrements the reference count of a buffer.

The buffer is put back into the pool if the reference count reaches zero.

Parameters

- `buf` – A valid pointer on a buffer

struct *net_buf* *net_buf_ref(struct *net_buf* *buf)

Increment the reference count of a buffer.

Parameters

- `buf` – A valid pointer on a buffer

Returns

the buffer newly referenced

struct *net_buf* *net_buf_clone(struct *net_buf* *buf, *k_timeout_t* timeout)

Clone buffer.

Duplicate given buffer including any (user) data and headers currently stored.

Parameters

- `buf` – A valid pointer on a buffer
- `timeout` – Affects the action taken should the pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait until the specified timeout.

Returns

Cloned buffer or NULL if out of buffers.

static inline void *net_buf_user_data(const struct *net_buf* *buf)

Get a pointer to the user data of a buffer.

Parameters

- `buf` – A valid pointer on a buffer

Returns

Pointer to the user data of the buffer.

int **net_buf_user_data_copy**(struct *net_buf* *dst, const struct *net_buf* *src)

Copy user data from one to another buffer.

Parameters

- **dst** – A valid pointer to a buffer gettings its user data overwritten.
- **src** – A valid pointer to a buffer gettings its user data copied. User data size must be equal to or exceed *dst*.

Returns

0 on success or negative error number on failure.

static inline void **net_buf_reserve**(struct *net_buf* *buf, size_t reserve)

Initialize buffer with the given headroom.

The buffer is not expected to contain any data when this API is called.

Parameters

- **buf** – Buffer to initialize.
- **reserve** – How much headroom to reserve.

static inline void ***net_buf_add**(struct *net_buf* *buf, size_t len)

Prepare data to be added at the end of the buffer.

Increments the data length of a buffer to account for more data at the end.

Parameters

- **buf** – Buffer to update.
- **len** – Number of bytes to increment the length with.

Returns

The original tail of the buffer.

static inline void ***net_buf_add_mem**(struct *net_buf* *buf, const void *mem, size_t len)

Copies the given number of bytes to the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

Parameters

- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added

Returns

The original tail of the buffer.

static inline uint8_t ***net_buf_add_u8**(struct *net_buf* *buf, uint8_t val)

Add (8-bit) byte at the end of the buffer.

Increments the data length of the buffer to account for more data at the end.

Parameters

- **buf** – Buffer to update.
- **val** – byte value to be added.

Returns

Pointer to the value added

static inline void **net_buf_add_le16**(struct *net_buf* *buf, uint16_t val)

Add 16-bit value at the end of the buffer.

Adds 16-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

static inline void **net_buf_add_be16**(struct *net_buf* *buf, uint16_t val)

Add 16-bit value at the end of the buffer.

Adds 16-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 16-bit value to be added.

static inline void **net_buf_add_le24**(struct *net_buf* *buf, uint32_t val)

Add 24-bit value at the end of the buffer.

Adds 24-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

static inline void **net_buf_add_be24**(struct *net_buf* *buf, uint32_t val)

Add 24-bit value at the end of the buffer.

Adds 24-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 24-bit value to be added.

static inline void **net_buf_add_le32**(struct *net_buf* *buf, uint32_t val)

Add 32-bit value at the end of the buffer.

Adds 32-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be added.

static inline void **net_buf_add_be32**(struct *net_buf* *buf, uint32_t val)

Add 32-bit value at the end of the buffer.

Adds 32-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be added.

static inline void **net_buf_add_le40**(struct *net_buf* *buf, uint64_t val)

Add 40-bit value at the end of the buffer.

Adds 40-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be added.

static inline void **net_buf_add_be40**(struct *net_buf* *buf, uint64_t val)

Add 40-bit value at the end of the buffer.

Adds 40-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be added.

static inline void **net_buf_add_le48**(struct *net_buf* *buf, uint64_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be added.

static inline void **net_buf_add_be48**(struct *net_buf* *buf, uint64_t val)

Add 48-bit value at the end of the buffer.

Adds 48-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be added.

static inline void **net_buf_add_le64**(struct *net_buf* *buf, uint64_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in little endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be added.

static inline void **net_buf_add_be64**(struct *net_buf* *buf, uint64_t val)

Add 64-bit value at the end of the buffer.

Adds 64-bit value in big endian format at the end of buffer. Increments the data length of a buffer to account for more data at the end.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be added.

static inline void *net_buf_remove_mem(struct *net_buf* *buf, size_t len)

Remove data from the end of the buffer.

Removes data from the end of the buffer by modifying the buffer length.

Parameters

- buf – Buffer to update.
- len – Number of bytes to remove.

Returns
New end of the buffer data.

static inline uint8_t net_buf_remove_u8(struct *net_buf* *buf)

Remove a 8-bit value from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 8-bit values.

Parameters

- buf – A valid pointer on a buffer.

Returns
The 8-bit removed value

static inline uint16_t net_buf_remove_le16(struct *net_buf* *buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 16-bit little endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns
16-bit value converted from little endian to host endian.

static inline uint16_t net_buf_remove_be16(struct *net_buf* *buf)

Remove and convert 16 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 16-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns
16-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_be24(struct *net_buf* *buf)

Remove and convert 24 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 24-bit big endian data.

Parameters

- buf – A valid pointer on a buffer.

Returns
24-bit value converted from big endian to host endian.

static inline uint32_t net_buf_remove_le24(struct *net_buf* *buf)

Remove and convert 24 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 24-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
24-bit value converted from little endian to host endian.

static inline uint32_t **net_buf_remove_le32**(struct *net_buf* *buf)

Remove and convert 32 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 32-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
32-bit value converted from little endian to host endian.

static inline uint32_t **net_buf_remove_be32**(struct *net_buf* *buf)

Remove and convert 32 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 32-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer

Returns
32-bit value converted from big endian to host endian.

static inline uint64_t **net_buf_remove_le40**(struct *net_buf* *buf)

Remove and convert 40 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 40-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
40-bit value converted from little endian to host endian.

static inline uint64_t **net_buf_remove_be40**(struct *net_buf* *buf)

Remove and convert 40 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 40-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer

Returns
40-bit value converted from big endian to host endian.

static inline uint64_t **net_buf_remove_le48**(struct *net_buf* *buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 48-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns
48-bit value converted from little endian to host endian.

static inline uint64_t **net_buf_remove_be48**(struct *net_buf* *buf)

Remove and convert 48 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 48-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer

Returns
48-bit value converted from big endian to host endian.

static inline uint64_t **net_buf_remove_le64**(struct *net_buf* *buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 64-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns
64-bit value converted from little endian to host endian.

static inline uint64_t **net_buf_remove_be64**(struct *net_buf* *buf)

Remove and convert 64 bits from the end of the buffer.

Same idea as with *net_buf_remove_mem()*, but a helper for operating on 64-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer

Returns
64-bit value converted from big endian to host endian.

static inline void *__net_buf_push__(struct *net_buf* *buf, size_t len)

Prepare data to be added at the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **len** – Number of bytes to add to the beginning.

Returns
The new beginning of the buffer data.

static inline void *__net_buf_push_mem__(struct *net_buf* *buf, const void *mem, size_t len)

Copies the given number of bytes to the start of the buffer.

Modifies the data pointer and buffer length to account for more data in the beginning of the buffer.

Parameters

- **buf** – Buffer to update.
- **mem** – Location of data to be added.
- **len** – Length of data to be added.

Returns
The new beginning of the buffer data.

static inline void **net_buf_push_u8**(struct *net_buf* *buf, uint8_t val)
Push 8-bit value to the beginning of the buffer.

Adds 8-bit value the beginning of the buffer.

Parameters
- `buf` – Buffer to update.
- `val` – 8-bit value to be pushed to the buffer.

static inline void **net_buf_push_le16**(struct *net_buf* *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in little endian format to the beginning of the buffer.

Parameters
- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

static inline void **net_buf_push_be16**(struct *net_buf* *buf, uint16_t val)
Push 16-bit value to the beginning of the buffer.

Adds 16-bit value in big endian format to the beginning of the buffer.

Parameters
- `buf` – Buffer to update.
- `val` – 16-bit value to be pushed to the buffer.

static inline void **net_buf_push_le24**(struct *net_buf* *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in little endian format to the beginning of the buffer.

Parameters
- `buf` – Buffer to update.
- `val` – 24-bit value to be pushed to the buffer.

static inline void **net_buf_push_be24**(struct *net_buf* *buf, uint32_t val)
Push 24-bit value to the beginning of the buffer.

Adds 24-bit value in big endian format to the beginning of the buffer.

Parameters
- `buf` – Buffer to update.
- `val` – 24-bit value to be pushed to the buffer.

static inline void **net_buf_push_le32**(struct *net_buf* *buf, uint32_t val)
Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in little endian format to the beginning of the buffer.

Parameters
- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

static inline void **net_buf_push_be32**(struct *net_buf* *buf, uint32_t val)

Push 32-bit value to the beginning of the buffer.

Adds 32-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 32-bit value to be pushed to the buffer.

static inline void **net_buf_push_le40**(struct *net_buf* *buf, uint64_t val)

Push 40-bit value to the beginning of the buffer.

Adds 40-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be pushed to the buffer.

static inline void **net_buf_push_be40**(struct *net_buf* *buf, uint64_t val)

Push 40-bit value to the beginning of the buffer.

Adds 40-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 40-bit value to be pushed to the buffer.

static inline void **net_buf_push_le48**(struct *net_buf* *buf, uint64_t val)

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

static inline void **net_buf_push_be48**(struct *net_buf* *buf, uint64_t val)

Push 48-bit value to the beginning of the buffer.

Adds 48-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 48-bit value to be pushed to the buffer.

static inline void **net_buf_push_le64**(struct *net_buf* *buf, uint64_t val)

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in little endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

static inline void **net_buf_push_be64**(struct *net_buf* *buf, uint64_t val)

Push 64-bit value to the beginning of the buffer.

Adds 64-bit value in big endian format to the beginning of the buffer.

Parameters

- `buf` – Buffer to update.
- `val` – 64-bit value to be pushed to the buffer.

static inline void *`net_buf_pull`(struct *net_buf* *buf, size_t len)

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

Returns

New beginning of the buffer data.

static inline void *`net_buf_pull_mem`(struct *net_buf* *buf, size_t len)

Remove data from the beginning of the buffer.

Removes data from the beginning of the buffer by modifying the data pointer and buffer length.

Parameters

- `buf` – Buffer to update.
- `len` – Number of bytes to remove.

Returns

Pointer to the old beginning of the buffer data.

static inline uint8_t `net_buf_pull_u8`(struct *net_buf* *buf)

Remove a 8-bit value from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 8-bit values.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

The 8-bit removed value

static inline uint16_t `net_buf_pull_le16`(struct *net_buf* *buf)

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 16-bit little endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

16-bit value converted from little endian to host endian.

static inline uint16_t `net_buf_pull_be16`(struct *net_buf* *buf)

Remove and convert 16 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 16-bit big endian data.

Parameters

- `buf` – A valid pointer on a buffer.

Returns

16-bit value converted from big endian to host endian.

static inline uint32_t **net_buf_pull_le24**(struct *net_buf* *buf)

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 24-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

24-bit value converted from little endian to host endian.

static inline uint32_t **net_buf_pull_be24**(struct *net_buf* *buf)

Remove and convert 24 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 24-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

24-bit value converted from big endian to host endian.

static inline uint32_t **net_buf_pull_le32**(struct *net_buf* *buf)

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 32-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

32-bit value converted from little endian to host endian.

static inline uint32_t **net_buf_pull_be32**(struct *net_buf* *buf)

Remove and convert 32 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 32-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer

Returns

32-bit value converted from big endian to host endian.

static inline uint64_t **net_buf_pull_le40**(struct *net_buf* *buf)

Remove and convert 40 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 40-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

40-bit value converted from little endian to host endian.

static inline uint64_t **net_buf_pull_be40**(struct *net_buf* *buf)

Remove and convert 40 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 40-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer

Returns

40-bit value converted from big endian to host endian.

static inline uint64_t **net_buf_pull_le48**(struct *net_buf* *buf)

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 48-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

48-bit value converted from little endian to host endian.

static inline uint64_t **net_buf_pull_be48**(struct *net_buf* *buf)

Remove and convert 48 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 48-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer

Returns

48-bit value converted from big endian to host endian.

static inline uint64_t **net_buf_pull_le64**(struct *net_buf* *buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 64-bit little endian data.

Parameters

- **buf** – A valid pointer on a buffer.

Returns

64-bit value converted from little endian to host endian.

static inline uint64_t **net_buf_pull_be64**(struct *net_buf* *buf)

Remove and convert 64 bits from the beginning of the buffer.

Same idea as with *net_buf_pull()*, but a helper for operating on 64-bit big endian data.

Parameters

- **buf** – A valid pointer on a buffer

Returns

64-bit value converted from big endian to host endian.

static inline size_t **net_buf_tailroom**(const struct *net_buf* *buf)

Check buffer tailroom.

Check how much free space there is at the end of the buffer.

Parameters

- **buf** – A valid pointer on a buffer

Returns

Number of bytes available at the end of the buffer.

static inline size_t **net_buf_headroom**(const struct *net_buf* *buf)

Check buffer headroom.

Check how much free space there is in the beginning of the buffer.

buf A valid pointer on a buffer

Returns

Number of bytes available in the beginning of the buffer.

static inline uint16_t **net_buf_max_len**(const struct *net_buf* *buf)

Check maximum *net_buf::len* value.

This value is depending on the number of bytes being reserved as headroom.

Parameters

- **buf** – A valid pointer on a buffer

Returns
Number of bytes usable behind the *net_buf::data* pointer.

static inline uint8_t ***net_buf_tail**(const struct *net_buf* *buf)

Get the tail pointer for a buffer.

Get a pointer to the end of the data in a buffer.

Parameters

- **buf** – Buffer.

Returns
Tail pointer for the buffer.

struct *net_buf* ***net_buf_frag_last**(struct *net_buf* *frags)

Find the last fragment in the fragment list.

Returns
Pointer to last fragment in the list.

void **net_buf_frag_insert**(struct *net_buf* *parent, struct *net_buf* *frag)

Insert a new fragment to a chain of bufs.

Insert a new fragment into the buffer fragments list after the parent.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters

- **parent** – Parent buffer/fragment.
- **frag** – Fragment to insert.

struct *net_buf* ***net_buf_frag_add**(struct *net_buf* *head, struct *net_buf* *frag)

Add a new fragment to the end of a chain of bufs.

Append a new fragment into the buffer fragments list.

Note: This function takes ownership of the fragment reference so the caller is not required to unref.

Parameters

- **head** – Head of the fragment chain.
- **frag** – Fragment to add.

Returns
New head of the fragment chain. Either head (if head was non-NULL) or frag (if head was NULL).

struct *net_buf* ***net_buf_frag_del**(struct *net_buf* *parent, struct *net_buf* *frag)

Delete existing fragment from a chain of bufs.

Parameters

- **parent** – Parent buffer/fragment, or NULL if there is no parent.
- **frag** – Fragment to delete.

Returns
Pointer to the buffer following the fragment, or NULL if it had no further fragments.

size_t **net_buf_linearize**(void *dst, size_t dst_len, const struct *net_buf* *src, size_t offset, size_t len)

Copy bytes from *net_buf* chain starting at offset to linear buffer.

Copy (extract) *len* bytes from *src* *net_buf* chain, starting from *offset* in it, to a linear buffer *dst*. Return number of bytes actually copied, which may be less than requested, if *net_buf* chain doesn't have enough data, or destination buffer is too small.

Parameters

- **dst** – Destination buffer
- **dst_len** – Destination buffer length
- **src** – Source *net_buf* chain
- **offset** – Starting offset to copy from
- **len** – Number of bytes to copy

Returns
number of bytes actually copied

size_t **net_buf_append_bytes**(struct *net_buf* *buf, size_t len, const void *value, *k_timeout_t* timeout, *net_buf_allocator_cb* allocate_cb, void *user_data)

Append data to a list of *net_buf*.

Append data to a *net_buf*. If there is not enough space in the *net_buf* then more *net_buf* will be added, unless there are no free *net_buf* and timeout occurs. If not allocator is provided it attempts to allocate from the same pool as the original buffer.

Parameters

- **buf** – Network buffer.
- **len** – Total length of input data
- **value** – Data to be added
- **timeout** – Timeout is passed to the *net_buf* allocator callback.
- **allocate_cb** – When a new *net_buf* is required, use this callback.
- **user_data** – A user data pointer to be supplied to the allocate_cb. This pointer is can be anything from a mem_pool or a *net_pkt*, the logic is left up to the allocate_cb function.

Returns
Length of data actually added. This may be less than input length if other timeout than K_FOREVER was used, and there were no free fragments in a pool to accommodate all data.

size_t **net_buf_data_match**(const struct *net_buf* *buf, size_t offset, const void *data, size_t len)

Match data with a *net_buf*'s content.

Compare data with a content of a *net_buf*. Provide information about the number of bytes matching between both. If needed, traverse through multiple buffer fragments.

Parameters

- **buf** – Network buffer
- **offset** – Starting offset to compare from
- **data** – Data buffer for comparison

- **len** – Number of bytes to compare

Returns
The number of bytes compared before the first difference.

static inline struct *net_buf* ***net_buf_skip**(struct *net_buf* *buf, size_t len)

Skip N number of bytes in a *net_buf*.

Skip N number of bytes starting from fragment's offset. If the total length of data is placed in multiple fragments, this function will skip from all fragments until it reaches N number of bytes. Any fully skipped buffers are removed from the *net_buf* list.

Parameters

- **buf** – Network buffer.
- **len** – Total length of data to be skipped.

Returns
Pointer to the fragment or NULL and pos is 0 after successful skip, NULL and pos is 0xffff otherwise.

static inline size_t **net_buf_frags_len**(const struct *net_buf* *buf)

Calculate amount of bytes stored in fragments.

Calculates the total amount of data stored in the given buffer and the fragments linked to it.

Parameters

- **buf** – Buffer to start off with.

Returns
Number of bytes in the buffer and its fragments.

struct **net_buf_simple**

#include <buf.h> Simple network buffer representation.

This is a simpler variant of the *net_buf* object (in fact *net_buf* uses *net_buf_simple* internally). It doesn't provide any kind of reference counting, user data, dynamic allocation, or in general the ability to pass through kernel objects such as FIFOs.

The main use of this is for scenarios where the meta-data of the normal *net_buf* isn't needed and causes too much overhead. This could be e.g. when the buffer only needs to be allocated on the stack or when the access to and lifetime of the buffer is well controlled and constrained.

Public Members

uint8_t ***data**

Pointer to the start of data in the buffer.

uint16_t **len**

Length of the data behind the data pointer.

To determine the max length, use *net_buf_simple_max_len()*, not *size*!

uint16_t **size**

Amount of data that net_buf_simple::__buf can store.

struct **net_buf_simple_state**

#include <*buf.h*> Parsing state of a buffer.

This is used for temporarily storing the parsing state of a buffer while giving control of the parsing to a routine which we don't control.

Public Members

uint16_t **offset**

Offset of the data pointer from the beginning of the storage.

uint16_t **len**

Length of data.

struct **net_buf**

#include <*buf.h*> Network buffer representation.

This struct is used to represent network buffers. Such buffers are normally defined through the NET_BUF_POOL_*_DEFINE() APIs and allocated using the *net_buf_alloc()* API.

Public Members

sys_snode_t **node**

Allow placing the buffer into sys_slist_t.

struct *net_buf* ***frags**

Fragments associated with this buffer.

uint8_t **ref**

Reference count.

uint8_t **flags**

Bit-field of buffer flags.

uint8_t **pool_id**

Where the buffer should go when freed up.

uint8_t **user_data_size**

Size of user data on this buffer.

uint8_t ***data**

Pointer to the start of data in the buffer.

uint16_t **len**

Length of the data behind the data pointer.

uint16_t **size**

Amount of data that this buffer can store.

union net_buf

Union for convenience access to the *net_buf_simple* members, also preserving the old API.

uint8_t user_data[]

System metadata for this buffer.

struct net_buf_pool

#include <buf.h> Network buffer pool representation.

This struct is used to represent a pool of network buffers.

Public Members

struct k_lifo free

LIFO to place the buffer into when free.

struct *k_spinlock* lock

To prevent concurrent access/modifications.

const uint16_t buf_count

Number of buffers in pool.

uint16_t uninit_count

Number of uninitialized buffers.

uint8_t user_data_size

Size of user data allocated to this pool.

void (*const destroy)(struct *net_buf* *buf)

Optional destroy callback when buffer is freed.

const struct net_buf_data_alloc *alloc

Data allocation handlers.

Overview Network packets are the main data the networking stack manipulates. Such data is represented through the net_pkt structure which provides a means to hold the packet, write and read it, as well as necessary metadata for the core to hold important information. Such an object is called net_pkt in this document.

The data structure and the whole API around it are defined in include/zephyr/net/net_pkt.h.

Architectural notes There are two network packets flows within the stack, **TX** for the transmission path, and **RX** for the reception one. In both paths, each net_pkt is written and read from the beginning to the end, or more specifically from the headers to the payload.

Memory management

Allocation All net_pkt objects come from a pre-defined pool of struct net_pkt. Such pool is defined via

```
NET_PKT_SLAB_DEFINE(name, count)
```

Note, however, one will rarely have to use it, as the core provides already two pools, one for the TX path and one for the RX path.

Allocating a raw net_pkt can be done through:

```
pkt = net_pkt_alloc(timeout);
```

However, by its nature, a raw net_pkt is useless without a buffer and needs various metadata information to become relevant as well. It requires at least to get the network interface it is meant to be sent through or through which it was received. As this is a very common operation, a helper exist:

```
pkt = net_pkt_alloc_on_iface(iface, timeout);
```

A more complete allocator exists, where both the net_pkt and its buffer can be allocated at once:

```
pkt = net_pkt_alloc_with_buffer(iface, size, family, proto, timeout);
```

See below how the buffer is allocated.

Buffer allocation The net_pkt object does not define its own buffer, but instead uses an existing object for this: *net_buf*. (See *Network Buffer* for more information). However, it mostly hides the usage of such a buffer because net_pkt brings network awareness to buffer allocation and, as we will see later, its operation too.

To allocate a buffer, a net_pkt needs to have at least its network interface set. This works if the family of the packet is unknown at the time of buffer allocation. Then one could do:

```
net_pkt_alloc_buffer(pkt, size, proto, timeout);
```

Where proto could be 0 if unknown (there is no IPPROTO_UNSPEC).

As seen previously, the net_pkt and its buffer can be allocated at once via *net_pkt_alloc_with_buffer()*. It is actually the most widely used allocator.

The network interface, the family, and the protocol of the packet are used by the buffer allocation to determine if the requested size can be allocated. Indeed, the allocator will use the network interface to know the MTU and then the family and protocol for the headers space (if only these 2 are specified). If the whole fits within the MTU, the allocated space will be of the requested size plus, eventually, the headers space. If there is insufficient MTU space, the requested size will be shrunk so the possible headers space and new size will fit within the MTU.

For instance, on an Ethernet network interface, with an MTU of 1500 bytes:

```
pkt = net_pkt_alloc_with_buffer(iface, 800, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 800 + 20 + 8 bytes of buffer for the new net_pkt where:

```
pkt = net_pkt_alloc_with_buffer(iface, 1600, AF_INET4, IPPROTO_UDP, K_FOREVER);
```

will successfully allocate 1500 bytes, and where 20 + 8 bytes (IPv4 + UDP headers) will not be used for the payload.

On the receiving side, when the family and protocol are not known:

```
pkt = net_pkt_rx_alloc_with_buffer(iface, 800, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 800 bytes and no extra header space. But a:

```
pkt = net_pkt_rx_alloc_with_buffer(iface, 1600, AF_UNSPEC, 0, K_FOREVER);
```

will allocate 1514 bytes, the MTU + Ethernet header space.

One can increase the amount of buffer space allocated by calling *net_pkt_alloc_buffer()*, as it will take into account the existing buffer. It will also account for the header space if net_pkt's family is a valid one, as well as the proto parameter. In that case, the newly allocated buffer space will be appended to the existing one, and not inserted in the front. Note however such a use case is rather limited. Usually, one should know from the start how much size should be requested.

Deallocation Each net_pkt is reference counted. At allocation, the reference is set to 1. The reference count can be incremented with *net_pkt_ref()* or decremented with *net_pkt_unref()*. When the count drops to zero the buffer is also un-referenced and net_pkt is automatically placed back into the free net_pkt_slabs

If net_pkt's buffer is needed even after net_pkt deallocation, one will need to reference once more all the chain of net_buf before calling last net_pkt_unref. See *Network Buffer* for more information.

Operations There are two ways to access the net_pkt buffer, explained in the following sections: basic read/write access and data access, the latter being the preferred way.

Read and Write access As said earlier, though net_pkt uses net_buf for its buffer, it provides its own API to access it. Indeed, a network packet might be scattered over a chain of net_buf objects, the functions provided by net_buf are then limited for such case. Instead, net_pkt provides functions which hide all the complexity of potential non-contiguous access.

Data movement into the buffer is made through a cursor maintained within each net_pkt. All read/write operations affect this cursor. Note as well that read or write functions are strict on their length parameters: if it cannot r/w the given length it will fail. Length is not interpreted as an upper limit, it is instead the exact amount of data that must be read or written.

As there are two paths, TX and RX, there are two access modes: write and overwrite. This might sound a bit unusual, but is in fact simple and provides flexibility.

In write mode, whatever is written in the buffer affects the length of actual data present in the buffer. Buffer length should not be confused with the buffer size which is a limit any mode cannot pass. In overwrite mode then, whatever is written must happen on valid data, and will not affect the buffer length. By default, a newly allocated net_pkt is on write mode, and its cursor points to the beginning of its buffer.

Let's see now, step by step, the functions and how they behave depending on the mode.

When freshly allocated with a buffer of 500 bytes, a net_pkt has 0 length, which means no valid data is in its buffer. One could verify this by:

```
len = net_pkt_get_len(pkt);
```

Now, let's write 8 bytes:

```
net_pkt_write(pkt, data, 8);
```

The buffer length is now 8 bytes. There are various helpers to write a byte, or big endian uint16_t, uint32_t.

```
net_pkt_write_u8(pkt, &foo);
net_pkt_write_be16(pkt, &ba);
net_pkt_write_be32(pkt, &bar);
```

Logically, net_pkt's length is now 15. But if we try to read at this point, it will fail because there is nothing to read at the cursor where we are at in the net_pkt. It is possible, while in write mode, to read what has been already written by resetting the cursor of the net_pkt. For instance:

```
net_pkt_cursor_init(pkt);
net_pkt_read(pkt, data, 15);
```

This will reset the cursor of the pkt to the beginning of the buffer and then let you read the actual 15 bytes present. The cursor is then again pointing at the end of the buffer.

To set a large area with the same byte, a memset function is provided:

```
net_pkt_memset(pkt, 0, 5);
```

Our net_pkt has now a length of 20 bytes.

Switching between modes can be achieved via `net_pkt_set_overwrite()` function. It is possible to switch mode back and forth at any time. The net_pkt will be set to overwrite and its cursor reset:

```
net_pkt_set_overwrite(pkt, true);
net_pkt_cursor_init(pkt);
```

Now the same operators can be used, but it will be limited to the existing data in the buffer, i.e. 20 bytes.

If it is necessary to know how much space is available in the net_pkt call:

```
net_pkt_available_buffer(pkt);
```

Or, if headers space needs to be accounted for, call:

```
net_pkt_available_payload_buffer(pkt, proto);
```

If you want to place the cursor at a known position use the function *net_pkt_skip()*. For example, to go after the IP header, use:

```
net_pkt_cursor_init(pkt);
net_pkt_skip(pkt, net_pkt_ip_header_len(pkt));
```

Data access Though the API shown previously is rather simple, it involves always copying things to and from the net_pkt buffer. In many occasions, it is more relevant to access the information stored in the buffer contiguously, especially with network packets which embed headers.

These headers are, most of the time, a known fixed set of bytes. It is then more natural to have a structure representing a certain type of header. In addition to this, if it is known the header size appears in a contiguous area of the buffer, it will be way more efficient to cast the actual position in the buffer to the type of header. Either for reading or writing the fields of such header, accessing it directly will save memory.

Net pkt comes with a dedicated API for this, built on top of the previously described API. It is able to handle both contiguous and non-contiguous access transparently.

There are two macros used to define a data access descriptor: `NET_PKT_DATA_ACCESS_DEFINE` when it is not possible to tell if the data will be in a contiguous area, and `NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE` when it is guaranteed the data is in a contiguous area.

Let's take the example of IP and UDP. Both IPv4 and IPv6 headers are always found at the beginning of the packet and are small enough to fit in a net_buf of 128 bytes (for instance, though 64 bytes could be chosen).

```
NET_PKT_DATA_ACCESS_CONTIGUOUS_DEFINE(ipv4_access, struct net_ipv4_hdr);
struct net_ipv4_hdr *ipv4_hdr;

ipv4_hdr = (struct net_ipv4_hdr *)net_pkt_get_data(pkt, &ipv4_access);
```

It would be the same for struct net_ipv4_hdr. For a UDP header it is likely not to be in a contiguous area in IPv6 for instance so:

```
NET_PKT_DATA_ACCESS_DEFINE(udp_access, struct net_udp_hdr);
struct net_udp_hdr *udp_hdr;

udp_hdr = (struct net_udp_hdr *)net_pkt_get_data(pkt, &udp_access);
```

At this point, the cursor of the net_pkt points at the beginning of the requested data. On the RX path, these headers will be read but not modified so to proceed further the cursor needs to advance past the data. There is a function dedicated for this:

```
net_pkt_acknowledge_data(pkt, &ipv4_access);
```

On the TX path, however, the header fields have been modified. In such a case:

```
net_pkt_set_data(pkt, &ipv4_access);
```

If the data are in a contiguous area, it will advance the cursor relevantly. If not, it will write the data and the cursor will be updated. Note that *net_pkt_set_data()* could be used in the RX path as well, but it is slightly faster to use *net_pkt_acknowledge_data()* as this one does not care about contiguity at all, it just advances the cursor via *net_pkt_skip()* directly.

API Reference

group `net_pkt`

Network packet management library.

Since
1.5

Version
0.8.0

Defines

`NET_PKT_SLAB_DEFINE`(name, count)

Create a *net_pkt* slab.

A *net_pkt* slab is used to store meta-information about network packets. It must be coupled with a data fragment pool (*NET_PKT_DATA_POOL_DEFINE*) used to store the actual packet data. The macro can be used by an application to define additional custom per-context TX packet slabs (see net_context_setup_pools()).

Parameters

- `name` – Name of the slab.
- `count` – Number of *net_pkt* in this slab.

`NET_PKT_DATA_POOL_DEFINE`(name, count)

Create a data fragment *net_buf* pool.

A *net_buf* pool is used to store actual data for network packets. It must be coupled with a *net_pkt* slab (*NET_PKT_SLAB_DEFINE*) used to store the packet meta-information. The macro can be used by an application to define additional custom per-context TX packet pools (see net_context_setup_pools()).

Parameters

- `name` – Name of the pool.
- `count` – Number of *net_buf* in this pool.

`net_pkt_print_frags`(pkt)

Print fragment list and the fragment sizes.

Only available if debugging is activated.

Parameters

- `pkt` – Network pkt.

Functions

struct *net_buf* *`net_pkt_get_reserve_data`(struct *net_buf_pool* *pool, size_t min_len, *k_timeout_t* timeout)

Get a data buffer from a given pool.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters

- `pool` – The *net_buf* pool to use.

- **min_len** – Minimum length of the requested fragment.
- **timeout** – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

struct *net_buf* ***net_pkt_get_reserve_rx_data**(size_t min_len, *k_timeout_t* timeout)

Get RX DATA buffer from pool.

Normally you should use *net_pkt_get_frag()* instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters

- **min_len** – Minimum length of the requested fragment.
- **timeout** – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

struct *net_buf* ***net_pkt_get_reserve_tx_data**(size_t min_len, *k_timeout_t* timeout)

Get TX DATA buffer from pool.

Normally you should use *net_pkt_get_frag()* instead.

Normally this version is not useful for applications but is mainly used by network fragmentation code.

Parameters

- **min_len** – Minimum length of the requested fragment.
- **timeout** – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

struct *net_buf* ***net_pkt_get_frag**(struct *net_pkt* *pkt, size_t min_len, *k_timeout_t* timeout)

Get a data fragment that might be from user specific buffer pool or from global DATA pool.

Parameters

- **pkt** – Network packet.
- **min_len** – Minimum length of the requested fragment.
- **timeout** – Affects the action taken should the net buf pool be empty. If K_NO_WAIT, then return immediately. If K_FOREVER, then wait as long as necessary. Otherwise, wait up to the specified time.

Returns
Network buffer if successful, NULL otherwise.

void **net_pkt_unref**(struct *net_pkt* *pkt)

Place packet back into the available packets slab.

Releases the packet to other use. This needs to be called by application after it has finished with the packet.

Parameters

- **pkt** – Network packet to release.

struct *net_pkt* ***net_pkt_ref**(struct *net_pkt* *pkt)

Increase the packet ref count.

Mark the packet to be used still.

Parameters

- **pkt** – Network packet to ref.

Returns
Network packet if successful, NULL otherwise.

struct *net_buf* ***net_pkt_frag_ref**(struct *net_buf* *frag)

Increase the packet fragment ref count.

Mark the fragment to be used still.

Parameters

- **frag** – Network fragment to ref.

Returns
a pointer on the referenced Network fragment.

void **net_pkt_frag_unref**(struct *net_buf* *frag)

Decrease the packet fragment ref count.

Parameters

- **frag** – Network fragment to unref.

struct *net_buf* ***net_pkt_frag_del**(struct *net_pkt* *pkt, struct *net_buf* *parent, struct *net_buf* *frag)

Delete existing fragment from a packet.

Parameters

- **pkt** – Network packet from which frag belongs to.
- **parent** – parent fragment of frag, or NULL if none.
- **frag** – Fragment to delete.

Returns
Pointer to the following fragment, or NULL if it had no further fragments.

void **net_pkt_frag_add**(struct *net_pkt* *pkt, struct *net_buf* *frag)

Add a fragment to a packet at the end of its fragment list.

Parameters

- **pkt** – pkt Network packet where to add the fragment
- **frag** – Fragment to add

void **net_pkt_frag_insert**(struct *net_pkt* *pkt, struct *net_buf* *frag)

Insert a fragment to a packet at the beginning of its fragment list.

Parameters

- **pkt** – pkt Network packet where to insert the fragment

- **frag** – Fragment to insert

void **net_pkt_compact**(struct *net_pkt* *pkt)

Compact the fragment list of a packet.

After this there is no more any free space in individual fragments.

Parameters

- **pkt** – Network packet.

void **net_pkt_get_info**(struct k_mem_slab **rx, struct k_mem_slab **tx, struct *net_buf_pool* **rx_data, struct *net_buf_pool* **tx_data)

Get information about predefined RX, TX and DATA pools.

Parameters

- **rx** – Pointer to RX pool is returned.
- **tx** – Pointer to TX pool is returned.
- **rx_data** – Pointer to RX DATA pool is returned.
- **tx_data** – Pointer to TX DATA pool is returned.

struct *net_pkt* ***net_pkt_alloc**(*k_timeout_t* timeout)

Allocate an initialized *net_pkt*.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for TX.

Parameters

- **timeout** – Maximum time to wait for an allocation.

Returns

a pointer to a newly allocated *net_pkt* on success, NULL otherwise.

struct *net_pkt* ***net_pkt_alloc_from_slab**(struct k_mem_slab *slab, *k_timeout_t* timeout)

Allocate an initialized *net_pkt* from a specific slab.

unlike *net_pkt_alloc()* which uses core slabs, this one will use an external slab (see *NET_PKT_SLAB_DEFINE()*). Do *not* use it unless you know what you are doing. Basically, only net_context should be using this, in order to allocate packet and then buffer on its local slab/pool (if any).

Parameters

- **slab** – The slab to use for allocating the packet
- **timeout** – Maximum time to wait for an allocation.

Returns

a pointer to a newly allocated *net_pkt* on success, NULL otherwise.

struct *net_pkt* ***net_pkt_rx_alloc**(*k_timeout_t* timeout)

Allocate an initialized *net_pkt* for RX.

for the time being, 2 pools are used. One for TX and one for RX. This allocator has to be used for RX.

Parameters

- **timeout** – Maximum time to wait for an allocation.

Returns

a pointer to a newly allocated *net_pkt* on success, NULL otherwise.

struct *net_pkt* *net_pkt_alloc_on_iface(struct *net_if* *iface, *k_timeout_t* timeout)

Allocate a network packet for a specific network interface.

Parameters

- **iface** – The network interface the packet is supposed to go through.
- **timeout** – Maximum time to wait for an allocation.

Returns

a pointer to a newly allocated *net_pkt* on success, NULL otherwise.

int net_pkt_alloc_buffer(struct *net_pkt* *pkt, size_t size, enum *net_ip_protocol* proto, *k_timeout_t* timeout)

Allocate buffer for a *net_pkt*.

: such allocator will take into account space necessary for headers, MTU, and existing buffer (if any). Beware that, due to all these criteria, the allocated size might be smaller/bigger than requested one.

Parameters

- **pkt** – The network packet requiring buffer to be allocated.
- **size** – The size of buffer being requested.
- **proto** – The IP protocol type (can be 0 for none).
- **timeout** – Maximum time to wait for an allocation.

Returns

0 on success, negative errno code otherwise.

int net_pkt_alloc_buffer_raw(struct *net_pkt* *pkt, size_t size, *k_timeout_t* timeout)

Allocate buffer for a *net_pkt*, of specified size, w/o any additional preconditions.

: The actual buffer size may be larger than requested one if fixed size buffers are in use.

Parameters

- **pkt** – The network packet requiring buffer to be allocated.
- **size** – The size of buffer being requested.
- **timeout** – Maximum time to wait for an allocation.

Returns

0 on success, negative errno code otherwise.

struct *net_pkt* *net_pkt_alloc_with_buffer(struct *net_if* *iface, size_t size, *sa_family_t* family, enum *net_ip_protocol* proto, *k_timeout_t* timeout)

Allocate a network packet and buffer at once.

Parameters

- **iface** – The network interface the packet is supposed to go through.
- **size** – The size of buffer.
- **family** – The family to which the packet belongs.
- **proto** – The IP protocol type (can be 0 for none).
- **timeout** – Maximum time to wait for an allocation.

Returns

a pointer to a newly allocated *net_pkt* on success, NULL otherwise.

void **net_pkt_append_buffer**(struct *net_pkt* *pkt, struct *net_buf* *buffer)

Append a buffer in packet.

Parameters

- **pkt** – Network packet where to append the buffer
- **buffer** – Buffer to append

size_t **net_pkt_available_buffer**(struct *net_pkt* *pkt)

Get available buffer space from a pkt.

> **Note**
>
> Reserved bytes (headroom) in any of the fragments are not considered to be available.

Parameters

- **pkt** – The *net_pkt* which buffer availability should be evaluated

Returns

the amount of buffer available

size_t **net_pkt_available_payload_buffer**(struct *net_pkt* *pkt, enum *net_ip_protocol* proto)

Get available buffer space for payload from a pkt.

Unlike *net_pkt_available_buffer()*, this will take into account the headers space.

> **Note**
>
> Reserved bytes (headroom) in any of the fragments are not considered to be available.

Parameters

- **pkt** – The *net_pkt* which payload buffer availability should be evaluated
- **proto** – The IP protocol type (can be 0 for none).

Returns

the amount of buffer available for payload

void **net_pkt_trim_buffer**(struct *net_pkt* *pkt)

Trim *net_pkt* buffer.

This will basically check for unused buffers and deallocate them relevantly

Parameters

- **pkt** – The *net_pkt* which buffer will be trimmed

int **net_pkt_remove_tail**(struct *net_pkt* *pkt, size_t length)

Remove *length* bytes from tail of packet.

This function does not take packet cursor into account. It is a helper to remove unneeded bytes from tail of packet (like appended CRC). It takes care of buffer deallocation if removed bytes span whole buffer(s).

Parameters

- **pkt** – Network packet
- **length** – Number of bytes to be removed

Return values

- **0** – On success.
- **-EINVAL** – If packet length is shorter than *length*.

void **net_pkt_cursor_init**(struct *net_pkt* *pkt)

Initialize *net_pkt* cursor.

This will initialize the *net_pkt* cursor from its buffer.

Parameters

- **pkt** – The *net_pkt* whose cursor is going to be initialized

static inline void **net_pkt_cursor_backup**(struct *net_pkt* *pkt, struct net_pkt_cursor *backup)

Backup *net_pkt* cursor.

Parameters

- **pkt** – The *net_pkt* whose cursor is going to be backed up
- **backup** – The cursor where to backup *net_pkt* cursor

static inline void **net_pkt_cursor_restore**(struct *net_pkt* *pkt, struct net_pkt_cursor *backup)

Restore *net_pkt* cursor from a backup.

Parameters

- **pkt** – The *net_pkt* whose cursor is going to be restored
- **backup** – The cursor from where to restore *net_pkt* cursor

static inline void ***net_pkt_cursor_get_pos**(struct *net_pkt* *pkt)

Returns current position of the cursor.

Parameters

- **pkt** – The *net_pkt* whose cursor position is going to be returned

Returns

cursor's position

int **net_pkt_skip**(struct *net_pkt* *pkt, size_t length)

Skip some data from a *net_pkt*.

net_pkt's cursor should be properly initialized Cursor position will be updated after the operation. Depending on the value of pkt->overwrite bit, this function will affect the buffer length or not. If it's true, it will advance the cursor to the requested length. If it's false, it will do the same but if the cursor was already also at the end of existing data, it will increment the buffer length. So in this case, its behavior is just like net_pkt_write or net_pkt_memset, difference being that it will not affect the buffer content itself (which may be just garbage then).

Parameters

- **pkt** – The *net_pkt* whose cursor will be updated to skip given amount of data from the buffer.
- **length** – Amount of data to skip in the buffer

Returns

0 in success, negative errno code otherwise.

int **net_pkt_memset**(struct *net_pkt* *pkt, int byte, size_t length)

Memset some data in a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The *net_pkt* whose buffer to fill starting at the current cursor position.
- **byte** – The byte to write in memory
- **length** – Amount of data to memset with given byte

Returns

0 in success, negative errno code otherwise.

int **net_pkt_copy**(struct *net_pkt* *pkt_dst, struct *net_pkt* *pkt_src, size_t length)

Copy data from a packet into another one.

Both *net_pkt* cursors should be properly initialized and, if needed, positioned using net_pkt_skip. The cursors will be updated after the operation.

Parameters

- **pkt_dst** – Destination network packet.
- **pkt_src** – Source network packet.
- **length** – Length of data to be copied.

Returns

0 on success, negative errno code otherwise.

struct *net_pkt* ***net_pkt_clone**(struct *net_pkt* *pkt, *k_timeout_t* timeout)

Clone pkt and its buffer.

The cloned packet will be allocated on the same pool as the original one.

Parameters

- **pkt** – Original pkt to be cloned
- **timeout** – Timeout to wait for free buffer

Returns

NULL if error, cloned packet otherwise.

struct *net_pkt* ***net_pkt_rx_clone**(struct *net_pkt* *pkt, *k_timeout_t* timeout)

Clone pkt and its buffer.

The cloned packet will be allocated on the RX packet poll.

Parameters

- **pkt** – Original pkt to be cloned
- **timeout** – Timeout to wait for free buffer

Returns

NULL if error, cloned packet otherwise.

struct *net_pkt* ***net_pkt_shallow_clone**(struct *net_pkt* *pkt, *k_timeout_t* timeout)

Clone pkt and increase the refcount of its buffer.

Parameters

- **pkt** – Original pkt to be shallow cloned
- **timeout** – Timeout to wait for free packet

Returns
NULL if error, cloned packet otherwise.

int **net_pkt_read**(struct *net_pkt* *pkt, void *data, size_t length)

Read some data from a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet from where to read some data
- **data** – The destination buffer where to copy the data
- **length** – The amount of data to copy

Returns
0 on success, negative errno code otherwise.

static inline int **net_pkt_read_u8**(struct *net_pkt* *pkt, uint8_t *data)

Read a byte (uint8_t) from a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet from where to read
- **data** – The destination uint8_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int **net_pkt_read_be16**(struct *net_pkt* *pkt, uint16_t *data)

Read uint16_t big endian data from a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet from where to read
- **data** – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int **net_pkt_read_le16**(struct *net_pkt* *pkt, uint16_t *data)

Read uint16_t little endian data from a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet from where to read
- **data** – The destination uint16_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int **net_pkt_read_be32**(struct *net_pkt* *pkt, uint32_t *data)

Read uint32_t big endian data from a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- `pkt` – The network packet from where to read
- `data` – The destination uint32_t where to copy the data

Returns
0 on success, negative errno code otherwise.

int `net_pkt_write`(struct *net_pkt* *pkt, const void *data, size_t length)

Write data into a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- `pkt` – The network packet where to write
- `data` – Data to be written
- `length` – Length of the data to be written

Returns
0 on success, negative errno code otherwise.

static inline int `net_pkt_write_u8`(struct *net_pkt* *pkt, uint8_t data)

Write a byte (uint8_t) data to a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- `pkt` – The network packet from where to read
- `data` – The uint8_t value to write

Returns
0 on success, negative errno code otherwise.

static inline int `net_pkt_write_be16`(struct *net_pkt* *pkt, uint16_t data)

Write a uint16_t big endian data to a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- `pkt` – The network packet from where to read
- `data` – The uint16_t value in host byte order to write

Returns
0 on success, negative errno code otherwise.

static inline int `net_pkt_write_be32`(struct *net_pkt* *pkt, uint32_t data)

Write a uint32_t big endian data to a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- `pkt` – The network packet from where to read
- `data` – The uint32_t value in host byte order to write

Returns
0 on success, negative errno code otherwise.

static inline int **net_pkt_write_le32**(struct *net_pkt* *pkt, uint32_t data)

Write a uint32_t little endian data to a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet from where to read
- **data** – The uint32_t value in host byte order to write

Returns
0 on success, negative errno code otherwise.

static inline int **net_pkt_write_le16**(struct *net_pkt* *pkt, uint16_t data)

Write a uint16_t little endian data to a *net_pkt*.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet from where to read
- **data** – The uint16_t value in host byte order to write

Returns
0 on success, negative errno code otherwise.

size_t **net_pkt_remaining_data**(struct *net_pkt* *pkt)

Get the amount of data which can be read from current cursor position.

Parameters

- **pkt** – Network packet

Returns
Amount of data which can be read from current pkt cursor

int **net_pkt_update_length**(struct *net_pkt* *pkt, size_t length)

Update the overall length of a packet.

Unlike *net_pkt_pull()* below, this does not take packet cursor into account. It's mainly a helper dedicated for ipv4 and ipv6 input functions. It shrinks the overall length by given parameter.

Parameters

- **pkt** – Network packet
- **length** – The new length of the packet

Returns
0 on success, negative errno code otherwise.

int **net_pkt_pull**(struct *net_pkt* *pkt, size_t length)

Remove data from the packet at current location.

net_pkt's cursor should be properly initialized and, eventually, properly positioned using net_pkt_skip/read/write. Note that *net_pkt*'s cursor is reset by this function.

Parameters

- **pkt** – Network packet
- **length** – Number of bytes to be removed

Returns
0 on success, negative errno code otherwise.

uint16_t **net_pkt_get_current_offset**(struct *net_pkt* *pkt)

Get the actual offset in the packet from its cursor.

Parameters

- **pkt** – Network packet.

Returns

a valid offset on success, 0 otherwise as there is nothing that can be done to evaluate the offset.

bool **net_pkt_is_contiguous**(struct *net_pkt* *pkt, size_t size)

Check if a data size could fit contiguously.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip.

Parameters

- **pkt** – Network packet.
- **size** – The size to check for contiguity

Returns

true if that is the case, false otherwise.

size_t **net_pkt_get_contiguous_len**(struct *net_pkt* *pkt)

Get the contiguous buffer space.

Parameters

- **pkt** – Network packet

Returns

The available contiguous buffer space in bytes starting from the current cursor position. 0 in case of an error.

void ***net_pkt_get_data**(struct *net_pkt* *pkt, struct net_pkt_data_access *access)

Get data from a network packet in a contiguous way.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Unlike other functions, cursor position will not be updated after the operation.

Parameters

- **pkt** – The network packet from where to get the data.
- **access** – A pointer to a valid net_pkt_data_access describing the data to get in a contiguous way.

Returns

a pointer to the requested contiguous data, NULL otherwise.

int **net_pkt_set_data**(struct *net_pkt* *pkt, struct net_pkt_data_access *access)

Set contiguous data into a network packet.

net_pkt's cursor should be properly initialized and, if needed, positioned using net_pkt_skip. Cursor position will be updated after the operation.

Parameters

- **pkt** – The network packet to where the data should be set.
- **access** – A pointer to a valid net_pkt_data_access describing the data to set.

Returns

0 on success, a negative errno otherwise.

static inline int **net_pkt_acknowledge_data**(struct *net_pkt* *pkt, struct net_pkt_data_access *access)

Acknowledge previously contiguous data taken from a network packet Packet needs to be set to overwrite mode.

struct **net_pkt**

#include <net_pkt.h> Network packet.

Note that if you add new fields into *net_pkt*, remember to update *net_pkt_clone()* function.

Public Members

intptr_t **fifo**

The fifo is used by RX/TX threads and by socket layer.

The *net_pkt* is queued via fifo to the processing thread.

struct k_mem_slab ***slab**

Slab pointer from where it belongs to.

struct *net_buf* ***frags**

buffer fragment

struct *net_buf* ***buffer**

alias to a buffer fragment

union net_pkt

buffer holding the packet

struct net_pkt_cursor **cursor**

Internal buffer iterator used for reading/writing.

struct net_context ***context**

Network connection context.

struct *net_if* ***iface**

Network interface.

Virtual LAN (VLAN) Support

- *Overview*
- *API Reference*

Overview Virtual LAN (VLAN) is a partitioned and isolated computer network at the data link layer (OSI layer 2). For ethernet network this refers to IEEE 802.1Q

In Zephyr, each individual VLAN is modeled as a virtual network interface. This means that there is an ethernet network interface that corresponds to a real physical ethernet port in the system. A virtual network interface is created for each VLAN, and this virtual network interface connects to the real network interface. This is similar to how Linux implements VLANs. The *eth0* is the real network interface and *vlan0* is a virtual network interface that is run on top of *eth0*.

VLAN support must be enabled at compile time by setting option `CONFIG_NET_VLAN` and `CONFIG_NET_VLAN_COUNT` to reflect how many network interfaces there will be in the system. For example, if there is one network interface without VLAN support, and two with VLAN support, the `CONFIG_NET_VLAN_COUNT` option should be set to 3.

Even if VLAN is enabled in a `prj.conf` file, the VLAN needs to be activated at runtime by the application. The VLAN API provides a *net_eth_vlan_enable()* function to do that. The application needs to give the network interface and desired VLAN tag as a parameter to that function. The VLAN tagging for a given network interface can be disabled by a *net_eth_vlan_disable()* function. The application needs to configure the VLAN network interface itself, such as setting the IP address, etc.

See also the VLAN sample application for API usage example. The source code for that sample application can be found at samples/net/vlan.

The net-shell module contains *net vlan add* and *net vlan del* commands that can be used to enable or disable VLAN tags for a given network interface.

See the IEEE 802.1Q spec for more information about ethernet VLANs.

NET_VLAN_TAG_UNSPEC
: Unspecified VLAN tag value.

Functions

static inline uint16_t **net_eth_vlan_get_vid**(uint16_t tci)
: Get VLAN identifier from TCI.

  Parameters
  - **tci** – VLAN tag control information.

  Returns
  VLAN identifier.

static inline uint8_t **net_eth_vlan_get_dei**(uint16_t tci)
: Get Drop Eligible Indicator from TCI.

  Parameters
  - **tci** – VLAN tag control information.

  Returns
  Drop eligible indicator.

static inline uint8_t **net_eth_vlan_get_pcp**(uint16_t tci)
: Get Priority Code Point from TCI.

  Parameters
  - **tci** – VLAN tag control information.

  Returns
  Priority code point.

static inline uint16_t **net_eth_vlan_set_vid**(uint16_t tci, uint16_t vid)
: Set VLAN identifier to TCI.

  Parameters
  - **tci** – VLAN tag control information.
  - **vid** – VLAN identifier.

  Returns
  New TCI value.

static inline uint16_t **net_eth_vlan_set_dei**(uint16_t tci, bool dei)
: Set Drop Eligible Indicator to TCI.

  Parameters
  - **tci** – VLAN tag control information.
  - **dei** – Drop eligible indicator.

  Returns
  New TCI value.

static inline uint16_t **net_eth_vlan_set_pcp**(uint16_t tci, uint8_t pcp)
: Set Priority Code Point to TCI.

  Parameters
  - **tci** – VLAN tag control information.
  - **pcp** – Priority code point.

Returns
New TCI value.

Link Layer Discovery Protocol

- *Overview*
- *API Reference*

Overview The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol used by network devices for advertising their identity, capabilities, and neighbors on a wired Ethernet network.

For more information, see this LLDP Wikipedia article.

Related code samples

Link Layer Discovery Protocol (LLDP)
Enable LLDP support and setup VLANs.

API Reference

group `lldp`

LLDP definitions and helpers.

Since
1.13

Version
0.8.0

Defines

`net_lldp_set_lldpdu`(iface)

Set LLDP protocol data unit (LLDPDU) for the network interface.

Parameters

- `iface` – Network interface

Returns
<0 if error, index in lldp array if iface is found there

`net_lldp_unset_lldpdu`(iface)

Unset LLDP protocol data unit (LLDPDU) for the network interface.

Parameters

- `iface` – Network interface

Typedefs

typedef enum *net_verdict* (*`net_lldp_recv_cb_t`)(struct *net_if* *iface, struct *net_pkt* *pkt)

LLDP Receive packet callback.

Callback gets called upon receiving packet. It is responsible for freeing packet or indicating to the stack that it needs to free packet by returning correct net_verdict.

Returns:

- NET_DROP, if packet was invalid, rejected or we want the stack to free it. In this case the core stack will free the packet.
- NET_OK, if the packet was accepted, in this case the ownership of the *net_pkt* goes to callback and core network stack will forget it.

Enums

enum `net_lldp_tlv_type`

TLV Types.

Please refer to table 8-1 from IEEE 802.1AB standard.

Values:

enumerator `LLDP_TLV_END_LLDPDU` = 0

End Of LLDPDU (optional)

enumerator `LLDP_TLV_CHASSIS_ID` = 1

Chassis ID (mandatory)

enumerator `LLDP_TLV_PORT_ID` = 2

Port ID (mandatory)

enumerator `LLDP_TLV_TTL` = 3

Time To Live (mandatory)

enumerator `LLDP_TLV_PORT_DESC` = 4

Port Description (optional)

enumerator `LLDP_TLV_SYSTEM_NAME` = 5

System Name (optional)

enumerator `LLDP_TLV_SYSTEM_DESC` = 6

System Description (optional)

enumerator `LLDP_TLV_SYSTEM_CAPABILITIES` = 7

System Capability (optional)

enumerator `LLDP_TLV_MANAGEMENT_ADDR` = 8

Management Address (optional)

enumerator `LLDP_TLV_ORG_SPECIFIC` = 127

Org specific TLVs (optional)

Functions

int `net_lldp_config`(struct *net_if* *iface, const struct *net_lldpdu* *lldpdu)

Set the LLDP data unit for a network interface.

Parameters

- `iface` – Network interface
- `lldpdu` – LLDP data unit struct

Returns

0 if ok, <0 if error

int `net_lldp_config_optional`(struct *net_if* *iface, const uint8_t *tlv, size_t len)

Set the Optional LLDP TLVs for a network interface.

Parameters

- `iface` – Network interface
- `tlv` – LLDP optional TLVs following mandatory part
- `len` – Length of the optional TLVs

Returns

0 if ok, <0 if error

void `net_lldp_init`(void)

Initialize LLDP engine.

int `net_lldp_register_callback`(struct *net_if* *iface, *net_lldp_recv_cb_t* cb)

Register LLDP Rx callback function.

Parameters

- `iface` – Network interface
- `cb` – Callback function

Returns

0 if ok, < 0 if error

enum *net_verdict* `net_lldp_recv`(struct *net_if* *iface, struct *net_pkt* *pkt)

Parse LLDP packet.

Parameters

- `iface` – Network interface
- `pkt` – Network packet

Returns

Return the policy for network buffer

struct `net_lldp_chassis_tlv`

#include <lldp.h> Chassis ID TLV, see chapter 8.5.2 in IEEE 802.1AB.

Public Members

uint16_t **type_length**
7 bits for type, 9 bits for length

uint8_t **subtype**
ID subtype.

uint8_t **value**[NET_LLDP_CHASSIS_ID_VALUE_LEN]
Chassis ID value.

struct **net_lldp_port_tlv**
#include <*lldp.h*> Port ID TLV, see chapter 8.5.3 in IEEE 802.1AB.

Public Members

uint16_t **type_length**
7 bits for type, 9 bits for length

uint8_t **subtype**
ID subtype.

uint8_t **value**[NET_LLDP_PORT_ID_VALUE_LEN]
Port ID value.

struct **net_lldp_time_to_live_tlv**
#include <*lldp.h*> Time To Live TLV, see chapter 8.5.4 in IEEE 802.1AB.

Public Members

uint16_t **type_length**
7 bits for type, 9 bits for length

uint16_t **ttl**
Time To Live (TTL) value.

struct **net_lldpdu**
#include <*lldp.h*> LLDP Data Unit (LLDPDU) shall contain the following ordered TLVs as stated in “8.2 LLDPDU format” from the IEEE 802.1AB.

Public Members

struct *net_lldp_chassis_tlv* **chassis_id**
Mandatory Chassis TLV.

struct *net_lldp_port_tlv* **port_id**
Mandatory Port TLV.

struct *net_lldp_time_to_live_tlv* **ttl**
Mandatory TTL TLV.

IEEE 802.1Qav

Overview Credit-based shaping is an alternative scheduling algorithm used in network schedulers to achieve fairness when sharing a limited network resource. Zephyr has support for configuring a credit-based shaper described in the IEEE 802.1Qav-2009 standard. Zephyr does not implement the actual shaper; it only provides a way to configure the shaper implemented by the Ethernet device driver.

Enabling 802.1Qav To enable 802.1Qav shaper, the Ethernet device driver must declare that it supports credit-based shaping. The Ethernet driver's capability function must return `ETHERNET_QAV` value for this purpose. Typically also priority queues `ETHERNET_PRIORITY_QUEUES` need to be supported.

```
static enum ethernet_hw_caps eth_get_capabilities(const struct device *dev)
{
        ARG_UNUSED(dev);

        return ETHERNET_QAV | ETHERNET_PRIORITY_QUEUES |
               ETHERNET_HW_VLAN | ETHERNET_LINK_10BASE_T |
               ETHERNET_LINK_100BASE_T;
}
```

See `sam-e70-xplained` board Ethernet driver drivers/ethernet/eth_sam_gmac.c for an example.

Configuring 802.1Qav The application can configure the credit-based shaper like this:

```
#include <zephyr/net/net_if.h>
#include <zephyr/net/ethernet.h>
#include <zephyr/net/ethernet_mgmt.h>

static void qav_set_status(struct net_if *iface,
                           int queue_id, bool enable)
{
        struct ethernet_req_params params;
        int ret;

        memset(&params, 0, sizeof(params));

        params.qav_param.queue_id = queue_id;
        params.qav_param.enabled = enable;
        params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_STATUS;

        /* Disable or enable Qav for a queue */
        ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                       iface, &params,
                       sizeof(struct ethernet_req_params));
        if (ret) {
                LOG_ERR("Cannot %s Qav for queue %d for interface %p",
                        enable ? "enable" : "disable",
```

(continues on next page)

(continued from previous page)

```
                        queue_id, iface);
        }
}

static void qav_set_bandwidth_and_slope(struct net_if *iface,
                                        int queue_id,
                                        unsigned int bandwidth,
                                        unsigned int idle_slope)
{
        struct ethernet_req_params params;
        int ret;

        memset(&params, 0, sizeof(params));

        params.qav_param.queue_id = queue_id;
        params.qav_param.delta_bandwidth = bandwidth;
        params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_DELTA_BANDWIDTH;

        ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                       iface, &params,
                       sizeof(struct ethernet_req_params));
        if (ret) {
                LOG_ERR("Cannot set Qav delta bandwidth %u for "
                        "queue %d for interface %p",
                        bandwidth, queue_id, iface);
        }

        params.qav_param.idle_slope = idle_slope;
        params.qav_param.type = ETHERNET_QAV_PARAM_TYPE_IDLE_SLOPE;

        ret = net_mgmt(NET_REQUEST_ETHERNET_SET_QAV_PARAM,
                       iface, &params,
                       sizeof(struct ethernet_req_params));
        if (ret) {
                LOG_ERR("Cannot set Qav idle slope %u for "
                        "queue %d for interface %p",
                        idle_slope, queue_id, iface);
        }
}
```

Overview Ethernet is a networking technology commonly used in local area networks (LAN). For more information, see this Ethernet Wikipedia article.

Zephyr supports following Ethernet features:

- 10, 100 and 1000 Mbit/sec links
- Auto negotiation
- Half/full duplex
- Promiscuous mode
- TX and RX checksum offloading
- MAC address filtering
- *Virtual LANs*
- *Priority queues*
- *IEEE 802.1AS (gPTP)*
- *IEEE 802.1Qav (credit based shaping)*

- *LLDP (Link Layer Discovery Protocol)*

Not all Ethernet device drivers support all of these features. You can see what is supported by `net iface` net-shell command. It will print currently supported Ethernet features.

Minimum Ethernet frame size.

`NET_ETH_MTU`

Ethernet MTU size.

`ETH_NET_DEVICE_INIT`(dev_id, name, init_fn, pm, data, config, prio, api, mtu)

Create an Ethernet network interface and bind it to network device.

Parameters

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.

- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`ETH_NET_DEVICE_INIT_INSTANCE`(dev_id, name, instance, init_fn, pm, data, config, prio, api, mtu)

Create multiple Ethernet network interfaces and bind them to network devices.

If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `instance` – Instance identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`ETH_NET_DEVICE_DT_DEFINE`(node_id, init_fn, pm, data, config, prio, api, mtu)

Like ETH_NET_DEVICE_INIT but taking metadata from a devicetree.

Create an Ethernet network interface and bind it to network device.

Parameters

- `node_id` – The devicetree node identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`ETH_NET_DEVICE_DT_INST_DEFINE`(inst, ...)

Like ETH_NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- `inst` – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to ETH_NET_DEVICE_DT_DEFINE.

- ... – other parameters as expected by ETH_NET_DEVICE_DT_DEFINE.

Enums

enum `ethernet_hw_caps`

Ethernet hardware capabilities.

Values:

enumerator `ETHERNET_HW_TX_CHKSUM_OFFLOAD` = *BIT*(0)

TX Checksum offloading supported for all of IPv4, UDP, TCP.

enumerator `ETHERNET_HW_RX_CHKSUM_OFFLOAD` = *BIT*(1)

RX Checksum offloading supported for all of IPv4, UDP, TCP.

enumerator `ETHERNET_HW_VLAN` = *BIT*(2)

VLAN supported.

enumerator `ETHERNET_AUTO_NEGOTIATION_SET` = *BIT*(3)

Enabling/disabling auto negotiation supported.

enumerator `ETHERNET_LINK_10BASE_T` = *BIT*(4)

10 Mbits link supported

enumerator `ETHERNET_LINK_100BASE_T` = *BIT*(5)

100 Mbits link supported

enumerator `ETHERNET_LINK_1000BASE_T` = *BIT*(6)

1 Gbits link supported

enumerator `ETHERNET_DUPLEX_SET` = *BIT*(7)

Changing duplex (half/full) supported.

enumerator `ETHERNET_PTP` = *BIT*(8)

IEEE 802.1AS (gPTP) clock supported.

enumerator `ETHERNET_QAV` = *BIT*(9)

IEEE 802.1Qav (credit-based shaping) supported.

enumerator `ETHERNET_PROMISC_MODE` = *BIT*(10)

Promiscuous mode supported.

enumerator `ETHERNET_PRIORITY_QUEUES` = *BIT*(11)

Priority queues available.

enumerator `ETHERNET_HW_FILTERING` = *BIT*(12)

MAC address filtering supported.

enumerator ETHERNET_LLDP = *BIT*(13)
Link Layer Discovery Protocol supported.

enumerator ETHERNET_HW_VLAN_TAG_STRIP = *BIT*(14)
VLAN Tag stripping.

enumerator ETHERNET_DSA_SLAVE_PORT = *BIT*(15)
DSA switch slave port.

enumerator ETHERNET_DSA_MASTER_PORT = *BIT*(16)
DSA switch master port.

enumerator ETHERNET_QBV = *BIT*(17)
IEEE 802.1Qbv (scheduled traffic) supported.

enumerator ETHERNET_QBU = *BIT*(18)
IEEE 802.1Qbu (frame preemption) supported.

enumerator ETHERNET_TXTIME = *BIT*(19)
TXTIME supported.

enumerator ETHERNET_TXINJECTION_MODE = *BIT*(20)
TX-Injection supported.

enum ethernet_if_types
Types of Ethernet L2.
Values:

enumerator L2_ETH_IF_TYPE_ETHERNET
IEEE 802.3 Ethernet (default)

enumerator L2_ETH_IF_TYPE_WIFI
IEEE 802.11 Wi-Fi.

enum ethernet_checksum_support
Protocols that are supported by checksum offloading.
Values:

enumerator ETHERNET_CHECKSUM_SUPPORT_NONE = NET_IF_CHECKSUM_NONE_BIT
Device does not support any L3/L4 checksum offloading.

enumerator ETHERNET_CHECKSUM_SUPPORT_IPV4_HEADER = NET_IF_CHECKSUM_IPV4_HEADER_BIT
Device supports checksum offloading for the IPv4 header.

enumerator ETHERNET_CHECKSUM_SUPPORT_IPV4_ICMP = NET_IF_CHECKSUM_IPV4_ICMP_BIT
Device supports checksum offloading for ICMPv4 payload (implies IPv4 header)

enumerator ETHERNET_CHECKSUM_SUPPORT_IPV6_HEADER = NET_IF_CHECKSUM_IPV6_HEADER_BIT

Device supports checksum offloading for the IPv6 header.

enumerator ETHERNET_CHECKSUM_SUPPORT_IPV6_ICMP = NET_IF_CHECKSUM_IPV6_ICMP_BIT

Device supports checksum offloading for ICMPv6 payload (implies IPv6 header)

enumerator ETHERNET_CHECKSUM_SUPPORT_TCP = NET_IF_CHECKSUM_TCP_BIT

Device supports TCP checksum offloading for all supported IP protocols.

enumerator ETHERNET_CHECKSUM_SUPPORT_UDP = NET_IF_CHECKSUM_UDP_BIT

Device supports UDP checksum offloading for all supported IP protocols.

Functions

static inline bool net_eth_is_addr_broadcast(struct *net_eth_addr* *addr)

Check if the Ethernet MAC address is a broadcast address.

Parameters

- addr – A valid pointer to a Ethernet MAC address.

Returns

true if address is a broadcast address, false if not

static inline bool net_eth_is_addr_all_zeroes(struct *net_eth_addr* *addr)

Check if the Ethernet MAC address is a all zeroes address.

Parameters

- addr – A valid pointer to an Ethernet MAC address.

Returns

true if address is an all zeroes address, false if not

static inline bool net_eth_is_addr_unspecified(struct *net_eth_addr* *addr)

Check if the Ethernet MAC address is unspecified.

Parameters

- addr – A valid pointer to a Ethernet MAC address.

Returns

true if address is unspecified, false if not

static inline bool net_eth_is_addr_multicast(struct *net_eth_addr* *addr)

Check if the Ethernet MAC address is a multicast address.

Parameters

- addr – A valid pointer to a Ethernet MAC address.

Returns

true if address is a multicast address, false if not

static inline bool net_eth_is_addr_group(struct *net_eth_addr* *addr)

Check if the Ethernet MAC address is a group address.

Parameters

- addr – A valid pointer to a Ethernet MAC address.

Returns
true if address is a group address, false if not

static inline bool **net_eth_is_addr_valid**(struct *net_eth_addr* *addr)
Check if the Ethernet MAC address is valid.

Parameters

- **addr** – A valid pointer to a Ethernet MAC address.

Returns
true if address is valid, false if not

static inline bool **net_eth_is_addr_lldp_multicast**(struct *net_eth_addr* *addr)
Check if the Ethernet MAC address is a LLDP multicast address.

Parameters

- **addr** – A valid pointer to a Ethernet MAC address.

Returns
true if address is a LLDP multicast address, false if not

static inline bool **net_eth_is_addr_ptp_multicast**(struct *net_eth_addr* *addr)
Check if the Ethernet MAC address is a PTP multicast address.

Parameters

- **addr** – A valid pointer to a Ethernet MAC address.

Returns
true if address is a PTP multicast address, false if not

const struct *net_eth_addr* ***net_eth_broadcast_addr**(void)
Return Ethernet broadcast address.

Returns
Ethernet broadcast address.

void **net_eth_ipv4_mcast_to_mac_addr**(const struct *in_addr* *ipv4_addr, struct *net_eth_addr* *mac_addr)
Convert IPv4 multicast address to Ethernet address.

Parameters

- **ipv4_addr** – IPv4 multicast address
- **mac_addr** – Output buffer for Ethernet address

void **net_eth_ipv6_mcast_to_mac_addr**(const struct *in6_addr* *ipv6_addr, struct *net_eth_addr* *mac_addr)
Convert IPv6 multicast address to Ethernet address.

Parameters

- **ipv6_addr** – IPv6 multicast address
- **mac_addr** – Output buffer for Ethernet address

static inline enum *ethernet_hw_caps* **net_eth_get_hw_capabilities**(struct *net_if* *iface)
Return ethernet device hardware capability information.

Parameters

- **iface** – Network interface

Returns
Hardware capabilities

static inline int **net_eth_get_hw_config**(struct *net_if* *iface, enum ethernet_config_type type, struct ethernet_config *config)

Return ethernet device hardware configuration information.

Parameters

- **iface** – Network interface
- **type** – configuration type
- **config** – Ethernet configuration

Returns
0 if ok, <0 if error

static inline int **net_eth_vlan_enable**(struct *net_if* *iface, uint16_t tag)

Add VLAN tag to the interface.

Parameters

- **iface** – Interface to use.
- **tag** – VLAN tag to add

Returns
0 if ok, <0 if error

static inline int **net_eth_vlan_disable**(struct *net_if* *iface, uint16_t tag)

Remove VLAN tag from the interface.

Parameters

- **iface** – Interface to use.
- **tag** – VLAN tag to remove

Returns
0 if ok, <0 if error

static inline uint16_t **net_eth_get_vlan_tag**(struct *net_if* *iface)

Return VLAN tag specified to network interface.

Note that the interface parameter must be the VLAN interface, and not the Ethernet one.

Parameters

- **iface** – VLAN network interface.

Returns
VLAN tag for this interface or NET_VLAN_TAG_UNSPEC if VLAN is not configured for that interface.

static inline struct *net_if* ***net_eth_get_vlan_iface**(struct *net_if* *iface, uint16_t tag)

Return network interface related to this VLAN tag.

Parameters

- **iface** – Main network interface (not the VLAN one).
- **tag** – VLAN tag

Returns
Network interface related to this tag or NULL if no such interface exists.

static inline struct *net_if* ***net_eth_get_vlan_main**(struct *net_if* *iface)

Return main network interface that is attached to this VLAN tag.

Parameters

- **iface** – VLAN network interface. This is used to get the pointer to ethernet L2 context

Returns
Network interface related to this tag or NULL if no such interface exists.

static inline bool **net_eth_is_vlan_enabled**(struct ethernet_context *ctx, struct *net_if* *iface)

Check if there are any VLAN interfaces enabled to this specific Ethernet network interface.

Note that the iface must be the actual Ethernet interface and not the virtual VLAN interface.

Parameters

- **ctx** – Ethernet context
- **iface** – Ethernet network interface

Returns
True if there are enabled VLANs for this network interface, false if not.

static inline bool **net_eth_get_vlan_status**(struct *net_if* *iface)

Get VLAN status for a given network interface (enabled or not).

Parameters

- **iface** – Network interface

Returns
True if VLAN is enabled for this network interface, false if not.

static inline bool **net_eth_is_vlan_interface**(struct *net_if* *iface)

Check if the given interface is a VLAN interface.

Parameters

- **iface** – Network interface

Returns
True if this network interface is VLAN one, false if not.

void **net_eth_carrier_on**(struct *net_if* *iface)

Inform ethernet L2 driver that ethernet carrier is detected.

This happens when cable is connected.

Parameters

- **iface** – Network interface

void **net_eth_carrier_off**(struct *net_if* *iface)

Inform ethernet L2 driver that ethernet carrier was lost.

This happens when cable is disconnected.

Parameters

- **iface** – Network interface

int **net_eth_promisc_mode**(struct *net_if* *iface, bool enable)

Set promiscuous mode either ON or OFF.

Parameters

- **iface** – Network interface
- **enable** – on (true) or off (false)

Returns
0 if mode set or unset was successful, <0 otherwise.

int **net_eth_txinjection_mode**(struct *net_if* *iface, bool enable)

Set TX-Injection mode either ON or OFF.

Parameters

- **iface** – Network interface
- **enable** – on (true) or off (false)

Returns
0 if mode set or unset was successful, <0 otherwise.

int **net_eth_mac_filter**(struct *net_if* *iface, struct *net_eth_addr* *mac, enum ethernet_filter_type type, bool enable)

Set or unset HW filtering for MAC address mac.

Parameters

- **iface** – Network interface
- **mac** – Pointer to an ethernet MAC address
- **type** – Filter type, either source or destination
- **enable** – Set (true) or unset (false)

Returns
0 if filter set or unset was successful, <0 otherwise.

const struct *device* ***net_eth_get_phy**(struct *net_if* *iface)

Return the PHY device that is tied to this ethernet network interface.

Parameters

- **iface** – Network interface

Returns
Pointer to PHY device if found, NULL if not found.

static inline const struct *device* ***net_eth_get_ptp_clock**(struct *net_if* *iface)

Return PTP clock that is tied to this ethernet network interface.

Parameters

- **iface** – Network interface

Returns
Pointer to PTP clock if found, NULL if not found or if this ethernet interface does not support PTP.

const struct *device* ***net_eth_get_ptp_clock_by_index**(int index)

Return PTP clock that is tied to this ethernet network interface index.

Parameters

- **index** – Network interface index

Returns
Pointer to PTP clock if found, NULL if not found or if this ethernet interface index does not support PTP.

static inline int **net_eth_get_ptp_port**(struct *net_if* *iface)

Return PTP port number attached to this interface.

Parameters

- **iface** – Network interface

Returns
Port number, no such port if < 0

static inline void **net_eth_set_ptp_port**(struct *net_if* *iface, int port)
Set PTP port number attached to this interface.

Parameters

- **iface** – Network interface
- **port** – Port number to set

static inline bool **net_eth_type_is_wifi**(struct *net_if* *iface)
Check if the Ethernet L2 network interface can perform Wi-Fi.

Parameters

- **iface** – Pointer to network interface

Returns
True if interface supports Wi-Fi, False otherwise.

struct **net_eth_addr**
#include <ethernet.h> Ethernet address.

Public Members

uint8_t **addr**[6U]
Buffer storing the address.

struct **ethernet_t1s_param**
#include <ethernet.h> Ethernet T1S specific parameters.

Public Members

enum ethernet_t1s_param_type **type**
Type of T1S parameter.

bool **enable**
T1S PLCA enabled.

uint8_t **node_id**
T1S PLCA node id range: 0 to 254.

uint8_t **node_count**
T1S PLCA node count range: 1 to 255.

uint8_t **burst_count**
T1S PLCA burst count range: 0x0 to 0xFF.

uint8_t **burst_timer**
T1S PLCA burst timer.

uint8_t **to_timer**

T1S PLCA TO value.

struct *ethernet_t1s_param* **plca**

PLCA is the Physical Layer (PHY) Collision Avoidance technique employed with multidrop 10Base-T1S standard.

The PLCA parameters are described in standard [1] as registers in memory map 4 (MMS = 4) (point 9.6).

IDVER (PLCA ID Version) CTRL0 (PLCA Control 0) CTRL1 (PLCA Control 1) STATUS (PLCA Status) TOTMR (PLCA TO Control) BURST (PLCA Burst Control)

Those registers are implemented by each OA TC6 compliant vendor (like for e.g. LAN865x - e.g. [2]).

Documents: [1] - “OPEN Alliance 10BASE-T1x MAC-PHY Serial

Interface” (ver. 1.1) [2] - “DS60001734C” - LAN865x data sheet

struct **ethernet_qav_param**

#include <*ethernet.h*> Ethernet Qav specific parameters.

Public Members

int **queue_id**

ID of the priority queue to use.

enum ethernet_qav_param_type **type**

Type of Qav parameter.

bool **enabled**

True if Qav is enabled for queue.

unsigned int **delta_bandwidth**

Delta Bandwidth (percentage of bandwidth)

unsigned int **idle_slope**

Idle Slope (bits per second)

unsigned int **oper_idle_slope**

Oper Idle Slope (bits per second)

unsigned int **traffic_class**

Traffic class the queue is bound to.

struct **ethernet_qbv_param**

#include <*ethernet.h*> Ethernet Qbv specific parameters.

Public Members

int **port_id**
Port id.

enum ethernet_qbv_param_type **type**
Type of Qbv parameter.

enum ethernet_qbv_state_type **state**
What state (Admin/Oper) parameters are these.

bool **enabled**
True if Qbv is enabled or not.

bool **gate_status**[NET_TC_TX_COUNT]
True = open, False = closed.

enum ethernet_gate_state_operation **operation**
GateState operation.

uint32_t **time_interval**
Time interval ticks (nanoseconds)

uint16_t **row**
Gate control list row.

struct *ethernet_qbv_param* **gate_control**
Gate control information.

uint32_t **gate_control_list_len**
Number of entries in gate control list.

struct *net_ptp_extended_time* **base_time**
Base time.

struct *net_ptp_time* **cycle_time**
Cycle time.

uint32_t **extension_time**
Extension time (nanoseconds)

struct **ethernet_qbu_param**
#include <ethernet.h> Ethernet Qbu specific parameters.

Public Members

int **port_id**
Port id.

enum ethernet_qbu_param_type **type**
Type of Qbu parameter.

uint32_t **hold_advance**
Hold advance (nanoseconds)

uint32_t **release_advance**
Release advance (nanoseconds)

enum ethernet_qbu_preempt_status **frame_preempt_statuses**[NET_TC_TX_COUNT]
sequence of framePreemptionAdminStatus values

bool **enabled**
True if Qbu is enabled or not.

bool **link_partner_status**
Link partner status (from Qbr)

uint8_t **additional_fragment_size**
Additional fragment size (from Qbr).
The minimum non-final fragment size is (additional_fragment_size + 1) * 64 octets

struct **ethernet_filter**
#include <*ethernet.h*> Ethernet filter description.

Public Members

enum ethernet_filter_type **type**
Type of filter.

struct *net_eth_addr* **mac_address**
MAC address to filter.

bool **set**
Set (true) or unset (false) the filter.

struct **ethernet_txtime_param**
#include <*ethernet.h*> Ethernet TXTIME specific parameters.

Public Members

enum ethernet_txtime_param_type **type**
Type of TXTIME parameter.

int **queue_id**
Queue number for configuring TXTIME.

bool **enable_txtime**

Enable or disable TXTIME per queue.

struct **ethernet_api**

#include <ethernet.h> Ethernet L2 API operations.

Public Members

struct net_if_api **iface_api**

The net_if_api must be placed in first position in this struct so that we are compatible with network interface API.

int (***start**)(const struct *device* *dev)

Collect optional ethernet specific statistics.

This pointer should be set by driver if statistics needs to be collected for that driver. Start the device

int (***stop**)(const struct *device* *dev)

Stop the device.

enum *ethernet_hw_caps* (***get_capabilities**)(const struct *device* *dev)

Get the device capabilities.

int (***set_config**)(const struct *device* *dev, enum ethernet_config_type type, const struct ethernet_config *config)

Set specific hardware configuration.

int (***get_config**)(const struct *device* *dev, enum ethernet_config_type type, struct ethernet_config *config)

Get hardware specific configuration.

const struct *device* *(***get_phy**)(const struct *device* *dev)

The IP stack will call this function when a VLAN tag is enabled or disabled.

If enable is set to true, then the VLAN tag was added, if it is false then the tag was removed. The driver can utilize this information if needed. Return ptp_clock device that is tied to this ethernet device Return PHY device that is tied to this ethernet device

int (***send**)(const struct *device* *dev, struct *net_pkt* *pkt)

Send a network packet.

struct **ethernet_lldp**

#include <ethernet.h> Ethernet LLDP specific parameters.

Public Members

sys_snode_t **node**
Used for track timers.

const struct *net_lldpdu* ***lldpdu**
LLDP Data Unit mandatory TLVs for the interface.

const uint8_t ***optional_du**
LLDP Data Unit optional TLVs for the interface.

size_t **optional_len**
Length of the optional Data Unit TLVs.

struct *net_if* ***iface**
Network interface that has LLDP supported.

int64_t **tx_timer_start**
LLDP TX timer start time.

uint32_t **tx_timer_timeout**
LLDP TX timeout.

net_lldp_recv_cb_t **cb**
LLDP RX callback function.

group **ethernet_mii**
Ethernet MII (media independent interface) functions.

- *Introduction*
- *API Reference*
  - *IEEE 802.15.4 API Overview*
  - *IEEE 802.15.4 Management API*
  - *IEEE 802.15.4 Driver API*
  - *IEEE 802.15.4 L2 / Native Stack API*
  - *OpenThread L2 Adaptation Layer API*

Introduction IEEE 802.15.4 is a technical standard which defines the operation of low-rate wireless personal area networks (LR-WPANs). For a more detailed overview of this standard, see the IEEE 802.15.4 Wikipedia article.

The most recent version of the standard is accessible through the IEEE GET Program. You need to create a free IEEE account and can then downloading it.

We're currently following the IEEE 802.15.4-2020 specification. This version is backwards compatible with IEEE 802.15.4-2015, parts of which are contained in the Thread protocol stack. The

2020 version also includes prior extensions that were accepted into the standard, namely IEEE 802.15.4g (SUN FSK) and IEEE 802.15.4e (TSCH) which are of relevance to industrial IoT and automation. For recent developments in UWB ranging technology, see IEEE 802.15.4z which is not yet integrated into the standard's mainline.

Whenever sections from the standard are cited in the documentation, they refer to IEEE 802.15.4-2020 section, table and figure numbering - unless otherwise specified.

Zephyr supports both, native IEEE 802.15.4 and Thread, with 6LoWPAN. Zephyr's *Thread protocol* implementation is based on OpenThread. The IPv6 header compression in 6LoWPAN is used for native IEEE 802.15.4.

API Reference

IEEE 802.15.4 API Overview Gives an introduction and overview over the whole IEEE 802.15.4 subsystem and all of its APIs, configuration and user interfaces for all audiences.

Related code samples

802.15.4 USB
Implement a device that exposes an IEEE 802.15.4 radio over USB.

group `ieee802154`

IEEE 802.15.4 native and OpenThread L2, configuration, management and driver APIs.

Since
1.0

Version
0.8.0

The IEEE 802.15.4 and Thread subsystems comprise the OpenThread L2 subsystem, the native IEEE 802.15.4 L2 subsystem ("Soft" MAC), a mostly vendor and protocol agnostic driver API shared between the OpenThread and native L2 stacks ("Hard" MAC and PHY) as well as several APIs to configure the subsystem (shell, net management, Kconfig, devicetree, etc.).

The **OpenThread subsystem API** integrates the external OpenThread stack into Zephyr. It builds upon Zephyr's native IEEE 802.15.4 driver API.

The **native IEEE 802.15.4 subsystem APIs** are exposed at different levels and address several audiences:

- shell (end users, application developers):
  - a set of IEEE 802.15.4 shell commands (see `shell> ieee802154 help`)
- application API (application developers):
  - IPv6, DGRAM and RAW sockets for actual peer-to-peer, multicast and broadcast data exchange between nodes including connection specific configuration (sample coming soon, see https://github.com/linux-wpan/wpan-tools/tree/master/examples for now which inspired our API and therefore has a similar socket API),
  - Kconfig and devicetree configuration options (net config library extension, subsystem-wide MAC and PHY Kconfig/DT options, driver/vendor specific Kconfig/DT options, watch out for options prefixed with IEEE802154/ieee802154),

  - Network Management: runtime configuration of the IEEE 802.15.4 protocols stack at the MAC (L2) and PHY (L1) levels (see *IEEE 802.15.4 Net Management*),
- L2 integration (subsystem contributors):
  - see *IEEE 802.15.4 L2*
  - implementation of Zephyr's internal L2-level socket and network context abstractions (context/socket operations, see *Network L2 Abstraction Layer*),
  - protocol-specific extension to the interface structure (see *Network Interface abstraction layer*)
  - protocol-specific extensions to the network packet structure (see *Network Packet Library*),
- OpenThread and native IEEE 802.15.4 share a common **driver API** (driver maintainers/contributors):
  - see *IEEE 802.15.4 Drivers*
  - a basic, mostly PHY-level driver API to be implemented by all drivers,
  - several "hard MAC" (hardware/firmware offloading) extension points for performance critical or timing sensitive aspects of the protocol

IEEE 802.15.4 Management API This is the main subsystem-specific API of interest to IEEE 802.15.4 **application developers** as it allows to configure the IEEE 802.15.4 subsystem at runtime. Other relevant interfaces for application developers are the typical shell, socket, Kconfig and devicetree APIs that can be accessed through Zephyr's generic subsystem-independent documentation. Look out for IEEE802154/ieee802154 prefixes there.

group `ieee802154_mgmt`

IEEE 802.15.4 net management library.

Since
1.0

Version
0.8.0

The IEEE 802.15.4 net management library provides runtime configuration features that applications can interface with directly.

Most of these commands are also accessible via shell commands. See the shell's help feature (`shell> ieee802154 help`).

> **Note**
>
> All section, table and figure references are to the IEEE 802.15.4-2020 standard.

Command Macros

IEEE 802.15.4 net management commands.

These IEEE 802.15.4 subsystem net management commands can be called by applications via *Network Management* macro.

All attributes and parameters are given in CPU byte order (scalars) or big endian (byte arrays) unless otherwise specified.

The following IEEE 802.15.4 MAC management service primitives are referenced in this enumeration:

- MLME-ASSOCIATE.request, see section 8.2.3
- MLME-DISASSOCIATE.request, see section 8.2.4
- MLME-SET/GET.request, see section 8.2.6
- MLME-SCAN.request, see section 8.2.11

The following IEEE 802.15.4 MAC data service primitives are referenced in this enumeration:

- MLME-DATA.request, see section 8.3.2

MAC PIB attributes (mac…/sec…): see sections 8.4.3 and 9.5. PHY PIB attributes (phy…): see section 11.3. Both are accessed through MLME-SET/GET primitives.

`NET_REQUEST_IEEE802154_SET_ACK`
: Sets AckTx for all subsequent MLME-DATA (aka TX) requests.

`NET_REQUEST_IEEE802154_UNSET_ACK`
: Unsets AckTx for all subsequent MLME-DATA requests.

`NET_REQUEST_IEEE802154_PASSIVE_SCAN`
: MLME-SCAN(PASSIVE, …) request.

  See *ieee802154_req_params* for associated command parameters.

`NET_REQUEST_IEEE802154_ACTIVE_SCAN`
: MLME-SCAN(ACTIVE, …) request.

  See *ieee802154_req_params* for associated command parameters.

`NET_REQUEST_IEEE802154_CANCEL_SCAN`
: Cancels an ongoing MLME-SCAN(…) command (non-standard).

`NET_REQUEST_IEEE802154_ASSOCIATE`
: MLME-ASSOCIATE(…) request.

`NET_REQUEST_IEEE802154_DISASSOCIATE`
: MLME-DISASSOCIATE(…) request.

`NET_REQUEST_IEEE802154_SET_CHANNEL`
: MLME-SET(phyCurrentChannel) request.

`NET_REQUEST_IEEE802154_GET_CHANNEL`
: MLME-GET(phyCurrentChannel) request.

`NET_REQUEST_IEEE802154_SET_PAN_ID`
: MLME-SET(macPanId) request.

`NET_REQUEST_IEEE802154_GET_PAN_ID`
: MLME-GET(macPanId) request.

NET_REQUEST_IEEE802154_SET_EXT_ADDR

Sets the extended interface address (non-standard), see sections 7.1 and 8.4.3.1, in big endian byte order.

NET_REQUEST_IEEE802154_GET_EXT_ADDR

like MLME-GET(macExtendedAddress) but in big endian byte order

NET_REQUEST_IEEE802154_SET_SHORT_ADDR

MLME-SET(macShortAddress) request, only allowed for co-ordinators.

NET_REQUEST_IEEE802154_GET_SHORT_ADDR

MLME-GET(macShortAddress) request.

NET_REQUEST_IEEE802154_GET_TX_POWER

MLME-SET(phyUnicastTxPower/phyBroadcastTxPower) request (currently not distinguished)

NET_REQUEST_IEEE802154_SET_TX_POWER

MLME-GET(phyUnicastTxPower/phyBroadcastTxPower) request.

NET_REQUEST_IEEE802154_SET_SECURITY_SETTINGS

Configures basic sec* MAC PIB attributes, implies macSecurityEnabled=true.

See *ieee802154_security_params* for associated command parameters.

NET_REQUEST_IEEE802154_GET_SECURITY_SETTINGS

Gets the configured sec* attributes.

See *ieee802154_security_params* for associated command parameters.

Event Macros

IEEE 802.15.4 net management events.

These IEEE 802.15.4 subsystem net management events can be subscribed to by applications via *net_mgmt_init_event_callback*, *net_mgmt_add_event_callback* and *net_mgmt_del_event_callback*.

NET_EVENT_IEEE802154_SCAN_RESULT

Signals the result of the *NET_REQUEST_IEEE802154_ACTIVE_SCAN* or *NET_REQUEST_IEEE802154_PASSIVE_SCAN* net management commands.

See *ieee802154_req_params* for associated event parameters.

struct ieee802154_req_params

#include <ieee802154_mgmt.h> Scanning parameters.

Used to request a scan and get results as well, see section 8.2.11.2

Public Members

uint32_t **channel_set**
: The set of channels to scan, use above macros to manage it.

uint32_t **duration**
: Duration of scan, per-channel, in milliseconds.

uint16_t **channel**
: Current channel in use as a result.

uint16_t **pan_id**
: Current pan_id in use as a result.

uint16_t **short_addr**
: in CPU byte order

uint8_t **addr**[*IEEE802154_MAX_ADDR_LENGTH*]
: in big endian

union ieee802154_req_params
: Result address.

uint8_t **len**
: length of address

uint8_t **lqi**
: Link quality information, between 0 and 255.

bool **association_permitted**
: Flag if association is permitted by the coordinator.

uint8_t ***beacon_payload**
: Additional payload of the beacon if any.

size_t **beacon_payload_len**
: Length of the additional payload.

struct **ieee802154_security_params**
: *#include <ieee802154_mgmt.h>* Security parameters.

Used to setup the link-layer security settings, see tables 9-9 and 9-10 in section 9.5.

Public Members

uint8_t **key**[16]
: secKeyDescriptor.secKey

uint8_t **key_len**
: Key length of 16 bytes is mandatory for standards conformance.

uint8_t **key_mode**

secKeyIdMode

uint8_t **level**

Used instead of a frame-specific SecurityLevel parameter when constructing the auxiliary security header.

IEEE 802.15.4 Driver API This is the main API of interest to IEEE 802.15.4 **driver developers**.

group **ieee802154_driver**

IEEE 802.15.4 driver API.

Since

1.0

Version

0.8.0

This API provides a common representation of vendor-specific hardware and firmware to the native IEEE 802.15.4 L2 and OpenThread stacks. **Application developers should never interface directly with this API.** It is of interest to driver maintainers only.

The IEEE 802.15.4 driver API consists of two separate parts:

- a basic, mostly PHY-level driver API to be implemented by all drivers,
- several optional MAC-level extension points to offload performance critical or timing sensitive aspects at MAC level to the driver hardware or firmware ("hard" MAC).

Implementing the basic driver API will ensure integration with the native L2 stack as well as basic support for OpenThread. Depending on the hardware, offloading to vendor-specific hardware or firmware features may be required to achieve full compliance with the Thread protocol or IEEE 802.15.4 subprotocols (e.g. fast enough ACK packages, precise timing of timed TX/RX in the TSCH or CSL subprotocols).

Whether or not MAC-level offloading extension points need to be implemented is to be decided by individual driver maintainers. Upper layers SHOULD provide a "soft" MAC fallback whenever possible.

Note

All section, table and figure references are to the IEEE 802.15.4-2020 standard.

IEEE 802.15.4, section 7.4.2: MAC header information elements

enum **ieee802154_ie_type**

Information Element Types.

See sections 7.4.2.1 and 7.4.3.1.

Values:

enumerator **IEEE802154_IE_TYPE_HEADER** = 0x0

Header type.

enumerator **IEEE802154_IE_TYPE_PAYLOAD**

Payload type.

enum **ieee802154_header_ie_element_id**

Header Information Element IDs.

See section 7.4.2.1, table 7-7, partial list, only IEs actually used are implemented.

Values:

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_VENDOR_SPECIFIC_IE** = 0x00

Vendor specific IE.

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_CSL_IE** = 0x1a

CSL IE.

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_RIT_IE** = 0x1b

RIT IE.

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_RENDEZVOUS_TIME_IE** = 0x1d

Rendezvous time IE.

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_TIME_CORRECTION_IE** = 0x1e

Time correction IE.

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_HEADER_TERMINATION_1** = 0x7e

Header termination 1.

enumerator **IEEE802154_HEADER_IE_ELEMENT_ID_HEADER_TERMINATION_2** = 0x7f

Header termination 2.

static inline int16_t **ieee802154_header_ie_get_time_correction_us**(struct *ieee802154_header_ie_time_correcti* *ie)

Retrieve the time correction value in microseconds from a Time Correction IE, see section 7.4.2.7.

Parameters

- **ie** – **[in]** pointer to the Time Correction IE structure

Returns

The time correction value in microseconds.

static inline void **ieee802154_header_ie_set_element_id**(struct ieee802154_header_ie *ie, uint8_t element_id)

Set the element ID of a header IE.

Parameters

- **ie** – **[in]** pointer to a header IE
- **element_id** – **[in]** IE element id in CPU byte order

static inline uint8_t **ieee802154_header_ie_get_element_id**(struct ieee802154_header_ie *ie)

Get the element ID of a header IE.

Parameters

- **ie** – **[in]** pointer to a header IE

Returns
header IE element id in CPU byte order

IEEE802154_HEADER_IE_HEADER_LENGTH

The header IE's header length (2 bytes).

IEEE802154_DEFINE_HEADER_IE_VENDOR_SPECIFIC(_vendor_oui, _vendor_specific_info, _vendor_specific_info_len)

Define a vendor specific header IE, see section 7.4.2.3.

Example usage (all parameters in little endian):

```
uint8_t vendor_specific_info[] = {...some vendor specific IE content...};
struct ieee802154_header_ie header_ie = IEEE802154_DEFINE_HEADER_IE_VENDOR_
↪SPECIFIC(
    {0x9b, 0xb8, 0xea}, vendor_specific_info, sizeof(vendor_specific_info));
```

Parameters

- **_vendor_oui** – an initializer for a 3 byte vendor oui array in little endian
- **_vendor_specific_info** – pointer to a variable length uint8_t array with the vendor specific IE content
- **_vendor_specific_info_len** – the length of the vendor specific IE content (in bytes)

IEEE802154_DEFINE_HEADER_IE_CSL_REDUCED(_csl_phase, _csl_period)

Define a reduced CSL IE, see section 7.4.2.3.

Example usage (all parameters in CPU byte order):

```
uint16_t csl_phase = ...;
uint16_t csl_period = ...;
struct ieee802154_header_ie header_ie =
    IEEE802154_DEFINE_HEADER_IE_CSL_REDUCED(csl_phase, csl_period);
```

Parameters

- **_csl_phase** – CSL phase in CPU byte order
- **_csl_period** – CSL period in CPU byte order

IEEE802154_DEFINE_HEADER_IE_CSL_FULL(_csl_phase, _csl_period, _csl_rendezvous_time)

Define a full CSL IE, see section 7.4.2.3.

Example usage (all parameters in CPU byte order):

```
uint16_t csl_phase = ...;
uint16_t csl_period = ...;
uint16_t csl_rendezvous_time = ...;
struct ieee802154_header_ie header_ie =
    IEEE802154_DEFINE_HEADER_IE_CSL_REDUCED(csl_phase, csl_period, csl_rendezvous_
↪time);
```

Parameters

- **_csl_phase** – CSL phase in CPU byte order
- **_csl_period** – CSL period in CPU byte order

- **_csl_rendezvous_time** – CSL rendezvous time in CPU byte order

IEEE802154_DEFINE_HEADER_IE_TIME_CORRECTION(_ack, _time_correction_us)

Define a Time Correction IE, see section 7.4.2.7.

Example usage (parameter in CPU byte order):

```
uint16_t time_sync_info = ...;
struct ieee802154_header_ie header_ie =
    IEEE802154_DEFINE_HEADER_IE_TIME_CORRECTION(true, time_sync_info);
```

Parameters

- **_ack** – whether or not the enhanced ACK frame that receives this IE is an ACK (true) or NACK (false)
- **_time_correction_us** – the positive or negative deviation from expected RX time in microseconds

IEEE802154_TIME_CORRECTION_HEADER_IE_LEN

The length in bytes of a “Time Correction” header IE.

IEEE802154_HEADER_TERMINATION_1_HEADER_IE_LEN

The length in bytes of a “Header Termination 1” header IE.

IEEE 802.15.4-2020, Section 10: General PHY requirements

enum ieee802154_phy_channel_page

PHY channel pages, see section 10.1.3.

A device driver must support the mandatory channel pages, frequency bands and channels of at least one IEEE 802.15.4 PHY.

Channel page and number assignments have developed over several versions of the standard and are not particularly well documented. Therefore some notes about peculiarities of channel pages and channel numbering:

- The 2006 version of the standard had a read-only phyChannelsSupported PHY PIB attribute that represented channel page/number combinations as a bitmap. This attribute was removed in later versions of the standard as the number of channels increased beyond what could be represented by a bit map. That’s the reason why it was decided to represent supported channels as a combination of channel pages and ranges instead.
- In the 2020 version of the standard, 13 channel pages are explicitly defined, but up to 32 pages could in principle be supported. This was a hard requirement in the 2006 standard. In later standards it is implicit from field specifications, e.g. the MAC PIB attribute macChannelPage (section 8.4.3.4, table 8-100) or channel page fields used in the SRM protocol (see section 8.2.26.5).
- ASK PHY (channel page one) was deprecated in the 2015 version of the standard. The 2020 version of the standard is a bit ambivalent whether channel page one disappeared as well or should be interpreted as O-QPSK now (see section 10.1.3.3). In Zephyr this ambivalence is resolved by deprecating channel page one.
- For some PHYs the standard doesn’t clearly specify a channel page, namely the GFSK, RS-GFSK, CMB and TASK PHYs. These are all rather new and left out in our list as long as no driver wants to implement them.

Warning

The bit numbers are not arbitrary but represent the channel page numbers as defined by the standard. Therefore do not change the bit numbering.

Values:

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_ZERO_OQPSK_2450_BPSK_868_915` = *BIT*(0)

Channel page zero supports the 2.4G channels of the O-QPSK PHY and all channels from the BPSK PHYs initially defined in the 2003 editions of the standard.

For channel page zero, 16 channels are available in the 2450 MHz band (channels 11-26, O-QPSK), 10 in the 915 MHz band (channels 1-10, BPSK), and 1 in the 868 MHz band (channel 0, BPSK).

You can retrieve the channels supported by a specific driver on this page via *IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES* attribute.

see section 10.1.3.3

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_ONE_DEPRECATED` = *BIT*(1)

Formerly ASK PHY - deprecated in IEEE 802.15.4-2015.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_TWO_OQPSK_868_915` = *BIT*(2)

O-QPSK PHY - 868 MHz and 915 MHz bands, see section 10.1.3.3.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_THREE_CSS` = *BIT*(3)

CSS PHY - 2450 MHz band, see section 10.1.3.4.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_FOUR_HRP_UWB` = *BIT*(4)

UWB PHY - SubG, low and high bands, see section 10.1.3.5.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_FIVE_OQPSK_780` = *BIT*(5)

O-QPSK PHY - 780 MHz band, see section 10.1.3.2.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_SIX_RESERVED` = *BIT*(6)

reserved - not currently assigned

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_SEVEN_MSK` = *BIT*(7)

MSK PHY - 780 MHz and 2450 MHz bands, see sections 10.1.3.6, 10.1.3.7.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_EIGHT_LRP_UWB` = *BIT*(8)

LRP UWB PHY, see sections 10.1.3.8.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_NINE_SUN_PREDEFINED` = *BIT*(9)

SUN FSK/OFDM/O-QPSK PHYs - predefined bands, operating modes and channels, see sections 10.1.3.9.

enumerator `IEEE802154_ATTR_PHY_CHANNEL_PAGE_TEN_SUN_FSK_GENERIC` = *BIT*(10)

SUN FSK/OFDM/O-QPSK PHYs - generic modulation and channel description, see sections 10.1.3.9, 7.4.4.11.

enumerator **IEEE802154_ATTR_PHY_CHANNEL_PAGE_ELEVEN_OQPSK_2380** = *BIT*(11)

O-QPSK PHY - 2380 MHz band, see section 10.1.3.10.

enumerator **IEEE802154_ATTR_PHY_CHANNEL_PAGE_TWELVE_LECIM** = *BIT*(12)

LECIM DSSS/FSK PHYs, see section 10.1.3.11.

enumerator **IEEE802154_ATTR_PHY_CHANNEL_PAGE_THIRTEEN_RCC** = *BIT*(13)

RCC PHY, see section 10.1.3.12.

IEEE802154_DEFINE_PHY_SUPPORTED_CHANNELS(drv_attr, from, to)

Allocate memory for the supported channels driver attribute with a single channel range constant across all driver instances.

This is what most IEEE 802.15.4 drivers need.

Example usage:

```
IEEE802154_DEFINE_PHY_SUPPORTED_CHANNELS(drv_attr, 11, 26);
```

The attribute may then be referenced like this:

```
... &drv_attr.phy_supported_channels ...
```

See *ieee802154_attr_get_channel_page_and_range()* for a further shortcut that can be combined with this macro.

Parameters

- **drv_attr** – name of the local static variable to be declared for the local attributes structure
- **from** – the first channel to be supported
- **to** – the last channel to be supported

IEEE 802.15.4-2020, Section 15: HRP UWB PHY

For HRP UWB the symbol period is derived from the preamble symbol period (T_psym), see section 11.3, table 11-1 and section 15.2.5, table 15-4 (confirmed in IEEE 802.15.4z, section 15.1). Choosing among those periods cannot be done based on channel page and channel alone. The mean pulse repetition frequency must also be known, see the 'UwbPrf' parameter of the MCPS-DATA.request primitive (section 8.3.2, table 8-88) and the preamble parameters for HRP-ERDEV length 91 codes (IEEE 802.15.4z, section 15.2.6.2, table 15-7b).

enum **ieee802154_phy_hrp_uwb_nominal_prf**

represents the nominal pulse rate frequency of an HRP UWB PHY

Values:

enumerator **IEEE802154_PHY_HRP_UWB_PRF_OFF** = 0

standard modes, see section 8.3.2, table 8-88.

enumerator **IEEE802154_PHY_HRP_UWB_NOMINAL_4_M** = *BIT*(0)

enumerator **IEEE802154_PHY_HRP_UWB_NOMINAL_16_M** = *BIT*(1)

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_64_M = *BIT*(2)

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_64_M_BPRF = *BIT*(3)

enhanced ranging device (ERDEV) modes not specified in table 8-88, see IEEE 802.15.4z, section 15.1, section 15.2.6.2, table 15-7b, section 15.3.4.2 and section 15.3.4.3.

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_128_M_HPRF = *BIT*(4)

enumerator IEEE802154_PHY_HRP_UWB_NOMINAL_256_M_HPRF = *BIT*(5)

IEEE802154_PHY_HRP_UWB_PRF4_TPSYM_SYMBOL_PERIOD_NS

Nominal PRF 4MHz symbol period.

IEEE802154_PHY_HRP_UWB_PRF16_TPSYM_SYMBOL_PERIOD_NS

Nominal PRF 16MHz symbol period.

IEEE802154_PHY_HRP_UWB_PRF64_TPSYM_SYMBOL_PERIOD_NS

Nominal PRF 64MHz symbol period.

IEEE802154_PHY_HRP_UWB_ERDEV_TPSYM_SYMBOL_PERIOD_NS

ERDEV symbol period.

IEEE802154_PHY_HRP_UWB_RDEV

RDEV device mask.

IEEE802154_PHY_HRP_UWB_ERDEV

ERDEV device mask.

IEEE 802.15.4 Driver API

enum ieee802154_hw_caps

IEEE 802.15.4 driver capabilities.

Any driver properties that can be represented in binary form should be modeled as capabilities. These are called “hardware” capabilities for historical reasons but may also represent driver firmware capabilities (e.g. MAC offloading features).

Values:

enumerator IEEE802154_HW_ENERGY_SCAN = *BIT*(0)

Energy detection (ED) supported (optional)

enumerator IEEE802154_HW_FCS = *BIT*(1)

Frame checksum verification supported.

enumerator IEEE802154_HW_FILTER = *BIT*(2)

Filtering of PAN ID, extended and short address supported.

enumerator **IEEE802154_HW_PROMISC** = *BIT*(3)

Promiscuous mode supported.

enumerator **IEEE802154_HW_CSMA** = *BIT*(4)

CSMA-CA procedure supported on TX.

enumerator **IEEE802154_HW_TX_RX_ACK** = *BIT*(5)

Waits for ACK on TX if AR bit is set in TX pkt.

enumerator **IEEE802154_HW_RETRANSMISSION** = *BIT*(6)

Supports retransmission on TX ACK timeout.

enumerator **IEEE802154_HW_RX_TX_ACK** = *BIT*(7)

Sends ACK on RX if AR bit is set in RX pkt.

enumerator **IEEE802154_HW_TXTIME** = *BIT*(8)

TX at specified time supported.

enumerator **IEEE802154_HW_SLEEP_TO_TX** = *BIT*(9)

TX directly from sleep supported.

```
@note This HW capability does not conform to the requirements
specified in #61227 as it closely couples the driver to OpenThread's
capability and device model which is different from Zephyr's:
 - "Sleeping" is a well defined term in Zephyr related to internal
   power and thread management and different from "RX off" as
   defined in OT.
 - Currently all OT-capable drivers have the "sleep to TX"
   capability anyway plus we expect future drivers to implement it
   ootb as well, so no information is actually conveyed by this
   capability.
 - The `start()`/`stop()` API of a net device controls the
   interface's operational state. Drivers MUST respond with
   -ENETDOWN when calling `tx()` while their operational state is
   "DOWN", only devices in the "UP" state MAY transmit packets (RFC
   2863).
 - A migration path has been defined in #63670 for actual removal of
   this capability in favor of a standard compliant
   `configure(rx_on/rx_off)` call, see there for details.

@deprecated Drivers and L2 SHALL not introduce additional references
to this capability and remove existing ones as outlined in #63670.
```

enumerator **IEEE802154_HW_RXTIME** = *BIT*(10)

Timed RX window scheduling supported.

enumerator **IEEE802154_HW_TX_SEC** = *BIT*(11)

TX security supported (key management, encryption and authentication)

enumerator **IEEE802154_RX_ON_WHEN_IDLE** = *BIT*(12)

RxOnWhenIdle handling supported.

enum **ieee802154_filter_type**

Filter type, see *ieee802154_radio_api::filter*.

Values:

enumerator `IEEE802154_FILTER_TYPE_IEEE_ADDR`
Address type filter.

enumerator `IEEE802154_FILTER_TYPE_SHORT_ADDR`
Short address type filter.

enumerator `IEEE802154_FILTER_TYPE_PAN_ID`
PAN id type filter.

enumerator `IEEE802154_FILTER_TYPE_SRC_IEEE_ADDR`
Source address type filter.

enumerator `IEEE802154_FILTER_TYPE_SRC_SHORT_ADDR`
Source short address type filter.

enum `ieee802154_event`
Driver events, see *IEEE802154_CONFIG_EVENT_HANDLER*.

Values:

enumerator `IEEE802154_EVENT_TX_STARTED`
Data transmission started.

enumerator `IEEE802154_EVENT_RX_FAILED`
Data reception failed.

enumerator `IEEE802154_EVENT_RX_OFF`
An RX slot ended, requires *IEEE802154_HW_RXTIME*.

> **Note**
>
> This event SHALL not be triggered by drivers when RX is synchronously switched of due to a call to `stop()` or an RX slot being configured.

enum `ieee802154_rx_fail_reason`
RX failed event reasons, see *IEEE802154_EVENT_RX_FAILED*.

Values:

enumerator `IEEE802154_RX_FAIL_NOT_RECEIVED`
Nothing received.

enumerator `IEEE802154_RX_FAIL_INVALID_FCS`
Frame had invalid checksum.

enumerator IEEE802154_RX_FAIL_ADDR_FILTERED
Address did not match.

enumerator IEEE802154_RX_FAIL_OTHER
General reason.

enum ieee802154_tx_mode
IEEE 802.15.4 Transmission mode.

Values:

enumerator IEEE802154_TX_MODE_DIRECT
Transmit packet immediately, no CCA.

enumerator IEEE802154_TX_MODE_CCA
Perform CCA before packet transmission.

enumerator IEEE802154_TX_MODE_CSMA_CA
Perform full CSMA/CA procedure before packet transmission.

Note

requires IEEE802154_HW_CSMA capability.

enumerator IEEE802154_TX_MODE_TXTIME
Transmit packet in the future, at the specified time, no CCA.

Note

requires IEEE802154_HW_TXTIME capability.

enumerator IEEE802154_TX_MODE_TXTIME_CCA
Transmit packet in the future, perform CCA before transmission.

Note

requires IEEE802154_HW_TXTIME capability.

Note

Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator IEEE802154_TX_MODE_COMMON_COUNT
Number of modes defined in ieee802154_tx_mode.

enumerator IEEE802154_TX_MODE_PRIV_START = *IEEE802154_TX_MODE_COMMON_COUNT*

This and higher values are specific to the protocol- or driver-specific extensions.

enum ieee802154_fpb_mode

IEEE 802.15.4 Frame Pending Bit table address matching mode.

Values:

enumerator IEEE802154_FPB_ADDR_MATCH_THREAD

The pending bit shall be set only for addresses found in the list.

enumerator IEEE802154_FPB_ADDR_MATCH_ZIGBEE

The pending bit shall be cleared for short addresses found in the list.

enum ieee802154_config_type

IEEE 802.15.4 driver configuration types.

Values:

enumerator IEEE802154_CONFIG_AUTO_ACK_FPB

Indicates how the driver should set the Frame Pending bit in ACK responses for Data Requests.

If enabled, the driver should determine whether to set the bit or not based on the information provided with *IEEE802154_CONFIG_ACK_FPB* config and FPB address matching mode specified. Otherwise, Frame Pending bit should be set to 1 (see section 6.7.3).

Note

requires *IEEE802154_HW_TX_RX_ACK* capability and is available in any interface operational state.

enumerator IEEE802154_CONFIG_ACK_FPB

Indicates whether to set ACK Frame Pending bit for specific address or not.

Disabling the Frame Pending bit with no address provided (NULL pointer) should disable it for all enabled addresses.

Note

requires *IEEE802154_HW_TX_RX_ACK* capability and is available in any interface operational state.

enumerator IEEE802154_CONFIG_PAN_COORDINATOR

Indicates whether the device is a PAN coordinator.

This influences packet filtering.

Note

Available in any interface operational state.

enumerator `IEEE802154_CONFIG_PROMISCUOUS`

Enable/disable promiscuous mode.

Note

Available in any interface operational state.

enumerator `IEEE802154_CONFIG_EVENT_HANDLER`

Specifies new IEEE 802.15.4 driver event handler.

Specifying NULL as a handler will disable events notification.

Note

Available in any interface operational state.

enumerator `IEEE802154_CONFIG_MAC_KEYS`

Updates MAC keys, key index and the per-key frame counter for drivers supporting transmit security offloading, see section 9.5, tables 9-9 and 9-10.

The key configuration SHALL NOT be accepted if the frame counter (in case frame counter per key is true) is not strictly larger than the current frame counter associated with the same key, see sections 8.2.2, 9.2.4 g/h) and 9.4.3.

Note

Requires *IEEE802154_HW_TX_SEC* capability and is available in any interface operational state.

enumerator `IEEE802154_CONFIG_FRAME_COUNTER`

Sets the current MAC frame counter value associated with the interface for drivers supporting transmit security offloading, see section 9.5, table 9-8, secFrameCounter.

Note

Requires *IEEE802154_HW_TX_SEC* capability and is available in any interface operational state.

Warning

The frame counter MUST NOT be accepted if it is not strictly greater than the current frame counter associated with the interface, see sections 8.2.2, 9.2.4 g/h) and 9.4.3. Otherwise the replay protection provided by the frame counter may

be compromised. Drivers SHALL return -EINVAL in case the configured frame counter does not conform to this requirement.

enumerator `IEEE802154_CONFIG_FRAME_COUNTER_IF_LARGER`

Sets the current MAC frame counter value if the provided value is greater than the current one.

Note

Requires *IEEE802154_HW_TX_SEC* capability and is available in any interface operational state.

Warning

This configuration option does not conform to the requirements specified in #61227 as it is redundant with *IEEE802154_CONFIG_FRAME_COUNTER*, and will therefore be deprecated in the future.

enumerator `IEEE802154_CONFIG_RX_SLOT`

Set or unset a radio reception window (RX slot).

This can be used for any scheduled reception, e.g.: Zigbee GP device, CSL, TSCH, etc.

The start and duration parameters of the RX slot are relative to the network subsystem's local clock. If the start parameter of the RX slot is -1 then any previously configured RX slot SHALL be canceled immediately. If the start parameter is any value in the past (including 0) or the duration parameter is zero then the receiver SHALL remain off forever until the RX slot has either been removed or re-configured to point to a future start time. If an RX slot is configured while the previous RX slot is still scheduled, then the previous slot SHALL be cancelled and the new slot scheduled instead.

RX slots MAY be programmed while the driver is "DOWN". If any past or future RX slot is configured when calling `start()` then the interface SHALL be placed in "UP" state but the receiver SHALL not be started.

The driver SHALL take care to start/stop the receiver autonomously, asynchronously and automatically around the RX slot. The driver SHALL resume power just before the RX slot and suspend it again after the slot unless another programmed event forces the driver not to suspend. The driver SHALL switch to the programmed channel before the RX slot and back to the channel set with set_channel() after the RX slot. If the driver interface is "DOWN" when the start time of an RX slot arrives, then the RX slot SHALL not be observed and the receiver SHALL remain off.

If the driver is "UP" while configuring an RX slot, the driver SHALL turn off the receiver immediately and (possibly asynchronously) put the driver into the lowest possible power saving mode until the start of the RX slot. If the driver is "UP" while the RX slot is deleted, then the driver SHALL enable the receiver immediately. The receiver MUST be ready to receive packets before returning from the `configure()` operation in this case.

This behavior means that setting an RX slot implicitly sets the MAC PIB attribute macRxOnWhenIdle (see section 8.4.3.1, table 8-94) to "false" while deleting the RX

slot implicitly sets macRxOnWhenIdle to “true”.

Note

requires *IEEE802154_HW_RXTIME* capability and is available in any interface operational state.

Note

Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator `IEEE802154_CONFIG_CSL_PERIOD`

Enables or disables a device as a CSL receiver and configures its CSL period.

Configures the CSL period in units of 10 symbol periods. Values greater than zero enable CSL if the driver supports it and the device starts to operate as a CSL receiver. Setting this to zero disables CSL on the device. If the driver does not support CSL, the configuration call SHALL return -ENOTSUP.

See section 7.4.2.3 and section 8.4.3.6, table 8-104, macCslPeriod.

To offload CSL receiver timing to the driver the upper layer SHALL combine several configuration options in the following way:

i. Use *IEEE802154_CONFIG_ENH_ACK_HEADER_IE* once with an appropriate prefilled CSL IE and the CSL phase set to an arbitrary value or left uninitialized. The CSL phase SHALL be injected on-the-fly by the driver at runtime as outlined in 2. below. Adding a short and extended address will inform the driver of the specific CSL receiver to which it SHALL inject CSL IEs. If no addresses are given then the CSL IE will be injected into all enhanced ACK frames as soon as CSL is enabled. This configuration SHALL be done before enabling CSL by setting a CSL period greater than zero.

ii. Configure *IEEE802154_CONFIG_EXPECTED_RX_TIME* immediately followed by *IEEE802154_CONFIG_CSL_PERIOD*. To prevent race conditions, the upper layer SHALL ensure that the receiver is not enabled during or between the two calls (e.g. by a previously configured RX slot) nor SHALL a frame be transmitted concurrently.

    The expected RX time SHALL point to the end of SFD of an ideally timed RX frame in an arbitrary past or future CSL channel sample, i.e. whose “end of SFD” arrives exactly at the locally predicted time inside the CSL channel sample.

    The driver SHALL derive CSL anchor points and the CSL phase from the given expected RX time as follows:

```
cslAnchorPointNs = last expected RX time
                   + PHY-specific PHR duration in ns

startOfMhrNs = start of MHR of the frame containing the
               CSL IE relative to the local network clock

cslPhase = (startOfMhrNs - cslAnchorPointNs)
```

(continues on next page)

(continued from previous page)

```
           / (10 * PHY specific symbol period in ns)
           % cslPeriod
```

The driver SHALL set the CSL phase in the IE configured in 1. and inject that IE on-the-fly into outgoing enhanced ACK frames if the destination address conforms to the IE's address filter.

iii. Use *IEEE802154_CONFIG_RX_SLOT* periodically to schedule each CSL channel sample early enough before its start time. The size of the CSL channel sample SHALL take relative clock drift and scheduling uncertainties with respect to CSL transmitters into account as specified by the standard such that at least the full SHR of a legitimate RX frame is guaranteed to land inside the channel sample.

To this avail, the last configured expected RX time plus an integer number of CSL periods SHALL point to a fixed offset of the RX slot (not necessarily its center):

```
expectedRxTimeNs_N = last expected RX time
    + N * (cslPeriod * 10 * PHY-specific symbol period in ns)

expectedRxTimeNs_N - rxSlot_N.start == const for all N
```

While the configured CSL period is greater than zero, drivers SHOULD validate the offset of the expected RX time inside each RX slot accordingly. If the driver finds that the offset varies from slot to slot, drivers SHOULD log the difference but SHALL nevertheless accept and schedule the RX slot with a zero success value to work around minor implementation or rounding errors in upper layers.

Configure and start a CSL receiver:

```
ENH_ACK_HEADER_IE
   |
   | EXPECTED_RX_TIME (end of SFD of a perfectly timed RX frame
   |    |              in any past or future channel sample)
   |    |
   |    | CSL_PERIOD (>0)            RX_SLOT
   |    |    |                          |
   v    v    v                          v
-----------------------------------------------[-CSL channel sample ]----+
                                    ^                                     |
                                    |                                     |
                                    +---------------------- loop ---------+
```

Disable CSL on the receiver:

```
CSL_PERIOD (=0)
   |
   v
---------------------
```

Update the CSL period to a new value:

```
EXPECTED_RX_TIME (based on updated period)
   |
   |  CSL_PERIOD (>0, updated)       RX_SLOT
   |     |                             |
   v     v                             v
-----------------------------------------------[-CSL channel sample ]----+
                                    ^                                     |
                                    |                                     |
                                    +---------------------- loop ---------+
```

Note

Confusingly the standard calls the CSL receiver “CSL

coordinator” (i.e. “coordinating the CSL protocol timing”, see section 6.12.2.2), although, typically, a CSL coordinator is NOT also an IEEE 802.15.4 FFD coordinator or PAN coordintor but a simple RFD end device (compare the device roles outlined in sections 5.1, 5.3, 5.5 and 6.1). To avoid confusion we therefore prefer calling CSL coordinators (typically an RFD end device) “CSL receivers” and CSL peer devices (typically FFD coordinators or PAN coordinators) “CSL

transmitters”. Also note that at this time, we do NOT support unsynchronized transmission with CSL wake up frames as specified in section 6.12.2.4.4.

Note

Available in any interface operational state.

Note

Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator `IEEE802154_CONFIG_EXPECTED_RX_TIME`

Configure a timepoint at which an RX frame is expected to arrive.

Configure the nanosecond resolution timepoint relative to the network subsystem’s local clock at which an RX frame’s end of SFD (i.e. equivalently its end of SHR, start of PHR, or in the case of PHYs with RDEV or ERDEV capability the RMARKER) is expected to arrive at the local antenna assuming perfectly synchronized local and remote network clocks and zero distance between antennas.

This parameter MAY be used to offload parts of timing sensitive TDMA (e.g. TSCH, beacon-enabled PAN including DSME), low-energy (e.g. CSL, RIT) or ranging (TDoA) protocols to the driver. In these protocols, medium access is tightly controlled such that the expected arrival time of a frame can be predicted within a well-defined time window. This feature will typically be combined with *IEEE802154_CONFIG_RX_SLOT* although this is not a hard requirement.

The “expected RX time” MAY be interpreted slightly differently depending on the protocol context:

- CSL phase (i.e. time to the next expected CSL transmission) or anchor time (i.e. any arbitrary timepoint with “zero CSL phase”) SHALL be derived by adding the PHY header duration to the expected RX time to calculate the “start of MHR” (“first symbol of MAC”, see section 6.12.2.1) required by the CSL protocol, compare *IEEE802154_CONFIG_CSL_PERIOD*.
- In TSCH the expected RX time MAY be set to macTsRxOffset + macTsRxWait / 2. Then the time correction SHALL be calculated as the expected RX time minus actual arrival timestamp, see section 6.5.4.3.
- In ranging applications, time difference of arrival (TDOA) MAY be calculated inside the driver comparing actual RMARKER timestamps against the assumed synchronized time at which the ranging frame was sent, see IEEE 802.15.4z.

In case of periodic protocols (e.g. CSL channel samples, periodic beacons of a single PAN, periodic ranging “blinks”), a single timestamp at any time in the past or in

the future may be given from which other expected timestamps can be derived by adding or subtracting multiples of the RX period. See e.g. the CSL documentation in this API.

Additionally this parameter MAY be used by drivers to discipline their local representation of a distributed network clock by deriving synchronization instants related to a remote representation of the same clock (as in PTP).

Note

Available in any interface operational state.

Note

Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

enumerator `IEEE802154_CONFIG_ENH_ACK_HEADER_IE`

Adds a header information element (IE) to be injected into enhanced ACK frames generated by the driver if the given destination address filter matches.

Drivers implementing the *IEEE802154_HW_RX_TX_ACK* capability generate ACK frames autonomously. Setting this configuration will ask the driver to inject the given preconfigured header IE when generating enhanced ACK frames where appropriate by the standard. IEs for all other frame types SHALL be provided by L2.

The driver shall return -ENOTSUP in the following cases:
- It does not support the *IEEE802154_HW_RX_TX_ACK*,
- It does not support header IE injection,
- It cannot inject the runtime fields on-the-fly required for the given IE element ID (see list below).

Enhanced ACK header IEs (element IDs in parentheses) that either need to be rejected or explicitly supported and parsed by the driver because they require on-the-fly timing information injection are:
- CSL IE (0x1a)
- Rendezvous Time IE (0x1d)
- Time Correction IE (0x1e)

Drivers accepting this configuration option SHALL check the list of configured IEs for each outgoing enhanced ACK frame, select the ones appropriate for the received frame based on their element ID, inject any required runtime information on-the-fly and include the selected IEs into the enhanced ACK frame's MAC header.

Drivers supporting enhanced ACK header IE injection SHALL autonomously inject header termination IEs as required by the standard.

A destination short address and extended address MAY be given by L2 to filter the devices to which the given IE is included. Setting the short address to the broadcast address and the extended address to NULL will inject the given IE into all ACK frames unless a more specific filter is also present for any given destination device (fallback configuration). L2 SHALL take care to either set both address fields to valid device addresses or none.

This configuration type may be called several times with distinct element IDs and/or addresses. The driver SHALL either store all configured IE/address combinations or return -ENOMEM if no additional configuration can be stored.

Configuring a header IE with a previously configured element ID and address filter SHALL override the previous configuration. This implies that repetition of the same header IE/address combination is NOT supported.

Configuring an existing element ID/address filter combination with the header IE's length field set to zero SHALL remove that configuration. SHALL remove the fallback configuration if no address is given.

Configuring a header IE for an address filter with the header IE pointer set to NULL SHALL remove all header IE's for that address filter. SHALL remove ALL header IE configuration (including but not limited to fallbacks) if no address is given.

If any of the deleted configurations didn't previously exist, then the call SHALL be ignored. Whenever the length field is set to zero, the content fields MUST NOT be accessed by the driver.

L2 SHALL minimize the space required to keep IE configuration inside the driver by consolidating address filters and by removing configuration that is no longer required.

Note

requires *IEEE802154_HW_RX_TX_ACK* capability and is available in any interface operational state. Currently we only support header IEs but that may change in the future.

Note

Required for Thread 1.2 Coordinated Sampled Listening feature (see Thread specification 1.2.0, ch. 3.2.6.3).

Note

Required for Thread 1.2 Link Metrics feature (see Thread specification 1.2.0, ch. 4.11.3.3).

enumerator `IEEE802154_CONFIG_RX_ON_WHEN_IDLE`

Enable/disable RxOnWhenIdle MAC PIB attribute (Table 8-94).

Since there is no clear guidance in IEEE 802.15.4 specification about the definition of an "idle period", this implementation expects that drivers use the RxOnWhenIdle attribute to determine next radio state (false –> off, true –> receive) in the following scenarios:

- Finalization of a regular frame reception task, provided that:
  - The frame is received without errors and passes the filtering and it's not an spurious ACK.
  - ACK is not requested or transmission of ACK is not possible due to internal conditions.
- Finalization of a frame transmission or transmission of an ACK frame, when ACK is not requested in the transmitted frame.
- Finalization of the reception operation of a requested ACK due to:
  - ACK timeout expiration.
  - Reception of an invalid ACK or not an ACK frame.
  - Reception of the proper ACK, unless the transmitted frame was a Data Request Command and the frame pending bit on the received ACK is set to true.

In this case the radio platform implementation SHOULD keep the receiver on until a determined timeout which triggers an idle period start.
- Finalization of a stand alone CCA task.
- Finalization of a CCA operation with busy result during CSMA/CA procedure.
- Finalization of an Energy Detection task.
- Finalization of a scheduled radio reception window (see *IEEE802154_CONFIG_RX_SLOT*).

enumerator **IEEE802154_CONFIG_COMMON_COUNT**

Number of types defined in ieee802154_config_type.

enumerator **IEEE802154_CONFIG_PRIV_START** = *IEEE802154_CONFIG_COMMON_COUNT*

This and higher values are specific to the protocol- or driver-specific extensions.

enum **ieee802154_attr**

IEEE 802.15.4 driver attributes.

See *ieee802154_attr_value* and *ieee802154_radio_api* for usage details.

Values:

enumerator **IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_PAGES**

Retrieves a bit field with supported channel pages.

This attribute SHALL be implemented by all drivers.

enumerator **IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES**

Retrieves a pointer to the array of supported channel ranges within the currently configured channel page.

This attribute SHALL be implemented by all drivers.

enumerator **IEEE802154_ATTR_PHY_HRP_UWB_SUPPORTED_PRFS**

Retrieves a bit field with supported HRP UWB nominal pulse repetition frequencies.

This attribute SHALL be implemented by all devices that support channel page four (HRP UWB).

enumerator **IEEE802154_ATTR_COMMON_COUNT**

Number of attributes defined in ieee802154_attr.

enumerator **IEEE802154_ATTR_PRIV_START** = *IEEE802154_ATTR_COMMON_COUNT*

This and higher values are specific to the protocol- or driver-specific extensions.

typedef void (***energy_scan_done_cb_t**)(const struct *device* *dev, int16_t max_ed)

Energy scan callback.

typedef void (***ieee802154_event_cb_t**)(const struct *device* *dev, enum *ieee802154_event* evt, void *event_params)

Driver event callback.

static inline int **ieee802154_attr_get_channel_page_and_range**(enum *ieee802154_attr* attr, const enum *ieee802154_phy_channel_page* phy_supported_channel_page, const struct *ieee802154_phy_supported_channels* *phy_supported_channels, struct *ieee802154_attr_value* *value)

Helper function to handle channel page and range to be called from drivers' attr_get() implementation.

This only applies to drivers with a single channel page.

Parameters

- **attr** – The attribute to be retrieved.
- **phy_supported_channel_page** – The driver's unique channel page.
- **phy_supported_channels** – Pointer to the structure that contains the driver's channel range or ranges.
- **value** – The pointer to the value struct provided by the user.

Return values

- **0** – if the attribute could be resolved
- **-ENOENT** – if the attribute could not be resolved

IEEE802154_HW_CAPS_BITS_COMMON_COUNT

Number of bits used by ieee802154_hw_caps type.

IEEE802154_HW_CAPS_BITS_PRIV_START

This and higher values are specific to the protocol- or driver-specific extensions.

IEEE802154_CONFIG_RX_SLOT_NONE

Configuring an RX slot with the start parameter set to this value will cancel and delete any previously configured RX slot.

IEEE802154_CONFIG_RX_SLOT_OFF

Configuring an RX slot with this start parameter while the driver is "down", will keep RX off when the driver is being started.

Configuring an RX slot with this start value while the driver is "up" will immediately switch RX off until either the slot is deleted, see *IEEE802154_CONFIG_RX_SLOT_NONE* or a slot with a future start parameter is configured and that start time arrives.

IEEE 802.15.4 driver utils

static inline bool **ieee802154_is_ar_flag_set**(struct *net_buf* *frag)

Check if the AR flag is set on the frame inside the given *Network Packet Library*.

Parameters

- **frag** – A valid pointer on a *net_buf* structure, must not be NULL, and its length should be at least 1 byte (ImmAck frames are the shortest supported frames with 3 bytes excluding FCS).

Returns
true if AR flag is set, false otherwise

IEEE 802.15.4 driver callbacks

enum *net_verdict* `ieee802154_handle_ack`(struct *net_if* *iface, struct *net_pkt* *pkt)

IEEE 802.15.4 driver ACK handling callback into L2 that drivers must call when receiving an ACK package.

The IEEE 802.15.4 standard prescribes generic procedures for ACK handling on L2 (MAC) level. L2 stacks therefore have to provides a fast and re-usable generic implementation of this callback for drivers to call when receiving an ACK packet.

Note: This function is part of Zephyr's 802.15.4 stack driver -> L2 "inversion-of-control" adaptation API and must be implemented by all IEEE 802.15.4 L2 stacks.

Warning

Deviating from other functions in the net stack returning net_verdict, this function will not unref the package even if it returns NET_OK.

Parameters

- `iface` – A valid pointer on a network interface that received the packet
- `pkt` – A valid pointer on a packet to check

Returns
NET_OK if L2 handles the ACK package, NET_CONTINUE or NET_DROP otherwise.

void `ieee802154_init`(struct *net_if* *iface)

IEEE 802.15.4 driver initialization callback into L2 called by drivers to initialize the active L2 stack for a given interface.

Drivers must call this function as part of their own initialization routine.

Note: This function is part of Zephyr's 802.15.4 stack driver -> L2 "inversion-of-control" adaptation API and must be implemented by all IEEE 802.15.4 L2 stacks.

Parameters

- `iface` – A valid pointer on a network interface

IEEE 802.15.4-2020, Section 6: MAC functional description

`IEEE802154_PHY_SYMBOLS_PER_SECOND`(symbol_period_ns)

The symbol period (and therefore symbol rate) is defined in section 6.1: "Some of the timing parameters in definition of the MAC are in units of PHY symbols.

For PHYs that have multiple symbol periods, the duration to be used for the MAC parameters is defined in that PHY clause."

This is not necessarily the true physical symbol period, so take care to use this macro only when either the symbol period used for MAC timing is the same as the physical symbol period or if you actually mean the MAC timing symbol period.

PHY specific symbol periods are defined in PHY specific sections below.

IEEE 802.15.4-2020, Section 8: MAC services

IEEE802154_MAC_A_BASE_SLOT_DURATION

The number of PHY symbols forming a superframe slot when the superframe order is equal to zero, see sections 8.4.2, table 8-93, aBaseSlotDuration and section 6.2.1.

IEEE802154_MAC_A_NUM_SUPERFRAME_SLOTS

The number of slots contained in any superframe, see section 8.4.2, table 8-93, aNumSuperframeSlots.

IEEE802154_MAC_A_BASE_SUPERFRAME_DURATION

The number of PHY symbols forming a superframe when the superframe order is equal to zero, see section 8.4.2, table 8-93, aBaseSuperframeDuration.

IEEE802154_MAC_A_UNIT_BACKOFF_PERIOD(turnaround_time)

MAC PIB attribute aUnitBackoffPeriod, see section 8.4.2, table 8-93, in symbol periods, valid for all PHYs except SUN PHY in the 920 MHz band.

IEEE802154_MAC_RESPONSE_WAIT_TIME_DEFAULT

Default macResponseWaitTime in multiples of aBaseSuperframeDuration as defined in section 8.4.3.1, table 8-94.

IEEE 802.15.4-2020, Section 11: PHY services

IEEE802154_PHY_A_TURNAROUND_TIME_DEFAULT

Default PHY PIB attribute aTurnaroundTime, in PHY symbols, see section 11.3, table 11-1.

IEEE802154_PHY_A_TURNAROUND_TIME_1MS(symbol_period_ns)

PHY PIB attribute aTurnaroundTime for SUN, RS-GFSK, TVWS, and LECIM FSK PHY, in PHY symbols, see section 11.3, table 11-1.

IEEE802154_PHY_A_CCA_TIME

PHY PIB attribute aCcaTime, in PHY symbols, all PHYs except for SUN O-QPSK, see section 11.3, table 11-1.

IEEE 802.15.4-2020, Section 12: O-QPSK PHY

IEEE802154_PHY_OQPSK_868MHZ_SYMBOL_PERIOD_NS

O-QPSK 868Mhz band symbol period, see section 12.3.3.

IEEE802154_PHY_OQPSK_780_TO_2450MHZ_SYMBOL_PERIOD_NS

O-QPSK 780MHz, 915MHz, 2380MHz and 2450MHz bands symbol period, see section 12.3.3.

IEEE 802.15.4-2020, Section 13: BPSK PHY

IEEE802154_PHY_BPSK_868MHZ_SYMBOL_PERIOD_NS
BPSK 868MHz band symbol period, see section 13.3.3.

IEEE802154_PHY_BPSK_915MHZ_SYMBOL_PERIOD_NS
BPSK 915MHz band symbol period, see section 13.3.3.

IEEE 802.15.4-2020, Section 19: SUN FSK PHY

IEEE802154_PHY_SUN_FSK_863MHZ_915MHZ_SYMBOL_PERIOD_NS
SUN FSK 863Mhz and 915MHz band symbol periods, see section 19.1, table 19-1.

IEEE802154_PHY_SUN_FSK_PHR_LEN
SUN FSK PHY header length, in bytes, see section 19.2.4.

struct ieee802154_header_ie_vendor_specific
#include <ieee802154_ie.h> Vendor Specific Header IE, see section 7.4.2.3.

Public Members

uint8_t vendor_oui[IEEE802154_VENDOR_SPECIFIC_IE_OUI_LEN]
Vendor OUI.

uint8_t *vendor_specific_info
Vendor specific information.

struct ieee802154_header_ie_csl_full
#include <ieee802154_ie.h> Full CSL IE, see section 7.4.2.3.

Public Members

uint16_t csl_phase
CSL phase.

uint16_t csl_period
CSL period.

uint16_t csl_rendezvous_time
Rendezvous time.

struct ieee802154_header_ie_csl_reduced
#include <ieee802154_ie.h> Reduced CSL IE, see section 7.4.2.3.

Public Members

uint16_t **csl_phase**
CSL phase.

uint16_t **csl_period**
CSL period.

#include <ieee802154_ie.h> RIT IE, see section 7.4.2.4.

Public Members

uint8_t **time_to_first_listen**
Time to First Listen.

uint8_t **number_of_repeat_listen**
Number of Repeat Listen.

uint16_t **repeat_listen_interval**
Repeat listen interval.

struct **ieee802154_header_ie_rendezvous_time_full**
#include <ieee802154_ie.h> Full Rendezvous Time IE, see section 7.4.2.6 (macCslInterval is nonzero).

Public Members

uint16_t **rendezvous_time**
Rendezvous time.

uint16_t **wakeup_interval**
Wakeup interval.

struct **ieee802154_header_ie_rendezvous_time_reduced**

#include <*ieee802154_ie.h*> Reduced Rendezvous Time IE, see section 7.4.2.6 (macCslInterval is zero).

Public Members

uint16_t **rendezvous_time**

Rendezvous time.

struct **ieee802154_header_ie_rendezvous_time**

#include <*ieee802154_ie.h*> Rendezvous Time IE, see section 7.4.2.6.

Public Members

struct *ieee802154_header_ie_rendezvous_time_full* **full**

Rendezvous time full information.

struct *ieee802154_header_ie_rendezvous_time_reduced* **reduced**

Rendezvous time reduced information.

struct **ieee802154_header_ie_time_correction**

#include <*ieee802154_ie.h*> Time Correction IE, see section 7.4.2.7.

Public Members

uint16_t **time_sync_info**

Time synchronization information.

struct **ieee802154_phy_channel_range**

#include <*ieee802154_radio.h*> Represents a supported channel range, see *ieee802154_phy_supported_channels*.

Public Members

uint16_t **from_channel**

From channel range.

uint16_t **to_channel**

To channel range.

struct **ieee802154_phy_supported_channels**

#include <*ieee802154_radio.h*> Represents a list channels supported by a driver for a given interface, see *IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES*.

Public Members

const struct *ieee802154_phy_channel_range* *const **ranges**
Pointer to an array of channel range structures.

> **Warning**
> The pointer must be valid and constant throughout the life of the interface.

const uint8_t **num_ranges**
The number of currently available channel ranges.

struct **ieee802154_filter**
#include <ieee802154_radio.h> Filter value, see *ieee802154_radio_api::filter*.

Public Members

uint8_t ***ieee_addr**
Extended address, in little endian.

uint16_t **short_addr**
Short address, in CPU byte order.

uint16_t **pan_id**
PAN ID, in CPU byte order.

struct **ieee802154_key**
#include <ieee802154_radio.h> Key configuration for transmit security offloading, see *IEEE802154_CONFIG_MAC_KEYS*.

Public Members

uint8_t ***key_value**
Key material.

uint32_t **key_frame_counter**
Initial value of frame counter associated with the key, see section 9.4.3.

bool **frame_counter_per_key**
Indicates if per-key frame counter should be used, see section 9.4.3.

uint8_t **key_id_mode**
Key Identifier Mode, see section 9.4.2.3, Table 9-7.

uint8_t ***key_id**
Key Identifier, see section 9.4.4.

struct **ieee802154_config**

#include <ieee802154_radio.h> IEEE 802.15.4 driver configuration data.

Public Members

bool **enabled**

Is auto ACK FPB enabled.

Is enabled.

enum *ieee802154_fpb_mode* **mode**

Auto ACK FPB mode.

struct *ieee802154_config* **auto_ack_fpb**

see *IEEE802154_CONFIG_AUTO_ACK_FPB*

uint8_t ***addr**

little endian for both short and extended address

bool **extended**

Is extended address.

struct *ieee802154_config* **ack_fpb**

see *IEEE802154_CONFIG_ACK_FPB*

bool **pan_coordinator**

see *IEEE802154_CONFIG_PAN_COORDINATOR*

bool **promiscuous**

see *IEEE802154_CONFIG_PROMISCUOUS*

bool **rx_on_when_idle**

see *IEEE802154_CONFIG_RX_ON_WHEN_IDLE*

ieee802154_event_cb_t **event_handler**

see *IEEE802154_CONFIG_EVENT_HANDLER*

struct *ieee802154_key* ***mac_keys**

see *IEEE802154_CONFIG_MAC_KEYS*

Pointer to an array containing a list of keys used for MAC encryption. Refer to secKeyIdLookupDescriptor and secKeyDescriptor in IEEE 802.15.4

The key_value field points to a buffer containing the 16 byte key. The buffer SHALL be copied by the driver before returning from the call.

The variable length array is terminated by key_value field set to NULL.

uint32_t **frame_counter**

see *IEEE802154_CONFIG_FRAME_COUNTER*

net_time_t **start**

Nanosecond resolution timestamp relative to the network subsystem's local clock defining the start of the RX window during which the receiver is expected to be listening (i.e.

not including any driver startup times).

Configuring an rx_slot with the start attribute set to -1 will cancel and delete any previously active rx slot.

net_time_t **duration**

Nanosecond resolution duration of the RX window relative to the above RX window start time during which the receiver is expected to be listening (i.e.

not including any shutdown times). Only positive values larger than or equal zero are allowed.

Setting the duration to zero will disable the receiver, no matter what the start parameter.

uint8_t **channel**

Used channel.

struct *ieee802154_config* **rx_slot**

see *IEEE802154_CONFIG_RX_SLOT*

uint32_t **csl_period**

see *IEEE802154_CONFIG_CSL_PERIOD*

in CPU byte order

net_time_t **expected_rx_time**

see *IEEE802154_CONFIG_EXPECTED_RX_TIME*

struct ieee802154_header_ie ***header_ie**

Pointer to the header IE, see section 7.4.2.1, figure 7-21.

Certain header IEs may be incomplete if they require timing information to be injected at runtime on-the-fly, see the list in *IEEE802154_CONFIG_ENH_ACK_HEADER_IE*.

const uint8_t ***ext_addr**

Filters the devices that will receive this IE by extended address.

MAY be set to NULL to configure a fallback for all devices (implies that short_addr MUST also be set to *IEEE802154_BROADCAST_ADDRESS*).

in big endian

uint16_t **short_addr**

Filters the devices that will receive this IE by short address.

MAY be set to *IEEE802154_BROADCAST_ADDRESS* to configure a fallback for all devices (implies that ext_addr MUST also set to NULL in this case).

in CPU byte order

bool **purge_ie**

Flag for purging enh ACK header IEs.

When flag is set to true, driver should remove all existing header IEs, and all other entries in config should be ignored. This means that purging current header IEs and configuring a new one in the same call is not allowed.

struct *ieee802154_config* **ack_ie**

see *IEEE802154_CONFIG_ENH_ACK_HEADER_IE*

union ieee802154_config

Configuration data.

struct **ieee802154_attr_value**

#include <ieee802154_radio.h> IEEE 802.15.4 driver attribute values.

This structure is reserved to scalar and structured attributes that originate in the driver implementation and can neither be implemented as boolean *ieee802154_hw_caps* nor be derived directly or indirectly by the MAC (L2) layer. In particular this structure MUST NOT be used to return configuration data that originate from L2.

Note

To keep this union reasonably small, any attribute requiring a large memory area, SHALL be provided pointing to static memory allocated by the driver and valid throughout the lifetime of the driver instance.

Public Members

uint32_t **phy_supported_channel_pages**

A bit field that represents the supported channel pages, see *ieee802154_phy_channel_page*.

Note

To keep the API extensible as required by the standard, supported pages are modeled as a bitmap to support drivers that implement runtime switching between multiple channel pages.

Note

Currently none of the Zephyr drivers implements more than one channel page at runtime, therefore only one bit will be set and the current channel page (see the PHY PIB attribute phyCurrentPage, section 11.3, table 11-2) is considered to be read-only, fixed and “well known” via the supported channel pages attribute.

const struct *ieee802154_phy_supported_channels* ***phy_supported_channels**

Pointer to a structure representing channel ranges currently available on the selected channel page.

The selected channel page corresponds to the phyCurrentPage PHY PIB attribute, see the description of phy_supported_channel_pages above. Currently it can be retrieved via the *IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_PAGES* attribute.

Most drivers will expose a single channel page with a single, often zero-based, fixed channel range.

Some notable exceptions:

- The legacy channel page (zero) exposes ranges in different bands and even PHYs that are usually not implemented by a single driver.
- SUN and LECIM PHYs specify a large number of bands and operating modes on a single page with overlapping channel ranges each. Some of these ranges are not zero-based or contain "holes". This explains why several ranges may be necessary to represent all available channels.
- UWB PHYs often support partial channel ranges on the same channel page depending on the supported bands.

In these cases, drivers may expose custom configuration attributes (Kconfig, devicetree, runtime, ...) that allow switching between sub-ranges within the same channel page (e.g. switching between SubG and 2.4G bands on channel page zero or switching between multiple operating modes in the SUN or LECIM PHYs.

Warning

The pointer must be valid and constant throughout the life of the interface.

uint32_t **phy_hrp_uwb_supported_nominal_prfs**

A bit field representing supported HRP UWB pulse repetition frequencies (PRF), see enum ieee802154_phy_hrp_uwb_nominal_prf.

Note

Currently none of the Zephyr HRP UWB drivers implements more than one nominal PRF at runtime, therefore only one bit will be set and the current PRF (UwbPrf, MCPS-DATA.request, section 8.3.2, table 8-88) is considered to be read-only, fixed and "well known" via the supported PRF attribute.

struct **ieee802154_radio_api**

#include <ieee802154_radio.h> IEEE 802.15.4 driver interface API.

While L1-level driver features are exclusively implemented by drivers and MAY be mandatory to support certain application requirements, L2 features SHOULD be optional by default and only need to be implemented for performance optimization or precise timing as deemed necessary by driver maintainers. Fallback implementations ("Soft MAC") SHOULD be provided in the driver-independent L2 layer for all L2/MAC features especially if these features are not implemented in vendor hardware/firmware by a majority of existing in-tree drivers. If, however, a driver offers offloading opportunities then L2 implementations SHALL delegate performance critical or resource intensive tasks to the driver.

All drivers SHALL support two externally observable interface operational states: "UP" and "DOWN". Drivers MAY additionally support a "TESTING" interface state (see *continuous_carrier()*).

The following rules apply:

- An interface is considered "UP" when it is able to transmit and receive packets, "DOWN" otherwise (see precise definitions of the corresponding ifOperStatus values in RFC 2863, section 3.1.14, *net_if_oper_state* and the *continuous_carrier()* exception below). A device that has its receiver temporarily disabled during "UP" state due to an active receive window configuration is still considered "UP".
- Upper layers will assume that the interface managed by the driver is "UP" after a call to *start()* returned zero or -EALREADY. Upper layers assume that the interface is "DOWN" after calling *stop()* returned zero or -EALREADY.
- The driver SHALL block *start()*/*stop()* calls until the interface fully transitioned to the new state (e.g. the receiver is operational, ongoing transmissions were finished, etc.). Drivers SHOULD yield the calling thread (i.e. "sleep") if waiting for the new state without CPU interaction is possible.
- Drivers are responsible of guaranteeing atomicity of state changes. Appropriate means of synchronization SHALL be implemented (locking, atomic flags, ...).
- While the interface is "DOWN", the driver SHALL be placed in the lowest possible power state. The driver MAY return from a call to *stop()* before it reaches the lowest possible power state, i.e. manage power asynchronously. While the interface is "UP", the driver SHOULD autonomously and asynchronously transition to lower power states whenever possible. If the driver claims to support timed RX/TX capabilities and the upper layers configure an RX slot, then the driver SHALL immediately transition (asynchronously) to the lowest possible power state until the start of the RX slot or until a scheduled packet needs to be transmitted.
- The driver SHALL NOT change the interface's "UP"/"DOWN" state on its own. Initially, the interface SHALL be in the "DOWN" state.
- Drivers that implement the optional *continuous_carrier()* operation will be considered to be in the RFC 2863 "testing" ifOperStatus state if that operation returns zero. This state is active until either *start()* or *stop()* is called. If *continuous_carrier()* returns a non-zero value then the previous state is assumed by upper layers.
- If calls to *start()*/*stop()* return any other value than zero or -EALREADY, upper layers will consider the interface to be in a "lowerLayerDown" state as defined in RFC 2863.
- The RFC 2863 "dormant", "unknown" and "notPresent" ifOperStatus states are currently not supported. The "lowerLevelUp" state.
- The *ed_scan()*, *cca()* and *tx()* operations SHALL only be supported in the "UP" state and return -ENETDOWN in any other state. See the function-level API documentation below for further details.

Note

This structure is called "radio" API for backwards compatibility. A better name would be "IEEE 802.15.4 driver API" as typical drivers will not only implement L1/radio (PHY) features but also L2 (MAC) features if the vendor-specific driver hardware or firmware offers offloading opportunities.

Note

In case of devices that support timed RX/TX, the "UP" state is not equal to "receiver enabled". If a receive window (i.e. RX slot, see *IEEE802154_CONFIG_RX_SLOT*) is configured before calling *start()* then the receiver will not be enabled when transitioning to the "UP" state. Configuring a receive window while the interface is "UP"

will cause the receiver to be disabled immediately until the configured reception time has arrived.

Public Members

struct net_if_api **iface_api**

network interface API

> **Note**
>
> Network devices must extend the network interface API. It is therefore mandatory to place it at the top of the driver API struct so that it can be cast to a network interface.

enum *ieee802154_hw_caps* (***get_capabilities**)(const struct *device* *dev)

Get the device driver capabilities.

> **Note**
>
> Implementations SHALL be **isr-ok** and MUST NOT **sleep**. MAY be called in any interface state once the driver is fully initialized (“ready”).

Param dev
pointer to IEEE 802.15.4 driver device
Return
Bit field with all supported device driver capabilities.

int (***cca**)(const struct *device* *dev)

Clear Channel Assessment - Check channel’s activity.

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return -ENETDOWN unless the interface is “UP”.

Param dev
pointer to IEEE 802.15.4 driver device
Retval 0
the channel is available
Retval -EBUSY
The channel is busy.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -ENETDOWN
The interface is not “UP”.
Retval -ENOTSUP
CCA is not supported by this driver.
Retval -EIO
The CCA procedure could not be executed.

int (*`set_channel`)(const struct *device* *dev, uint16_t channel)

Set current channel.

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

Param dev
pointer to IEEE 802.15.4 driver device
Param channel
the number of the channel to be set in CPU byte order
Retval 0
channel was successfully set
Retval -EALREADY
The previous channel is the same as the requested channel.
Retval -EINVAL
The given channel is not within the range of valid channels of the driver’s current channel page, see the IEEE802154_ATTR_PHY_SUPPORTED_CHANNEL_RANGES driver attribute.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -ENOTSUP
The given channel is within the range of valid channels of the driver’s current channel page but unsupported by the current driver.
Retval -EIO
The channel could not be set.

int (*`filter`)(const struct *device* *dev, bool set, enum *ieee802154_filter_type* type, const struct *ieee802154_filter* *filter)

Set/Unset PAN ID, extended or short address filters.

> **Note**
>
> requires IEEE802154_HW_FILTER capability.

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return -EIO unless the interface is either “UP” or “DOWN”.

Param dev
pointer to IEEE 802.15.4 driver device
Param set
true to set the filter, false to remove it
Param type
the type of entity to be added/removed from the filter list (a PAN ID or a source/destination address)
Param filter
the entity to be added/removed from the filter list
Retval 0
The filter was successfully added/removed.

Retval -EINVAL
The given filter entity or filter entity type was not valid.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -ENOTSUP
Setting/removing this filter or filter type is not supported by this driver.
Retval -EIO
Error while setting/removing the filter.

int (***set_txpower**)(const struct *device* *dev, int16_t dbm)

Set TX power level in dbm.

Note

Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return -EIO unless the interface is either "UP" or "DOWN".

Param dev
pointer to IEEE 802.15.4 driver device
Param dbm
TX power in dbm
Retval 0
The TX power was successfully set.
Retval -EINVAL
The given dbm value is invalid or not supported by the driver.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -EIO
The TX power could not be set.

int (***tx**)(const struct *device* *dev, enum *ieee802154_tx_mode* mode, struct *net_pkt* *pkt, struct *net_buf* *frag)

Transmit a packet fragment as a single frame.

Depending on the level of offloading features supported by the driver, the frame MAY not be fully encrypted/authenticated or it MAY not contain an FCS. It is the responsibility of L2 implementations to prepare the frame according to the offloading capabilities announced by the driver and to decide whether CCA, CSMA/CA, ACK or retransmission procedures need to be executed outside ("soft MAC") or inside ("hard MAC") the driver .

All frames originating from L2 SHALL have all required IEs pre-allocated and prefilled such that the driver does not have to parse and manipulate IEs at all. This includes ACK packets if the driver does not have the *IEEE802154_HW_RX_TX_ACK* capability. Also see *IEEE802154_CONFIG_ENH_ACK_HEADER_IE* for drivers that have the *IEEE802154_HW_RX_TX_ACK* capability.

IEs that cannot be prepared by L2 unless the TX time is known (e.g. CSL IE, Rendezvous Time IE, Time Correction IE, ...) SHALL be sent in any of the timed TX modes with appropriate timing information pre-filled in the IE such that drivers do not have to parse and manipulate IEs at all unless the frame is generated by the driver itself.

In case any of the timed TX modes is supported and used (see *ieee802154_hw_caps* and *ieee802154_tx_mode*), the driver SHALL take responsibility of scheduling and sending the packet at the precise programmed time autonomously without further interaction by upper layers. The call to *tx()* will block until the package has

either been sent successfully (possibly including channel acquisition and packet acknowledgment) or a terminal transmission error occurred. The driver SHALL sleep and keep power consumption to the lowest possible level until the scheduled transmission time arrives or during any other idle waiting time.

Note

Implementations MAY **sleep** and will usually NOT be **isr-ok** - especially when timed TX, CSMA/CA, retransmissions, auto-ACK or any other offloading feature is supported that implies considerable idle waiting time. SHALL return `-ENETDOWN` unless the interface is "UP".

Warning

The driver SHALL NOT take ownership of the given network packet and frame (fragment) buffer. Any data required by the driver including the actual frame content must be read synchronously and copied internally if needed at a later time (e.g. the contents of IEs required for protocol configuration, states of frame counters, sequence numbers, etc). Both, the packet and the buffer MAY be reused or released by upper layers immediately after the function returns.

Param dev
pointer to IEEE 802.15.4 driver device
Param mode
the transmission mode, some of which require specific offloading capabilities.
Param pkt
pointer to the network packet to be transmitted.
Param frag
pointer to a network buffer containing a single fragment with the frame data to be transmitted
Retval 0
The frame was successfully sent or scheduled. If the driver supports ACK offloading and the frame requested acknowledgment (AR bit set), this means that the packet was successfully acknowledged by its peer.
Retval -EINVAL
Invalid packet (e.g. an expected IE is missing or the encryption/authentication state is not as expected).
Retval -EBUSY
The frame could not be sent because the medium was busy (CSMA/CA or CCA offloading feature only).
Retval -ENOMSG
The frame was not confirmed by an ACK packet (TX ACK offloading feature only) or the received ACK packet was invalid.
Retval -ENOBUFS
The frame could not be scheduled due to missing internal resources (timed TX offloading feature only).
Retval -ENETDOWN
The interface is not "UP".
Retval -ENOTSUP
The given TX mode is not supported.
Retval -EIO
The frame could not be sent due to some unspecified driver error (e.g. the driver being busy).

int (***start**)(const struct *device* *dev)

Start the device.

Upper layers will assume the interface is "UP" if this operation returns with zero or `-EALREADY`. The interface is placed in receive mode before returning from this operation unless an RX slot has been configured (even if it lies in the past, see *IEEE802154_CONFIG_RX_SLOT*).

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. MAY be called in any interface state once the driver is fully initialized ("ready").

Param dev
pointer to IEEE 802.15.4 driver device
Retval 0
The driver was successfully started.
Retval -EALREADY
The driver was already "UP".
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -EIO
The driver could not be started.

int (***stop**)(const struct *device* *dev)

Stop the device.

Upper layers will assume the interface is "DOWN" if this operation returns with zero or `-EALREADY`. The driver switches off the receiver before returning if it was previously on. The driver enters the lowest possible power mode after this operation is called. This MAY happen asynchronously (i.e. after the operation already returned control).

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. MAY be called in any interface state once the driver is fully initialized ("ready").

Param dev
pointer to IEEE 802.15.4 driver device
Retval 0
The driver was successfully stopped.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -EALREADY
The driver was already "DOWN".
Retval -EIO
The driver could not be stopped.

int (***continuous_carrier**)(const struct *device* *dev)

Start continuous carrier wave transmission.

The method blocks until the interface has started to emit a continuous carrier. To leave this mode, *start()* or *stop()* should be called, which will put the driver back into the "UP" or "DOWN" states, respectively.

> **Note**
>
> Implementations MAY **sleep** and will usually NOT be **isr-ok**. MAY be called in any interface state once the driver is fully initialized (“ready”).

Param dev
pointer to IEEE 802.15.4 driver device
Retval 0
continuous carrier wave transmission started
Retval -EALREADY
The driver was already in “TESTING” state and emitting a continuous carrier.
Retval -EIO
not started

int (*`configure`)(const struct *device* *dev, enum *ieee802154_config_type* type, const struct *ieee802154_config* *config)

Set or update driver configuration.

The method blocks until the interface has been reconfigured atomically with respect to ongoing package reception, transmission or any other ongoing driver operation.

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. MAY be called in any interface state once the driver is fully initialized (“ready”). Some configuration options may not be supported in all interface operational states, see the detailed specifications in *ieee802154_config_type*. In this case the operation returns `-EACCES`.

Param dev
pointer to IEEE 802.15.4 driver device
Param type
the configuration type to be set
Param config
the configuration parameters to be set for the given configuration type
Retval 0
configuration successful
Retval -EINVAL
The configuration parameters are invalid for the given configuration type.
Retval -ENOTSUP
The given configuration type is not supported by this driver.
Retval -EACCES
The given configuration type is supported by this driver but cannot be configured in the current interface operational state.
Retval -ENOMEM
The configuration cannot be saved due to missing memory resources.
Retval -ENOENT
The resource referenced in the configuration parameters cannot be found in the configuration.
Retval -EWOULDBLOCK
The operation is called from ISR context but temporarily cannot be executed without blocking.
Retval -EIO
An internal error occurred while trying to configure the given configura-

tion parameter.

int (*ed_scan)(const struct *device* *dev, uint16_t duration, *energy_scan_done_cb_t* done_cb)

Run an energy detection scan.

> **Note**
>
> requires IEEE802154_HW_ENERGY_SCAN capability

> **Note**
>
> The radio channel must be set prior to calling this function.

> **Note**
>
> Implementations SHALL be **isr-ok** and MAY **sleep**. SHALL return `-ENETDOWN` unless the interface is "UP".

Param dev
pointer to IEEE 802.15.4 driver device
Param duration
duration of energy scan in ms
Param done_cb
function called when the energy scan has finished
Retval 0
the energy detection scan was successfully scheduled
Retval -EBUSY
the energy detection scan could not be scheduled at this time
Retval -EALREADY
a previous energy detection scan has not finished yet.
Retval -ENETDOWN
The interface is not "UP".
Retval -ENOTSUP
This driver does not support energy scans.
Retval -EIO
The energy detection procedure could not be executed.

net_time_t (*get_time)(const struct *device* *dev)

Get the current time in nanoseconds relative to the network subsystem's local uptime clock as represented by this network interface.

See *net_time_t* for semantic details.

> **Note**
>
> requires IEEE802154_HW_TXTIME and/or IEEE802154_HW_RXTIME capabilities. Implementations SHALL be **isr-ok** and MUST NOT **sleep**. MAY be called in any interface state once the driver is fully initialized ("ready").

Param dev
pointer to IEEE 802.15.4 driver device

Return
nanoseconds relative to the network subsystem's local clock, -1 if an error occurred or the operation is not supported

uint8_t (***get_sch_acc**)(const struct *device* *dev)

Get the current estimated worst case accuracy (maximum ± deviation from the nominal frequency) of the network subsystem's local clock used to calculate tolerances and guard times when scheduling delayed receive or transmit radio operations.

The deviation is given in units of PPM (parts per million).

Note

requires IEEE802154_HW_TXTIME and/or IEEE802154_HW_RXTIME capabilities.

Note

Implementations may estimate this value based on current operating conditions (e.g. temperature). Implementations SHALL be **isr-ok** and MUST NOT **sleep**. MAY be called in any interface state once the driver is fully initialized ("ready").

Param dev
pointer to IEEE 802.15.4 driver device
Return
current estimated clock accuracy in PPM

int (***attr_get**)(const struct *device* *dev, enum *ieee802154_attr* attr, struct *ieee802154_attr_value* *value)

Get the value of a driver specific attribute.

Note

This function SHALL NOT return any values configurable by the MAC (L2) layer. It is reserved to non-boolean (i.e. scalar or structured) attributes that originate from the driver implementation and cannot be directly or indirectly derived by L2. Boolean attributes SHALL be implemented as *ieee802154_hw_caps*.

Note

Implementations SHALL be **isr-ok** and MUST NOT **sleep**. MAY be called in any interface state once the driver is fully initialized ("ready").

Retval 0
The requested attribute is supported by the driver and the value can be retrieved from the corresponding *ieee802154_attr_value* member.
Retval -ENOENT
The driver does not provide the requested attribute. The value structure has not been updated with attribute data. The content of the value attribute is undefined.

IEEE 802.15.4 L2 / Native Stack API This documents the IEEE 802.15.4 L2 native stack, which neither applications nor drivers will ever access directly. It is called internally by Zephyr's upper network layers (L3+), its socket and network context abstractions. This API is therefore of interest to IEEE 802.15.4 **subsystem contributors** only.

group `ieee802154_l2`

IEEE 802.15.4 L2 APIs.

Since
1.0

Version
0.8.0

This API provides integration with Zephyr's sockets and network contexts. **Application and driver developers should never interface directly with this API.** It is of interest to subsystem maintainers only.

The API implements and extends the following structures:

- implements Zephyr's internal L2-level socket and network context abstractions (context/socket operations, see *Network L2 Abstraction Layer*),
- protocol-specific extension to the interface structure (see *Network Interface abstraction layer*)
- protocol-specific extensions to the network packet structure (see *Network Packet Library*),

> **Note**
>
> All section, table and figure references are to the IEEE 802.15.4-2020 standard.

Defines

`IEEE802154_MAX_PHY_PACKET_SIZE`

Represents the PHY constant aMaxPhyPacketSize, see section 11.3.

> **Note**
>
> Currently only 127 byte sized packets are supported although some PHYs (e.g. SUN, MSK, LECIM, ...) support larger packet sizes. Needs to be changed once those PHYs should be fully supported.

`IEEE802154_FCS_LENGTH`

Represents the frame check sequence length, see section 7.2.1.1.

> **Note**
>
> Currently only a 2 byte FCS is supported although some PHYs (e.g. SUN, TVWS, ...) optionally support a 4 byte FCS. Needs to be changed once those PHYs should be fully supported.

IEEE802154_MTU

IEEE 802.15.4 “hardware” MTU (not to be confused with L3/IP MTU), i.e.

the actual payload available to the next higher layer.

This is equivalent to the IEEE 802.15.4 MAC frame length minus checksum bytes which is again equivalent to the PHY payload aka PSDU length minus checksum bytes. This definition exists for compatibility with the same concept in Linux and Zephyr’s L3. It is not a concept from the IEEE 802.15.4 standard.

Note

Currently only the original frame size from the 2006 standard version and earlier is supported. The 2015+ standard introduced PHYs with larger PHY payload. These are not (yet) supported in Zephyr.

IEEE802154_SHORT_ADDR_LENGTH

IEEE 802.15.4 short address length.

IEEE802154_EXT_ADDR_LENGTH

IEEE 802.15.4 extended address length.

IEEE802154_MAX_ADDR_LENGTH

IEEE 802.15.4 maximum address length.

IEEE802154_NO_CHANNEL

A special channel value that symbolizes “all” channels or “any” channel - depending on context.

IEEE802154_BROADCAST_ADDRESS

Represents the IEEE 802.15.4 broadcast short address, see sections 6.1 and 8.4.3, table 8-94, macShortAddress.

IEEE802154_NO_SHORT_ADDRESS_ASSIGNED

Represents a special IEEE 802.15.4 short address that indicates that a device has been associated with a coordinator but did not receive a short address, see sections 6.4.1 and 8.4.3, table 8-94, macShortAddress.

IEEE802154_BROADCAST_PAN_ID

Represents the IEEE 802.15.4 broadcast PAN ID, see section 6.1.

IEEE802154_SHORT_ADDRESS_NOT_ASSOCIATED

Represents a special value of the macShortAddress MAC PIB attribute, while the device is not associated, see section 8.4.3, table 8-94.

IEEE802154_PAN_ID_NOT_ASSOCIATED

Represents a special value of the macPanId MAC PIB attribute, while the device is not associated, see section 8.4.3, table 8-94.

Enums

enum `ieee802154_device_role`

IEEE 802.15.4 device role.

Values:

enumerator `IEEE802154_DEVICE_ROLE_ENDDEVICE`

End device.

enumerator `IEEE802154_DEVICE_ROLE_COORDINATOR`

Coordinator.

enumerator `IEEE802154_DEVICE_ROLE_PAN_COORDINATOR`

PAN coordinator.

struct `ieee802154_security_ctx`

#include <ieee802154.h> Interface-level security attributes, see section 9.5.

Public Members

uint32_t `frame_counter`

Interface-level outgoing frame counter, section 9.5, table 9-8, secFrameCounter.

Only used when the driver does not implement key-specific frame counters.

uint8_t `key`[16]

Interface-level frame encryption security key material.

Currently native L2 only supports a single secKeySource, see section 9.5, table 9-9, in combination with secKeyMode zero (implicit key mode), see section 9.4.2.3, table 9-7.

Warning

This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

uint8_t `key_len`

Length in bytes of the interface-level security key material.

uint8_t `level`

Frame security level, possible values are defined in section 9.4.2.2, table 9-6.

Warning

Currently native L2 allows to configure one common security level for all frame types, commands and information elements. This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

uint8_t **key_mode**

Frame security key mode.

Currently only implicit key mode is partially supported, see section 9.4.2.3, table 9-7, secKeyMode.

Warning

This is no longer in accordance with the 2015+ versions of the standard and needs to be extended in the future for full security procedure compliance.

struct **ieee802154_context**

#include <*ieee802154.h*> IEEE 802.15.4 L2 context.

Public Members

uint16_t **pan_id**

PAN ID.

The identifier of the PAN on which the device is operating. If this value is 0xffff, the device is not associated. See section 8.4.3.1, table 8-94, macPanId.

in CPU byte order

uint16_t **channel**

Channel Number.

The RF channel to use for all transmissions and receptions, see section 11.3, table 11-2, phyCurrentChannel. The allowable range of values is PHY dependent as defined in section 10.1.3.

in CPU byte order

uint16_t **short_addr**

Short Address (in CPU byte order)

Range:
- 0x0000–0xfffd: associated, short address was assigned
- 0xfffe: associated but no short address assigned
- 0xffff: not associated (default),

See section 6.4.1, table 6-4 (Usage of the shart address) and section 8.4.3.1, table 8-94, macShortAddress.

uint8_t **ext_addr**[8]

Extended Address (in little endian)

The extended address is device specific, usually permanently stored on the device and immutable.

See section 8.4.3.1, table 8-94, macExtendedAddress.

struct *net_linkaddr_storage* **linkaddr**

Link layer address (in big endian)

struct *ieee802154_security_ctx* **sec_ctx**

Security context.

struct *ieee802154_req_params* ***scan_ctx**

Pointer to scanning parameters and results, guarded by scan_ctx_lock.

struct k_sem **scan_ctx_lock**

Used to maintain integrity of data for all fields in this struct unless otherwise documented on field level.

uint8_t **coord_ext_addr**[8]

Coordinator extended address.

see section 8.4.3.1, table 8-94, macCoordExtendedAddress, the address of the coordinator through which the device is associated.

A value of zero indicates that a coordinator extended address is unknown (default).

in little endian

uint16_t **coord_short_addr**

Coordinator short address.

see section 8.4.3.1, table 8-94, macCoordShortAddress, the short address assigned to the coordinator through which the device is associated.

A value of 0xfffe indicates that the coordinator is only using its extended address. A value of 0xffff indicates that this value is unknown.

in CPU byte order

int16_t **tx_power**

Transmission power in dBm.

enum *net_l2_flags* **flags**

L2 flags.

uint8_t **sequence**

Data sequence number.

The sequence number added to the transmitted Data frame or MAC command, see section 8.4.3.1, table 8-94, macDsn.

uint8_t **device_role**

Device Role.

See section 6.1: A device may be operating as end device (0), coordinator (1), or PAN coordinator (2). If no device role is explicitly configured then the device will be treated as an end device.

A value of 3 is undefined.

Can be read/set via *ieee802154_device_role*.

uint8_t **ack_requested**

ACK requested flag, guarded by ack_lock.

uint8_t **ack_seq**
: ACK expected sequence number, guarded by ack_lock.

struct k_sem **ack_lock**
: ACK lock, guards ack_* fields.

struct k_sem **ctx_lock**
: Context lock.

  This lock guards all mutable context attributes unless otherwise mentioned on attribute level.

OpenThread L2 Adaptation Layer API Zephyr's OpenThread L2 platform adaptation layer glues the external OpenThread stack together with Zephyr's IEEE 802.15.4 protocol agnostic driver API. This API is of interest to OpenThread L2 **subsystem contributors** only.

The OpenThread API is part of the *Thread protocol* subsystem and documented there.

Thread protocol

- *Overview*
- *Internet connectivity*
- *Sample usage*
- *Thread related APIs*
  - *OpenThread Driver API*
  - *OpenThread L2 Adaptation Layer API*

Overview Thread is a low-power mesh networking technology, designed specifically for home automation applications. It is an IPv6-based standard, which uses 6LoWPAN technology over IEEE 802.15.4 protocol. IP connectivity lets you easily connect a Thread mesh network to the internet with a Thread Border Router.

The Thread specification provides a high level of network security. Mesh networks built with Thread are secure - only authenticated devices can join the network and all communications within the mesh are encrypted. More information about Thread protocol can be found at Thread Group website.

Zephyr integrates an open source Thread protocol implementation called OpenThread, documented on the OpenThread website.

Internet connectivity A Thread Border Router is required to connect mesh network to the internet. An open source implementation of Thread Border Router is provided by the OpenThread community. See OpenThread Border Router guide for instructions on how to set up a Border Router.

Sample usage You can try using OpenThread with the Zephyr Echo server and Echo client samples, which provide out-of-the-box configuration for OpenThread. To enable OpenThread support in these samples, build them with `overlay-ot.conf` overlay config file. See sockets-echo-server and sockets-echo-client samples for details.

Thread related APIs

OpenThread Driver API OpenThread L2 uses Zephyr's protocol agnostic IEEE 802.15.4 driver API internally. This API is of interest to **driver developers** that want to support OpenThread.

The driver API is part of the *IEEE 802.15.4 Driver API* subsystem and documented there.

OpenThread L2 Adaptation Layer API Zephyr's OpenThread L2 platform adaptation layer glues the external OpenThread stack together with Zephyr's IEEE 802.15.4 protocol agnostic driver API. This API is of interest to OpenThread L2 **subsystem contributors** only.

Version
0.8.0

Functions

int `openthread_state_changed_cb_register`(struct openthread_context *ot_context, struct *openthread_state_changed_cb* *cb)

Registers callbacks which will be called when certain configuration or state changes occur within OpenThread.

Parameters

- `ot_context` – the OpenThread context to register the callback with.
- `cb` – callback struct to register.

int `openthread_state_changed_cb_unregister`(struct openthread_context *ot_context, struct *openthread_state_changed_cb* *cb)

Unregisters OpenThread configuration or state changed callbacks.

Parameters

- `ot_context` – the OpenThread context to unregister the callback from.
- `cb` – callback struct to unregister.

k_tid_t `openthread_thread_id_get`(void)

Get OpenThread thread identification.

struct openthread_context *`openthread_get_default_context`(void)

Get pointer to default OpenThread context.

Return values

- `!NULL` – On success.

- `NULL` – On failure.

struct otInstance *`openthread_get_default_instance`(void)

Get pointer to default OpenThread instance.

Return values

- `!NULL` – On success.
- `NULL` – On failure.

int `openthread_start`(struct openthread_context *ot_context)

Starts the OpenThread network.

Depends on active settings: it uses stored network configuration, start joining procedure or uses default network configuration. Additionally when the device is MTD, it sets the SED mode to properly attach the network.

Parameters

- `ot_context`

void `openthread_api_mutex_lock`(struct openthread_context *ot_context)

Lock internal mutex before accessing OT API.

OpenThread API is not thread-safe, therefore before accessing any API function, it's needed to lock the internal mutex, to prevent the OpenThread thread from preempting the API call.

Parameters

- `ot_context` – Context to lock.

int `openthread_api_mutex_try_lock`(struct openthread_context *ot_context)

Try to lock internal mutex before accessing OT API.

This function behaves like *openthread_api_mutex_lock()* provided that the internal mutex is unlocked. Otherwise, it exists immediately and returns a negative value.

Parameters

- `ot_context` – Context to lock.

Return values

- `0` – On success.
- `<0` – On failure.

void `openthread_api_mutex_unlock`(struct openthread_context *ot_context)

Unlock internal mutex after accessing OT API.

Parameters

- `ot_context` – Context to unlock.

struct `openthread_state_changed_cb`

#include <openthread.h> OpenThread state change callback

OpenThread state change callback structure

Used to register a callback in the callback list. As many callbacks as needed can be added as long as each of them are unique pointers of struct *openthread_state_changed_cb*. Beware such structure should not be allocated on stack.

Public Members

void (*`state_changed_cb`)(otChangedFlags flags, struct openthread_context *ot_context, void *user_data)

Callback for notifying configuration or state changes.

Param flags
as per OpenThread otStateChangedCallback() aFlags parameter. See https://openthread.io/reference/group/api-instance#otstatechangedcallback

Param ot_context
the OpenThread context the callback is registered with.

Param user_data
Data to pass to the callback.

void *`user_data`

User data if required.

sys_snode_t `node`

Internally used field for list handling.

- user must not directly modify

Point-to-Point Protocol (PPP) Support

- *Overview*
- *Testing*

Overview Point-to-Point Protocol (PPP) is a data link layer (layer 2) communications protocol used to establish a direct connection between two nodes. PPP is used over many types of serial links since IP packets cannot be transmitted over a modem line on their own, without some data link protocol.

In Zephyr, each individual PPP link is modelled as a network interface. This is similar to how Linux implements PPP.

PPP support must be enabled at compile time by setting option `CONFIG_NET_L2_PPP`. The PPP implementation supports only these protocols:

- LCP (Link Control Protocol, RFC1661)
- HDLC (High-level data link control, RFC1662)
- IPCP (IP Control Protocol, RFC1332)
- IPV6CP (IPv6 Control Protocol, RFC5072)

For using PPP with a cellular modem, see cellular-modem sample for additional information.

Testing See the net-tools README file for more details on how to test the Zephyr PPP against pppd running in Linux.

Wi-Fi Management

Overview The Wi-Fi management API is used to manage Wi-Fi networks. It supports below modes:

- IEEE802.11 Station (STA)
- IEEE802.11 Access Point (AP)

Only personal mode security is supported with below types:

- Open
- WPA2-PSK
- WPA3-PSK-256
- WPA3-SAE

The Wi-Fi management API is implemented in the *wifi_mgmt* module as a part of the networking L2 stack. Currently, two types of Wi-Fi drivers are supported:

- Networking or socket offloaded drivers
- Native L2 Ethernet drivers

API Reference

group `wifi_mgmt`

Wi-Fi Management API.

Since
1.12

Version
0.8.0

Wi-Fi utility functions.

Utility functions for the Wi-Fi subsystem.

int `wifi_utils_parse_scan_bands`(char *scan_bands_str, uint8_t *band_map)

Convert a band specification string to a bitmap representing the bands.

The function will parse a string which specifies Wi-Fi frequency band values as a comma separated string and convert it to a bitmap. The string can use the following characters to represent the bands:

- 2: 2.4 GHz
- 5: 5 GHz
- 6: 6 GHz

For the bitmap generated refer to *wifi_frequency_bands* for bit position of each band.

E.g. a string "2,5,6" will be converted to a bitmap value of 0x7

Parameters

- `scan_bands_str` – String which spe.
- `band_map` – Pointer to the bitmap variable to be updated.

Return values

- `0` – on success.

- `-errno` – value in case of failure.

int `wifi_utils_parse_scan_ssids`(char *scan_ssids_str, const char *ssids[], uint8_t num_ssids)

Append a string containing an SSID to an array of SSID strings.

Parameters

- `scan_ssids_str` – string to be appended in the list of scanned SSIDs.
- `ssids` – Pointer to an array where the SSIDs pointers are to be stored.
- `num_ssids` – Maximum number of SSIDs that can be stored.

Return values

- `0` – on success.
- `-errno` – value in case of failure.

int `wifi_utils_parse_scan_chan`(char *scan_chan_str, struct *wifi_band_channel* *chan, uint8_t max_channels)

Convert a string containing a specification of scan channels to an array.

The function will parse a string which specifies channels to be scanned as a string and convert it to an array.

The channel string has to be formatted using the colon (:), comma(,), hyphen (-) and underscore (_) delimiters as follows:

- A colon identifies the value preceding it as a band. A band value (2: 2.4 GHz, 5: 5 GHz 6: 6 GHz) has to precede the channels in that band (e.g. 2: etc)
- Hyphens (-) are used to identify channel ranges (e.g. 2-7, 32-48 etc)
- Commas are used to separate channel values within a band. Channels can be specified as individual values (2,6,48 etc) or channel ranges using hyphens (1-14, 32-48 etc)
- Underscores (_) are used to specify multiple band-channel sets (e.g. 2:1,2_5:36,40 etc)
- No spaces should be used anywhere, i.e. before/after commas, before/after hyphens etc.

An example channel specification specifying channels in the 2.4 GHz and 5 GHz bands is as below: 2:1,5,7,9-11_5:36-48,100,163-167

Parameters

- `scan_chan_str` – List of channels expressed in the format described above.
- `chan` – Pointer to an array where the parsed channels are to be stored.
- `max_channels` – Maximum number of channels to store

Return values

- `0` – on success.
- `-errno` – value in case of failure.

bool `wifi_utils_validate_chan`(uint8_t band, uint16_t chan)

Validate a channel against a band.

Parameters

- `band` – Band to validate the channel against.
- `chan` – Channel to validate.

Return values

- `true` – if the channel is valid for the band.
- `false` – if the channel is not valid for the band.

bool `wifi_utils_validate_chan_2g`(uint16_t chan)

Validate a channel against the 2.4 GHz band.

Parameters

- `chan` – Channel to validate.

Return values

- `true` – if the channel is valid for the band.
- `false` – if the channel is not valid for the band.

bool `wifi_utils_validate_chan_5g`(uint16_t chan)

Validate a channel against the 5 GHz band.

Parameters

- `chan` – Channel to validate.

Return values

- `true` – if the channel is valid for the band.
- `false` – if the channel is not valid for the band.

bool `wifi_utils_validate_chan_6g`(uint16_t chan)

Validate a channel against the 6 GHz band.

Parameters

- `chan` – Channel to validate.

Return values

- `true` – if the channel is valid for the band.
- `false` – if the channel is not valid for the band.

`WIFI_UTILS_MAX_BAND_STR_LEN`

Maximum length of the band specification string.

`WIFI_UTILS_MAX_CHAN_STR_LEN`

Maximum length of the channel specification string.

Defines

`WIFI_COUNTRY_CODE_LEN`

Length of the country code string.

`WIFI_SSID_MAX_LEN`

Max SSID length.

`WIFI_PSK_MIN_LEN`

Minimum PSK length.

`WIFI_PSK_MAX_LEN`
: Maximum PSK length.

`WIFI_SAE_PSWD_MAX_LEN`
: Max SAW password length.

`WIFI_MAC_ADDR_LEN`
: MAC address length.

`WIFI_CHANNEL_MIN`
: Minimum channel number.

`WIFI_CHANNEL_MAX`
: Maximum channel number.

`WIFI_CHANNEL_ANY`
: Any channel number.

`WIFI_INTERFACE_INDEX_MIN`
: Network interface index min value.

`WIFI_INTERFACE_INDEX_MAX`
: Network interface index max value.

`NET_REQUEST_WIFI_SCAN`
: Request a Wi-Fi scan.

`NET_REQUEST_WIFI_CONNECT`
: Request a Wi-Fi connect.

`NET_REQUEST_WIFI_DISCONNECT`
: Request a Wi-Fi disconnect.

`NET_REQUEST_WIFI_AP_ENABLE`
: Request a Wi-Fi access point enable.

`NET_REQUEST_WIFI_AP_DISABLE`
: Request a Wi-Fi access point disable.

`NET_REQUEST_WIFI_IFACE_STATUS`
: Request a Wi-Fi network interface status.

`NET_REQUEST_WIFI_PS`
: Request a Wi-Fi power save.

`NET_REQUEST_WIFI_TWT`
: Request a Wi-Fi TWT.

NET_REQUEST_WIFI_PS_CONFIG
: Request a Wi-Fi power save configuration.

NET_REQUEST_WIFI_REG_DOMAIN
: Request a Wi-Fi regulatory domain.

NET_REQUEST_WIFI_MODE
: Request current Wi-Fi mode.

NET_REQUEST_WIFI_PACKET_FILTER
: Request Wi-Fi packet filter.

NET_REQUEST_WIFI_CHANNEL
: Request a Wi-Fi channel.

NET_REQUEST_WIFI_AP_STA_DISCONNECT
: Request a Wi-Fi access point to disconnect a station.

NET_REQUEST_WIFI_VERSION
: Request a Wi-Fi version.

NET_REQUEST_WIFI_RTS_THRESHOLD
: Request a Wi-Fi RTS threshold.

NET_REQUEST_WIFI_AP_CONFIG_PARAM
: Request a Wi-Fi AP parameters configuration.

NET_EVENT_WIFI_SCAN_RESULT
: Event emitted for Wi-Fi scan result.

NET_EVENT_WIFI_SCAN_DONE
: Event emitted when Wi-Fi scan is done.

NET_EVENT_WIFI_CONNECT_RESULT
: Event emitted for Wi-Fi connect result.

NET_EVENT_WIFI_DISCONNECT_RESULT
: Event emitted for Wi-Fi disconnect result.

NET_EVENT_WIFI_IFACE_STATUS
: Event emitted for Wi-Fi network interface status.

NET_EVENT_WIFI_TWT
: Event emitted for Wi-Fi TWT information.

NET_EVENT_WIFI_TWT_SLEEP_STATE
: Event emitted for Wi-Fi TWT sleep state.

NET_EVENT_WIFI_RAW_SCAN_RESULT
: Event emitted for Wi-Fi raw scan result.

NET_EVENT_WIFI_DISCONNECT_COMPLETE
: Event emitted Wi-Fi disconnect is completed.

NET_EVENT_WIFI_AP_ENABLE_RESULT
: Event emitted for Wi-Fi access point enable result.

NET_EVENT_WIFI_AP_DISABLE_RESULT
: Event emitted for Wi-Fi access point disable result.

NET_EVENT_WIFI_AP_STA_CONNECTED
: Event emitted when Wi-Fi station is connected in AP mode.

NET_EVENT_WIFI_AP_STA_DISCONNECTED
: Event emitted Wi-Fi station is disconnected from AP.

MAX_REG_CHAN_NUM
: Max regulatory channel number.

Typedefs

typedef void (*scan_result_cb_t)(struct *net_if* *iface, int status, struct *wifi_scan_result* *entry)

Scan result callback.

Param iface
Network interface

Param status
Scan result status

Param entry
Scan result entry

Enums

enum wifi_security_type

IEEE 802.11 security types.

Values:

enumerator WIFI_SECURITY_TYPE_NONE = 0

No security.

enumerator WIFI_SECURITY_TYPE_PSK

WPA2-PSK security.

enumerator WIFI_SECURITY_TYPE_PSK_SHA256
WPA2-PSK-SHA256 security.

enumerator WIFI_SECURITY_TYPE_SAE
WPA3-SAE security.

enumerator WIFI_SECURITY_TYPE_WAPI
GB 15629.11-2003 WAPI security.

enumerator WIFI_SECURITY_TYPE_EAP
EAP security - Enterprise.

enumerator WIFI_SECURITY_TYPE_WEP
WEP security.

enumerator WIFI_SECURITY_TYPE_WPA_PSK
WPA-PSK security.

enumerator WIFI_SECURITY_TYPE_WPA_AUTO_PERSONAL
WPA/WPA2/WPA3 PSK security.

enum wifi_mfp_options
IEEE 802.11w - Management frame protection.
Values:

enumerator WIFI_MFP_DISABLE = 0
MFP disabled.

enumerator WIFI_MFP_OPTIONAL
MFP optional.

enumerator WIFI_MFP_REQUIRED
MFP required.

enum wifi_frequency_bands
IEEE 802.11 operational frequency bands (not exhaustive).
Values:

enumerator WIFI_FREQ_BAND_2_4_GHZ = 0
2.4 GHz band.

enumerator WIFI_FREQ_BAND_5_GHZ
5 GHz band.

enumerator WIFI_FREQ_BAND_6_GHZ
6 GHz band (Wi-Fi 6E, also extends to 7GHz).

enumerator **__WIFI_FREQ_BAND_AFTER_LAST**
Number of frequency bands available.

enumerator **WIFI_FREQ_BAND_MAX** = *__WIFI_FREQ_BAND_AFTER_LAST* - 1
Highest frequency band available.

enumerator **WIFI_FREQ_BAND_UNKNOWN**
Invalid frequency band.

enum **wifi_iface_state**
Wi-Fi interface states.

Based on https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc

Values:

enumerator **WIFI_STATE_DISCONNECTED** = 0
Interface is disconnected.

enumerator **WIFI_STATE_INTERFACE_DISABLED**
Interface is disabled (administratively).

enumerator **WIFI_STATE_INACTIVE**
No enabled networks in the configuration.

enumerator **WIFI_STATE_SCANNING**
Interface is scanning for networks.

enumerator **WIFI_STATE_AUTHENTICATING**
Authentication with a network is in progress.

enumerator **WIFI_STATE_ASSOCIATING**
Association with a network is in progress.

enumerator **WIFI_STATE_ASSOCIATED**
Association with a network completed.

enumerator **WIFI_STATE_4WAY_HANDSHAKE**
4-way handshake with a network is in progress.

enumerator **WIFI_STATE_GROUP_HANDSHAKE**
Group Key exchange with a network is in progress.

enumerator **WIFI_STATE_COMPLETED**
All authentication completed, ready to pass data.

enum **wifi_iface_mode**
Wi-Fi interface modes.

Based on https://w1.fi/wpa_supplicant/devel/defs_8h.html#a4aeb27c1e4abd046df3064ea9756f0bc

Values:

enumerator WIFI_MODE_INFRA = 0
Infrastructure station mode.

enumerator WIFI_MODE_IBSS = 1
IBSS (ad-hoc) station mode.

enumerator WIFI_MODE_AP = 2
AP mode.

enumerator WIFI_MODE_P2P_GO = 3
P2P group owner mode.

enumerator WIFI_MODE_P2P_GROUP_FORMATION = 4
P2P group formation mode.

enumerator WIFI_MODE_MESH = 5
802.11s Mesh mode.

enum wifi_link_mode
Wi-Fi link operating modes.
As per https://en.wikipedia.org/wiki/Wi-Fi#Versions_and_generations.
Values:

enumerator WIFI_0 = 0
802.11 (legacy).

enumerator WIFI_1
802.11b.

enumerator WIFI_2
802.11a.

enumerator WIFI_3
802.11g.

enumerator WIFI_4
802.11n.

enumerator WIFI_5
802.11ac.

enumerator WIFI_6
802.11ax.

enumerator WIFI_6E
802.11ax 6GHz.

enumerator **WIFI_7**
802.11be.

enum **wifi_scan_type**
Wi-Fi scanning types.
Values:

enumerator **WIFI_SCAN_TYPE_ACTIVE** = 0
Active scanning (default).

enumerator **WIFI_SCAN_TYPE_PASSIVE**
Passive scanning.

enum **wifi_ps**
Wi-Fi power save states.
Values:

enumerator **WIFI_PS_DISABLED** = 0
Power save disabled.

enumerator **WIFI_PS_ENABLED**
Power save enabled.

enum **wifi_ps_mode**
Wi-Fi power save modes.
Values:

enumerator **WIFI_PS_MODE_LEGACY** = 0
Legacy power save mode.

enumerator **WIFI_PS_MODE_WMM**
WMM power save mode.

enum **wifi_operational_modes**
Wifi operational mode.
Values:

enumerator **WIFI_STA_MODE** = *BIT*(0)
STA mode setting enable.

enumerator **WIFI_MONITOR_MODE** = *BIT*(1)
Monitor mode setting enable.

enumerator **WIFI_TX_INJECTION_MODE** = *BIT*(2)
TX injection mode setting enable.

enumerator **WIFI_PROMISCUOUS_MODE** = *BIT*(3)
Promiscuous mode setting enable.

enumerator WIFI_AP_MODE = *BIT*(4)
AP mode setting enable.

enumerator WIFI_SOFTAP_MODE = *BIT*(5)
Softap mode setting enable.

enum wifi_filter
Mode filter settings.
Values:

enumerator WIFI_PACKET_FILTER_ALL = *BIT*(0)
Support management, data and control packet sniffing.

enumerator WIFI_PACKET_FILTER_MGMT = *BIT*(1)
Support only sniffing of management packets.

enumerator WIFI_PACKET_FILTER_DATA = *BIT*(2)
Support only sniffing of data packets.

enumerator WIFI_PACKET_FILTER_CTRL = *BIT*(3)
Support only sniffing of control packets.

enum wifi_twt_operation
Wi-Fi Target Wake Time (TWT) operations.
Values:

enumerator WIFI_TWT_SETUP = 0
TWT setup operation.

enumerator WIFI_TWT_TEARDOWN
TWT teardown operation.

enum wifi_twt_negotiation_type
Wi-Fi Target Wake Time (TWT) negotiation types.
Values:

enumerator WIFI_TWT_INDIVIDUAL = 0
TWT individual negotiation.

enumerator WIFI_TWT_BROADCAST
TWT broadcast negotiation.

enumerator WIFI_TWT_WAKE_TBTT
TWT wake TBTT negotiation.

enum wifi_twt_setup_cmd
Wi-Fi Target Wake Time (TWT) setup commands.
Values:

enumerator WIFI_TWT_SETUP_CMD_REQUEST = 0
TWT setup request.

enumerator WIFI_TWT_SETUP_CMD_SUGGEST
TWT setup suggest (parameters can be changed by AP)

enumerator WIFI_TWT_SETUP_CMD_DEMAND
TWT setup demand (parameters can not be changed by AP)

enumerator WIFI_TWT_SETUP_CMD_GROUPING
TWT setup grouping (grouping of TWT flows)

enumerator WIFI_TWT_SETUP_CMD_ACCEPT
TWT setup accept (parameters accepted by AP)

enumerator WIFI_TWT_SETUP_CMD_ALTERNATE
TWT setup alternate (alternate parameters suggested by AP)

enumerator WIFI_TWT_SETUP_CMD_DICTATE
TWT setup dictate (parameters dictated by AP)

enumerator WIFI_TWT_SETUP_CMD_REJECT
TWT setup reject (parameters rejected by AP)

enum wifi_twt_setup_resp_status
Wi-Fi Target Wake Time (TWT) negotiation status.
Values:

enumerator WIFI_TWT_RESP_RECEIVED = 0
TWT response received for TWT request.

enumerator WIFI_TWT_RESP_NOT_RECEIVED
TWT response not received for TWT request.

enum wifi_twt_fail_reason
Target Wake Time (TWT) error codes.
Values:

enumerator WIFI_TWT_FAIL_UNSPECIFIED
Unspecified error.

enumerator WIFI_TWT_FAIL_CMD_EXEC_FAIL
Command execution failed.

enumerator WIFI_TWT_FAIL_OPERATION_NOT_SUPPORTED
Operation not supported.

enumerator WIFI_TWT_FAIL_UNABLE_TO_GET_IFACE_STATUS
Unable to get interface status.

enumerator WIFI_TWT_FAIL_DEVICE_NOT_CONNECTED
Device not connected to AP.

enumerator WIFI_TWT_FAIL_PEER_NOT_HE_CAPAB
Peer not HE (802.11ax/Wi-Fi 6) capable.

enumerator WIFI_TWT_FAIL_PEER_NOT_TWT_CAPAB
Peer not TWT capable.

enumerator WIFI_TWT_FAIL_OPERATION_IN_PROGRESS
A TWT flow is already in progress.

enumerator WIFI_TWT_FAIL_INVALID_FLOW_ID
Invalid negotiated flow id.

enumerator WIFI_TWT_FAIL_IP_NOT_ASSIGNED
IP address not assigned or configured.

enumerator WIFI_TWT_FAIL_FLOW_ALREADY_EXISTS
Flow already exists.

enum wifi_twt_teardown_status
Wi-Fi Target Wake Time (TWT) teradown status.
Values:

enumerator WIFI_TWT_TEARDOWN_SUCCESS = 0
TWT teardown success.

enumerator WIFI_TWT_TEARDOWN_FAILED
TWT teardown failure.

enum wifi_ps_param_type
Wi-Fi power save parameters.
Values:

enumerator WIFI_PS_PARAM_STATE
Power save state.

enumerator WIFI_PS_PARAM_LISTEN_INTERVAL
Power save listen interval.

enumerator WIFI_PS_PARAM_WAKEUP_MODE
Power save wakeup mode.

enumerator WIFI_PS_PARAM_MODE
Power save mode.

enumerator WIFI_PS_PARAM_TIMEOUT
Power save timeout.

enum wifi_ps_wakeup_mode
Wi-Fi power save modes.

Values:

enumerator WIFI_PS_WAKEUP_MODE_DTIM = 0
DTIM based wakeup.

enumerator WIFI_PS_WAKEUP_MODE_LISTEN_INTERVAL
Listen interval based wakeup.

enum wifi_config_ps_param_fail_reason
Wi-Fi power save error codes.

Values:

enumerator WIFI_PS_PARAM_FAIL_UNSPECIFIED
Unspecified error.

enumerator WIFI_PS_PARAM_FAIL_CMD_EXEC_FAIL
Command execution failed.

enumerator WIFI_PS_PARAM_FAIL_OPERATION_NOT_SUPPORTED
Parameter not supported.

enumerator WIFI_PS_PARAM_FAIL_UNABLE_TO_GET_IFACE_STATUS
Unable to get interface status.

enumerator WIFI_PS_PARAM_FAIL_DEVICE_NOT_CONNECTED
Device not connected to AP.

enumerator WIFI_PS_PARAM_FAIL_DEVICE_CONNECTED
Device already connected to AP.

enumerator WIFI_PS_PARAM_LISTEN_INTERVAL_RANGE_INVALID
Listen interval out of range.

enum wifi_ap_config_param
Wi-Fi AP mode configuration parameter.

Values:

enumerator WIFI_AP_CONFIG_PARAM_MAX_INACTIVITY = *BIT*(0)
Used for AP mode configuration parameter ap_max_inactivity.

enumerator WIFI_AP_CONFIG_PARAM_MAX_NUM_STA = *BIT*(1)
Used for AP mode configuration parameter max_num_sta.

enum net_request_wifi_cmd
Wi-Fi management commands.
Values:

enumerator NET_REQUEST_WIFI_CMD_SCAN = 1
Scan for Wi-Fi networks.

enumerator NET_REQUEST_WIFI_CMD_CONNECT
Connect to a Wi-Fi network.

enumerator NET_REQUEST_WIFI_CMD_DISCONNECT
Disconnect from a Wi-Fi network.

enumerator NET_REQUEST_WIFI_CMD_AP_ENABLE
Enable AP mode.

enumerator NET_REQUEST_WIFI_CMD_AP_DISABLE
Disable AP mode.

enumerator NET_REQUEST_WIFI_CMD_IFACE_STATUS
Get interface status.

enumerator NET_REQUEST_WIFI_CMD_PS
Set power save status.

enumerator NET_REQUEST_WIFI_CMD_TWT
Setup or teardown TWT flow.

enumerator NET_REQUEST_WIFI_CMD_PS_CONFIG
Get power save config.

enumerator NET_REQUEST_WIFI_CMD_REG_DOMAIN
Set or get regulatory domain.

enumerator NET_REQUEST_WIFI_CMD_MODE
Set or get Mode of operation.

enumerator NET_REQUEST_WIFI_CMD_PACKET_FILTER
Set or get packet filter setting for current mode.

enumerator NET_REQUEST_WIFI_CMD_CHANNEL
Set or get Wi-Fi channel for Monitor or TX-Injection mode.

enumerator NET_REQUEST_WIFI_CMD_AP_STA_DISCONNECT
Disconnect a STA from AP.

enumerator NET_REQUEST_WIFI_CMD_VERSION
Get Wi-Fi driver and Firmware versions.

enumerator NET_REQUEST_WIFI_CMD_RTS_THRESHOLD
Set RTS threshold.

enumerator NET_REQUEST_WIFI_CMD_AP_CONFIG_PARAM
Configure AP parameter.

enum net_event_wifi_cmd
Wi-Fi management events.
Values:

enumerator NET_EVENT_WIFI_CMD_SCAN_RESULT = 1
Scan results available.

enumerator NET_EVENT_WIFI_CMD_SCAN_DONE
Scan done.

enumerator NET_EVENT_WIFI_CMD_CONNECT_RESULT
Connect result.

enumerator NET_EVENT_WIFI_CMD_DISCONNECT_RESULT
Disconnect result.

enumerator NET_EVENT_WIFI_CMD_IFACE_STATUS
Interface status.

enumerator NET_EVENT_WIFI_CMD_TWT
TWT events.

enumerator NET_EVENT_WIFI_CMD_TWT_SLEEP_STATE
TWT sleep status: awake or sleeping, can be used by application to determine if it can send data or not.

enumerator NET_EVENT_WIFI_CMD_RAW_SCAN_RESULT
Raw scan results available.

enumerator NET_EVENT_WIFI_CMD_DISCONNECT_COMPLETE
Disconnect complete.

enumerator NET_EVENT_WIFI_CMD_AP_ENABLE_RESULT
AP mode enable result.

enumerator NET_EVENT_WIFI_CMD_AP_DISABLE_RESULT
AP mode disable result.

enumerator NET_EVENT_WIFI_CMD_AP_STA_CONNECTED
STA connected to AP.

enumerator NET_EVENT_WIFI_CMD_AP_STA_DISCONNECTED

STA disconnected from AP.

enum wifi_conn_status

Wi-Fi connect result codes.

To be overlaid on top of *wifi_status* in the connect result event for detailed status.

Values:

enumerator WIFI_STATUS_CONN_SUCCESS = 0

Connection successful.

enumerator WIFI_STATUS_CONN_FAIL

Connection failed - generic failure.

enumerator WIFI_STATUS_CONN_WRONG_PASSWORD

Connection failed - wrong password Few possible reasons for 4-way handshake failure that we can guess are as follows: 1) Incorrect key 2) EAPoL frames lost causing timeout.

#1 is the likely cause, so, we convey to the user that it is due to Wrong passphrase/password.

enumerator WIFI_STATUS_CONN_TIMEOUT

Connection timed out.

enumerator WIFI_STATUS_CONN_AP_NOT_FOUND

Connection failed - AP not found.

enumerator WIFI_STATUS_CONN_LAST_STATUS

Last connection status.

enumerator WIFI_STATUS_DISCONN_FIRST_STATUS = *WIFI_STATUS_CONN_LAST_STATUS*

Connection disconnected status.

enum wifi_disconn_reason

Wi-Fi disconnect reason codes.

To be overlaid on top of *wifi_status* in the disconnect result event for detailed reason.

Values:

enumerator WIFI_REASON_DISCONN_SUCCESS = 0

Success, overload status as reason.

enumerator WIFI_REASON_DISCONN_UNSPECIFIED

Unspecified reason.

enumerator WIFI_REASON_DISCONN_USER_REQUEST

Disconnected due to user request.

enumerator WIFI_REASON_DISCONN_AP_LEAVING
Disconnected due to AP leaving.

enumerator WIFI_REASON_DISCONN_INACTIVITY
Disconnected due to inactivity.

enum wifi_ap_status
Wi-Fi AP mode result codes.

To be overlaid on top of *wifi_status* in the AP mode enable or disable result event for detailed status.

Values:

enumerator WIFI_STATUS_AP_SUCCESS = 0
AP mode enable or disable successful.

enumerator WIFI_STATUS_AP_FAIL
AP mode enable or disable failed - generic failure.

enumerator WIFI_STATUS_AP_CHANNEL_NOT_SUPPORTED
AP mode enable failed - channel not supported.

enumerator WIFI_STATUS_AP_CHANNEL_NOT_ALLOWED
AP mode enable failed - channel not allowed.

enumerator WIFI_STATUS_AP_SSID_NOT_ALLOWED
AP mode enable failed - SSID not allowed.

enumerator WIFI_STATUS_AP_AUTH_TYPE_NOT_SUPPORTED
AP mode enable failed - authentication type not supported.

enumerator WIFI_STATUS_AP_OP_NOT_SUPPORTED
AP mode enable failed - operation not supported.

enumerator WIFI_STATUS_AP_OP_NOT_PERMITTED
AP mode enable failed - operation not permitted.

enum wifi_mgmt_op
Generic get/set operation for any command.

Values:

enumerator WIFI_MGMT_GET = 0
Get operation.

enumerator WIFI_MGMT_SET = 1
Set operation.

enum **wifi_twt_sleep_state**

Wi-Fi TWT sleep states.

Values:

enumerator **WIFI_TWT_STATE_SLEEP** = 0

TWT sleep state: sleeping.

enumerator **WIFI_TWT_STATE_AWAKE** = 1

TWT sleep state: awake.

Functions

const char ***wifi_security_txt**(enum *wifi_security_type* security)

Helper function to get user-friendly security type name.

const char ***wifi_mfp_txt**(enum *wifi_mfp_options* mfp)

Helper function to get user-friendly MFP name.

const char ***wifi_band_txt**(enum *wifi_frequency_bands* band)

Helper function to get user-friendly frequency band name.

const char ***wifi_state_txt**(enum *wifi_iface_state* state)

Helper function to get user-friendly interface state name.

const char ***wifi_mode_txt**(enum *wifi_iface_mode* mode)

Helper function to get user-friendly interface mode name.

const char ***wifi_link_mode_txt**(enum *wifi_link_mode* link_mode)

Helper function to get user-friendly link mode name.

const char ***wifi_ps_txt**(enum *wifi_ps* ps_name)

Helper function to get user-friendly ps name.

const char ***wifi_ps_mode_txt**(enum *wifi_ps_mode* ps_mode)

Helper function to get user-friendly ps mode name.

const char ***wifi_twt_operation_txt**(enum *wifi_twt_operation* twt_operation)

Helper function to get user-friendly twt operation name.

const char ***wifi_twt_negotiation_type_txt**(enum *wifi_twt_negotiation_type* twt_negotiation)

Helper function to get user-friendly twt negotiation type name.

const char ***wifi_twt_setup_cmd_txt**(enum *wifi_twt_setup_cmd* twt_setup)

Helper function to get user-friendly twt setup cmd name.

static inline const char ***wifi_twt_get_err_code_str**(int16_t err_no)

Helper function to get user-friendly TWT error code name.

const char ***wifi_ps_wakeup_mode_txt**(enum *wifi_ps_wakeup_mode* ps_wakeup_mode)

Helper function to get user-friendly ps wakeup mode name.

static inline const char ***wifi_ps_get_config_err_code_str**(int16_t err_no)

Helper function to get user-friendly power save error code name.

void **wifi_mgmt_raise_connect_result_event**(struct *net_if* *iface, int status)

Wi-Fi management connect result event.

Parameters

- **iface** – Network interface
- **status** – Connect result status

void **wifi_mgmt_raise_disconnect_result_event**(struct *net_if* *iface, int status)

Wi-Fi management disconnect result event.

Parameters

- **iface** – Network interface
- **status** – Disconnect result status

void **wifi_mgmt_raise_iface_status_event**(struct *net_if* *iface, struct *wifi_iface_status* *iface_status)

Wi-Fi management interface status event.

Parameters

- **iface** – Network interface
- **iface_status** – Interface status

void **wifi_mgmt_raise_twt_event**(struct *net_if* *iface, struct *wifi_twt_params* *twt_params)

Wi-Fi management TWT event.

Parameters

- **iface** – Network interface
- **twt_params** – TWT parameters

void **wifi_mgmt_raise_twt_sleep_state**(struct *net_if* *iface, int twt_sleep_state)

Wi-Fi management TWT sleep state event.

Parameters

- **iface** – Network interface
- **twt_sleep_state** – TWT sleep state

void **wifi_mgmt_raise_raw_scan_result_event**(struct *net_if* *iface, struct *wifi_raw_scan_result* *raw_scan_info)

Wi-Fi management raw scan result event.

Parameters

- **iface** – Network interface
- **raw_scan_info** – Raw scan result

void **wifi_mgmt_raise_disconnect_complete_event**(struct *net_if* *iface, int status)

Wi-Fi management disconnect complete event.

Parameters

- **iface** – Network interface
- **status** – Disconnect complete status

void **wifi_mgmt_raise_ap_enable_result_event**(struct *net_if* *iface, enum *wifi_ap_status* status)

Wi-Fi management AP mode enable result event.

Parameters

- `iface` – Network interface
- `status` – AP mode enable result status

void `wifi_mgmt_raise_ap_disable_result_event`(struct *net_if* *iface, enum *wifi_ap_status* status)

Wi-Fi management AP mode disable result event.

Parameters

- `iface` – Network interface
- `status` – AP mode disable result status

void `wifi_mgmt_raise_ap_sta_connected_event`(struct *net_if* *iface, struct *wifi_ap_sta_info* *sta_info)

Wi-Fi management AP mode STA connected event.

Parameters

- `iface` – Network interface
- `sta_info` – STA information

void `wifi_mgmt_raise_ap_sta_disconnected_event`(struct *net_if* *iface, struct *wifi_ap_sta_info* *sta_info)

Wi-Fi management AP mode STA disconnected event.

Parameters

- `iface` – Network interface
- `sta_info` – STA information

struct `wifi_version`

#include <wifi_mgmt.h> Wi-Fi version.

Public Members

const char *`drv_version`

Driver version.

const char *`fw_version`

Firmware version.

struct `wifi_band_channel`

#include <wifi_mgmt.h> Wi-Fi structure to uniquely identify a band-channel pair.

Public Members

uint8_t `band`

Frequency band.

uint8_t `channel`

Channel.

struct **wifi_scan_params**

#include <wifi_mgmt.h> Wi-Fi scan parameters structure.

Used to specify parameters which can control how the Wi-Fi scan is performed.

Public Members

enum *wifi_scan_type* **scan_type**

Scan type, see enum wifi_scan_type.

The scan_type is only a hint to the underlying Wi-Fi chip for the preferred mode of scan. The actual mode of scan can depend on factors such as the Wi-Fi chip implementation support, regulatory domain restrictions etc.

uint8_t **bands**

Bitmap of bands to be scanned.

Refer to *wifi_frequency_bands* for bit position of each band.

uint16_t **dwell_time_active**

Active scan dwell time (in ms) on a channel.

uint16_t **dwell_time_passive**

Passive scan dwell time (in ms) on a channel.

const char ***ssids**[WIFI_MGMT_SCAN_SSID_FILT_MAX]

Array of SSID strings to scan.

uint16_t **max_bss_cnt**

Specifies the maximum number of scan results to return.

These results would be the BSSIDS with the best RSSI values, in all the scanned channels. This should only be used to limit the number of returned scan results, and cannot be counted upon to limit the scan time, since the underlying Wi-Fi chip might have to scan all the channels to find the max_bss_cnt number of APs with the best signal strengths. A value of 0 signifies that there is no restriction on the number of scan results to be returned.

struct *wifi_band_channel* **band_chan**[WIFI_MGMT_SCAN_CHAN_MAX_MANUAL]

Channel information array indexed on Wi-Fi frequency bands and channels within that band.

E.g. to scan channel 6 and 11 on the 2.4 GHz band, channel 36 on the 5 GHz band:

```
chan[0] = {WIFI_FREQ_BAND_2_4_GHZ, 6};
chan[1] = {WIFI_FREQ_BAND_2_4_GHZ, 11};
chan[2] = {WIFI_FREQ_BAND_5_GHZ, 36};
```

This list specifies the channels to be **considered for scan**. The underlying Wi-Fi chip can silently omit some channels due to various reasons such as channels not conforming to regulatory restrictions etc. The invoker of the API should ensure that the channels specified follow regulatory rules.

struct **wifi_scan_result**

#include <wifi_mgmt.h> Wi-Fi scan result, each result is provided to the *net_mgmt_event_callback* via its info attribute (see net_mgmt.h)

Public Members

uint8_t **ssid**[*WIFI_SSID_MAX_LEN*]

SSID.

uint8_t **ssid_length**

SSID length.

uint8_t **band**

Frequency band.

uint8_t **channel**

Channel.

enum *wifi_security_type* **security**

Security type.

enum *wifi_mfp_options* **mfp**

MFP options.

int8_t **rssi**

RSSI.

uint8_t **mac**[*WIFI_MAC_ADDR_LEN*]

BSSID.

uint8_t **mac_length**

BSSID length.

struct **wifi_connect_req_params**

#include <wifi_mgmt.h> Wi-Fi connect request parameters.

Public Members

const uint8_t ***ssid**

SSID.

uint8_t **ssid_length**

SSID length.

const uint8_t ***psk**

Pre-shared key.

uint8_t **psk_length**
Pre-shared key length.

const uint8_t ***sae_password**
SAE password (same as PSK but with no length restrictions), optional.

uint8_t **sae_password_length**
SAE password length.

uint8_t **band**
Frequency band.

uint8_t **channel**
Channel.

enum *wifi_security_type* **security**
Security type.

enum *wifi_mfp_options* **mfp**
MFP options.

uint8_t **bssid**[*WIFI_MAC_ADDR_LEN*]
BSSID.

int **timeout**
Connect timeout in seconds, SYS_FOREVER_MS for no timeout.

struct **wifi_status**
#include <*wifi_mgmt.h*> Generic Wi-Fi status for commands and events.

Public Members

int **status**
Status value.

enum *wifi_conn_status* **conn_status**
Connection status.

enum *wifi_disconn_reason* **disconn_reason**
Disconnection reason status.

enum *wifi_ap_status* **ap_status**
Access point status.

struct **wifi_iface_status**
#include <*wifi_mgmt.h*> Wi-Fi interface status.

Public Members

int **state**
Interface state, see enum wifi_iface_state.

unsigned int **ssid_len**
SSID length.

char **ssid**[*WIFI_SSID_MAX_LEN*]
SSID.

char **bssid**[*WIFI_MAC_ADDR_LEN*]
BSSID.

enum *wifi_frequency_bands* **band**
Frequency band.

unsigned int **channel**
Channel.

enum *wifi_iface_mode* **iface_mode**
Interface mode, see enum wifi_iface_mode.

enum *wifi_link_mode* **link_mode**
Link mode, see enum wifi_link_mode.

enum *wifi_security_type* **security**
Security type, see enum wifi_security_type.

enum *wifi_mfp_options* **mfp**
MFP options, see enum wifi_mfp_options.

int **rssi**
RSSI.

unsigned char **dtim_period**
DTIM period.

unsigned short **beacon_interval**
Beacon interval.

bool **twt_capable**
is TWT capable?

struct **wifi_ps_params**
#include <wifi_mgmt.h> Wi-Fi power save parameters.

Public Members

enum *wifi_ps* **enabled**

Power save state.

unsigned short **listen_interval**

Listen interval.

enum *wifi_ps_wakeup_mode* **wakeup_mode**

Wi-Fi power save wakeup mode.

enum *wifi_ps_mode* **mode**

Wi-Fi power save mode.

unsigned int **timeout_ms**

Wi-Fi power save timeout.

This is the time out to wait after sending a TX packet before going back to power save (in ms) to receive any replies from the AP. Zero means this feature is disabled.

It's a tradeoff between power consumption and latency.

enum *wifi_ps_param_type* **type**

Wi-Fi power save type.

enum *wifi_config_ps_param_fail_reason* **fail_reason**

Wi-Fi power save fail reason.

struct **wifi_twt_params**

#include <*wifi_mgmt.h*> Wi-Fi TWT parameters.

Public Members

enum *wifi_twt_operation* **operation**

TWT operation, see enum wifi_twt_operation.

enum *wifi_twt_negotiation_type* **negotiation_type**

TWT negotiation type, see enum wifi_twt_negotiation_type.

enum *wifi_twt_setup_cmd* **setup_cmd**

TWT setup command, see enum wifi_twt_setup_cmd.

enum *wifi_twt_setup_resp_status* **resp_status**

TWT setup response status, see enum wifi_twt_setup_resp_status.

enum *wifi_twt_teardown_status* **teardown_status**

TWT teardown cmd status, see enum wifi_twt_teardown_status.

uint8_t **dialog_token**
Dialog token, used to map requests to responses.

uint8_t **flow_id**
Flow ID, used to map setup with teardown.

uint64_t **twt_interval**
Interval = Wake up time + Sleeping time.

bool **responder**
Requestor or responder.

bool **trigger**
Trigger enabled or disabled.

bool **implicit**
Implicit or explicit.

bool **announce**
Announced or unannounced.

uint32_t **twt_wake_interval**
Wake up time.

uint32_t **twt_wake_ahead_duration**
Wake ahead notification is sent earlier than TWT Service period (SP) start based on this duration.

This should give applications ample time to prepare the data before TWT SP starts.

struct *wifi_twt_params* **setup**
Setup specific parameters.

bool **teardown_all**
Teardown all flows.

struct *wifi_twt_params* **teardown**
Teardown specific parameters.

enum *wifi_twt_fail_reason* **fail_reason**
TWT fail reason, see enum wifi_twt_fail_reason.

struct **wifi_twt_flow_info**
#include <wifi_mgmt.h> Wi-Fi TWT flow information.

Public Members

uint64_t **twt_interval**
Interval = Wake up time + Sleeping time.

uint8_t **dialog_token**
Dialog token, used to map requests to responses.

uint8_t **flow_id**
Flow ID, used to map setup with teardown.

enum *wifi_twt_negotiation_type* **negotiation_type**
TWT negotiation type, see enum wifi_twt_negotiation_type.

bool **responder**
Requestor or responder.

bool **trigger**
Trigger enabled or disabled.

bool **implicit**
Implicit or explicit.

bool **announce**
Announced or unannounced.

uint32_t **twt_wake_interval**
Wake up time.

uint32_t **twt_wake_ahead_duration**
Wake ahead duration.

struct **wifi_ps_config**
#include <wifi_mgmt.h> Wi-Fi power save configuration.

Public Members

char **num_twt_flows**
Number of TWT flows.

struct *wifi_twt_flow_info* **twt_flows**[WIFI_MAX_TWT_FLOWS]
TWT flow details.

struct *wifi_ps_params* **ps_params**
Power save configuration.

struct **wifi_reg_chan_info**
#include <wifi_mgmt.h> Per-channel regulatory attributes.

Public Members

unsigned short **center_frequency**
Center frequency in MHz.

unsigned short **max_power**
Maximum transmission power (in dBm)

unsigned short **supported**
Is channel supported or not.

unsigned short **passive_only**
Passive transmissions only.

unsigned short **dfs**
Is a DFS channel.

struct **wifi_reg_domain**
#include <*wifi_mgmt.h*> Regulatory domain information or configuration.

Public Members

enum *wifi_mgmt_op* **oper**
Regulatory domain operation.

bool **force**
Ignore all other regulatory hints over this one.

uint8_t **country_code**[*WIFI_COUNTRY_CODE_LEN*]
Country code: ISO/IEC 3166-1 alpha-2.

unsigned int **num_channels**
Number of channels supported.

struct *wifi_reg_chan_info* ***chan_info**
Channels information.

struct **wifi_raw_scan_result**
#include <*wifi_mgmt.h*> Wi-Fi raw scan result.

Public Members

int8_t **rssi**
RSSI.

int **frame_length**
Frame length.

unsigned short **frequency**
Frequency.

uint8_t **data**[CONFIG_WIFI_MGMT_RAW_SCAN_RESULT_LENGTH]
Raw scan data.

struct **wifi_ap_sta_info**
#include <*wifi_mgmt.h*> AP mode - connected STA details.

Public Members

enum *wifi_link_mode* **link_mode**
Link mode, see enum wifi_link_mode.

uint8_t **mac**[*WIFI_MAC_ADDR_LEN*]
MAC address.

uint8_t **mac_length**
MAC address length.

bool **twt_capable**
is TWT capable ?

struct **wifi_mode_info**
#include <*wifi_mgmt.h*> Wi-Fi mode setup.

Public Members

uint8_t **mode**
Mode setting for a specific mode of operation.

uint8_t **if_index**
Interface index.

enum *wifi_mgmt_op* **oper**
Get or set operation.

struct **wifi_filter_info**
#include <*wifi_mgmt.h*> Wi-Fi filter setting for monitor, prmoiscuous, TX-injection modes.

Public Members

uint8_t **filter**
Filter setting.

uint8_t **if_index**
Interface index.

uint16_t **buffer_size**
Filter buffer size.

enum *wifi_mgmt_op* **oper**
Get or set operation.

struct **wifi_channel_info**
#include <*wifi_mgmt.h*> Wi-Fi channel setting for monitor and TX-injection modes.

Public Members

uint16_t **channel**
Channel value to set.

uint8_t **if_index**
Interface index.

enum *wifi_mgmt_op* **oper**
Get or set operation.

struct **wifi_ap_config_params**
#include <*wifi_mgmt.h*> Wi-Fi AP configuration parameter.

Public Members

enum *wifi_ap_config_param* **type**
Parameter used to identify the different AP parameters.

uint32_t **max_inactivity**
Parameter used for setting maximum inactivity duration for stations.

uint32_t **max_num_sta**
Parameter used for setting maximum number of stations.

struct **wifi_mgmt_ops**
#include <*wifi_mgmt.h*> Wi-Fi management API.

Public Members

int (***scan**)(const struct *device* *dev, struct *wifi_scan_params* *params, *scan_result_cb_t* cb)
Scan for Wi-Fi networks.

Param dev
Pointer to the device structure for the driver instance.
Param params
Scan parameters
Param cb
Callback to be called for each result cb parameter is the cb that should be called for each result by the driver. The wifi mgmt part will take care of raising the necessary event etc.
Return
0 if ok, < 0 if error

int (*`connect`)(const struct *device* *dev, struct *wifi_connect_req_params* *params)

Connect to a Wi-Fi network.
Param dev
Pointer to the device structure for the driver instance.
Param params
Connect parameters
Return
0 if ok, < 0 if error

int (*`disconnect`)(const struct *device* *dev)

Disconnect from a Wi-Fi network.
Param dev
Pointer to the device structure for the driver instance.
Return
0 if ok, < 0 if error

int (*`ap_enable`)(const struct *device* *dev, struct *wifi_connect_req_params* *params)

Enable AP mode.
Param dev
Pointer to the device structure for the driver instance.
Param params
AP mode parameters
Return
0 if ok, < 0 if error

int (*`ap_disable`)(const struct *device* *dev)

Disable AP mode.
Param dev
Pointer to the device structure for the driver instance.
Return
0 if ok, < 0 if error

int (*`ap_sta_disconnect`)(const struct *device* *dev, const uint8_t *mac)

Disconnect a STA from AP.
Param dev
Pointer to the device structure for the driver instance.
Param mac
MAC address of the STA to disconnect
Return
0 if ok, < 0 if error

int (*`iface_status`)(const struct *device* *dev, struct *wifi_iface_status* *status)

Get interface status.

Param dev
Pointer to the device structure for the driver instance.
Param status
Interface status
Return
0 if ok, < 0 if error

int (*`get_stats`)(const struct *device* *dev, struct *net_stats_wifi* *stats)

Get Wi-Fi statistics.
Param dev
Pointer to the device structure for the driver instance.
Param stats
Wi-Fi statistics
Return
0 if ok, < 0 if error

int (*`set_power_save`)(const struct *device* *dev, struct *wifi_ps_params* *params)

Set power save status.
Param dev
Pointer to the device structure for the driver instance.
Param params
Power save parameters
Return
0 if ok, < 0 if error

int (*`set_twt`)(const struct *device* *dev, struct *wifi_twt_params* *params)

Setup or teardown TWT flow.
Param dev
Pointer to the device structure for the driver instance.
Param params
TWT parameters
Return
0 if ok, < 0 if error

int (*`get_power_save_config`)(const struct *device* *dev, struct *wifi_ps_config* *config)

Get power save config.
Param dev
Pointer to the device structure for the driver instance.
Param config
Power save config
Return
0 if ok, < 0 if error

int (*`reg_domain`)(const struct *device* *dev, struct *wifi_reg_domain* *reg_domain)

Set or get regulatory domain.
Param dev
Pointer to the device structure for the driver instance.
Param reg_domain
Regulatory domain
Return
0 if ok, < 0 if error

int (*`filter`)(const struct *device* *dev, struct *wifi_filter_info* *filter)

Set or get packet filter settings for monitor and promiscuous modes.

Param dev
Pointer to the device structure for the driver instance.
Param packet
filter settings
Return
0 if ok, < 0 if error

int (*`mode`)(const struct *device* *dev, struct *wifi_mode_info* *mode)

Set or get mode of operation.
Param dev
Pointer to the device structure for the driver instance.
Param mode
settings
Return
0 if ok, < 0 if error

int (*`channel`)(const struct *device* *dev, struct *wifi_channel_info* *channel)

Set or get current channel of operation.
Param dev
Pointer to the device structure for the driver instance.
Param channel
settings
Return
0 if ok, < 0 if error

int (*`get_version`)(const struct *device* *dev, struct *wifi_version* *params)

Get Version of WiFi driver and Firmware.

The driver that implements the get_version function must not use stack to allocate the version information pointers that are returned as params struct members. The version pointer parameters should point to a static memory either in ROM (preferred) or in RAM.
Param dev
Pointer to the device structure for the driver instance
Param params
Version parameters
Return
0 if ok, < 0 if error

int (*`set_rts_threshold`)(const struct *device* *dev, unsigned int rts_threshold)

Set RTS threshold value.
Param dev
Pointer to the device structure for the driver instance.
Param RTS
threshold value
Return
0 if ok, < 0 if error

int (*`ap_config_params`)(const struct *device* *dev, struct *wifi_ap_config_params* *params)

Configure AP parameter.
Param dev
Pointer to the device structure for the driver instance.
Param params
AP mode parameter configuration parameter info

Return
0 if ok, < 0 if error

struct **net_wifi_mgmt_offload**

#include <wifi_mgmt.h> Wi-Fi management offload API.

Public Members

struct *ethernet_api* **wifi_iface**

Mandatory to get in first position.

A network device should indeed provide a pointer on such net_if_api structure. So we make current structure pointer that can be casted to a net_if_api structure pointer. Ethernet API

const struct *wifi_mgmt_ops* *const **wifi_mgmt_api**

Wi-Fi management API.

const void ***wifi_drv_ops**

Wi-Fi supplicant driver API.

Protocols

CoAP

- *Overview*
- *Sample Usage*
  - *CoAP Server*
  - *CoAP Client*
- *Testing*
  - *libcoap*
  - *TTCN3*
- *API Reference*

Overview The Constrained Application Protocol (CoAP) is a specialized web transfer protocol for use with constrained nodes and constrained (e.g., low-power, lossy) networks. It provides a convenient API for RESTful Web services that support CoAP's features. For more information about the protocol itself, see IETF RFC7252 The Constrained Application Protocol.

Zephyr provides a CoAP library which supports client and server roles. The library can be enabled with `CONFIG_COAP` Kconfig option and is configurable as per user needs. The Zephyr CoAP library is implemented using plain buffers. Users of the API create sockets for communication and pass the buffer to the library for parsing and other purposes. The library itself doesn't create any sockets for users.

On top of CoAP, Zephyr has support for LWM2M "Lightweight Machine 2 Machine" protocol, a simple, low-cost remote management and service enablement mechanism. See *Lightweight M2M (LWM2M)* for more information.

Supported RFCs:

- RFC7252: The Constrained Application Protocol (CoAP)
- RFC6690: Constrained RESTful Environments (CoRE) Link Format
- RFC7959: Block-Wise Transfers in the Constrained Application Protocol (CoAP)
- RFC7641: Observing Resources in the Constrained Application Protocol (CoAP)

Note

Not all parts of these RFCs are supported. Features are supported based on Zephyr requirements.

Sample Usage

Note

A *CoAP server* subsystem is available, the following is for creating a custom server implementation.

CoAP Server To create a CoAP server, resources for the server need to be defined. The `.well-known/core` resource should be added before all other resources that should be included in the responses of the `.well-known/core` resource.

```
static struct coap_resource resources[] = {
    { .get = well_known_core_get,
      .path = COAP_WELL_KNOWN_CORE_PATH,
    },
    { .get  = sample_get,
      .post = sample_post,
      .del  = sample_del,
      .put  = sample_put,
      .path = sample_path
    },
    { },
};
```

An application reads data from the socket and passes the buffer to the CoAP library to parse the message. If the CoAP message is proper, the library uses the buffer along with resources defined above to call the correct callback function to handle the CoAP request from the client. It's the callback function's responsibility to either reply or act according to CoAP request.

```
coap_packet_parse(&request, data, data_len, options, opt_num);
...
coap_handle_request(&request, resources, options, opt_num,
                    client_addr, client_addr_len);
```

If `CONFIG_COAP_URI_WILDCARD` enabled, server may accept multiple resources using MQTT-like wildcard style:

- the plus symbol represents a single-level wild card in the path;
- the hash symbol represents the multi-level wild card in the path.

```
static const char * const led_set[] = { "led","+","set", NULL };
static const char * const btn_get[] = { "button","#", NULL };
static const char * const no_wc[] = { "test","+1", NULL };
```

It accepts /led/0/set, led/1234/set, led/any/set, /button/door/1, /test/+1, but returns -ENOENT for /led/1, /test/21, /test/1.

This option is enabled by default, disable it to avoid unexpected behaviour with resource path like '/some_resource/+/#'.

Note

A *CoAP client* subsystem is available, the following is for creating a custom client implementation.

CoAP Client If the CoAP client knows about resources in the CoAP server, the client can start prepare CoAP requests and wait for responses. If the client doesn't know about resources in the CoAP server, it can request resources through the `.well-known/core` CoAP message.

```
/* Initialize the CoAP message */
char *path = "test";
struct coap_packet request;
uint8_t data[100];
uint8_t payload[20];

coap_packet_init(&request, data, sizeof(data),
                 1, COAP_TYPE_CON, 8, coap_next_token(),
                 COAP_METHOD_GET, coap_next_id());

/* Append options */
coap_packet_append_option(&request, COAP_OPTION_URI_PATH,
                          path, strlen(path));

/* Append Payload marker if you are going to add payload */
coap_packet_append_payload_marker(&request);

/* Append payload */
coap_packet_append_payload(&request, (uint8_t *)payload,
                           sizeof(payload) - 1);

/* send over sockets */
```

Testing There are various ways to test Zephyr CoAP library.

libcoap libcoap implements a lightweight application-protocol for devices that are resource constrained, such as by computing power, RF range, memory, bandwidth, or network packet sizes. Sources can be found here libcoap. libcoap has a script (`examples/etsi_coaptest.sh`) to test coap-server functionality in Zephyr.

See the net-tools project for more details

The coap-server sample can be built and executed on QEMU as described in *Networking with QEMU*.

Use this command on the host to run the libcoap implementation of the ETSI test cases:

```
sudo ./libcoap/examples/etsi_coaptest.sh -i tap0 2001:db8::1
```

TTCN3 Eclipse has TTCN3 based tests to run against CoAP implementations.

Install eclipse-titan and set symbolic links for titan tools

```
sudo apt-get install eclipse-titan

cd /usr/share/titan

sudo ln -s /usr/bin bin
sudo ln /usr/bin/titanver bin
sudo ln -s /usr/bin/mctr_cli bin
sudo ln -s /usr/include/titan include
sudo ln -s /usr/lib/titan lib

export TTCN3_DIR=/usr/share/titan

git clone https://gitlab.eclipse.org/eclipse/titan/titan.misc.git

cd titan.misc
```

Follow the instruction to setup CoAP test suite from here:

- https://gitlab.eclipse.org/eclipse/titan/titan.misc
- https://gitlab.eclipse.org/eclipse/titan/titan.misc/-/tree/master/CoAP_Conf

After the build is complete, the coap-server sample can be built and executed on QEMU as described in *Networking with QEMU*.

Change the client (test suite) and server (Zephyr coap-server sample) addresses in coap.cfg file as per your setup.

Execute the test cases with following command.

```
ttcn3_start coaptests coap.cfg
```

Sample output of ttcn3 tests looks like this.

```
Verdict statistics: 0 none (0.00 %), 10 pass (100.00 %), 0 inconc (0.00 %), 0 fail (0.00 %),
↪ 0 error (0.00 %).
Test execution summary: 10 test cases were executed. Overall verdict: pass
```

Related code samples

CoAP client
Use the CoAP library to implement a client that fetches a resource.

CoAP service
Use the CoAP server subsystem to register CoAP resources.

API Reference

group coap
COAP library.

Since
1.10

Version
0.8.0

Defines

COAP_MAKE_RESPONSE_CODE(class, det)

Utility macro to create a CoAP response code.

Parameters

- **class** – Class of the response code (ex. 2, 4, 5, ...)
- **det** – Detail of the response code

Returns

Response code literal

COAP_WELL_KNOWN_CORE_PATH

This resource should be added before all other resources that should be included in the responses of the .well-known/core resource if is to be used with coap_well_known_core_get.

Typedefs

typedef int (*coap_method_t)(struct *coap_resource* *resource, struct *coap_packet* *request, struct *sockaddr* *addr, *socklen_t* addr_len)

Type of the callback being called when a resource's method is invoked by the remote entity.

typedef void (*coap_notify_t)(struct *coap_resource* *resource, struct *coap_observer* *observer)

Type of the callback being called when a resource's has observers to be informed when an update happens.

typedef int (*coap_reply_t)(const struct *coap_packet* *response, struct *coap_reply* *reply, const struct *sockaddr* *from)

Helper function to be called when a response matches the a pending request.

When sending blocks, the callback is only executed when the reply of the last block is received. i.e. it is not called when the code of the reply is 'continue' (2.31).

Enums

enum coap_option_num

Set of CoAP packet options we are aware of.

Users may add options other than these to their packets, provided they know how to format them correctly. The only restriction is that all options must be added to a packet in numeric order.

Refer to RFC 7252, section 12.2 for more information.

Values:

enumerator COAP_OPTION_IF_MATCH = 1

If-Match.

enumerator COAP_OPTION_URI_HOST = 3
Uri-Host.

enumerator COAP_OPTION_ETAG = 4
ETag.

enumerator COAP_OPTION_IF_NONE_MATCH = 5
If-None-Match.

enumerator COAP_OPTION_OBSERVE = 6
Observe (RFC 7641)

enumerator COAP_OPTION_URI_PORT = 7
Uri-Port.

enumerator COAP_OPTION_LOCATION_PATH = 8
Location-Path.

enumerator COAP_OPTION_URI_PATH = 11
Uri-Path.

enumerator COAP_OPTION_CONTENT_FORMAT = 12
Content-Format.

enumerator COAP_OPTION_MAX_AGE = 14
Max-Age.

enumerator COAP_OPTION_URI_QUERY = 15
Uri-Query.

enumerator COAP_OPTION_ACCEPT = 17
Accept.

enumerator COAP_OPTION_LOCATION_QUERY = 20
Location-Query.

enumerator COAP_OPTION_BLOCK2 = 23
Block2 (RFC 7959)

enumerator COAP_OPTION_BLOCK1 = 27
Block1 (RFC 7959)

enumerator COAP_OPTION_SIZE2 = 28
Size2 (RFC 7959)

enumerator COAP_OPTION_PROXY_URI = 35
Proxy-Uri.

enumerator COAP_OPTION_PROXY_SCHEME = 39
Proxy-Scheme.

enumerator COAP_OPTION_SIZE1 = 60
Size1.

enumerator COAP_OPTION_ECHO = 252
Echo (RFC 9175)

enumerator COAP_OPTION_REQUEST_TAG = 292
Request-Tag (RFC 9175)

enum coap_method
Available request methods.

To be used when creating a request or a response.

Values:

enumerator COAP_METHOD_GET = 1
GET.

enumerator COAP_METHOD_POST = 2
POST.

enumerator COAP_METHOD_PUT = 3
PUT.

enumerator COAP_METHOD_DELETE = 4
DELETE.

enumerator COAP_METHOD_FETCH = 5
FETCH.

enumerator COAP_METHOD_PATCH = 6
PATCH.

enumerator COAP_METHOD_IPATCH = 7
IPATCH.

enum coap_msgtype
CoAP packets may be of one of these types.

Values:

enumerator COAP_TYPE_CON = 0
Confirmable message.

The packet is a request or response the destination end-point must acknowledge.

enumerator COAP_TYPE_NON_CON = 1

Non-confirmable message.

The packet is a request or response that doesn't require acknowledgements.

enumerator COAP_TYPE_ACK = 2

Acknowledge.

Response to a confirmable message.

enumerator COAP_TYPE_RESET = 3

Reset.

Rejecting a packet for any reason is done by sending a message of this type.

enum coap_response_code

Set of response codes available for a response packet.

To be used when creating a response.

Values:

enumerator COAP_RESPONSE_CODE_OK = ((2 « 5) | (0))

2.00 - OK

enumerator COAP_RESPONSE_CODE_CREATED = ((2 « 5) | (1))

2.01 - Created

enumerator COAP_RESPONSE_CODE_DELETED = ((2 « 5) | (2))

2.02 - Deleted

enumerator COAP_RESPONSE_CODE_VALID = ((2 « 5) | (3))

2.03 - Valid

enumerator COAP_RESPONSE_CODE_CHANGED = ((2 « 5) | (4))

2.04 - Changed

enumerator COAP_RESPONSE_CODE_CONTENT = ((2 « 5) | (5))

2.05 - Content

enumerator COAP_RESPONSE_CODE_CONTINUE = ((2 « 5) | (31))

2.31 - Continue

enumerator COAP_RESPONSE_CODE_BAD_REQUEST = ((4 « 5) | (0))

4.00 - Bad Request

enumerator COAP_RESPONSE_CODE_UNAUTHORIZED = ((4 « 5) | (1))

4.01 - Unauthorized

enumerator COAP_RESPONSE_CODE_BAD_OPTION = ((4 « 5) | (2))

4.02 - Bad Option

enumerator COAP_RESPONSE_CODE_FORBIDDEN = ((4 « 5) | (3))
4.03 - Forbidden

enumerator COAP_RESPONSE_CODE_NOT_FOUND = ((4 « 5) | (4))
4.04 - Not Found

enumerator COAP_RESPONSE_CODE_NOT_ALLOWED = ((4 « 5) | (5))
4.05 - Method Not Allowed

enumerator COAP_RESPONSE_CODE_NOT_ACCEPTABLE = ((4 « 5) | (6))
4.06 - Not Acceptable

enumerator COAP_RESPONSE_CODE_INCOMPLETE = ((4 « 5) | (8))
4.08 - Request Entity Incomplete

enumerator COAP_RESPONSE_CODE_CONFLICT = ((4 « 5) | (9))
4.12 - Precondition Failed

enumerator COAP_RESPONSE_CODE_PRECONDITION_FAILED = ((4 « 5) | (12))
4.12 - Precondition Failed

enumerator COAP_RESPONSE_CODE_REQUEST_TOO_LARGE = ((4 « 5) | (13))
4.13 - Request Entity Too Large

enumerator COAP_RESPONSE_CODE_UNSUPPORTED_CONTENT_FORMAT = ((4 « 5) | (15))
4.15 - Unsupported Content-Format

enumerator COAP_RESPONSE_CODE_UNPROCESSABLE_ENTITY = ((4 « 5) | (22))
4.22 - Unprocessable Entity

enumerator COAP_RESPONSE_CODE_TOO_MANY_REQUESTS = ((4 « 5) | (29))
4.29 - Too Many Requests

enumerator COAP_RESPONSE_CODE_INTERNAL_ERROR = ((5 « 5) | (0))
5.00 - Internal Server Error

enumerator COAP_RESPONSE_CODE_NOT_IMPLEMENTED = ((5 « 5) | (1))
5.01 - Not Implemented

enumerator COAP_RESPONSE_CODE_BAD_GATEWAY = ((5 « 5) | (2))
5.02 - Bad Gateway

enumerator COAP_RESPONSE_CODE_SERVICE_UNAVAILABLE = ((5 « 5) | (3))
5.03 - Service Unavailable

enumerator COAP_RESPONSE_CODE_GATEWAY_TIMEOUT = ((5 « 5) | (4))
5.04 - Gateway Timeout

enumerator COAP_RESPONSE_CODE_PROXYING_NOT_SUPPORTED = ((5 « 5) | (5))
5.05 - Proxying Not Supported

enum coap_content_format
Set of Content-Format option values for CoAP.
To be used when encoding or decoding a Content-Format option.
Values:

enumerator COAP_CONTENT_FORMAT_TEXT_PLAIN = 0
text/plain;charset=utf-8

enumerator COAP_CONTENT_FORMAT_APP_LINK_FORMAT = 40
application/link-format

enumerator COAP_CONTENT_FORMAT_APP_XML = 41
application/xml

enumerator COAP_CONTENT_FORMAT_APP_OCTET_STREAM = 42
application/octet-stream

enumerator COAP_CONTENT_FORMAT_APP_EXI = 47
application/exi

enumerator COAP_CONTENT_FORMAT_APP_JSON = 50
application/json

enumerator COAP_CONTENT_FORMAT_APP_JSON_PATCH_JSON = 51
application/json-patch+json

enumerator COAP_CONTENT_FORMAT_APP_MERGE_PATCH_JSON = 52
application/merge-patch+json

enumerator COAP_CONTENT_FORMAT_APP_CBOR = 60
application/cbor

enum coap_block_size
Represents the size of each block that will be transferred using block-wise transfers [RFC7959]:
Each entry maps directly to the value that is used in the wire.
https://tools.ietf.org/html/rfc7959
Values:

enumerator COAP_BLOCK_16
16-byte block size

enumerator COAP_BLOCK_32
32-byte block size

enumerator COAP_BLOCK_64
64-byte block size

enumerator COAP_BLOCK_128
128-byte block size

enumerator COAP_BLOCK_256
256-byte block size

enumerator COAP_BLOCK_512
512-byte block size

enumerator COAP_BLOCK_1024
1024-byte block size

Functions

uint8_t coap_header_get_version(const struct *coap_packet* *cpkt)
Returns the version present in a CoAP packet.

Parameters

- cpkt – CoAP packet representation

Returns
the CoAP version in packet

uint8_t coap_header_get_type(const struct *coap_packet* *cpkt)
Returns the type of the CoAP packet.

Parameters

- cpkt – CoAP packet representation

Returns
the type of the packet

uint8_t coap_header_get_token(const struct *coap_packet* *cpkt, uint8_t *token)
Returns the token (if any) in the CoAP packet.

Parameters

- cpkt – CoAP packet representation
- token – Where to store the token, must point to a buffer containing at least COAP_TOKEN_MAX_LEN bytes

Returns
Token length in the CoAP packet (0 - COAP_TOKEN_MAX_LEN).

uint8_t coap_header_get_code(const struct *coap_packet* *cpkt)
Returns the code of the CoAP packet.

Parameters

- cpkt – CoAP packet representation

Returns
the code present in the packet

int **coap_header_set_code**(const struct *coap_packet* *cpkt, uint8_t code)

Modifies the code of the CoAP packet.

Parameters

- **cpkt** – CoAP packet representation
- **code** – CoAP code

Returns
0 on success, -EINVAL on failure

uint16_t **coap_header_get_id**(const struct *coap_packet* *cpkt)

Returns the message id associated with the CoAP packet.

Parameters

- **cpkt** – CoAP packet representation

Returns
the message id present in the packet

const uint8_t ***coap_packet_get_payload**(const struct *coap_packet* *cpkt, uint16_t *len)

Returns the data pointer and length of the CoAP packet.

Parameters

- **cpkt** – CoAP packet representation
- **len** – Total length of CoAP payload

Returns
data pointer and length if payload exists NULL pointer and length set to 0 in case there is no payload

bool **coap_uri_path_match**(const char *const *path, struct *coap_option* *options, uint8_t opt_num)

Verify if CoAP URI path matches with provided options.

Parameters

- **path** – Null-terminated array of strings.
- **options** – Parsed options from *coap_packet_parse()*
- **opt_num** – Number of options

Returns
true if the CoAP URI path matches, false otherwise.

int **coap_packet_parse**(struct *coap_packet* *cpkt, uint8_t *data, uint16_t len, struct *coap_option* *options, uint8_t opt_num)

Parses the CoAP packet in data, validating it and initializing *cpkt*.

data must remain valid while *cpkt* is used.

Parameters

- **cpkt** – Packet to be initialized from received *data*.
- **data** – Data containing a CoAP packet, its *data* pointer is positioned on the start of the CoAP packet.
- **len** – Length of the data
- **options** – Parse options and cache its details.
- **opt_num** – Number of options

Return values

- `0` – in case of success.
- `-EINVAL` – in case of invalid input args.
- `-EBADMSG` – in case of malformed coap packet header.
- `-EILSEQ` – in case of malformed coap options.

int `coap_packet_set_path`(struct *coap_packet* *cpkt, const char *path)

Parses provided coap path (with/without query) or query and appends that as options to the *cpkt*.

Parameters

- `cpkt` – Packet to append path and query options for.
- `path` – Null-terminated string of coap path, query or both.

Return values

`0` – in case of success or negative in case of error.

int `coap_packet_init`(struct *coap_packet* *cpkt, uint8_t *data, uint16_t max_len, uint8_t ver, uint8_t type, uint8_t token_len, const uint8_t *token, uint8_t code, uint16_t id)

Creates a new CoAP Packet from input data.

Parameters

- `cpkt` – New packet to be initialized using the storage from *data*.
- `data` – Data that will contain a CoAP packet information
- `max_len` – Maximum allowable length of data
- `ver` – CoAP header version
- `type` – CoAP header type
- `token_len` – CoAP header token length
- `token` – CoAP header token
- `code` – CoAP header code
- `id` – CoAP header message id

Returns

0 in case of success or negative in case of error.

int `coap_ack_init`(struct *coap_packet* *cpkt, const struct *coap_packet* *req, uint8_t *data, uint16_t max_len, uint8_t code)

Create a new CoAP Acknowledgment message for given request.

This function works like *coap_packet_init*, filling CoAP header type, CoAP header token, and CoAP header message id fields according to acknowledgment rules.

Parameters

- `cpkt` – New packet to be initialized using the storage from *data*.
- `req` – CoAP request packet that is being acknowledged
- `data` – Data that will contain a CoAP packet information
- `max_len` – Maximum allowable length of data
- `code` – CoAP header code

Returns

0 in case of success or negative in case of error.

uint8_t *coap_next_token(void)

Returns a randomly generated array of 8 bytes, that can be used as a message's token.

Returns
a 8-byte pseudo-random token.

uint16_t coap_next_id(void)

Helper to generate message ids.

Returns
a new message id

int coap_find_options(const struct *coap_packet* *cpkt, uint16_t code, struct *coap_option* *options, uint16_t veclen)

Return the values associated with the option of value *code*.

Parameters

- **cpkt** – CoAP packet representation
- **code** – Option number to look for
- **options** – Array of *coap_option* where to store the value of the options found
- **veclen** – Number of elements in the options array

Returns
The number of options found in packet matching code, negative on error.

int coap_packet_append_option(struct *coap_packet* *cpkt, uint16_t code, const uint8_t *value, uint16_t len)

Appends an option to the packet.

Note: options can be added out of numeric order of their codes. But it's more efficient to add them in order.

Parameters

- **cpkt** – Packet to be updated
- **code** – Option code to add to the packet, see *coap_option_num*
- **value** – Pointer to the value of the option, will be copied to the packet
- **len** – Size of the data to be added

Returns
0 in case of success or negative in case of error.

int coap_packet_remove_option(struct *coap_packet* *cpkt, uint16_t code)

Remove an option from the packet.

Parameters

- **cpkt** – Packet to be updated
- **code** – Option code to remove from the packet, see *coap_option_num*

Returns
0 in case of success or negative in case of error.

unsigned int coap_option_value_to_int(const struct *coap_option* *option)

Converts an option to its integer representation.

Assumes that the number is encoded in the network byte order in the option.

Parameters

- **option** – Pointer to the option value, retrieved by *coap_find_options()*

Returns
The integer representation of the option

int `coap_append_option_int`(struct *coap_packet* *cpkt, uint16_t code, unsigned int val)

Appends an integer value option to the packet.

The option must be added in numeric order of their codes, and the least amount of bytes will be used to encode the value.

Parameters

- `cpkt` – Packet to be updated
- `code` – Option code to add to the packet, see *coap_option_num*
- `val` – Integer value to be added

Returns
0 in case of success or negative in case of error.

int `coap_packet_append_payload_marker`(struct *coap_packet* *cpkt)

Append payload marker to CoAP packet.

Parameters

- `cpkt` – Packet to append the payload marker (0xFF)

Returns
0 in case of success or negative in case of error.

int `coap_packet_append_payload`(struct *coap_packet* *cpkt, const uint8_t *payload, uint16_t payload_len)

Append payload to CoAP packet.

Parameters

- `cpkt` – Packet to append the payload
- `payload` – CoAP packet payload
- `payload_len` – CoAP packet payload len

Returns
0 in case of success or negative in case of error.

bool `coap_packet_is_request`(const struct *coap_packet* *cpkt)

Check if a CoAP packet is a CoAP request.

Parameters

- `cpkt` – Packet to be checked.

Returns
true if the packet is a request, false otherwise.

int `coap_handle_request_len`(struct *coap_packet* *cpkt, struct *coap_resource* *resources, size_t resources_len, struct *coap_option* *options, uint8_t opt_num, struct *sockaddr* *addr, *socklen_t* addr_len)

When a request is received, call the appropriate methods of the matching resources.

Parameters

- `cpkt` – Packet received
- `resources` – Array of known resources
- `resources_len` – Number of resources in the array
- `options` – Parsed options from *coap_packet_parse()*
- `opt_num` – Number of options

- **addr** – Peer address
- **addr_len** – Peer address length

Return values

- **>=** – 0 in case of success.
- **-ENOTSUP** – in case of invalid request code.
- **-EPERM** – in case resource handler is not implemented.
- **-ENOENT** – in case the resource is not found.

int **coap_handle_request**(struct *coap_packet* *cpkt, struct *coap_resource* *resources, struct *coap_option* *options, uint8_t opt_num, struct *sockaddr* *addr, *socklen_t* addr_len)

When a request is received, call the appropriate methods of the matching resources.

Parameters

- **cpkt** – Packet received
- **resources** – Array of known resources (terminated with empty resource)
- **options** – Parsed options from *coap_packet_parse()*
- **opt_num** – Number of options
- **addr** – Peer address
- **addr_len** – Peer address length

Return values

- **>=** – 0 in case of success.
- **-ENOTSUP** – in case of invalid request code.
- **-EPERM** – in case resource handler is not implemented.
- **-ENOENT** – in case the resource is not found.

static inline uint16_t **coap_block_size_to_bytes**(enum *coap_block_size* block_size)

Helper for converting the enumeration to the size expressed in bytes.

Parameters

- **block_size** – The block size to be converted

Returns

The size in bytes that the block_size represents

static inline enum *coap_block_size* **coap_bytes_to_block_size**(uint16_t bytes)

Helper for converting block size in bytes to enumeration.

NOTE: Only valid CoAP block sizes map correctly.

Parameters

- **bytes** – CoAP block size in bytes.

Returns

enum coap_block_size

int **coap_block_transfer_init**(struct *coap_block_context* *ctx, enum *coap_block_size* block_size, size_t total_size)

Initializes the context of a block-wise transfer.

Parameters

- **ctx** – The context to be initialized

- **block_size** – The size of the block
- **total_size** – The total size of the transfer, if known

Returns
0 in case of success or negative in case of error.

int **coap_append_descriptive_block_option**(struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Append BLOCK1 or BLOCK2 option to the packet.

If the CoAP packet is a request then BLOCK1 is appended otherwise BLOCK2 is appended.

Parameters

- **cpkt** – Packet to be updated
- **ctx** – Block context from which to retrieve the information for the block option

Returns
0 in case of success or negative in case of error.

bool **coap_has_descriptive_block_option**(struct *coap_packet* *cpkt)

Check if a descriptive block option is set in the packet.

If the CoAP packet is a request then an available BLOCK1 option would be checked otherwise a BLOCK2 option would be checked.

Parameters

- **cpkt** – Packet to be checked.

Returns
true if the corresponding block option is set, false otherwise.

int **coap_remove_descriptive_block_option**(struct *coap_packet* *cpkt)

Remove BLOCK1 or BLOCK2 option from the packet.

If the CoAP packet is a request then BLOCK1 is removed otherwise BLOCK2 is removed.

Parameters

- **cpkt** – Packet to be updated.

Returns
0 in case of success or negative in case of error.

bool **coap_block_has_more**(struct *coap_packet* *cpkt)

Check if BLOCK1 or BLOCK2 option has more flag set.

Parameters

- **cpkt** – Packet to be checked.

Returns
true If more flag is set in BLOCK1 or BLOCK2

Returns
false If MORE flag is not set or BLOCK header not found.

int **coap_append_block1_option**(struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Append BLOCK1 option to the packet.

Parameters

- **cpkt** – Packet to be updated

- **ctx** – Block context from which to retrieve the information for the Block1 option

Returns
0 in case of success or negative in case of error.

int **coap_append_block2_option**(struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Append BLOCK2 option to the packet.

Parameters

- **cpkt** – Packet to be updated
- **ctx** – Block context from which to retrieve the information for the Block2 option

Returns
0 in case of success or negative in case of error.

int **coap_append_size1_option**(struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Append SIZE1 option to the packet.

Parameters

- **cpkt** – Packet to be updated
- **ctx** – Block context from which to retrieve the information for the Size1 option

Returns
0 in case of success or negative in case of error.

int **coap_append_size2_option**(struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Append SIZE2 option to the packet.

Parameters

- **cpkt** – Packet to be updated
- **ctx** – Block context from which to retrieve the information for the Size2 option

Returns
0 in case of success or negative in case of error.

int **coap_get_option_int**(const struct *coap_packet* *cpkt, uint16_t code)

Get the integer representation of a CoAP option.

Parameters

- **cpkt** – Packet to be inspected
- **code** – CoAP option code

Returns
Integer value >= 0 in case of success or negative in case of error.

int **coap_get_block1_option**(const struct *coap_packet* *cpkt, bool *has_more, uint8_t *block_number)

Get the block size, more flag and block number from the CoAP block1 option.

Parameters

- **cpkt** – Packet to be inspected
- **has_more** – Is set to the value of the more flag
- **block_number** – Is set to the number of the block

Returns
Integer value of the block size in case of success or negative in case of error.

int `coap_get_block2_option`(const struct *coap_packet* *cpkt, uint8_t *block_number)

Get values from CoAP block2 option.

Decode block number and block size from option. Ignore the has_more flag as it should always be zero on queries.

Parameters

- `cpkt` – Packet to be inspected
- `block_number` – Is set to the number of the block

Returns
Integer value of the block size in case of success or negative in case of error.

int `coap_update_from_block`(const struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Retrieves BLOCK{1,2} and SIZE{1,2} from *cpkt* and updates *ctx* accordingly.

Parameters

- `cpkt` – Packet in which to look for block-wise transfers options
- `ctx` – Block context to be updated

Returns
0 in case of success or negative in case of error.

int `coap_next_block_for_option`(const struct *coap_packet* *cpkt, struct *coap_block_context* *ctx, enum *coap_option_num* option)

Updates *ctx* according to *option* set in *cpkt* so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters

- `cpkt` – Packet in which to look for block-wise transfers options
- `ctx` – Block context to be updated
- `option` – Either COAP_OPTION_BLOCK1 or COAP_OPTION_BLOCK2

Returns
The offset in the block-wise transfer, 0 if the transfer has finished or a negative value in case of an error.

size_t `coap_next_block`(const struct *coap_packet* *cpkt, struct *coap_block_context* *ctx)

Updates *ctx* so after this is called the current entry indicates the correct offset in the body of data being transferred.

Parameters

- `cpkt` – Packet in which to look for block-wise transfers options
- `ctx` – Block context to be updated

Returns
The offset in the block-wise transfer, 0 if the transfer has finished.

void `coap_observer_init`(struct *coap_observer* *observer, const struct *coap_packet* *request, const struct *sockaddr* *addr)

Indicates that the remote device referenced by *addr*, with *request*, wants to observe a resource.

Parameters

- **observer** – Observer to be initialized
- **request** – Request on which the observer will be based
- **addr** – Address of the remote device

bool **coap_register_observer**(struct *coap_resource* *resource, struct *coap_observer* *observer)

After the observer is initialized, associate the observer with an resource.

Parameters

- **resource** – Resource to add an observer
- **observer** – Observer to be added

Returns
true if this is the first observer added to this resource.

bool **coap_remove_observer**(struct *coap_resource* *resource, struct *coap_observer* *observer)

Remove this observer from the list of registered observers of that resource.

Parameters

- **resource** – Resource in which to remove the observer
- **observer** – Observer to be removed

Returns
true if the observer was found and removed.

struct *coap_observer* ***coap_find_observer**(struct *coap_observer* *observers, size_t len, const struct *sockaddr* *addr, const uint8_t *token, uint8_t token_len)

Returns the observer that matches address *addr* and has token *token*.

Parameters

- **observers** – Pointer to the array of observers
- **len** – Size of the array of observers
- **addr** – Address of the endpoint observing a resource
- **token** – Pointer to the token
- **token_len** – Length of valid bytes in the token

Returns
A pointer to a observer if a match is found, NULL otherwise.

struct *coap_observer* ***coap_find_observer_by_addr**(struct *coap_observer* *observers, size_t len, const struct *sockaddr* *addr)

Returns the observer that matches address *addr*.

Note

The function *coap_find_observer()* should be preferred if both the observer's address and token are known.

Parameters

- **observers** – Pointer to the array of observers
- **len** – Size of the array of observers

- **addr** – Address of the endpoint observing a resource

Returns
A pointer to a observer if a match is found, NULL otherwise.

struct *coap_observer* ***coap_find_observer_by_token**(struct *coap_observer* *observers, size_t len, const uint8_t *token, uint8_t token_len)

Returns the observer that has token *token*.

> **Note**
>
> The function *coap_find_observer()* should be preferred if both the observer's address and token are known.

Parameters

- **observers** – Pointer to the array of observers
- **len** – Size of the array of observers
- **token** – Pointer to the token
- **token_len** – Length of valid bytes in the token

Returns
A pointer to a observer if a match is found, NULL otherwise.

struct *coap_observer* ***coap_observer_next_unused**(struct *coap_observer* *observers, size_t len)

Returns the next available observer representation.

Parameters

- **observers** – Pointer to the array of observers
- **len** – Size of the array of observers

Returns
A pointer to a observer if there's an available observer, NULL otherwise.

void **coap_reply_init**(struct *coap_reply* *reply, const struct *coap_packet* *request)

Indicates that a reply is expected for *request*.

Parameters

- **reply** – Reply structure to be initialized
- **request** – Request from which *reply* will be based

int **coap_pending_init**(struct *coap_pending* *pending, const struct *coap_packet* *request, const struct *sockaddr* *addr, const struct *coap_transmission_parameters* *params)

Initialize a pending request with a request.

The request's fields are copied into the pending struct, so *request* doesn't have to live for as long as the pending struct lives, but "data" that needs to live for at least that long.

Parameters

- **pending** – Structure representing the waiting for a confirmation message, initialized with data from *request*
- **request** – Message waiting for confirmation
- **addr** – Address to send the retransmission

- **params** – Pointer to the CoAP transmission parameters struct, or NULL to use default values

Returns
0 in case of success or negative in case of error.

struct *coap_pending* ***coap_pending_next_unused**(struct *coap_pending* *pendings, size_t len)

Returns the next available pending struct, that can be used to track the retransmission status of a request.

Parameters

- **pendings** – Pointer to the array of *coap_pending* structures
- **len** – Size of the array of *coap_pending* structures

Returns
pointer to a free *coap_pending* structure, NULL in case none could be found.

struct *coap_reply* ***coap_reply_next_unused**(struct *coap_reply* *replies, size_t len)

Returns the next available reply struct, so it can be used to track replies and notifications received.

Parameters

- **replies** – Pointer to the array of *coap_reply* structures
- **len** – Size of the array of *coap_reply* structures

Returns
pointer to a free *coap_reply* structure, NULL in case none could be found.

struct *coap_pending* ***coap_pending_received**(const struct *coap_packet* *response, struct *coap_pending* *pendings, size_t len)

After a response is received, returns if there is any matching pending request exits.

User has to clear all pending retransmissions related to that response by calling *coap_pending_clear()*.

Parameters

- **response** – The received response
- **pendings** – Pointer to the array of *coap_reply* structures
- **len** – Size of the array of *coap_reply* structures

Returns
pointer to the associated *coap_pending* structure, NULL in case none could be found.

struct *coap_reply* ***coap_response_received**(const struct *coap_packet* *response, const struct *sockaddr* *from, struct *coap_reply* *replies, size_t len)

After a response is received, call coap_reply_t handler registered in *coap_reply* structure.

Parameters

- **response** – A response received
- **from** – Address from which the response was received
- **replies** – Pointer to the array of *coap_reply* structures
- **len** – Size of the array of *coap_reply* structures

Returns
Pointer to the reply matching the packet received, NULL if none could be found.

struct *coap_pending* ***coap_pending_next_to_expire**(struct *coap_pending* *pendings, size_t len)

Returns the next pending about to expire, pending->timeout informs how many ms to next expiration.

Parameters

- **pendings** – Pointer to the array of *coap_pending* structures
- **len** – Size of the array of *coap_pending* structures

Returns
The next *coap_pending* to expire, NULL if none is about to expire.

bool **coap_pending_cycle**(struct *coap_pending* *pending)

After a request is sent, user may want to cycle the pending retransmission so the timeout is updated.

Parameters

- **pending** – Pending representation to have its timeout updated

Returns
false if this is the last retransmission.

void **coap_pending_clear**(struct *coap_pending* *pending)

Cancels the pending retransmission, so it again becomes available.

Parameters

- **pending** – Pending representation to be canceled

void **coap_pendings_clear**(struct *coap_pending* *pendings, size_t len)

Cancels all pending retransmissions, so they become available again.

Parameters

- **pendings** – Pointer to the array of *coap_pending* structures
- **len** – Size of the array of *coap_pending* structures

size_t **coap_pendings_count**(struct *coap_pending* *pendings, size_t len)

Count number of pending requests.

Parameters

- **len** – Number of elements in array.
- **pendings** – Array of pending requests.

Returns
count of elements where timeout is not zero.

void **coap_reply_clear**(struct *coap_reply* *reply)

Cancels awaiting for this reply, so it becomes available again.

User responsibility to free the memory associated with data.

Parameters

- **reply** – The reply to be canceled

void **coap_replies_clear**(struct *coap_reply* *replies, size_t len)

Cancels all replies, so they become available again.

Parameters

- **replies** – Pointer to the array of *coap_reply* structures
- **len** – Size of the array of *coap_reply* structures

int **coap_resource_notify**(struct *coap_resource* *resource)

Indicates that this resource was updated and that the *notify* callback should be called for every registered observer.

Parameters

- **resource** – Resource that was updated

Returns

0 in case of success or negative in case of error.

bool **coap_request_is_observe**(const struct *coap_packet* *request)

Returns if this request is enabling observing a resource.

Parameters

- **request** – Request to be checked

Returns

True if the request is enabling observing a resource, False otherwise

struct *coap_transmission_parameters* **coap_get_transmission_parameters**(void)

Get currently active CoAP transmission parameters.

Returns

CoAP transmission parameters structure.

void **coap_set_transmission_parameters**(const struct *coap_transmission_parameters* *params)

Set CoAP transmission parameters.

Parameters

- **params** – Pointer to the transmission parameters structure.

int **coap_well_known_core_get**(struct *coap_resource* *resource, const struct *coap_packet* *request, struct *coap_packet* *response, uint8_t *data, uint16_t data_len)

Build a CoAP response for a .well-known/core CoAP request.

Parameters

- **resource** – Array of known resources, terminated with an empty resource
- **request** – A pointer to the .well-known/core CoAP request
- **response** – A pointer to a CoAP response, will be initialized
- **data** – A data pointer to be used to build the CoAP response
- **data_len** – The maximum length of the data buffer

Returns

0 in case of success or negative in case of error.

int **coap_well_known_core_get_len**(struct *coap_resource* *resources, size_t resources_len, const struct *coap_packet* *request, struct *coap_packet* *response, uint8_t *data, uint16_t data_len)

Build a CoAP response for a .well-known/core CoAP request.

Parameters

- `resources` – Array of known resources
- `resources_len` – Number of resources in the array
- `request` – A pointer to the .well-known/core CoAP request
- `response` – A pointer to a CoAP response, will be initialized
- `data` – A data pointer to be used to build the CoAP response
- `data_len` – The maximum length of the data buffer

Returns

0 in case of success or negative in case of error.

struct `coap_resource`

#include <*coap.h*> Description of CoAP resource.

CoAP servers often want to register resources, so that clients can act on them, by fetching their state or requesting updates to them.

Public Members

coap_method_t `get`

Which function to be called for each CoAP method.

coap_notify_t `notify`

Notify function to call.

const char *const *`path`

Resource path.

void *`user_data`

User specific opaque data.

sys_slist_t `observers`

List of resource observers.

int `age`

Resource age.

struct `coap_observer`

#include <*coap.h*> Represents a remote device that is observing a local resource.

Public Members

sys_snode_t `list`

Observer list node.

struct *sockaddr* `addr`

Observer connection end point information.

uint8_t **token**[8]
Observer token.

uint8_t **tkl**
Extended token length.

struct **coap_packet**
#include <*coap.h*> Representation of a CoAP Packet.

Public Members

uint8_t ***data**
User allocated buffer.

uint16_t **offset**
CoAP lib maintains offset while adding data.

uint16_t **max_len**
Max CoAP packet data length.

uint8_t **hdr_len**
CoAP header length.

uint16_t **opt_len**
Total options length (delta + len + value)

uint16_t **delta**
Used for delta calculation in CoAP packet.

struct **coap_option**
#include <*coap.h*> Representation of a CoAP option.

Public Members

uint16_t **delta**
Option delta.

uint8_t **len**
Option length.

uint8_t **value**[12]
Option value.

struct **coap_transmission_parameters**
#include <*coap.h*> CoAP transmission parameters.

Public Members

uint32_t **ack_timeout**

Initial ACK timeout.

Value is used as a base value to retry pending CoAP packets.

uint16_t **coap_backoff_percent**

Set CoAP retry backoff factor.

A value of 200 means a factor of 2.0.

uint8_t **max_retransmission**

Maximum number of retransmissions.

struct **coap_pending**

#include <*coap.h*> Represents a request awaiting for an acknowledgment (ACK).

Public Members

struct *sockaddr* **addr**

Remote address.

int64_t **t0**

Time when the request was sent.

uint32_t **timeout**

Timeout in ms.

uint16_t **id**

Message id.

uint8_t ***data**

User allocated buffer.

uint16_t **len**

Length of the CoAP packet.

uint8_t **retries**

Number of times the request has been sent.

struct *coap_transmission_parameters* **params**

Transmission parameters.

struct **coap_reply**

#include <*coap.h*> Represents the handler for the reply of a request, it is also used when observing resources.

Public Members

coap_reply_t **reply**
CoAP reply callback.

void ***user_data**
User specific opaque data.

int **age**
Reply age.

uint16_t **id**
Reply id.

uint8_t **token**[8]
Reply token.

uint8_t **tkl**
Extended token length.

struct **coap_block_context**
#include <coap.h> Represents the current state of a block-wise transaction.

Public Members

size_t **total_size**
Total size of the block-wise transaction.

size_t **current**
Current size of the block-wise transaction.

enum *coap_block_size* **block_size**
Block size.

struct **coap_core_metadata**
#include <coap_link_format.h> In case you want to add attributes to the resources included in the 'well-known/core' "virtual" resource, the 'user_data' field should point to a valid *coap_core_metadata* structure.

Public Members

const char *const ***attributes**
List of attributes to add.

void ***user_data**
User specific data.

CoAP client

- *Overview*
- *Sample Usage*
- *API Reference*

Overview The CoAP client library allows application to send CoAP requests and parse CoAP responses. The library can be enabled with `CONFIG_COAP_CLIENT` Kconfig option. The application is notified about the response via a callback that is provided to the API in the request. The CoAP client handles the communication over sockets. As the CoAP client doesn't create socket it is using, the application is responsible for creating the socket. Plain UDP or DTLS sockets are supported.

Sample Usage The following is an example of a CoAP client initialization and request sending:

```
static struct coap_client;
struct coap_client_request req = { 0 };

coap_client_init(&client, NULL);

req.method = COAP_METHOD_GET;
req.confirmable = true;
req.path = "test";
req.fmt = COAP_CONTENT_FORMAT_TEXT_PLAIN;
req.cb = response_cb;
req.payload = NULL;
req.len = 0;

/* Sock is a file descriptor referencing a socket, address is the sockaddr struct for the
 * destination address of the request or NULL if the socket is already connected.
 */
ret = coap_client_req(&client, sock, &address, &req, -1);
```

Before any requests can be sent, the CoAP client needs to be initialized. After initialization, the application can send a CoAP request and wait for the response. Currently only one request can be sent for a single CoAP client at a time. There can be multiple CoAP clients.

The callback provided in the callback will be called in following cases:

- There is a response for the request
- The request failed for some reason

The callback contains a flag *last_block*, which indicates if there is more data to come in the response and means that the current response is part of a blockwise transfer. When the *last_block* is set to true, the response is finished and the client is ready for the next request after returning from the callback.

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the response can be a blockwise transfer and the client calls the callback once per each block, the application should be to process all of the blocks to be able to process the response.

The following is an example of a very simple response handling function:

```
void response_cb(int16_t code, size_t offset, const uint8_t *payload, size_t len,
                 bool last_block, void *user_data)
{
    if (code >= 0) {
            LOG_INF("CoAP response from server %d", code);
            if (last_block) {
                    LOG_INF("Last packet received");
            }
    } else {
            LOG_ERR("Error in sending request %d", code);
    }
}
```

CoAP options may also be added to the request by the application. The following is an example of the application adding a Block2 option to the initial request, to suggest a maximum block size to the server for a resource that it expects to be large enough to require a blockwise transfer (see RFC7959 Figure 3: Block-Wise GET with Early Negotiation).

```
static struct coap_client;
struct coap_client_request req = { 0 };

/* static, since options must remain valid throughout the whole execution of the request */
static struct coap_client_option block2_option;

coap_client_init(&client, NULL);
block2_option = coap_client_option_initial_block2();

req.method = COAP_METHOD_GET;
req.confirmable = true;
req.path = "test";
req.fmt = COAP_CONTENT_FORMAT_TEXT_PLAIN;
req.cb = response_cb;
req.options = &block2_option;
req.num_options = 1;
req.payload = NULL;
req.len = 0;

ret = coap_client_req(&client, sock, &address, &req, -1);
```

API Reference

group `coap_client`

CoAP client API.

Since
3.4

Version
0.1.0

Defines

`MAX_COAP_MSG_LEN`

Maximum size of a CoAP message.

Typedefs

typedef void (*`coap_client_response_cb_t`)(int16_t result_code, size_t offset, const uint8_t *payload, size_t len, bool last_block, void *user_data)

Callback for CoAP request.

This callback is called for responses to CoAP client requests. It is used to indicate errors, response codes from server or to deliver payload. Blockwise transfers cause this callback to be called sequentially with increasing payload offset and only partial content in buffer pointed by payload parameter.

Param result_code
Result code of the response. Negative if there was a failure in send. *coap_response_code* for positive.

Param offset
Payload offset from the beginning of a blockwise transfer.

Param payload
Buffer containing the payload from the response. NULL for empty payload.

Param len
Size of the payload.

Param last_block
Indicates the last block of the response.

Param user_data
User provided context.

Functions

int `coap_client_init`(struct coap_client *client, const char *info)

Initialize the CoAP client.

Parameters

- `client` – **[in]** Client instance.
- `info` – **[in]** Name for the receiving thread of the client. Setting this NULL will result as default name of "coap_client".

Returns
int Zero on success, otherwise a negative error code.

int `coap_client_req`(struct coap_client *client, int sock, const struct *sockaddr* *addr, struct *coap_client_request* *req, struct *coap_transmission_parameters* *params)

Send CoAP request.

Operation is handled asynchronously using a background thread. If the socket isn't connected to a destination address, user must provide a destination address, otherwise the address should be set as NULL. Once the callback is called with last block set as true, socket can be closed or used for another query.

Parameters

- `client` – Client instance.
- `sock` – Open socket file descriptor.
- `addr` – the destination address of the request, NULL if socket is already connected.

- `req` – CoAP request structure
- `params` – Pointer to transmission parameters structure or NULL to use default values.

Returns
zero when operation started successfully or negative error code otherwise.

void `coap_client_cancel_requests`(struct coap_client *client)

Cancel all current requests.

This is intended for canceling long-running requests (e.g. GETs with the OBSERVE option set) which has gone stale for some reason.

Parameters

- `client` – Client instance.

static inline struct *coap_client_option* `coap_client_option_initial_block2`(void)

Initialise a Block2 option to be added to a request.

If the application expects a request to require a blockwise transfer, it may preemptively suggest a maximum block size to the server - see RFC7959 Figure 3: Block-Wise GET with Early Negotiation.

This helper function returns a Block2 option to send with the initial request.

Returns
CoAP client initial Block2 option structure

struct `coap_client_request`

#include <*coap_client.h*> Representation of a CoAP client request.

Public Members

enum *coap_method* `method`

Method of the request.

bool `confirmable`

CoAP Confirmable/Non-confirmable message.

const char *`path`

Path of the requested resource.

enum *coap_content_format* `fmt`

Content format to be used.

uint8_t *`payload`

User allocated buffer for send request.

size_t `len`

Length of the payload.

coap_client_response_cb_t `cb`

Callback when response received.

struct *coap_client_option* ***options**
Extra options to be added to request.

uint8_t **num_options**
Number of extra options.

void ***user_data**
User provided context.

struct **coap_client_option**
#include <*coap_client.h*> Representation of extra options for the CoAP client request.

Public Members

uint16_t **code**
Option code.

uint8_t **len**
Option len.

uint8_t **value**[12]
Buffer for the length.

CoAP server

- *Overview*
- *Setup*
- *Sample Usage*
- *Observable resources*
- *CoAP Events*
- *CoRE Link Format*
- *API Reference*

Overview Zephyr comes with a batteries-included CoAP server, which uses services to listen for CoAP requests. The CoAP services handle communication over sockets and pass requests to registered CoAP resources.

Setup Some configuration is required to make sure services can be started using the CoAP server. The `CONFIG_COAP_SERVER` option should be enabled in your project:

Listing 1: prj.conf

```
CONFIG_COAP_SERVER=y
```

All services are added to a predefined linker section and all resources for each service also get their respective linker sections. If you would have a service `my_service` it has to be prefixed with `coap_resource_` and added to a linker file:

Listing 2: sections-ram.ld

```
#include <zephyr/linker/iterable_sections.h>

ITERABLE_SECTION_RAM(coap_resource_my_service, 4)
```

Add this linker file to your application using CMake:

Listing 3: CMakeLists.txt

```
zephyr_linker_sources(DATA_SECTIONS sections-ram.ld)
```

You can now define your service as part of the application:

```
#include <zephyr/net/coap_service.h>

static const uint16_t my_service_port = 5683;

COAP_SERVICE_DEFINE(my_service, "0.0.0.0", &my_service_port, COAP_SERVICE_AUTOSTART);
```

Note

Services defined with the `COAP_SERVICE_AUTOSTART` flag will be started together with the CoAP server thread. Services can be manually started and stopped with `coap_service_start` and `coap_service_stop` respectively.

Sample Usage The following is an example of a CoAP resource registered with our service:

```
#include <zephyr/net/coap_service.h>

static int my_get(struct coap_resource *resource, struct coap_packet *request,
                  struct sockaddr *addr, socklen_t addr_len)
{
    static const char *msg = "Hello, world!";
    uint8_t data[CONFIG_COAP_SERVER_MESSAGE_SIZE];
    struct coap_packet response;
    uint16_t id;
    uint8_t token[COAP_TOKEN_MAX_LEN];
    uint8_t tkl, type;

    type = coap_header_get_type(request);
    id = coap_header_get_id(request);
    tkl = coap_header_get_token(request, token);

    /* Determine response type */
    type = (type == COAP_TYPE_CON) ? COAP_TYPE_ACK : COAP_TYPE_NON_CON;

    coap_packet_init(&response, data, sizeof(data), COAP_VERSION_1, type, tkl, token,
                     COAP_RESPONSE_CODE_CONTENT, id);
```

(continues on next page)

(continued from previous page)

```
    /* Set content format */
    coap_append_option_int(&response, COAP_OPTION_CONTENT_FORMAT,
                           COAP_CONTENT_FORMAT_TEXT_PLAIN);

    /* Append payload */
    coap_packet_append_payload_marker(&response);
    coap_packet_append_payload(&response, (uint8_t *)msg, sizeof(msg));

    /* Send to response back to the client */
    return coap_resource_send(resource, &response, addr, addr_len, NULL);
}

static int my_put(struct coap_resource *resource, struct coap_packet *request,
                  struct sockaddr *addr, socklen_t addr_len)
{
    /* ... Handle the incoming request ... */

    /* Return a CoAP response code as a shortcut for an empty ACK message */
    return COAP_RESPONSE_CODE_CHANGED;
}

static const char * const my_resource_path[] = { "test", NULL };
COAP_RESOURCE_DEFINE(my_resource, my_service, {
    .path = my_resource_path,
    .get = my_get,
    .put = my_put,
});
```

Note

As demonstrated in the example above, a CoAP resource handler can return response codes to let the server respond with an empty ACK response.

Observable resources The CoAP server provides logic for parsing observe requests and stores these using the runtime data of CoAP services. An example using a temperature sensor can look like:

```
#include <zephyr/kernel.h>
#include <zephyr/drivers/sensor.h>
#include <zephyr/net/coap_service.h>

static void notify_observers(struct k_work *work);
K_WORK_DELAYABLE_DEFINE(temp_work, notify_observers);

static int send_temperature(struct coap_resource *resource,
                            const struct sockaddr *addr, socklen_t addr_len,
                            uint16_t age, uint16_t id, const uint8_t *token, uint8_t tkl,
                            bool is_response)
{
    const struct device *dev = DEVICE_DT_GET(DT_ALIAS(ambient_temp0));
    uint8_t data[CONFIG_COAP_SERVER_MESSAGE_SIZE];
    struct coap_packet response;
    char payload[14];
    struct sensor_value value;
    double temp;
    uint8_t type;

    /* Determine response type */
```

(continues on next page)

(continued from previous page)

```
    type = is_response ? COAP_TYPE_ACK : COAP_TYPE_CON;

    if (!is_response) {
        id = coap_next_id();
    }

    coap_packet_init(&response, data, sizeof(data), COAP_VERSION_1, type, tkl, token,
                     COAP_RESPONSE_CODE_CONTENT, id);

    if (age >= 2U) {
        coap_append_option_int(&response, COAP_OPTION_OBSERVE, age);
    }

    /* Set content format */
    coap_append_option_int(&response, COAP_OPTION_CONTENT_FORMAT,
                           COAP_CONTENT_FORMAT_TEXT_PLAIN);

    /* Get the sensor date */
    sensor_sample_fetch_chan(dev, SENSOR_CHAN_AMBIENT_TEMP);
    sensor_channel_get(dev, SENSOR_CHAN_AMBIENT_TEMP, &value);
    temp = sensor_value_to_double(&value);

    snprintk(payload, sizeof(payload), "%0.2f°C", temp);

    /* Append payload */
    coap_packet_append_payload_marker(&response);
    coap_packet_append_payload(&response, (uint8_t *)payload, strlen(payload));

    return coap_resource_send(resource, &response, addr, addr_len, NULL);
}

static int temp_get(struct coap_resource *resource, struct coap_packet *request,
                    struct sockaddr *addr, socklen_t addr_len)
{
    uint8_t token[COAP_TOKEN_MAX_LEN];
    uint16_t id;
    uint8_t tkl;
    int r;

    /* Let the CoAP server parse the request and add/remove observers if needed */
    r = coap_resource_parse_observe(resource, request, addr);

    id = coap_header_get_id(request);
    tkl = coap_header_get_token(request, token);

    return send_temperature(resource, addr, addr_len, r == 0 ? resource->age : 0,
                            id, token, tkl, true);
}

static void temp_notify(struct coap_resource *resource, struct coap_observer *observer)
{
    send_temperature(resource, &observer->addr, sizeof(observer->addr), resource->age, 0,
                     observer->token, observer->tkl, false);
}

static const char * const temp_resource_path[] = { "sensors", "temp1", NULL };
COAP_RESOURCE_DEFINE(temp_resource, my_service, {
    .path = temp_resource_path,
    .get = temp_get,
    .notify = temp_notify,
});
```

(continues on next page)

(continued from previous page)

```
static void notify_observers(struct k_work *work)
{
    if (sys_slist_is_empty(&temp_resource.observers)) {
        return;
    }

    coap_resource_notify(&temp_resource);
    k_work_reschedule(&temp_work, K_SECONDS(1));
}
```

CoAP Events By enabling `CONFIG_NET_MGMT_EVENT` the user can register for CoAP events. The following example simply prints when an event occurs.

```
#include <zephyr/sys/printk.h>
#include <zephyr/net/coap_mgmt.h>
#include <zephyr/net/coap_service.h>

#define COAP_EVENTS_SET (NET_EVENT_COAP_OBSERVER_ADDED | NET_EVENT_COAP_OBSERVER_REMOVED | \
                         NET_EVENT_COAP_SERVICE_STARTED | NET_EVENT_COAP_SERVICE_STOPPED)

void coap_event_handler(uint32_t mgmt_event, struct net_if *iface,
                        void *info, size_t info_length, void *user_data)
{
    switch (mgmt_event) {
    case NET_EVENT_COAP_OBSERVER_ADDED:
        printk("CoAP observer added");
        break;
    case NET_EVENT_COAP_OBSERVER_REMOVED:
        printk("CoAP observer removed");
        break;
    case NET_EVENT_COAP_SERVICE_STARTED:
        if (info != NULL && info_length == sizeof(struct net_event_coap_service)) {
            struct net_event_coap_service *net_event = info;

            printk("CoAP service %s started", net_event->service->name);
        } else {
            printk("CoAP service started");
        }
        break;
    case NET_EVENT_COAP_SERVICE_STOPPED:
        if (info != NULL && info_length == sizeof(struct net_event_coap_service)) {
            struct net_event_coap_service *net_event = info;

            printk("CoAP service %s stopped", net_event->service->name);
        } else {
            printk("CoAP service stopped");
        }
        break;
    }
}

NET_MGMT_REGISTER_EVENT_HANDLER(coap_events, COAP_EVENTS_SET, coap_event_handler, NULL);
```

CoRE Link Format The `CONFIG_COAP_SERVER_WELL_KNOWN_CORE` option enables handling the `.well-known/core` GET requests by the server. This allows clients to get a list of hypermedia links to other resources hosted in that server.

CoAP Service configuration flags

`COAP_SERVICE_AUTOSTART`

Start the service on boot.

Defines

`COAP_RESOURCE_DEFINE`(_name, _service, ...)

Define a static CoAP resource owned by the service named `_service` .

```
static const struct gpio_dt_spec led = GPIO_DT_SPEC_GET(DT_ALIAS(led0), gpios);

static int led_put(struct coap_resource *resource, struct coap_packet *request,
                   struct sockaddr *addr, socklen_t addr_len)
{
        const uint8_t *payload;
        uint16_t payload_len;

        payload = coap_packet_get_payload(request, &payload_len);
        if (payload_len != 1) {
                return COAP_RESPONSE_CODE_BAD_REQUEST;
        }

        if (gpio_pin_set_dt(&led, payload[0]) < 0) {
                return COAP_RESPONSE_CODE_INTERNAL_ERROR;
        }

        return COAP_RESPONSE_CODE_CHANGED;
}

COAP_RESOURCE_DEFINE(my_resource, my_service, {
        .put = led_put,
});
```

Note

The handlers registered with the resource can return a CoAP response code to reply with an acknowledge without any payload, nothing is sent if the return value is 0 or negative. As seen in the example.

Parameters

- **_name** – Name of the resource.
- **_service** – Name of the associated service.

`COAP_SERVICE_DEFINE`(_name, _host, _port, _flags)

Define a CoAP service with static resources.

See also

COAP_SERVICE_FLAGS.

Note

The `_host` parameter can be `NULL`. If not, it is used to specify an IP address either in IPv4 or IPv6 format a fully-qualified hostname or a virtual host, otherwise the any address is used.

Note

The `_port` parameter must be non-`NULL`. It points to a location that specifies the port number to use for the service. If the specified port number is zero, then an ephemeral port number will be used and the actual port number assigned will be written back to memory. For ephemeral port numbers, the memory pointed to by `_port` must be writeable.

Parameters

- **_name** – Name of the service.
- **_host** – IP address or hostname associated with the service.
- **_port** – **[inout]** Pointer to port associated with the service.
- **_flags** – Configuration flags

`COAP_SERVICE_COUNT`(_dst)

Count the number of CoAP services.

Parameters

- **_dst** – **[out]** Pointer to location where result is written.

`COAP_SERVICE_RESOURCE_COUNT`(_service)

Count CoAP service static resources.

Parameters

- **_service** – Pointer to a service.

COAP_SERVICE_HAS_RESOURCE(_service, _resource)

Check if service has the specified resource.

Parameters

- **_service** – Pointer to a service.
- **_resource** – Pointer to a resource.

COAP_SERVICE_FOREACH(_it)

Iterate over all CoAP services.

Parameters

- **_it** – Name of iterator (of type *CoAP service API*)

COAP_RESOURCE_FOREACH(_service, _it)

Iterate over static CoAP resources associated with a given _service.

> **Note**
>
> This macro requires that _service is defined with *COAP_SERVICE_DEFINE*.

Parameters

- **_service** – Name of CoAP service
- **_it** – Name of iterator (of type *coap_resource*)

COAP_SERVICE_FOREACH_RESOURCE(_service, _it)

Iterate over all static resources associated with _service .

> **Note**
>
> This macro is suitable for a _service defined with *COAP_SERVICE_DEFINE*.

Parameters

- **_service** – Pointer to COAP service
- **_it** – Name of iterator (of type *coap_resource*)

Functions

int coap_service_start(const struct coap_service *service)

Start the provided service .

> **Note**
>
> This function is suitable for a service defined with *COAP_SERVICE_DEFINE*.

Parameters

- **service** – Pointer to CoAP service

Return values

- **0** – in case of success.
- **-EALREADY** – in case of an already running service.

- `-ENOTSUP` – in case the server has no valid host and port configuration.

int `coap_service_stop`(const struct coap_service *service)

Stop the provided `service` .

> **Note**
>
> This function is suitable for a `service` defined with *COAP_SERVICE_DEFINE*.

Parameters

- `service` – Pointer to CoAP service

Return values

- `0` – in case of success.
- `-EALREADY` – in case the service isn't running.

int `coap_service_is_running`(const struct coap_service *service)

Query the provided `service` running state.

> **Note**
>
> This function is suitable for a `service` defined with *COAP_SERVICE_DEFINE*.

Parameters

- `service` – Pointer to CoAP service

Return values

- `1` – if the service is running
- `0` – if the service is stopped
- `negative` – in case of an error.

int `coap_service_send`(const struct coap_service *service, const struct *coap_packet* *cpkt, const struct *sockaddr* *addr, *socklen_t* addr_len, const struct *coap_transmission_parameters* *params)

Send a CoAP message from the provided `service` .

> **Note**
>
> This function is suitable for a `service` defined with *COAP_SERVICE_DEFINE*.

Parameters

- `service` – Pointer to CoAP service
- `cpkt` – CoAP Packet to send
- `addr` – Peer address
- `addr_len` – Peer address length
- `params` – Pointer to transmission parameters structure or NULL to use default values.

Returns
0 in case of success or negative in case of error.

int `coap_resource_send`(const struct *coap_resource* *resource, const struct *coap_packet* *cpkt, const struct *sockaddr* *addr, *socklen_t* addr_len, const struct *coap_transmission_parameters* *params)

Send a CoAP message from the provided `resource` .

> **Note**
> This function is suitable for a `resource` defined with *COAP_RESOURCE_DEFINE*.

Parameters

- `resource` – Pointer to CoAP resource
- `cpkt` – CoAP Packet to send
- `addr` – Peer address
- `addr_len` – Peer address length
- `params` – Pointer to transmission parameters structure or NULL to use default values.

Returns
0 in case of success or negative in case of error.

int `coap_resource_parse_observe`(struct *coap_resource* *resource, const struct *coap_packet* *request, const struct *sockaddr* *addr)

Parse a CoAP observe request for the provided `resource` .

If the observe option value is equal to 0, an observer will be added, if the value is equal to 1, an existing observer will be removed.

> **Note**
> This function is suitable for a `resource` defined with *COAP_RESOURCE_DEFINE*.

Parameters

- `resource` – Pointer to CoAP resource
- `request` – CoAP request to parse
- `addr` – Peer address

Returns
the observe option value in case of success or negative in case of error.

int `coap_resource_remove_observer_by_addr`(struct *coap_resource* *resource, const struct *sockaddr* *addr)

Lookup an observer by address and remove it from the `resource` .

> **Note**
> This function is suitable for a `resource` defined with *COAP_RESOURCE_DEFINE*.

Parameters

- `resource` – Pointer to CoAP resource
- `addr` – Peer address

Returns
0 in case of success or negative in case of error.

int `coap_resource_remove_observer_by_token`(struct *coap_resource* *resource, const uint8_t *token, uint8_t token_len)

Lookup an observer by token and remove it from the `resource` .

> **Note**
> This function is suitable for a `resource` defined with *COAP_RESOURCE_DEFINE*.

Parameters

- `resource` – Pointer to CoAP resource
- `token` – Pointer to the token
- `token_len` – Length of valid bytes in the token

Returns
0 in case of success or negative in case of error.

group `coap_mgmt`

Defines

`NET_EVENT_COAP_SERVICE_STARTED`

coap_mgmt event raised when a service has started

`NET_EVENT_COAP_SERVICE_STOPPED`

coap_mgmt event raised when a service has stopped

`NET_EVENT_COAP_OBSERVER_ADDED`

coap_mgmt event raised when an observer has been added to a resource

`NET_EVENT_COAP_OBSERVER_REMOVED`

coap_mgmt event raised when an observer has been removed from a resource

struct `net_event_coap_service`

#include <coap_mgmt.h> CoAP Service event structure.

Public Members

const struct coap_service *service
The CoAP service for which the event is emitted.

struct net_event_coap_observer
#include <*coap_mgmt.h*> CoAP Observer event structure.

Public Members

struct *coap_resource* *resource
The CoAP resource for which the event is emitted.

struct *coap_observer* *observer
The observer that is added/removed.

HTTP Client

- *Overview*
- *Sample Usage*
- *API Reference*

Overview The HTTP client library allows you to send HTTP requests and parse HTTP responses. The library communicates over the sockets API but it does not create sockets on its own. It can be enabled with CONFIG_HTTP_CLIENT Kconfig option.

The application must be responsible for creating a socket and passing it to the library. Therefore, depending on the application's needs, the library can communicate over either a plain TCP socket (HTTP) or a TLS socket (HTTPS).

Sample Usage The API of the HTTP client library has a single function.

The following is an example of a request structure created correctly:

```
struct http_request req = { 0 };
static uint8_t recv_buf[512];

req.method = HTTP_GET;
req.url = "/";
req.host = "localhost";
req.protocol = "HTTP/1.1";
req.response = response_cb;
req.recv_buf = recv_buf;
req.recv_buf_len = sizeof(recv_buf);

/* sock is a file descriptor referencing a socket that has been connected
 * to the HTTP server.
 */
ret = http_client_req(sock, &req, 5000, NULL);
```

If the server responds to the request, the library provides the response to the application through the response callback registered in the request structure. As the library can provide the response in chunks, the application must be able to process these.

Together with the structure containing the response data, the callback function also provides information about whether the library expects to receive more data.

The following is an example of a very simple response handling function:

```
static void response_cb(struct http_response *rsp,
                        enum http_final_call final_data,
                        void *user_data)
{
    if (final_data == HTTP_DATA_MORE) {
        LOG_INF("Partial data received (%zd bytes)", rsp->data_len);
    } else if (final_data == HTTP_DATA_FINAL) {
        LOG_INF("All the data received (%zd bytes)", rsp->data_len);
    }

    LOG_INF("Response status %s", rsp->http_status);
}
```

See HTTP client sample application for more information about the library usage.

Version
0.2.0

Typedefs

typedef int (***http_payload_cb_t**)(int sock, struct *http_request* *req, void *user_data)

Callback used when data needs to be sent to the server.

Param sock
Socket id of the connection

Param req
HTTP request information

Param user_data
User specified data specified in *http_client_req()*

Return
>=0 amount of data sent, in this case *http_client_req()* should continue sending data, <0 if *http_client_req()* should return the error code to the caller.

typedef int (***http_header_cb_t**)(int sock, struct *http_request* *req, void *user_data)

Callback can be used if application wants to construct additional HTTP headers when the HTTP request is sent.

Usage of this is optional.

Param sock
Socket id of the connection

Param req
HTTP request information

Param user_data
User specified data specified in *http_client_req()*

Return
>=0 amount of data sent, in this case *http_client_req()* should continue sending data, <0 if *http_client_req()* should return the error code to the caller.

typedef void (***http_response_cb_t**)(struct *http_response* *rsp, enum *http_final_call* final_data, void *user_data)

Callback used when data is received from the server.

Param rsp
HTTP response information

Param final_data
Does this data buffer contain all the data or is there still more data to come.

Param user_data
User specified data specified in *http_client_req()*

Enums

enum **http_final_call**

Is there more data to come.

Values:

enumerator **HTTP_DATA_MORE** = 0

More data will come.

enumerator **HTTP_DATA_FINAL** = 1

End of data.

Functions

int **http_client_req**(int sock, struct *http_request* *req, int32_t timeout, void *user_data)

Do a HTTP request.

The callback is called when data is received from the HTTP server. The caller must have created a connection to the server before calling this function so *connect()* call must have be done successfully for the socket.

Parameters

- **sock** – Socket id of the connection.
- **req** – HTTP request information
- **timeout** – Max timeout to wait for the data. The timeout value cannot be 0 as there would be no time to receive the data. The timeout value is in milliseconds.
- **user_data** – User specified data that is passed to the callback.

Returns
<0 if error, >=0 amount of data sent to the server

struct **http_response**

#include <*client.h*> HTTP response from the server.

Public Members

const struct http_parser_settings ***http_cb**

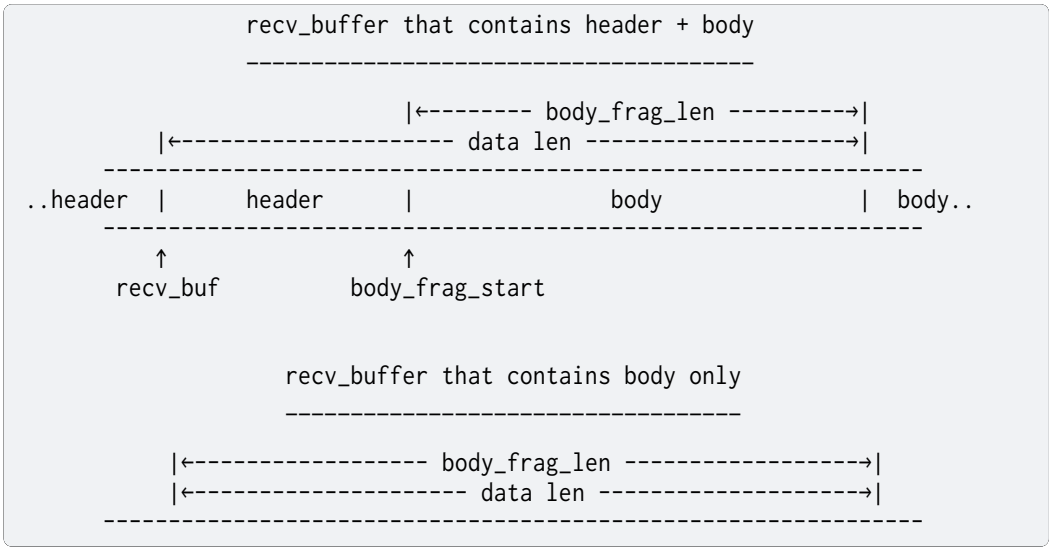
HTTP parser settings for the application usage.

http_response_cb_t **cb**

User provided HTTP response callback which is called when a response is received to a sent HTTP request.

uint8_t ***body_frag_start**

Start address of the body fragment contained in the recv_buf.



size_t **body_frag_len**

Length of the body fragment contained in the recv_buf.

uint8_t ***recv_buf**

Where the response is stored, this is to be provided by the user.

size_t **recv_buf_len**

Response buffer maximum length.

size_t **data_len**

Length of the data in the result buf.

If the value is larger than recv_buf_len, then it means that the data is truncated and could not be fully copied into recv_buf. This can only happen if the user did not set the response callback. If the callback is set, then the HTTP client API will call response callback many times so that all the data is delivered to the user. Will be zero in the event of a null response.

size_t **content_length**

HTTP Content-Length field value.

Will be set to zero in the event of a null response.

size_t **processed**

Amount of data given to the response callback so far, including the current data given to the callback.

This should be equal to the content_length field once the entire body has been received. Will be zero if a null response is given.

char **http_status**[HTTP_STATUS_STR_SIZE]

See https://tools.ietf.org/html/rfc7230#section-3.1.2 for more information.

The status-code element is a 3-digit integer code

The reason-phrase element exists for the sole purpose of providing a textual description associated with the numeric status code. A client SHOULD ignore the reason-phrase content.

Will be blank if a null HTTP response is given.

uint16_t **http_status_code**

Numeric HTTP status code which corresponds to the textual description.

Set to zero if null response is given. Otherwise, will be a 3-digit integer code if valid HTTP response is given.

uint8_t **cl_present**

Is Content-Length field present.

uint8_t **body_found**

Is message body found.

uint8_t **message_complete**

Is HTTP message parsing complete.

struct **http_client_internal_data**

#include <client.h> HTTP client internal data that the application should not touch.

Public Members

struct http_parser **parser**

HTTP parser context.

struct http_parser_settings **parser_settings**

HTTP parser settings.

struct *http_response* **response**

HTTP response specific data (filled by *http_client_req()* when data is received)

void ***user_data**

User data.

int **sock**

HTTP socket.

struct **http_request**

#include <*client.h*> HTTP client request.

This contains all the data that is needed when doing a HTTP request.

Public Members

struct *http_client_internal_data* **internal**

HTTP client request internal data.

enum http_method **method**

The HTTP method: GET, HEAD, OPTIONS, POST, ...

http_response_cb_t **response**

User supplied callback function to call when response is received.

const struct http_parser_settings ***http_cb**

User supplied list of HTTP callback functions if the calling application wants to know the parsing status or the HTTP fields.

This is optional and normally not needed.

uint8_t ***recv_buf**

User supplied buffer where received data is stored.

size_t **recv_buf_len**

Length of the user supplied receive buffer.

const char ***url**

The URL for this request, for example: /index.html.

const char ***protocol**

The HTTP protocol, for example “HTTP/1.1”.

const char ****header_fields**

The HTTP header fields (application specific) The Content-Type may be specified here or in the next field.

Depending on your application, the Content-Type may vary, however some header fields may remain constant through the application's life cycle. This is a NULL terminated list of header fields.

const char *`content_type_value`

The value of the Content-Type header field, may be NULL.

const char *`host`

Hostname to be used in the request.

const char *`port`

Port number to be used in the request.

http_payload_cb_t `payload_cb`

User supplied callback function to call when payload needs to be sent.

This can be NULL in which case the payload field in *http_request* is used. The idea of this payload callback is to allow user to send more data that is practical to store in allocated memory.

const char *`payload`

Payload, may be NULL.

size_t `payload_len`

Payload length is used to calculate Content-Length.

Set to 0 for chunked transfers.

http_header_cb_t `optional_headers_cb`

User supplied callback function to call when optional headers need to be sent.

This can be NULL, in which case the optional_headers field in *http_request* is used. The idea of this optional_headers callback is to allow user to send more HTTP header data that is practical to store in allocated memory.

const char **`optional_headers`

A NULL terminated list of any optional headers that should be added to the HTTP request.

May be NULL. If the optional_headers_cb is specified, then this field is ignored. Note that there are two similar fields that contain headers, the header_fields above and this optional_headers. This is done like this to support Websocket use case where Websocket will use header_fields variable and any optional application specific headers will be placed into this field.

HTTP Server

- *Overview*
- *Server Setup*
- *Sample Usage*
  - *Services*

- *Static resources*
- *Static filesystem resources*
- *Dynamic resources*
- *Websocket resources*

- *API Reference*

Overview Zephyr provides an HTTP server library, which allows to register HTTP services and HTTP resources associated with those services. The server creates a listening socket for every registered service, and handles incoming client connections. It's possible to communicate over a plain TCP socket (HTTP) or a TLS socket (HTTPS). Both, HTTP/1.1 (RFC 2616) and HTTP/2 (RFC 9113) protocol versions are supported.

The server operation is generally transparent for the application, running in a background thread. The application can control the server activity with respective API functions.

Certain resource types (for example dynamic resource) provide resource-specific application callbacks, allowing the server to interact with the application (for instance provide resource content, or process request payload).

Currently, the following resource types are supported:

- Static resources - content defined compile-time, cannot be modified at runtime (*HTTP_RESOURCE_TYPE_STATIC*).
- Dynamic resources - content provided at runtime by respective application callback (*HTTP_RESOURCE_TYPE_DYNAMIC*).
- Websocket resources - allowing to establish Websocket connections with the server (*HTTP_RESOURCE_TYPE_WEBSOCKET*).

Zephyr provides a sample demonstrating HTTP(s) server operation and various resource types usage. See sockets-http-server for more information.

Server Setup A few prerequisites are needed in order to enable HTTP server functionality in the application.

First of all, the HTTP server has to be enabled in applications configuration file with `CONFIG_HTTP_SERVER` Kconfig option:

Listing 4: `prj.conf`

```
CONFIG_HTTP_SERVER=y
```

All HTTP services and HTTP resources are placed in a dedicated linker section. The linker section for services is predefined locally, however the application is responsible for defining linker sections for resources associated with respective services. Linker section names for resources should be prefixed with `http_resource_desc_`, appended with the service name.

Linker sections for resources should be defined in a linker file. For example, for a service named `my_service`, the linker section shall be defined as follows:

Listing 5: `sections-rom.ld`

```
#include <zephyr/linker/iterable_sections.h>

ITERABLE_SECTION_ROM(http_resource_desc_my_service, Z_LINK_ITERABLE_SUBALIGN)
```

Finally, the linker file and linker section have to be added to your application using CMake:

Listing 6: CMakeLists.txt

```
zephyr_linker_sources(SECTIONS sections-rom.ld)
zephyr_linker_section(NAME http_resource_desc_my_service
                      KVMA RAM_REGION GROUP RODATA_REGION
                      SUBALIGN Z_LINK_ITERABLE_SUBALIGN)
```

Note

You need to define a separate linker section for each HTTP service registered in the system.

Sample Usage

Services The application needs to define an HTTP service (or multiple services), with the same name as used for the linker section with *HTTP_SERVICE_DEFINE* macro:

```
#include <zephyr/net/http/service.h>

static uint16_t http_service_port = 80;

HTTP_SERVICE_DEFINE(my_service, "0.0.0.0", &http_service_port, 1, 10, NULL);
```

Alternatively, an HTTPS service can be defined with *HTTPS_SERVICE_DEFINE*:

```
#include <zephyr/net/http/service.h>
#include <zephyr/net/tls_credentials.h>

#define HTTP_SERVER_CERTIFICATE_TAG 1

static uint16_t https_service_port = 443;
static const sec_tag_t sec_tag_list[] = {
    HTTP_SERVER_CERTIFICATE_TAG,
};

HTTPS_SERVICE_DEFINE(my_service, "0.0.0.0", &https_service_port, 1, 10,
                     NULL, sec_tag_list, sizeof(sec_tag_list));
```

Note

HTTPS services rely on TLS credentials being registered in the system. See *TLS credentials subsystem* for information on how to configure TLS credentials in the system.

Once HTTP(s) service is defined, resources can be registered for it with *HTTP_RESOURCE_DEFINE* macro.

Application can enable resource wildcard support by enabling CONFIG_HTTP_SERVER_RESOURCE_WILDCARD option. When this option is set, then it is possible to match several incoming HTTP requests with just one resource handler. The fnmatch() POSIX API function is used to match the pattern in the URL paths.

Example:

```
HTTP_RESOURCE_DEFINE(my_resource, my_service, "/foo*", &resource_detail);
```

This would match all URLs that start with a string foo. See POSIX.2 chapter 2.13 for pattern matching syntax description.

Static resources Static resource content is defined build-time and is immutable. The following example shows how gzip compressed webpage can be defined as a static resource in the application:

```
static const uint8_t index_html_gz[] = {
    #include "index.html.gz.inc"
};

struct http_resource_detail_static index_html_gz_resource_detail = {
    .common = {
        .type = HTTP_RESOURCE_TYPE_STATIC,
        .bitmask_of_supported_http_methods = BIT(HTTP_GET),
        .content_encoding = "gzip",
    },
    .static_data = index_html_gz,
    .static_data_len = sizeof(index_html_gz),
};

HTTP_RESOURCE_DEFINE(index_html_gz_resource, my_service, "/",
                     &index_html_gz_resource_detail);
```

The resource content and content encoding is application specific. For the above example, a gzip compressed webpage can be generated during build, by adding the following code to the application's `CMakeLists.txt` file:

Listing 7: `CMakeLists.txt`

```
set(gen_dir ${ZEPHYR_BINARY_DIR}/include/generated/)
set(source_file_index src/index.html)
generate_inc_file_for_target(app ${source_file_index} ${gen_dir}/index.html.gz.inc --gzip)
```

where `src/index.html` is the location of the webpage to be compressed.

Static filesystem resources Static filesystem resource content is defined build-time and is immutable. The following example shows how the path can be defined as a static resource in the application:

```
struct http_resource_detail_static_fs static_fs_resource_detail = {
    .common = {
        .type                              = HTTP_RESOURCE_TYPE_STATIC_FS,
        .bitmask_of_supported_http_methods = BIT(HTTP_GET),
    },
    .fs_path = "/lfs1/www",
};

HTTP_RESOURCE_DEFINE(static_fs_resource, my_service, "*", &static_fs_resource_detail);
```

All files located in /lfs1/www are made available to the client. If a file is gzipped, .gz must be appended to the file name (e.g. index.html.gz), then the server delivers index.html.gz when the client requests index.html and adds gzip content-encoding to the HTTP header.

The content type is evaluated based on the file extension. The server supports .html, .js, .css, .jpg, .png and .svg. More content types can be provided with the *HTTP_SERVER_CONTENT_TYPE* macro. All other files are provided with the content type text/html.

```
HTTP_SERVER_CONTENT_TYPE(json, "application/json")
```

Dynamic resources For dynamic resource, a resource callback is registered to exchange data between the server and the application. The application defines a resource buffer used to pass

the request payload data from the server, and to provide response payload to the server. The following example code shows how to register a dynamic resource with a simple resource handler, which echoes received data back to the client:

```
static uint8_t recv_buffer[1024];

static int dyn_handler(struct http_client_ctx *client,
                       enum http_data_status status, uint8_t *buffer,
                       size_t len, void *user_data)
{
#define MAX_TEMP_PRINT_LEN 32
    static char print_str[MAX_TEMP_PRINT_LEN];
    enum http_method method = client->method;
    static size_t processed;

    __ASSERT_NO_MSG(buffer != NULL);

    if (status == HTTP_SERVER_DATA_ABORTED) {
        LOG_DBG("Transaction aborted after %zd bytes.", processed);
        processed = 0;
        return 0;
    }

    processed += len;

    snprintf(print_str, sizeof(print_str), "%s received (%zd bytes)",
             http_method_str(method), len);
    LOG_HEXDUMP_DBG(buffer, len, print_str);

    if (status == HTTP_SERVER_DATA_FINAL) {
        LOG_DBG("All data received (%zd bytes).", processed);
        processed = 0;
    }

    /* This will echo data back to client as the buffer and recv_buffer
     * point to same area.
     */
    return len;
}

struct http_resource_detail_dynamic dyn_resource_detail = {
    .common = {
        .type = HTTP_RESOURCE_TYPE_DYNAMIC,
        .bitmask_of_supported_http_methods =
            BIT(HTTP_GET) | BIT(HTTP_POST),
    },
    .cb = dyn_handler,
    .data_buffer = recv_buffer,
    .data_buffer_len = sizeof(recv_buffer),
    .user_data = NULL,
};

HTTP_RESOURCE_DEFINE(dyn_resource, my_service, "/dynamic",
                     &dyn_resource_detail);
```

The resource callback may be called multiple times for a single request, hence the application should be able to keep track of the received data progress.

The `status` field informs the application about the progress in passing request payload from the server to the application. As long as the status reports *HTTP_SERVER_DATA_MORE*, the application should expect more data to be provided in a consecutive callback calls. Once all request payload has been passed to the application, the server reports *HTTP_SERVER_DATA_FINAL* status. In case of communication errors during request processing (for example client closed the connection be-

fore complete payload has been received), the server reports *HTTP_SERVER_DATA_ABORTED*. Either of the two events indicate that the application shall reset any progress recorded for the resource, and await a new request to come. The server guarantees that the resource can only be accessed by single client at a time.

The resource callback returns the number of bytes to be replied in the response payload to the server (provided in the resource data buffer). In case there is no more data to be included in the response, the callback should return 0.

The server will call the resource callback until it provided all request data to the application, and the application reports there is no more data to include in the reply.

Websocket resources Websocket resources register an application callback, which is called when a Websocket connection upgrade takes place. The callback is provided with a socket descriptor corresponding to the underlying TCP/TLS connection. Once called, the application takes full control over the socket, i. e. is responsible to release it when done.

```
static int ws_socket;
static uint8_t ws_recv_buffer[1024];

int ws_setup(int sock, void *user_data)
{
    ws_socket = sock;
    return 0;
}

struct http_resource_detail_websocket ws_resource_detail = {
    .common = {
        .type = HTTP_RESOURCE_TYPE_WEBSOCKET,
        /* We need HTTP/1.1 Get method for upgrading */
        .bitmask_of_supported_http_methods = BIT(HTTP_GET),
    },
    .cb = ws_setup,
    .data_buffer = ws_recv_buffer,
    .data_buffer_len = sizeof(ws_recv_buffer),
    .user_data = NULL, /* Fill this for any user specific data */
};

HTTP_RESOURCE_DEFINE(ws_resource, my_service, "/", &ws_resource_detail);
```

The above minimalistic example shows how to register a Websocket resource with a simple callback, used only to store the socket descriptor provided. Further processing of the Websocket connection is application-specific, hence outside of scope of this guide. See sockets-http-server for an example Websocket-based echo service implementation.

HTTP Server
: Implement an HTTP(s) Server demonstrating various resource types.

API Reference

group `http_service`

Since
: 3.4

Version
0.1.0

Defines

`HTTP_RESOURCE_DEFINE`(_name, _service, _resource, _detail)

Define a static HTTP resource.

A static HTTP resource is one that is known prior to system initialization. In contrast, dynamic resources may be discovered upon system initialization. Dynamic resources may also be inserted, or removed by events originating internally or externally to the system at runtime.

> **Note**
>
> The `_resource` is the URL without the associated protocol, host, or URL parameters. E.g. the resource for `#param1=value1` would be `/bar/baz.html`. It is often referred to as the "path" of the URL. Every `(service, resource)` pair should be unique. The `_resource` must be non-NULL.

Parameters

- **`_name`** – Name of the resource.
- **`_service`** – Name of the associated service.
- **`_resource`** – Pathname-like string identifying the resource.
- **`_detail`** – Implementation-specific detail associated with the resource.

`HTTP_SERVICE_DEFINE_EMPTY`(_name, _host, _port, _concurrent, _backlog, _detail)

Define an HTTP service without static resources.

> **Note**
>
> The `_host` parameter must be non-`NULL`. It is used to specify an IP address either in IPv4 or IPv6 format a fully-qualified hostname or a virtual host.

> **Note**
>
> The `_port` parameter must be non-`NULL`. It points to a location that specifies the port number to use for the service. If the specified port number is zero, then an ephemeral port number will be used and the actual port number assigned will be written back to memory. For ephemeral port numbers, the memory pointed to by `_port` must be writeable.

Parameters

- **`_name`** – Name of the service.
- **`_host`** – IP address or hostname associated with the service.
- **`_port`** – **[inout]** Pointer to port associated with the service.
- **`_concurrent`** – Maximum number of concurrent clients.
- **`_backlog`** – Maximum number queued connections.

- **_detail** – Implementation-specific detail associated with the service.

HTTPS_SERVICE_DEFINE_EMPTY(_name, _host, _port, _concurrent, _backlog, _detail, _sec_tag_list, _sec_tag_list_size)

Define an HTTPS service without static resources.

> **Note**
>
> The _host parameter must be non-NULL. It is used to specify an IP address either in IPv4 or IPv6 format a fully-qualified hostname or a virtual host.

> **Note**
>
> The _port parameter must be non-NULL. It points to a location that specifies the port number to use for the service. If the specified port number is zero, then an ephemeral port number will be used and the actual port number assigned will be written back to memory. For ephemeral port numbers, the memory pointed to by _port must be writeable.

Parameters

- **_name** – Name of the service.
- **_host** – IP address or hostname associated with the service.
- **_port** – **[inout]** Pointer to port associated with the service.
- **_concurrent** – Maximum number of concurrent clients.
- **_backlog** – Maximum number queued connections.
- **_detail** – Implementation-specific detail associated with the service.
- **_sec_tag_list** – TLS security tag list used to setup a HTTPS socket.
- **_sec_tag_list_size** – TLS security tag list size used to setup a HTTPS socket.

HTTP_SERVICE_DEFINE(_name, _host, _port, _concurrent, _backlog, _detail)

Define an HTTP service with static resources.

> **Note**
>
> The _host parameter must be non-NULL. It is used to specify an IP address either in IPv4 or IPv6 format a fully-qualified hostname or a virtual host.

> **Note**
>
> The _port parameter must be non-NULL. It points to a location that specifies the port number to use for the service. If the specified port number is zero, then an ephemeral port number will be used and the actual port number assigned will be written back to memory. For ephemeral port numbers, the memory pointed to by _port must be writeable.

Parameters

- **_name** – Name of the service.

- **_host** – IP address or hostname associated with the service.
- **_port** – **[inout]** Pointer to port associated with the service.
- **_concurrent** – Maximum number of concurrent clients.
- **_backlog** – Maximum number queued connections.
- **_detail** – Implementation-specific detail associated with the service.

HTTPS_SERVICE_DEFINE(_name, _host, _port, _concurrent, _backlog, _detail, _sec_tag_list, _sec_tag_list_size)

Define an HTTPS service with static resources.

Note

The _host parameter must be non-NULL. It is used to specify an IP address either in IPv4 or IPv6 format a fully-qualified hostname or a virtual host.

Note

The _port parameter must be non-NULL. It points to a location that specifies the port number to use for the service. If the specified port number is zero, then an ephemeral port number will be used and the actual port number assigned will be written back to memory. For ephemeral port numbers, the memory pointed to by _port must be writeable.

Parameters

- **_name** – Name of the service.
- **_host** – IP address or hostname associated with the service.
- **_port** – **[inout]** Pointer to port associated with the service.
- **_concurrent** – Maximum number of concurrent clients.
- **_backlog** – Maximum number queued connections.
- **_detail** – Implementation-specific detail associated with the service.
- **_sec_tag_list** – TLS security tag list used to setup a HTTPS socket.
- **_sec_tag_list_size** – TLS security tag list size used to setup a HTTPS socket.

HTTP_SERVICE_COUNT(_dst)

Count the number of HTTP services.

Parameters

- **_dst** – **[out]** Pointer to location where result is written.

HTTP_SERVICE_RESOURCE_COUNT(_service)

Count HTTP service static resources.

Parameters

- **_service** – Pointer to a service.

HTTP_SERVICE_FOREACH(_it)

Iterate over all HTTP services.

Parameters

- **_it** – Name of http_service_desc iterator

HTTP_RESOURCE_FOREACH(_service, _it)

Iterate over static HTTP resources associated with a given _service.

> **Note**
>
> This macro requires that _service is defined with *HTTP_SERVICE_DEFINE*.

Parameters

- **_service** – Name of HTTP service
- **_it** – Name of iterator (of type *http_resource_desc*)

HTTP_SERVICE_FOREACH_RESOURCE(_service, _it)

Iterate over all static resources associated with _service .

> **Note**
>
> This macro is suitable for a _service defined with either *HTTP_SERVICE_DEFINE* or *HTTP_SERVICE_DEFINE_EMPTY*.

Parameters

- **_service** – Pointer to HTTP service
- **_it** – Name of iterator (of type *http_resource_desc*)

struct **http_resource_desc**

#include <*service.h*> HTTP resource description.

Public Members

const char ***resource**

Resource name.

void ***detail**

Detail associated with this resource.

group **http_server**

Since
3.7

Version
0.1.0

Defines

`HTTP_SERVER_CONTENT_TYPE`(_extension, _content_type)

`HTTP_SERVER_CONTENT_TYPE_FOREACH`(_it)

Typedefs

typedef int (*`http_resource_dynamic_cb_t`)(struct *http_client_ctx* *client, enum *http_data_status* status, uint8_t *data_buffer, size_t data_len, void *user_data)

Callback used when data is received.

Data to be sent to client can be specified.

Param client
HTTP context information for this client connection.

Param status
HTTP data status, indicate whether more data is expected or not.

Param data_buffer
Data received.

Param data_len
Amount of data received.

Param user_data
User specified data.

Return
>0 amount of data to be sent to client, let server to call this function again when new data is received. 0 nothing to sent to client, close the connection <0 error, close the connection.

typedef int (*`http_resource_websocket_cb_t`)(int ws_socket, void *user_data)

Callback used when a Websocket connection is setup.

The application will need to handle all functionality related to the connection like reading and writing websocket data, and closing the connection.

Param ws_socket
A socket for the Websocket data.

Param user_data
User specified data.

Return
0 Accepting the connection, HTTP server library will no longer handle data to/from the socket and it is application responsibility to send and receive data to/from the supplied socket. <0 error, close the connection.

Enums

enum `http_resource_type`

HTTP server resource type.

Values:

enumerator HTTP_RESOURCE_TYPE_STATIC

Static resource, cannot be modified on runtime.

enumerator HTTP_RESOURCE_TYPE_STATIC_FS

serves static gzipped files from a filesystem

enumerator HTTP_RESOURCE_TYPE_DYNAMIC

Dynamic resource, server interacts with the application via registered *http_resource_dynamic_cb_t*.

enumerator HTTP_RESOURCE_TYPE_WEBSOCKET

Websocket resource, application takes control over Websocket connection after and upgrade.

enum http_data_status

Indicates the status of the currently processed piece of data.

Values:

enumerator HTTP_SERVER_DATA_ABORTED = -1

Transaction aborted, data incomplete.

enumerator HTTP_SERVER_DATA_MORE = 0

Transaction incomplete, more data expected.

enumerator HTTP_SERVER_DATA_FINAL = 1

Final data fragment in current transaction.

Functions

int http_server_start(void)

Start the HTTP2 server.

The server runs in a background thread. Once started, the server will create a server socket for all HTTP services registered in the system and accept connections from clients (see *HTTP_SERVICE_DEFINE*).

int http_server_stop(void)

Stop the HTTP2 server.

All server sockets are closed and the server thread is suspended.

struct http_resource_detail

#include <server.h> Representation of a server resource, common for all resource types.

Public Members

uint32_t bitmask_of_supported_http_methods

Bitmask of supported HTTP methods (http_method).

enum *http_resource_type* **type**
Resource type.

int **path_len**
Length of the URL path.

const char ***content_encoding**
Content encoding of the resource.

const char ***content_type**
Content type of the resource.

struct **http_resource_detail_static**
#include <*server.h*> Representation of a static server resource.

Public Members

struct *http_resource_detail* **common**
Common resource details.

const void ***static_data**
Content of the static resource.

size_t **static_data_len**
Size of the static resource.

struct **http_resource_detail_static_fs**
#include <*server.h*> Representation of a static filesystem server resource.

Public Members

struct *http_resource_detail* **common**
Common resource details.

const char ***fs_path**
Path in the local filesystem.

struct **http_content_type**
#include <*server.h*>

struct **http_resource_detail_dynamic**
#include <*server.h*> Representation of a dynamic server resource.

Public Members

struct *http_resource_detail* **common**

Common resource details.

http_resource_dynamic_cb_t **cb**

Resource callback used by the server to interact with the application.

uint8_t ***data_buffer**

Data buffer used to exchanged data between server and the, application.

size_t **data_buffer_len**

Length of the data in the data buffer.

struct *http_client_ctx* ***holder**

A pointer to the client currently processing resource, used to prevent concurrent access to the resource from multiple clients.

void ***user_data**

A pointer to the user data registered by the application.

struct **http_resource_detail_websocket**

#include <server.h> Representation of a websocket server resource.

Public Members

struct *http_resource_detail* **common**

Common resource details.

int **ws_sock**

Websocket socket value.

http_resource_websocket_cb_t **cb**

Resource callback used by the server to interact with the application.

uint8_t ***data_buffer**

Data buffer used to exchanged data between server and the, application.

size_t **data_buffer_len**

Length of the data in the data buffer.

void ***user_data**

A pointer to the user data registered by the application.

struct **http2_stream_ctx**

#include <server.h> HTTP/2 stream representation.

Public Members

int **stream_id**
Stream identifier.

enum http2_stream_state **stream_state**
Stream state.

int **window_size**
Stream-level window size.

bool **headers_sent**
Flag indicating that headers were sent in the reply.

bool **end_stream_sent**
Flag indicating that END_STREAM flag was sent.

struct **http2_frame**
#include <*server.h*> HTTP/2 frame representation.

Public Members

uint32_t **length**
Frame payload length.

uint32_t **stream_identifier**
Stream ID the frame belongs to.

uint8_t **type**
Frame type.

uint8_t **flags**
Frame flags.

uint8_t **padding_len**
Frame padding length.

struct **http_client_ctx**
#include <*server.h*> Representation of an HTTP client connected to the server.

Public Members

int **fd**
Socket descriptor associated with the server.

unsigned char **buffer**[HTTP_SERVER_CLIENT_BUFFER_SIZE]
Client data buffer.

unsigned char *cursor
: Cursor indicating currently processed byte.

size_t data_len
: Data left to process in the buffer.

int window_size
: Connection-level window size.

enum http_server_state server_state
: Server state for the associated client.

struct *http2_frame* current_frame
: Currently processed HTTP/2 frame.

struct *http_resource_detail* *current_detail
: Currently processed resource detail.

struct *http2_stream_ctx* *current_stream
: Currently processed stream.

struct http_hpack_header_buf header_field
: HTTP/2 header parser context.

struct *http2_stream_ctx* streams[HTTP_SERVER_MAX_STREAMS]
: HTTP/2 streams context.

struct http_parser_settings parser_settings
: HTTP/1 parser configuration.

struct http_parser parser
: HTTP/1 parser context.

unsigned char url_buffer[HTTP_SERVER_MAX_URL_LENGTH]
: Request URL.

unsigned char content_type[HTTP_SERVER_MAX_CONTENT_TYPE_LEN]
: Request content type.

unsigned char header_buffer[HTTP_SERVER_MAX_HEADER_LEN]
: Temp buffer for currently processed header (HTTP/1 only).

size_t content_len
: Request content length.

enum http_method method
: Request method.

enum http1_parser_state **parser_state**

HTTP/1 parser state.

int **http1_frag_data_len**

Length of the payload length in the currently processed request fragment (HTTP/1 only).

struct *k_work_delayable* **inactivity_timer**

Client inactivity timer.

The client connection is closed by the server when it expires.

bool **preface_sent**

Flag indicating that HTTP2 preface was sent.

bool **http1_headers_sent**

Flag indicating that HTTP1 headers were sent.

bool **has_upgrade_header**

Flag indicating that upgrade header was present in the request.

bool **http2_upgrade**

Flag indicating HTTP/2 upgrade takes place.

bool **websocket_upgrade**

Flag indicating Websocket upgrade takes place.

bool **websocket_sec_key_next**

Flag indicating Websocket key is being processed.

bool **expect_continuation**

The next frame on the stream is expectd to be a continuation frame.

Lightweight M2M (LWM2M)

- *API Reference*

Overview Lightweight Machine to Machine (LwM2M) is an application layer protocol designed with device management, data reporting and device actuation in mind. Based on CoAP/UDP, LwM2M is a standard defined by the Open Mobile Alliance and suitable for constrained devices by its use of CoAP packet-size optimization and a simple, stateless flow that supports a REST API.

One of the key differences between LwM2M and CoAP is that an LwM2M client initiates the connection to an LwM2M server. The server can then use the REST API to manage various interfaces with the client.

LwM2M uses a simple resource model with the core set of objects and resources defined in the specification.

The LwM2M library can be enabled with `CONFIG_LWM2M` Kconfig option.

Example LwM2M object and resources: Device *Object definition*

Object ID	Name	Instance	Mandatory
3	Device	Single	Mandatory

Resource definitions

`* R=Read, W=Write, E=Execute`

ID	Name	OP*	Instance	Mandatory	Type
0	Manufacturer	R	Single	Optional	String
1	Model	R	Single	Optional	String
2	Serial number	R	Single	Optional	String
3	Firmware version	R	Single	Optional	String
4	Reboot	E	Single	Mandatory	
5	Factory Reset	E	Single	Optional	
6	Available Power Sources	R	Multiple	Optional	Integer 0-7
7	Power Source Voltage (mV)	R	Multiple	Optional	Integer
8	Power Source Current (mA)	R	Multiple	Optional	Integer
9	Battery Level %	R	Single	Optional	Integer
10	Memory Free (Kb)	R	Single	Optional	Integer
11	Error Code	R	Multiple	Optional	Integer 0-8
12	Reset Error	E	Single	Optional	
13	Current Time	RW	Single	Optional	Time
14	UTC Offset	RW	Single	Optional	String
15	Timezone	RW	Single	Optional	String
16	Supported Binding	R	Single	Mandatory	String
17	Device Type	R	Single	Optional	String
18	Hardware Version	R	Single	Optional	String
19	Software Version	R	Single	Optional	String
20	Battery Status	R	Single	Optional	Integer 0-6
21	Memory Total (Kb)	R	Single	Optional	Integer
22	ExtDevInfo	R	Multiple	Optional	ObjLnk

The server could query the `Manufacturer` resource for `Device` object instance 0 (the default and only instance) by sending a `READ 3/0/0` operation to the client.

The full list of registered objects and resource IDs can be found in the LwM2M registry.

Zephyr's LwM2M library lives in the subsys/net/lib/lwm2m, with a client sample in samples/net/lwm2m_client. For more information about the provided sample see: lwm2m-client. The sample can be configured to use normal unsecure network sockets or sockets secured via DTLS.

The Zephyr LwM2M library implements the following items:

- engine to process networking events and core functions
- RD client which performs BOOTSTRAP and REGISTRATION functions
- SenML CBOR, SenML JSON, CBOR, TLV, JSON, and plain text formatting functions
- LwM2M Technical Specification Enabler objects such as Security, Server, Device, Firmware Update, etc.
- Extended IPSO objects such as Light Control, Temperature Sensor, and Timer

By default, the library implements LwM2M specification 1.0.2 and can be set to LwM2M specification 1.1.1 with a Kconfig option.

For more information about LwM2M visit OMA Specworks LwM2M.

Sample usage To use the LwM2M library, start by creating an LwM2M client context *lwm2m_ctx* structure:

```
/* LwM2M client context */
static struct lwm2m_ctx client;
```

Create callback functions for LwM2M resource executions:

```
static int device_reboot_cb(uint16_t obj_inst_id, uint8_t *args,
                            uint16_t args_len)
{
        LOG_INF("Device rebooting.");
        LOG_PANIC();
        sys_reboot(0);
        return 0; /* won't reach this */
}
```

The LwM2M RD client can send events back to the sample. To receive those events, setup a callback function:

```
static void rd_client_event(struct lwm2m_ctx *client,
                            enum lwm2m_rd_client_event client_event)
{
        switch (client_event) {

        case LWM2M_RD_CLIENT_EVENT_NONE:
                /* do nothing */
                break;

        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE:
                LOG_DBG("Bootstrap registration failure!");
                break;

        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE:
                LOG_DBG("Bootstrap registration complete");
                break;
```

(continues on next page)

(continued from previous page)

```
        case LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE:
                LOG_DBG("Bootstrap transfer complete");
                break;

        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE:
                LOG_DBG("Registration failure!");
                break;

        case LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE:
                LOG_DBG("Registration complete");
                break;

        case LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT:
                LOG_DBG("Registration timeout!");
                break;

        case LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE:
                LOG_DBG("Registration update complete");
                break;

        case LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE:
                LOG_DBG("Deregister failure!");
                break;

        case LWM2M_RD_CLIENT_EVENT_DISCONNECT:
                LOG_DBG("Disconnected");
                break;

        case LWM2M_RD_CLIENT_EVENT_REG_UPDATE:
                LOG_DBG("Registration update");
                break;

        case LWM2M_RD_CLIENT_EVENT_DEREGISTER:
                LOG_DBG("Deregistration client");
                break;

        case LWM2M_RD_CLIENT_EVENT_SERVER_DISABLED:
                LOG_DBG("LwM2M server disabled");
          break;
        }
}
```

Next we assign `Security` resource values to let the client know where and how to connect as well as set the `Manufacturer` and `Reboot` resources in the `Device` object with some data and the callback we defined above:

```
/*
 * Server URL of default Security object = 0/0/0
 * Use leshan.eclipse.org server IP (5.39.83.206) for connection
 */
lwm2m_set_string(&LWM2M_OBJ(0, 0, 0), "coap://5.39.83.206");

/*
 * Security Mode of default Security object = 0/0/2
 * 3 = NoSec mode (no security beware!)
 */
lwm2m_set_u8(&LWM2M_OBJ(0, 0, 2), 3);

#define CLIENT_MANUFACTURER "Zephyr Manufacturer"
```

(continues on next page)

(continued from previous page)

```
/*
 * Manufacturer resource of Device object = 3/0/0
 * We use lwm2m_set_res_data() function to set a pointer to the
 * CLIENT_MANUFACTURER string.
 * Note the LWM2M_RES_DATA_FLAG_RO flag which stops the engine from
 * trying to assign a new value to the buffer.
 */
lwm2m_set_res_data(&LWM2M_OBJ(3, 0, 0), CLIENT_MANUFACTURER,
                   sizeof(CLIENT_MANUFACTURER),
                   LWM2M_RES_DATA_FLAG_RO);

/* Reboot resource of Device object = 3/0/4 */
lwm2m_register_exec_callback(&LWM2M_OBJ(3, 0, 4), device_reboot_cb);
```

Lastly, we start the LwM2M RD client (which in turn starts the LwM2M engine). The second parameter of *lwm2m_rd_client_start()* is the client endpoint name. This is important as it needs to be unique per LwM2M server:

```
(void)memset(&client, 0x0, sizeof(client));
lwm2m_rd_client_start(&client, "unique-endpoint-name", 0, rd_client_event);
```

LwM2M security modes The Zephyr LwM2M library can be used either without security or use DTLS to secure the communication channel. When using DTLS with the LwM2M engine, PSK (Pre-Shared Key) and X.509 certificates are the security modes that can be used to secure the communication. The engine uses LwM2M Security object (Id 0) to read the stored credentials and feed keys from the security object into the TLS credential subsystem, see *secure sockets documentation*. Enable the `CONFIG_LWM2M_DTLS_SUPPORT` Kconfig option to use the security.

Depending on the selected mode, the security object must contain following data:

PSK
: Security Mode (Resource ID 2) set to zero (Pre-Shared Key mode). Identity (Resource ID 3) contains PSK ID in binary form. Secret key (Resource ID 5) contains the PSK key in binary form. If the key or identity is provided as a hex string, it must be converted to binary before storing into the security object.

X509
: When X509 certificates are used, set Security Mode (ID 2) to `2` (Certificate mode). Identity (ID 3) is used to store the client certificate and Secret key (ID 5) must have a private key associated with the certificate. Server Public Key resource (ID 4) must contain a server certificate or CA certificate used to sign the certificate chain. If the `CONFIG_MBEDTLS_PEM_CERTIFICATE_FORMAT` Kconfig option is enabled, certificates and private key can be entered in PEM format. Otherwise, they must be in binary DER format.

NoSec
: When no security is used, set Security Mode (Resource ID 2) to `3` (NoSec).

In all modes, Server URI resource (ID 0) must contain the full URI for the target server. When DNS names are used, the DNS resolver must be enabled.

When DTLS is used, following options are recommended to reduce DTLS handshake traffic when connection is re-established:

- `CONFIG_LWM2M_DTLS_CID` enables DTLS Connection Identifier support. When server supports it, this completely removes the handshake when device resumes operation after long idle period. Greatly helps when NAT mappings have timed out.
- `CONFIG_LWM2M_TLS_SESSION_CACHING` uses session cache when before falling back to full DTLS handshake. Reduces few packets from handshake, when session is still cached on server side. Most significant effect is to avoid full registration.

LwM2M stack provides callbacks in the *lwm2m_ctx* structure. They are used to feed keys from the LwM2M security object into the TLS credential subsystem. By default, these callbacks can be left as NULL pointers, in which case default callbacks are used. When an external TLS stack, or non-default socket options are required, you can overwrite the *lwm2m_ctx.load_credentials()* or *lwm2m_ctx.set_socketoptions()* callbacks.

An example of setting up the security object for PSK mode:

```
/* "000102030405060708090a0b0c0d0e0f" */
static unsigned char client_psk[] = {
        0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07,
        0x08, 0x09, 0x0a, 0x0b, 0x0c, 0x0d, 0x0e, 0x0f
};

static const char client_identity[] = "Client_identity";

lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 0), "coaps://lwm2m.example.com");
lwm2m_set_u8(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 2), LWM2M_SECURITY_PSK);
/* Set the client identity as a string, but this could be binary as well */
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 3), client_identity);
/* Set the client pre-shared key (PSK) */
lwm2m_set_opaque(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), client_psk, sizeof(client_
↪psk));
```

An example of setting up the security object for X509 certificate mode:

```
static const char certificate[] = "-----BEGIN CERTIFICATE-----\nMIIB6jCCAY+gAw...";
static const char key[] = "-----BEGIN EC PRIVATE KEY-----\nMHcCAQ...";
static const char root_ca[] = "-----BEGIN CERTIFICATE-----\nMIIBaz...";

lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 0), "coaps://lwm2m.example.com");
lwm2m_set_u8(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 2), LWM2M_SECURITY_CERT);
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 3), certificate);
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 5), key);
lwm2m_set_string(&LWM2M_OBJ(LWM2M_OBJECT_SECURITY_ID, 0, 4), root_ca);
```

Before calling *lwm2m_rd_client_start()* assign the tls_tag # where the LwM2M library should store the DTLS information prior to connection (normally a value of 1 is ok here).

```
(void)memset(&client, 0x0, sizeof(client));
client.tls_tag = 1; /* <---- */
lwm2m_rd_client_start(&client, "endpoint-name", 0, rd_client_event);
```

For a more detailed LwM2M client sample see: lwm2m-client.

Multi-thread usage Writing a value to a resource can be done using functions like lwm2m_set_u8. When writing to multiple resources, the function lwm2m_registry_lock will ensure that the client halts until all writing operations are finished:

```
lwm2m_registry_lock();
lwm2m_set_u32(&LWM2M_OBJ(1, 0, 1), 60);
lwm2m_set_u8(&LWM2M_OBJ(5, 0, 3), 0);
lwm2m_set_f64(&LWM2M_OBJ(3303, 0, 5700), value);
lwm2m_registry_unlock();
```

This is especially useful if the server is composite-observing the resources being written to. Locking will then ensure that the client only updates and sends notifications to the server after all operations are done, resulting in fewer messages in general.

Support for time series data LwM2M version 1.1 adds support for SenML CBOR and SenML JSON data formats. These data formats add support for time series data. Time series formats can

be used for READ, NOTIFY and SEND operations. When data cache is enabled for a resource, each write will create a timestamped entry in a cache, and its content is then returned as a content in READ, NOTIFY or SEND operation for a given resource.

Data cache is only supported for resources with a fixed data size.

Supported resource types:

- Signed and unsigned 8-64-bit integers
- Float
- Boolean

Enabling and configuring Enable data cache by selecting `CONFIG_LWM2M_RESOURCE_DATA_CACHE_SUPPORT`. Application needs to allocate an array of *lwm2m_time_series_elem* structures and then enable the cache by calling `lwm2m_engine_enable_cache()` for a given resource. Each resource must be enabled separately and each resource needs their own storage.

```
/* Allocate data cache storage */
static struct lwm2m_time_series_elem temperature_cache[10];
/* Enable data cache */
lwm2m_engine_enable_cache(LWM2M_PATH(IPSO_OBJECT_TEMP_SENSOR_ID, 0, SENSOR_VALUE_RID),
        temperature_cache, ARRAY_SIZE(temperature_cache));
```

LwM2M engine have room for four resources that have cache enabled. Limit can be increased by changing `CONFIG_LWM2M_MAX_CACHED_RESOURCES`. This affects a static memory usage of engine.

Data caches depends on one of the SenML data formats `CONFIG_LWM2M_RW_SENML_CBOR_SUPPORT` or `CONFIG_LWM2M_RW_SENML_JSON_SUPPORT` and needs `CONFIG_POSIX_TIMERS` so it can request a timestamp from the system and `CONFIG_RING_BUFFER` for ring buffer.

Read and Write operations Full content of data cache is written into a payload when any READ, SEND or NOTIFY operation internally reads the content of a given resource. This has a side effect that any read callbacks registered for a that resource are ignored when cache is enabled. Data is written into a cache when any of the `lwm2m_set_*` functions are called. To filter the data entering the cache, application may register a validation callback using *lwm2m_register_validate_callback()*.

Limitations Cache size should be manually set so small that the content can fit normal packets sizes. When cache is full, new values are dropped.

LwM2M engine and application events The Zephyr LwM2M engine defines events that can be sent back to the application through callback functions. The engine state machine shows when the events are spawned. Events depicted in the diagram are listed in the table. The events are prefixed with `LWM2M_RD_CLIENT_EVENT_`.

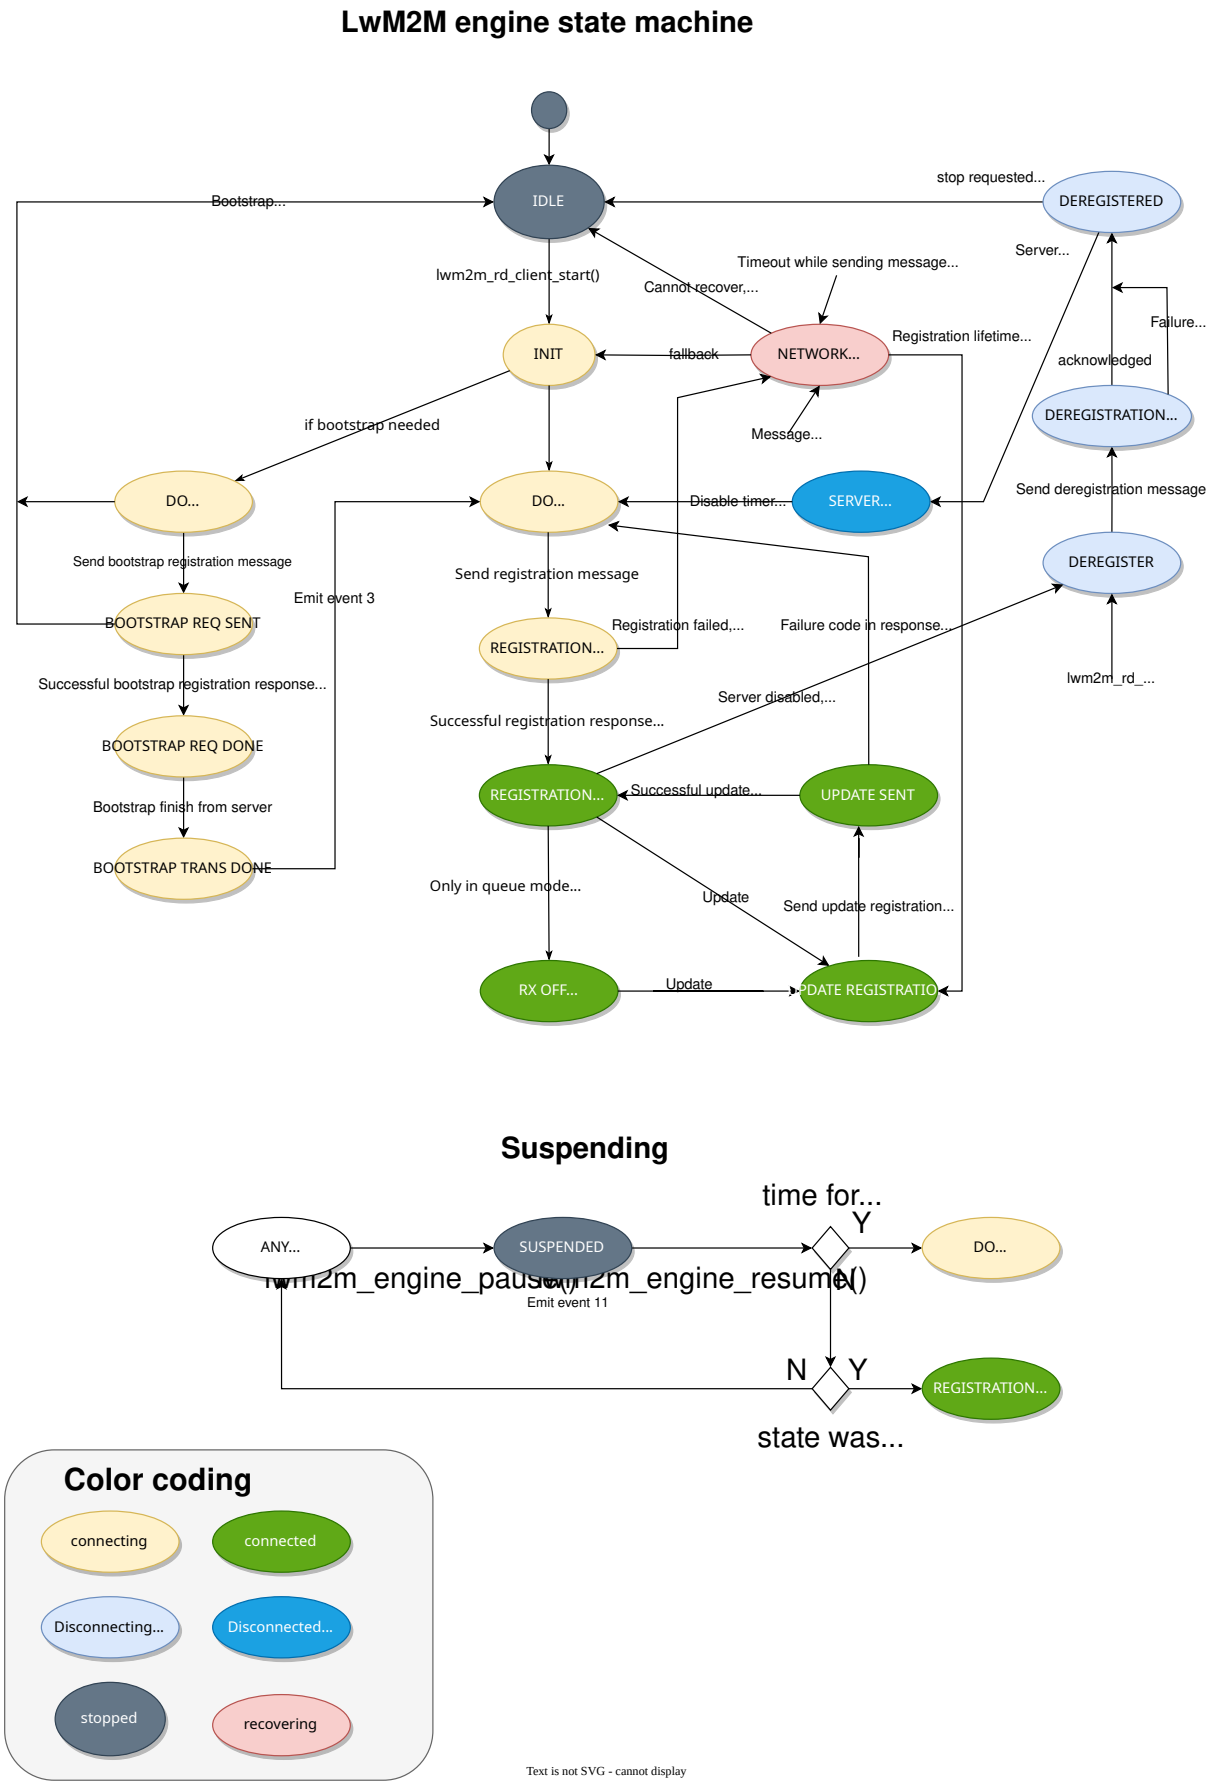

Fig. 15: State machine for the LwM2M engine

Table 30: LwM2M RD Client events

Ever ID	Event Name	Description
0	NONE	No event
1	BOOT-STRAP_REG_F	Bootstrap registration failed. Occurs if there is a timeout or failure in bootstrap registration.
2	BOOT-STRAP_REG_C	Bootstrap registration complete. Occurs after successful bootstrap registration.
3	BOOT-STRAP_TRANS	Bootstrap finish command received from the server.
4	REGISTRA-TION_FAILUR	Registration to LwM2M server failed. Occurs if there is a failure in the registration.
5	REGISTRA-TION_COMPL	Registration to LwM2M server successful. Occurs after a successful registration reply from the LwM2M server or when session resumption is used.
6	REG_TIMEOU	Registration or registration update timeout. Occurs if there is a timeout during registration. Client have lost connection to the server.
7	REG_UPDATE_	Registration update completed. Occurs after successful registration update reply from the LwM2M server.
8	DEREGIS-TER_FAILURE	Deregistration to LwM2M server failed. Occurs if there is a timeout or failure in the deregistration.
9	DISCON-NECT	LwM2M client have de-registered from server and is now stopped. Triggered only if the application have requested the client to stop.
10	QUEUE_MODI	Used only in queue mode, not actively listening for incoming packets. In queue mode the client is not required to actively listen for the incoming packets after a configured time period.
11	EN-GINE_SUSPEN	Indicate that client has now paused as a result of calling *lwm2m_engine_pause()*. State machine is no longer running and the handler thread is suspended. All timers are stopped so notifications are not triggered.
12	SERVER_DISA	Server have executed the disable command. Client will deregister and stay idle for the disable period.
13	NET-WORK_ERROI	Sending messages to the network failed too many times. Client cannot reach any servers or fallback to bootstrap. LwM2M engine cannot recover and have stopped.

The LwM2M client engine handles most of the state transitions automatically. The application needs to handle only the events that indicate that the client have stopped or is in a state where it cannot recover.

Table 31: How application should react to events

Event Name	How application should react
NONE	Ignore the event.
BOOT-STRAP_REG_FAIL	Try to recover network connection. Then restart the client by calling *lwm2m_rd_client_start()*. This might also indicate configuration issue.
BOOT-STRAP_REG_COM	No actions needed
BOOT-STRAP_TRANSFE	No actions needed
REGISTRA-TION_FAILURE	No actions needed
REGISTRA-TION_COMPLETI	No actions needed. Application can send or receive data.
REG_TIMEOUT	No actions needed. Client proceeds to re-registration automatically. Cannot send or receive data.
REG_UPDATE_CO	No actions needed Application can send or receive data.
DEREGIS-TER_FAILURE	No actions needed, client proceeds to idle state automatically. Cannot send or receive data.
DISCONNECT	Engine have stopped as a result of calling *lwm2m_rd_client_stop()*. If connection is required, the application should restart the client by calling *lwm2m_rd_client_start()*.
QUEUE_MODE_R	No actions needed. Application can send but cannot receive data. Any data transmission will trigger a registration update.
EN-GINE_SUSPENDE	Engine can be resumed by calling *lwm2m_engine_resume()*. Cannot send or receive data.
SERVER_DISABLI	No actions needed, client will re-register once the disable period is over. Cannot send or receive data.
NET-WORK_ERROR	Try to recover network connection. Then restart the client by calling *lwm2m_rd_client_start()*. This might also indicate configuration issue.

Sending of data in the table above refers to calling *lwm2m_send_cb()* or by writing into one of the observed resources where observation would trigger a notify message. Receiving of data refers to receiving read, write or execute operations from the server. Application can register callbacks for these operations.

Configuring lifetime and activity period In LwM2M engine, there are three Kconfig options and one runtime value that configures how often the client will send LwM2M Update message.

Table 32: Update period variables

Variable	Effect
LwM2M regis-tration lifetime	The lifetime parameter in LwM2M specifies how long a device's registration with an LwM2M server remains valid. Device is expected to send LwM2M Update message before the lifetime exprires.
CON-FIG_LWM2M_ENGIN	Default lifetime value, unless set by the bootstrap server. Also defines lower limit that client accepts as a lifetime.
CON-FIG_LWM2M_UPDAT	How long the client can stay idle before sending a next update.
CON-FIG_LWM2M_SECON	Minimum time margin to send the update message before the registration lifetime expires.

By default, the client uses `CONFIG_LWM2M_SECONDS_TO_UPDATE_EARLY` to calculate how many seconds before the expiration of lifetime it is going to send the registration update. The problem with default mode is when the server changes the lifetime of the registration. This is then affecting the period of updates the client is doing. If this is used with the QUEUE mode, which is

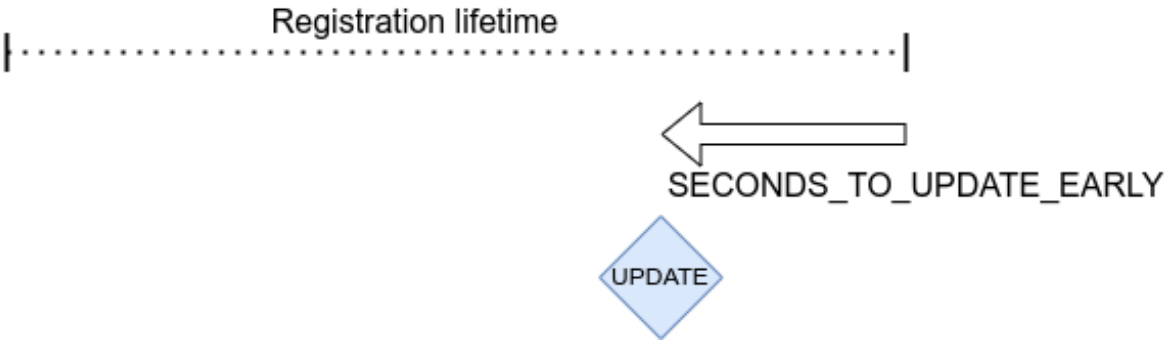

Fig. 16: Default way of calculating when to update registration.

typical in IPv4 networks, it is also affecting the period of when the device is reachable from the server.

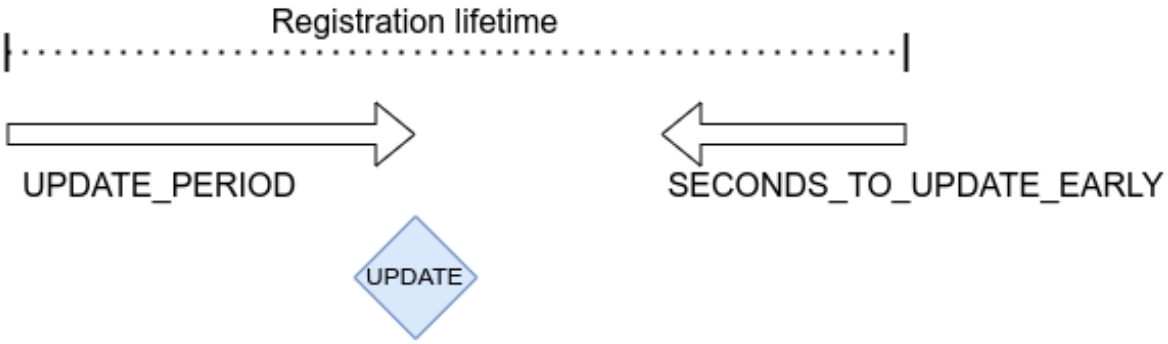

Fig. 17: Update time is controlled by UPDATE_PERIOD.

When also the `CONFIG_LWM2M_UPDATE_PERIOD` is set, time to send the update message is the earliest when any of these values expire. This allows setting long lifetime for the registration and configure the period accurately, even if server changes the lifetime parameter.

In runtime, the update frequency is limited to once in 15 seconds to avoid flooding.

LwM2M shell For testing the client it is possible to enable Zephyr's shell and LwM2M specific commands which support changing the state of the client. Operations supported are read, write and execute resources. Client start, stop, pause and resume are also available. The feature is enabled by selecting `CONFIG_LWM2M_SHELL`. The shell is meant for testing so productions systems should not enable it.

One imaginable scenario, where to use the shell, would be executing client side actions over UART when a server side tests would require those. It is assumed that not all tests are able to trigger required actions from the server side.

```
uart:~$ lwm2m
lwm2m - LwM2M commands
Subcommands:
  send    :send PATHS
          LwM2M SEND operation

  exec    :exec PATH [PARAM]
          Execute a resource

  read    :read PATH [OPTIONS]
          Read value from LwM2M resource
```

(continues on next page)

(continued from previous page)

```
          -x   Read value as hex stream (default)
          -s   Read value as string
          -b   Read value as bool (1/0)
          -uX  Read value as uintX_t
          -sX  Read value as intX_t
          -f   Read value as float
          -t   Read value as time_t

  write   :write PATH [OPTIONS] VALUE
          Write into LwM2M resource
          -s   Write value as string (default)
          -b   Write value as bool
          -uX  Write value as uintX_t
          -sX  Write value as intX_t
          -f   Write value as float
          -t   Write value as time_t

  create  :create PATH
          Create object or resource instance

  delete  :delete PATH
          Delete object or resource instance

  cache   :cache PATH NUM
          Enable data cache for resource
          PATH is LwM2M path
          NUM how many elements to cache

  start   :start EP_NAME [BOOTSTRAP FLAG]
          Start the LwM2M RD (Registration / Discovery) Client
          -b   Set the bootstrap flag (default 0)

  stop    :stop [OPTIONS]
          Stop the LwM2M RD (De-register) Client
          -f   Force close the connection

  update  :Trigger Registration Update of the LwM2M RD Client

  pause   :LwM2M engine thread pause
  resume  :LwM2M engine thread resume
  lock    :Lock the LwM2M registry
  unlock  :Unlock the LwM2M registry
```

LwM2M client
Implement a LwM2M client that connects to a LwM2M server.

API Reference

group `lwm2m_api`

Since
1.9

Version
0.8.0

LwM2M Objects managed by OMA for LwM2M tech specification.

Objects in this range have IDs from 0 to 1023.

`LWM2M_OBJECT_SECURITY_ID`
: Security object.

`LWM2M_OBJECT_SERVER_ID`
: Server object.

`LWM2M_OBJECT_ACCESS_CONTROL_ID`
: Access Control object.

`LWM2M_OBJECT_DEVICE_ID`
: Device object.

`LWM2M_OBJECT_CONNECTIVITY_MONITORING_ID`
: Connectivity Monitoring object.

`LWM2M_OBJECT_FIRMWARE_ID`
: Firmware object.

`LWM2M_OBJECT_LOCATION_ID`
: Location object.

`LWM2M_OBJECT_CONNECTIVITY_STATISTICS_ID`
: Connectivity Statistics object.

`LWM2M_OBJECT_SOFTWARE_MANAGEMENT_ID`
: Software Management object.

`LWM2M_OBJECT_PORTFOLIO_ID`
: Portfolio object.

`LWM2M_OBJECT_BINARYAPPDATACONTAINER_ID`
: Binary App Data Container object.

`LWM2M_OBJECT_EVENT_LOG_ID`
: Event Log object.

`LWM2M_OBJECT_OSCORE_ID`
: OSCORE object.

`LWM2M_OBJECT_GATEWAY_ID`
: Gateway object.

LwM2M Objects produced by 3rd party Standards Development

Organizations.

Refer to the OMA LightweightM2M (LwM2M) Object and Resource Registry: http://www.openmobilealliance.org/wp/OMNA/LwM2M/LwM2MRegistry.html

`IPSO_OBJECT_GENERIC_SENSOR_ID`
: IPSO Generic Sensor object.

`IPSO_OBJECT_TEMP_SENSOR_ID`
: IPSO Temperature Sensor object.

`IPSO_OBJECT_HUMIDITY_SENSOR_ID`
: IPSO Humidity Sensor object.

`IPSO_OBJECT_LIGHT_CONTROL_ID`
: IPSO Light Control object.

`IPSO_OBJECT_ACCELEROMETER_ID`
: IPSO Accelerometer object.

`IPSO_OBJECT_VOLTAGE_SENSOR_ID`
: IPSO Voltage Sensor object.

`IPSO_OBJECT_CURRENT_SENSOR_ID`
: IPSO Current Sensor object.

`IPSO_OBJECT_PRESSURE_ID`
: IPSO Pressure Sensor object.

`IPSO_OBJECT_BUZZER_ID`
: IPSO Buzzer object.

`IPSO_OBJECT_TIMER_ID`
: IPSO Timer object.

`IPSO_OBJECT_ONOFF_SWITCH_ID`
: IPSO On/Off Switch object.

`IPSO_OBJECT_PUSH_BUTTON_ID`
: IPSO Push Button object.

`UCIFI_OBJECT_BATTERY_ID`
: uCIFI Battery object

`IPSO_OBJECT_FILLING_LEVEL_SENSOR_ID`
: IPSO Filling Level Sensor object.

Power source types used for the “Available Power Sources” resource of

the LwM2M Device object (3/0/6).

`LWM2M_DEVICE_PWR_SRC_TYPE_DC_POWER`
: DC power.

`LWM2M_DEVICE_PWR_SRC_TYPE_BAT_INT`
: Internal battery.

`LWM2M_DEVICE_PWR_SRC_TYPE_BAT_EXT`
: External battery.

`LWM2M_DEVICE_PWR_SRC_TYPE_FUEL_CELL`
: Fuel cell.

`LWM2M_DEVICE_PWR_SRC_TYPE_PWR_OVER_ETH`
: Power over Ethernet.

`LWM2M_DEVICE_PWR_SRC_TYPE_USB`
: USB.

`LWM2M_DEVICE_PWR_SRC_TYPE_AC_POWER`
: AC (mains) power.

`LWM2M_DEVICE_PWR_SRC_TYPE_SOLAR`
: Solar.

`LWM2M_DEVICE_PWR_SRC_TYPE_MAX`
: Max value for Available Power Source type.

Error codes used for the “Error Code” resource of the LwM2M Device

object.

An LwM2M client can register one of the following error codes via the *lwm2m_device_add_err()* function.

`LWM2M_DEVICE_ERROR_NONE`
: No error.

`LWM2M_DEVICE_ERROR_LOW_POWER`
: Low battery power.

`LWM2M_DEVICE_ERROR_EXT_POWER_SUPPLY_OFF`
: External power supply off.

`LWM2M_DEVICE_ERROR_GPS_FAILURE`
: GPS module failure.

`LWM2M_DEVICE_ERROR_LOW_SIGNAL_STRENGTH`
: Low received signal strength.

`LWM2M_DEVICE_ERROR_OUT_OF_MEMORY`
: Out of memory.

`LWM2M_DEVICE_ERROR_SMS_FAILURE`
: SMS failure.

`LWM2M_DEVICE_ERROR_NETWORK_FAILURE`
: IP Connectivity failure.

`LWM2M_DEVICE_ERROR_PERIPHERAL_FAILURE`
: Peripheral malfunction.

Battery status codes used for the “Battery Status” resource (3/0/20)

of the LwM2M Device object.

As the battery status changes, an LwM2M client can set one of the following codes via: lwm2m_set_u8(“3/0/20”, [battery status])

`LWM2M_DEVICE_BATTERY_STATUS_NORMAL`
: The battery is operating normally and not on power.

`LWM2M_DEVICE_BATTERY_STATUS_CHARGING`
: The battery is currently charging.

`LWM2M_DEVICE_BATTERY_STATUS_CHARGE_COMP`
: The battery is fully charged and the charger is still connected.

`LWM2M_DEVICE_BATTERY_STATUS_DAMAGED`
: The battery has some problem.

`LWM2M_DEVICE_BATTERY_STATUS_LOW`
: The battery is low on charge.

`LWM2M_DEVICE_BATTERY_STATUS_NOT_INST`
: The battery is not installed.

`LWM2M_DEVICE_BATTERY_STATUS_UNKNOWN`
: The battery information is not available.

LWM2M Firmware Update object states

An LwM2M client or the LwM2M Firmware Update object use the following codes to represent the LwM2M Firmware Update state (5/0/3).

`STATE_IDLE`
: Idle.

  Before downloading or after successful updating.

STATE_DOWNLOADING
: Downloading.

  The data sequence is being downloaded.

STATE_DOWNLOADED
: Downloaded.

  The whole data sequence has been downloaded.

STATE_UPDATING
: Updating.

  The device is being updated.

LWM2M Firmware Update object result codes

After processing a firmware update, the client sets the result via one of the following codes via lwm2m_set_u8("5/0/5", [result code])

RESULT_DEFAULT
: Initial value.

RESULT_SUCCESS
: Firmware updated successfully.

RESULT_NO_STORAGE
: Not enough flash memory for the new firmware package.

RESULT_OUT_OF_MEM
: Out of RAM during downloading process.

RESULT_CONNECTION_LOST
: Connection lost during downloading process.

RESULT_INTEGRITY_FAILED
: Integrity check failure for new downloaded package.

RESULT_UNSUP_FW
: Unsupported package type.

RESULT_INVALID_URI
: Invalid URI.

RESULT_UPDATE_FAILED
: Firmware update failed.

RESULT_UNSUP_PROTO
: Unsupported protocol.

Defines

LWM2M_OBJLNK_MAX_ID
: Maximum value for Objlnk resource fields.

LWM2M_RES_DATA_READ_ONLY
: Resource read-only value bit.

LWM2M_RES_DATA_FLAG_RO
: Resource read-only flag.

LWM2M_HAS_RES_FLAG(res, f)
: Read resource flags helper macro.

LWM2M_RD_CLIENT_FLAG_BOOTSTRAP
: Run bootstrap procedure in current session.

LWM2M_MAX_PATH_STR_SIZE
: LwM2M path maximum length.

Typedefs

typedef void (*lwm2m_socket_fault_cb_t)(int error)
: Callback function called when a socket error is encountered.

  Param error
  : Error code

typedef void (*lwm2m_observe_cb_t)(enum *lwm2m_observe_event* event, struct *lwm2m_obj_path* *path, void *user_data)
: Observe callback indicating observer adds and deletes, and notification ACKs and timeouts.

  Param event
  : **[in]** Observer add/delete or notification ack/timeout

  Param path
  : **[in]** LwM2M path

  Param user_data
  : **[in]** Pointer to user_data buffer, as provided in send_traceable_notification(). Used to determine for which data the ACKed/timed out notification was.

typedef void (*lwm2m_ctx_event_cb_t)(struct *lwm2m_ctx* *ctx, enum *lwm2m_rd_client_event* event)
: Asynchronous RD client event callback.

  Param ctx
  : **[in]** LwM2M context generating the event

  Param event
  : **[in]** LwM2M RD client event code

typedef void *(*lwm2m_engine_get_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, size_t *data_len)

Asynchronous callback to get a resource buffer and length.

Prior to accessing the data buffer of a resource, the engine can use this callback to get the buffer pointer and length instead of using the resource's data buffer.

The client or LwM2M objects can register a function of this type via: *lwm2m_register_read_callback() lwm2m_register_pre_write_callback()*

Param obj_inst_id
[in] Object instance ID generating the callback.

Param res_id
[in] Resource ID generating the callback.

Param res_inst_id
[in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

Param data_len
[out] Length of the data buffer.

Return
Callback returns a pointer to the data buffer or NULL for failure.

typedef int (*lwm2m_engine_set_data_cb_t)(uint16_t obj_inst_id, uint16_t res_id, uint16_t res_inst_id, uint8_t *data, uint16_t data_len, bool last_block, size_t total_size, size_t offset)

Asynchronous callback when data has been set to a resource buffer.

After changing the data of a resource buffer, the LwM2M engine can make use of this callback to pass the data back to the client or LwM2M objects.

On a block-wise transfers the handler is called multiple times with the data blocks and increasing offset. The last block has the last_block flag set to true. Beginning of the block transfer has the offset set to 0.

A function of this type can be registered via: *lwm2m_register_validate_callback() lwm2m_register_post_write_callback()*

Param obj_inst_id
[in] Object instance ID generating the callback.

Param res_id
[in] Resource ID generating the callback.

Param res_inst_id
[in] Resource instance ID generating the callback (typically 0 for non-multi instance resources).

Param data
[in] Pointer to data.

Param data_len
[in] Length of the data.

Param last_block
[in] Flag used during block transfer to indicate the last block of data. For non-block transfers this is always false.

Param total_size
[in] Expected total size of data for a block transfer. For non-block transfers this is 0.

Param offset
[in] Offset of the data block. For non-block transfers this is always 0.

Return
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*`lwm2m_engine_user_cb_t`)(uint16_t obj_inst_id)

Asynchronous event notification callback.

Various object instance and resource-based events in the LwM2M engine can trigger a callback of this function type: object instance create, and object instance delete.

Register a function of this type via: *lwm2m_register_create_callback()* *lwm2m_register_delete_callback()*

Param obj_inst_id
[in] Object instance ID generating the callback.

Return
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef int (*`lwm2m_engine_execute_cb_t`)(uint16_t obj_inst_id, uint8_t *args, uint16_t args_len)

Asynchronous execute notification callback.

Resource executes trigger a callback of this type.

Register a function of this type via: *lwm2m_register_exec_callback()*

Param obj_inst_id
[in] Object instance ID generating the callback.

Param args
[in] Pointer to execute arguments payload. (This can be NULL if no arguments are provided)

Param args_len
[in] Length of argument payload in bytes.

Return
Callback returns a negative error code (errno.h) indicating reason of failure or 0 for success.

typedef void (*`lwm2m_send_cb_t`)(enum *lwm2m_send_status* status)

Callback returning send status.

Enums

enum `lwm2m_observe_event`

Observe callback events.

Values:

enumerator `LWM2M_OBSERVE_EVENT_OBSERVER_ADDED`

Observer added.

enumerator `LWM2M_OBSERVE_EVENT_OBSERVER_REMOVED`

Observer removed.

enumerator LWM2M_OBSERVE_EVENT_NOTIFY_ACK

Notification ACKed.

enumerator LWM2M_OBSERVE_EVENT_NOTIFY_TIMEOUT

Notification timed out.

enum lwm2m_socket_states

Different traffic states of the LwM2M socket.

This information can be used to give hints for the network interface that can decide what kind of power management should be used.

These hints are given from CoAP layer messages, so usage of DTLS might affect the actual number of expected datagrams.

Values:

enumerator LWM2M_SOCKET_STATE_ONGOING

Ongoing traffic is expected.

enumerator LWM2M_SOCKET_STATE_ONE_RESPONSE

One response is expected for the next message.

enumerator LWM2M_SOCKET_STATE_LAST

Next message is the last one.

enumerator LWM2M_SOCKET_STATE_NO_DATA

No more data is expected.

enum lwm2m_rd_client_event

LwM2M RD client events.

LwM2M client events are passed back to the event_cb function in *lwm2m_rd_client_start()*

Values:

enumerator LWM2M_RD_CLIENT_EVENT_NONE

Invalid event.

enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_FAILURE

Bootstrap registration failure.

enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_REG_COMPLETE

Bootstrap registration complete.

enumerator LWM2M_RD_CLIENT_EVENT_BOOTSTRAP_TRANSFER_COMPLETE

Bootstrap transfer complete.

enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_FAILURE

Registration failure.

enumerator LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE
Registration complete.

enumerator LWM2M_RD_CLIENT_EVENT_REG_TIMEOUT
Registration timeout.

enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE
Registration update complete.

enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER_FAILURE
De-registration failure.

enumerator LWM2M_RD_CLIENT_EVENT_DISCONNECT
Disconnected.

enumerator LWM2M_RD_CLIENT_EVENT_QUEUE_MODE_RX_OFF
Queue mode RX off.

enumerator LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED
Engine suspended.

enumerator LWM2M_RD_CLIENT_EVENT_NETWORK_ERROR
Network error.

enumerator LWM2M_RD_CLIENT_EVENT_REG_UPDATE
Registration update.

enumerator LWM2M_RD_CLIENT_EVENT_DEREGISTER
De-register.

enumerator LWM2M_RD_CLIENT_EVENT_SERVER_DISABLED
Server disabled.

enum lwm2m_send_status
LwM2M send status.

LwM2M send status are generated back to the lwm2m_send_cb_t function in *lwm2m_send_cb()*

Values:

enumerator LWM2M_SEND_STATUS_SUCCESS
Succeed.

enumerator LWM2M_SEND_STATUS_FAILURE
Failure.

enumerator LWM2M_SEND_STATUS_TIMEOUT
Timeout.

enum `lwm2m_security_mode_e`

Security modes as defined in LwM2M Security object.

Values:

enumerator `LWM2M_SECURITY_PSK` = 0

Pre-Shared Key mode.

enumerator `LWM2M_SECURITY_RAW_PK` = 1

Raw Public Key mode.

enumerator `LWM2M_SECURITY_CERT` = 2

Certificate mode.

enumerator `LWM2M_SECURITY_NOSEC` = 3

NoSec mode.

enumerator `LWM2M_SECURITY_CERT_EST` = 4

Certificate mode with EST.

Functions

int `lwm2m_device_add_err`(uint8_t error_code)

Register a new error code with LwM2M Device object.

Parameters

- `error_code` – **[in]** New error code.

Returns

0 for success or negative in case of error.

void `lwm2m_firmware_set_write_cb`(*lwm2m_engine_set_data_cb_t* cb)

Set data callback for firmware block transfer.

LwM2M clients use this function to register a callback for receiving the block transfer data when performing a firmware update.

Parameters

- `cb` – **[in]** A callback function to receive the block transfer data

lwm2m_engine_set_data_cb_t `lwm2m_firmware_get_write_cb`(void)

Get the data callback for firmware block transfer writes.

Returns

A registered callback function to receive the block transfer data

void `lwm2m_firmware_set_write_cb_inst`(uint16_t obj_inst_id, *lwm2m_engine_set_data_cb_t* cb)

Set data callback for firmware block transfer.

LwM2M clients use this function to register a callback for receiving the block transfer data when performing a firmware update.

Parameters

- `obj_inst_id` – **[in]** Object instance ID
- `cb` – **[in]** A callback function to receive the block transfer data

lwm2m_engine_set_data_cb_t **lwm2m_firmware_get_write_cb_inst**(uint16_t obj_inst_id)

Get the data callback for firmware block transfer writes.

Parameters

- **obj_inst_id** – **[in]** Object instance ID

Returns

A registered callback function to receive the block transfer data

void **lwm2m_firmware_set_cancel_cb**(*lwm2m_engine_user_cb_t* cb)

Set callback for firmware update cancel.

LwM2M clients use this function to register a callback to perform actions on firmware update cancel.

Parameters

- **cb** – **[in]** A callback function perform actions on firmware update cancel.

lwm2m_engine_user_cb_t **lwm2m_firmware_get_cancel_cb**(void)

Get a callback for firmware update cancel.

Returns

A registered callback function perform actions on firmware update cancel.

void **lwm2m_firmware_set_cancel_cb_inst**(uint16_t obj_inst_id, *lwm2m_engine_user_cb_t* cb)

Set data callback for firmware update cancel.

LwM2M clients use this function to register a callback to perform actions on firmware update cancel.

Parameters

- **obj_inst_id** – **[in]** Object instance ID
- **cb** – **[in]** A callback function perform actions on firmware update cancel.

lwm2m_engine_user_cb_t **lwm2m_firmware_get_cancel_cb_inst**(uint16_t obj_inst_id)

Get the callback for firmware update cancel.

Parameters

- **obj_inst_id** – **[in]** Object instance ID

Returns

A registered callback function perform actions on firmware update cancel.

void **lwm2m_firmware_set_update_cb**(*lwm2m_engine_execute_cb_t* cb)

Set data callback to handle firmware update execute events.

LwM2M clients use this function to register a callback for receiving the update resource “execute” operation on the LwM2M Firmware Update object.

Parameters

- **cb** – **[in]** A callback function to receive the execute event.

lwm2m_engine_execute_cb_t **lwm2m_firmware_get_update_cb**(void)

Get the event callback for firmware update execute events.

Returns

A registered callback function to receive the execute event.

void **lwm2m_firmware_set_update_cb_inst**(uint16_t obj_inst_id, *lwm2m_engine_execute_cb_t* cb)

Set data callback to handle firmware update execute events.

LwM2M clients use this function to register a callback for receiving the update resource "execute" operation on the LwM2M Firmware Update object.

Parameters

- **obj_inst_id** – **[in]** Object instance ID
- **cb** – **[in]** A callback function to receive the execute event.

lwm2m_engine_execute_cb_t **lwm2m_firmware_get_update_cb_inst**(uint16_t obj_inst_id)

Get the event callback for firmware update execute events.

Parameters

- **obj_inst_id** – **[in]** Object instance ID

Returns

A registered callback function to receive the execute event.

int **lwm2m_swmgmt_set_activate_cb**(uint16_t obj_inst_id, *lwm2m_engine_execute_cb_t* cb)

Set callback to handle software activation requests.

The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Activate resource instance.

Parameters

- **obj_inst_id** – **[in]** The instance number to set the callback for.
- **cb** – **[in]** A callback function to receive the execute event.

Returns

0 on success, otherwise a negative integer.

int **lwm2m_swmgmt_set_deactivate_cb**(uint16_t obj_inst_id, *lwm2m_engine_execute_cb_t* cb)

Set callback to handle software deactivation requests.

The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Deactivate resource instance.

Parameters

- **obj_inst_id** – **[in]** The instance number to set the callback for.
- **cb** – **[in]** A callback function to receive the execute event.

Returns

0 on success, otherwise a negative integer.

int **lwm2m_swmgmt_set_install_package_cb**(uint16_t obj_inst_id, *lwm2m_engine_execute_cb_t* cb)

Set callback to handle software install requests.

The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Install resource instance.

Parameters

- **obj_inst_id** – **[in]** The instance number to set the callback for.
- **cb** – **[in]** A callback function to receive the execute event.

Returns

0 on success, otherwise a negative integer.

int `lwm2m_swmgmt_set_delete_package_cb`(uint16_t obj_inst_id, *lwm2m_engine_execute_cb_t* cb)

Set callback to handle software uninstall requests.

The callback will be executed when the LWM2M execute operation gets called on the corresponding object's Uninstall resource instance.

Parameters

- `obj_inst_id` – **[in]** The instance number to set the callback for.
- `cb` – **[in]** A callback function for handling the execute event.

Returns
0 on success, otherwise a negative integer.

int `lwm2m_swmgmt_set_read_package_version_cb`(uint16_t obj_inst_id, *lwm2m_engine_get_data_cb_t* cb)

Set callback to read software package.

The callback will be executed when the LWM2M read operation gets called on the corresponding object.

Parameters

- `obj_inst_id` – **[in]** The instance number to set the callback for.
- `cb` – **[in]** A callback function for handling the read event.

Returns
0 on success, otherwise a negative integer.

int `lwm2m_swmgmt_set_write_package_cb`(uint16_t obj_inst_id, *lwm2m_engine_set_data_cb_t* cb)

Set data callback for software management block transfer.

The callback will be executed when the LWM2M block write operation gets called on the corresponding object's resource instance.

Parameters

- `obj_inst_id` – **[in]** The instance number to set the callback for.
- `cb` – **[in]** A callback function for handling the block write event.

Returns
0 on success, otherwise a negative integer.

int `lwm2m_swmgmt_install_completed`(uint16_t obj_inst_id, int error_code)

Function to be called when a Software Management object instance completed the Install operation.

return 0 on success, otherwise a negative integer.

Parameters

- `obj_inst_id` – **[in]** The Software Management object instance
- `error_code` – **[in]** The result code of the operation. Zero on success otherwise it should be a negative integer.

void `lwm2m_event_log_set_read_log_data_cb`(*lwm2m_engine_get_data_cb_t* cb)

Set callback to read log data.

The callback will be executed when the LWM2M read operation gets called on the corresponding object.

Parameters

- **cb** – **[in]** A callback function for handling the read event.

int **lwm2m_update_observer_min_period**(struct *lwm2m_ctx* *client_ctx, const struct *lwm2m_obj_path* *path, uint32_t period_s)

Change an observer's pmin value.

LwM2M clients use this function to modify the pmin attribute for an observation being made. Example to update the pmin of a temperature sensor value being observed: lwm2m_update_observer_min_period(client_ctx, &LWM2M_OBJ(3303, 0, 5700), 5);

Parameters

- **client_ctx** – **[in]** LwM2M context
- **path** – **[in]** LwM2M path as a struct
- **period_s** – **[in]** Value of pmin to be given (in seconds).

Returns

0 for success or negative in case of error.

int **lwm2m_update_observer_max_period**(struct *lwm2m_ctx* *client_ctx, const struct *lwm2m_obj_path* *path, uint32_t period_s)

Change an observer's pmax value.

LwM2M clients use this function to modify the pmax attribute for an observation being made. Example to update the pmax of a temperature sensor value being observed: lwm2m__update_observer_max_period(client_ctx, &LWM2M_OBJ(3303, 0, 5700), 5);

Parameters

- **client_ctx** – **[in]** LwM2M context
- **path** – **[in]** LwM2M path as a struct
- **period_s** – **[in]** Value of pmax to be given (in seconds).

Returns

0 for success or negative in case of error.

int **lwm2m_create_object_inst**(const struct *lwm2m_obj_path* *path)

Create an LwM2M object instance.

LwM2M clients use this function to create non-default LwM2M objects: Example to create first temperature sensor object: lwm2m_create_obj_inst(&LWM2M_OBJ(3303, 0));

Parameters

- **path** – **[in]** LwM2M path as a struct

Returns

0 for success or negative in case of error.

int **lwm2m_delete_object_inst**(const struct *lwm2m_obj_path* *path)

Delete an LwM2M object instance.

LwM2M clients use this function to delete LwM2M objects.

Parameters

- **path** – **[in]** LwM2M path as a struct

Returns

0 for success or negative in case of error.

void `lwm2m_registry_lock`(void)

Locks the registry for this thread.

Use this function before writing to multiple resources. This halts the lwm2m main thread until all the write-operations are finished.

void `lwm2m_registry_unlock`(void)

Unlocks the registry previously locked by *lwm2m_registry_lock()*.

int `lwm2m_set_opaque`(const struct *lwm2m_obj_path* *path, const char *data_ptr, uint16_t data_len)

Set resource (instance) value (opaque buffer)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `data_ptr` – **[in]** Data buffer
- `data_len` – **[in]** Length of buffer

Returns

0 for success or negative in case of error.

int `lwm2m_set_string`(const struct *lwm2m_obj_path* *path, const char *data_ptr)

Set resource (instance) value (string)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `data_ptr` – **[in]** NULL terminated char buffer

Returns

0 for success or negative in case of error.

int `lwm2m_set_u8`(const struct *lwm2m_obj_path* *path, uint8_t value)

Set resource (instance) value (u8)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** u8 value

Returns

0 for success or negative in case of error.

int `lwm2m_set_u16`(const struct *lwm2m_obj_path* *path, uint16_t value)

Set resource (instance) value (u16)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** u16 value

Returns

0 for success or negative in case of error.

int `lwm2m_set_u32`(const struct *lwm2m_obj_path* *path, uint32_t value)

Set resource (instance) value (u32)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** u32 value

Returns
0 for success or negative in case of error.

int **lwm2m_set_u64**(const struct *lwm2m_obj_path* *path, uint64_t value)
Set resource (instance) value (u64)

Deprecated:
Unsigned 64bit value type does not exits. This is internally handled as a int64_t. Use *lwm2m_set_s64()* instead.

Parameters
- **path** – **[in]** LwM2M path as a struct
- **value** – **[in]** u64 value

Returns
0 for success or negative in case of error.

int **lwm2m_set_s8**(const struct *lwm2m_obj_path* *path, int8_t value)
Set resource (instance) value (s8)

Parameters
- **path** – **[in]** LwM2M path as a struct
- **value** – **[in]** s8 value

Returns
0 for success or negative in case of error.

int **lwm2m_set_s16**(const struct *lwm2m_obj_path* *path, int16_t value)
Set resource (instance) value (s16)

Parameters
- **path** – **[in]** LwM2M path as a struct
- **value** – **[in]** s16 value

Returns
0 for success or negative in case of error.

int **lwm2m_set_s32**(const struct *lwm2m_obj_path* *path, int32_t value)
Set resource (instance) value (s32)

Parameters
- **path** – **[in]** LwM2M path as a struct
- **value** – **[in]** s32 value

Returns
0 for success or negative in case of error.

int **lwm2m_set_s64**(const struct *lwm2m_obj_path* *path, int64_t value)
Set resource (instance) value (s64)

Parameters
- **path** – **[in]** LwM2M path as a struct
- **value** – **[in]** s64 value

Returns
0 for success or negative in case of error.

int `lwm2m_set_bool`(const struct *lwm2m_obj_path* *path, bool value)

Set resource (instance) value (bool)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** bool value

Returns

0 for success or negative in case of error.

int `lwm2m_set_f64`(const struct *lwm2m_obj_path* *path, const double value)

Set resource (instance) value (double)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** double value

Returns

0 for success or negative in case of error.

int `lwm2m_set_objlnk`(const struct *lwm2m_obj_path* *path, const struct *lwm2m_objlnk* *value)

Set resource (instance) value (Objlnk)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** pointer to the *lwm2m_objlnk* structure

Returns

0 for success or negative in case of error.

int `lwm2m_set_time`(const struct *lwm2m_obj_path* *path, time_t value)

Set resource (instance) value (Time)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[in]** Epoch timestamp

Returns

0 for success or negative in case of error.

int `lwm2m_set_bulk`(const struct *lwm2m_res_item* res_list[], size_t res_list_size)

Set multiple resource (instance) values.

NOTE: Value type must match the target resource as this function does not do any type conversion. See struct *lwm2m_res_item* for list of resource types.

Parameters

- `res_list` – **[in]** LwM2M resource item list
- `res_list_size` – **[in]** Length of resource list

Returns

0 for success or negative in case of error.

int `lwm2m_get_opaque`(const struct *lwm2m_obj_path* *path, void *buf, uint16_t buflen)

Get resource (instance) value (opaque buffer)

Parameters

- `path` – **[in]** LwM2M path as a struct

- `buf` – **[out]** Data buffer to copy data into
- `buflen` – **[in]** Length of buffer

Returns
0 for success or negative in case of error.

int `lwm2m_get_string`(const struct *lwm2m_obj_path* *path, void *str, uint16_t buflen)
Get resource (instance) value (string)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `str` – **[out]** String buffer to copy data into
- `buflen` – **[in]** Length of buffer

Returns
0 for success or negative in case of error.

int `lwm2m_get_u8`(const struct *lwm2m_obj_path* *path, uint8_t *value)
Get resource (instance) value (u8)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** u8 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_u16`(const struct *lwm2m_obj_path* *path, uint16_t *value)
Get resource (instance) value (u16)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** u16 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_u32`(const struct *lwm2m_obj_path* *path, uint32_t *value)
Get resource (instance) value (u32)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** u32 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_u64`(const struct *lwm2m_obj_path* *path, uint64_t *value)
Get resource (instance) value (u64)

Deprecated:
Unsigned 64bit value type does not exits. This is internally handled as a int64_t. Use *lwm2m_get_s64()* instead.

Parameters

- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** u64 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_s8`(const struct *lwm2m_obj_path* *path, int8_t *value)
Get resource (instance) value (s8)

Parameters
- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** s8 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_s16`(const struct *lwm2m_obj_path* *path, int16_t *value)
Get resource (instance) value (s16)

Parameters
- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** s16 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_s32`(const struct *lwm2m_obj_path* *path, int32_t *value)
Get resource (instance) value (s32)

Parameters
- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** s32 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_s64`(const struct *lwm2m_obj_path* *path, int64_t *value)
Get resource (instance) value (s64)

Parameters
- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** s64 buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_bool`(const struct *lwm2m_obj_path* *path, bool *value)
Get resource (instance) value (bool)

Parameters
- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** bool buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_f64`(const struct *lwm2m_obj_path* *path, double *value)
Get resource (instance) value (double)

Parameters
- `path` – **[in]** LwM2M path as a struct
- `value` – **[out]** double buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_objlnk`(const struct *lwm2m_obj_path* *path, struct *lwm2m_objlnk* *buf)

Get resource (instance) value (Objlnk)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `buf` – **[out]** *lwm2m_objlnk* buffer to copy data into

Returns
0 for success or negative in case of error.

int `lwm2m_get_time`(const struct *lwm2m_obj_path* *path, time_t *buf)

Get resource (instance) value (Time)

Parameters

- `path` – **[in]** LwM2M path as a struct
- `buf` – **[out]** time_t pointer to copy data

Returns
0 for success or negative in case of error.

int `lwm2m_register_read_callback`(const struct *lwm2m_obj_path* *path,
lwm2m_engine_get_data_cb_t cb)

Set resource (instance) read callback.

LwM2M clients can use this to set the callback function for resource reads when data handling in the LwM2M engine needs to be bypassed. For example reading back opaque binary data from external storage.

This callback should not generally be used for any data that might be observed as engine does not have any knowledge of data changes.

When separate buffer for data should be used, use *lwm2m_set_res_buf()* instead to set the storage.

Parameters

- `path` – **[in]** LwM2M path as a struct
- `cb` – **[in]** Read resource callback

Returns
0 for success or negative in case of error.

int `lwm2m_register_pre_write_callback`(const struct *lwm2m_obj_path* *path,
lwm2m_engine_get_data_cb_t cb)

Set resource (instance) pre-write callback.

This callback is triggered before setting the value of a resource. It can pass a special data buffer to the engine so that the actual resource value can be calculated later, etc.

Parameters

- `path` – **[in]** LwM2M path as a struct
- `cb` – **[in]** Pre-write resource callback

Returns
0 for success or negative in case of error.

int **lwm2m_register_validate_callback**(const struct *lwm2m_obj_path* *path, *lwm2m_engine_set_data_cb_t* cb)

Set resource (instance) validation callback.

This callback is triggered before setting the value of a resource to the resource data buffer.

The callback allows an LwM2M client or object to validate the data before writing and notify an error if the data should be discarded for any reason (by returning a negative error code).

> **Note**
>
> All resources that have a validation callback registered are initially decoded into a temporary validation buffer. Make sure that CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE is large enough to store each of the validated resources (individually).

Parameters

- **path** – **[in]** LwM2M path as a struct
- **cb** – **[in]** Validate resource data callback

Returns
0 for success or negative in case of error.

int **lwm2m_register_post_write_callback**(const struct *lwm2m_obj_path* *path, *lwm2m_engine_set_data_cb_t* cb)

Set resource (instance) post-write callback.

This callback is triggered after setting the value of a resource to the resource data buffer.

It allows an LwM2M client or object to post-process the value of a resource or trigger other related resource calculations.

Parameters

- **path** – **[in]** LwM2M path as a struct
- **cb** – **[in]** Post-write resource callback

Returns
0 for success or negative in case of error.

int **lwm2m_register_exec_callback**(const struct *lwm2m_obj_path* *path, *lwm2m_engine_execute_cb_t* cb)

Set resource execute event callback.

This event is triggered when the execute method of a resource is enabled.

Parameters

- **path** – **[in]** LwM2M path as a struct
- **cb** – **[in]** Execute resource callback

Returns
0 for success or negative in case of error.

int **lwm2m_register_create_callback**(uint16_t obj_id, *lwm2m_engine_user_cb_t* cb)

Set object instance create event callback.

This event is triggered when an object instance is created.

Parameters

- `obj_id` – **[in]** LwM2M object id
- `cb` – **[in]** Create object instance callback

Returns
0 for success or negative in case of error.

int `lwm2m_register_delete_callback`(uint16_t obj_id, *lwm2m_engine_user_cb_t* cb)

Set object instance delete event callback.

This event is triggered when an object instance is deleted.

Parameters

- `obj_id` – **[in]** LwM2M object id
- `cb` – **[in]** Delete object instance callback

Returns
0 for success or negative in case of error.

int `lwm2m_set_res_buf`(const struct *lwm2m_obj_path* *path, void *buffer_ptr, uint16_t buffer_len, uint16_t data_len, uint8_t data_flags)

Set data buffer for a resource.

Use this function to set the data buffer and flags for the specified LwM2M resource.

Parameters

- `path` – **[in]** LwM2M path as a struct
- `buffer_ptr` – **[in]** Data buffer pointer
- `buffer_len` – **[in]** Length of buffer
- `data_len` – **[in]** Length of existing data in the buffer
- `data_flags` – **[in]** Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

int `lwm2m_set_res_data_len`(const struct *lwm2m_obj_path* *path, uint16_t data_len)

Update data size for a resource.

Use this function to set the new size of data in the buffer if you write to a buffer received by *lwm2m_get_res_buf()*.

Parameters

- `path` – **[in]** LwM2M path as a struct
- `data_len` – **[in]** Length of data

Returns
0 for success or negative in case of error.

int `lwm2m_get_res_buf`(const struct *lwm2m_obj_path* *path, void **buffer_ptr, uint16_t *buffer_len, uint16_t *data_len, uint8_t *data_flags)

Get data buffer for a resource.

Use this function to get the data buffer information for the specified LwM2M resource.

If you directly write into the buffer, you must use *lwm2m_set_res_data_len()* function to update the new size of the written data.

All parameters, except for the pathstr, can be NULL if you don't want to read those values.

Parameters

- `path` – **[in]** LwM2M path as a struct
- `buffer_ptr` – **[out]** Data buffer pointer
- `buffer_len` – **[out]** Length of buffer
- `data_len` – **[out]** Length of existing data in the buffer
- `data_flags` – **[out]** Data buffer flags (such as read-only, etc)

Returns
0 for success or negative in case of error.

int `lwm2m_create_res_inst`(const struct *lwm2m_obj_path* *path)

Create a resource instance.

LwM2M clients use this function to create multi-resource instances: Example to create 0 instance of device available power sources: lwm2m_create_res_inst(&LWM2M_OBJ(3, 0, 6, 0));

Parameters

- `path` – **[in]** LwM2M path as a struct

Returns
0 for success or negative in case of error.

int `lwm2m_delete_res_inst`(const struct *lwm2m_obj_path* *path)

Delete a resource instance.

Use this function to remove an existing resource instance

Parameters

- `path` – **[in]** LwM2M path as a struct

Returns
0 for success or negative in case of error.

int `lwm2m_update_device_service_period`(uint32_t period_ms)

Update the period of the device service.

Change the duration of the periodic device service that notifies the current time.

Parameters

- `period_ms` – **[in]** New period for the device service (in milliseconds)

Returns
0 for success or negative in case of error.

bool `lwm2m_path_is_observed`(const struct *lwm2m_obj_path* *path)

Check whether a path is observed.

Parameters

- `path` – **[in]** LwM2M path as a struct to check

Returns
true when there exists an observation of the same level or lower as the given path, false if it doesn't or path is not a valid LwM2M-path. E.g. true if path refers to a resource and the parent object has an observation, false for the inverse.

int **lwm2m_engine_stop**(struct *lwm2m_ctx* *client_ctx)

Stop the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called within lwm2m_rd_client. However, if the client does not use the RD client implementation, it will need to be called manually.

Parameters

- **client_ctx** – **[in]** LwM2M context

Returns
0 for success or negative in case of error.

int **lwm2m_engine_start**(struct *lwm2m_ctx* *client_ctx)

Start the LwM2M engine.

LwM2M clients normally do not need to call this function as it is called by *lwm2m_rd_client_start()*. However, if the client does not use the RD client implementation, it will need to be called manually.

Parameters

- **client_ctx** – **[in]** LwM2M context

Returns
0 for success or negative in case of error.

void **lwm2m_acknowledge**(struct *lwm2m_ctx* *client_ctx)

Acknowledge the currently processed request with an empty ACK.

LwM2M engine by default sends piggybacked responses for requests. This function allows to send an empty ACK for a request earlier (from the application callback). The LwM2M engine will then send the actual response as a separate CON message after all callbacks are executed.

Parameters

- **client_ctx** – **[in]** LwM2M context

int **lwm2m_rd_client_start**(struct *lwm2m_ctx* *client_ctx, const char *ep_name, uint32_t flags, *lwm2m_ctx_event_cb_t* event_cb, *lwm2m_observe_cb_t* observe_cb)

Start the LwM2M RD (Registration / Discovery) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the “Registration interface”. For more information see Section “Client Registration Interface” of LwM2M Technical Specification.

NOTE: *lwm2m_engine_start()* is called automatically by this function.

Parameters

- **client_ctx** – **[in]** LwM2M context
- **ep_name** – **[in]** Registered endpoint name
- **flags** – **[in]** Flags used to configure current LwM2M session.
- **event_cb** – **[in]** Client event callback function
- **observe_cb** – **[in]** Observe callback function called when an observer was added or deleted, and when a notification was acked or has timed out

Returns
0 for success, -EINPROGRESS when client is already running or negative error codes in case of failure.

int **lwm2m_rd_client_stop**(struct *lwm2m_ctx* *client_ctx, *lwm2m_ctx_event_cb_t* event_cb, bool deregister)

Stop the LwM2M RD (De-register) Client.

The RD client sits just above the LwM2M engine and performs the necessary actions to implement the "Registration interface". For more information see Section "Client Registration Interface" of the LwM2M Technical Specification.

Parameters

- **client_ctx** – **[in]** LwM2M context
- **event_cb** – **[in]** Client event callback function
- **deregister** – **[in]** True to deregister the client if registered. False to force close the connection.

Returns

0 for success or negative in case of error.

int **lwm2m_engine_pause**(void)

Suspend the LwM2M engine Thread.

Suspend LwM2M engine. Use case could be when network connection is down. LwM2M Engine indicate before it suspend by LWM2M_RD_CLIENT_EVENT_ENGINE_SUSPENDED event.

Returns

0 for success or negative in case of error.

int **lwm2m_engine_resume**(void)

Resume the LwM2M engine thread.

Resume suspended LwM2M engine. After successful resume call engine will do full registration or registration update based on suspended time. Event's LWM2M_RD_CLIENT_EVENT_REGISTRATION_COMPLETE or LWM2M_RD_CLIENT_EVENT_REG_UPDATE_COMPLETE indicate that client is connected to server.

Returns

0 for success or negative in case of error.

void **lwm2m_rd_client_update**(void)

Trigger a Registration Update of the LwM2M RD Client.

char ***lwm2m_path_log_buf**(char *buf, struct *lwm2m_obj_path* *path)

Helper function to print path objects' contents to log.

Parameters

- **buf** – **[in]** The buffer to use for formatting the string
- **path** – **[in]** The path to stringify

Returns

Resulting formatted path string

int **lwm2m_send_cb**(struct *lwm2m_ctx* *ctx, const struct *lwm2m_obj_path* path_list[], uint8_t path_list_size, *lwm2m_send_cb_t* reply_cb)

LwM2M SEND operation to given path list asynchronously with confirmation callback

Parameters

- **ctx** – LwM2M context
- **path_list** – LwM2M path struct list

- **path_list_size** – Length of path list. Max size is CONFIG_LWM2M_COMPOSITE_PATH_LIST_SIZE
- **reply_cb** – Callback triggered with confirmation state or NULL if not used

Returns
0 for success or negative in case of error.

struct *lwm2m_ctx* ***lwm2m_rd_client_ctx**(void)

Returns LwM2Mclient context

Returns
ctx LwM2M context

int **lwm2m_enable_cache**(const struct *lwm2m_obj_path* *path, struct *lwm2m_time_series_elem* *data_cache, size_t cache_len)

Enable data cache for a resource.

Application may enable caching of resource data by allocating buffer for LwM2M engine to use. Buffer must be size of struct *lwm2m_time_series_elem* times cache_len

Parameters

- **path** – LwM2M path to resource as a struct
- **data_cache** – Pointer to Data cache array
- **cache_len** – number of cached entries

Returns
0 for success or negative in case of error.

int **lwm2m_security_mode**(struct *lwm2m_ctx* *ctx)

Read security mode from selected security object instance.

This data is valid only if RD client is running.

Parameters

- **ctx** – Pointer to client context.

Returns
int Positive values are *lwm2m_security_mode_e*, negative error codes otherwise.

int **lwm2m_set_default_sockopt**(struct *lwm2m_ctx* *ctx)

Set default socket options for DTLS connections.

The engine calls this when *lwm2m_ctx::set_socketoptions* is not overwritten. You can call this from the overwritten callback to set extra options after or before defaults.

Parameters

- **ctx** – Client context

Returns
0 for success or negative in case of error.

struct **lwm2m_obj_path**

#include <*lwm2m.h*> LwM2M object path structure.

Public Members

uint16_t **obj_id**

Object ID.

uint16_t **obj_inst_id**

Object instance ID.

uint16_t **res_id**

Resource ID.

uint16_t **res_inst_id**

Resource instance ID.

uint8_t **level**

Path level (0-4).

Ex. 4 = resource instance.

struct **lwm2m_ctx**

#include <lwm2m.h> LwM2M context structure to maintain information for a single LwM2M connection.

DTLS related information

Available only when `CONFIG_LWM2M_DTLS_SUPPORT` is enabled and *lwm2m_ctx::use_dtls* is set to true.

int **tls_tag**

TLS tag is set by client as a reference used when the LwM2M engine calls tls_credential_(add|delete)

char ***desthostname**

Destination hostname.

When MBEDTLS SNI is enabled socket must be set with destination server hostname.

uint16_t **desthostnamelen**

Destination hostname length.

bool **hostname_verify**

Flag to indicate if hostname verification is enabled.

int (***load_credentials**)(struct *lwm2m_ctx* *client_ctx)

Custom load_credentials function.

Client can set load_credentials function as a way of overriding the default behavior of load_tls_credential() in lwm2m_engine.c

Public Members

struct *sockaddr* **remote_addr**

Destination address storage.

void ***processed_req**

A pointer to currently processed request, for internal LwM2M engine use.

The underlying type is `struct lwm2m_message`, but since it's declared in a private header and not exposed to the application, it's stored as a void pointer.

int (***set_socketoptions**)(struct *lwm2m_ctx* *client_ctx)

Custom socket options.

Client can override default socket options by providing a callback that is called after a socket is created and before connect.

bool **use_dtls**

Flag to indicate if context should use DTLS.

Enabled via the use of coaps:// protocol prefix in connection information. NOTE: requires `CONFIG_LWM2M_DTLS_SUPPORT`

bool **connection_suspended**

Flag to indicate that the socket connection is suspended.

With queue mode, this will tell if there is a need to reconnect.

bool **buffer_client_messages**

Flag to indicate that the client is buffering Notifications and Send messages.

True value buffer Notifications and Send messages.

int **sec_obj_inst**

Current index of Security Object used for server credentials.

int **srv_obj_inst**

Current index of Server Object used in this context.

bool **bootstrap_mode**

Flag to enable BOOTSTRAP interface.

See Section "Bootstrap Interface" of LwM2M Technical Specification for more information.

int **sock_fd**

Socket File Descriptor.

lwm2m_socket_fault_cb_t **fault_cb**

Socket fault callback.

LwM2M processing thread will call this callback in case of socket errors on receive.

lwm2m_observe_cb_t **observe_cb**

Callback for new or cancelled observations, and acknowledged or timed out notifications.

lwm2m_ctx_event_cb_t **event_cb**

Callback for client events.

uint8_t **validate_buf**[CONFIG_LWM2M_ENGINE_VALIDATION_BUFFER_SIZE]

Validation buffer.

Used as a temporary buffer to decode the resource value before validation. On successful validation, its content is copied into the actual resource buffer.

void (***set_socket_state**)(int fd, enum *lwm2m_socket_states* state)

Callback to indicate transmission states.

Client application may request LwM2M engine to indicate hints about transmission states and use that information to control various power saving modes.

struct **lwm2m_time_series_elem**

#include <*lwm2m.h*> LwM2M Time series data structure.

Public Members

time_t **t**

Cached data Unix timestamp.

union lwm2m_time_series_elem

Element value.

struct **lwm2m_objlnk**

#include <*lwm2m.h*> LWM2M Objlnk resource type structure.

Public Members

uint16_t **obj_id**

Object ID.

uint16_t **obj_inst**

Object instance ID.

struct **lwm2m_res_item**

#include <*lwm2m.h*> LwM2M resource item structure.

Value type must match the target resource as no type conversion are done and the value is just memcopied.

Following C types are used for resource types:

- BOOL is uint8_t
- U8 is uint8_t
- S8 is int8_t
- U16 is uint16_t
- S16 is int16_t

- U32 is uint32_t
- S32 is int32_t
- S64 is int64_t
- TIME is time_t
- FLOAT is double
- OBJLNK is struct *lwm2m_objlnk*
- STRING is char * and the null-terminator should be included in the size.
- OPAQUE is any binary data. When null-terminated string is written in OPAQUE resource, the terminator should not be included in size.

Public Members

struct *lwm2m_obj_path* ***path**

Pointer to LwM2M path as a struct.

void ***value**

Pointer to resource value.

uint16_t **size**

Size of the value.

For string resources, it should contain the null-terminator.

MQTT

- *Overview*
- *Sample usage*
- *Using MQTT with TLS*
- *API Reference*

Overview MQTT (Message Queuing Telemetry Transport) is an application layer protocol which works on top of the TCP/IP stack. It is a lightweight publish/subscribe messaging transport for machine-to-machine communication. For more information about the protocol itself, see http://mqtt.org/.

Zephyr provides an MQTT client library built on top of BSD sockets API. The library can be enabled with `CONFIG_MQTT_LIB` Kconfig option and is configurable at a per-client basis, with support for MQTT versions 3.1.0 and 3.1.1. The Zephyr MQTT implementation can be used with either plain sockets communicating over TCP, or with secure sockets communicating over TLS. See *BSD Sockets* for more information about Zephyr sockets.

MQTT clients require an MQTT server to connect to. Such a server, called an MQTT Broker, is responsible for managing client subscriptions and distributing messages published by clients. There are many implementations of MQTT brokers, one of them being Eclipse Mosquitto. See https://mosquitto.org/ for more information about the Eclipse Mosquitto project.

Sample usage To create an MQTT client, a client context structure and buffers need to be defined:

```
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT client context */
static struct mqtt_client client_ctx;
```

Multiple MQTT client instances can be created in the application and managed independently. Additionally, a structure for MQTT Broker address information is needed. This structure must be accessible throughout the lifespan of the MQTT client and can be shared among MQTT clients:

```
/* MQTT Broker address information. */
static struct sockaddr_storage broker;
```

An MQTT client library will notify MQTT events to the application through a callback function created to handle respective events:

```
void mqtt_evt_handler(struct mqtt_client *client,
                      const struct mqtt_evt *evt)
{
   switch (evt->type) {
      /* Handle events here. */
   }
}
```

For a list of possible events, see *API Reference*.

The client context structure needs to be initialized and set up before it can be used. An example configuration for TCP transport is shown below:

```
mqtt_client_init(&client_ctx);

/* MQTT client configuration */
client_ctx.broker = &broker;
client_ctx.evt_cb = mqtt_evt_handler;
client_ctx.client_id.utf8 = (uint8_t *)"zephyr_mqtt_client";
client_ctx.client_id.size = sizeof("zephyr_mqtt_client") - 1;
client_ctx.password = NULL;
client_ctx.user_name = NULL;
client_ctx.protocol_version = MQTT_VERSION_3_1_1;
client_ctx.transport.type = MQTT_TRANSPORT_NON_SECURE;

/* MQTT buffers configuration */
client_ctx.rx_buf = rx_buffer;
client_ctx.rx_buf_size = sizeof(rx_buffer);
client_ctx.tx_buf = tx_buffer;
client_ctx.tx_buf_size = sizeof(tx_buffer);
```

After the configuration is set up, the MQTT client can connect to the MQTT broker. Call the `mqtt_connect` function, which will create the appropriate socket, establish a TCP/TLS connection, and send an `MQTT CONNECT` message. When notified, the application should call the `mqtt_input` function to process the response received. Note, that `mqtt_input` is a non-blocking function, therefore the application should use socket `poll` to wait for the response. If the connection was successful, `MQTT_EVT_CONNACK` will be notified to the application through the callback function.

```
rc = mqtt_connect(&client_ctx);
if (rc != 0) {
   return rc;
}
```

(continues on next page)

(continued from previous page)

```
fds[0].fd = client_ctx.transport.tcp.sock;
fds[0].events = ZSOCK_POLLIN;
poll(fds, 1, 5000);

mqtt_input(&client_ctx);

if (!connected) {
   mqtt_abort(&client_ctx);
}
```

In the above code snippet, the MQTT callback function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted, and the underlying socket closed.

After the connection is established, an application needs to call `mqtt_input` and `mqtt_live` functions periodically to process incoming data and upkeep the connection. If an MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_disconnect` function.

Zephyr provides sample code utilizing the MQTT client API. See mqtt-publisher for more information.

Using MQTT with TLS The Zephyr MQTT library can be used with TLS transport for secure communication by selecting a secure transport type (`MQTT_TRANSPORT_SECURE`) and some additional configuration information:

```
client_ctx.transport.type = MQTT_TRANSPORT_SECURE;

struct mqtt_sec_config *tls_config = &client_ctx.transport.tls.config;

tls_config->peer_verify = TLS_PEER_VERIFY_REQUIRED;
tls_config->cipher_list = NULL;
tls_config->sec_tag_list = m_sec_tags;
tls_config->sec_tag_count = ARRAY_SIZE(m_sec_tags);
tls_config->hostname = MQTT_BROKER_HOSTNAME;
```

In this sample code, the `m_sec_tags` array holds a list of tags, referencing TLS credentials that the MQTT library should use for authentication. We do not specify `cipher_list`, to allow the use of all cipher suites available in the system. We set `hostname` field to broker hostname, which is required for server authentication. Finally, we enforce peer certificate verification by setting the `peer_verify` field.

Note, that TLS credentials referenced by the `m_sec_tags` array must be registered in the system first. For more information on how to do that, refer to *secure sockets documentation*.

An example of how to use TLS with MQTT is also present in mqtt-publisher sample application.

API Reference

group `mqtt_socket`

Since
1.14

Version
0.8.0

Defines

`MQTT_UTF8_LITERAL`(literal)
Initialize UTF-8 encoded string from C literal string.

Use it as follows:

struct *mqtt_utf8* password = MQTT_UTF8_LITERAL("my_pass");

Parameters

- `literal` – **[in]** Literal string from which to generate *mqtt_utf8* object.

Typedefs

typedef void (*`mqtt_evt_cb_t`)(struct *mqtt_client* *client, const struct *mqtt_evt* *evt)
Asynchronous event notification callback registered by the application.

Param client
[in] Identifies the client for which the event is notified.

Param evt
[in] Event description along with result and associated parameters (if any).

Enums

enum `mqtt_evt_type`
MQTT Asynchronous Events notified to the application from the module through the callback registered by the application.

Values:

enumerator `MQTT_EVT_CONNACK`
Acknowledgment of connection request.

Event result accompanying the event indicates whether the connection failed or succeeded.

enumerator `MQTT_EVT_DISCONNECT`

Disconnection Event.

MQTT Client Reference is no longer valid once this event is received for the client.

enumerator `MQTT_EVT_PUBLISH`

Publish event received when message is published on a topic client is subscribed to.

> **Note**
>
> PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with *mqtt_read_publish_payload* function.

enumerator `MQTT_EVT_PUBACK`

Acknowledgment for published message with QoS 1.

enumerator `MQTT_EVT_PUBREC`

Reception confirmation for published message with QoS 2.

enumerator `MQTT_EVT_PUBREL`

Release of published message with QoS 2.

enumerator `MQTT_EVT_PUBCOMP`

Confirmation to a publish release message with QoS 2.

enumerator `MQTT_EVT_SUBACK`

Acknowledgment to a subscribe request.

enumerator `MQTT_EVT_UNSUBACK`

Acknowledgment to a unsubscribe request.

enumerator `MQTT_EVT_PINGRESP`

Ping Response from server.

enum `mqtt_version`

MQTT version protocol level.

Values:

enumerator `MQTT_VERSION_3_1_0` = 3

Protocol level for 3.1.0.

enumerator `MQTT_VERSION_3_1_1` = 4

Protocol level for 3.1.1.

enum `mqtt_qos`

MQTT Quality of Service types.

Values:

enumerator MQTT_QOS_0_AT_MOST_ONCE = 0x00

Lowest Quality of Service, no acknowledgment needed for published message.

enumerator MQTT_QOS_1_AT_LEAST_ONCE = 0x01

Medium Quality of Service, if acknowledgment expected for published message, duplicate messages permitted.

enumerator MQTT_QOS_2_EXACTLY_ONCE = 0x02

Highest Quality of Service, acknowledgment expected and message shall be published only once.

Message not published to interested parties unless client issues a PUBREL.

enum mqtt_conn_return_code

MQTT CONNACK return codes.

Values:

enumerator MQTT_CONNECTION_ACCEPTED = 0x00

Connection accepted.

enumerator MQTT_UNACCEPTABLE_PROTOCOL_VERSION = 0x01

The Server does not support the level of the MQTT protocol requested by the Client.

enumerator MQTT_IDENTIFIER_REJECTED = 0x02

The Client identifier is correct UTF-8 but not allowed by the Server.

enumerator MQTT_SERVER_UNAVAILABLE = 0x03

The Network Connection has been made but the MQTT service is unavailable.

enumerator MQTT_BAD_USER_NAME_OR_PASSWORD = 0x04

The data in the user name or password is malformed.

enumerator MQTT_NOT_AUTHORIZED = 0x05

The Client is not authorized to connect.

enum mqtt_suback_return_code

MQTT SUBACK return codes.

Values:

enumerator MQTT_SUBACK_SUCCESS_QoS_0 = 0x00

Subscription with QoS 0 succeeded.

enumerator MQTT_SUBACK_SUCCESS_QoS_1 = 0x01

Subscription with QoS 1 succeeded.

enumerator MQTT_SUBACK_SUCCESS_QoS_2 = 0x02

Subscription with QoS 2 succeeded.

enumerator MQTT_SUBACK_FAILURE = 0x80

Subscription for a topic failed.

enum mqtt_transport_type

MQTT transport type.

Values:

enumerator MQTT_TRANSPORT_NON_SECURE

Use non secure TCP transport for MQTT connection.

enumerator MQTT_TRANSPORT_NUM

Shall not be used as a transport type.

Indicator of maximum transport types possible.

Functions

void mqtt_client_init(struct *mqtt_client* *client)

Initializes the client instance.

> **Note**
>
> Shall be called to initialize client structure, before setting any client parameters and before connecting to broker.

Parameters

- client – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

int mqtt_connect(struct *mqtt_client* *client)

API to request new MQTT client connection.

> **Note**
>
> This memory is assumed to be resident until mqtt_disconnect is called.

> **Note**
>
> Any subsequent changes to parameters like broker address, user name, device id, etc. have no effect once MQTT connection is established.

> **Note**
>
> Default protocol revision used for connection request is 3.1.1. Please set client.protocol_version = MQTT_VERSION_3_1_0 to use protocol 3.1.0.

> **Note**
>
> Please modify `CONFIG_MQTT_KEEPALIVE` time to override default of 1 minute.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_publish**(struct *mqtt_client* *client, const struct *mqtt_publish_param* *param)

API to publish messages on topics.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- **param** – **[in]** Parameters to be used for the publish message. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_publish_qos1_ack**(struct *mqtt_client* *client, const struct *mqtt_puback_param* *param)

API used by client to send acknowledgment on receiving QoS1 publish message.

Should be called on reception of *MQTT_EVT_PUBLISH* with QoS level *MQTT_QOS_1_AT_LEAST_ONCE*.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- **param** – **[in]** Identifies message being acknowledged.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_publish_qos2_receive**(struct *mqtt_client* *client, const struct *mqtt_pubrec_param* *param)

API used by client to send acknowledgment on receiving QoS2 publish message.

Should be called on reception of *MQTT_EVT_PUBLISH* with QoS level *MQTT_QOS_2_EXACTLY_ONCE*.

Parameters

- **client** – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- **param** – **[in]** Identifies message being acknowledged.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_publish_qos2_release**(struct *mqtt_client* *client, const struct *mqtt_pubrel_param* *param)

API used by client to request release of QoS2 publish message.

Should be called on reception of *MQTT_EVT_PUBREC*.

Parameters

- `client` – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- `param` – **[in]** Identifies message being released.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_publish_qos2_complete`(struct *mqtt_client* *client, const struct *mqtt_pubcomp_param* *param)

API used by client to send acknowledgment on receiving QoS2 publish release message.

Should be called on reception of *MQTT_EVT_PUBREL*.

Parameters

- `client` – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – **[in]** Identifies message being completed.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_subscribe`(struct *mqtt_client* *client, const struct *mqtt_subscription_list* *param)

API to request subscription of one or more topics on the connection.

Parameters

- `client` – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – **[in]** Subscription parameters. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_unsubscribe`(struct *mqtt_client* *client, const struct *mqtt_subscription_list* *param)

API to request unsubscription of one or more topics on the connection.

> **Note**
>
> QoS included in topic description is unused in this API.

Parameters

- `client` – **[in]** Identifies client instance for which the procedure is requested. Shall not be NULL.
- `param` – **[in]** Parameters describing topics being unsubscribed from. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int `mqtt_ping`(struct *mqtt_client* *client)

API to send MQTT ping.

The use of this API is optional, as the library handles the connection keep-alive on it's own, see *mqtt_live*.

Parameters

- **client** – **[in]** Identifies client instance for which procedure is requested.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_disconnect**(struct *mqtt_client* *client)

API to disconnect MQTT connection.

Parameters

- **client** – **[in]** Identifies client instance for which procedure is requested.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_abort**(struct *mqtt_client* *client)

API to abort MQTT connection.

This will close the corresponding transport without closing the connection gracefully at the MQTT level (with disconnect message).

Parameters

- **client** – **[in]** Identifies client instance for which procedure is requested.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_live**(struct *mqtt_client* *client)

This API should be called periodically for the client to be able to keep the connection alive by sending Ping Requests if need be.

Note

Application shall ensure that the periodicity of calling this function makes it possible to respect the Keep Alive time agreed with the broker on connection. *mqtt_connect* for details on Keep Alive time.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_keepalive_time_left**(const struct *mqtt_client* *client)

Helper function to determine when next keep alive message should be sent.

Can be used for instance as a source for `poll` timeout.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested.

Returns
Time in milliseconds until next keep alive message is expected to be sent. Function will return -1 if keep alive messages are not enabled.

int **mqtt_input**(struct *mqtt_client* *client)

Receive an incoming MQTT packet.

The registered callback will be called with the packet content.

Note

In case of PUBLISH message, the payload has to be read separately with *mqtt_read_publish_payload* function. The size of the payload to read is provided in the publish event structure.

Note

This is a non-blocking call.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_read_publish_payload**(struct *mqtt_client* *client, void *buffer, size_t length)

Read the payload of the received PUBLISH message.

This function should be called within the MQTT event handler, when MQTT PUBLISH message is notified.

Note

This is a non-blocking call.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** – **[out]** Buffer where payload should be stored.
- **length** – **[in]** Length of the buffer, in bytes.

Returns

Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int **mqtt_read_publish_payload_blocking**(struct *mqtt_client* *client, void *buffer, size_t length)

Blocking version of *mqtt_read_publish_payload* function.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** – **[out]** Buffer where payload should be stored.
- **length** – **[in]** Length of the buffer, in bytes.

Returns

Number of bytes read or a negative error code (errno.h) indicating reason of failure.

int **mqtt_readall_publish_payload**(struct *mqtt_client* *client, uint8_t *buffer, size_t length)

Blocking version of *mqtt_read_publish_payload* function which runs until the required number of bytes are read.

Parameters

- **client** – **[in]** Client instance for which the procedure is requested. Shall not be NULL.
- **buffer** – **[out]** Buffer where payload should be stored.
- **length** – **[in]** Number of bytes to read.

Returns

0 if success, otherwise a negative error code (errno.h) indicating reason of failure.

struct **mqtt_utf8**

#include <mqtt.h> Abstracts UTF-8 encoded strings.

Public Members

const uint8_t ***utf8**

Pointer to UTF-8 string.

uint32_t **size**

Size of UTF string, in bytes.

struct **mqtt_binstr**

#include <mqtt.h> Abstracts binary strings.

Public Members

uint8_t ***data**

Pointer to binary stream.

uint32_t **len**

Length of binary stream.

struct **mqtt_topic**

#include <mqtt.h> Abstracts MQTT UTF-8 encoded topic that can be subscribed to or published.

Public Members

struct *mqtt_utf8* **topic**

Topic on to be published or subscribed to.

uint8_t **qos**

Quality of service requested for the subscription.

mqtt_qos for details.

struct **mqtt_publish_message**

#include <*mqtt.h*> Parameters for a publish message.

Public Members

struct *mqtt_topic* **topic**

Topic on which data was published.

struct *mqtt_binstr* **payload**

Payload on the topic published.

struct **mqtt_connack_param**

#include <*mqtt.h*> Parameters for a connection acknowledgment (CONNACK).

Public Members

uint8_t **session_present_flag**

The Session Present flag enables a Client to establish whether the Client and Server have a consistent view about whether there is already stored Session state.

enum *mqtt_conn_return_code* **return_code**

The appropriate non-zero Connect return code indicates if the Server is unable to process a connection request for some reason.

struct **mqtt_puback_param**

#include <*mqtt.h*> Parameters for MQTT publish acknowledgment (PUBACK).

Public Members

uint16_t **message_id**

Message id of the PUBLISH message being acknowledged.

struct **mqtt_pubrec_param**

#include <*mqtt.h*> Parameters for MQTT publish receive (PUBREC).

Public Members

uint16_t **message_id**

Message id of the PUBLISH message being acknowledged.

struct **mqtt_pubrel_param**

#include <*mqtt.h*> Parameters for MQTT publish release (PUBREL).

Public Members

uint16_t **message_id**

Message id of the PUBREC message being acknowledged.

struct **mqtt_pubcomp_param**

#include <*mqtt.h*> Parameters for MQTT publish complete (PUBCOMP).

Public Members

uint16_t **message_id**

Message id of the PUBREL message being acknowledged.

struct **mqtt_suback_param**

#include <*mqtt.h*> Parameters for MQTT subscription acknowledgment (SUBACK).

Public Members

uint16_t **message_id**

Message id of the SUBSCRIBE message being acknowledged.

struct *mqtt_binstr* **return_codes**

Return codes indicating maximum QoS level granted for each topic in the subscription list.

struct **mqtt_unsuback_param**

#include <*mqtt.h*> Parameters for MQTT unsubscribe acknowledgment (UNSUBACK).

Public Members

uint16_t **message_id**

Message id of the UNSUBSCRIBE message being acknowledged.

struct **mqtt_publish_param**

#include <*mqtt.h*> Parameters for a publish message (PUBLISH).

Public Members

struct *mqtt_publish_message* **message**

Messages including topic, QoS and its payload (if any) to be published.

uint16_t **message_id**

Message id used for the publish message.

Redundant for QoS 0.

uint8_t **dup_flag**

Duplicate flag.

If 1, it indicates the message is being retransmitted. Has no meaning with QoS 0.

uint8_t **retain_flag**

Retain flag.

If 1, the message shall be stored persistently by the broker.

struct **mqtt_subscription_list**

#include <mqtt.h> List of topics in a subscription request.

Public Members

struct *mqtt_topic* ***list**

Array containing topics along with QoS for each.

uint16_t **list_count**

Number of topics in the subscription list.

uint16_t **message_id**

Message id used to identify subscription request.

union **mqtt_evt_param**

#include <mqtt.h> Defines event parameters notified along with asynchronous events to the application.

Public Members

struct *mqtt_connack_param* **connack**

Parameters accompanying MQTT_EVT_CONNACK event.

struct *mqtt_publish_param* **publish**

Parameters accompanying MQTT_EVT_PUBLISH event.

> **Note**
>
> PUBLISH event structure only contains payload size, the payload data parameter should be ignored. Payload content has to be read manually with *mqtt_read_publish_payload* function.

struct *mqtt_puback_param* **puback**

Parameters accompanying MQTT_EVT_PUBACK event.

struct *mqtt_pubrec_param* **pubrec**

Parameters accompanying MQTT_EVT_PUBREC event.

struct *mqtt_pubrel_param* **pubrel**
Parameters accompanying MQTT_EVT_PUBREL event.

struct *mqtt_pubcomp_param* **pubcomp**
Parameters accompanying MQTT_EVT_PUBCOMP event.

struct *mqtt_suback_param* **suback**
Parameters accompanying MQTT_EVT_SUBACK event.

struct *mqtt_unsuback_param* **unsuback**
Parameters accompanying MQTT_EVT_UNSUBACK event.

struct **mqtt_evt**
#include <mqtt.h> Defines MQTT asynchronous event notified to the application.

Public Members

enum *mqtt_evt_type* **type**
Identifies the event.

union *mqtt_evt_param* **param**
Contains parameters (if any) accompanying the event.

int **result**
Event result.
0 or a negative error code (errno.h) indicating reason of failure.

struct **mqtt_sec_config**
#include <mqtt.h> TLS configuration for secure MQTT transports.

Public Members

int **peer_verify**
Indicates the preference for peer verification.

uint32_t **cipher_count**
Indicates the number of entries in the cipher list.

const int ***cipher_list**
Indicates the list of ciphers to be used for the session.
May be NULL to use the default ciphers.

uint32_t **sec_tag_count**
Indicates the number of entries in the sec tag list.

const *sec_tag_t* ***sec_tag_list**

Indicates the list of security tags to be used for the session.

const char ***hostname**

Peer hostname for ceritificate verification.

May be NULL to skip hostname verification.

int **cert_nocopy**

Indicates the preference for copying certificates to the heap.

struct **mqtt_transport**

#include <*mqtt.h*> MQTT transport specific data.

Public Members

enum *mqtt_transport_type* **type**

Transport type selection for client instance.

mqtt_transport_type for possible values. MQTT_TRANSPORT_MAX is not a valid type.

int **sock**

Socket descriptor.

struct *mqtt_transport* **tcp**

TCP socket transport for MQTT.

union mqtt_transport

Use either unsecured TCP or secured TLS transport.

struct **mqtt_internal**

#include <*mqtt.h*> MQTT internal state.

Public Members

struct sys_mutex **mutex**

Internal.

Mutex to protect access to the client instance.

uint32_t **last_activity**

Internal.

Wall clock value (in milliseconds) of the last activity that occurred. Needed for periodic PING.

uint32_t **state**

Internal.

Client's state in the connection.

uint32_t **rx_buf_datalen**

Internal.

Packet length read so far.

uint32_t **remaining_payload**

Internal.

Remaining payload length to read.

struct **mqtt_client**

#include <*mqtt.h*> MQTT Client definition to maintain information relevant to the client.

Public Members

struct *mqtt_internal* **internal**

MQTT client internal state.

struct *mqtt_transport* **transport**

MQTT transport configuration and data.

struct *mqtt_utf8* **client_id**

Unique client identification to be used for the connection.

const void ***broker**

Broker details, for example, address, port.

Address type should be compatible with transport used.

struct *mqtt_utf8* ***user_name**

User name (if any) to be used for the connection.

NULL indicates no user name.

struct *mqtt_utf8* ***password**

Password (if any) to be used for the connection.

Note that if password is provided, user name shall also be provided. NULL indicates no password.

struct *mqtt_topic* ***will_topic**

Will topic and QoS.

Can be NULL.

struct *mqtt_utf8* ***will_message**

Will message.

Can be NULL. Non NULL value valid only if will topic is not NULL.

mqtt_evt_cb_t **evt_cb**

Application callback registered with the module to get MQTT events.

uint8_t *rx_buf
: Receive buffer used for MQTT packet reception in RX path.

uint32_t rx_buf_size
: Size of receive buffer.

uint8_t *tx_buf
: Transmit buffer used for creating MQTT packet in TX path.

uint32_t tx_buf_size
: Size of transmit buffer.

uint16_t keepalive
: Keepalive interval for this client in seconds.

  Default is CONFIG_MQTT_KEEPALIVE.

uint8_t protocol_version
: MQTT protocol version.

int8_t unacked_ping
: Unanswered PINGREQ count on this connection.

uint8_t will_retain
: Will retain flag, 1 if will message shall be retained persistently.

uint8_t clean_session
: Clean session flag indicating a fresh (1) or a retained session (0).

  Default is CONFIG_MQTT_CLEAN_SESSION.

void *user_data
: User specific opaque data.

MQTT-SN

- *Overview*
- *Sample usage*
- *Deviations from the standard*
- *API Reference*

Overview MQTT-SN is a variant of the well-known MQTT protocol - see *MQTT*.

In contrast to MQTT, MQTT-SN does not require a TCP transport, but is designed to be used over any message-based transport. Originally, it was mainly created with ZigBee in mind, but others like Bluetooth, UDP or even a UART can be used just as well.

Zephyr provides an MQTT-SN client library built on top of BSD sockets API. The library can be enabled with `CONFIG_MQTT_SN_LIB` Kconfig option and is configurable at a per-client basis, with

support for MQTT-SN version 1.2. The Zephyr MQTT-SN implementation can be used with any message-based transport, but support for UDP is already built-in.

MQTT-SN clients require an MQTT-SN gateway to connect to. These gateways translate between MQTT-SN and MQTT. The Eclipse Paho project offers an implementation of a MQTT-SN gateway, but others are available too. https://www.eclipse.org/paho/index.php?page=components/mqtt-sn-transparent-gateway/index.php

The MQTT-SN spec v1.2 can be found here: https://www.oasis-open.org/committees/download.php/66091/MQTT-SN_spec_v1.2.pdf

Sample usage To create an MQTT-SN client, a client context structure and buffers need to be defined:

```
/* Buffers for MQTT client. */
static uint8_t rx_buffer[256];
static uint8_t tx_buffer[256];

/* MQTT-SN client context */
static struct mqtt_sn_client client;
```

Multiple MQTT-SN client instances can be created in the application and managed independently. Additionally, a structure for the transport is needed as well. The library already comes with an example implementation for UDP.

```
/* MQTT Broker address information. */
static struct mqtt_sn_transport tp;
```

The MQTT-SN library will inform clients about certain events using a callback.

```
static void evt_cb(struct mqtt_sn_client *client,
                   const struct mqtt_sn_evt *evt)
{
   switch(evt->type) {
   {
      /* Handle events here. */
   }
}
```

For a list of possible events, see *API Reference*.

The client context structure needs to be initialized and set up before it can be used. An example configuration for UDP transport is shown below:

```
struct mqtt_sn_data client_id = MQTT_SN_DATA_STRING_LITERAL("ZEPHYR");
struct sockaddr_in gateway = {0};

uint8_t tx_buf[256];
uint8_t rx_buf[256];

mqtt_sn_transport_udp_init(&tp, (struct sockaddr*)&gateway, sizeof((gateway)));

mqtt_sn_client_init(&client, &client_id, &tp.tp, evt_cb, tx_buf, sizeof(tx_buf), rx_buf,␣
↪sizeof(rx_buf));
```

After the configuration is set up, the MQTT-SN client can connect to the gateway. While the MQTT-SN protocol offers functionality to discover gateways through an advertisement mechanism, this is not implemented yet in the library.

Call the `mqtt_sn_connect` function, which will send a `CONNECT` message. The application should periodically call the `mqtt_sn_input` function to process the response received. The application does not have to call `mqtt_sn_input` if it knows that no data has been received (e.g. when using

Bluetooth). Note that `mqtt_sn_input` is a non-blocking function, if the transport struct contains a `poll` compatible function pointer. If the connection was successful, `MQTT_SN_EVT_CONNECTED` will be notified to the application through the callback function.

```
err = mqtt_sn_connect(&client, false, true);
__ASSERT(err == 0, "mqtt_sn_connect() failed %d", err);

while (1) {
        mqtt_sn_input(&client);
        if (connected) {
                mqtt_sn_publish(&client, MQTT_SN_QOS_0, &topic_p, false, &pubdata);
        }
        k_sleep(K_MSEC(500));
}
```

In the above code snippet, the event handler function should set the `connected` flag upon a successful connection. If the connection fails at the MQTT level or a timeout occurs, the connection will be aborted.

After the connection is established, an application needs to call `mqtt_input` function periodically to process incoming data. Connection upkeep, on the other hand, is done automatically using a k_work item. If a MQTT message is received, an MQTT callback function will be called and an appropriate event notified.

The connection can be closed by calling the `mqtt_sn_disconnect` function. This has no effect on the transport, however. If you want to close the transport (e.g. the socket), call `mqtt_sn_client_deinit`, which will deinit the transport as well.

Zephyr provides sample code utilizing the MQTT-SN client API. See mqtt-sn-publisher for more information.

Deviations from the standard Certain parts of the protocol are not yet supported in the library.

- Pre-defined topic IDs
- QoS -1 - it's most useful with predefined topics
- Gateway discovery using ADVERTISE, SEARCHGW and GWINFO messages.
- Setting the will topic and message after the initial connect
- Forwarder Encapsulation

Related code samples

MQTT-SN publisher
Send MQTT-SN PUBLISH messages to an MQTT-SN gateway.

API Reference

group `mqtt_sn_socket`

Since
3.3

Version
0.1.0

Defines

MQTT_SN_DATA_STRING_LITERAL(literal)

Initialize memory buffer from C literal string.

Use it as follows:

struct *mqtt_sn_data* topic = MQTT_SN_DATA_STRING_LITERAL("/zephyr");

Parameters

- `literal` – **[in]** Literal string from which to generate *mqtt_sn_data* object.

MQTT_SN_DATA_BYTES(...)

Initialize memory buffer from single bytes.

Use it as follows:

struct *mqtt_sn_data* data = *MQTT_SN_DATA_BYTES(0x13, 0x37)*;

Typedefs

typedef void (*`mqtt_sn_evt_cb_t`)(struct *mqtt_sn_client* *client, const struct *mqtt_sn_evt* *evt)

Asynchronous event notification callback registered by the application.

Param client
[in] Identifies the client for which the event is notified.

Param evt
[in] Event description along with result and associated parameters (if any).

Enums

enum `mqtt_sn_qos`

Quality of Service.

QoS 0-2 work the same as basic MQTT, QoS -1 is an MQTT-SN addition. QOS -1 is not supported yet.

Values:

enumerator MQTT_SN_QOS_0

QOS 0.

enumerator MQTT_SN_QOS_1

QOS 1.

enumerator MQTT_SN_QOS_2

QOS 2.

enumerator MQTT_SN_QOS_M1

QOS -1.

enum **mqtt_sn_topic_type**

MQTT-SN topic types.

Values:

enumerator **MQTT_SN_TOPIC_TYPE_NORMAL**

Normal topic.

It allows usage of any valid UTF-8 string as a topic name.

enumerator **MQTT_SN_TOPIC_TYPE_PREDEF**

Pre-defined topic.

It allows usage of a two-byte identifier representing a topic name for which the corresponding topic name is known in advance by both the client and the gateway/server.

enumerator **MQTT_SN_TOPIC_TYPE_SHORT**

Short topic.

It allows usage of a two-byte string as a topic name.

enum **mqtt_sn_return_code**

MQTT-SN return codes.

Values:

enumerator **MQTT_SN_CODE_ACCEPTED** = 0x00

Accepted.

enumerator **MQTT_SN_CODE_REJECTED_CONGESTION** = 0x01

Rejected: congestion.

enumerator **MQTT_SN_CODE_REJECTED_TOPIC_ID** = 0x02

Rejected: Invalid Topic ID.

enumerator **MQTT_SN_CODE_REJECTED_NOTSUP** = 0x03

Rejected: Not Supported.

enum **mqtt_sn_evt_type**

Event types that can be emitted by the library.

Values:

enumerator **MQTT_SN_EVT_CONNECTED**

Connected to a gateway.

enumerator **MQTT_SN_EVT_DISCONNECTED**

Disconnected.

enumerator **MQTT_SN_EVT_ASLEEP**

Entered ASLEEP state.

enumerator MQTT_SN_EVT_AWAKE
Entered AWAKE state.

enumerator MQTT_SN_EVT_PUBLISH
Received a PUBLISH message.

enumerator MQTT_SN_EVT_PINGRESP
Received a PINGRESP.

Functions

int mqtt_sn_client_init(struct *mqtt_sn_client* *client, const struct *mqtt_sn_data* *client_id, struct *mqtt_sn_transport* *transport, *mqtt_sn_evt_cb_t* evt_cb, void *tx, size_t txsz, void *rx, size_t rxsz)
Initialize a client.

Parameters

- client – The MQTT-SN client to initialize.
- client_id – The ID to be used by the client.
- transport – The transport to be used by the client.
- evt_cb – The event callback function for the client.
- tx – Pointer to the transmit buffer.
- txsz – Size of the transmit buffer.
- rx – Pointer to the receive buffer.
- rxsz – Size of the receive buffer.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

void mqtt_sn_client_deinit(struct *mqtt_sn_client* *client)
Deinitialize the client.

This removes all topics and publishes, and also de-inits the transport.

Parameters

- client – The MQTT-SN client to deinitialize.

int mqtt_sn_connect(struct *mqtt_sn_client* *client, bool will, bool clean_session)
Connect the client.

Parameters

- client – The MQTT-SN client to connect.
- will – Flag indicating if a Will message should be sent.
- clean_session – Flag indicating if a clean session should be started.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int mqtt_sn_disconnect(struct *mqtt_sn_client* *client)
Disconnect the client.

Parameters

- **client** – The MQTT-SN client to disconnect.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_sn_sleep**(struct *mqtt_sn_client* *client, uint16_t duration)

Set the client into sleep state.

Parameters

- **client** – The MQTT-SN client to be put to sleep.
- **duration** – Sleep duration (in seconds).

Returns
0 on success, negative errno code on failure.

int **mqtt_sn_subscribe**(struct *mqtt_sn_client* *client, enum *mqtt_sn_qos* qos, struct *mqtt_sn_data* *topic_name)

Subscribe to a given topic.

Parameters

- **client** – The MQTT-SN client that should subscribe.
- **qos** – The desired quality of service for the subscription.
- **topic_name** – The name of the topic to subscribe to.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_sn_unsubscribe**(struct *mqtt_sn_client* *client, enum *mqtt_sn_qos* qos, struct *mqtt_sn_data* *topic_name)

Unsubscribe from a topic.

Parameters

- **client** – The MQTT-SN client that should unsubscribe.
- **qos** – The quality of service used when subscribing.
- **topic_name** – The name of the topic to unsubscribe from.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_sn_publish**(struct *mqtt_sn_client* *client, enum *mqtt_sn_qos* qos, struct *mqtt_sn_data* *topic_name, bool retain, struct *mqtt_sn_data* *data)

Publish a value.

If the topic is not yet registered with the gateway, the library takes care of it.

Parameters

- **client** – The MQTT-SN client that should publish.
- **qos** – The desired quality of service for the publish.
- **topic_name** – The name of the topic to publish to.
- **retain** – Flag indicating if the message should be retained by the broker.
- **data** – The data to be published.

Returns
0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_sn_input**(struct *mqtt_sn_client* *client)

Check the transport for new incoming data.

Call this function periodically, or if you have good reason to believe there is any data. If the client's transport struct contains a poll-function, this function is non-blocking.

Parameters

- **client** – The MQTT-SN client to check for incoming data.

Returns

0 or a negative error code (errno.h) indicating reason of failure.

int **mqtt_sn_get_topic_name**(struct *mqtt_sn_client* *client, uint16_t id, struct *mqtt_sn_data* *topic_name)

Get topic name by topic ID.

Parameters

- **client** – **[in]** The MQTT-SN client that uses this topic.
- **id** – **[in]** Topic identifier.
- **topic_name** – **[out]** Will be assigned to topic name.

Returns

0 on success, -ENOENT if topic ID doesn't exist, or -EINVAL on invalid arguments.

struct **mqtt_sn_data**

#include <*mqtt_sn.h*> Abstracts memory buffers.

Public Members

const uint8_t ***data**

Pointer to data.

uint16_t **size**

Size of data, in bytes.

union **mqtt_sn_evt_param**

#include <*mqtt_sn.h*> Event metadata.

Public Members

struct *mqtt_sn_data* **data**

The payload data associated with the event.

enum *mqtt_sn_topic_type* **topic_type**

The type of topic for the event.

uint16_t **topic_id**

The identifier for the topic of the event.

struct *mqtt_sn_evt_param* **publish**
Structure holding publish event details.

struct **mqtt_sn_evt**
#include <mqtt_sn.h> MQTT-SN event structure to be handled by the event callback.

Public Members

enum *mqtt_sn_evt_type* **type**
Event type.

union *mqtt_sn_evt_param* **param**
Event parameters.

struct **mqtt_sn_transport**
#include <mqtt_sn.h> Structure to describe an MQTT-SN transport.

MQTT-SN does not require transports to be reliable or to hold a connection. Transports just need to be frame-based, so you can use UDP, ZigBee, or even a simple UART, given some kind of framing protocol is used.

Public Members

int (***init**)(struct *mqtt_sn_transport* *transport)
Will be called once on client init to initialize the transport.

Use this to open sockets or similar. May be NULL.

void (***deinit**)(struct *mqtt_sn_transport* *transport)
Will be called on client deinit.

Use this to close sockets or similar. May be NULL.

int (***msg_send**)(struct *mqtt_sn_client* *client, void *buf, size_t sz)
Will be called by the library when it wants to send a message.

ssize_t (***recv**)(struct *mqtt_sn_client* *client, void *buffer, size_t length)
Will be called by the library when it wants to receive a message.

Implementations should follow recv conventions.

int (***poll**)(struct *mqtt_sn_client* *client)
Check if incoming data is available.

If *poll()* returns a positive number, recv must not block.

May be NULL, but recv should not block then either.

Return
Positive number if data is available, or zero if there is none. Negative values signal errors.

struct **mqtt_sn_client**
#include <mqtt_sn.h> Structure describing an MQTT-SN client.

Public Members

struct *mqtt_sn_data* **client_id**
1-23 character unique client ID

struct *mqtt_sn_data* **will_topic**
Topic for Will message.
Must be initialized before connecting with will=true

struct *mqtt_sn_data* **will_msg**
Will message.
Must be initialized before connecting with will=true

enum *mqtt_sn_qos* **will_qos**
Quality of Service for the Will message.

bool **will_retain**
Flag indicating if the will message should be retained by the broker.

struct *mqtt_sn_transport* ***transport**
Underlying transport to be used by the client.

struct *net_buf_simple* **tx**
Buffer for outgoing data.

struct *net_buf_simple* **rx**
Buffer for incoming data.

mqtt_sn_evt_cb_t **evt_cb**
Event callback.

uint16_t **next_msg_id**
Message ID for the next message to be sent.

sys_slist_t **publish**
List of pending publish messages.

sys_slist_t **topic**
List of registered topics.

int **state**
Current state of the MQTT-SN client.

int64_t **last_ping**
Timestamp of the last ping request.

uint8_t **ping_retries**
Number of retries for failed ping attempts.

struct *k_work_delayable* `process_work`

Delayable work structure for processing MQTT-SN events.

Precision Time Protocol (PTP)

- *Overview*
- *Supported features*
- *Supported Management messages*
- *Enabling the stack*
- *Testing*
- *API Reference*

Overview PTP is a network protocol implemented in the application layer, used to synchronize clocks in a computer network. It's accurate up to less than a microsecond. The stack supports the protocol and procedures as defined in the IEEE 1588-2019 standard (IEEE Standard for a Precision Clock Synchronization Protocol for Networked Measurement and Control Systems). It has multiple profiles, and can be implemented on top of L2 (Ethernet) or L3 (UDP/IPv4 or UDP/IPv6). Its accuracy is achieved by using hardware timestamping of the protocol packets.

Zephyr's implementation of PTP stack consist following items:

- PTP stack thread that handles incoming messages and events
- Integration with ptp_clock driver
- PTP stack initialization executed during system init

The implementation automatically creates PTP Ports (each PTP Port corresponds to unique interface).

Supported features Implementation of the stack doesn't support all features specified in the standard. In the table below all supported features are listed.

Table 33: Supported features

Feature	Supported
Ordinary Clock	yes
Boundary Clock	yes
Transparent Clock	
Management Node	
End to end delay mechanism	yes
Peer to peer delay mechanism	
Multicast operation mode	
Hybrid operation mode	
Unicast operation mode	
Non-volatile storage	
UDP IPv4 transport protocol	yes
UDP IPv6 transport protocol	yes
IEEE 802.3 (Ethernet) transport protocol	
Hardware timestamping	yes
Software timestamping	
TIME_RECEIVER_ONLY PTP Instance	yes
TIME_TRANSMITTER_ONLY PTP Instance	

Supported Management messages Based on Table 59 from section 15.5.2.3 of the IEEE 1588-2019 following management TLVs are supported:

Table 34: Supported management message's IDs

Management_ID	Management_ID name	Allowed actions
0x0000	NULL_PTP_MANAGEMENT	GET SET COMMAND
0x0001	CLOCK_DESCRIPTION	GET
0x0002	USER_DESCRIPTION	GET

Defines

`TFTP_BLOCK_SIZE`
RFC1350: the file is sent in fixed length blocks of 512 bytes.

Each data packet contains one block of data, and must be acknowledged by an acknowledgment packet before the next packet can be sent. A data packet of less than 512 bytes signals termination of a transfer.

`TFTP_HEADER_SIZE`
RFC1350: For non-request TFTP message, the header contains 2-byte operation code plus 2-byte block number or error code.

`TFTPC_MAX_BUF_SIZE`
Maximum amount of data that can be sent or received.

Typedefs

typedef void (*`tftp_callback_t`)(const struct *tftp_evt* *evt)

TFTP event notification callback registered by the application.

Param evt
[in] Event description along with result and associated parameters (if any).

Enums

enum `tftp_evt_type`

TFTP Asynchronous Events notified to the application from the module through the callback registered by the application.

Values:

enumerator `TFTP_EVT_DATA`

DATA event when data is received from remote server.

> **Note**
> DATA event structure contains payload data and size.

enumerator `TFTP_EVT_ERROR`

ERROR event when error is received from remote server.

> **Note**
> ERROR event structure contains error code and message.

Functions

int `tftp_get`(struct *tftpc* *client, const char *remote_file, const char *mode)

This function gets data from a "file" on the remote server.

> **Note**
> This function blocks until the transfer is completed or network error happens. The integrity of the `client` structure must be ensured until the function returns.

Parameters

- `client` – Client information of type *tftpc*.
- `remote_file` – Name of the remote file to get.
- `mode` – TFTP Client "mode" setting.

Return values

- `The` – size of data being received if the operation completed successfully.

- `TFTPC_BUFFER_OVERFLOW` – if the file is larger than the user buffer.
- `TFTPC_REMOTE_ERROR` – if the server failed to process our request.
- `TFTPC_RETRIES_EXHAUSTED` – if the client timed out waiting for server.
- `-EINVAL` – if `client` is NULL.

int **tftp_put**(struct *tftpc* *client, const char *remote_file, const char *mode, const uint8_t *user_buf, uint32_t user_buf_size)

This function puts data to a "file" on the remote server.

Note

This function blocks until the transfer is completed or network error happens. The integrity of the `client` structure must be ensured until the function returns.

Parameters

- `client` – Client information of type *tftpc*.
- `remote_file` – Name of the remote file to put.
- `mode` – TFTP Client "mode" setting.
- `user_buf` – Data buffer containing the data to put.
- `user_buf_size` – Length of the data to put.

Return values

- `The` – size of data being sent if the operation completed successfully.
- `TFTPC_REMOTE_ERROR` – if the server failed to process our request.
- `TFTPC_RETRIES_EXHAUSTED` – if the client timed out waiting for server.
- `-EINVAL` – if `client` or `user_buf` is NULL or if `user_buf_size` is zero.

struct **tftp_data_param**

#include <tftp.h> Parameters for data event.

Public Members

uint8_t ***data_ptr**

Pointer to binary data.

uint32_t **len**

Length of binary data.

struct **tftp_error_param**

#include <tftp.h> Parameters for error event.

Public Members

char *msg
: Error message.

int code
: Error code.

union tftp_evt_param
: *#include* <*tftp.h*> Defines event parameters notified along with asynchronous events to the application.

Public Members

struct *tftp_data_param* data
: Parameters accompanying TFTP_EVT_DATA event.

struct *tftp_error_param* error
: Parameters accompanying TFTP_EVT_ERROR event.

struct tftp_evt
: *#include* <*tftp.h*> Defines TFTP asynchronous event notified to the application.

Public Members

enum *tftp_evt_type* type
: Identifies the event.

union *tftp_evt_param* param
: Contains parameters (if any) accompanying the event.

struct tftpc
: *#include* <*tftp.h*> TFTP client definition to maintain information relevant to the client.

> **Note**
>
> Application must initialize `server` and `callback` before calling GET or PUT API with the `tftpc` structure.

Public Members

struct *sockaddr* server
: Socket address pointing to the remote TFTP server.

tftp_callback_t callback
: Event notification callback.

  No notification if NULL

uint8_t **tftp_buf**[(512 + 4)]
Buffer for internal usage.

Network System Management

Network Configuration Library

- *Overview*
- *Sample usage*
- *API Reference*

Overview The network configuration library sets up networking devices in a semi-automatic way during the system boot, based on user-supplied Kconfig options.

The following Kconfig options affect how configuration library will setup the system:

Table 35: Kconfig options for network configuration library

Option name	Description
CONFIG_NET_CONFIG_SETTINGS	This option controls whether the network system is configured or initialized at all. If not set, then the config library is not used for initialization and the application needs to do all the network related configuration itself. If this option is set, then the user can optionally configure static IP addresses to be set to the first network interface in the system. Typically setting static IP addresses is only usable in testing and should not be used in production code. See the config library Kconfig file subsys/net/lib/config/Kconfig for specific options to set the static IP addresses.
CONFIG_NET_CONFIG_AUTO_INIT	The networking system is automatically configured when the device is started.
CONFIG_NET_CONFIG_INIT_TIMEOUT	This tells how long to wait for the networking to be ready and available. If for example IPv4 address from DHCPv4 is not received within this limit, then a call to net_config_init() will return error during the device startup.
CONFIG_NET_CONFIG_NEED_IPV4	The network application needs IPv4 support to function properly. This option makes sure the network application is initialized properly in order to use IPv4. If CONFIG_NET_IPV4 is not enabled, then setting this option will automatically enable IPv4.
CONFIG_NET_CONFIG_NEED_IPV6	The network application needs IPv6 support to function properly. This option makes sure the network application is initialized properly in order to use IPv6. If CONFIG_NET_IPV6 is not enabled, then setting this option will automatically enable IPv6.
CONFIG_NET_CONFIG_NEED_IPV6_ROUTER	If IPv6 is enabled, then this option tells that the network application needs IPv6 router to exists before continuing. This means in practice that the application wants to wait until it receives IPv6 router advertisement message before continuing.
CONFIG_NET_CONFIG_MY_IPV6_ADDR	Local static IPv6 address assigned to the default network interface.
CONFIG_NET_CONFIG_PEER_IPV6_ADDR	Peer static IPv6 address. This is mainly useful in testing setups where the application can connect to a pre-defined host.
CONFIG_NET_CONFIG_MY_IPV4_ADDR	Local static IPv4 address assigned to the default network interface.
CONFIG_NET_CONFIG_MY_IPV4_NETMASK	Static IPv4 netmask assigned to the IPv4 address.
CONFIG_NET_CONFIG_MY_IPV4_GW	Static IPv4 gateway address assigned to the default network interface.
CONFIG_NET_CONFIG_PEER_IPV4_ADDR	Peer static IPv4 address. This is mainly useful in testing setups where the application can connect to a pre-defined host.

Sample usage If CONFIG_NET_CONFIG_AUTO_INIT is set, then the configuration library is automatically enabled and run during the device boot. In this case, the library will call net_config_init() automatically and the application does not need to do any network configuration.

If you want to use the network configuration library but without automatic initialization, you can

call `net_config_init()` manually. The `flags` parameter can be used to give hints to the library about what kind of functionality the application wishes to have before the actual application starts.

Related code samples

zperf: Network Traffic Generator
Use the zperf shell utility to evaluate network bandwidth.

API Reference

group `net_config`

Network configuration library.

Since
1.8

Version
0.8.0

Defines

`NET_CONFIG_NEED_ROUTER`

Application needs routers to be set so that connectivity to remote network is possible.

For IPv6 networks, this means that the device should receive IPv6 router advertisement message before continuing.

`NET_CONFIG_NEED_IPV6`

Application needs IPv6 subsystem configured and initialized.

Typically this means that the device has IPv6 address set.

`NET_CONFIG_NEED_IPV4`

Application needs IPv4 subsystem configured and initialized.

Typically this means that the device has IPv4 address set.

Functions

int `net_config_init`(const char *app_info, uint32_t flags, int32_t timeout)

Initialize this network application.

This will call *net_config_init_by_iface()* with NULL network interface.

Parameters

- `app_info` – String describing this application.
- `flags` – Flags related to services needed by the client.
- `timeout` – How long to wait the network setup before continuing the startup.

Returns
0 if ok, <0 if error.

int **net_config_init_by_iface**(struct *net_if* *iface, const char *app_info, uint32_t flags, int32_t timeout)

Initialize this network application using a specific network interface.

If network interface is set to NULL, then the default one is used in the configuration.

Parameters

- **iface** – Initialize networking using this network interface.
- **app_info** – String describing this application.
- **flags** – Flags related to services needed by the client.
- **timeout** – How long to wait the network setup before continuing the startup.

Returns
0 if ok, <0 if error.

int **net_config_init_app**(const struct *device* *dev, const char *app_info)

Initialize this network application.

If CONFIG_NET_CONFIG_AUTO_INIT is set, then this function is called automatically when the device boots. If that is not desired, unset the config option and call the function manually when the application starts.

Parameters

- **dev** – Network device to use. The function will figure out what network interface to use based on the device. If the device is NULL, then default network interface is used by the function.
- **app_info** – String describing this application.

Returns
0 if ok, <0 if error.

DHCPv4

- *Overview*
- *Sample usage*
- *API Reference*

Overview The Dynamic Host Configuration Protocol (DHCP) is a network management protocol used on IPv4 networks. A DHCPv4 server dynamically assigns an IPv4 address and other network configuration parameters to each device on a network so they can communicate with other IP networks. See this DHCP Wikipedia article for a detailed overview of how DHCP works.

Note that Zephyr supports both DHCPv4 client and server functionality.

Sample usage See dhcpv4-client sample application for details.

Related code samples

DHCPv4 client
Start a DHCPv4 client to obtain an IPv4 address from a DHCPv4 server.

API Reference

DHCPv4.

Since
1.7

Version
0.8.0

Typedefs

typedef void (*`net_dhcpv4_option_callback_handler_t`)(struct net_dhcpv4_option_callback *cb, size_t length, enum *net_dhcpv4_msg_type* msg_type, struct *net_if* *iface)

Define the application callback handler function signature.

Note: cb pointer can be used to retrieve private data through *CONTAINER_OF()* if original struct net_dhcpv4_option_callback is stored in another private structure.

Param cb
Original struct net_dhcpv4_option_callback owning this handler

Param length
The length of data returned by the server. If this is greater than cb->max_length, only cb->max_length bytes will be available in cb->data

Param msg_type
Type of DHCP message that triggered the callback

Param iface
The interface on which the DHCP message was received

Enums

enum `net_dhcpv4_msg_type`

DHCPv4 message types.

These enumerations represent RFC2131 defined msy type codes, hence they should not be renumbered.

Additions, removald and reorders in this definition must be reflected within corresponding changes to net_dhcpv4_msg_type_name.

Values:

enumerator NET_DHCPV4_MSG_TYPE_DISCOVER = 1
Discover message.

enumerator NET_DHCPV4_MSG_TYPE_OFFER = 2
Offer message.

enumerator NET_DHCPV4_MSG_TYPE_REQUEST = 3
Request message.

enumerator NET_DHCPV4_MSG_TYPE_DECLINE = 4
Decline message.

enumerator NET_DHCPV4_MSG_TYPE_ACK = 5
Acknowledge message.

enumerator NET_DHCPV4_MSG_TYPE_NAK = 6
Negative acknowledge message.

enumerator NET_DHCPV4_MSG_TYPE_RELEASE = 7
Release message.

enumerator NET_DHCPV4_MSG_TYPE_INFORM = 8
Inform message.

Functions

static inline void **net_dhcpv4_init_option_callback**(struct net_dhcpv4_option_callback *callback, *net_dhcpv4_option_callback_handler_t* handler, uint8_t option, void *data, size_t max_length)

Helper to initialize a struct net_dhcpv4_option_callback properly.

Parameters

- **callback** – A valid Application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **option** – The DHCP option the callback responds to.
- **data** – A pointer to a buffer for max_length bytes.
- **max_length** – The maximum length of the data returned.

int **net_dhcpv4_add_option_callback**(struct net_dhcpv4_option_callback *cb)

Add an application callback.

Parameters

- **cb** – A valid application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

int **net_dhcpv4_remove_option_callback**(struct net_dhcpv4_option_callback *cb)

Remove an application callback.

Parameters

- **cb** – A valid application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

static inline void **net_dhcpv4_init_option_vendor_callback**(struct net_dhcpv4_option_callback *callback, *net_dhcpv4_option_callback_handler_t* handler, uint8_t option, void *data, size_t max_length)

Helper to initialize a struct net_dhcpv4_option_callback for encapsulated vendor-specific options properly.

Parameters

- **callback** – A valid Application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **option** – The DHCP encapsulated vendor-specific option the callback responds to.
- **data** – A pointer to a buffer for max_length bytes.
- **max_length** – The maximum length of the data returned.

int **net_dhcpv4_add_option_vendor_callback**(struct net_dhcpv4_option_callback *cb)

Add an application callback for encapsulated vendor-specific options.

Parameters

- **cb** – A valid application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

int **net_dhcpv4_remove_option_vendor_callback**(struct net_dhcpv4_option_callback *cb)

Remove an application callback for encapsulated vendor-specific options.

Parameters

- **cb** – A valid application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

void **net_dhcpv4_start**(struct *net_if* *iface)

Start DHCPv4 client on an iface.

Start DHCPv4 client on a given interface. DHCPv4 client will start negotiation for IPv4 address. Once the negotiation is success IPv4 address details will be added to interface.

Parameters

- **iface** – A valid pointer on an interface

void **net_dhcpv4_stop**(struct *net_if* *iface)

Stop DHCPv4 client on an iface.

Stop DHCPv4 client on a given interface. DHCPv4 client will remove all configuration obtained from a DHCP server from the interface and stop any further negotiation with the server.

Parameters

- `iface` – A valid pointer on an interface

void `net_dhcpv4_restart`(struct *net_if* *iface)

Restart DHCPv4 client on an iface.

Restart DHCPv4 client on a given interface. DHCPv4 client will restart the state machine without any of the initial delays used in start.

Parameters

- `iface` – A valid pointer on an interface

const char *`net_dhcpv4_msg_type_name`(enum *net_dhcpv4_msg_type* msg_type)

Return a text representation of the msg_type.

Parameters

- `msg_type` – The msg_type to be converted to text

Returns

A text representation of msg_type

DHCPv6

- *Overview*
- *API Reference*

Overview The Dynamic Host Configuration Protocol (DHCP) for IPv6 is a network management protocol used on IPv6 based networks. A DHCPv6 server dynamically assigns an IPv6 address and other network configuration parameters to each device on a network so they can communicate with other IP networks. See this DHCPv6 Wikipedia article for a detailed overview of how DHCPv6 works.

Note that Zephyr only supports DHCPv6 client functionality.

API Reference

Functions

void `net_dhcpv6_start`(struct *net_if* *iface, struct *net_dhcpv6_params* *params)

Start DHCPv6 client on an iface.

Start DHCPv6 client on a given interface. DHCPv6 client will start negotiation for IPv6 address and/or prefix, depending on the configuration. Once the negotiation is complete, IPv6 address/prefix details will be added to the interface.

Parameters

- `iface` – A valid pointer to a network interface
- `params` – DHCPv6 client configuration parameters.

void `net_dhcpv6_stop`(struct *net_if* *iface)

Stop DHCPv6 client on an iface.

Stop DHCPv6 client on a given interface. DHCPv6 client will remove all configuration obtained from a DHCP server from the interface and stop any further negotiation with the server.

Parameters

- `iface` – A valid pointer to a network interface

void `net_dhcpv6_restart`(struct *net_if* *iface)

Restart DHCPv6 client on an iface.

Restart DHCPv6 client on a given interface. DHCPv6 client will restart the state machine without any of the initial delays.

Parameters

- `iface` – A valid pointer to a network interface

struct `net_dhcpv6_params`

#include <dhcpv6.h> DHCPv6 client configuration parameters.

Public Members

bool `request_addr`

Request IPv6 address.

bool `request_prefix`

Request IPv6 prefix.

Hostname Configuration

- *Overview*
- *API Reference*

Overview A networked device might need a hostname, for example, if the device is configured to be a mDNS responder (see *DNS Resolve* for details) and needs to respond to `<hostname>.local` DNS queries.

The `CONFIG_NET_HOSTNAME_ENABLE` must be set in order to store the hostname and enable the relevant APIs. If the option is enabled, then the default hostname is set to be `zephyr` by `CONFIG_NET_HOSTNAME` option.

If the same firmware image is used to flash multiple boards, then it is not practical to use the same hostname in all of the boards. In that case, one can enable `CONFIG_NET_HOSTNAME_UNIQUE` which will add a unique postfix to the hostname. By default the link local address of the first network interface is used as a postfix. In Ethernet networks, the link local address refers to MAC address. For example, if the link local address is `01:02:03:04:05:06`,

then the unique hostname could be `zephyr010203040506`. If you want to set the prefix yourself, then call `net_hostname_set_postfix_str()` before the network interfaces are created. Alternatively, if you prefer a hexadecimal conversion for the prefix, then call `net_hostname_set_postfix()`. For example for the Ethernet networks, the initialization priority is set by `CONFIG_ETH_INIT_PRIORITY` so you would need to set the postfix before that. The postfix can be set only once.

API Reference

group `net_hostname`

Network hostname configuration library.

Since
1.10

Version
0.8.0

Defines

`NET_HOSTNAME_MAX_LEN`

Maximum hostname length.

Functions

static inline const char ***net_hostname_get**(void)

Get the device hostname.

Return pointer to device hostname.

Returns
Pointer to hostname or NULL if not set.

static inline int **net_hostname_set**(char *host, size_t len)

Set the device hostname.

Parameters

- **host** – new hostname as char array.
- **len** – Length of the hostname array.

Returns
0 if ok, <0 on error

static inline void **net_hostname_init**(void)

Initialize and set the device hostname.

static inline int **net_hostname_set_postfix**(const uint8_t *hostname_postfix, int postfix_len)

Set the device hostname postfix.

Convert the hostname postfix to hexadecimal value and set the device hostname with the converted value. This is only used if CONFIG_NET_HOSTNAME_UNIQUE is set.

Parameters

- **hostname_postfix** – Usually link address. The function will convert this to a hexadecimal string.

- **postfix_len** – Length of the hostname_postfix array.

Returns
0 if ok, <0 if error

static inline int **net_hostname_set_postfix_str**(const uint8_t *hostname_postfix, int postfix_len)

Set the postfix string for the network hostname.

Set the hostname postfix string for the network hostname as is, without any conversion. This is only used if CONFIG_NET_HOSTNAME_UNIQUE is set. The function checks if the combined length of the default hostname (defined by CONFIG_NET_HOSTNAME) and the postfix does not exceed NET_HOSTNAME_MAX_LEN. If the postfix is too long, the function returns an error.

Parameters

- **hostname_postfix** – Pointer to the postfix string to be appended to the network hostname.
- **postfix_len** – Length of the hostname_postfix array.

Returns
0 if ok, <0 if error

Network Core Helpers

- *Overview*
- *API Reference*

Overview The network subsystem contains two functions for sending and receiving data from the network. The `net_recv_data()` is typically used by network device driver when the received network data needs to be pushed up in the network stack for further processing. All the data is received via a network interface which is typically created by the device driver.

For sending, the `net_send_data()` can be used. Typically applications do not call this function directly as there is the *BSD Sockets* API for sending and receiving network data.

Related code samples

Telnet console
Access Zephyr shell over telnet.

API Reference

group **net_core**

Network core library.

Since
1.0

Version
1.0.0

Enums

enum `net_verdict`

Net Verdict.

Values:

enumerator `NET_OK`

Packet has been taken care of.

enumerator `NET_CONTINUE`

Packet has not been touched, other part should decide about its fate.

enumerator `NET_DROP`

Packet must be dropped.

Functions

int `net_recv_data`(struct *net_if* *iface, struct *net_pkt* *pkt)

Called by lower network stack or network device driver when a network packet has been received.

The function will push the packet up in the network stack for further processing.

Parameters

- `iface` – Network interface where the packet was received.
- `pkt` – Network packet data.

Returns
0 if ok, <0 if error.

int `net_send_data`(struct *net_pkt* *pkt)

Send data to network.

Send data to network. This should not be used normally by applications as it requires that the network packet is properly constructed.

Parameters

- `pkt` – Network packet.

Returns
0 if ok, <0 if error. If <0 is returned, then the caller needs to unref the pkt in order to avoid memory leak.

Network Interface

- *Overview*
- *Network interface state management*

- *API Reference*

Overview The network interface is a nexus that ties the network device drivers and the upper part of the network stack together. All the sent and received data is transferred via a network interface. The network interfaces cannot be created at runtime. A special linker section will contain information about them and that section is populated at linking time.

Network interfaces are created by `NET_DEVICE_INIT()` macro. For Ethernet network, a macro called `ETH_NET_DEVICE_INIT()` should be used instead as it will create VLAN interfaces automatically if `CONFIG_NET_VLAN` is enabled. These macros are typically used in network device driver source code.

The network interface can be turned ON by calling `net_if_up()` and OFF by calling `net_if_down()`. When the device is powered ON, the network interface is also turned ON by default.

The network interfaces can be referenced either by a `struct net_if *` pointer or by a network interface index. The network interface can be resolved from its index by calling `net_if_get_by_index()` and from interface pointer by calling `net_if_get_by_iface()`.

The IP address for network devices must be set for them to be connectable. In a typical dynamic network environment, IP addresses are set automatically by DHCPv4, for example. If needed though, the application can set a device's IP address manually. See the API documentation below for functions such as `net_if_ipv4_addr_add()` that do that.

The `net_if_get_default()` returns a *default* network interface. What this default interface means can be configured via options like `CONFIG_NET_DEFAULT_IF_FIRST` and `CONFIG_NET_DEFAULT_IF_ETHERNET`. See Kconfig file subsys/net/ip/Kconfig what options are available for selecting the default network interface.

The transmitted and received network packets can be classified via a network packet priority. This is typically done in Ethernet networks when virtual LANs (VLANs) are used. Higher priority packets can be sent or received earlier than lower priority packets. The traffic class setup can be configured by `CONFIG_NET_TC_TX_COUNT` and `CONFIG_NET_TC_RX_COUNT` options.

If the `CONFIG_NET_PROMISCUOUS_MODE` is enabled and if the underlying network technology supports promiscuous mode, then it is possible to receive all the network packets that the network device driver is able to receive. See *Promiscuous Mode* API for more details.

Network interface state management Zephyr distinguishes between two interface states: administrative state and operational state, as described in RFC 2863. The administrative state indicate whether an interface is turned ON or OFF. This state is represented by *`NET_IF_UP`* flag and is controlled by the application. It can be changed by calling *`net_if_up()`* or *`net_if_down()`* functions. Network drivers or L2 implementations should not change administrative state on their own.

Bringing an interface up however not always means that the interface is ready to transmit packets. Because of that, operational state, which represents the internal interface status, was implemented. The operational state is updated whenever one of the following conditions take place:

- The interface is brought up/down by the application (administrative state changes).
- The interface is notified by the driver/L2 that PHY status has changed.
- The interface is notified by the driver/L2 that it joined/left a network.

The PHY status is represented with *`NET_IF_LOWER_UP`* flag and can be changed with *`net_if_carrier_on()`* and *`net_if_carrier_off()`*. By default, the flag is set on a newly initialized interface. An example of an event that changes the carrier state is Ethernet cable being plugged in or out.

The network association status is represented with *NET_IF_DORMANT* flag and can be changed with *net_if_dormant_on()* and *net_if_dormant_off()*. By default, the flag is cleared on a newly initialized interface. An example of an event that changes the dormant state is a Wi-Fi driver successfully connecting to an access point. In this scenario, driver should set the dormant state to ON during initialization, and once it detects that it connected to a Wi-Fi network, the dormant state should be set to OFF.

The operational state of an interface is updated as follows:

- `!net_if_is_admin_up()`

  Interface is in *NET_IF_OPER_DOWN*.

- `net_if_is_admin_up() && !net_if_is_carrier_ok()`

  Interface is in *NET_IF_OPER_DOWN* or *NET_IF_OPER_LOWERLAYERDOWN* if the interface is stacked (virtual).

- `net_if_is_admin_up() && net_if_is_carrier_ok() && net_if_is_dormant()`

  Interface is in *NET_IF_OPER_DORMANT*.

- `net_if_is_admin_up() && net_if_is_carrier_ok() && !net_if_is_dormant()`

  Interface is in *NET_IF_OPER_UP*.

Only after an interface enters *NET_IF_OPER_UP* state the *NET_IF_RUNNING* flag is set on the interface indicating that the interface is ready to be used by the application.

Defines

`NET_DEVICE_INIT`(dev_id, name, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Create a network interface and bind it to network device.

Parameters

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`NET_DEVICE_DT_DEFINE`(node_id, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like NET_DEVICE_INIT but taking metadata from a devicetree node.

Create a network interface and bind it to network device.

Parameters

- `node_id` – The devicetree node identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`NET_DEVICE_DT_INST_DEFINE`(inst, ...)

Like NET_DEVICE_DT_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- `inst` – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to NET_DEVICE_DT_DEFINE.
- `...` – other parameters as expected by NET_DEVICE_DT_DEFINE.

`NET_DEVICE_INIT_INSTANCE`(dev_id, name, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Create multiple network interfaces and bind them to network device.

If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters

- `dev_id` – Network device id.
- `name` – The name this instance of the driver exposes to the system.
- `instance` – Instance identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`NET_DEVICE_DT_DEFINE_INSTANCE`(node_id, instance, init_fn, pm, data, config, prio, api, l2, l2_ctx_type, mtu)

Like NET_DEVICE_OFFLOAD_INIT but taking metadata from a devicetree.

Create multiple network interfaces and bind them to network device. If your network device needs more than one instance of a network interface, use this macro below and provide a different instance suffix each time (0, 1, 2, ... or a, b, c ... whatever works for you)

Parameters

- `node_id` – The devicetree node identifier.
- `instance` – Instance identifier.
- `init_fn` – Address to the init function of the driver.
- `pm` – Reference to struct *pm_device* associated with the device. (optional).
- `data` – Pointer to the device's private data.
- `config` – The address to the structure containing the configuration information for this instance of the driver.
- `prio` – The initialization level at which configuration occurs.
- `api` – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- `l2` – Network L2 layer for this network interface.
- `l2_ctx_type` – Type of L2 context data.
- `mtu` – Maximum transfer unit in bytes for this network interface.

`NET_DEVICE_DT_INST_DEFINE_INSTANCE`(inst, ...)

Like NET_DEVICE_DT_DEFINE_INSTANCE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- `inst` – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to NET_DEVICE_DT_DEFINE_INSTANCE.

- ... – other parameters as expected by NET_DEVICE_DT_DEFINE_INSTANCE.

NET_DEVICE_OFFLOAD_INIT(dev_id, name, init_fn, pm, data, config, prio, api, mtu)

Create a offloaded network interface and bind it to network device.

The offloaded network interface is implemented by a device vendor HAL or similar.

Parameters

- dev_id – Network device id.
- name – The name this instance of the driver exposes to the system.
- init_fn – Address to the init function of the driver.
- pm – Reference to struct *pm_device* associated with the device. (optional).
- data – Pointer to the device's private data.
- config – The address to the structure containing the configuration information for this instance of the driver.
- prio – The initialization level at which configuration occurs.
- api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_OFFLOAD_DEFINE(node_id, init_fn, pm, data, config, prio, api, mtu)

Like NET_DEVICE_OFFLOAD_INIT but taking metadata from a devicetree node.

Create a offloaded network interface and bind it to network device. The offloaded network interface is implemented by a device vendor HAL or similar.

Parameters

- node_id – The devicetree node identifier.
- init_fn – Address to the init function of the driver.
- pm – Reference to struct *pm_device* associated with the device. (optional).
- data – Pointer to the device's private data.
- config – The address to the structure containing the configuration information for this instance of the driver.
- prio – The initialization level at which configuration occurs.
- api – Provides an initial pointer to the API function struct used by the driver. Can be NULL.
- mtu – Maximum transfer unit in bytes for this network interface.

NET_DEVICE_DT_INST_OFFLOAD_DEFINE(inst, ...)

Like NET_DEVICE_DT_OFFLOAD_DEFINE for an instance of a DT_DRV_COMPAT compatible.

Parameters

- inst – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to NET_DEVICE_DT_OFFLOAD_DEFINE.
- ... – other parameters as expected by NET_DEVICE_DT_OFFLOAD_DEFINE.

NET_IFACE_COUNT(_dst)

Count the number of network interfaces.

Parameters

- **_dst** – **[out]** Pointer to location where result is written.

Typedefs

typedef int (*net_socket_create_t)(int, int, int)

A function prototype to create an offloaded socket.

The prototype is compatible with *socket()* function.

typedef void (*net_if_ip_addr_cb_t)(struct *net_if* *iface, struct *net_if_addr* *addr, void *user_data)

Callback used while iterating over network interface IP addresses.

Param iface
Pointer to the network interface the address belongs to

Param addr
Pointer to current IP address

Param user_data
A valid pointer to user data or NULL

typedef void (*net_if_ip_maddr_cb_t)(struct *net_if* *iface, struct *net_if_mcast_addr* *maddr, void *user_data)

Callback used while iterating over network interface multicast IP addresses.

Param iface
Pointer to the network interface the address belongs to

Param maddr
Pointer to current multicast IP address

Param user_data
A valid pointer to user data or NULL

typedef void (*net_if_mcast_callback_t)(struct *net_if* *iface, const struct net_addr *addr, bool is_joined)

Define a callback that is called whenever a IPv6 or IPv4 multicast address group is joined or left.

Param iface
A pointer to a struct *net_if* to which the multicast address is attached.

Param addr
IP multicast address.

Param is_joined
True if the multicast group is joined, false if group is left.

typedef void (*net_if_link_callback_t)(struct *net_if* *iface, struct *net_linkaddr* *dst, int status)

Define callback that is called after a network packet has been sent.

Param iface
A pointer to a struct *net_if* to which the *net_pkt* was sent to.

Param dst
Link layer address of the destination where the network packet was sent.

Param status
Send status, 0 is ok, < 0 error.

typedef void (*`net_if_cb_t`)(struct *net_if* *iface, void *user_data)

Callback used while iterating over network interfaces.

Param iface
Pointer to current network interface

Param user_data
A valid pointer to user data or NULL

Enums

enum `net_if_flag`

Network interface flags.

Values:

enumerator `NET_IF_UP`

Interface is admin up.

enumerator `NET_IF_POINTOPOINT`

Interface is pointopoint.

enumerator `NET_IF_PROMISC`

Interface is in promiscuous mode.

enumerator `NET_IF_NO_AUTO_START`

Do not start the interface immediately after initialization.

This requires that either the device driver or some other entity will need to manually take the interface up when needed. For example for Ethernet this will happen when the driver calls the *net_eth_carrier_on()* function.

enumerator `NET_IF_SUSPENDED`

Power management specific: interface is being suspended.

enumerator `NET_IF_FORWARD_MULTICASTS`

Flag defines if received multicasts of other interface are forwarded on this interface.

This activates multicast routing / forwarding for this interface.

enumerator `NET_IF_IPV4`

Interface supports IPv4.

enumerator `NET_IF_IPV6`

Interface supports IPv6.

enumerator NET_IF_RUNNING
Interface up and running (ready to receive and transmit).

enumerator NET_IF_LOWER_UP
Driver signals L1 is up.

enumerator NET_IF_DORMANT
Driver signals dormant.

enumerator NET_IF_IPV6_NO_ND
IPv6 Neighbor Discovery disabled.

enumerator NET_IF_IPV6_NO_MLD
IPv6 Multicast Listener Discovery disabled.

enumerator NET_IF_NO_TX_LOCK
Mutex locking on TX data path disabled on the interface.

enum net_if_oper_state
Network interface operational status (RFC 2863).
Values:

enumerator NET_IF_OPER_UNKNOWN
Initial (unknown) value.

enumerator NET_IF_OPER_NOTPRESENT
Hardware missing.

enumerator NET_IF_OPER_DOWN
Interface is down.

enumerator NET_IF_OPER_LOWERLAYERDOWN
Lower layer interface is down.

enumerator NET_IF_OPER_TESTING
Training mode.

enumerator NET_IF_OPER_DORMANT
Waiting external action.

enumerator NET_IF_OPER_UP
Interface is up.

enum net_if_checksum_type
Type of checksum for which support in the interface will be queried.
Values:

enumerator **NET_IF_CHECKSUM_IPV4_HEADER** = NET_IF_CHECKSUM_IPV4_HEADER_BIT

Interface supports IP version 4 header checksum calculation.

enumerator **NET_IF_CHECKSUM_IPV4_TCP** = NET_IF_CHECKSUM_IPV4_HEADER_BIT | NET_IF_CHECKSUM_TCP_BIT

Interface supports checksum calculation for TCP payload in IPv4.

enumerator **NET_IF_CHECKSUM_IPV4_UDP** = NET_IF_CHECKSUM_IPV4_HEADER_BIT | NET_IF_CHECKSUM_UDP_BIT

Interface supports checksum calculation for UDP payload in IPv4.

enumerator **NET_IF_CHECKSUM_IPV4_ICMP** = NET_IF_CHECKSUM_IPV4_ICMP_BIT

Interface supports checksum calculation for ICMP4 payload in IPv4.

enumerator **NET_IF_CHECKSUM_IPV6_HEADER** = NET_IF_CHECKSUM_IPV6_HEADER_BIT

Interface supports IP version 6 header checksum calculation.

enumerator **NET_IF_CHECKSUM_IPV6_TCP** = NET_IF_CHECKSUM_IPV6_HEADER_BIT | NET_IF_CHECKSUM_TCP_BIT

Interface supports checksum calculation for TCP payload in IPv6.

enumerator **NET_IF_CHECKSUM_IPV6_UDP** = NET_IF_CHECKSUM_IPV6_HEADER_BIT | NET_IF_CHECKSUM_UDP_BIT

Interface supports checksum calculation for UDP payload in IPv6.

enumerator **NET_IF_CHECKSUM_IPV6_ICMP** = NET_IF_CHECKSUM_IPV6_ICMP_BIT

Interface supports checksum calculation for ICMP6 payload in IPv6.

Functions

static inline void **net_if_flag_set**(struct *net_if* *iface, enum *net_if_flag* value)

Set a value in network interface flags.

Parameters

- **iface** – Pointer to network interface
- **value** – Flag value

static inline bool **net_if_flag_test_and_set**(struct *net_if* *iface, enum *net_if_flag* value)

Test and set a value in network interface flags.

Parameters

- **iface** – Pointer to network interface
- **value** – Flag value

Returns

true if the bit was set, false if it wasn't.

static inline void **net_if_flag_clear**(struct *net_if* *iface, enum *net_if_flag* value)

Clear a value in network interface flags.

Parameters

- **iface** – Pointer to network interface

- **value** – Flag value

static inline bool **net_if_flag_test_and_clear**(struct *net_if* *iface, enum *net_if_flag* value)

Test and clear a value in network interface flags.

Parameters

- **iface** – Pointer to network interface
- **value** – Flag value

Returns
true if the bit was set, false if it wasn't.

static inline bool **net_if_flag_is_set**(struct *net_if* *iface, enum *net_if_flag* value)

Check if a value in network interface flags is set.

Parameters

- **iface** – Pointer to network interface
- **value** – Flag value

Returns
True if the value is set, false otherwise

static inline enum *net_if_oper_state* **net_if_oper_state_set**(struct *net_if* *iface, enum *net_if_oper_state* oper_state)

Set an operational state on an interface.

Parameters

- **iface** – Pointer to network interface
- **oper_state** – Operational state to set

Returns
The new operational state of an interface

static inline enum *net_if_oper_state* **net_if_oper_state**(struct *net_if* *iface)

Get an operational state of an interface.

Parameters

- **iface** – Pointer to network interface

Returns
Operational state of an interface

enum *net_verdict* **net_if_send_data**(struct *net_if* *iface, struct *net_pkt* *pkt)

Send a packet through a net iface.

return verdict about the packet

Parameters

- **iface** – Pointer to a network interface structure
- **pkt** – Pointer to a net packet to send

static inline const struct *net_l2* ***net_if_l2**(struct *net_if* *iface)

Get a pointer to the interface L2.

Parameters

- **iface** – a valid pointer to a network interface structure

Returns
a pointer to the iface L2

enum *net_verdict* **net_if_recv_data**(struct *net_if* *iface, struct *net_pkt* *pkt)
Input a packet through a net iface.

Parameters
- **iface** – Pointer to a network interface structure
- **pkt** – Pointer to a net packet to input

Returns
verdict about the packet

static inline void ***net_if_l2_data**(struct *net_if* *iface)
Get a pointer to the interface L2 private data.

Parameters
- **iface** – a valid pointer to a network interface structure

Returns
a pointer to the iface L2 data

static inline const struct *device* ***net_if_get_device**(struct *net_if* *iface)
Get an network interface's device.

Parameters
- **iface** – Pointer to a network interface structure

Returns
a pointer to the device driver instance

void **net_if_queue_tx**(struct *net_if* *iface, struct *net_pkt* *pkt)
Queue a packet to the net interface TX queue.

Parameters
- **iface** – Pointer to a network interface structure
- **pkt** – Pointer to a net packet to queue

static inline bool **net_if_is_ip_offloaded**(struct *net_if* *iface)
Return the IP offload status.

Parameters
- **iface** – Network interface

Returns
True if IP offloading is active, false otherwise.

bool **net_if_is_offloaded**(struct *net_if* *iface)
Return offload status of a given network interface.

Parameters
- **iface** – Network interface

Returns
True if IP or socket offloading is active, false otherwise.

static inline struct net_offload ***net_if_offload**(struct *net_if* *iface)
Return the IP offload plugin.

Parameters
- **iface** – Network interface

Returns
NULL if there is no offload plugin defined, valid pointer otherwise

static inline bool **net_if_is_socket_offloaded**(struct *net_if* *iface)

Return the socket offload status.

Parameters

- **iface** – Network interface

Returns
True if socket offloading is active, false otherwise.

static inline void **net_if_socket_offload_set**(struct *net_if* *iface, *net_socket_create_t* socket_offload)

Set the function to create an offloaded socket.

Parameters

- **iface** – Network interface
- **socket_offload** – A function to create an offloaded socket

static inline *net_socket_create_t* **net_if_socket_offload**(struct *net_if* *iface)

Return the function to create an offloaded socket.

Parameters

- **iface** – Network interface

Returns
NULL if the interface is not socket offloaded, valid pointer otherwise

static inline struct *net_linkaddr* ***net_if_get_link_addr**(struct *net_if* *iface)

Get an network interface's link address.

Parameters

- **iface** – Pointer to a network interface structure

Returns
a pointer to the network link address

static inline struct *net_if_config* ***net_if_get_config**(struct *net_if* *iface)

Return network configuration for this network interface.

Parameters

- **iface** – Pointer to a network interface structure

Returns
Pointer to configuration

static inline void **net_if_start_dad**(struct *net_if* *iface)

Start duplicate address detection procedure.

Parameters

- **iface** – Pointer to a network interface structure

void **net_if_start_rs**(struct *net_if* *iface)

Start neighbor discovery and send router solicitation message.

Parameters

- **iface** – Pointer to a network interface structure

static inline void **net_if_stop_rs**(struct *net_if* *iface)

Stop neighbor discovery.

Parameters

- **iface** – Pointer to a network interface structure

static inline void **net_if_nbr_reachability_hint**(struct *net_if* *iface, const struct *in6_addr* *ipv6_addr)

Provide a reachability hint for IPv6 Neighbor Discovery.

This function is intended for upper-layer protocols to inform the IPv6 Neighbor Discovery process about an active link to a specific neighbor. By signaling a recent "forward progress" event, such as the reception of an ACK, this function can help reduce unnecessary ND traffic as per the guidelines in RFC 4861 (section 7.3).

Parameters

- **iface** – A pointer to the network interface.
- **ipv6_addr** – Pointer to the IPv6 address of the neighbor node.

static inline int **net_if_set_link_addr**(struct *net_if* *iface, uint8_t *addr, uint8_t len, enum *net_link_type* type)

Set a network interface's link address.

Parameters

- **iface** – Pointer to a network interface structure
- **addr** – A pointer to a uint8_t buffer representing the address. The buffer must remain valid throughout interface lifetime.
- **len** – length of the address buffer
- **type** – network bearer type of this link address

Returns

0 on success

static inline uint16_t **net_if_get_mtu**(struct *net_if* *iface)

Get an network interface's MTU.

Parameters

- **iface** – Pointer to a network interface structure

Returns

the MTU

static inline void **net_if_set_mtu**(struct *net_if* *iface, uint16_t mtu)

Set an network interface's MTU.

Parameters

- **iface** – Pointer to a network interface structure
- **mtu** – New MTU, note that we store only 16 bit mtu value.

static inline void **net_if_addr_set_lf**(struct *net_if_addr* *ifaddr, bool is_infinite)

Set the infinite status of the network interface address.

Parameters

- **ifaddr** – IP address for network interface
- **is_infinite** – Infinite status

struct *net_if* *net_if_get_by_link_addr(struct *net_linkaddr* *ll_addr)

Get an interface according to link layer address.

Parameters

- ll_addr – Link layer address.

Returns

Network interface or NULL if not found.

struct *net_if* *net_if_lookup_by_dev(const struct *device* *dev)

Find an interface from it's related device.

Parameters

- dev – A valid struct device pointer to relate with an interface

Returns

a valid struct *net_if* pointer on success, NULL otherwise

static inline struct *net_if_config* *net_if_config_get(struct *net_if* *iface)

Get network interface IP config.

Parameters

- iface – Interface to use.

Returns

NULL if not found or pointer to correct config settings.

void net_if_router_rm(struct *net_if_router* *router)

Remove a router from the system.

Parameters

- router – Pointer to existing router

void net_if_set_default(struct *net_if* *iface)

Set the default network interface.

Parameters

- iface – New default interface, or NULL to revert to the one set by Kconfig.

struct *net_if* *net_if_get_default(void)

Get the default network interface.

Returns

Default interface or NULL if no interfaces are configured.

struct *net_if* *net_if_get_first_by_type(const struct *net_l2* *l2)

Get the first network interface according to its type.

Parameters

- l2 – Layer 2 type of the network interface.

Returns

First network interface of a given type or NULL if no such interfaces was found.

struct *net_if* *net_if_get_first_up(void)

Get the first network interface which is up.

Returns

First network interface which is up or NULL if all interfaces are down.

int **net_if_config_ipv6_get**(struct *net_if* *iface, struct *net_if_ipv6* **ipv6)

Allocate network interface IPv6 config.

This function will allocate new IPv6 config.

Parameters

- **iface** – Interface to use.
- **ipv6** – Pointer to allocated IPv6 struct is returned to caller.

Returns
0 if ok, <0 if error

int **net_if_config_ipv6_put**(struct *net_if* *iface)

Release network interface IPv6 config.

Parameters

- **iface** – Interface to use.

Returns
0 if ok, <0 if error

struct *net_if_addr* ***net_if_ipv6_addr_lookup**(const struct *in6_addr* *addr, struct *net_if* **iface)

Check if this IPv6 address belongs to one of the interfaces.

Parameters

- **addr** – IPv6 address
- **iface** – Pointer to interface is returned

Returns
Pointer to interface address, NULL if not found.

struct *net_if_addr* ***net_if_ipv6_addr_lookup_by_iface**(struct *net_if* *iface, struct *in6_addr* *addr)

Check if this IPv6 address belongs to this specific interfaces.

Parameters

- **iface** – Network interface
- **addr** – IPv6 address

Returns
Pointer to interface address, NULL if not found.

int **net_if_ipv6_addr_lookup_by_index**(const struct *in6_addr* *addr)

Check if this IPv6 address belongs to one of the interface indices.

Parameters

- **addr** – IPv6 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

struct *net_if_addr* ***net_if_ipv6_addr_add**(struct *net_if* *iface, struct *in6_addr* *addr, enum *net_addr_type* addr_type, uint32_t vlifetime)

Add a IPv6 address to an interface.

Parameters

- **iface** – Network interface

- **addr** – IPv6 address
- **addr_type** – IPv6 address type
- **vlifetime** – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool **net_if_ipv6_addr_add_by_index**(int index, struct *in6_addr* *addr, enum *net_addr_type* addr_type, uint32_t vlifetime)

Add a IPv6 address to an interface by index.

Parameters

- **index** – Network interface index
- **addr** – IPv6 address
- **addr_type** – IPv6 address type
- **vlifetime** – Validity time for this address

Returns
True if ok, false if address could not be added

void **net_if_ipv6_addr_update_lifetime**(struct *net_if_addr* *ifaddr, uint32_t vlifetime)

Update validity lifetime time of an IPv6 address.

Parameters

- **ifaddr** – Network IPv6 address
- **vlifetime** – Validity time for this address

bool **net_if_ipv6_addr_rm**(struct *net_if* *iface, const struct *in6_addr* *addr)

Remove an IPv6 address from an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv6 address

Returns
True if successfully removed, false otherwise

bool **net_if_ipv6_addr_rm_by_index**(int index, const struct *in6_addr* *addr)

Remove an IPv6 address from an interface by index.

Parameters

- **index** – Network interface index
- **addr** – IPv6 address

Returns
True if successfully removed, false otherwise

void **net_if_ipv6_addr_foreach**(struct *net_if* *iface, *net_if_ip_addr_cb_t* cb, void *user_data)

Go through all IPv6 addresses on a network interface and call callback for each used address.

Parameters

- **iface** – Pointer to the network interface
- **cb** – User-supplied callback function to call
- **user_data** – User specified data

struct *net_if_mcast_addr* **net_if_ipv6_maddr_add**(struct *net_if* *iface, const struct *in6_addr* *addr)

Add a IPv6 multicast address to an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv6 multicast address

Returns
Pointer to interface multicast address, NULL if cannot be added

bool **net_if_ipv6_maddr_rm**(struct *net_if* *iface, const struct *in6_addr* *addr)

Remove an IPv6 multicast address from an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv6 multicast address

Returns
True if successfully removed, false otherwise

void **net_if_ipv6_maddr_foreach**(struct *net_if* *iface, *net_if_ip_maddr_cb_t* cb, void *user_data)

Go through all IPv6 multicast addresses on a network interface and call callback for each used address.

Parameters

- **iface** – Pointer to the network interface
- **cb** – User-supplied callback function to call
- **user_data** – User specified data

struct *net_if_mcast_addr* **net_if_ipv6_maddr_lookup**(const struct *in6_addr* *addr, struct *net_if* **iface)

Check if this IPv6 multicast address belongs to a specific interface or one of the interfaces.

Parameters

- **addr** – IPv6 address
- **iface** – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

Returns
Pointer to interface multicast address, NULL if not found.

void **net_if_mcast_mon_register**(struct *net_if_mcast_monitor* *mon, struct *net_if* *iface, *net_if_mcast_callback_t* cb)

Register a multicast monitor.

Parameters

- **mon** – Monitor handle. This is a pointer to a monitor storage structure which should be allocated by caller, but does not need to be initialized.
- **iface** – Network interface or NULL for all interfaces
- **cb** – Monitor callback

void **net_if_mcast_mon_unregister**(struct *net_if_mcast_monitor* *mon)

Unregister a multicast monitor.

Parameters

- **mon** – Monitor handle

void **net_if_mcast_monitor**(struct *net_if* *iface, const struct net_addr *addr, bool is_joined)

Call registered multicast monitors.

Parameters

- **iface** – Network interface
- **addr** – Multicast address
- **is_joined** – Is this multicast address group joined (true) or not (false)

void **net_if_ipv6_maddr_join**(struct *net_if* *iface, struct *net_if_mcast_addr* *addr)

Mark a given multicast address to be joined.

Parameters

- **iface** – Network interface the address belongs to
- **addr** – IPv6 multicast address

static inline bool **net_if_ipv6_maddr_is_joined**(struct *net_if_mcast_addr* *addr)

Check if given multicast address is joined or not.

Parameters

- **addr** – IPv6 multicast address

Returns

True if address is joined, False otherwise.

void **net_if_ipv6_maddr_leave**(struct *net_if* *iface, struct *net_if_mcast_addr* *addr)

Mark a given multicast address to be left.

Parameters

- **iface** – Network interface the address belongs to
- **addr** – IPv6 multicast address

struct *net_if_ipv6_prefix* ***net_if_ipv6_prefix_get**(struct *net_if* *iface, const struct *in6_addr* *addr)

Return prefix that corresponds to this IPv6 address.

Parameters

- **iface** – Network interface
- **addr** – IPv6 address

Returns

Pointer to prefix, NULL if not found.

struct *net_if_ipv6_prefix* ***net_if_ipv6_prefix_lookup**(struct *net_if* *iface, struct *in6_addr* *addr, uint8_t len)

Check if this IPv6 prefix belongs to this interface.

Parameters

- **iface** – Network interface
- **addr** – IPv6 address
- **len** – Prefix length

Returns
Pointer to prefix, NULL if not found.

struct *net_if_ipv6_prefix* ***net_if_ipv6_prefix_add**(struct *net_if* *iface, struct *in6_addr* *prefix, uint8_t len, uint32_t lifetime)

Add a IPv6 prefix to an network interface.

Parameters

- **iface** – Network interface
- **prefix** – IPv6 address
- **len** – Prefix length
- **lifetime** – Prefix lifetime in seconds

Returns
Pointer to prefix, NULL if the prefix was not added.

bool **net_if_ipv6_prefix_rm**(struct *net_if* *iface, struct *in6_addr* *addr, uint8_t len)

Remove an IPv6 prefix from an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv6 prefix address
- **len** – Prefix length

Returns
True if successfully removed, false otherwise

static inline void **net_if_ipv6_prefix_set_lf**(struct *net_if_ipv6_prefix* *prefix, bool is_infinite)

Set the infinite status of the prefix.

Parameters

- **prefix** – IPv6 address
- **is_infinite** – Infinite status

void **net_if_ipv6_prefix_set_timer**(struct *net_if_ipv6_prefix* *prefix, uint32_t lifetime)

Set the prefix lifetime timer.

Parameters

- **prefix** – IPv6 address
- **lifetime** – Prefix lifetime in seconds

void **net_if_ipv6_prefix_unset_timer**(struct *net_if_ipv6_prefix* *prefix)

Unset the prefix lifetime timer.

Parameters

- **prefix** – IPv6 address

bool **net_if_ipv6_addr_onlink**(struct *net_if* **iface, struct *in6_addr* *addr)

Check if this IPv6 address is part of the subnet of our network interface.

Parameters

- **iface** – Network interface. This is returned to the caller. The iface can be NULL in which case we check all the interfaces.
- **addr** – IPv6 address

Returns
True if address is part of our subnet, false otherwise

static inline struct *in6_addr* ***net_if_router_ipv6**(struct *net_if_router* *router)
Get the IPv6 address of the given router.

Parameters

- **router** – a network router

Returns
pointer to the IPv6 address, or NULL if none

struct *net_if_router* ***net_if_ipv6_router_lookup**(struct *net_if* *iface, struct *in6_addr* *addr)
Check if IPv6 address is one of the routers configured in the system.

Parameters

- **iface** – Network interface
- **addr** – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

struct *net_if_router* ***net_if_ipv6_router_find_default**(struct *net_if* *iface, struct *in6_addr* *addr)
Find default router for this IPv6 address.

Parameters

- **iface** – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
- **addr** – IPv6 address

Returns
Pointer to router information, NULL if cannot be found

void **net_if_ipv6_router_update_lifetime**(struct *net_if_router* *router, uint16_t lifetime)
Update validity lifetime time of a router.

Parameters

- **router** – Network IPv6 address
- **lifetime** – Lifetime of this router.

struct *net_if_router* ***net_if_ipv6_router_add**(struct *net_if* *iface, struct *in6_addr* *addr, uint16_t router_lifetime)
Add IPv6 router to the system.

Parameters

- **iface** – Network interface
- **addr** – IPv6 address
- **router_lifetime** – Lifetime of the router

Returns
Pointer to router information, NULL if could not be added

bool **net_if_ipv6_router_rm**(struct *net_if_router* *router)
Remove IPv6 router from the system.

Parameters

- **router** – Router information.

Returns
True if successfully removed, false otherwise

uint8_t **net_if_ipv6_get_hop_limit**(struct *net_if* *iface)

Get IPv6 hop limit specified for a given interface.

This is the default value but can be overridden by the user.

Parameters

- **iface** – Network interface

Returns
Hop limit

void **net_if_ipv6_set_hop_limit**(struct *net_if* *iface, uint8_t hop_limit)

Set the default IPv6 hop limit of a given interface.

Parameters

- **iface** – Network interface
- **hop_limit** – New hop limit

uint8_t **net_if_ipv6_get_mcast_hop_limit**(struct *net_if* *iface)

Get IPv6 multicast hop limit specified for a given interface.

This is the default value but can be overridden by the user.

Parameters

- **iface** – Network interface

Returns
Hop limit

void **net_if_ipv6_set_mcast_hop_limit**(struct *net_if* *iface, uint8_t hop_limit)

Set the default IPv6 multicast hop limit of a given interface.

Parameters

- **iface** – Network interface
- **hop_limit** – New hop limit

static inline void **net_if_ipv6_set_base_reachable_time**(struct *net_if* *iface, uint32_t reachable_time)

Set IPv6 reachable time for a given interface.

Parameters

- **iface** – Network interface
- **reachable_time** – New reachable time

static inline uint32_t **net_if_ipv6_get_reachable_time**(struct *net_if* *iface)

Get IPv6 reachable timeout specified for a given interface.

Parameters

- **iface** – Network interface

Returns
Reachable timeout

uint32_t **net_if_ipv6_calc_reachable_time**(struct *net_if_ipv6* *ipv6)

Calculate next reachable time value for IPv6 reachable time.

Parameters

- **ipv6** – IPv6 address configuration

Returns
Reachable time

static inline void **net_if_ipv6_set_reachable_time**(struct *net_if_ipv6* *ipv6)

Set IPv6 reachable time for a given interface.

This requires that base reachable time is set for the interface.

Parameters

- **ipv6** – IPv6 address configuration

static inline void **net_if_ipv6_set_retrans_timer**(struct *net_if* *iface, uint32_t retrans_timer)

Set IPv6 retransmit timer for a given interface.

Parameters

- **iface** – Network interface
- **retrans_timer** – New retransmit timer

static inline uint32_t **net_if_ipv6_get_retrans_timer**(struct *net_if* *iface)

Get IPv6 retransmit timer specified for a given interface.

Parameters

- **iface** – Network interface

Returns
Retransmit timer

static inline const struct *in6_addr* ***net_if_ipv6_select_src_addr**(struct *net_if* *iface, const struct *in6_addr* *dst)

Get a IPv6 source address that should be used when sending network data to destination.

Parameters

- **iface** – Interface that was used when packet was received. If the interface is not known, then NULL can be given.
- **dst** – IPv6 destination address

Returns
Pointer to IPv6 address to use, NULL if no IPv6 address could be found.

static inline const struct *in6_addr* ***net_if_ipv6_select_src_addr_hint**(struct *net_if* *iface, const struct *in6_addr* *dst, int flags)

Get a IPv6 source address that should be used when sending network data to destination.

Use a hint set to the socket to select the proper address.

Parameters

- **iface** – Interface that was used when packet was received. If the interface is not known, then NULL can be given.

- **dst** – IPv6 destination address
- **flags** – Hint from the related socket. See RFC 5014 for value details.

Returns
Pointer to IPv6 address to use, NULL if no IPv6 address could be found.

static inline struct *net_if* ***net_if_ipv6_select_src_iface**(const struct *in6_addr* *dst)

Get a network interface that should be used when sending IPv6 network data to destination.

Parameters

- **dst** – IPv6 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

struct *in6_addr* ***net_if_ipv6_get_ll**(struct *net_if* *iface, enum *net_addr_state* addr_state)

Get a IPv6 link local address in a given state.

Parameters

- **iface** – Interface to use. Must be a valid pointer to an interface.
- **addr_state** – IPv6 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv6 address, NULL if no proper IPv6 address could be found.

struct *in6_addr* ***net_if_ipv6_get_ll_addr**(enum *net_addr_state* state, struct *net_if* **iface)

Return link local IPv6 address from the first interface that has a link local address matching give state.

Parameters

- **state** – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
- **iface** – Pointer to interface is returned

Returns
Pointer to IPv6 address, NULL if not found.

void **net_if_ipv6_dad_failed**(struct *net_if* *iface, const struct *in6_addr* *addr)

Stop IPv6 Duplicate Address Detection (DAD) procedure if we find out that our IPv6 address is already in use.

Parameters

- **iface** – Interface where the DAD was running.
- **addr** – IPv6 address that failed DAD

struct *in6_addr* ***net_if_ipv6_get_global_addr**(enum *net_addr_state* state, struct *net_if* **iface)

Return global IPv6 address from the first interface that has a global IPv6 address matching the given state.

Parameters

- **state** – IPv6 address state (ANY, TENTATIVE, PREFERRED, DEPRECATED)
- **iface** – Caller can give an interface to check. If iface is set to NULL, then all the interfaces are checked. Pointer to interface where the IPv6 address is defined is returned to the caller.

Returns
Pointer to IPv6 address, NULL if not found.

int **net_if_config_ipv4_get**(struct *net_if* *iface, struct *net_if_ipv4* **ipv4)
Allocate network interface IPv4 config.

This function will allocate new IPv4 config.

Parameters
- **iface** – Interface to use.
- **ipv4** – Pointer to allocated IPv4 struct is returned to caller.

Returns
0 if ok, <0 if error

int **net_if_config_ipv4_put**(struct *net_if* *iface)
Release network interface IPv4 config.

Parameters
- **iface** – Interface to use.

Returns
0 if ok, <0 if error

uint8_t **net_if_ipv4_get_ttl**(struct *net_if* *iface)
Get IPv4 time-to-live value specified for a given interface.

Parameters
- **iface** – Network interface

Returns
Time-to-live

void **net_if_ipv4_set_ttl**(struct *net_if* *iface, uint8_t ttl)
Set IPv4 time-to-live value specified to a given interface.

Parameters
- **iface** – Network interface
- **ttl** – Time-to-live value

uint8_t **net_if_ipv4_get_mcast_ttl**(struct *net_if* *iface)
Get IPv4 multicast time-to-live value specified for a given interface.

Parameters
- **iface** – Network interface

Returns
Time-to-live

void **net_if_ipv4_set_mcast_ttl**(struct *net_if* *iface, uint8_t ttl)
Set IPv4 multicast time-to-live value specified to a given interface.

Parameters
- **iface** – Network interface
- **ttl** – Time-to-live value

struct *net_if_addr* ***net_if_ipv4_addr_lookup**(const struct *in_addr* *addr, struct *net_if* **iface)
Check if this IPv4 address belongs to one of the interfaces.

Parameters

- **addr** – IPv4 address
- **iface** – Interface is returned

Returns
Pointer to interface address, NULL if not found.

struct *net_if_addr* ***net_if_ipv4_addr_add**(struct *net_if* *iface, struct *in_addr* *addr, enum *net_addr_type* addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv4 address
- **addr_type** – IPv4 address type
- **vlifetime** – Validity time for this address

Returns
Pointer to interface address, NULL if cannot be added

bool **net_if_ipv4_addr_rm**(struct *net_if* *iface, const struct *in_addr* *addr)

Remove a IPv4 address from an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv4 address

Returns
True if successfully removed, false otherwise

int **net_if_ipv4_addr_lookup_by_index**(const struct *in_addr* *addr)

Check if this IPv4 address belongs to one of the interface indices.

Parameters

- **addr** – IPv4 address

Returns
>0 if address was found in given network interface index, all other values mean address was not found

bool **net_if_ipv4_addr_add_by_index**(int index, struct *in_addr* *addr, enum *net_addr_type* addr_type, uint32_t vlifetime)

Add a IPv4 address to an interface by network interface index.

Parameters

- **index** – Network interface index
- **addr** – IPv4 address
- **addr_type** – IPv4 address type
- **vlifetime** – Validity time for this address

Returns
True if ok, false if the address could not be added

bool **net_if_ipv4_addr_rm_by_index**(int index, const struct *in_addr* *addr)

Remove a IPv4 address from an interface by interface index.

Parameters

- **index** – Network interface index

- **addr** – IPv4 address

Returns
True if successfully removed, false otherwise

void **net_if_ipv4_addr_foreach**(struct *net_if* *iface, *net_if_ip_addr_cb_t* cb, void *user_data)

Go through all IPv4 addresses on a network interface and call callback for each used address.

Parameters

- **iface** – Pointer to the network interface
- **cb** – User-supplied callback function to call
- **user_data** – User specified data

struct *net_if_mcast_addr* ***net_if_ipv4_maddr_add**(struct *net_if* *iface, const struct *in_addr* *addr)

Add a IPv4 multicast address to an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv4 multicast address

Returns
Pointer to interface multicast address, NULL if cannot be added

bool **net_if_ipv4_maddr_rm**(struct *net_if* *iface, const struct *in_addr* *addr)

Remove an IPv4 multicast address from an interface.

Parameters

- **iface** – Network interface
- **addr** – IPv4 multicast address

Returns
True if successfully removed, false otherwise

void **net_if_ipv4_maddr_foreach**(struct *net_if* *iface, *net_if_ip_maddr_cb_t* cb, void *user_data)

Go through all IPv4 multicast addresses on a network interface and call callback for each used address.

Parameters

- **iface** – Pointer to the network interface
- **cb** – User-supplied callback function to call
- **user_data** – User specified data

struct *net_if_mcast_addr* ***net_if_ipv4_maddr_lookup**(const struct *in_addr* *addr, struct *net_if* **iface)

Check if this IPv4 multicast address belongs to a specific interface or one of the interfaces.

Parameters

- **addr** – IPv4 address
- **iface** – If *iface is null, then pointer to interface is returned, otherwise the *iface value needs to be matched.

Returns
Pointer to interface multicast address, NULL if not found.

void **net_if_ipv4_maddr_join**(struct *net_if* *iface, struct *net_if_mcast_addr* *addr)

Mark a given multicast address to be joined.

Parameters

- **iface** – Network interface the address belongs to
- **addr** – IPv4 multicast address

static inline bool **net_if_ipv4_maddr_is_joined**(struct *net_if_mcast_addr* *addr)

Check if given multicast address is joined or not.

Parameters

- **addr** – IPv4 multicast address

Returns

True if address is joined, False otherwise.

void **net_if_ipv4_maddr_leave**(struct *net_if* *iface, struct *net_if_mcast_addr* *addr)

Mark a given multicast address to be left.

Parameters

- **iface** – Network interface the address belongs to
- **addr** – IPv4 multicast address

static inline struct *in_addr* ***net_if_router_ipv4**(struct *net_if_router* *router)

Get the IPv4 address of the given router.

Parameters

- **router** – a network router

Returns

pointer to the IPv4 address, or NULL if none

struct *net_if_router* ***net_if_ipv4_router_lookup**(struct *net_if* *iface, struct *in_addr* *addr)

Check if IPv4 address is one of the routers configured in the system.

Parameters

- **iface** – Network interface
- **addr** – IPv4 address

Returns

Pointer to router information, NULL if cannot be found

struct *net_if_router* ***net_if_ipv4_router_find_default**(struct *net_if* *iface, struct *in_addr* *addr)

Find default router for this IPv4 address.

Parameters

- **iface** – Network interface. This can be NULL in which case we go through all the network interfaces to find a suitable router.
- **addr** – IPv4 address

Returns

Pointer to router information, NULL if cannot be found

struct *net_if_router* ***net_if_ipv4_router_add**(struct *net_if* *iface, struct *in_addr* *addr, bool is_default, uint16_t router_lifetime)

Add IPv4 router to the system.

Parameters

- **iface** – Network interface
- **addr** – IPv4 address
- **is_default** – Is this router the default one
- **router_lifetime** – Lifetime of the router

Returns
Pointer to router information, NULL if could not be added

bool **net_if_ipv4_router_rm**(struct *net_if_router* *router)

Remove IPv4 router from the system.

Parameters

- **router** – Router information.

Returns
True if successfully removed, false otherwise

bool **net_if_ipv4_addr_mask_cmp**(struct *net_if* *iface, const struct *in_addr* *addr)

Check if the given IPv4 address belongs to local subnet.

Parameters

- **iface** – Interface to use. Must be a valid pointer to an interface.
- **addr** – IPv4 address

Returns
True if address is part of local subnet, false otherwise.

bool **net_if_ipv4_is_addr_bcast**(struct *net_if* *iface, const struct *in_addr* *addr)

Check if the given IPv4 address is a broadcast address.

Parameters

- **iface** – Interface to use. Must be a valid pointer to an interface.
- **addr** – IPv4 address, this should be in network byte order

Returns
True if address is a broadcast address, false otherwise.

static inline struct *net_if* ***net_if_ipv4_select_src_iface**(const struct *in_addr* *dst)

Get a network interface that should be used when sending IPv4 network data to destination.

Parameters

- **dst** – IPv4 destination address

Returns
Pointer to network interface to use, NULL if no suitable interface could be found.

static inline const struct *in_addr* ***net_if_ipv4_select_src_addr**(struct *net_if* *iface, const struct *in_addr* *dst)

Get a IPv4 source address that should be used when sending network data to destination.

Parameters

- **iface** – Interface to use when sending the packet. If the interface is not known, then NULL can be given.
- **dst** – IPv4 destination address

Returns
Pointer to IPv4 address to use, NULL if no IPv4 address could be found.

struct *in_addr* *`net_if_ipv4_get_ll`(struct *net_if* *iface, enum *net_addr_state* addr_state)

Get a IPv4 link local address in a given state.

Parameters

- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr_state` – IPv4 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

struct *in_addr* *`net_if_ipv4_get_global_addr`(struct *net_if* *iface, enum *net_addr_state* addr_state)

Get a IPv4 global address in a given state.

Parameters

- `iface` – Interface to use. Must be a valid pointer to an interface.
- `addr_state` – IPv4 address state (preferred, tentative, deprecated)

Returns
Pointer to link local IPv4 address, NULL if no proper IPv4 address could be found.

struct *in_addr* `net_if_ipv4_get_netmask_by_addr`(struct *net_if* *iface, const struct *in_addr* *addr)

Get IPv4 netmask related to an address of an interface.

Parameters

- `iface` – Interface to use.
- `addr` – IPv4 address to check.

Returns
The netmask set on the interface related to the give address, unspecified address if not found.

struct *in_addr* `net_if_ipv4_get_netmask`(struct *net_if* *iface)

Get IPv4 netmask of an interface.

Deprecated:
Use *net_if_ipv4_get_netmask_by_addr()* instead.

Parameters

- `iface` – Interface to use.

Returns
The netmask set on the interface, unspecified address if not found.

void `net_if_ipv4_set_netmask`(struct *net_if* *iface, const struct *in_addr* *netmask)

Set IPv4 netmask for an interface.

Deprecated:
Use *net_if_ipv4_set_netmask_by_addr()* instead.

Parameters

- `iface` – Interface to use.
- `netmask` – IPv4 netmask

bool `net_if_ipv4_set_netmask_by_index`(int index, const struct *in_addr* *netmask)

Set IPv4 netmask for an interface index.

Deprecated:

Use *net_if_ipv4_set_netmask_by_addr()* instead.

Parameters

- `index` – Network interface index
- `netmask` – IPv4 netmask

Returns

True if netmask was added, false otherwise.

bool `net_if_ipv4_set_netmask_by_addr_by_index`(int index, const struct *in_addr* *addr, const struct *in_addr* *netmask)

Set IPv4 netmask for an interface index for a given address.

Parameters

- `index` – Network interface index
- `addr` – IPv4 address related to this netmask
- `netmask` – IPv4 netmask

Returns

True if netmask was added, false otherwise.

bool `net_if_ipv4_set_netmask_by_addr`(struct *net_if* *iface, const struct *in_addr* *addr, const struct *in_addr* *netmask)

Set IPv4 netmask for an interface index for a given address.

Parameters

- `iface` – Network interface
- `addr` – IPv4 address related to this netmask
- `netmask` – IPv4 netmask

Returns

True if netmask was added, false otherwise.

struct *in_addr* `net_if_ipv4_get_gw`(struct *net_if* *iface)

Get IPv4 gateway of an interface.

Parameters

- `iface` – Interface to use.

Returns

The gateway set on the interface, unspecified address if not found.

void `net_if_ipv4_set_gw`(struct *net_if* *iface, const struct *in_addr* *gw)

Set IPv4 gateway for an interface.

Parameters

- `iface` – Interface to use.

- **gw** – IPv4 address of an gateway

bool **net_if_ipv4_set_gw_by_index**(int index, const struct *in_addr* *gw)

Set IPv4 gateway for an interface index.

Parameters

- **index** – Network interface index
- **gw** – IPv4 address of an gateway

Returns

True if gateway was added, false otherwise.

struct *net_if* ***net_if_select_src_iface**(const struct *sockaddr* *dst)

Get a network interface that should be used when sending IPv6 or IPv4 network data to destination.

Parameters

- **dst** – IPv6 or IPv4 destination address

Returns

Pointer to network interface to use. Note that the function will return the default network interface if the best network interface is not found.

void **net_if_register_link_cb**(struct *net_if_link_cb* *link, *net_if_link_callback_t* cb)

Register a link callback.

Parameters

- **link** – Caller specified handler for the callback.
- **cb** – Callback to register.

void **net_if_unregister_link_cb**(struct *net_if_link_cb* *link)

Unregister a link callback.

Parameters

- **link** – Caller specified handler for the callback.

void **net_if_call_link_cb**(struct *net_if* *iface, struct *net_linkaddr* *lladdr, int status)

Call a link callback function.

Parameters

- **iface** – Network interface.
- **lladdr** – Destination link layer address
- **status** – 0 is ok, < 0 error

bool **net_if_need_calc_rx_checksum**(struct *net_if* *iface, enum *net_if_checksum_type* chksum_type)

Check if received network packet checksum calculation can be avoided or not.

For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters

- **iface** – Network interface
- **chksum_type** – L3 and/or L4 protocol for which to compute checksum

Returns

True if checksum needs to be calculated, false otherwise.

bool **net_if_need_calc_tx_checksum**(struct *net_if* *iface, enum *net_if_checksum_type* chksum_type)

Check if network packet checksum calculation can be avoided or not when sending the packet.

For example many ethernet devices support network packet offloading in which case the IP stack does not need to calculate the checksum.

Parameters

- **iface** – Network interface
- **chksum_type** – L3 and/or L4 protocol for which to compute checksum

Returns
True if checksum needs to be calculated, false otherwise.

struct *net_if* ***net_if_get_by_index**(int index)

Get interface according to index.

This is a syscall only to provide access to the object for purposes of assigning permissions.

Parameters

- **index** – Interface index

Returns
Pointer to interface or NULL if not found.

int **net_if_get_by_iface**(struct *net_if* *iface)

Get interface index according to pointer.

Parameters

- **iface** – Pointer to network interface

Returns
Interface index

void **net_if_foreach**(*net_if_cb_t* cb, void *user_data)

Go through all the network interfaces and call callback for each interface.

Parameters

- **cb** – User-supplied callback function to call
- **user_data** – User specified data

int **net_if_up**(struct *net_if* *iface)

Bring interface up.

Parameters

- **iface** – Pointer to network interface

Returns
0 on success

static inline bool **net_if_is_up**(struct *net_if* *iface)

Check if interface is up and running.

Parameters

- **iface** – Pointer to network interface

Returns
True if interface is up, False if it is down.

int **net_if_down**(struct *net_if* *iface)

Bring interface down.

Parameters

- **iface** – Pointer to network interface

Returns

0 on success

static inline bool **net_if_is_admin_up**(struct *net_if* *iface)

Check if interface was brought up by the administrator.

Parameters

- **iface** – Pointer to network interface

Returns

True if interface is admin up, false otherwise.

void **net_if_carrier_on**(struct *net_if* *iface)

Underlying network device has detected the carrier (cable connected).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters

- **iface** – Pointer to network interface

void **net_if_carrier_off**(struct *net_if* *iface)

Underlying network device has lost the carrier (cable disconnected).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters

- **iface** – Pointer to network interface

static inline bool **net_if_is_carrier_ok**(struct *net_if* *iface)

Check if carrier is present on network device.

Parameters

- **iface** – Pointer to network interface

Returns

True if carrier is present, false otherwise.

void **net_if_dormant_on**(struct *net_if* *iface)

Mark interface as dormant.

Dormant state indicates that the interface is not ready to pass packets yet, but is waiting for some event (for example Wi-Fi network association).

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters

- **iface** – Pointer to network interface

void **net_if_dormant_off**(struct *net_if* *iface)

Mark interface as not dormant.

The function should be used by the respective network device driver or L2 implementation to update its state on a network interface.

Parameters

- **iface** – Pointer to network interface

static inline bool **net_if_is_dormant**(struct *net_if* *iface)

Check if the interface is dormant.

Parameters

- **iface** – Pointer to network interface

Returns

True if interface is dormant, false otherwise.

static inline int **net_if_set_promisc**(struct *net_if* *iface)

Set network interface into promiscuous mode.

Note that not all network technologies will support this.

Parameters

- **iface** – Pointer to network interface

Returns

0 on success, <0 if error

static inline void **net_if_unset_promisc**(struct *net_if* *iface)

Set network interface into normal mode.

Parameters

- **iface** – Pointer to network interface

static inline bool **net_if_is_promisc**(struct *net_if* *iface)

Check if promiscuous mode is set or not.

Parameters

- **iface** – Pointer to network interface

Returns

True if interface is in promisc mode, False if interface is not in promiscuous mode.

static inline bool **net_if_are_pending_tx_packets**(struct *net_if* *iface)

Check if there are any pending TX network data for a given network interface.

Parameters

- **iface** – Pointer to network interface

Returns

True if there are pending TX network packets for this network interface, False otherwise.

bool **net_if_is_wifi**(struct *net_if* *iface)

Check if the network interface supports Wi-Fi.

Parameters

- **iface** – Pointer to network interface

Returns

True if interface supports Wi-Fi, False otherwise.

struct *net_if* ***net_if_get_first_wifi**(void)

Get first Wi-Fi network interface.

Returns

Pointer to network interface, NULL if not found.

struct *net_if* *net_if_get_wifi_sta(void)

Get Wi-Fi network station interface.

Returns
Pointer to network interface, NULL if not found.

struct *net_if* *net_if_get_wifi_sap(void)

Get first Wi-Fi network Soft-AP interface.

Returns
Pointer to network interface, NULL if not found.

int net_if_get_name(struct *net_if* *iface, char *buf, int len)

Get network interface name.

If interface name support is not enabled, empty string is returned.

Parameters

- iface – Pointer to network interface
- buf – User supplied buffer
- len – Length of the user supplied buffer

Returns
Length of the interface name copied to buf, -EINVAL if invalid parameters, -ERANGE if name cannot be copied to the user supplied buffer, -ENOTSUP if interface name support is disabled,

int net_if_set_name(struct *net_if* *iface, const char *buf)

Set network interface name.

Normally this function is not needed to call as the system will automatically assign a name to the network interface.

Parameters

- iface – Pointer to network interface
- buf – User supplied name

Returns
0 name is set correctly -ENOTSUP interface name support is disabled -EINVAL if invalid parameters are given, -ENAMETOOLONG if name is too long

int net_if_get_by_name(const char *name)

Get interface index according to its name.

Parameters

- name – Name of the network interface

Returns
Interface index

struct net_if_addr

#include <net_if.h> Network Interface unicast IP addresses.

Stores the unicast IP addresses assigned to this network interface.

Public Members

struct net_addr **address**

IP address.

atomic_t **atomic_ref**

Reference counter.

This is used to prevent address removal if there are sockets that have bound the local endpoint to this address.

enum *net_addr_type* **addr_type**

How the IP address was set.

enum *net_addr_state* **addr_state**

What is the current state of the address.

uint8_t **is_infinite**

Is the IP address valid forever.

uint8_t **is_used**

Is this IP address used or not.

uint8_t **is_mesh_local**

Is this IP address usage limited to the subnet (mesh) or not.

uint8_t **is_temporary**

Is this IP address temporary and generated for example by IPv6 privacy extension (RFC 8981)

struct **net_if_mcast_addr**

#include <*net_if.h*> Network Interface multicast IP addresses.

Stores the multicast IP addresses assigned to this network interface.

Public Members

struct net_addr **address**

IP address.

uint8_t **is_used**

Is this multicast IP address used or not.

uint8_t **is_joined**

Did we join to this group.

struct **net_if_ipv6_prefix**

#include <*net_if.h*> Network Interface IPv6 prefixes.

Stores the IPV6 prefixes assigned to this network interface.

Public Members

struct *net_timeout* **lifetime**
Prefix lifetime.

struct *in6_addr* **prefix**
IPv6 prefix.

struct *net_if* ***iface**
Backpointer to network interface where this prefix is used.

uint8_t **len**
Prefix length.

uint8_t **is_infinite**
Is the IP prefix valid forever.

uint8_t **is_used**
Is this prefix used or not.

struct **net_if_router**
#include <net_if.h> Information about routers in the system.

Stores the router information.

Public Members

sys_snode_t **node**
Slist lifetime timer node.

struct net_addr **address**
IP address.

struct *net_if* ***iface**
Network interface the router is connected to.

uint32_t **life_start**
Router life timer start.

uint16_t **lifetime**
Router lifetime.

uint8_t **is_used**
Is this router used or not.

uint8_t **is_default**
Is default router.

uint8_t **is_infinite**
Is the router valid forever.

struct **net_if_ipv6**
#include <net_if.h> IPv6 configuration.

Public Members

struct *net_if_addr* **unicast**[NET_IF_MAX_IPV6_ADDR]
Unicast IP addresses.

struct *net_if_mcast_addr* **mcast**[NET_IF_MAX_IPV6_MADDR]
Multicast IP addresses.

struct *net_if_ipv6_prefix* **prefix**[NET_IF_MAX_IPV6_PREFIX]
Prefixes.

uint32_t **base_reachable_time**
Default reachable time (RFC 4861, page 52)

uint32_t **reachable_time**
Reachable time (RFC 4861, page 20)

uint32_t **retrans_timer**
Retransmit timer (RFC 4861, page 52)

uint8_t **hop_limit**
IPv6 hop limit.

uint8_t **mcast_hop_limit**
IPv6 multicast hop limit.

struct **net_if_addr_ipv4**
#include <net_if.h> Network Interface unicast IPv4 address and netmask.
Stores the unicast IPv4 address and related netmask.

Public Members

struct *net_if_addr* **ipv4**
IPv4 address.

struct *in_addr* **netmask**
Netmask.

struct **net_if_ipv4**
#include <net_if.h> IPv4 configuration.

Public Members

struct *net_if_addr_ipv4* **unicast**[NET_IF_MAX_IPV4_ADDR]
Unicast IP addresses.

struct *net_if_mcast_addr* **mcast**[NET_IF_MAX_IPV4_MADDR]
Multicast IP addresses.

struct *in_addr* **gw**
Gateway.

uint8_t **ttl**
IPv4 time-to-live.

uint8_t **mcast_ttl**
IPv4 time-to-live for multicast packets.

struct **net_if_ip**
#include <*net_if.h*> Network interface IP address configuration.

struct **net_if_config**
#include <*net_if.h*> IP and other configuration related data for network interface.

struct **net_traffic_class**
#include <*net_if.h*> Network traffic class.

Traffic classes are used when sending or receiving data that is classified with different priorities. So some traffic can be marked as high priority and it will be sent or received first. Each network packet that is transmitted or received goes through a fifo to a thread that will transmit it.

Public Members

struct k_fifo **fifo**
Fifo for handling this Tx or Rx packet.

struct *k_thread* **handler**
Traffic class handler thread.

k_thread_stack_t ***stack**
Stack for this handler.

struct **net_if_dev**
#include <*net_if.h*> Network Interface Device structure.

Used to handle a network interface on top of a device driver instance. There can be many *net_if_dev* instance against the same device.

Such interface is mainly to be used by the link layer, but is also tight to a network context: it then makes the relation with a network context and the network device.

Because of the strong relationship between a device driver and such network interface, each *net_if_dev* should be instantiated by one of the network device init macros found in net_if.h.

Public Members

const struct *device* *dev
: The actually device driver instance the *net_if* is related to.

const struct *net_l2* *const l2
: Interface's L2 layer.

void *l2_data
: Interface's private L2 data pointer.

atomic_t flags[*ATOMIC_BITMAP_SIZE*(NET_IF_NUM_FLAGS)]
: For internal use.

struct *net_linkaddr* link_addr
: The hardware link address.

uint16_t mtu
: The hardware MTU.

enum *net_if_oper_state* oper_state
: RFC 2863 operational status.

struct net_if
: *#include <net_if.h>* Network Interface structure.

Used to handle a network interface on top of a *net_if_dev* instance. There can be many *net_if* instance against the same *net_if_dev* instance.

Public Members

struct *net_if_dev* *if_dev
: The *net_if_dev* instance the *net_if* is related to.

struct *net_if_config* config
: Network interface instance configuration.

struct *k_mutex* lock
: Mutex protecting this network interface instance.

struct *k_mutex* tx_lock
: Mutex used when sending data.

uint8_t **pe_enabled**

Network interface specific flags.

Enable IPv6 privacy extension (RFC 8981), this is enabled by default if PE support is enabled in configuration.

uint8_t **pe_prefer_public**

If PE is enabled, then this tells whether public addresses are preferred over temporary ones for this interface.

struct **net_if_mcast_monitor**

#include <net_if.h> Multicast monitor handler struct.

Stores the multicast callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snode_t **node**

Node information for the slist.

struct *net_if* ***iface**

Network interface.

net_if_mcast_callback_t **cb**

Multicast callback.

struct **net_if_link_cb**

#include <net_if.h> Link callback handler struct.

Stores the link callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snode_t **node**

Node information for the slist.

net_if_link_callback_t **cb**

Link callback.

L2 Layer Management

- *Overview*
- *L2 layer API*

- *Network Device drivers*
  - *Ethernet device driver*
  - *IEEE 802.15.4 device driver*
- *API Reference*

Overview The L2 stack is designed to hide the whole networking link-layer part and the related device drivers from the upper network stack. This is made through a *net_if* declared in include/zephyr/net/net_if.h.

The upper layers are unaware of implementation details beyond the net_if object and the generic API provided by the L2 layer in include/zephyr/net/net_l2.h as *net_l2*.

Only the L2 layer can talk to the device driver, linked to the net_if object. The L2 layer dictates the API provided by the device driver, specific for that device, and optimized for working together.

Currently, there are L2 layers for *Ethernet*, *IEEE 802.15.4 Soft-MAC*, *CANBUS*, *OpenThread*, Wi-Fi, and a dummy layer example that can be used as a template for writing a new one.

L2 layer API In order to create an L2 layer, or a driver for a specific L2 layer, one needs to understand how the L3 layer interacts with it and how the L2 layer is supposed to behave. See also *network stack architecture* for more details. The generic L2 API has these functions:

- `recv()`: All device drivers, once they receive a packet which they put into a *net_pkt*, will push this buffer to the network stack via *net_recv_data()*. At this point, the network stack does not know what to do with it. Instead, it passes the buffer along to the L2 stack's `recv()` function for handling. The L2 stack does what it needs to do with the packet, for example, parsing the link layer header, or handling link-layer only packets. The `recv()` function will return `NET_DROP` in case of an erroneous packet, `NET_OK` if the packet was fully consumed by the L2, or `NET_CONTINUE` if the network stack should then handle it.
- `send()`: Similar to receive function, the network stack will call this function to actually send a network packet. All relevant link-layer content will be generated and added by this function. The `send()` function returns the number of bytes sent, or a negative error code if there was a failure sending the network packet.
- `enable()`: This function is used to enable/disable traffic over a network interface. The function returns `<0` if error and `>=0` if no error.
- `get_flags()`: This function will return the capabilities of an L2 driver, for example whether the L2 supports multicast or promiscuous mode.

Network Device drivers Network device drivers fully follows Zephyr device driver model as a basis. Please refer to *Device Driver Model*.

There are, however, two differences:

- The driver_api pointer must point to a valid `net_if_api` pointer.
- The network device driver must use *NET_DEVICE_INIT_INSTANCE()* or *ETH_NET_DEVICE_INIT()* for Ethernet devices. These macros will call the *DEVICE_DEFINE()* macro, and also instantiate a unique *net_if* related to the created device driver instance.

Implementing a network device driver depends on the L2 stack it belongs to: *Ethernet*, *IEEE 802.15.4*, etc. In the next section, we will describe how a device driver should behave when receiving or sending a network packet. The rest is hardware dependent and is not detailed here.

Ethernet device driver On reception, it is up to the device driver to fill-in the network packet with as many data buffers as required. The network packet itself is a *net_pkt* and should be allocated through `net_pkt_rx_alloc_with_buffer()`. Then all data buffers will be automatically allocated and filled by *net_pkt_write()*.

After all the network data has been received, the device driver needs to call *net_recv_data()*. If that call fails, it will be up to the device driver to unreference the buffer via *net_pkt_unref()*.

On sending, the device driver send function will be called, and it is up to the device driver to send the network packet all at once, with all the buffers.

Each Ethernet device driver will need, in the end, to call `ETH_NET_DEVICE_INIT()` like this:

```
ETH_NET_DEVICE_INIT(..., CONFIG_ETH_INIT_PRIORITY,
                    &the_valid_net_if_api_instance, 1500);
```

IEEE 802.15.4 device driver Device drivers for IEEE 802.15.4 L2 work basically the same as for Ethernet. What has been described above, especially for `recv()`, applies here as well. There are two specific differences however:

- It requires a dedicated device driver API: *ieee802154_radio_api*, which overloads `net_if_api`. This is because 802.15.4 L2 needs more from the device driver than just `send()` and `recv()` functions. This dedicated API is declared in include/zephyr/net/ieee802154_radio.h. Each and every IEEE 802.15.4 device driver must provide a valid pointer on such relevantly filled-in API structure.
- Sending a packet is slightly different than in Ethernet. Most IEEE 802.15.4 PHYs support relatively small frames only, 127 bytes all inclusive: frame header, payload and frame checksum. Buffers to be sent over the radio will often not fit this frame size limitation, e.g. a buffer containing an IPv6 packet will often have to be split into several fragments and IP6 packet headers and fragments need to be compressed using a protocol like 6LoWPAN before being passed on to the radio driver. Additionally the IEEE 802.15.4 standard defines medium access (e.g. CSMA/CA), frame retransmission, encryption and other pre-processing procedures (e.g. addition of information elements) that individual radio drivers should not have to care about. This is why the *ieee802154_radio_api* requires a tx function pointer which differs from the `net_if_api` send function pointer. Zephyr's native IEEE 802.15.4 L2 implementation provides a generic `ieee802154_send()` instead, meant to be given as *net_if* send function. The implementation of `ieee802154_send()` takes care of IEEE 802.15.4 standard packet preparation procedures, splitting the packet into possibly compressed, encrypted and otherwise pre-processed fragment buffers, sending one buffer at a time through *ieee802154_radio_api* tx function and unreferencing the network packet only when the transmission as a whole was either successful or failed.

Interaction between IEEE 802.15.4 radio device drivers and L2 is bidirectional:

- L2 -> L1: Methods as `ieee802154_send()` and several IEEE 802.15.4 net management calls will call into the driver, e.g. to send a packet over the radio link or re-configure the driver at runtime. These incoming calls will all be handled by the methods in the *ieee802154_radio_api*.
- L1 -> L2: There are several situations in which the driver needs to initiate calls into the L2/MAC layer. Zephyr's IEEE 802.15.4 L1 -> L2 adaptation API employs an "inversion-of-control" pattern in such cases avoids duplication of complex logic across independent driver implementations and ensures implementation agnostic loose coupling and clean separation of concerns between MAC (L2) and PHY (L1) whenever reverse information transfer or close co-operation between hardware and L2 is required. During driver initialization, for example, the driver calls *ieee802154_init()* to pass the interface's MAC address as well as other hardware-related configuration to L2. Similarly, drivers may indicate performance or timing critical radio events to L2 that require close integration with the hardware (e.g. *ieee802154_handle_ack()*). Calls from L1 into L2 are not implemented as methods in *ieee802154_radio_api* but are standalone functions declared and documented

as such in include/zephyr/net/ieee802154_radio.h. The API documentation will clearly state which functions must be implemented by all L2 stacks as part of the L1 -> L2 "inversion-of-control" adaptation API.

Note: Standalone functions in include/zephyr/net/ieee802154_radio.h that are not explicitly documented as callbacks are considered to be helper functions within the PHY (L1) layer implemented independently of any specific L2 stack, see for example *ieee802154_is_ar_flag_set()*.

As all net interfaces, IEEE 802.15.4 device driver implementations will have to call `NET_DEVICE_INIT_INSTANCE()` in the end:

```
NET_DEVICE_INIT_INSTANCE(...,
                         the_device_init_prio,
                         &the_valid_ieee802154_radio_api_instance,
                         IEEE802154_L2,
                         NET_L2_GET_CTX_TYPE(IEEE802154_L2), 125);
```

Related code samples

Link Layer Discovery Protocol (LLDP)
Enable LLDP support and setup VLANs.

Setup two virtual LAN networks and use net-shell to view the networks' settings.

API Reference

group `net_l2`

Network Layer 2 abstraction layer.

Since
1.5

Version
1.0.0

Enums

enum `net_l2_flags`

L2 flags.

Values:

enumerator `NET_L2_MULTICAST` = *BIT*(0)

IP multicast supported.

enumerator `NET_L2_MULTICAST_SKIP_JOIN_SOLICIT_NODE` = *BIT*(1)

Do not join solicited node multicast group.

enumerator `NET_L2_PROMISC_MODE` = *BIT*(2)

Is promiscuous mode supported.

enumerator NET_L2_POINT_TO_POINT = *BIT*(3)

Is this L2 point-to-point with tunneling so no need to have IP address etc to network interface.

struct net_l2

#include <net_l2.h> Network L2 structure.

Used to provide an interface to lower network stack.

Public Members

enum *net_verdict* (*recv)(struct *net_if* *iface, struct *net_pkt* *pkt)

This function is used by net core to get iface's L2 layer parsing what's relevant to itself.

int (*send)(struct *net_if* *iface, struct *net_pkt* *pkt)

This function is used by net core to push a packet to lower layer (interface's L2), which in turn might work on the packet relevantly.

(adding proper header etc...) Returns a negative error code, or the number of bytes sent otherwise.

int (*enable)(struct *net_if* *iface, bool state)

This function is used to enable/disable traffic over a network interface.

The function returns <0 if error and >=0 if no error.

enum *net_l2_flags* (*get_flags)(struct *net_if* *iface)

Return L2 flags for the network interface.

Network Traffic Offloading

- *Network Offloading*
  - *Overview*
  - *API Reference*
- *Socket Offloading*
  - *Overview*

Network Offloading

Overview The network offloading API provides hooks that a device vendor can use to provide an alternate implementation for an IP stack. This means that the actual network connection creation, data transfer, etc., is done in the vendor HAL instead of the Zephyr network stack.

API Reference

group `net_offload`

Network offloading interface.

Since
1.7

Version
0.8.0

Socket Offloading

Overview In addition to the network offloading API, Zephyr allows offloading of networking functionality at the socket API level. With this approach, vendors who provide an alternate implementation of the networking stack, exposing socket API for their networking devices, can easily integrate it with Zephyr.

See drivers/wifi/simplelink/simplelink_sockets.c for a sample implementation on how to integrate network offloading at socket level.

Link Layer Address Handling

- *Overview*
- *API Reference*

Overview The link layer addresses are set for network interfaces so that L2 connectivity works correctly in the network stack. Typically the link layer addresses are 6 bytes long like in Ethernet but for IEEE 802.15.4 the link layer address length is 8 bytes.

API Reference

group `net_linkaddr`

Network link address library.

Since
1.0

Version
1.0.0

Defines

`NET_LINK_ADDR_MAX_LENGTH`

Maximum length of the link address.

Enums

enum **net_link_type**

Type of the link address.

This indicates the network technology that this address is used in. Note that in order to save space we store the value into a uint8_t variable, so please do not introduce any values > 255 in this enum.

Values:

enumerator **NET_LINK_UNKNOWN** = 0

Unknown link address type.

enumerator **NET_LINK_IEEE802154**

IEEE 802.15.4 link address.

enumerator **NET_LINK_BLUETOOTH**

Bluetooth IPSP link address.

enumerator **NET_LINK_ETHERNET**

Ethernet link address.

enumerator **NET_LINK_DUMMY**

Dummy link address.

Used in testing apps and loopback support.

enumerator **NET_LINK_CANBUS_RAW**

CANBUS link address.

Functions

static inline bool **net_linkaddr_cmp**(struct *net_linkaddr* *lladdr1, struct *net_linkaddr* *lladdr2)

Compare two link layer addresses.

Parameters

- **lladdr1** – Pointer to a link layer address
- **lladdr2** – Pointer to a link layer address

Returns

True if the addresses are the same, false otherwise.

static inline int **net_linkaddr_set**(struct *net_linkaddr_storage* *lladdr_store, uint8_t *new_addr, uint8_t new_len)

Set the member data of a link layer address storage structure.

Parameters

- **lladdr_store** – The link address storage structure to change.
- **new_addr** – Array of bytes containing the link address.
- **new_len** – Length of the link address array. This value should always be <= NET_LINK_ADDR_MAX_LENGTH.

struct **net_linkaddr**

#include <net_linkaddr.h> Hardware link address structure.

Used to hold the link address information

Public Members

uint8_t ***addr**

The array of byte representing the address.

uint8_t **len**

Length of that address array.

uint8_t **type**

What kind of address is this for.

struct **net_linkaddr_storage**

#include <net_linkaddr.h> Hardware link address structure.

Used to hold the link address information. This variant is needed when we have to store the link layer address.

Note that you cannot cast this to *net_linkaddr* as uint8_t * is handled differently than uint8_t addr[] and the fields are purposely in different order.

Public Members

uint8_t **type**

What kind of address is this for.

uint8_t **len**

The real length of the ll address.

uint8_t **addr**[6]

The array of bytes representing the address.

Ethernet Management

- *Overview*
- *API Reference*

Overview Ethernet management API provides functions to manage the Ethernet network interface low level status. The caller of these functions can:

- raise `carrier ON` or `carrier OFF` management events
- raise `VLAN enabled` or `VLAN disabled` management events

Typically the `carrier OFF` event would be generated by the Ethernet device driver when it notices that the Ethernet cable is disconnected. The `carrier ON` event would be generated if the Ethernet device driver notices that the Ethernet cable is re-connected.

Currently the VLAN events are generated by the Ethernet L2 layer when a specific VLAN tag is either enabled or disabled.

The user application can monitor these events if it needs to act when the corresponding status changes.

API Reference

group `ethernet_mgmt`

Ethernet library.

Since
1.12

Version
0.8.0

Functions

void `ethernet_mgmt_raise_carrier_on_event`(struct *net_if* *iface)

Raise CARRIER_ON event when Ethernet is connected.

Parameters

- `iface` – Ethernet network interface.

void `ethernet_mgmt_raise_carrier_off_event`(struct *net_if* *iface)

Raise CARRIER_OFF event when Ethernet is disconnected.

Parameters

- `iface` – Ethernet network interface.

void `ethernet_mgmt_raise_vlan_enabled_event`(struct *net_if* *iface, uint16_t tag)

Raise VLAN_ENABLED event when VLAN is enabled.

Parameters

- `iface` – Ethernet network interface.
- `tag` – VLAN tag which is enabled.

void `ethernet_mgmt_raise_vlan_disabled_event`(struct *net_if* *iface, uint16_t tag)

Raise VLAN_DISABLED event when VLAN is disabled.

Parameters

- `iface` – Ethernet network interface.
- `tag` – VLAN tag which is disabled.

Traffic Classification

Overview Traffic classification is an automated process that categorizes computer network traffic according to various parameters. For Zephyr, the VLAN priority code point (PCP) is used to classify both received and sent network packets. See more information about VLAN priority at IEEE 802.1Q.

By default, all network traffic is treated equal in Zephyr. If desired, the option `CONFIG_NET_TC_TX_COUNT` can be used to set the number of transmit queues. The option `CONFIG_NET_TC_RX_COUNT` can be used to set the number of receive queues. Each traffic class queue corresponds to a specific kernel work queue. Each kernel work queue has a priority. The VLAN priority is mapped to a certain traffic class according to rules specified in IEEE 802.1Q spec chapter I.3, chapter 8.6.6 table 8-4, and chapter 34.5 table 34-1. Each traffic class is in turn mapped to a certain kernel work queue. The maximum number of traffic classes for both Rx and Tx is 8.

See subsys/net/ip/net_tc.c for details of how various mappings are done.

Network Packet Filtering

- *Overview*
- *Examples*
- *API Reference*

Overview The Network Packet Filtering facility provides the infrastructure to construct custom rules for accepting and/or denying packet transmission and reception. This can be used to create a basic firewall, control network traffic, etc.

The `CONFIG_NET_PKT_FILTER` must be set in order to enable the relevant APIs.

Both the transmission and reception paths may have a list of filter rules. Each rule is made of a set of conditions and a packet outcome. Every packet is subjected to the conditions attached to a rule. When all the conditions for a given rule are true then the packet outcome is immediately determined as specified by the current rule and no more rules are considered. If one condition is false then the next rule in the list is considered.

Packet outcome is either `NET_OK` to accept the packet or `NET_DROP` to drop it.

A rule is represented by a *`npf_rule`* object. It can be inserted to, appended to or removed from a rule list contained in a *`npf_rule_list`* object using *`npf_insert_rule()`*, *`npf_append_rule()`*, and *`npf_remove_rule()`*. Currently, two such rule lists exist: `npf_send_rules` for outgoing packets, and `npf_recv_rules` for incoming packets.

If a filter rule list is empty then `NET_OK` is assumed. If a non-empty rule list runs to the end then `NET_DROP` is assumed. However it is recommended to always terminate a non-empty rule list with an explicit default termination rule, either `npf_default_ok` or `npf_default_drop`.

Rule conditions are represented by a *`npf_test`*. This structure can be embedded into a larger structure when a specific condition requires extra test data. It is up to the test function for such conditions to retrieve the outer structure from the provided `npf_test` structure pointer.

Convenience macros are provided in include/zephyr/net/net_pkt_filter.h to statically define condition instances for various conditions, and *`NPF_RULE()`* to create a rule instance to tie them.

Examples Here's an example usage:

```
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);
```

(continues on next page)

(continued from previous page)

```
static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to achieve the same result could be:

```
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);

static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```

API Reference

group `net_pkt_filter`

Network Packet Filter API.

Since
3.0

Version
0.8.0

Defines

`NPF_RULE`(_name, _result, ...)

Statically define one packet filter rule.

This creates a rule from a variable amount of filter conditions. This rule can then be inserted or appended to the rule list for a given network packet path.

Example:

```
static NPF_SIZE_MAX(maxsize_200, 200);
static NPF_ETH_TYPE_MATCH(ip_packet, NET_ETH_PTYPE_IP);

static NPF_RULE(small_ip_pkt, NET_OK, ip_packet, maxsize_200);

void install_my_filter(void)
{
    npf_insert_recv_rule(&npf_default_drop);
    npf_insert_recv_rule(&small_ip_pkt);
}
```

The above would accept IP packets that are 200 bytes or smaller, and drop all other packets.

Another (less efficient) way to create the same result could be:

```
static NPF_SIZE_MIN(minsize_201, 201);
static NPF_ETH_TYPE_UNMATCH(not_ip_packet, NET_ETH_PTYPE_IP);

static NPF_RULE(reject_big_pkts, NET_DROP, minsize_201);
static NPF_RULE(reject_non_ip, NET_DROP, not_ip_packet);

void install_my_filter(void) {
    npf_append_recv_rule(&reject_big_pkts);
    npf_append_recv_rule(&reject_non_ip);
    npf_append_recv_rule(&npf_default_ok);
}
```

The first rule in the list for which all conditions are true determines the fate of the packet. If one condition is false then the next rule in the list is evaluated.

Parameters

- **_name** – Name for this rule.
- **_result** – Fate of the packet if all conditions are true, either NET_OK or NET_DROP.
- **...** – List of conditions for this rule.

Functions

void **npf_insert_rule**(struct *npf_rule_list* *rules, struct *npf_rule* *rule)

Insert a rule at the front of given rule list.

Parameters

- **rules** – the affected rule list
- **rule** – the rule to be inserted

void **npf_append_rule**(struct *npf_rule_list* *rules, struct *npf_rule* *rule)

Append a rule at the end of given rule list.

Parameters

- **rules** – the affected rule list
- **rule** – the rule to be appended

bool **npf_remove_rule**(struct *npf_rule_list* *rules, struct *npf_rule* *rule)

Remove a rule from the given rule list.

Parameters

- **rules** – the affected rule list
- **rule** – the rule to be removed

Return values

true – if given rule was found in the rule list and removed

bool **npf_remove_all_rules**(struct *npf_rule_list* *rules)

Remove all rules from the given rule list.

Parameters

- **rules** – the affected rule list

Return values

true – if at least one rule was removed from the rule list

Variables

struct *npf_rule* **npf_default_ok**
Default rule list termination for accepting a packet.

struct *npf_rule* **npf_default_drop**
Default rule list termination for rejecting a packet.

struct *npf_rule_list* **npf_send_rules**
rule list applied to outgoing packets

struct *npf_rule_list* **npf_recv_rules**
rule list applied to incoming packets

struct *npf_rule_list* **npf_local_in_recv_rules**
rule list applied for local incoming packets

struct *npf_rule_list* **npf_ipv4_recv_rules**
rule list applied for IPv4 incoming packets

struct *npf_rule_list* **npf_ipv6_recv_rules**
rule list applied for IPv6 incoming packets

struct **npf_test**
#include <net_pkt_filter.h> common filter test structure to be embedded into larger structures

Public Members

npf_test_fn_t ***fn**
packet condition test function

struct **npf_rule**
#include <net_pkt_filter.h> filter rule structure

Public Members

sys_snode_t **node**
Slist rule list node.

enum *net_verdict* **result**
result if all tests pass

uint32_t **nb_tests**
number of tests for this rule

struct *npf_test* **tests[]**
pointers to *npf_test* instances

struct **npf_rule_list**
#include <net_pkt_filter.h> rule set for a given test location

Public Members

sys_slist_t **rule_head**
List head.

struct *k_spinlock* **lock**
Lock protecting the list access.

Defines

NPF_IFACE_MATCH(_name, _iface)
Statically define an “interface match” packet filter condition.

Parameters
- **_name** – Name of the condition
- **_iface** – Interface to match

NPF_IFACE_UNMATCH(_name, _iface)
Statically define an “interface unmatch” packet filter condition.

Parameters
- **_name** – Name of the condition
- **_iface** – Interface to exclude

NPF_ORIG_IFACE_MATCH(_name, _iface)
Statically define an “orig interface match” packet filter condition.

Parameters
- **_name** – Name of the condition
- **_iface** – Interface to match

NPF_ORIG_IFACE_UNMATCH(_name, _iface)
Statically define an “orig interface unmatch” packet filter condition.

Parameters
- **_name** – Name of the condition
- **_iface** – Interface to exclude

NPF_SIZE_MIN(_name, _size)

Statically define a “data minimum size” packet filter condition.

Parameters

- **_name** – Name of the condition
- **_size** – Lower bound of the packet’s data size

NPF_SIZE_MAX(_name, _size)

Statically define a “data maximum size” packet filter condition.

Parameters

- **_name** – Name of the condition
- **_size** – Higher bound of the packet’s data size

NPF_SIZE_BOUNDS(_name, _min_size, _max_size)

Statically define a “data bounded size” packet filter condition.

Parameters

- **_name** – Name of the condition
- **_min_size** – Lower bound of the packet’s data size
- **_max_size** – Higher bound of the packet’s data size

NPF_IP_SRC_ADDR_ALLOWLIST(_name, _ip_addr_array, _ip_addr_num, _af)

Statically define a “ip address allowlist” packet filter condition.

This tests if the packet source ip address matches any of the ip addresses contained in the provided set.

Parameters

- **_name** – Name of the condition
- **_ip_addr_array** – Array of struct *in_addr* or struct *in6_addr* items to test against
- **_ip_addr_num** – number of IP addresses in the array
- **_af** – Addresses family type (AF_INET / AF_INET6) in the array

NPF_IP_SRC_ADDR_BLOCKLIST(_name, _ip_addr_array, _ip_addr_num, _af)

Statically define a “ip address blocklist” packet filter condition.

This tests if the packet source ip address matches any of the ip addresses contained in the provided set.

Parameters

- **_name** – Name of the condition
- **_ip_addr_array** – Array of struct *in_addr* or struct *in6_addr* items to test against
- **_ip_addr_num** – number of IP addresses in the array
- **_af** – Addresses family type (AF_INET / AF_INET6) in the array

Defines

NPF_ETH_SRC_ADDR_MATCH(_name, _addr_array)

Statically define a “source address match” packet filter condition.

This tests if the packet source address matches any of the Ethernet addresses contained in the provided set.

Parameters

- **_name** – Name of the condition
- **_addr_array** – Array of struct *net_eth_addr* items to test against

NPF_ETH_SRC_ADDR_UNMATCH(_name, _addr_array)

Statically define a “source address unmatch” packet filter condition.

This tests if the packet source address matches none of the Ethernet addresses contained in the provided set.

Parameters

- **_name** – Name of the condition
- **_addr_array** – Array of struct *net_eth_addr* items to test against

NPF_ETH_DST_ADDR_MATCH(_name, _addr_array)

Statically define a “destination address match” packet filter condition.

This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set.

Parameters

- **_name** – Name of the condition
- **_addr_array** – Array of struct *net_eth_addr* items to test against

NPF_ETH_DST_ADDR_UNMATCH(_name, _addr_array)

Statically define a “destination address unmatch” packet filter condition.

This tests if the packet destination address matches none of the Ethernet addresses contained in the provided set.

Parameters

- **_name** – Name of the condition
- **_addr_array** – Array of struct *net_eth_addr* items to test against

NPF_ETH_SRC_ADDR_MASK_MATCH(_name, _addr_array, ...)

Statically define a “source address match with mask” packet filter condition.

This tests if the packet source address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters

- **_name** – Name of the condition
- **_addr_array** – Array of struct *net_eth_addr* items to test against
- **...** – up to 6 mask bytes

NPF_ETH_DST_ADDR_MASK_MATCH(_name, _addr_array, ...)

Statically define a “destination address match with mask” packet filter condition.

This tests if the packet destination address matches any of the Ethernet addresses contained in the provided set after applying specified mask.

Parameters

- **_name** – Name of the condition
- **_addr_array** – Array of `struct` *net_eth_addr* items to test against
- **...** – up to 6 mask bytes

`NPF_ETH_TYPE_MATCH`(_name, _type)

Statically define an "Ethernet type match" packet filter condition.

Parameters

- **_name** – Name of the condition
- **_type** – Ethernet type to match

`NPF_ETH_TYPE_UNMATCH`(_name, _type)

Statically define an "Ethernet type unmatch" packet filter condition.

Parameters

- **_name** – Name of the condition
- **_type** – Ethernet type to exclude

Network Shell Network shell provides helpers for figuring out network status, enabling/disabling features, and issuing commands like ping or DNS resolving. Note that `net-shell` should probably not be used in production code as it will require extra memory. See also *generic shell* for detailed shell information.

The following net-shell commands are implemented:

Table 36: net-shell commands

Command	Description
net allocs	Print network memory allocations. Only available if `CONFIG_NET_DEBUG_NET_PKT_ALLOC` is set.
net arp	Print information about IPv4 ARP cache. Only available if `CONFIG_NET_ARP` is set in IPv4 enabled networks.
net capture	Monitor network traffic See *Monitor Network Traffic* for details.
net conn	Print information about network connections.
net dns	Show how DNS is configured. The command can also be used to resolve a DNS name. Only available if `CONFIG_DNS_RESOLVER` is set.
net events	Enable network event monitoring. Only available if `CONFIG_NET_MGMT_EVENT_MONITOR` is set.
net gptp	Print information about gPTP support. Only available if `CONFIG_NET_GPTP` is set.
net iface	Print information about network interfaces.
net ipv6	Print IPv6 specific information and configuration. Only available if `CONFIG_NET_IPV6` is set.
net mem	Print information about network memory usage. The command will print more information if `CONFIG_NET_BUF_POOL_USAGE` is set.
net nbr	Print neighbor information. Only available if `CONFIG_NET_IPV6` is set.
net ping	Ping a network host.
net route	Show IPv6 network routes. Only available if `CONFIG_NET_ROUTE` is set.
net sockets	Show network socket information and statistics. Only available if `CONFIG_NET_SOCKETS_OBJ_CORE` and `CONFIG_OBJ_CORE` are set.
net stats	Show network statistics.
net tcp	Connect/send data/close TCP connection. Only available if `CONFIG_NET_TCP` is set.
net vlan	Show Ethernet virtual LAN information. Only available if `CONFIG_NET_VLAN` is set.

TLS Credentials Shell The TLS Credentials shell provides a command-line interface for managing installed TLS credentials.

Commands

Buffer Credential (buf) Buffer data incrementally into the credential buffer so that it can be added using the *Add Credential (add)* command.

Alternatively, clear the credential buffer.

Usage To append <DATA> to the credential buffer, use:

```
cred buf <DATA>
```

Use this as many times as needed to load the full credential into the credential buffer, then use the *Add Credential (add)* command to store it.

To clear the credential buffer, use:

```
cred buf clear
```

Arguments

Argument	Description
<DATA>	Text data to be appended to credential buffer. It can be either text, or base64-encoded binary. See *Add Credential (add)* and *Storage/Retrieval Formats* for details.

Add Credential (add) Add a TLS credential to the TLS Credential store.

Credential contents can be provided in-line with the call to `cred add`, or will otherwise be sourced from the credential buffer.

Usage To add a TLS credential using the data from the credential buffer, use:

```
cred add <SECTAG> <TYPE> <BACKEND> <FORMAT>
```

To add a TLS credential using data provided with the same command, use:

```
cred add <SECTAG> <TYPE> <BACKEND> <FORMAT> <DATA>
```

Arguments

Argument	Description
<SECTAG>	The sectag to use for the new credential. Can be any non-negative integer.
<TYPE>	The type of credential to add. See *Credential Types* for valid values.
<BACKEND>	Reserved. Must always be DEFAULT (case-insensitive).
<FORMAT>	Specifies the storage format of the provided credential. See *Storage/Retrieval Formats* for valid values.
<DATA>	If provided, this argument will be used as the credential data, instead of any data in the credential buffer. Can be either text, or base64-encoded binary.

Delete Credential (`del`) Delete a specified credential from the credential store.

Usage To delete a credential matching a specified sectag and credential type (if it exists), use:

```
cred del <SECTAG> <TYPE>
```

Arguments

Argument	Description
<SECTAG>	The sectag of the credential to delete. Can be any non-negative integer.
<TYPE>	The type of credential to delete. See *Credential Types* for valid values.

Get Credential Contents (`get`) Retrieve and print the contents of a specified credential.

Usage To retrieve and print a credential matching a specified sectag and credential type (if it exists), use:

```
cred get <SECTAG> <TYPE> <FORMAT>
```

Arguments

Argument	Description
<SECTAG>	The sectag of the credential to get. Can be any non-negative integer.
<TYPE>	The type of credential to get. See *Credential Types* for valid values.
<FORMAT>	Specifies the retrieval format for the provided credential. See *Storage/Retrieval Formats* for valid values.

List Credentials (`list`) List TLS credentials in the credential store.

Usage To list all available credentials, use:

```
cred list
```

To list all credentials with a specified sectag, use:

```
cred list <SECTAG>
```

To list all credentials with a specified credential type, use:

```
cred list any <TYPE>
```

To list all credentials with a specified credential type and sectag, use:

```
cred list <SECTAG> <TYPE>
```

Arguments

Argument	Description
<SECTAG>	Optional. If provided, only list credentials with this sectag. Pass any or omit to allow any sectag. Otherwise, can be any non-negative integer.
<TYPE>	Optional. If provided, only list credentials with this credential type. Pass any or omit to allow any credential type. Otherwise, see *Credential Types* for valid values.

Output The command outputs all matching credentials in the following (CSV-compliant) format:

```
<SECTAG>,<TYPE>,<DIGEST>,<STATUS>
```

Where:

Symbol	Value
<SECTAG>	The sectag of the listed credential. A non-negative integer.
<TYPE>	Credential type short-code (see *Credential Types* for details) of the listed credential.
<DIGEST>	A string digest representing the credential contents. The exact nature of this digest may vary depending on credentials storage backend, but currently for all backends this is a base64 encoded SHA256 hash of the raw credential contents (so different storage formats for essentially identical credentials will have different digests).
<STATUS>	Status code indicating success or failure with generating a digest of the listed credential. 0 if successful, negative error code specific to the storage backend otherwise. Lines for which status is not zero will be printed with error formatting.

After the list is printed, a final summary of the found credentials will be printed in the form:

```
<N> credentials found.
```

Where <*N*> is the number of credentials found, and is zero if none are found.

Credential Types The following keywords (case-insensitive) may be used to specify a credential type:

Keyword(s)	Meaning
CA_CERT, CA	A trusted CA certificate.
SERVER_CERT, SELF_CERT, CLIENT_CERT, CLIENT, SELF, SERV	Self or server certificate.
PRIVATE_KEY, PK	A private key.
PRE_SHARED_K PSK	A pre-shared key.
PRE_SHARED_K PSK_ID	ID for pre-shared key.

Storage/Retrieval Formats The *tls_credentials* module treats stored credentials as arbitrary binary buffers.

For convenience, the TLS credentials shell offers four formats for providing and later retrieving these buffers using the shell.

These formats and their (case-insensitive) keywords are as follows:

Kw	Meaning	Behavior during storage (`cred add`)	Behavior during retrieval (`cred get`)
B	Credential is handled by shell as base64 and stored without NULL termination.	Data entered into shell will be decoded from base64 into raw binary before storage. No terminator will be appended.	Stored data will be encoded into base64 before being printed.
B	Credential is handled by shell as base64 and stored with NULL termination.	Data entered into shell will be decoded from base64 into raw binary and a NULL terminator will be appended before storage.	NULL terminator will be truncated from stored data before said data is encoded into base64 and then printed.
S	Credential is handled by shell as literal string and stored without NULL termination.	Text data entered into shell will be passed into storage as-written, without a NULL terminator.	Stored data will be printed as text. Non-printable characters will be printed as ?
S	Credential is handled by shell as literal string and stored with NULL-termination.	Text data entered into shell will be passed into storage as-written, with a NULL terminator.	NULL terminator will be truncated from stored data before said data is printed as text. Non-printable characters will be printed as ?

The `BIN` format can be used to install credentials of any type, since base64 can be used to encode any concievable binary buffer. The remaining three formats are provided for convenience in special use-cases.

For example:

- To install printable pre-shared-keys, use `STR` to enter the PSK without first encoding it. This ensures it is stored without a NULL terminator.
- To install DER-formatted X.509 certificates (or other raw-binary credentials, such as non-printable PSKs) base64-encode the binary and use the `BIN` format.
- To install PEM-formatted X.509 certificates or certificate chains, base64 encode the full PEM string (including new-lines and `----BEGIN X ----` / `----END X----` markers), and then use the `BINT` format to make sure the stored string is NULL-terminated. This is required because Zephyr does not support multi-line strings in the shell. Otherwise, the `STRT` format could be used for this purpose without base64 encoding. It is possible to use `BIN` instead if you manually encode a NULL terminator into the base64.

Time Sensitive Networking

generic Precision Time Protocol (gPTP)

- *Overview*
- *Supported features*

- *Supported hardware*
- *Enabling the stack*
- *Application interfaces*
- *Testing*
- *API Reference*

Overview This gPTP stack supports the protocol and procedures as defined in the IEEE 802.1AS-2011 standard (Timing and Synchronization for Time-Sensitive Applications in Bridged Local Area Networks).

Supported features The stack handles communications and state machines defined in the IEEE 802.1AS-2011 standard. Mandatory requirements for a full-duplex point-to-point link end-point, as defined in Annex A of the standard, are supported.

The stack is in principle capable of handling communications on multiple network interfaces (also defined as "ports" in the standard) and thus act as a 802.1AS bridge. However, this mode of operation has not been validated on the Zephyr OS.

Supported hardware Although the stack itself is hardware independent, Ethernet frame timestamping support must be enabled in ethernet drivers.

Boards supported:

- frdm_k64f
- nucleo_h743zi_board
- nucleo_h745zi_q_board
- nucleo_f767zi_board
- sam_e70_xplained
- native_sim (only usable for simple testing, limited capabilities due to lack of hardware clock)
- qemu_x86 (emulated, limited capabilities due to lack of hardware clock)

Enabling the stack The following configuration option must me enabled in `prj.conf` file.

- `CONFIG_NET_GPTP`

Application interfaces Only two Application Interfaces as defined in section 9 of the standard are available:

- `ClockTargetPhaseDiscontinuity` interface (*`gptp_register_phase_dis_cb()`*)
- `ClockTargetEventCapture` interface (*`gptp_event_capture()`*)

Testing The stack has been informally tested using the OpenAVnu gPTP and Linux ptp4l daemons. The gPTP sample application from the Zephyr source distribution can be used for testing.

generic Precision Time Protocol (gPTP) support

Since
1.13

Version
0.1.0

Typedefs

typedef void (***gptp_phase_dis_callback_t**)(uint8_t *gm_identity, uint16_t *time_base, struct *gptp_scaled_ns* *last_gm_ph_change, double *last_gm_freq_change)

Define callback that is called after a phase discontinuity has been sent by the grandmaster.

Param gm_identity
A pointer to first element of a ClockIdentity array. The size of the array is GPTP_CLOCK_ID_LEN.

Param time_base
A pointer to the value of timeBaseIndicator of the current grandmaster.

Param last_gm_ph_change
A pointer to the value of lastGmPhaseChange received from grandmaster.

Param last_gm_freq_change
A pointer to the value of lastGmFreqChange received from the grandmaster.

typedef void (***gptp_port_cb_t**)(int port, struct *net_if* *iface, void *user_data)

Callback used while iterating over gPTP ports.

Param port
Port number

Param iface
Pointer to network interface

Param user_data
A valid pointer to user data or NULL

Functions

void **gptp_register_phase_dis_cb**(struct *gptp_phase_dis_cb* *phase_dis, *gptp_phase_dis_callback_t* cb)

Register a phase discontinuity callback.

Parameters

- `phase_dis` – Caller specified handler for the callback.
- `cb` – Callback to register.

void `gptp_unregister_phase_dis_cb`(struct *gptp_phase_dis_cb* *phase_dis)

Unregister a phase discontinuity callback.

Parameters

- `phase_dis` – Caller specified handler for the callback.

void `gptp_call_phase_dis_cb`(void)

Call a phase discontinuity callback function.

int `gptp_event_capture`(struct *net_ptp_time* *slave_time, bool *gm_present)

Get gPTP time.

Parameters

- `slave_time` – A pointer to structure where timestamp will be saved.
- `gm_present` – A pointer to a boolean where status of the presence of a grand master will be saved.

Returns

Error code. 0 if no error.

char *`gptp_sprint_clock_id`(const uint8_t *clk_id, char *output, size_t output_len)

Utility function to print clock id to a user supplied buffer.

Parameters

- `clk_id` – Clock id
- `output` – Output buffer
- `output_len` – Output buffer len

Returns

Pointer to output buffer

void `gptp_foreach_port`(*gptp_port_cb_t* cb, void *user_data)

Go through all the gPTP ports and call callback for each of them.

Parameters

- `cb` – User-supplied callback function to call
- `user_data` – User specified data

struct gptp_domain *`gptp_get_domain`(void)

Get gPTP domain.

This contains all the configuration / status of the gPTP domain.

Returns

Pointer to domain or NULL if not found.

void `gptp_clk_src_time_invoke`(struct *gptp_clk_src_time_invoke_params* *arg)

This interface is used by the ClockSource entity to provide time to the ClockMaster entity of a time-aware system.

Parameters

- `arg` – Current state and parameters of the ClockSource entity.

struct *gptp_hdr* *gptp_get_hdr(struct *net_pkt* *pkt)

Return pointer to gPTP packet header in network packet.

Parameters

- pkt – Network packet (received or sent)

Returns

Pointer to gPTP header.

struct gptp_scaled_ns

#include <*gptp.h*> Scaled Nanoseconds.

Public Members

int32_t high

High half.

int64_t low

Low half.

struct gptp_uscaled_ns

#include <*gptp.h*> UScaled Nanoseconds.

Public Members

uint32_t high

High half.

uint64_t low

Low half.

struct gptp_port_identity

#include <*gptp.h*> Port Identity.

Public Members

uint8_t clk_id[GPTP_CLOCK_ID_LEN]

Clock identity of the port.

uint16_t port_number

Number of the port.

struct gptp_flags

#include <*gptp.h*> gPTP message flags

Public Members

uint8_t **octets**[2]
Byte access.

uint16_t **all**
Whole field access.

struct **gptp_hdr**
#include <*gptp.h*> gPTP message header

Public Members

uint8_t **message_type**
Type of the message.

uint8_t **transport_specific**
Transport specific, always 1.

uint8_t **ptp_version**
Version of the PTP, always 2.

uint8_t **reserved0**
Reserved field.

uint16_t **message_length**
Total length of the message from the header to the last TLV.

uint8_t **domain_number**
Domain number, always 0.

uint8_t **reserved1**
Reserved field.

struct *gptp_flags* **flags**
Message flags.

int64_t **correction_field**
Correction Field.

The content depends of the message type.

uint32_t **reserved2**
Reserved field.

struct *gptp_port_identity* **port_id**
Port Identity of the sender.

uint16_t **sequence_id**

Sequence Id.

uint8_t **control**

Control value.

Sync: 0, Follow-up: 2, Others: 5.

int8_t **log_msg_interval**

Message Interval in Log2 for Sync and Announce messages.

struct **gptp_phase_dis_cb**

#include <*gptp.h*> Phase discontinuity callback structure.

Stores the phase discontinuity callback information. Caller must make sure that the variable pointed by this is valid during the lifetime of registration. Typically this means that the variable cannot be allocated from stack.

Public Members

sys_snode_t **node**

Node information for the slist.

gptp_phase_dis_callback_t **cb**

Phase discontinuity callback.

struct **gptp_clk_src_time_invoke_params**

#include <*gptp.h*> ClockSourceTime.invoke function parameters.

Parameters passed by ClockSourceTime.invoke function.

Public Members

double **last_gm_freq_change**

Frequency change on the last Time Base Indicator Change.

struct *net_ptp_extended_time* **src_time**

The time this function is invoked.

struct *gptp_scaled_ns* **last_gm_phase_change**

Phase change on the last Time Base Indicator Change.

uint16_t **time_base_indicator**

Time Base - changed only if Phase or Frequency changes.

Network time representation in the network stack

API Reference

group `net_time`

Since
3.5

Version
0.1.0

Defines

`NET_TIME_MAX`
The largest positive time value that can be represented by net_time_t.

`NET_TIME_MIN`
The smallest negative time value that can be represented by net_time_t.

`NET_TIME_SEC_MAX`
The largest positive number of seconds that can be safely represented by net_time_t.

`NET_TIME_SEC_MIN`
The smallest negative number of seconds that can be safely represented by net_time_t.

Typedefs

typedef int64_t **`net_time_t`**

Any occurrence of net_time_t specifies a concept of nanosecond resolution scalar time span, future (positive) or past (negative) relative time or absolute timestamp referred to some local network uptime reference clock that does not wrap during uptime and is - in a certain, well-defined sense - common to all local network interfaces, sometimes even to remote interfaces on the same network.

This type is EXPERIMENTAL. Usage is currently restricted to representation of time within the network subsystem.

Timed network protocols (PTP, TDMA, ...) usually require several local or remote interfaces to share a common notion of elapsed time within well-defined tolerances. Network uptime therefore differs from time represented by a single hardware counter peripheral in that it will need to be represented in several distinct hardware peripherals with different frequencies, accuracy and precision. To co-operate, these hardware counters will have to be “syntonized” or “disciplined” (i.e. frequency and phase locked) with respect to a common local or remote network reference time signal. Be aware that while syntonized clocks share the same frequency and phase, they do not usually share the same epoch (zero-point).

This also explains why network time, if represented as a cycle value of some specific hardware counter, will never be “precise” but only can be “good

enough” with respect to the tolerances (resolution, drift, jitter) required by a given network protocol. All counter peripherals involved in a timed network protocol must comply with these tolerances.

Please use specific cycle/tick counter values rather than net_time_t whenever possible especially when referring to the kernel system clock or values of any single counter peripheral.

net_time_t cannot represent general clocks referred to an arbitrary epoch as it only covers roughly +/- ~290 years. It also cannot be used to represent time according to a more complex timescale (e.g. including leap seconds, time adjustments, complex calendars or time zones). In these cases you may use timespec (C11, POSIX.1-2001), timeval (POSIX.1-2001) or broken down time as in tm (C90). The advantage of net_time_t over these structured time representations is lower memory footprint, faster and simpler scalar arithmetic and easier conversion from/to low-level hardware counter values. Also net_time_t can be used in the network stack as well as in applications while POSIX concepts cannot. Converting net_time_t from/to structured time representations is possible in a limited way but - except for timespec - requires concepts that must be implemented by higher-level APIs. Utility functions converting from/to timespec will be provided as part of the net_time_t API as and when needed.

If you want to represent more coarse grained scalar time in network applications, use time_t (C99, POSIX.1-2001) which is specified to represent seconds or suseconds_t (POSIX.1-2001) for microsecond resolution. Kernel *k_ticks_t* and cycles (both specific to Zephyr) have an unspecified resolution but are useful to represent kernel timer values and implement high resolution spinning.

If you need even finer grained time resolution, you may want to look at (g)PTP concepts, see *net_ptp_extended_time*.

The reason why we don't use int64_t directly to represent scalar nanosecond resolution times in the network stack is that it has been shown in the past that fields using generic type will often not be used correctly (e.g. with the wrong resolution or to represent underspecified concepts of time with unclear syntonization semantics).

Any API that exposes or consumes net_time_t values SHALL ensure that it maintains the specified contract including all protocol specific tolerances and therefore clients can rely on common semantics of this type. This makes times coming from different hardware peripherals and even from different network nodes comparable within well-defined limits and therefore net_time_t is the ideal intermediate building block for timed network protocols.

Precision Time Protocol (PTP) time format

- *Overview*
- *API Reference*

Overview The PTP time struct can store time information in high precision format (nanoseconds). The extended timestamp format can store the time in fractional nanoseconds accuracy. The PTP time format is used in *generic Precision Time Protocol (gPTP)* implementation.

Related code samples

PTP
Enable PTP support and monitor messages and events via logging.

API Reference

group `ptp_time`

Precision Time Protocol time specification.

Since
1.13

Version
0.8.0

Functions

static inline *net_time_t* `net_ptp_time_to_ns`(struct *net_ptp_time* *ts)

Convert a PTP timestamp to a nanosecond precision timestamp, both related to the local network reference clock.

Note

Only timestamps representing up to ~290 years can be converted to nanosecond timestamps. Larger timestamps will return the maximum representable nanosecond precision timestamp.

Parameters

- `ts` – the PTP timestamp

Returns
the corresponding nanosecond precision timestamp

static inline struct *net_ptp_time* `ns_to_net_ptp_time`(*net_time_t* nsec)

Convert a nanosecond precision timestamp to a PTP timestamp, both related to the local network reference clock.

Parameters

- `nsec` – a nanosecond precision timestamp

Returns
the corresponding PTP timestamp

struct `net_ptp_time`

#include <ptp_time.h> (Generalized) Precision Time Protocol Timestamp format.

This structure represents a timestamp according to the Precision Time Protocol standard (“PTP”, IEEE 1588, section 5.3.3), the Generalized Precision Time Protocol standard (“gPTP”, IEEE 802.1AS, section 6.4.3.4), or any other well-defined context in which precision structured timestamps are required on network messages in Zephyr.

Seconds are encoded as a 48 bits unsigned integer. Nanoseconds are encoded as a 32 bits unsigned integer.

In the context of (g)PTP, *timestamps* designate the time, relative to a local clock (“LocalClock”) at which the message timestamp point passes a reference plane marking

the boundary between the PTP Instance and the network medium (IEEE 1855, section 7.3.4.2; IEEE 802.1AS, section 8.4.3).

The exact definitions of the *message timestamp point* and *reference plane* depends on the network medium and use case.

For (g)PTP the media-specific message timestamp points and reference planes are defined in the standard. In non-PTP contexts specific to Zephyr, timestamps are measured relative to the same local clock but with a context-specific message timestamp point and reference plane, defined below per use case.

A *"LocalClock"* is a freerunning clock, embedded into a well-defined entity (e.g. a PTP Instance) and provides a common time to that entity relative to an arbitrary epoch (IEEE 1855, section 3.1.26, IEEE 802.1AS, section 3.16).

In Zephyr, the local clock is usually any instance of a kernel system clock driver, counter driver, RTC API driver or low-level counter/timer peripheral (e.g. an ethernet peripheral with hardware timestamp support or a radio timer) with sufficient precision for the context in which it is used.

See IEEE 802.1AS, Annex B for specific performance requirements regarding conformance of local clocks in the gPTP context. See IEEE 1588, Annex A, section A5.4 for general performance requirements regarding PTP local clocks. See IEEE 802.15.4-2020, section 15.7 for requirements in the context of ranging applications and ibid., section 6.7.6 for the relation between guard times and clock accuracy which again influence the precision required for subprotocols like CSL, TSCH, RIT, etc.

Applications that use timestamps across different subsystems or media must ensure that they understand the definition of the respective reference planes and interpret timestamps accordingly. Applications must further ensure that timestamps are either all referenced to the same local clock or convert between clocks based on sufficiently precise conversion algorithms.

Timestamps may be measured on ingress (RX timestamps) or egress (TX timestamps) of network messages. Timestamps can also be used to schedule a network message to a well-defined point in time in the future at which it is to be sent over the medium (timed TX). A future timestamp and a duration, both referenced to the local clock, may be given to specify a time window at which a network device should expect incoming messages (RX window).

In Zephyr this timestamp structure is currently used in the following contexts:

- gPTP for Full Duplex Point-to-Point IEEE 802.3 links (IEEE 802.1AS, section 11): the reference plane and message timestamp points are as defined in the standard.
- IEEE 802.15.4 timed TX and RX: Timestamps designate the point in time at which the end of the last symbol of the start-of-frame delimiter (SFD) (or equivalently, the start of the first symbol of the PHY header) is at the local antenna. The standard also refers to this as the "RMARKER" (IEEE 802.15.4-2020, section 6.9.1) or "symbol boundary" (ibid., section 6.5.2), depending on the context. In the context of beacon timestamps, the difference between the timestamp measurement plane and the reference plane is defined by the MAC PIB attribute "macSyncSymbolOffset", ibid., section 8.4.3.1, table 8-94.

If further use cases are added to Zephyr using this timestamp structure, their clock performance requirements, message timestamp points and reference plane definition SHALL be added to the above list.

Public Members

uint64_t **second**

Second value.

union net_ptp_time

Seconds encoded on 48 bits.

uint32_t nanosecond

Nanoseconds.

struct net_ptp_extended_time

uint64_t fract_nsecond

Fractional nanoseconds value.

union net_ptp_extended_time

Fractional nanoseconds on 48 bits.

zperf: Network Traffic Generator

- *Overview*
- *Sample Usage*

Overview zperf is a shell utility which allows to generate network traffic in Zephyr. The tool may be used to evaluate network bandwidth.

zperf is compatible with iPerf_2.0.5. Note that in newer iPerf versions, an error message like this is printed and the server reported statistics are missing.

```
LAST PACKET NOT RECEIVED!!!
```

zperf can be enabled in any application, a dedicated sample is also present in Zephyr. See zperf sample application for details.

Sample Usage If Zephyr acts as a client, iPerf must be executed in server mode. For example, the following command line must be used for UDP testing:

```
$ iperf -s -l 1K -u -V -B 2001:db8::2
```

For TCP testing, the command line would look like this:

```
$ iperf -s -l 1K -V -B 2001:db8::2
```

In the Zephyr console, zperf can be executed as follows:

```
zperf udp upload 2001:db8::2 5001 10 1K 1M
```

For TCP the zperf command would look like this:

```
zperf tcp upload 2001:db8::2 5001 10 1K 1M
```

If the IP addresses of Zephyr and the host machine are specified in the config file, zperf can be started as follows:

```
zperf udp upload2 v6 10 1K 1M
```

or like this if you want to test TCP:

```
zperf tcp upload2 v6 10 1K 1M
```

If Zephyr is acting as a server, set the download mode as follows for UDP:

```
zperf udp download 5001
```

or like this for TCP:

```
zperf tcp download 5001
```

and in the host side, iPerf must be executed with the following command line if you are testing UDP:

```
$ iperf -l 1K -u -V -c 2001:db8::1 -p 5001
```

and this if you are testing TCP:

```
$ iperf -l 1K -V -c 2001:db8::1 -p 5001
```

iPerf output can be limited by using the -b option if Zephyr is not able to receive all the packets in orderly manner.

6.3.7 Connection Manager

Overview

Connection Manager is a collection of optional Zephyr features that aim to allow applications to monitor and control connectivity (access to IP-capable networks) with minimal concern for the specifics of underlying network technologies.

Using Connection Manager, applications can use a single abstract API to control network association and monitor Internet access, and avoid excessive use of technology-specific boilerplate.

This allows an application to potentially support several very different connectivity technologies (for example, Wi-Fi and LTE) with a single codebase.

Applications can also use Connection Manager to generically manage and use multiple connectivity technologies simultaneously.

Structure Connection Manager is split into the following two subsystems:

- *Connectivity monitoring* (header file `include/zephyr/net/conn_mgr_monitoring.h`) monitors all available *Zephyr network interfaces (ifaces)* and triggers *network management* events indicating when IP connectivity is gained or lost.
- *Connectivity control* (header file `include/zephyr/net/conn_mgr_connectivity.h`) provides an abstract API for controlling iface network association.

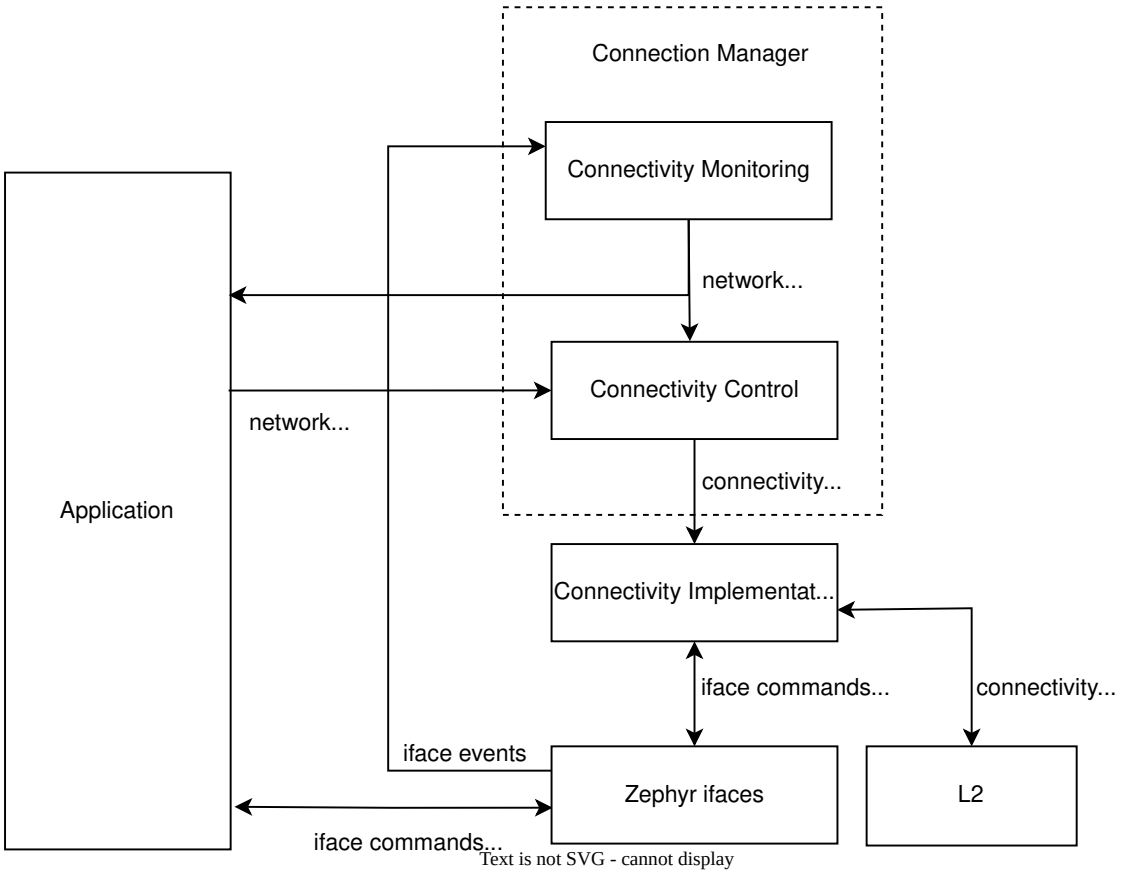

Fig. 18: A simplified view of how Connection Manager integrates with Zephyr and the application.

See *here* for a more detailed version.

Connectivity monitoring

Connectivity monitoring tracks all available ifaces (whether or not they support *Connectivity control*) as they transition through various *operational states* and acquire or lose assigned IP addresses.

Each available iface is considered ready if it meets the following criteria:

- The iface is admin-up
  - This means the iface has been instructed to become operational-up (ready for use). This is done by a call to *net_if_up()*.
- The iface is oper-up
  - This means the interface is completely ready for use; It is online, and if applicable, has associated with a network.
  - See *Network interface state management* for details.

- The iface has at least one assigned IP address
  - Both IPv4 and IPv6 addresses are acceptable. This condition is met as soon as one or both of these is assigned.
  - See *Network Interface* for details on iface IP assignment.
- The iface has not been ignored
  - Ignored ifaces are always treated as unready.
  - See *Ignoring ifaces* for more details.

Note

Typically, iface state and IP assignment are updated either by the iface's *L2 implementation* or bound *connectivity implementation*.

See *Implement iface state reporting* for details.

A ready iface ceases to be ready the moment any of the above conditions is lost.

When at least one iface is ready, the *NET_EVENT_L4_CONNECTED network management* event is triggered, and IP connectivity is said to be ready.

Afterwards, ifaces can become ready or unready without firing additional events, so long as there always remains at least one ready iface.

When there are no longer any ready ifaces left, the *NET_EVENT_L4_DISCONNECTED network management* event is triggered, and IP connectivity is said to be unready.

Note

Connection Manager also fires the following more specific `CONNECTED` / `DISCONNECTED` events:

- *NET_EVENT_L4_IPV4_CONNECTED*
- *NET_EVENT_L4_IPV4_DISCONNECTED*
- *NET_EVENT_L4_IPV6_CONNECTED*
- *NET_EVENT_L4_IPV6_DISCONNECTED*

These are similar to *NET_EVENT_L4_CONNECTED* and *NET_EVENT_L4_DISCONNECTED*, but specifically track whether IPv4- and IPv6-capable ifaces are ready.

Usage Connectivity monitoring is enabled if the `CONFIG_NET_CONNECTION_MANAGER` Kconfig option is enabled.

To receive connectivity updates, create and register a listener for the *NET_EVENT_L4_CONNECTED* and *NET_EVENT_L4_DISCONNECTED network management* events:

```
/* Callback struct where the callback will be stored */
struct net_mgmt_event_callback l4_callback;

/* Callback handler */
static void l4_event_handler(struct net_mgmt_event_callback *cb,
                             uint32_t event, struct net_if *iface)
{
        if (event == NET_EVENT_L4_CONNECTED) {
                LOG_INF("Network connectivity gained!");
        } else if (event == NET_EVENT_L4_DISCONNECTED) {
                LOG_INF("Network connectivity lost!");
```

(continues on next page)

(continued from previous page)

```
        }

        /* Otherwise, it's some other event type we didn't register for. */
}

/* Call this before Connection Manager monitoring initializes */
static void my_application_setup(void)
{
        /* Configure the callback struct to respond to (at least) the L4_CONNECTED
         * and L4_DISCONNECTED events.
         *
         *
         * Note that the callback may also be triggered for events other than those␣
↪specified here!
         * (See the net_mgmt documentation)
         */
        net_mgmt_init_event_callback(
                &l4_callback, l4_event_handler,
                NET_EVENT_L4_CONNECTED | NET_EVENT_L4_DISCONNECTED
        );

        /* Register the callback */
        net_mgmt_add_event_callback(&l4_callback);
}
```

See *Listening to network events* for more details on listening for net_mgmt events.

Note

To avoid missing initial connectivity events, you should register your listener(s) before Connection Manager monitoring initializes. See *Avoiding missed notifications* for strategies to ensure this.

Avoiding missed notifications Connectivity monitoring may trigger events immediately upon initialization.

If your application registers its event listeners after connectivity monitoring initializes, it is possible to miss this first wave of events, and not be informed the first time network connectivity is gained.

If this is a concern, your application should *register its event listeners* before connectivity monitoring initializes.

Connectivity monitoring initializes using the `SYS_INIT` `APPLICATION` initialization priority specified by the `CONFIG_NET_CONNECTION_MANAGER_MONITOR_PRIORITY` Kconfig option.

You can register your callbacks before this initialization by using `SYS_INIT` with an earlier initialization priority than this value, for instance priority 0:

```
static int my_application_setup(void)
{
        /* Register callbacks here */
        return 0;
}

SYS_INIT(my_application_setup, APPLICATION, 0);
```

If this is not feasible, you can instead request that connectivity monitoring resend the latest connectivity events at any time by calling *conn_mgr_mon_resend_status()*:

```
static void my_late_application_setup(void)
{
  /* Register callbacks here */

  /* Once done, request that events be re-triggered */
  conn_mgr_mon_resend_status();
}
```

Ignoring ifaces Applications can request that ifaces be ignored by Connection Manager by calling *conn_mgr_ignore_iface()* with the iface to be ignored.

Alternatively, an entire *L2 implementation* can be ignored by calling *conn_mgr_ignore_l2()*.

This has the effect of individually ignoring all the ifaces using that *L2 implementation*.

While ignored, the iface is treated by Connection Manager as though it were unready for network traffic, no matter its actual state.

This may be useful, for instance, if your application has configured one or more ifaces that cannot (or for whatever reason should not) be used to contact the wider Internet.

Bulk convenience functions optionally skip ignored ifaces.

See *conn_mgr_ignore_iface()* and *conn_mgr_watch_iface()* for more details.

Connectivity monitoring API Include header file `include/zephyr/net/conn_mgr_monitoring.h` to access these.

group **conn_mgr**

Connection Manager API.

Since
2.0

Version
0.1.0

Functions

void **conn_mgr_mon_resend_status**(void)

Resend either NET_L4_CONNECTED or NET_L4_DISCONNECTED depending on whether connectivity is currently available.

void **conn_mgr_ignore_iface**(struct *net_if* *iface)

Mark an iface to be ignored by conn_mgr.

Ignoring an iface forces conn_mgr to consider it unready/disconnected.

This means that events related to the iface connecting/disconnecting will not be fired, and if the iface was connected before being ignored, events will be fired as though it disconnected at that moment.

Parameters

- **iface** – iface to be ignored.

void **conn_mgr_watch_iface**(struct *net_if* *iface)

Watch (stop ignoring) an iface.

conn_mgr will no longer be forced to consider the iface unreadly/disconnected.

Events related to the iface connecting/disconnecting will no longer be blocked, and if the iface was connected before being watched, events will be fired as though it connected in that moment.

All ifaces default to watched at boot.

Parameters

- **iface** – iface to no longer ignore.

bool **conn_mgr_is_iface_ignored**(struct *net_if* *iface)

Check whether the provided iface is currently ignored.

Parameters

- **iface** – The iface to check.

Return values

- **true** – if the iface is being ignored by conn_mgr.
- **false** – if the iface is being watched by conn_mgr.

void **conn_mgr_ignore_l2**(const struct *net_l2* *l2)

Mark an L2 to be ignored by conn_mgr.

This is a wrapper for conn_mgr_ignore_iface that ignores all ifaces that use the L2.

Parameters

- **l2** – L2 to be ignored.

void **conn_mgr_watch_l2**(const struct *net_l2* *l2)

Watch (stop ignoring) an L2.

This is a wrapper for conn_mgr_watch_iface that watches all ifaces that use the L2.

Parameters

- **l2** – L2 to watch.

Connectivity control

Many network interfaces require a network association procedure to be completed before being usable.

For such ifaces, connectivity control can provide a generic API to request network association (*conn_mgr_if_connect()*) and disassociation (*conn_mgr_if_disconnect()*). Network interfaces implement support for this API by *binding themselves to a connectivity implementation*.

Using this API, applications can associate with networks with minimal technology-specific boilerplate.

Connectivity control also provides the following additional features:

- Standardized *persistence and timeout* behaviors during association.
- *Bulk functions* for controlling the admin state and network association of all available ifaces simultaneously.
- Optional *convenience automations* for common connectivity actions.

Basic operation The following sections outline the basic operation of Connection Manager's connectivity control.

Binding Before an iface can be commanded to associate or disassociate using Connection Manager, it must first be bound to a *connectivity implementation*. Binding is performed by the provider of the iface, not by the application (see *Binding an iface to an implementation*), and can be thought of as an extension of the iface declaration.

Once an iface is bound, all connectivity commands passed to it (such as `conn_mgr_if_connect()` or `conn_mgr_if_disconnect()`) will be routed to the corresponding implementation function in the connectivity implementation.

> **Note**
>
> To avoid inconsistent behavior, all connectivity implementations must adhere to the *implementation guidelines*.

Connecting Once a bound iface is admin-up (see *Network interface state management*), `conn_mgr_if_connect()` can be called to cause it to associate with a network.

If association succeeds, the connectivity implementation will mark the iface as operational-up (see *Network interface state management*).

If association fails unrecoverably, the *fatal error event* will be triggered.

You can configure an optional *timeout* for this process.

> **Note**
>
> The `conn_mgr_if_connect()` function is intentionally minimalistic, and does not take any kind of configuration. Each connectivity implementation should provide a way to pre-configure or automatically configure any required association settings or credentials. See *Allow connectivity pre-configuration* for details.

Connection loss If connectivity is lost due to external factors, the connectivity implementation will mark the iface as operational-down.

Depending on whether *persistence* is set, the iface may then attempt to reconnect.

Manual disconnection The application can also request that connectivity be intentionally abandoned by calling `conn_mgr_if_disconnect()`.

In this case, the connectivity implementation will disassociate the iface from its network and mark the iface as operational-down (see *Network interface state management*). A new connection attempt will not be initiated, regardless of whether persistence is enabled.

Timeouts and Persistence Connection Manager requires that all connectivity implementations support the following standard key features:

- *Connection timeouts*
- *Connection persistence*

These features describe how ifaces should behave during connect and disconnect events. You can individually set them for each iface.

Note

It is left to connectivity implementations to successfully and accurately implement these two features as described below. See *Implementing timeouts and persistence* for more details from the connectivity implementation perspective.

Connection Timeouts When `conn_mgr_if_connect()` is called on an iface, a connection attempt begins.

The connection attempt continues indefinitely until it succeeds, unless a timeout has been specified for the iface (using `conn_mgr_if_set_timeout()`).

In that case, the connection attempt will be abandoned if the timeout elapses before it succeeds. If this happens, the *timeout event* is raised.

Connection Persistence Each iface also has a connection persistence setting that you can enable or disable by setting the `CONN_MGR_IF_PERSISTENT` flag with `conn_mgr_binding_set_flag()`.

This setting specifies how the iface should handle unintentional connection loss.

If persistence is enabled, any unintentional connection loss will initiate a new connection attempt, with a new timeout if applicable.

Otherwise, the iface will not attempt to reconnect.

Note

Persistence not does affect connection attempt behavior. Only the timeout setting affects this.

For instance, if a connection attempt on an iface times out, the iface will not attempt to reconnect, even if it is persistent.

Conversely, if there is not a specified timeout, the iface will try to connect forever until it succeeds, even if it is not persistent.

See *Persistence during connection attempts* for the equivalent implementation guideline.

Control events Connectivity control triggers *network management* events to inform the application of important state changes.

See *Trigger connectivity control events* for the corresponding connectivity implementation guideline.

Fatal Error The `NET_EVENT_CONN_IF_FATAL_ERROR` event is raised when an iface encounters an error from which it cannot recover (meaning any subsequent attempts to associate are guaranteed to fail, and all such attempts should be abandoned).

Handlers of this event will be passed a pointer to the iface for which the fatal error occurred. Individual connectivity implementations may also pass an application-specific data pointer.

Timeout The `NET_EVENT_CONN_IF_TIMEOUT` event is raised when an *iface association* attempt *times out*.

Handlers of this event will be passed a pointer to the iface that timed out attempting to associate.

Listening for control events You can listen for control events as follows:

```
/* Declare a net_mgmt callback struct to store the callback */
struct net_mgmt_event_callback my_conn_evt_callback;

/* Declare a handler to receive control events */
static void my_conn_evt_handler(struct net_mgmt_event_callback *cb,
                                uint32_t event, struct net_if *iface)
{
        if (event == NET_EVENT_CONN_IF_TIMEOUT) {
                /* Timeout occurred, handle it */
        } else if (event == NET_EVENT_CONN_IF_FATAL_ERROR) {
                /* Fatal error occurred, handle it */
        }

        /* Otherwise, it's some other event type we didn't register for. */
}

int main()
{
        /* Configure the callback struct to respond to (at least) the CONN_IF_TIMEOUT
         * and CONN_IF_FATAL_ERROR events.
         *
         * Note that the callback may also be triggered for events other than those␣
↪specified here!
         * (See the net_mgmt documentation)
         */

        net_mgmt_init_event_callback(
                &conn_mgr_conn_callback, conn_mgr_conn_handler,
                    NET_EVENT_CONN_IF_TIMEOUT | NET_EVENT_CONN_IF_FATAL_ERROR
        );

        /* Register the callback */
        net_mgmt_add_event_callback(&conn_mgr_conn_callback);
        return 0;
}
```

See *Listening to network events* for more details on listening for net_mgmt events.

Automated behaviors There are a few actions related to connectivity that are (by default at least) performed automatically for the user.

Automatic admin-up

In Zephyr, ifaces are automatically taken admin-up (see *Network interface state management* for details on iface states) during initialization.

Applications can disable this behavior by setting the *NET_IF_NO_AUTO_START* interface flag with *net_if_flag_set()*.

Automatic connect

By default, Connection Manager will automatically connect any *bound* iface that becomes admin-up.

Applications can disable this by setting the *CONN_MGR_IF_NO_AUTO_CONNECT* connectivity flag with *conn_mgr_if_set_flag()*.

Automatic admin-down

By default, Connection Manager will automatically take any bound iface admin-down if it has given up on associating.

Applications can disable this for all ifaces by disabling the CONFIG_NET_CONNECTION_MANAGER_AUTO_IF_DOWN Kconfig option, or for individual ifaces by setting the *CONN_MGR_IF_NO_AUTO_DOWN* connectivity flag with *conn_mgr_if_set_flag()*.

Connectivity control API Include header file `include/zephyr/net/conn_mgr_connectivity.h` to access these.

group `conn_mgr_connectivity`

Connection Manager Connectivity API.

Since

3.4

Version

0.1.0

Defines

`NET_EVENT_CONN_IF_TIMEOUT`

net_mgmt event raised when a connection attempt times out

`NET_EVENT_CONN_IF_FATAL_ERROR`

net_mgmt event raised when a non-recoverable connectivity error occurs on an iface

`CONN_MGR_IF_NO_TIMEOUT`

Value to use with *conn_mgr_if_set_timeout* and *conn_mgr_conn_binding::timeout* to indicate no timeout.

Enums

enum `conn_mgr_if_flag`

Per-iface connectivity flags.

Values:

enumerator `CONN_MGR_IF_PERSISTENT`

Persistent.

When set, indicates that the connectivity implementation bound to this iface should attempt to persist connectivity by automatically reconnecting after connection loss.

enumerator CONN_MGR_IF_NO_AUTO_CONNECT

No auto-connect.

When set, conn_mgr will not automatically attempt to connect this iface when it reaches admin-up.

enumerator CONN_MGR_IF_NO_AUTO_DOWN

No auto-down.

When set, conn_mgr will not automatically take the iface admin-down when it stops trying to connect, even if CONFIG_NET_CONNECTION_MANAGER_AUTO_IF_DOWN is enabled.

Functions

int **conn_mgr_if_connect**(struct *net_if* *iface)

Connect interface.

If the provided iface has been bound to a connectivity implementation, initiate network connect/association.

Automatically takes the iface admin-up (by calling *net_if_up*) if it isn't already.

Non-Blocking.

Parameters

- **iface** – Pointer to network interface

Return values

- **0** – on success.
- **-ESHUTDOWN** – if the iface is not admin-up.
- **-ENOTSUP** – if the iface does not have a connectivity implementation.
- **implementation-specific** – status code otherwise.

int **conn_mgr_if_disconnect**(struct *net_if* *iface)

Disconnect interface.

If the provided iface has been bound to a connectivity implementation, disconnect/disassociate it from the network, and cancel any pending attempts to connect/associate.

Does nothing if the iface is currently admin-down.

Parameters

- **iface** – Pointer to network interface

Return values

- **0** – on success.
- **-ENOTSUP** – if the iface does not have a connectivity implementation.
- **implementation-specific** – status code otherwise.

bool `conn_mgr_if_is_bound`(struct *net_if* *iface)

Check whether the provided network interface supports connectivity / has been bound to a connectivity implementation.

Parameters

- `iface` – Pointer to the iface to check.

Return values

- `true` – if connectivity is supported (a connectivity implementation has been bound).
- `false` – otherwise.

int `conn_mgr_if_set_opt`(struct *net_if* *iface, int optname, const void *optval, size_t optlen)

Set implementation-specific connectivity options.

If the provided iface has been bound to a connectivity implementation that supports it, implementation-specific connectivity options related to the iface.

Parameters

- `iface` – Pointer to the network interface.
- `optname` – Integer value representing the option to set. The meaning of values is up to the *conn_mgr_conn_api* implementation. Some settings may affect multiple ifaces.
- `optval` – Pointer to the value to be assigned to the option.
- `optlen` – Length (in bytes) of the value to be assigned to the option.

Return values

- `0` – if successful.
- `-ENOTSUP` – if conn_mgr_if_set_opt not implemented by the iface.
- `-ENOBUFS` – if optlen is too long.
- `-EINVAL` – if NULL optval pointer provided.
- `-ENOPROTOOPT` – if the optname is not recognized.
- `implementation-specific` – error code otherwise.

int `conn_mgr_if_get_opt`(struct *net_if* *iface, int optname, void *optval, size_t *optlen)

Get implementation-specific connectivity options.

If the provided iface has been bound to a connectivity implementation that supports it, retrieves implementation-specific connectivity options related to the iface.

optlen will always be set to the total number of bytes written, regardless of whether an error is returned, even if zero bytes were written.

Parameters

- `iface` – Pointer to the network interface.
- `optname` – Integer value representing the option to set. The meaning of values is up to the *conn_mgr_conn_api* implementation. Some settings may be shared by multiple ifaces.
- `optval` – Pointer to where the retrieved value should be stored.

- **optlen** – Pointer to length (in bytes) of the destination buffer available for storing the retrieved value. If the available space is less than what is needed, -ENOBUFS is returned. If the available space is invalid, -EINVAL is returned.

Return values

- **0** – if successful.
- **-ENOTSUP** – if conn_mgr_if_get_opt is not implemented by the iface.
- **-ENOBUFS** – if retrieval buffer is too small.
- **-EINVAL** – if invalid retrieval buffer length is provided, or if NULL optval or optlen pointer provided.
- **-ENOPROTOOPT** – if the optname is not recognized.
- **implementation-specific** – error code otherwise.

bool **conn_mgr_if_get_flag**(struct *net_if* *iface, enum *conn_mgr_if_flag* flag)

Check the value of connectivity flags.

If the provided iface is bound to a connectivity implementation, retrieves the value of the specified connectivity flag associated with that iface.

Parameters

- **iface** – - Pointer to the network interface to check.
- **flag** – - The flag to check.

Returns

True if the flag is set, otherwise False. Also returns False if the provided iface is not bound to a connectivity implementation, or the requested flag doesn't exist.

int **conn_mgr_if_set_flag**(struct *net_if* *iface, enum *conn_mgr_if_flag* flag, bool value)

Set the value of a connectivity flags.

If the provided iface is bound to a connectivity implementation, sets the value of the specified connectivity flag associated with that iface.

Parameters

- **iface** – - Pointer to the network interface to modify.
- **flag** – - The flag to set.
- **value** – - Whether the flag should be enabled or disabled.

Return values

- **0** – on success.
- **-EINVAL** – if the flag does not exist.
- **-ENOTSUP** – if the provided iface is not bound to a connectivity implementation.

int **conn_mgr_if_get_timeout**(struct *net_if* *iface)

Get the connectivity timeout for an iface.

If the provided iface is bound to a connectivity implementation, retrieves the timeout setting in seconds for it.

Parameters

- **iface** – - Pointer to the iface to check.

Returns
int - The connectivity timeout value (in seconds) if it could be retrieved, otherwise CONN_MGR_IF_NO_TIMEOUT.

int **conn_mgr_if_set_timeout**(struct *net_if* *iface, int timeout)

Set the connectivity timeout for an iface.

If the provided iface is bound to a connectivity implementation, sets the timeout setting in seconds for it.

Parameters

- **iface** – - Pointer to the network interface to modify.
- **timeout** – - The timeout value to set (in seconds). Pass *CONN_MGR_IF_NO_TIMEOUT* to disable the timeout.

Return values

- **0** – on success.
- **-ENOTSUP** – if the provided iface is not bound to a connectivity implementation.

Bulk API Connectivity control provides several bulk functions allowing all ifaces to be controlled at once.

You can restrict these functions to operate only on non-*ignored* ifaces if desired.

Include header file `include/zephyr/net/conn_mgr_connectivity.h` to access these.

group **conn_mgr_connectivity_bulk**

Connection Manager Bulk API.

Since
3.4

Version
0.1.0

Functions

int **conn_mgr_all_if_up**(bool skip_ignored)

Convenience function that takes all available ifaces into the admin-up state.

Essentially a wrapper for *net_if_up*.

Parameters

- **skip_ignored** – - If true, only affect ifaces that aren't ignored by conn_mgr. Otherwise, affect all ifaces.

Returns
0 if all net_if_up calls returned 0, otherwise the first nonzero value returned by a net_if_up call.

int **conn_mgr_all_if_down**(bool skip_ignored)

Convenience function that takes all available ifaces into the admin-down state.

Essentially a wrapper for *net_if_down*.

Parameters

- **skip_ignored** – - If true, only affect ifaces that aren't ignored by conn_mgr. Otherwise, affect all ifaces.

Returns
0 if all net_if_down calls returned 0, otherwise the first nonzero value returned by a net_if_down call.

int **conn_mgr_all_if_connect**(bool skip_ignored)

Convenience function that takes all available ifaces into the admin-up state, and connects those that support connectivity.

Essentially a wrapper for *net_if_up* and *conn_mgr_if_connect*.

Parameters

- **skip_ignored** – - If true, only affect ifaces that aren't ignored by conn_mgr. Otherwise, affect all ifaces.

Returns
0 if all net_if_up and conn_mgr_if_connect calls returned 0, otherwise the first nonzero value returned by either net_if_up or conn_mgr_if_connect.

int **conn_mgr_all_if_disconnect**(bool skip_ignored)

Convenience function that disconnects all available ifaces that support connectivity without putting them into admin-down state (unless auto-down is enabled for the iface).

Essentially a wrapper for *net_if_down*.

Parameters

- **skip_ignored** – - If true, only affect ifaces that aren't ignored by conn_mgr. Otherwise, affect all ifaces.

Returns
0 if all net_if_up and conn_mgr_if_connect calls returned 0, otherwise the first nonzero value returned by either net_if_up or conn_mgr_if_connect.

Connectivity Implementations

Overview Connectivity implementations are technology-specific modules that allow specific Zephyr ifaces to support *Connectivity Control*. They are responsible for translating generic *connectivity control API* calls into hardware-specific operations. They are also responsible for implementing standardized *persistence and timeout* behaviors.

See the *implementation guidelines* for details on writing conformant connectivity implementations.

Architecture The *implementation API* allows connectivity implementations to be *defined* at build time using *CONN_MGR_CONN_DEFINE*.

This creates a static instance of the *conn_mgr_conn_impl* struct, which then stores a reference to the passed in *conn_mgr_conn_api* struct (which should be populated with implementation callbacks).

Once defined, you can reference implementations by name and bind them to any unbound iface using *CONN_MGR_BIND_CONN*. Make sure not to accidentally bind two connectivity implementations to a single iface.

Once the iface is bound, *connectivity control API* functions can be called on the iface, and they will be translated to the corresponding implementation functions in *conn_mgr_conn_api*.

Binding an iface does not directly modify its *iface struct*.

Instead, an instance of *conn_mgr_conn_binding* is created and appended an internal *iterable section*.

This binding structure will contain a reference to the bound iface, the connectivity implementation it is bound to, as well as a pointer to a per-iface *context pointer*.

This iterable section can then be iterated over to find out what (if any) connectivity implementation has been bound to a given iface. This search process is used by most of the functions in the *connectivity control API*. As such, these functions should be called sparingly, due to their relatively high search cost.

A single connectivity implementation may be bound to multiple ifaces. See *Do not instance implementations* for more details.

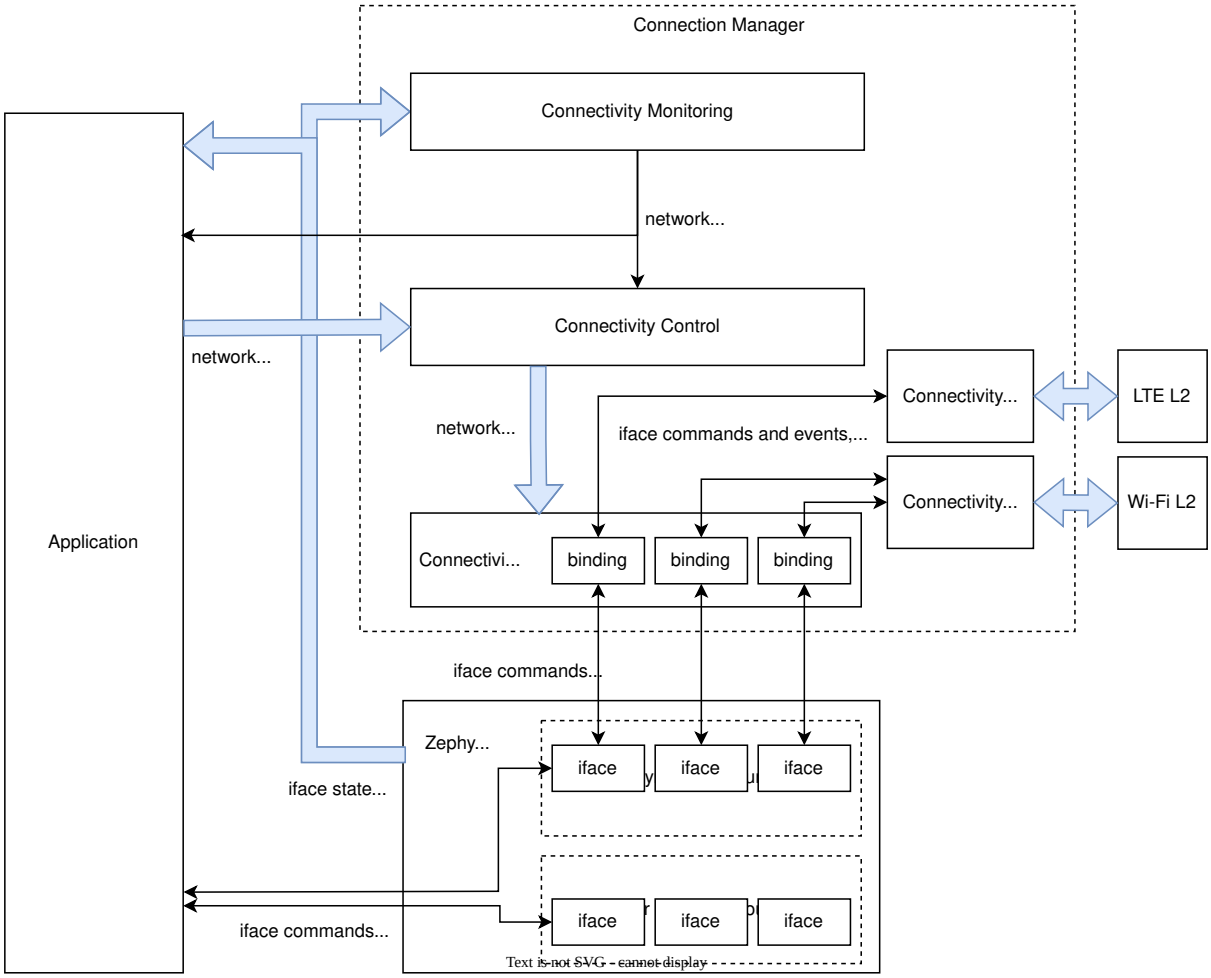

Fig. 19: A detailed view of how Connection Manager integrates with Zephyr and the application. See *here* for a simplified version.

Context Pointer Since a single connectivity implementation may be shared by several Zephyr ifaces, each binding instantiates a context container (of *configurable type*) unique to that binding. Each binding is then instantiated with a reference to that container, which implementations can then use to access per-iface state information.

See also *Do not access bindings without locking them* and *Do not instance implementations*.

Defining an implementation A connectivity implementation may be defined as follows:

```
/* Create the API implementation functions */
int my_connect_impl(struct conn_mgr_conn_binding *const binding) {
        /* Cause your underlying technology to associate */
}
int my_disconnect_impl(struct conn_mgr_conn_binding *const binding) {
        /* Cause your underlying technology to disassociate */
}
void my_init_impl(struct conn_mgr_conn_binding *const binding) {
        /* Perform any required initialization for your underlying technology */
}

/* Declare the API struct */
static struct conn_mgr_conn_api my_impl_api = {
        .connect = my_connect_impl,
        .disconnect = my_disconnect_impl,
        .init = my_init_impl,
        /* ... so on */
};

/* Define the implementation (named MY_CONNECTIVITY_IMPL) */
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

Note

This does not work unless you also *declare the context pointer type*.

Declaring an implementation publicly Once defined, you can make a connectivity implementation available to other compilation units by declaring it (in a header file) as follows:

Listing 8: `my_connectivity_header.h`

```
CONN_MGR_CONN_DECLARE_PUBLIC(MY_CONNECTIVITY_IMPL);
```

The header file that contains this declaration must be included in any compilation units that need to reference the implementation.

Declaring a context type For *CONN_MGR_CONN_DEFINE* to work, you must declare a corresponding context pointer type. This is because all connectivity bindings contain a *Context Pointer* of their associated context pointer type.

If you are using *CONN_MGR_CONN_DECLARE_PUBLIC*, declare this type alongside the declaration:

Listing 9: `my_connectivity_impl.h`

```
#define MY_CONNECTIVITY_IMPL_CTX_TYPE struct my_context_type *
CONN_MGR_CONN_DECLARE_PUBLIC(MY_CONNECTIVITY_IMPL);
```

Then, make sure to include the header file before calling *CONN_MGR_CONN_DEFINE*:

Listing 10: `my_connectivity_impl.c`

```
#include "my_connectivity_impl.h"

CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

Otherwise, it is sufficient to simply declare the context pointer type immediately before the call to *CONN_MGR_CONN_DEFINE*:

```
#define MY_CONNECTIVITY_IMPL_CTX_TYPE struct my_context_type *
CONN_MGR_CONN_DEFINE(MY_CONNECTIVITY_IMPL, &my_impl_api);
```

Note

Naming is important. Your context pointer type declaration must use the same name as your implementation declaration, but with `_CTX_TYPE` appended.

In the previous example, the context type is named `MY_CONNECTIVITY_IMPL_CTX_TYPE`, because `MY_CONNECTIVITY_IMPL` was used as the connectivity implementation name.

If your connectivity implementation does not need a context pointer, simply declare the type as void:

```
#define MY_CONNECTIVITY_IMPL_CTX_TYPE void *
```

Binding an iface to an implementation A defined connectivity implementation may be bound to an iface by calling *CONN_MGR_BIND_CONN* anywhere after the iface's device definition:

```
/* Define an iface */
NET_DEVICE_INIT(my_iface,
        /* ... the specifics here don't matter ... */
);

/* Now bind MY_CONNECTIVITY_IMPL to that iface --
 * the name used should match with the above
 */
CONN_MGR_BIND_CONN(my_iface, MY_CONNECTIVITY_IMPL);
```

Connectivity implementation guidelines Rather than implement all features centrally, Connection Manager relies on each connectivity implementation to implement many behaviors and features individually.

This approach allows Connection Manager to remain lean, and allows each connectivity implementation to choose the most appropriate approach to these behaviors for itself. However, it relies on trust that all connectivity implementations will faithfully implement the features that have been delegated to them.

To maintain consistency between all connectivity implementations, observe the following guidelines when writing your own implementation:

Completely implement timeout and persistence All connectivity implementations must offer complete support for *timeout and persistence*, such that a user can disable or enable these features, regardless of the inherent behavior of the underlying technology. In other words, no matter how the underlying technology behaves, your implementation must make it appear to the end user to behave exactly as specified in the *Timeouts and Persistence* section.

See *Implementing timeouts and persistence* for a detailed technical discussion on implementing timeouts and persistence.

Conform to API specifications Each *implementation API function* you implement should behave as-described in the corresponding connectivity control API function.

For example, your implementation of *conn_mgr_conn_api.connect* should conform to the behavior described for *conn_mgr_if_connect()*.

Allow connectivity pre-configuration Connectivity implementations should provide means for applications to pre-configure all necessary connection parameters (for example, network SSID, or PSK, if applicable), before the call to *conn_mgr_if_connect()*. It should not be necessary to provide this information as part of, or following the *conn_mgr_if_connect()* call, although implementations *should await this information if it is not provided*.

Await valid connectivity configuration If network association fails because the application pre-configured invalid connection parameters, or did not configure connection parameters at all, this should be treated as a network failure.

In other words, the connectivity implementation should not give up on the connection attempt, even if valid connection parameters have not been configured.

Instead, the connectivity implementation should asynchronously wait for valid connection parameters to be configured, either indefinitely, or until the configured *connectivity timeout* elapses.

Implement iface state reporting All connectivity implementations must keep bound iface state up to date.

To be specific:

- Set the iface to dormant, carrier-down, or both during *binding init*.
  - See *Network interface state management* for details regarding iface carrier and dormant states.
- Update dormancy and carrier state so that the iface is non-dormant and carrier-up whenever (and only when) association is complete and connectivity is ready.
- Set the iface either to dormant or to carrier-down as soon as interruption of service is detected.
  - It is acceptable to gate this behind a small timeout (separate from the connection timeout) for network technologies where service is commonly intermittent.
- If the technology also handles IP assignment, ensure those IP addresses are *assigned to the iface*.

Note

iface state updates do not necessarily need to be performed directly by connectivity implementations.

For instance:

- IP assignment is not necessary if *DHCP* is used for the iface.
- The connectivity implementation does not need to update iface dormancy if the underlying *L2 implementation* already does so.

Do not use iface state as implementation state Zephyr ifaces may be accessed from other threads without respecting the binding mutex. As such, Zephyr iface state may change unpredictably during connectivity implementation callbacks.

Therefore, do not base implementation behaviors on iface state.

Keep iface state updated to reflect network availability, but do not read iface state for any purpose.

If you need to keep track of dormancy or IP assignment, use a separate state variable stored in the *context pointer*.

Remain non-interferent Connectivity implementations should not prevent applications from interacting directly with associated technology-specific APIs.

In other words, it should be possible for an application to directly use your underlying technology without breaking your connectivity implementation.

If exceptions to this are absolutely necessary, they should be constrained to specific API calls and should be documented.

Note

While connectivity implementations must not break, it is acceptable for implementations to have potentially unexpected behavior if applications attempt to directly control the association state.

For instance, if an application directly instructs an underlying technology to disassociate, it would be acceptable for the connectivity implementation to interpret this as an unexpected connection loss and immediately attempt to re-associate.

Remain non-blocking All connectivity implementation callbacks should be non-blocking.

For instance, calls to `conn_mgr_conn_api.connect` should initiate a connection process and return immediately.

One exception is `conn_mgr_conn_api.init`, whose implementations are permitted to block.

However, bear in mind that blocking during this callback will delay system init, so still consider offloading time-consuming tasks to a background thread.

Make API immediately ready Connectivity implementations must be ready to receive API calls immediately after `conn_mgr_conn_api.init`.

For instance, a call to `conn_mgr_conn_api.connect` must eventually lead to an association attempt, even if called immediately after `conn_mgr_conn_api.init`.

If the underlying technology cannot be made ready for connect commands immediately when `conn_mgr_conn_api.init` is called, calls to `conn_mgr_conn_api.connect` must be queued in a non-blocking fashion, and then executed later when ready.

Do not store state information outside the context pointer Connection Manager provides a context pointer to each binding.

Connectivity implementations should store all state information in this context pointer.

The only exception is connectivity implementations that are meant to be bound to only a single iface. Such implementations may use statically declared state instead.

See also *Do not instance implementations*.

Access ifaces only through binding structs Do not use statically declared ifaces or externally acquire references to ifaces.

For example, do not use `net_if_get_default()` under the assumption that the bound iface will be the default iface.

Instead, always use the `iface pointer` provided by the relevant `binding struct`. See also *Do not access bindings without locking them*.

Make implementations optional at compile-time Connectivity implementations should provide a Kconfig option to enable or disable the implementation without affecting bound iface availability.

In other words, it should be possible to configure builds that include Connectivity Manager, as well as the iface that would have been bound to the implementation, but not the implementation itself, nor its binding.

Do not instance implementations Do not declare a separate connectivity implementation for every iface you are going to bind to.

Instead, bind one global connectivity implementation to all of your ifaces, and use the context pointer to store state relevant to individual ifaces.

See also *Do not access bindings without locking them* and *Access ifaces only through binding structs*.

Do not access bindings without locking them Bindings may be accessed and modified at random by multiple threads, so modifying or reading from a binding without first *locking it* may lead to unpredictable behavior.

This applies to all descendents of the binding, including anything in the *context container*.

Make sure to *unlock* the binding when you are done accessing it.

Note

A possible exception to this rule is if the resource in question is inherently thread-safe.

However, be careful taking advantage of this exception. It may still be possible to create a race condition, for instance when accessing multiple thread-safe resources simultaneously.

Therefore, it is recommended to simply always lock the binding, whether or not the resource being accessed is inherently thread-safe.

Do not disable built-in features Do not attempt to prevent the use of built-in features (such as *Timeouts and Persistence* or *Automated behaviors*).

All connectivity implementations must fully support these features. Implementations must not attempt to force certain features to be always enabled or always disabled.

Trigger connectivity control events Connectivity control *network management* events are not triggered automatically by Connection Manager.

Connectivity implementations must trigger these events themselves.

Trigger `NET_EVENT_CONN_CMD_IF_TIMEOUT` when a connection *timeout* occurs. See *Timeout* for details.

Trigger *NET_EVENT_CONN_IF_FATAL_ERROR* when a fatal (non-recoverable) connection error occurs. See *Fatal Error* for details.

See *Network Management* for details on firing network management events.

Implementing timeouts and persistence First, see *Timeouts and Persistence* for a high-level description of the expected behavior of timeouts and persistence.

Connectivity implementations must fully conform to that description, regardless of the behavior of the underlying connectivity technology.

Sometimes this means writing extra logic in the connectivity implementation to fake certain behaviors. The following sections discuss various common edge-cases and nuances and how to handle them.

Inherently persistent technologies If the underlying technology automatically attempts to reconnect or retry connection after connection loss or failure, the connectivity implementation must manually cancel such attempts when they are in conflict with timeout or persistence settings.

For example:

- If the underlying technology automatically attempts to reconnect after losing connection, and persistence is disabled for the iface, the connectivity implementation should immediately cancel this reconnection attempt.
- If a connection attempt times out on an iface whose underlying technology does not have a built-in timeout, the connectivity implementation must simulate a timeout by cancelling the connection attempt manually.

Technologiess that give up on connection attempts If the underlying technology has no mechanism to retry connection attempts, or would give up on them before the user-configured timeout, or would not reconnect after connection loss, the connectivity implementation must manually re-request connection to counteract these deviances.

- If your underlying technology is not persistent, you must manually trigger reconnect attempts when persistence is enabled.
- If your underlying technology does not support a timeout, you must manually cancel connection attempts if the timeout is enabled.
- If your underlying technology forces a timeout, you must manually trigger a new connection attempts if that timeout is shorter than the Connection Manager timeout.

Technologies with association retry Many underlying technologies do not usually associate in a single attempt.

Instead, these underlying technologies may need to make multiple back-to-back association attempts in a row, usually with a small delay.

In these situations, the connectivity implementation should treat this series of back-to-back association sub-attempts as a single unified connection attempt.

For instance, after a sub-attempt failure, persistence being disabled should not prevent further sub-attempts, since they all count as one single overall connection attempt. See also *Persistence during connection attempts*.

At which point a series of failed sub-attempts should be considered a failure of the connection attempt as a whole is up to each implementation to decide.

If the connection attempt crosses this threshold, but the configured timeout has not yet elapsed, or there is no timeout, sub-attempts should continue.

Persistence during connection attempts Persistence should not affect any aspect of implementation behavior during a connection attempt. Persistence should only affect whether or not connection attempts are automatically triggered after a connection loss.

The configured timeout should fully determine whether connection retry should be performed.

Implementation API Include header file `include/zephyr/net/conn_mgr_connectivity_impl.h` to access these.

Only for use by connectivity implementations.

group `conn_mgr_connectivity_impl`

Connection Manager Connectivity Implementation API.

Since
3.4

Version
0.1.0

Defines

`CONN_MGR_CONN_DEFINE`(conn_id, conn_api)

Define a conn_mgr connectivity implementation that can be bound to network devices.

Parameters

- `conn_id` – The name of the new connectivity implementation
- `conn_api` – A pointer to a *conn_mgr_conn_api* struct

`CONN_MGR_CONN_DECLARE_PUBLIC`(conn_id)

Helper macro to make a conn_mgr connectivity implementation publicly available.

`CONN_MGR_BIND_CONN_INST`(dev_id, inst, conn_id)

Associate a connectivity implementation with an existing network device instance.

Parameters

- `dev_id` – Network device id.
- `inst` – Network device instance.
- `conn_id` – Name of the connectivity implementation to associate.

`CONN_MGR_BIND_CONN`(dev_id, conn_id)

Associate a connectivity implementation with an existing network device.

Parameters

- `dev_id` – Network device id.
- `conn_id` – Name of the connectivity implementation to associate.

Functions

static inline struct *conn_mgr_conn_binding* ***conn_mgr_if_get_binding**(struct *net_if* *iface)

Retrieves the conn_mgr binding struct for a provided iface if it exists.

Bindings for connectivity implementations with missing API structs are ignored.

For use only by connectivity implementations.

Parameters

- `iface` – - bound network interface to obtain the binding struct for.

Returns
struct conn_mgr_conn_binding* Pointer to the retrieved binding struct if it exists, NULL otherwise.

static inline void **conn_mgr_binding_lock**(struct *conn_mgr_conn_binding* *binding)

Lock the passed-in binding, making it safe to access.

Call this whenever accessing binding data, unless inside a *conn_mgr_conn_api* callback, where it is called automatically by conn_mgr.

Reentrant.

For use only by connectivity implementations.

Parameters

- **binding** – - Binding to lock

static inline void **conn_mgr_binding_unlock**(struct *conn_mgr_conn_binding* *binding)

Unlocks the passed-in binding.

Call this after any call to *conn_mgr_binding_lock* once done accessing binding data.

Reentrant.

For use only by connectivity implementations.

Parameters

- **binding** – - Binding to unlock

static inline void **conn_mgr_binding_set_flag**(struct *conn_mgr_conn_binding* *binding, enum *conn_mgr_if_flag* flag, bool value)

Set the value of the specified connectivity flag for the provided binding.

Can be used from any thread or callback without calling *conn_mgr_binding_lock*.

For use only by connectivity implementations

Parameters

- **binding** – The binding to check
- **flag** – The flag to check
- **value** – New value for the specified flag

static inline bool **conn_mgr_binding_get_flag**(struct *conn_mgr_conn_binding* *binding, enum *conn_mgr_if_flag* flag)

Check the value of the specified connectivity flag for the provided binding.

Can be used from any thread or callback without calling *conn_mgr_binding_lock*.

For use only by connectivity implementations

Parameters

- **binding** – The binding to check
- **flag** – The flag to check

Returns
bool The value of the specified flag

struct **conn_mgr_conn_api**

#include <conn_mgr_connectivity_impl.h> Connectivity Manager Connectivity API structure.

Used to provide generic access to network association parameters and procedures

Public Members

int (***connect**)(struct *conn_mgr_conn_binding* *const binding)

When called, the connectivity implementation should start attempting to establish connectivity (association with a network) for the bound iface pointed to by if_conn->iface.

Must be non-blocking.

Called by *conn_mgr_if_connect*.

int (***disconnect**)(struct *conn_mgr_conn_binding* *const binding)

When called, the connectivity implementation should disconnect (disassociate), or stop any in-progress attempts to associate to a network, the bound iface pointed to by if_conn->iface.

Must be non-blocking.

Called by *conn_mgr_if_disconnect*.

void (***init**)(struct *conn_mgr_conn_binding* *const binding)

Called once for each iface that has been bound to a connectivity implementation using this API.

Connectivity implementations should use this callback to perform any required per-bound-iface initialization.

Implementations may choose to gracefully handle invalid buffer lengths with partial writes, rather than raise errors, if deemed appropriate.

int (***set_opt**)(struct *conn_mgr_conn_binding* *const binding, int optname, const void *optval, size_t optlen)

Implementation callback for conn_mgr_if_set_opt.

Used to set implementation-specific connectivity settings.

Calls to conn_mgr_if_set_opt on an iface will result in calls to this callback with the *conn_mgr_conn_binding* struct bound to that iface.

It is up to the connectivity implementation to interpret optname. Options can be specific to the bound iface (pointed to by if_conn->iface), or can apply to the whole connectivity implementation.

See the description of conn_mgr_if_set_opt for more details. set_opt implementations should conform to that description.

Implementations may choose to gracefully handle invalid buffer lengths with partial reads, rather than raise errors, if deemed appropriate.

int (***get_opt**)(struct *conn_mgr_conn_binding* *const binding, int optname, void *optval, size_t *optlen)

Implementation callback for conn_mgr_if_get_opt.

Used to retrieve implementation-specific connectivity settings.

Calls to conn_mgr_if_get_opt on an iface will result in calls to this callback with the *conn_mgr_conn_binding* struct bound to that iface.

It is up to the connectivity implementation to interpret optname. Options can be specific to the bound iface (pointed to by if_conn->iface), or can apply to the whole connectivity implementation.

See the description of conn_mgr_if_get_opt for more details. get_opt implementations should conform to that description.

struct **conn_mgr_conn_impl**

#include <*conn_mgr_connectivity_impl.h*> Connectivity Implementation struct.

Declares a conn_mgr connectivity layer implementation with the provided API

Public Members

struct *conn_mgr_conn_api* ***api**

The connectivity API used by the implementation.

struct **conn_mgr_conn_binding**

#include <*conn_mgr_connectivity_impl.h*> Connectivity Manager network interface binding structure.

Binds a conn_mgr connectivity implementation to an iface / network device. Stores per-iface state for the connectivity implementation.

Generic connectivity state

uint32_t **flags**

Connectivity flags.

Public boolean state and configuration values supported by all bindings. See conn_mgr_if_flag for options.

int **timeout**

Timeout (seconds)

Indicates to the connectivity implementation how long it should attempt to establish connectivity for during a connection attempt before giving up.

The connectivity implementation should give up on establishing connectivity after this timeout, even if persistence is enabled.

Set to *CONN_MGR_IF_NO_TIMEOUT* to indicate that no timeout should be used.

Public Members

struct *net_if* ***iface**

The network interface the connectivity implementation is bound to.

const struct *conn_mgr_conn_impl* ***impl**

The connectivity implementation the network device is bound to.

void ***ctx**

Pointer to private, per-iface connectivity context.

6.4 LoRa and LoRaWAN

6.4.1 Overview

LoRa (abbrev. for Long Range) is a proprietary low-power wireless communication protocol developed by the Semtech Corporation.

LoRa acts as the physical layer (PHY) based on the chirp spread spectrum (CSS) modulation technique.

LoRaWAN (for Long Range Wide Area Network) defines a networking layer on top of the LoRa PHY.

Zephyr provides APIs for LoRa to send raw data packets directly over the wireless interface as well as APIs for LoRaWAN to connect the end device to the internet through a gateway.

The Zephyr implementation is based on Semtech's LoRaMac-node library, which is included as a Zephyr module.

The LoRaWAN specification is published by the LoRa Alliance.

6.4.2 Configuration Options

LoRa PHY

Related configuration options can be found under drivers/lora/Kconfig.

- CONFIG_LORA
- CONFIG_LORA_SHELL
- CONFIG_LORA_INIT_PRIORITY

LoRaWAN

Related configuration options can be found under subsys/lorawan/Kconfig.

- CONFIG_LORAWAN
- CONFIG_LORAWAN_SYSTEM_MAX_RX_ERROR
- CONFIG_LORAMAC_REGION_AS923
- CONFIG_LORAMAC_REGION_AU915
- CONFIG_LORAMAC_REGION_CN470
- CONFIG_LORAMAC_REGION_CN779
- CONFIG_LORAMAC_REGION_EU433
- CONFIG_LORAMAC_REGION_EU868
- CONFIG_LORAMAC_REGION_KR920
- CONFIG_LORAMAC_REGION_IN865
- CONFIG_LORAMAC_REGION_US915
- CONFIG_LORAMAC_REGION_RU864

6.4.3 API Reference

LoRa PHY

Related code samples

LoRa receive
Receive packets in both synchronous and asynchronous mode using the LoRa radio.

LoRa send
Transmit a preconfigured payload every second using the LoRa radio.

enumerator CR_4_7 = 3

enumerator CR_4_8 = 4

Functions

static inline int lora_config(const struct *device* *dev, struct *lora_modem_config* *config)

Configure the LoRa modem.

Parameters

- dev – LoRa device
- config – Data structure containing the intended configuration for the modem

Returns

0 on success, negative on error

static inline int lora_send(const struct *device* *dev, uint8_t *data, uint32_t data_len)

Send data over LoRa.

> **Note**
>
> This blocks until transmission is complete.

Parameters

- dev – LoRa device
- data – Data to be sent
- data_len – Length of the data to be sent

Returns

0 on success, negative on error

static inline int lora_send_async(const struct *device* *dev, uint8_t *data, uint32_t data_len, struct *k_poll_signal* *async)

Asynchronously send data over LoRa.

> **Note**
>
> This returns immediately after starting transmission, and locks the LoRa modem until the transmission completes.

Parameters

- `dev` – LoRa device
- `data` – Data to be sent
- `data_len` – Length of the data to be sent
- `async` – A pointer to a valid and ready to be signaled struct *k_poll_signal*. (Note: if NULL this function will not notify the end of the transmission).

Returns
0 on success, negative on error

static inline int `lora_recv`(const struct *device* *dev, uint8_t *data, uint8_t size, *k_timeout_t* timeout, int16_t *rssi, int8_t *snr)

Receive data over LoRa.

> **Note**
>
> This is a blocking call.

Parameters

- `dev` – LoRa device
- `data` – Buffer to hold received data
- `size` – Size of the buffer to hold the received data. Max size allowed is 255.
- `timeout` – Duration to wait for a packet.
- `rssi` – RSSI of received data
- `snr` – SNR of received data

Returns
Length of the data received on success, negative on error

static inline int `lora_recv_async`(const struct *device* *dev, lora_recv_cb cb)

Receive data asynchronously over LoRa.

Receive packets continuously under the configuration previously setup by *lora_config*.

Reception is cancelled by calling this function again with cb = NULL. This can be done within the callback handler.

Parameters

- `dev` – Modem to receive data on.
- `cb` – Callback to run on receiving data. If NULL, any pending asynchronous receptions will be cancelled.

Returns
0 when reception successfully setup, negative on error

static inline int `lora_test_cw`(const struct *device* *dev, uint32_t frequency, int8_t tx_power, uint16_t duration)

Transmit an unmodulated continuous wave at a given frequency.

> **Note**
>
> Only use this functionality in a test setup where the transmission does not interfere with other devices.

Parameters

- `dev` – LoRa device
- `frequency` – Output frequency (Hertz)
- `tx_power` – TX power (dBm)
- `duration` – Transmission duration in seconds.

Returns

0 on success, negative on error

struct `lora_modem_config`

#include <*lora.h*> Structure containing the configuration of a LoRa modem.

Public Members

uint32_t `frequency`

Frequency in Hz to use for transceiving.

enum *lora_signal_bandwidth* `bandwidth`

The bandwidth to use for transceiving.

enum *lora_datarate* `datarate`

The data-rate to use for transceiving.

enum *lora_coding_rate* `coding_rate`

The coding rate to use for transceiving.

uint16_t `preamble_len`

Length of the preamble.

int8_t `tx_power`

TX-power in dBm to use for transmission.

bool `tx`

Set to true for transmission, false for receiving.

bool `iq_inverted`

Invert the In-Phase and Quadrature (IQ) signals.

Normally this should be set to false. In advanced use-cases where a differentation is needed between “uplink” and “downlink” traffic, the IQ can be inverted to create two different channels on the same frequency

bool `public_network`

Sets the sync-byte to use:

- false: for using the private network sync-byte
- true: for using the public network sync-byte The public network sync-byte is only intended for advanced usage. Normally the private network sync-byte should be used for peer to peer communications and the LoRaWAN APIs should be used for interacting with a public network.

Typedefs

typedef uint8_t (*`lorawan_battery_level_cb_t`)(void)

Defines the battery level callback handler function signature.

Retval 0
if the node is connected to an external power source

Retval 1..254
battery level, where 1 is the minimum and 254 is the maximum value

Retval 255
if the node was not able to measure the battery level

typedef void (*`lorawan_dr_changed_cb_t`)(enum *lorawan_datarate* dr)

Defines the datarate changed callback handler function signature.

Param dr
Updated datarate.

Enums

enum `lorawan_class`

LoRaWAN class types.

Values:

enumerator `LORAWAN_CLASS_A` = 0x00

Class A device.

enumerator `LORAWAN_CLASS_B` = 0x01

Class B device.

enumerator `LORAWAN_CLASS_C` = 0x02

Class C device.

enum `lorawan_act_type`

LoRaWAN activation types.

Values:

enumerator `LORAWAN_ACT_OTAA` = 0

Over-the-Air Activation (OTAA)

enumerator `LORAWAN_ACT_ABP`

Activation by Personalization (ABP)

enum `lorawan_channels_mask_size`

LoRaWAN channels mask sizes.

Values:

enumerator `LORAWAN_CHANNELS_MASK_SIZE_AS923` = 1

Region AS923 mask size.

enumerator `LORAWAN_CHANNELS_MASK_SIZE_AU915` = 6

Region AU915 mask size.

enumerator `LORAWAN_CHANNELS_MASK_SIZE_CN470` = 6

Region CN470 mask size.

enumerator `LORAWAN_CHANNELS_MASK_SIZE_CN779` = 1

Region CN779 mask size.

enumerator `LORAWAN_CHANNELS_MASK_SIZE_EU433` = 1

Region EU433 mask size.

enumerator `LORAWAN_CHANNELS_MASK_SIZE_EU868` = 1

India 865 MHz frequency band.

enumerator LORAWAN_REGION_US915
United States 915 MHz frequency band.

enumerator LORAWAN_REGION_RU864
Russia 864 MHz frequency band.

enum `lorawan_message_type`

LoRaWAN message types.

Values:

enumerator `LORAWAN_MSG_UNCONFIRMED` = 0

Unconfirmed message.

enumerator `LORAWAN_MSG_CONFIRMED`

Confirmed message.

Functions

void `lorawan_register_battery_level_callback`(*lorawan_battery_level_cb_t* cb)

Register a battery level callback function.

Provide the LoRaWAN stack with a function to be called whenever a battery level needs to be read.

Should no callback be provided the lorawan backend will report 255.

Parameters

- `cb` – Pointer to the battery level function

void `lorawan_register_downlink_callback`(struct *lorawan_downlink_cb* *cb)

Register a callback to be run on downlink packets.

Parameters

- `cb` – Pointer to structure containing callback parameters

void `lorawan_register_dr_changed_callback`(*lorawan_dr_changed_cb_t* cb)

Register a callback to be called when the datarate changes.

The callback is called once upon successfully joining a network and again each time the datarate changes due to ADR.

Parameters

- `cb` – Pointer to datarate update callback

int `lorawan_join`(const struct *lorawan_join_config* *config)

Join the LoRaWAN network.

Join the LoRaWAN network using OTAA or AWB.

Parameters

- `config` – Configuration to be used

Returns

0 if successful, negative errno code if failure

int `lorawan_start`(void)

Start the LoRaWAN stack.

This function need to be called before joining the network.

Returns

0 if successful, negative errno code if failure

int **lorawan_send**(uint8_t port, uint8_t *data, uint8_t len, enum *lorawan_message_type* type)

Send data to the LoRaWAN network.

Send data to the connected LoRaWAN network.

Parameters

- **port** – Port to be used for sending data. Must be set if the payload is not empty.
- **data** – Data buffer to be sent
- **len** – Length of the buffer to be sent. Maximum length of this buffer is 255 bytes but the actual payload size varies with region and datarate.
- **type** – Specifies if the message shall be confirmed or unconfirmed. Must be one of *lorawan_message_type*.

Returns
0 if successful, negative errno code if failure

int **lorawan_set_class**(enum *lorawan_class* dev_class)

Set the current device class.

Change the current device class. This function may be called before or after a network connection has been established.

Parameters

- **dev_class** – New device class

Returns
0 if successful, negative errno code if failure

int **lorawan_set_conf_msg_tries**(uint8_t tries)

Set the number of tries used for transmissions.

Parameters

- **tries** – Number of tries to be used

Returns
0 if successful, negative errno code if failure

void **lorawan_enable_adr**(bool enable)

Enable Adaptive Data Rate (ADR)

Control whether adaptive data rate (ADR) is enabled. When ADR is enabled, the data rate is treated as a default data rate that will be used if the ADR algorithm has not established a data rate. ADR should normally only be enabled for devices with stable RF conditions (i.e., devices in a mostly static location).

Parameters

- **enable** – Enable or Disable adaptive data rate.

int **lorawan_set_channels_mask**(uint16_t *channels_mask, size_t channels_mask_size)

Set the channels mask.

Change the default channels mask. When mask is not changed, all the channels can be used for data transmission. Some Network Servers don't use all the channels, in this case, the channels mask must be provided.

Parameters

- **channels_mask** – Buffer with channels mask to be used.
- **channels_mask_size** – Size of channels mask buffer.

Return values

- `0` – successful
- `-EINVAL` – channels mask or channels mask size is wrong

int `lorawan_set_datarate`(enum *lorawan_datarate* dr)

Set the default data rate.

Change the default data rate.

Parameters

- `dr` – Data rate used for transmissions

Returns

0 if successful, negative errno code if failure

enum *lorawan_datarate* `lorawan_get_min_datarate`(void)

Get the minimum possible datarate.

The minimum possible datarate may change in response to a TxParamSetupReq command from the network server.

Returns

Minimum possible data rate

void `lorawan_get_payload_sizes`(uint8_t *max_next_payload_size, uint8_t *max_payload_size)

Get the current payload sizes.

Query the current payload sizes. The maximum payload size varies with datarate, while the current payload size can be less due to MAC layer commands which are inserted into uplink packets.

Parameters

- `max_next_payload_size` – Maximum payload size for the next transmission
- `max_payload_size` – Maximum payload size for this datarate

int `lorawan_set_region`(enum *lorawan_region* region)

Set the region and frequency to be used.

Control the LoRa region and frequency settings. This should be called before lorawan_start(). If you only have support for a single region selected via Kconfig, this function does not need to be called at all.

Parameters

- `region` – The region to be selected

Returns

0 if successful, negative errno otherwise

struct `lorawan_join_otaa`

#include <*lorawan.h*> LoRaWAN join parameters for over-the-Air activation (OTAA)

Note that all of the fields use LoRaWAN 1.1 terminology.

All parameters are optional if a secure element is present in which case the values stored in the secure element will be used instead.

Public Members

uint8_t *`join_eui`
: Join EUI.

uint8_t *`nwk_key`
: Network Key.

uint8_t *`app_key`
: Application Key.

uint16_t `dev_nonce`
: Device Nonce.

  Starting with LoRaWAN 1.0.4 the DevNonce must be monotonically increasing for each OTAA join with the same EUI. The DevNonce should be stored in non-volatile memory by the application.

struct `lorawan_join_abp`
: *#include* <*lorawan.h*> LoRaWAN join parameters for activation by personalization (ABP)

Public Members

uint32_t `dev_addr`
: Device address on the network.

uint8_t *`app_skey`
: Application session key.

uint8_t *`nwk_skey`
: Network session key.

uint8_t *`app_eui`
: Application EUI.

struct `lorawan_join_config`
: *#include* <*lorawan.h*> LoRaWAN join parameters.

Public Members

struct *lorawan_join_otaa* `otaa`
: OTAA join parameters.

struct *lorawan_join_abp* `abp`
: ABP join parameters.

union lorawan_join_config

Join parameters.

uint8_t *dev_eui

Device EUI.

Optional if a secure element is present.

enum *lorawan_act_type* mode

Activation mode.

struct lorawan_downlink_cb

#include <*lorawan.h*> LoRaWAN downlink callback parameters.

Public Members

uint16_t port

Port to handle messages for.

- Port 0: TX packet acknowledgements
- Ports 1-255: Standard downlink port
- LW_RECV_PORT_ANY: All downlinks

void (*cb)(uint8_t port, bool data_pending, int16_t rssi, int8_t snr, uint8_t len, const uint8_t *data)

Callback function to run on downlink data.

> **Note**
>
> Callbacks are run on the system workqueue, and should therefore be as short as possible.

Param port
Port message was sent on
Param data_pending
Network server has more downlink packets pending
Param rssi
Received signal strength in dBm
Param snr
Signal to Noise ratio in dBm
Param len
Length of data received, will be 0 for ACKs
Param data
Data received, will be NULL for ACKs

sys_snode_t node

Node for callback list.

- *USB Vendor and Product identifiers*

Overview

The USB device stack is a hardware independent interface between USB device controller driver and USB device class drivers or customer applications. It is a port of the LPCUSB device stack and has been modified and expanded over time. It provides the following functionalities:

- Uses the *USB device controller driver API* provided by the device controller drivers to interact with the USB device controller.
- Responds to standard device requests and returns standard descriptors, essentially handling 'Chapter 9' processing, specifically the standard device requests in table 9-3 from the universal serial bus specification revision 2.0.
- Provides a programming interface to be used by USB device classes or customer applications. The APIs is described in include/zephyr/usb/usb_device.h

Note

It is planned to deprecate all APIs listed in *USB device support APIs* and the functions that depend on them between Zephyr v3.7.0 and v4.0.0, and remove them in v4.2.0. The new USB

device support, represented by the APIs in *New USB device support APIs*, will become the default in Zephyr v4.0.0.

Supported USB classes

Audio There is an experimental implementation of the Audio class. It follows specification version 1.00 (`bcdADC 0x0100`) and supports synchronous synchronisation type only. See usb-audio-headphones-microphone and usb-audio-headset samples for reference.

Bluetooth HCI USB transport layer Bluetooth HCI USB transport layer implementation uses *HCI RAW channel* to expose HCI interface to the host. It is not fully in line with the description in the Bluetooth specification and consists only of an interface with the endpoint configuration:

- HCI commands through control endpoint (host-to-device only)
- HCI events through interrupt IN endpoint
- ACL data through one bulk IN and one bulk OUT endpoints

A second interface for the voice channels has not been implemented as there is no support for this type in *Bluetooth*. It is not a big problem under Linux if HCI USB transport layer is the only interface that appears in the configuration, the btusb driver would not try to claim a second (isochronous) interface. The consequence is that if HCI USB is used in a composite configuration and is the first interface, then the Linux btusb driver will claim both the first and the next interface, preventing other composite functions from working. Because of this problem, HCI USB should not be used in a composite configuration. This problem is fixed in the implementation for new USB support.

See bluetooth-hci-usb-sample sample for reference.

CDC ACM The CDC ACM class is used as backend for different subsystems in Zephyr. However, its configuration may not be easy for the inexperienced user. Below is a description of the different use cases and some pitfalls.

The interface for CDC ACM user is *Universal Asynchronous Receiver-Transmitter (UART)* driver API. But there are two important differences in behavior to a real UART controller:

- Data transfer is only possible after the USB device stack has been initialized and started, until then any data is discarded
- If device is connected to the host, it still needs an application on the host side which requests the data
- The CDC ACM poll out implementation follows the API and blocks when the TX ring buffer is full only if the hw-flow-control property is enabled and called from a non-ISR context.

The devicetree compatible property for CDC ACM UART is `zephyr,cdc-acm-uart`. CDC ACM support is automatically selected when USB device support is enabled and a compatible node in the devicetree sources is present. If necessary, CDC ACM support can be explicitly disabled by `CONFIG_USB_CDC_ACM`. About four CDC ACM UART instances can be defined and used, limited by the maximum number of supported endpoints on the controller.

CDC ACM UART node is supposed to be child of a USB device controller node. Since the designation of the controller nodes varies from vendor to vendor, and our samples and application should be as generic as possible, the default USB device controller is usually assigned an `zephyr_udc0` node label. Often, CDC ACM UART is described in a devicetree overlay file and looks like this:

```
&zephyr_udc0 {
        cdc_acm_uart0: cdc_acm_uart0 {
                compatible = "zephyr,cdc-acm-uart";
                label = "CDC_ACM_0";
        };
};
```

Sample usb-cdc-acm has similar overlay files. And since no special properties are present, it may seem overkill to use devicetree to describe CDC ACM UART. The motivation behind using devicetree is the easy interchangeability of a real UART controller and CDC ACM UART in applications.

Console over CDC ACM UART With the CDC ACM UART node from above and `zephyr,console` property of the chosen node, we can describe that CDC ACM UART is to be used with the console. A similar overlay file is used by the usb-cdc-acm-console sample.

```
/ {
        chosen {
                zephyr,console = &cdc_acm_uart0;
        };
};

&zephyr_udc0 {
        cdc_acm_uart0: cdc_acm_uart0 {
                compatible = "zephyr,cdc-acm-uart";
                label = "CDC_ACM_0";
        };
};
```

Before the application uses the console, it is recommended to wait for the DTR signal:

```
const struct device *const dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_console));
uint32_t dtr = 0;

if (usb_enable(NULL)) {
        return;
}

while (!dtr) {
        uart_line_ctrl_get(dev, UART_LINE_CTRL_DTR, &dtr);
        k_sleep(K_MSEC(100));
}

printk("nuqneH\n");
```

CDC ACM UART as backend As for the console sample, it is possible to configure CDC ACM UART as backend for other subsystems by setting *Chosen nodes* properties.

List of few Zephyr specific chosen properties which can be used to select CDC ACM UART as backend for a subsystem or application:

- `zephyr,bt-c2h-uart` used in Bluetooth, for example see bluetooth-hci-uart-sample
- `zephyr,ot-uart` used in OpenThread, for example see coprocessor
- `zephyr,shell-uart` used by shell for serial backend, for example see samples/subsys/shell/shell_module
- `zephyr,uart-mcumgr` used by smp-svr sample

POSIX default tty ECHO mitigation POSIX systems, like Linux, default to enabling ECHO on tty devices. Host side application can disable ECHO by calling `open()` on the tty device and issuing `ioctl()` (preferably via `tcsetattr()`) to disable echo if it is not desired. Unfortunately, there is an inherent race between the `open()` and `ioctl()` where the ECHO is enabled and any characters received (even if host application does not call `read()`) will be echoed back. This issue is especially visible when the CDC ACM port is used without any real UART on the other side because there is no arbitrary delay due to baud rate.

To mitigate the issue, Zephyr CDC ACM implementation arms IN endpoint with ZLP after device is configured. When the host reads the ZLP, which is pretty much the best indication that host application has opened the tty device, Zephyr will force `CONFIG_CDC_ACM_TX_DELAY_MS` millisecond delay before real payload is sent. This should allow sufficient time for first, and only first, application that opens the tty device to disable ECHO if ECHO is not desired. If ECHO is not desired at all from CDC ACM device it is best to set up udev rule to disable ECHO as soon as device is connected.

ECHO is particurarly unwanted when CDC ACM instance is used for Zephyr shell, because the control characters to set color sent back to shell are interpreted as (invalid) command and user will see garbage as a result. While minicom does disable ECHO by default, on exit with reset it will restore the termios settings to whatever was set on entry. Therefore, if minicom is the first application to open the tty device, the exit with reset will enable ECHO back and thus set up a problem for the next application (which cannot be mitigated at Zephyr side). To prevent the issue it is recommended either to leave minicom without reset or to disable ECHO before minicom is started.

DFU USB DFU class implementation is tightly coupled to *Device Firmware Upgrade* and *MCUBoot API*. This means that the target platform must support the *Flash Image* API.

See usb-dfu sample for reference.

USB Human Interface Devices (HID) support HID support abuses *Device Driver Model* simply to allow applications to use the *device_get_binding()*. Note that there is no HID device API as such, instead the interface is provided by *hid_ops*. The default instance name is `HID_n`, where n can be {0, 1, 2, ...} depending on the `CONFIG_USB_HID_DEVICE_COUNT`.

Each HID instance requires a HID report descriptor. The interface to the core and the report descriptor must be registered using *usb_hid_register_device()*.

As the USB HID specification is not only used by the USB subsystem, the USB HID API reference is split into two parts, *Human Interface Devices (HID)* and *USB HID Class API*. HID helper macros from *Human Interface Devices (HID)* should be used to compose a HID report descriptor. Macro names correspond to those used in the USB HID specification.

For the HID class interface, an IN interrupt endpoint is required for each instance, an OUT interrupt endpoint is optional. Thus, the minimum implementation requirement for *hid_ops* is to provide `int_in_ready` callback.

```
#define REPORT_ID               1
static bool configured;
static const struct device *hdev;

static void int_in_ready_cb(const struct device *dev)
{
        static uint8_t report[2] = {REPORT_ID, 0};

        if (hid_int_ep_write(hdev, report, sizeof(report), NULL)) {
                LOG_ERR("Failed to submit report");
        } else {
                report[1]++;
        }
```

(continues on next page)

(continued from previous page)

```
}

static void status_cb(enum usb_dc_status_code status, const uint8_t *param)
{
        if (status == USB_DC_RESET) {
                configured = false;
        }

        if (status == USB_DC_CONFIGURED && !configured) {
                int_in_ready_cb(hdev);
                configured = true;
        }
}

static const uint8_t hid_report_desc[] = {
        HID_USAGE_PAGE(HID_USAGE_GEN_DESKTOP),
        HID_USAGE(HID_USAGE_GEN_DESKTOP_UNDEFINED),
        HID_COLLECTION(HID_COLLECTION_APPLICATION),
        HID_LOGICAL_MIN8(0x00),

        int ret;

        hdev = device_get_binding("HID_0");
        if (hdev == NULL) {
                return -ENODEV;
        }

        usb_hid_register_device(hdev, hid_report_desc, sizeof(hid_report_desc),
                                &my_ops);

        ret = usb_hid_init(hdev);
        if (ret) {
                return ret;
        }

        return usb_enable(status_cb);
}
```

If the application wishes to receive output reports via the OUT interrupt endpoint, it must enable `CONFIG_ENABLE_HID_INT_OUT_EP` and provide `int_out_ready` callback. The disadvantage of this is that Kconfig options such as `CONFIG_ENABLE_HID_INT_OUT_EP` or `CONFIG_HID_INTERRUPT_EP_MPS` apply to all instances. This design issue will be fixed in the HID class implementation for the new USB support.

See usb-hid or usb-hid-mouse sample for reference.

Mass Storage Class MSC follows Bulk-Only Transport specification and uses *Disk Access* to access and expose a RAM disk, emulated block device on a flash partition, or SD Card to the host. Only one disk instance can be exported at a time.

The disc to be used by the implementation is set by the `CONFIG_MASS_STORAGE_DISK_NAME` and should be the same as the name used by the disc access driver that the application wants to expose to the host. SD card disk drivers use options `CONFIG_MMC_VOLUME_NAME` or `CONFIG_SDMMC_VOLUME_NAME`, and flash and RAM disk drivers use node property `disk-name` to set the disk name.

For the emulated block device on a flash partition, the flash partition and flash disk to be used must be described in the devicetree. If a storage partition is already described at the board level, application devicetree overlay must also delete `storage_partition` node first. `CONFIG_MASS_STORAGE_DISK_NAME` should be the same as `disk-name` property.

```
/delete-node/ &storage_partition;

&mx25r64 {
        partitions {
                compatible = "fixed-partitions";
                #address-cells = <1>;
                #size-cells = <1>;

                storage_partition: partition@0 {
                        label = "storage";
                        reg = <0x00000000 0x00020000>;
                };
        };
};

/ {
        msc_disk0 {
                compatible = "zephyr,flash-disk";
                partition = <&storage_partition>;
                disk-name = "NAND";
                cache-size = <4096>;
        };
};
```

The `disk-property` "NAND" may be confusing, but it is simply how some file systems identifies the disc. Therefore, if the application also accesses the file system on the exposed disc, default names should be used, see usb-mass sample for reference.

Networking There are three implementations that work in a similar way, providing a virtual Ethernet connection between the remote (USB host) and Zephyr network support.

- CDC ECM class, enabled with `CONFIG_USB_DEVICE_NETWORK_ECM`
- CDC EEM class, enabled with `CONFIG_USB_DEVICE_NETWORK_EEM`
- RNDIS support, enabled with `CONFIG_USB_DEVICE_NETWORK_RNDIS`

See zperf or socket-dumb-http-server for reference. Typically, users will need to add a configuration file overlay to the build, such as samples/net/zperf/overlay-netusb.conf.

Applications using RNDIS support should enable `CONFIG_USB_DEVICE_OS_DESC` for a better user experience on a host running Microsoft Windows OS.

Binary Device Object Store (BOS) support

BOS handling can be enabled with Kconfig option `CONFIG_USB_DEVICE_BOS`. This option also has the effect of changing device descriptor `bcdUSB` to `0210`. The application should register descrip-

tors such as Capability Descriptor using *usb_bos_register_cap()*. Registered descriptors are added to the root BOS descriptor and handled by the stack.

See webusb sample for reference.

Implementing a non-standard USB class

The configuration of USB device is done in the stack layer.

The following structures and callbacks need to be defined:

- Part of USB Descriptor table
- USB Endpoint configuration table
- USB Device configuration structure
- Endpoint callbacks
- Optionally class, vendor and custom handlers

For example, for the USB loopback application:

```
struct usb_loopback_config {
        struct usb_if_descriptor if0;
        struct usb_ep_descriptor if0_out_ep;
        struct usb_ep_descriptor if0_in_ep;
} __packed;

USBD_CLASS_DESCR_DEFINE(primary, 0) struct usb_loopback_config loopback_cfg = {
        /* Interface descriptor 0 */
        .if0 = {
                .bLength = sizeof(struct usb_if_descriptor),
                .bDescriptorType = USB_DESC_INTERFACE,
                .bInterfaceNumber = 0,
                .bAlternateSetting = 0,
                .bNumEndpoints = 2,
                .bInterfaceClass = USB_BCC_VENDOR,
                .bInterfaceSubClass = 0,
                .bInterfaceProtocol = 0,
                .iInterface = 0,
        },

        /* Data Endpoint OUT */
        .if0_out_ep = {
                .bLength = sizeof(struct usb_ep_descriptor),
                .bDescriptorType = USB_DESC_ENDPOINT,
                .bEndpointAddress = LOOPBACK_OUT_EP_ADDR,
                .bmAttributes = USB_DC_EP_BULK,
                .wMaxPacketSize = sys_cpu_to_le16(CONFIG_LOOPBACK_BULK_EP_MPS),
                .bInterval = 0x00,
        },

        /* Data Endpoint IN */
        .if0_in_ep = {
                .bLength = sizeof(struct usb_ep_descriptor),
                .bDescriptorType = USB_DESC_ENDPOINT,
                .bEndpointAddress = LOOPBACK_IN_EP_ADDR,
                .bmAttributes = USB_DC_EP_BULK,
                .wMaxPacketSize = sys_cpu_to_le16(CONFIG_LOOPBACK_BULK_EP_MPS),
                .bInterval = 0x00,
        },
};
```

Endpoint configuration:

```
static struct usb_ep_cfg_data ep_cfg[] = {
        {
                .ep_cb = loopback_out_cb,
                .ep_addr = LOOPBACK_OUT_EP_ADDR,
        },
        {
                .ep_cb = loopback_in_cb,
                .ep_addr = LOOPBACK_IN_EP_ADDR,
        },
};
```

USB Device configuration structure:

```
USBD_DEFINE_CFG_DATA(loopback_config) = {
        .usb_device_description = NULL,
        .interface_config = loopback_interface_config,
        .interface_descriptor = &loopback_cfg.if0,
        .cb_usb_status = loopback_status_cb,
        .interface = {
                .class_handler = NULL,
                .custom_handler = NULL,
                .vendor_handler = loopback_vendor_handler,
        },
        .num_endpoints = ARRAY_SIZE(ep_cfg),
        .endpoint = ep_cfg,
};
```

The vendor device requests are forwarded by the USB stack core driver to the class driver through the registered vendor handler.

For the loopback class driver, `loopback_vendor_handler()` processes the vendor requests:

```
static int loopback_vendor_handler(struct usb_setup_packet *setup,
                                   int32_t *len, uint8_t **data)
{
        LOG_DBG("Class request: bRequest 0x%x bmRequestType 0x%x len %d",
                setup->bRequest, setup->bmRequestType, *len);

        if (setup->RequestType.recipient != USB_REQTYPE_RECIPIENT_DEVICE) {
                return -ENOTSUP;
        }

        if (usb_reqtype_is_to_device(setup) &&
            setup->bRequest == 0x5b) {
                LOG_DBG("Host-to-Device, data %p", *data);
                /*
                 * Copy request data in loopback_buf buffer and reuse
                 * it later in control device-to-host transfer.
                 */
                memcpy(loopback_buf, *data,
                       MIN(sizeof(loopback_buf), setup->wLength));
                return 0;
        }

        if ((usb_reqtype_is_to_host(setup)) &&
            (setup->bRequest == 0x5c)) {
                LOG_DBG("Device-to-Host, wLength %d, data %p",
                        setup->wLength, *data);
                *data = loopback_buf;
                *len = MIN(sizeof(loopback_buf), setup->wLength);
                return 0;
        }
```

(continues on next page)

(continued from previous page)

```
31
32          return -ENOTSUP;
33  }
```

The class driver waits for the `USB_DC_CONFIGURED` device status code before transmitting any data.

Interface number and endpoint address assignment

In USB terminology, a `function` is a device that provides a capability to the host, such as a HID class device that implements a keyboard. A function contains a collection of `interfaces`; at least one interface is required. An interface may contain device `endpoints`; for example, at least one input endpoint is required to implement a HID class device, and no endpoints are required to implement a USB DFU class. A USB device that combines functions is a multifunction USB device, for example, a combination of a HID class device and a CDC ACM device.

With Zephyr RTOS USB support, various combinations are possible with built-in USB classes/functions or custom user implementations. The limitation is the number of available device endpoints. Each device endpoint is uniquely addressable. The endpoint address is a combination of endpoint direction and endpoint number, a four-bit value. Endpoint number zero is used for the default control method to initialize and configure a USB device. By specification, a maximum of `15 IN` and `15 OUT` device endpoints are also available for use in functions. The actual number depends on the device controller used. Not all controllers support the maximum number of endpoints and all endpoint types. For example, a device controller might support one IN and one OUT isochronous endpoint, but only for endpoint number 8, resulting in endpoint addresses 0x88 and 0x08. Also, one controller may be able to have IN/OUT endpoints on the same endpoint number, interrupt IN endpoint 0x81 and bulk OUT endpoint 0x01, while the other may only be able to handle one endpoint per endpoint number. Information about the number of interfaces, interface associations, endpoint types, and addresses is provided to the host by the interface, interface specific, and endpoint descriptors.

Host driver for specific function, uses interface and endpoint descriptor to obtain endpoint addresses, types, and other properties. This allows function host drivers to be generic, for example, a multi-function device consisting of one or more CDC ACM and one or more CDC ECM class implementations is possible and no specific drivers are required.

Interface and endpoint descriptors of built-in USB class/function implementations in Zephyr RTOS typically have default interface numbers and endpoint addresses assigned in ascending order. During initialization, default interface numbers may be reassigned based on the number of interfaces in a given configuration. Endpoint addresses are reassigned based on controller capabilities, since certain endpoint combinations are not possible with every controller, and the number of interfaces in a given configuration. This also means that the device side class/function in the Zephyr RTOS must check the actual interface and endpoint descriptor values at runtime. This mechanism also allows as to provide generic samples and generic multifunction samples that are limited only by the resources provided by the controller, such as the number of endpoints and the size of the endpoint FIFOs.

There may be host drivers for a specific function, for example in the Linux Kernel, where the function driver does not read interface and endpoint descriptors to check interface numbers or endpoint addresses, but instead uses hardcoded values. Therefore, the host driver cannot be used in a generic way, meaning it cannot be used with different device controllers and different device configurations in combination with other functions. This may also be because the driver is designed for a specific hardware and is not intended to be used with a clone of this specific hardware. On the contrary, if the driver is generic in nature and should work with different hardware variants, then it must not use hardcoded interface numbers and endpoint addresses. It is not possible to disable endpoint reassignment in Zephyr RTOS, which may prevent you from implementing a hardware-clone firmware. Instead, if possible, the host driver implementation should be fixed to use values from the interface and endpoint descriptor.

Testing over USPIP in native_sim

A virtual USB controller implemented through USBIP might be used to test the USB device stack. Follow the general build procedure to build the USB sample for the native_sim configuration.

Run built sample with:

```
west build -t run
```

In a terminal window, run the following command to list USB devices:

```
$ usbip list -r localhost
Exportable USB devices
======================
 - 127.0.0.1
        1-1: unknown vendor : unknown product (2fe3:0100)
           : /sys/devices/pci0000:00/0000:00:01.2/usb1/1-1
           : (Defined at Interface level) (00/00/00)
           :  0 - Vendor Specific Class / unknown subclass / unknown protocol (ff/00/00)
```

In a terminal window, run the following command to attach the USB device:

```
$ sudo usbip attach -r localhost -b 1-1
```

The USB device should be connected to your Linux host, and verified with the following commands:

```
$ sudo usbip port
Imported USB devices
====================
Port 00: <Port in Use> at Full Speed(12Mbps)
       unknown vendor : unknown product (2fe3:0100)
       7-1 -> usbip://localhost:3240/1-1
           -> remote bus/dev 001/002
$ lsusb -d 2fe3:0100
Bus 007 Device 004: ID 2fe3:0100
```

USB Vendor and Product identifiers

The USB Vendor ID for the Zephyr project is `0x2FE3`. This USB Vendor ID must not be used when a vendor integrates Zephyr USB device support into its own product.

Each USB sample has its own unique Product ID. The USB maintainer, if one is assigned, or otherwise the Zephyr Technical Steering Committee, may allocate other USB Product IDs based on well-motivated and documented requests.

The following Product IDs are currently used:

Sample	PID
usb-cdc-acm	0x0001
usb-cdc-acm-composite	0x0002
Reserved (previously: usb-hid-cdc)	0x0003
usb-cdc-acm-console	0x0004
usb-dfu (Run-Time)	0x0005
usb-hid	0x0006
usb-hid-mouse	0x0007
usb-mass	0x0008
testusb-app	0x0009
webusb	0x000A
bluetooth-hci-usb-sample	0x000B
bluetooth-hci-usb-h4-sample	0x000C
wpan-usb	0x000D
uac2-explicit-feedback	0x000E
usb-dfu (DFU Mode)	0xFFFF

The USB device descriptor field `bcdDevice` (Device Release Number) represents the Zephyr kernel major and minor versions as a binary coded decimal value.

6.5.2 USB device support APIs

USB device controller driver API

The USB device controller driver API is described in include/zephyr/drivers/usb/usb_dc.h and sometimes referred to as the `usb_dc` API.

This API has some limitations by design, it does not follow *Device Driver Model* and is being replaced by *USB device controller (UDC) driver API*.

API reference

group `_usb_device_controller_api`

USB Device Controller API.

Typedefs

typedef void (*`usb_dc_ep_callback`)(uint8_t ep, enum *usb_dc_ep_cb_status_code* cb_status)

Callback function signature for the USB Endpoint status.

typedef void (*`usb_dc_status_callback`)(enum *usb_dc_status_code* cb_status, const uint8_t *param)

Callback function signature for the device.

Enums

enum `usb_dc_status_code`

USB Driver Status Codes.

Status codes reported by the registered device status callback.

Values:

enumerator USB_DC_ERROR
USB error reported by the controller.

enumerator USB_DC_RESET
USB reset.

enumerator USB_DC_CONNECTED
USB connection established, hardware enumeration is completed.

enumerator USB_DC_CONFIGURED
USB configuration done.

enumerator USB_DC_DISCONNECTED
USB connection lost.

enumerator USB_DC_SUSPEND
USB connection suspended by the HOST.

enumerator USB_DC_RESUME
USB connection resumed by the HOST.

enumerator USB_DC_INTERFACE
USB interface selected.

enumerator USB_DC_SET_HALT
Set Feature ENDPOINT_HALT received.

enumerator USB_DC_CLEAR_HALT
Clear Feature ENDPOINT_HALT received.

enumerator USB_DC_SOF
Start of Frame received.

enumerator USB_DC_UNKNOWN
Initial USB connection status.

enum usb_dc_ep_cb_status_code
USB Endpoint Callback Status Codes.

Status Codes reported by the registered endpoint callback.

Values:

enumerator USB_DC_EP_SETUP
SETUP received.

enumerator USB_DC_EP_DATA_OUT
Out transaction on this EP, data is available for read.

enumerator USB_DC_EP_DATA_IN
In transaction done on this EP.

enum usb_dc_ep_transfer_type
USB Endpoint Transfer Type.

Values:

enumerator USB_DC_EP_CONTROL = 0
Control type endpoint.

enumerator USB_DC_EP_ISOCHRONOUS
Isochronous type endpoint.

enumerator USB_DC_EP_BULK
Bulk type endpoint.

enumerator USB_DC_EP_INTERRUPT
Interrupt type endpoint

enum usb_dc_ep_synchronozation_type
USB Endpoint Synchronization Type.

Note

Valid only for Isochronous Endpoints

Values:

enumerator USB_DC_EP_NO_SYNCHRONIZATION = (0U « 2U)
No Synchronization.

enumerator USB_DC_EP_ASYNCHRONOUS = (1U « 2U)
Asynchronous.

enumerator USB_DC_EP_ADAPTIVE = (2U « 2U)
Adaptive.

enumerator USB_DC_EP_SYNCHRONOUS = (3U « 2U)
Synchronous.

Functions

int usb_dc_attach(void)
Attach USB for device connection.

Function to attach USB for device connection. Upon success, the USB PLL is enabled, and the USB device is now capable of transmitting and receiving on the USB bus and of generating interrupts.

Returns
0 on success, negative errno code on fail.

int `usb_dc_detach`(void)

Detach the USB device.

Function to detach the USB device. Upon success, the USB hardware PLL is powered down and USB communication is disabled.

Returns
0 on success, negative errno code on fail.

int `usb_dc_reset`(void)

Reset the USB device.

This function returns the USB device and firmware back to it's initial state. N.B. the USB PLL is handled by the usb_detach function

Returns
0 on success, negative errno code on fail.

int `usb_dc_set_address`(const uint8_t addr)

Set USB device address.

Parameters

- `addr` – **[in]** Device address

Returns
0 on success, negative errno code on fail.

void `usb_dc_set_status_callback`(const *usb_dc_status_callback* cb)

Set USB device controller status callback.

Function to set USB device controller status callback. The registered callback is used to report changes in the status of the device controller. The status code are described by the usb_dc_status_code enumeration.

Parameters

- `cb` – **[in]** Callback function

int `usb_dc_ep_check_cap`(const struct *usb_dc_ep_cfg_data* *const cfg)

check endpoint capabilities

Function to check capabilities of an endpoint. *usb_dc_ep_cfg_data* structure provides the endpoint configuration parameters: endpoint address, endpoint maximum packet size and endpoint type. The driver should check endpoint capabilities and return 0 if the endpoint configuration is possible.

Parameters

- `cfg` – **[in]** Endpoint config

Returns
0 on success, negative errno code on fail.

int `usb_dc_ep_configure`(const struct *usb_dc_ep_cfg_data* *const cfg)

Configure endpoint.

Function to configure an endpoint. *usb_dc_ep_cfg_data* structure provides the endpoint configuration parameters: endpoint address, endpoint maximum packet size and endpoint type.

Parameters

- `cfg` – **[in]** Endpoint config

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_set_stall(const uint8_t ep)

Set stall condition for the selected endpoint.

Parameters

- ep – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_clear_stall(const uint8_t ep)

Clear stall condition for the selected endpoint.

Parameters

- ep – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_is_stalled(const uint8_t ep, uint8_t *const stalled)

Check if the selected endpoint is stalled.

Parameters

- ep – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- stalled – **[out]** Endpoint stall status

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_halt(const uint8_t ep)

Halt the selected endpoint.

Parameters

- ep – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_enable(const uint8_t ep)

Enable the selected endpoint.

Function to enable the selected endpoint. Upon success interrupts are enabled for the corresponding endpoint and the endpoint is ready for transmitting/receiving data.

Parameters

- ep – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int usb_dc_ep_disable(const uint8_t ep)

Disable the selected endpoint.

Function to disable the selected endpoint. Upon success interrupts are disabled for the corresponding endpoint and the endpoint is no longer able for transmitting/receiving data.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int `usb_dc_ep_flush`(const uint8_t ep)

Flush the selected endpoint.

This function flushes the FIFOs for the selected endpoint.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

int `usb_dc_ep_write`(const uint8_t ep, const uint8_t *const data, const uint32_t data_len, uint32_t *const ret_bytes)

Write data to the specified endpoint.

This function is called to write data to the specified endpoint. The supplied usb_ep_callback function will be called when data is transmitted out.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- `data` – **[in]** Pointer to data to write
- `data_len` – **[in]** Length of the data requested to write. This may be zero for a zero length status packet.
- `ret_bytes` – **[out]** Bytes scheduled for transmission. This value may be NULL if the application expects all bytes to be written

Returns
0 on success, negative errno code on fail.

int `usb_dc_ep_read`(const uint8_t ep, uint8_t *const data, const uint32_t max_data_len, uint32_t *const read_bytes)

Read data from the specified endpoint.

This function is called by the endpoint handler function, after an OUT interrupt has been received for that EP. The application must only call this function through the supplied usb_ep_callback function. This function clears the ENDPOINT NAK, if all data in the endpoint FIFO has been read, so as to accept more data from host.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- `data` – **[in]** Pointer to data buffer to write to
- `max_data_len` – **[in]** Max length of data to read
- `read_bytes` – **[out]** Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

Returns
0 on success, negative errno code on fail.

int **usb_dc_ep_set_callback**(const uint8_t ep, const *usb_dc_ep_callback* cb)

Set callback function for the specified endpoint.

Function to set callback function for notification of data received and available to application or transmit done on the selected endpoint, NULL if callback not required by application code. The callback status code is described by usb_dc_ep_cb_status_code.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- **cb** – **[in]** Callback function

Returns

0 on success, negative errno code on fail.

int **usb_dc_ep_read_wait**(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *read_bytes)

Read data from the specified endpoint.

This is similar to usb_dc_ep_read, the difference being that, it doesn't clear the endpoint NAKs so that the consumer is not bogged down by further upcalls till he is done with the processing of the data. The caller should reactivate ep by invoking *usb_dc_ep_read_continue()* do so.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- **data** – **[in]** Pointer to data buffer to write to
- **max_data_len** – **[in]** Max length of data to read
- **read_bytes** – **[out]** Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

Returns

0 on success, negative errno code on fail.

int **usb_dc_ep_read_continue**(uint8_t ep)

Continue reading data from the endpoint.

Clear the endpoint NAK and enable the endpoint to accept more data from the host. Usually called after *usb_dc_ep_read_wait()* when the consumer is fine to accept more data. Thus these calls together act as a flow control mechanism.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns

0 on success, negative errno code on fail.

int **usb_dc_ep_mps**(uint8_t ep)

Get endpoint max packet size.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns

Endpoint max packet size (mps)

int **usb_dc_wakeup_request**(void)

Start the host wake up procedure.

Function to wake up the host if it's currently in sleep mode.

Returns

0 on success, negative errno code on fail.

struct **usb_dc_ep_cfg_data**

#include <*usb_dc.h*> USB Endpoint Configuration.

Structure containing the USB endpoint configuration.

Public Members

uint8_t **ep_addr**

The number associated with the EP in the device configuration structure IN EP = 0x80 | <endpoint number> OUT EP = 0x00 | <endpoint number>

uint16_t **ep_mps**

Endpoint max packet size.

enum *usb_dc_ep_transfer_type* **ep_type**

Endpoint Transfer Type.

May be Bulk, Interrupt, Control or Isochronous

USB device stack API

API reference There are two ways to transmit data, using the 'low' level read/write API or the 'high' level transfer API.

Low level API

To transmit data to the host, the class driver should call usb_write(). Upon completion the registered endpoint callback will be called. Before sending another packet the class driver should wait for the completion of the previous write. When data is received, the registered endpoint callback is called. usb_read() should be used for retrieving the received data. For CDC ACM sample driver this happens via the OUT bulk endpoint handler (cdc_acm_bulk_out) mentioned in the endpoint array (cdc_acm_ep_data).

High level API

The usb_transfer method can be used to transfer data to/from the host. The transfer API will automatically split the data transmission into one or more USB transaction(s), depending endpoint max packet size. The class driver does not have to implement endpoint callback and should set this callback to the generic usb_transfer_ep_callback.

WebUSB
Receive and echo data from a web page using WebUSB API.

group `_usb_device_core_api`

USB Device Core Layer API.

Defines

`USB_TRANS_READ`

`USB_TRANS_WRITE`

`USB_TRANS_NO_ZLP`

`USB_DEVICE_BOS_DESC_DEFINE_CAP`

Helper macro to place the BOS compatibility descriptor in the right memory section.

Typedefs

typedef void (*`usb_ep_callback`)(uint8_t ep, enum *usb_dc_ep_cb_status_code* cb_status)

Callback function signature for the USB Endpoint status.

typedef int (*`usb_request_handler`)(struct usb_setup_packet *setup, int32_t *transfer_len, uint8_t **payload_data)

Callback function signature for class specific requests.

Function which handles Class specific requests corresponding to an interface number specified in the device descriptor table. For host to device direction the 'len' and 'payload_data' contain the length of the received data and the pointer to the received data respectively. For device to host class requests, 'len' and 'payload_data' should be set

by the callback function with the length and the address of the data to be transmitted buffer respectively.

typedef void (*`usb_interface_config`)(struct usb_desc_header *head, uint8_t bInterfaceNumber)

Function for interface runtime configuration.

typedef void (*`usb_transfer_callback`)(uint8_t ep, int tsize, void *priv)

Callback function signature for transfer completion.

Functions

int `usb_set_config`(const uint8_t *usb_descriptor)

Configure USB controller.

Function to configure USB controller. Configuration parameters must be valid or an error is returned

Parameters

- `usb_descriptor` – **[in]** USB descriptor table

Returns

0 on success, negative errno code on fail

int `usb_deconfig`(void)

Deconfigure USB controller.

This function returns the USB device to it's initial state

Returns

0 on success, negative errno code on fail

int `usb_enable`(*usb_dc_status_callback* status_cb)

Enable the USB subsystem and associated hardware.

This function initializes the USB core subsystem and enables the corresponding hardware so that it can begin transmitting and receiving on the USB bus, as well as generating interrupts.

Class-specific initialization and registration must be performed by the user before invoking this, so that any data or events on the bus are processed correctly by the associated class handling code.

Parameters

- `status_cb` – **[in]** Callback registered by user to notify about USB device controller state.

Returns

0 on success, negative errno code on fail.

int `usb_disable`(void)

Disable the USB device.

Function to disable the USB device. Upon success, the specified USB interface is clock gated in hardware, it is no longer capable of generating interrupts.

Returns

0 on success, negative errno code on fail

int `usb_write`(uint8_t ep, const uint8_t *data, uint32_t data_len, uint32_t *bytes_ret)

Write data to the specified endpoint.

Function to write data to the specified endpoint. The supplied usb_ep_callback will be called when transmission is done.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- `data` – **[in]** Pointer to data to write
- `data_len` – **[in]** Length of data requested to write. This may be zero for a zero length status packet.
- `bytes_ret` – **[out]** Bytes written to the EP FIFO. This value may be NULL if the application expects all bytes to be written

Returns

0 on success, negative errno code on fail

int `usb_read`(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *ret_bytes)

Read data from the specified endpoint.

This function is called by the Endpoint handler function, after an OUT interrupt has been received for that EP. The application must only call this function through the supplied usb_ep_callback function.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- `data` – **[in]** Pointer to data buffer to write to
- `max_data_len` – **[in]** Max length of data to read
- `ret_bytes` – **[out]** Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read is returned.

Returns

0 on success, negative errno code on fail

int `usb_ep_set_stall`(uint8_t ep)

Set STALL condition on the specified endpoint.

This function is called by USB device class handler code to set stall condition on endpoint.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns

0 on success, negative errno code on fail

int `usb_ep_clear_stall`(uint8_t ep)

Clears STALL condition on the specified endpoint.

This function is called by USB device class handler code to clear stall condition on endpoint.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail

int **usb_ep_read_wait**(uint8_t ep, uint8_t *data, uint32_t max_data_len, uint32_t *read_bytes)

Read data from the specified endpoint.

This is similar to usb_ep_read, the difference being that, it doesn't clear the endpoint NAKs so that the consumer is not bogged down by further upcalls till he is done with the processing of the data. The caller should reactivate ep by invoking *usb_ep_read_continue()* do so.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- **data** – **[in]** pointer to data buffer to write to
- **max_data_len** – **[in]** max length of data to read
- **read_bytes** – **[out]** Number of bytes read. If data is NULL and max_data_len is 0 the number of bytes available for read should be returned.

Returns
0 on success, negative errno code on fail.

int **usb_ep_read_continue**(uint8_t ep)

Continue reading data from the endpoint.

Clear the endpoint NAK and enable the endpoint to accept more data from the host. Usually called after *usb_ep_read_wait()* when the consumer is fine to accept more data. Thus these calls together acts as flow control mechanism.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
0 on success, negative errno code on fail.

void **usb_transfer_ep_callback**(uint8_t ep, enum *usb_dc_ep_cb_status_code*)

Transfer management endpoint callback.

If a USB class driver wants to use high-level transfer functions, driver needs to register this callback as usb endpoint callback.

int **usb_transfer**(uint8_t ep, uint8_t *data, size_t dlen, unsigned int flags, *usb_transfer_callback* cb, void *priv)

Start a transfer.

Start a usb transfer to/from the data buffer. This function is asynchronous and can be executed in IRQ context. The provided callback will be called on transfer completion (or error) in thread context.

Parameters

- **ep** – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- **data** – **[in]** Pointer to data buffer to write-to/read-from
- **dlen** – **[in]** Size of data buffer
- **flags** – **[in]** Transfer flags (USB_TRANS_READ, USB_TRANS_WRITE...)

- `cb` – **[in]** Function called on transfer completion/failure
- `priv` – **[in]** Data passed back to the transfer completion callback

Returns
0 on success, negative errno code on fail.

int `usb_transfer_sync`(uint8_t ep, uint8_t *data, size_t dlen, unsigned int flags)

Start a transfer and block-wait for completion.

Synchronous version of usb_transfer, wait for transfer completion before returning. A return value of zero can also mean that transfer was cancelled or that the endpoint is not ready. This is due to the design of transfers and usb_dc API.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table
- `data` – **[in]** Pointer to data buffer to write-to/read-from
- `dlen` – **[in]** Size of data buffer
- `flags` – **[in]** Transfer flags

Returns
number of bytes transferred on success, negative errno code on fail.

void `usb_cancel_transfer`(uint8_t ep)

Cancel any ongoing transfer on the specified endpoint.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table

void `usb_cancel_transfers`(void)

Cancel all ongoing transfers.

bool `usb_transfer_is_busy`(uint8_t ep)

Check that transfer is ongoing for the endpoint.

Parameters

- `ep` – **[in]** Endpoint address corresponding to the one listed in the device configuration table

Returns
true if transfer is ongoing, false otherwise.

int `usb_wakeup_request`(void)

Start the USB remote wakeup procedure.

Function to request a remote wakeup. This feature must be enabled in configuration, otherwise it will always return -ENOTSUP error.

Returns
0 on success, negative errno code on fail, i.e. when the bus is already active.

bool `usb_get_remote_wakeup_status`(void)

Get status of the USB remote wakeup feature.

Returns
true if remote wakeup has been enabled by the host, false otherwise.

void usb_bos_register_cap(void *hdr)

Register BOS capability descriptor.

This function should be used by the application to register BOS capability descriptors before the USB device stack is enabled.

Parameters

- hdr – **[in]** Pointer to BOS capability descriptor

struct usb_ep_cfg_data

#include <*usb_device.h*> USB Endpoint Configuration.

This structure contains configuration for the endpoint.

Public Members

usb_ep_callback ep_cb

Callback function for notification of data received and available to application or transmit done, NULL if callback not required by application code.

uint8_t ep_addr

The number associated with the EP in the device configuration structure IN EP = 0x80 | <endpoint number> OUT EP = 0x00 | <endpoint number>

struct usb_interface_cfg_data

#include <*usb_device.h*> USB Interface Configuration.

This structure contains USB interface configuration.

Public Members

usb_request_handler class_handler

Handler for USB Class specific Control (EP 0) communications.

usb_request_handler vendor_handler

Handler for USB Vendor specific commands.

usb_request_handler custom_handler

The custom request handler gets a first chance at handling the request before it is handed over to the 'chapter 9' request handler.

return 0 on success, -EINVAL if the request has not been handled by the custom handler and instead needs to be handled by the core USB stack. Any other error code to denote failure within the custom handler.

struct usb_cfg_data

#include <*usb_device.h*> USB device configuration.

The Application instantiates this with given parameters added using the "usb_set_config" function. Once this function is called changes to this structure will result in undefined behavior. This structure may only be updated after calls to usb_deconfig

Public Members

const uint8_t *`usb_device_description`

USB device description, see http://www.beyondlogic.org/usbnutshell/usb5.shtml#DeviceDescriptors.

void *`interface_descriptor`

Pointer to interface descriptor.

usb_interface_config `interface_config`

Function for interface runtime configuration.

void (*`cb_usb_status`)(struct *usb_cfg_data* *cfg, enum *usb_dc_status_code* cb_status, const uint8_t *param)

Callback to be notified on USB connection status change.

struct *usb_interface_cfg_data* `interface`

USB interface (Class) handler and storage space.

uint8_t `num_endpoints`

Number of individual endpoints in the device configuration.

struct *usb_ep_cfg_data* *`endpoint`

Pointer to an array of endpoint structs of length equal to the number of EP associated with the device description, not including control endpoints.

USB HID Class API

USB device specific part for HID support defined in include/zephyr/usb/class/usb_hid.h.

Related code samples

USB HID (Human Interface Device)
Use USB HID driver to enumerate as a raw HID device.

USB HID mouse
Implement a basic HID mouse device.

Functions

void `usb_hid_register_device`(const struct *device* *dev, const uint8_t *desc, size_t size, const struct *hid_ops* *op)

Register HID device.

Parameters

- `dev` – **[in]** Pointer to USB HID device
- `desc` – **[in]** Pointer to HID report descriptor
- `size` – **[in]** Size of HID report descriptor
- `op` – **[in]** Pointer to USB HID device interrupt struct

int `hid_int_ep_write`(const struct *device* *dev, const uint8_t *data, uint32_t data_len, uint32_t *bytes_ret)

Write to USB HID interrupt endpoint buffer.

Parameters

- `dev` – **[in]** Pointer to USB HID device
- `data` – **[in]** Pointer to data buffer
- `data_len` – **[in]** Length of data to copy
- `bytes_ret` – **[out]** Bytes written to the EP buffer.

Returns

0 on success, negative errno code on fail.

int `hid_int_ep_read`(const struct *device* *dev, uint8_t *data, uint32_t max_data_len, uint32_t *ret_bytes)

Read from USB HID interrupt endpoint buffer.

Parameters

- `dev` – **[in]** Pointer to USB HID device
- `data` – **[in]** Pointer to data buffer
- `max_data_len` – **[in]** Max length of data to copy
- `ret_bytes` – **[out]** Number of bytes to copy. If data is NULL and max_data_len is 0 the number of bytes available in the buffer will be returned.

Returns

0 on success, negative errno code on fail.

int `usb_hid_set_proto_code`(const struct *device* *dev, uint8_t proto_code)

Set USB HID class Protocol Code.

Should be called before *usb_hid_init()*.

Parameters

- `dev` – **[in]** Pointer to USB HID device
- `proto_code` – **[in]** Protocol Code to be used for bInterfaceProtocol

Returns
0 on success, negative errno code on fail.

int `usb_hid_init`(const struct *device* *dev)
Initialize USB HID class support.

Parameters

- `dev` – **[in]** Pointer to USB HID device

Returns
0 on success, negative errno code on fail.

struct `hid_ops`
#include <*usb_hid.h*> USB HID device interface.

Binary Device Object Store (BOS) support API

struct `usb_bos_capability_msos`
#include <*bos.h*> Microsoft OS 2.0 descriptor specific part of platform capability descriptor.

New experimental USB support

6.5.3 New USB device support

Overview

USB device support consists of the USB device controller (UDC) drivers , *USB device controller (UDC) driver API*, and USB device stack, *USB device stack (next) API*. The *USB device controller (UDC) driver API* provides a generic and vendor independent interface to USB device controllers, and although, there a is clear separation between these layers, the purpose of *USB device controller (UDC) driver API* is to serve new Zephyr's USB device stack exclusively.

The new device stack supports multiple device controllers, meaning that if a SoC has multiple controllers, they can be used simultaneously. Full and high-speed device controllers are supported. It also provides support for registering multiple function or class instances to a configuration at runtime, or changing the configuration later. It has built-in support for several USB classes and provides an API to implement custom USB functions.

The new USB device support is considered experimental and will replace *USB device support*.

Built-in functions The USB device stack has built-in USB functions. Some can be used directly in the user application through a special API, such as HID or Audio class devices, while others use a general Zephyr RTOS driver API, such as MSC and CDC class implementations. The *Identification string* identifies a class or function instance (*n*) and is used as an argument to the `usbd_register_class()`.

Class or function	User API (if any)	Identification string
USB Audio 2 class	*Audio Class 2 device API*	`uac2_n`
USB CDC ACM class	*Universal Asynchronous Receiver-Transmitter (UART)*	`cdc_acm_n`
USB CDC ECM class	Ethernet device	`cdc_ecm_n`
USB Mass Storage Class (MSC)	*USB Mass Storage Class device API*	`msc_n`
USB Human Interface Devices (HID)	*HID device API*	`hid_n`
Bluetooth HCI USB transport layer	*HCI RAW channel*	`bt_hci_n`

Samples

- usb-hid-keyboard
- uac2-explicit-feedback

Samples ported to new USB device support To build a sample that supports both the old and new USB device stack, set the configuration `-DCONF_FILE=usbd_next_prj.conf` either directly or via `west`.

- bluetooth-hci-usb-sample
- usb-cdc-acm
- usb-cdc-acm-console
- usb-mass
- usb-hid-mouse
- zperf To build the sample for the new device support, set the configuration overlay file `-DDEXTRA_CONF_FILE=overlay-usbd_next_ecm.conf` and devicetree overlay file `-DDTC_OVERLAY_FILE="usbd_next_ecm.overlay` either directly or via `west`.

How to configure and enable USB device support

For the USB device support samples in the Zephyr project repository, we have a common file for instantiation, configuration and initialization, samples/subsys/usb/common/sample_usbd_init.c. The following code snippets from this file are used as examples. USB Samples Kconfig options used in the USB samples and prefixed with SAMPLE_USBD_ have default values specific to the Zephyr project and the scope is limited to the project samples. In the examples below, you will need to replace these Kconfig options and other defaults with values appropriate for your application or hardware.

The USB device stack requires a context structure to manage its properties and runtime data. The preferred way to define a device context is to use the *USBD_DEVICE_DEFINE* macro. This creates a static *usbd_context* variable with a given name. Any number of contexts may be instantiated. A USB controller device can be assigned to multiple contexts, but only one context can be initialized and used at a time. Context properties must not be directly accessed or manipulated by the application.

```
/*
 * Instantiate a context named sample_usbd using the default USB device
 * controller, the Zephyr project vendor ID, and the sample product ID.
 * Zephyr project vendor ID must not be used outside of Zephyr samples.
 */
USBD_DEVICE_DEFINE(sample_usbd,
                   DEVICE_DT_GET(DT_NODELABEL(zephyr_udc0)),
                   ZEPHYR_PROJECT_USB_VID, CONFIG_SAMPLE_USBD_PID);
```

Your USB device may have manufacturer, product, and serial number string descriptors. To instantiate these string descriptors, the application should use the appropriate *USBD_DESC_MANUFACTURER_DEFINE*, *USBD_DESC_PRODUCT_DEFINE*, and *USBD_DESC_SERIAL_NUMBER_DEFINE* macros. String descriptors also require a single instantiation of the language descriptor using the *USBD_DESC_LANG_DEFINE* macro.

```
USBD_DESC_LANG_DEFINE(sample_lang);
USBD_DESC_MANUFACTURER_DEFINE(sample_mfr, CONFIG_SAMPLE_USBD_MANUFACTURER);
USBD_DESC_PRODUCT_DEFINE(sample_product, CONFIG_SAMPLE_USBD_PRODUCT);
USBD_DESC_SERIAL_NUMBER_DEFINE(sample_sn);
```

String descriptors must be added to the device context at runtime before initializing the USB device with *usbd_add_descriptor()*.

```
err = usbd_add_descriptor(&sample_usbd, &sample_lang);
if (err) {
        LOG_ERR("Failed to initialize language descriptor (%d)", err);
        return NULL;
}

err = usbd_add_descriptor(&sample_usbd, &sample_mfr);
if (err) {
        LOG_ERR("Failed to initialize manufacturer descriptor (%d)", err);
        return NULL;
}

err = usbd_add_descriptor(&sample_usbd, &sample_product);
if (err) {
        LOG_ERR("Failed to initialize product descriptor (%d)", err);
        return NULL;
}

err = usbd_add_descriptor(&sample_usbd, &sample_sn);
if (err) {
        LOG_ERR("Failed to initialize SN descriptor (%d)", err);
```

(continues on next page)

(continued from previous page)

```
        return NULL;
}
```

USB device requires at least one configuration instance per supported speed. The application should use *USBD_CONFIGURATION_DEFINE* to instantiate a configuration. Later, USB device functions are assigned to a configuration.

```
static const uint8_t attributes = (IS_ENABLED(CONFIG_SAMPLE_USBD_SELF_POWERED) ?
                                   USB_SCD_SELF_POWERED : 0) |
                                  (IS_ENABLED(CONFIG_SAMPLE_USBD_REMOTE_WAKEUP) ?
                                   USB_SCD_REMOTE_WAKEUP : 0);

/* Full speed configuration */
USBD_CONFIGURATION_DEFINE(sample_fs_config,
                          attributes,
                          CONFIG_SAMPLE_USBD_MAX_POWER, &fs_cfg_desc);

/* High speed configuration */
USBD_CONFIGURATION_DEFINE(sample_hs_config,
                          attributes,
                          CONFIG_SAMPLE_USBD_MAX_POWER, &hs_cfg_desc);
```

Each configuration instance for a specific speed must be added to the device context at runtime before the USB device is initialized using *usbd_add_configuration()*. Note *USBD_SPEED_FS* and *USBD_SPEED_HS*. The first full-speed or high-speed configuration will get `bConfigurationValue` one, and then further upward.

```
err = usbd_add_configuration(&sample_usbd, USBD_SPEED_FS,
                             &sample_fs_config);
if (err) {
        LOG_ERR("Failed to add Full-Speed configuration");
        return NULL;
}
```

Although we have already done a lot, this USB device has no function. A device can have multiple configurations with different set of functions at different speeds. A function or class can be registered on a USB device before it is initialized using *usbd_register_class()*. The desired configuration is specified using *USBD_SPEED_FS* or *USBD_SPEED_HS* and the configuration number. For simple cases, *usbd_register_all_classes()* can be used to register all available instances.

```
err = usbd_register_all_classes(&sample_usbd, USBD_SPEED_FS, 1);
if (err) {
        LOG_ERR("Failed to add register classes");
        return NULL;
}
```

The last step in the preparation is to initialize the device with *usbd_init()*. After this, the configuration of the device cannot be changed. A device can be deinitialized with *usbd_shutdown()* and all instances can be reused, but the previous steps must be repeated. So it is possible to shutdown a device, register another type of configuration or function, and initialize it again. At the USB controller level, *usbd_init()* does only what is necessary to detect VBUS changes. There are controller types where the next step is only possible if a VBUS signal is present.

A function or class implementation may require its own specific configuration steps, which should be performed prior to initializing the USB device.

```
err = usbd_init(&sample_usbd);
if (err) {
        LOG_ERR("Failed to initialize device support");
        return NULL;
}
```

The final step to enable the USB device is *usbd_enable()*, after that, if the USB device is connected to a USB host controller, the host can start enumerating the device. The application can disable the USB device using *usbd_disable()*.

```
ret = usbd_enable(sample_usbd);
if (ret) {
        LOG_ERR("Failed to enable device support");
        return ret;
}
```

USB Message notifications The application can register a callback using *usbd_msg_register_cb()* to receive message notification from the USB device support subsystem. The messages are mostly about the common device state changes, and a few specific types from the USB CDC ACM implementation.

```
err = usbd_msg_register_cb(&sample_usbd, msg_cb);
if (err) {
        LOG_ERR("Failed to register message callback");
        return NULL;
}
```

The helper function *usbd_msg_type_string()* can be used to convert *usbd_msg_type* to a human readable form for logging.

If the controller supports VBUS state change detection, the battery-powered application may want to enable the USB device only when it is connected to a host. A generic application should use *usbd_can_detect_vbus()* to check for this capability.

```
static void msg_cb(struct usbd_context *const usbd_ctx,
                   const struct usbd_msg *const msg)
{
        LOG_INF("USBD message: %s", usbd_msg_type_string(msg->type));

        if (usbd_can_detect_vbus(usbd_ctx)) {
                if (msg->type == USBD_MSG_VBUS_READY) {
                        if (usbd_enable(usbd_ctx)) {
                                LOG_ERR("Failed to enable device support");
                        }
                }

                if (msg->type == USBD_MSG_VBUS_REMOVED) {
                        if (usbd_disable(usbd_ctx)) {
                                LOG_ERR("Failed to disable device support");
                        }
                }
        }
}
```

6.5.4 New USB device support APIs

USB device controller (UDC) driver API

The USB device controller driver API is described in include/zephyr/drivers/usb/udc.h and referred to as the `UDC driver` API.

UDC driver API is experimental and is subject to change without notice. It is a replacement for *USB device controller driver API*. If you wish to port an existing driver to UDC driver API, or add a new driver, please use drivers/usb/udc/udc_skeleton.c as a starting point.

API reference

group `udc_api`

New USB device controller (UDC) driver API.

Functions

static inline bool `udc_is_initialized`(const struct *device* *dev)

Checks whether the controller is initialized.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Returns

true if controller is initialized, false otherwise

static inline bool `udc_is_enabled`(const struct *device* *dev)

Checks whether the controller is enabled.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Returns

true if controller is enabled, false otherwise

static inline bool `udc_is_suspended`(const struct *device* *dev)

Checks whether the controller is suspended.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Returns

true if controller is suspended, false otherwise

int `udc_init`(const struct *device* *dev, udc_event_cb_t event_cb)

Initialize USB device controller.

Initialize USB device controller and control IN/OUT endpoint. After initialization controller driver should be able to detect power state of the bus and signal power state changes.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `event_cb` – **[in]** Event callback from the higher layer (USB device stack)

Return values

- `-EINVAL` – on parameter error (no callback is passed)
- `-EALREADY` – already initialized

Returns

0 on success, all other values should be treated as error.

int `udc_enable`(const struct *device* *dev)

Enable USB device controller.

Enable powered USB device controller and allow host to recognize and enumerate the device.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values

- `-EPERM` – controller is not initialized
- `-EALREADY` – already enabled

Returns
0 on success, all other values should be treated as error.

int `udc_disable`(const struct *device* *dev)

Disable USB device controller.

Disable enabled USB device controller. The driver should continue to detect power state changes.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values
`-EALREADY` – already disabled

Returns
0 on success, all other values should be treated as error.

int `udc_shutdown`(const struct *device* *dev)

Poweroff USB device controller.

Shut down the controller completely to reduce energy consumption or to change the role of the controller.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values
`-EALREADY` – controller is not initialized

Returns
0 on success, all other values should be treated as error.

static inline struct udc_device_caps `udc_caps`(const struct *device* *dev)

Get USB device controller capabilities.

Obtain the capabilities of the controller such as full speed (FS), high speed (HS), and more.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Returns
USB device controller capabilities.

enum udc_bus_speed `udc_device_speed`(const struct *device* *dev)

Get actual USB device speed.

The function should be called after the reset event to determine the actual bus speed.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Returns
USB device controller capabilities.

static inline int `udc_set_address`(const struct *device* *dev, const uint8_t addr)

Set USB device address.

Set address of enabled USB device.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `addr` – **[in]** USB device address

Return values

`-EPERM` – controller is not enabled (or not initialized)

Returns

0 on success, all other values should be treated as error.

static inline int `udc_test_mode`(const struct *device* *dev, const uint8_t mode, const bool dryrun)

Enable Test Mode.

For compliance testing, high-speed controllers must support test modes. A particular test is enabled by a SetFeature(TEST_MODE) request. To disable a test mode, device needs to be power cycled.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `mode` – **[in]** Test mode
- `dryrun` – **[in]** Verify that a particular mode can be enabled, but do not enable test mode

Return values

`-ENOTSUP` – Test mode is not supported

Returns

0 on success, all other values should be treated as error.

static inline int `udc_host_wakeup`(const struct *device* *dev)

Initiate host wakeup procedure.

Initiate host wakeup. Only possible when the bus is suspended.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values

`-EPERM` – controller is not enabled (or not initialized)

Returns

0 on success, all other values should be treated as error.

int `udc_ep_try_config`(const struct *device* *dev, const uint8_t ep, const uint8_t attributes, uint16_t *const mps, const uint8_t interval)

Try an endpoint configuration.

Try an endpoint configuration based on endpoint descriptor. This function may modify wMaxPacketSize descriptor fields of the endpoint. All properties of the descriptor, such as direction, and transfer type, should be set correctly. If wMaxPacketSize value is zero, it will be updated to maximum buffer size of the endpoint.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `ep` – **[in]** Endpoint address (same as bEndpointAddress)
- `attributes` – **[in]** Endpoint attributes (same as bmAttributes)
- `mps` – **[in]** Maximum packet size (same as wMaxPacketSize)
- `interval` – **[in]** Polling interval (same as bInterval)

Return values

- `-EINVAL` – on wrong parameter
- `-ENOTSUP` – endpoint configuration not supported
- `-ENODEV` – no endpoints available

Returns
0 on success, all other values should be treated as error.

int `udc_ep_enable`(const struct *device* *dev, const uint8_t ep, const uint8_t attributes, const uint16_t mps, const uint8_t interval)

Configure and enable endpoint.

Configure and make an endpoint ready for use. Valid for all endpoints except control IN/OUT.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `ep` – **[in]** Endpoint address (same as bEndpointAddress)
- `attributes` – **[in]** Endpoint attributes (same as bmAttributes)
- `mps` – **[in]** Maximum packet size (same as wMaxPacketSize)
- `interval` – **[in]** Polling interval (same as bInterval)

Return values

- `-EINVAL` – on wrong parameter (control IN/OUT endpoint)
- `-EPERM` – controller is not initialized
- `-ENODEV` – endpoint configuration not found
- `-EALREADY` – endpoint is already enabled

Returns
0 on success, all other values should be treated as error.

int `udc_ep_disable`(const struct *device* *dev, const uint8_t ep)

Disable endpoint.

Valid for all endpoints except control IN/OUT.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `ep` – **[in]** Endpoint address

Return values

- `-EINVAL` – on wrong parameter (control IN/OUT endpoint)
- `-ENODEV` – endpoint configuration not found
- `-EALREADY` – endpoint is already disabled
- `-EPERM` – controller is not initialized

Returns
0 on success, all other values should be treated as error.

int `udc_ep_set_halt`(const struct *device* *dev, const uint8_t ep)

Halt endpoint.

Valid for all endpoints.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `ep` – **[in]** Endpoint address

Return values

- `-ENODEV` – endpoint configuration not found
- `-ENOTSUP` – not supported (e.g. isochronous endpoint)
- `-EPERM` – controller is not enabled

Returns
0 on success, all other values should be treated as error.

int `udc_ep_clear_halt`(const struct *device* *dev, const uint8_t ep)

Clear endpoint halt.

Valid for all endpoints.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `ep` – **[in]** Endpoint address

Return values

- `-ENODEV` – endpoint configuration not found
- `-ENOTSUP` – not supported (e.g. isochronous endpoint)
- `-EPERM` – controller is not enabled

Returns
0 on success, all other values should be treated as error.

int `udc_ep_enqueue`(const struct *device* *dev, struct *net_buf* *const buf)

Queue USB device controller request.

Add request to the queue. If the queue is empty, the request buffer can be claimed by the controller immediately.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `buf` – **[in]** Pointer to UDC request buffer

Return values

- `-ENODEV` – endpoint configuration not found
- `-EACCES` – endpoint is not enabled (TBD)
- `-EBUSY` – request can not be queued
- `-EPERM` – controller is not initialized

Returns
0 on success, all other values should be treated as error.

int `udc_ep_dequeue`(const struct *device* *dev, const uint8_t ep)

Remove all USB device controller requests from endpoint queue.

UDC_EVT_EP_REQUEST event will be generated when the driver releases claimed buffer, no new requests will be claimed, all requests in the queue will passed as chained list of the event variable buf. The endpoint queue is empty after that.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

- `ep` – **[in]** Endpoint address

Return values

- `-ENODEV` – endpoint configuration not found
- `-EACCES` – endpoint is not disabled
- `-EPERM` – controller is not initialized

Returns
0 on success, all other values should be treated as error.

struct *net_buf* *`udc_ep_buf_alloc`(const struct *device* *dev, const uint8_t ep, const size_t size)

Allocate UDC request buffer.

Allocate a new buffer from common request buffer pool.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `ep` – **[in]** Endpoint address
- `size` – **[in]** Size of the request buffer

Returns
pointer to allocated request or NULL on error.

int `udc_ep_buf_free`(const struct *device* *dev, struct *net_buf* *const buf)

Free UDC request buffer.

Put the buffer back into the request buffer pool.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `buf` – **[in]** Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

static inline void `udc_ep_buf_set_zlp`(struct *net_buf* *const buf)

Set ZLP flag in requests metadata.

The controller should send a ZLP at the end of the transfer.

Parameters

- `buf` – **[in]** Pointer to UDC request buffer

static inline struct udc_buf_info *`udc_get_buf_info`(const struct *net_buf* *const buf)

Get requests metadata.

Parameters

- `buf` – **[in]** Pointer to UDC request buffer

Returns
pointer to metadata structure.

group `udc_buf`

Buffer macros and definitions used in USB device support.

Defines

UDC_BUF_ALIGN

Buffer alignment required by the UDC driver.

UDC_BUF_GRANULARITY

Buffer granularity required by the UDC driver.

UDC_STATIC_BUF_DEFINE(name, size)

Define a UDC driver-compliant static buffer.

This macro should be used if the application defines its own buffers to be used for USB transfers.

Parameters

- **name** – Buffer name
- **size** – Buffer size

IS_UDC_ALIGNED(buf)

Verify that the buffer is aligned as required by the UDC driver.

See also

IS_ALIGNED

Parameters

- **buf** – Buffer pointer

UDC_BUF_POOL_VAR_DEFINE(pname, count, size, ud_size, fdestroy)

Define a new pool for UDC buffers with variable-size payloads.

This macro is similar to NET_BUF_POOL_VAR_DEFINE, but provides buffers with alignment and granularity suitable for use by UDC driver.

See also

NET_BUF_POOL_VAR_DEFINE

Parameters

- **pname** – Name of the pool variable.
- **count** – Number of buffers in the pool.
- **size** – Maximum data payload per buffer.
- **ud_size** – User data space to reserve per buffer.
- **fdestroy** – Optional destroy callback when buffer is freed.

`UDC_BUF_POOL_DEFINE`(pname, count, size, ud_size, fdestroy)

Define a new pool for UDC buffers based on fixed-size data.

This macro is similar to `NET_BUF_POOL_DEFINE`, but provides buffers with alignment and granularity suitable for use by UDC driver.

See also

NET_BUF_POOL_DEFINE

Parameters

- `pname` – Name of the pool variable.
- `count` – Number of buffers in the pool.
- `size` – Maximum data payload per buffer.
- `ud_size` – User data space to reserve per buffer.
- `fdestroy` – Optional destroy callback when buffer is freed.

USB device stack (next) API

New USB device stack API is experimental and is subject to change without notice.

API reference

group `usbd_api`

New USB device stack core API.

Defines

`USB_BSTRING_LENGTH`(s)

USB_STRING_DESCRIPTOR_LENGTH(s)

USBD_NUMOF_INTERFACES_MAX

USBD_CCTX_REGISTERED

USB Class instance registered flag.

USBD_DEVICE_DEFINE(device_name, udc_dev, vid, pid)

Define USB device context structure.

Macro defines a USB device structure needed by the stack to manage its properties and runtime data. The `vid` and `pid` parameters can also be changed using *usbd_device_set_vid()* and *usbd_device_set_pid()*.

Example of use:

```
USBD_DEVICE_DEFINE(sample_usbd,
                   DEVICE_DT_GET(DT_NODELABEL(zephyr_udc0)),
                   YOUR_VID, YOUR_PID);
```

Parameters

- **device_name** – USB device context name
- **udc_dev** – Pointer to UDC device structure
- **vid** – Vendor ID
- **pid** – Product ID

USBD_CONFIGURATION_DEFINE(name, attrib, power, desc_nd)

Define USB device configuration.

USB device requires at least one configuration instance per supported speed. `attrib` is a combination of `USB_SCD_SELF_POWERED` or `USB_SCD_REMOTE_WAKEUP`, depending on which characteristic the USB device should have in this configuration.

Parameters

- **name** – Configuration name
- **attrib** – Configuration characteristics. Attributes can also be updated with *usbd_config_attrib_rwup()* and *usbd_config_attrib_self()*
- **power** – bMaxPower value in 2 mA units. This value can also be set with *usbd_config_maxpower()*
- **desc_nd** – Address of the string descriptor node used to describe the configuration, see *USBD_DESC_CONFIG_DEFINE()*. String descriptors are optional and the parameter can be NULL.

USBD_DESC_LANG_DEFINE(name)

Create a string descriptor node and language string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the language string descriptor zero. Both descriptor node and descriptor are defined with static-storage-class specifier. Default and currently only supported language ID is 0x0409 English (United States). If string descriptors are used, it is necessary to add this descriptor as the first one to the USB device context.

Parameters

- **name** – Language string descriptor node identifier.

`USBD_DESC_STRING_DEFINE`(d_name, d_string, d_utype)

Create a string descriptor.

This macro defines a descriptor node and a string descriptor. The string literal passed to the macro should be in the ASCII7 format. It is converted to UTF16LE format on the host request.

Parameters

- `d_name` – Internal string descriptor node identifier name
- `d_string` – ASCII7 encoded string literal
- `d_utype` – String descriptor usage type

`USBD_DESC_MANUFACTURER_DEFINE`(d_name, d_string)

Create a string descriptor node and manufacturer string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the manufacturer string descriptor. Both descriptor node and descriptor are defined with static-storage-class specifier.

Parameters

- `d_name` – String descriptor node identifier.
- `d_string` – ASCII7 encoded manufacturer string literal

`USBD_DESC_PRODUCT_DEFINE`(d_name, d_string)

Create a string descriptor node and product string descriptor.

This macro defines a descriptor node and a string descriptor that, when added to the device context, is automatically used as the product string descriptor. Both descriptor node and descriptor are defined with static-storage-class specifier.

Parameters

- `d_name` – String descriptor node identifier.
- `d_string` – ASCII7 encoded product string literal

`USBD_DESC_SERIAL_NUMBER_DEFINE`(d_name)

Create a string descriptor node and serial number string descriptor.

This macro defines a descriptor node that, when added to the device context, is automatically used as the serial number string descriptor. A valid serial number is generated from HWID (HWINFO= whenever this string descriptor is requested.

Parameters

- `d_name` – String descriptor node identifier.

`USBD_DESC_CONFIG_DEFINE`(d_name, d_string)

Create a string descriptor node for configuration descriptor.

This macro defines a descriptor node whose address can be used as an argument for the *USBD_CONFIGURATION_DEFINE()* macro.

Parameters

- `d_name` – String descriptor node identifier.
- `d_string` – ASCII7 encoded configuration description string literal

`USBD_DESC_BOS_DEFINE`(name, len, subset)

Define BOS Device Capability descriptor node.

The application defines a BOS capability descriptor node for descriptors such as USB 2.0 Extension Descriptor.

Parameters

- `name` – Descriptor node identifier
- `len` – Device Capability descriptor length
- `subset` – Pointer to a Device Capability descriptor

`USBD_DEFINE_CLASS`(class_name, class_api, class_priv, class_v_reqs)

Define USB device support class data.

Macro defines class (function) data, as well as corresponding node structures used internally by the stack.

Parameters

- `class_name` – Class name
- `class_api` – Pointer to struct *usbd_class_api*
- `class_priv` – Class private data
- `class_v_reqs` – Pointer to struct *usbd_cctx_vendor_req*

`VENDOR_REQ_DEFINE`(_reqs, _len)

Helper to declare request table of *usbd_cctx_vendor_req*.

Parameters

- `_reqs` – Pointer to the vendor request field
- `_len` – Number of supported vendor requests

`USBD_VENDOR_REQ`(_reqs...)

Helper to declare supported vendor requests.

Parameters

- `_reqs` – Variable number of vendor requests

Typedefs

typedef void (*`usbd_msg_cb_t`)(struct *usbd_context* *const ctx, const struct *usbd_msg* *const msg)

Callback type definition for USB device message delivery.

The implementation uses the system workqueue, and a callback provided and registered by the application. The application callback is called in the context of the system workqueue. Notification messages are stored in a queue and delivered to the callback in sequence.

Param ctx
[in] Pointer to USB device support context

Param msg
[in] Pointer to USB device message

Enums

enum `usbd_ch9_state`

USB device support middle layer runtime state.

Part of USB device states without suspended and powered states, as it is better to track them separately.

Values:

enumerator USBD_STATE_DEFAULT = 0

enumerator USBD_STATE_ADDRESS

enumerator USBD_STATE_CONFIGURED

enum usbd_speed

USB device speed.

Values:

enumerator USBD_SPEED_FS

Device supports or is connected to a full speed bus.

enumerator USBD_SPEED_HS

Device supports or is connected to a high speed bus

enumerator USBD_SPEED_SS

Device supports or is connected to a super speed bus.

Functions

static inline struct *usbd_context* *usbd_class_get_ctx(const struct *usbd_class_data* *const c_data)

Get the USB device runtime context under which the class is registered.

The class implementation must use this function and not access the members of the struct directly.

Parameters

- c_data – **[in]** Pointer to USB device class data

Returns

Pointer to USB device runtime context

static inline void *usbd_class_get_private(const struct *usbd_class_data* *const c_data)

Get class implementation private data.

The class implementation must use this function and not access the members of the struct directly.

Parameters

- c_data – **[in]** Pointer to USB device class data

Returns

Pointer to class implementation private data

int usbd_add_descriptor(struct *usbd_context* *uds_ctx, struct *usbd_desc_node* *dn)

Add common USB descriptor.

Add common descriptor like string or BOS Device Capability.

Parameters

- uds_ctx – **[in]** Pointer to USB device support context

- **dn** – **[in]** Pointer to USB descriptor node

Returns
0 on success, other values on fail.

uint8_t **usbd_str_desc_get_idx**(const struct *usbd_desc_node* *const desc_nd)

Get USB string descriptor index from descriptor node.

Parameters

- **desc_nd** – **[in]** Pointer to USB descriptor node

Returns
Descriptor index, 0 if descriptor is not part of any device

void **usbd_remove_descriptor**(struct *usbd_desc_node* *const desc_nd)

Remove USB string descriptor.

Remove linked USB string descriptor from any list.

Parameters

- **desc_nd** – **[in]** Pointer to USB descriptor node

int **usbd_add_configuration**(struct *usbd_context* *uds_ctx, const enum *usbd_speed* speed, struct *usbd_config_node* *cd)

Add a USB device configuration.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **speed** – **[in]** Speed at which this configuration operates
- **cd** – **[in]** Pointer to USB configuration node

Returns
0 on success, other values on fail.

int **usbd_register_class**(struct *usbd_context* *uds_ctx, const char *name, const enum *usbd_speed* speed, uint8_t cfg)

Register an USB class instance.

An USB class implementation can have one or more instances. To identify the instances we use device drivers API. Device names have a prefix derived from the name of the class, for example CDC_ACM for CDC ACM class instance, and can also be easily identified in the shell. Class instance can only be registered when the USB device stack is disabled. Registered instances are initialized at initialization of the USB device stack, and the interface descriptors of each instance are adapted to the whole context.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **name** – **[in]** Class instance name
- **speed** – **[in]** Configuration speed
- **cfg** – **[in]** Configuration value (bConfigurationValue)

Returns
0 on success, other values on fail.

int **usbd_register_all_classes**(struct *usbd_context* *uds_ctx, const enum *usbd_speed* speed, uint8_t cfg)

Register all available USB class instances.

Register all available instances. Like usbd_register_class, but does not take the instance name and instead registers all available instances.

Note

This cannot be combined. If your application calls usbd_register_class for any device, configuration number, or instance, either usbd_register_class or this function will fail.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context
- `speed` – **[in]** Configuration speed
- `cfg` – **[in]** Configuration value (bConfigurationValue)

Returns

0 on success, other values on fail.

int `usbd_unregister_class`(struct *usbd_context* *uds_ctx, const char *name, const enum *usbd_speed* speed, uint8_t cfg)

Unregister an USB class instance.

USB class instance will be removed and will not appear on the next start of the stack. Instance can only be unregistered when the USB device stack is disabled.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context
- `name` – **[in]** Class instance name
- `speed` – **[in]** Configuration speed
- `cfg` – **[in]** Configuration value (bConfigurationValue)

Returns

0 on success, other values on fail.

int `usbd_unregister_all_classes`(struct *usbd_context* *uds_ctx, const enum *usbd_speed* speed, uint8_t cfg)

Unregister all available USB class instances.

Unregister all available instances. Like usbd_unregister_class, but does not take the instance name and instead unregisters all available instances.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context
- `speed` – **[in]** Configuration speed
- `cfg` – **[in]** Configuration value (bConfigurationValue)

Returns

0 on success, other values on fail.

int `usbd_msg_register_cb`(struct *usbd_context* *const uds_ctx, const *usbd_msg_cb_t* cb)

Register USB notification message callback.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context
- `cb` – **[in]** Pointer to message callback function

Returns

0 on success, other values on fail.

int `usbd_init`(struct *usbd_context* *uds_ctx)

Initialize USB device.

Initialize USB device descriptors and configuration, initialize USB device controller. Class instances should be registered before they are involved. However, the stack should also initialize without registered instances, even if the host would complain about missing interfaces.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context

Returns
0 on success, other values on fail.

int `usbd_enable`(struct *usbd_context* *uds_ctx)

Enable the USB device support and registered class instances.

This function enables the USB device support.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context

Returns
0 on success, other values on fail.

int `usbd_disable`(struct *usbd_context* *uds_ctx)

Disable the USB device support.

This function disables the USB device support.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context

Returns
0 on success, other values on fail.

int `usbd_shutdown`(struct *usbd_context* *const uds_ctx)

Shutdown the USB device support.

This function completely disables the USB device support.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context

Returns
0 on success, other values on fail.

int `usbd_ep_set_halt`(struct *usbd_context* *uds_ctx, uint8_t ep)

Halt endpoint.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context
- `ep` – **[in]** Endpoint address

Returns
0 on success, or error from *udc_ep_set_halt()*

int `usbd_ep_clear_halt`(struct *usbd_context* *uds_ctx, uint8_t ep)

Clear endpoint halt.

Parameters

- `uds_ctx` – **[in]** Pointer to USB device support context
- `ep` – **[in]** Endpoint address

Returns
0 on success, or error from *udc_ep_clear_halt()*

bool **usbd_ep_is_halted**(struct *usbd_context* *uds_ctx, uint8_t ep)

Checks whether the endpoint is halted.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **ep** – **[in]** Endpoint address

Returns
true if endpoint is halted, false otherwise

struct *net_buf* ***usbd_ep_buf_alloc**(const struct *usbd_class_data* *const c_data, const uint8_t ep, const size_t size)

Allocate buffer for USB device request.

Allocate a new buffer from controller's driver buffer pool.

Parameters

- **c_data** – **[in]** Pointer to USB device class data
- **ep** – **[in]** Endpoint address
- **size** – **[in]** Size of the request buffer

Returns
pointer to allocated request or NULL on error.

int **usbd_ep_ctrl_enqueue**(struct *usbd_context* *const uds_ctx, struct *net_buf* *const buf)

Queue USB device control request.

Add control request to the queue.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **buf** – **[in]** Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

int **usbd_ep_enqueue**(const struct *usbd_class_data* *const c_data, struct *net_buf* *const buf)

Queue USB device request.

Add request to the queue.

Parameters

- **c_data** – **[in]** Pointer to USB device class data
- **buf** – **[in]** Pointer to UDC request buffer

Returns
0 on success, or error from *udc_ep_enqueue()*

int **usbd_ep_dequeue**(struct *usbd_context* *uds_ctx, const uint8_t ep)

Remove all USB device controller requests from endpoint queue.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **ep** – **[in]** Endpoint address

Returns
0 on success, or error from *udc_ep_dequeue()*

int **usbd_ep_buf_free**(struct *usbd_context* *uds_ctx, struct *net_buf* *buf)
Free USB device request buffer.

Put the buffer back into the request buffer pool.

Parameters
- **uds_ctx** – **[in]** Pointer to USB device support context
- **buf** – **[in]** Pointer to UDC request buffer

Returns
0 on success, all other values should be treated as error.

bool **usbd_is_suspended**(struct *usbd_context* *uds_ctx)
Checks whether the USB device controller is suspended.

Parameters
- **uds_ctx** – **[in]** Pointer to USB device support context

Returns
true if endpoint is halted, false otherwise

int **usbd_wakeup_request**(struct *usbd_context* *uds_ctx)
Initiate the USB remote wakeup (TBD)

Returns
0 on success, other values on fail.

enum *usbd_speed* **usbd_bus_speed**(const struct *usbd_context* *const uds_ctx)
Get actual device speed.

Parameters
- **uds_ctx** – **[in]** Pointer to a device context

Returns
Actual device speed

enum *usbd_speed* **usbd_caps_speed**(const struct *usbd_context* *const uds_ctx)
Get highest speed supported by the controller.

Parameters
- **uds_ctx** – **[in]** Pointer to a device context

Returns
Highest supported speed

int **usbd_device_set_bcd_usb**(struct *usbd_context* *const uds_ctx, const enum *usbd_speed* speed, const uint16_t bcd)
Set USB device descriptor value bcdUSB.

Parameters
- **uds_ctx** – **[in]** Pointer to USB device support context
- **speed** – **[in]** Speed for which the bcdUSB should be set
- **bcd** – **[in]** bcdUSB value

Returns
0 on success, other values on fail.

int **usbd_device_set_vid**(struct *usbd_context* *const uds_ctx, const uint16_t vid)

Set USB device descriptor value idVendor.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **vid** – **[in]** idVendor value

Returns

0 on success, other values on fail.

int **usbd_device_set_pid**(struct *usbd_context* *const uds_ctx, const uint16_t pid)

Set USB device descriptor value idProduct.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **pid** – **[in]** idProduct value

Returns

0 on success, other values on fail.

int **usbd_device_set_bcd_device**(struct *usbd_context* *const uds_ctx, const uint16_t bcd)

Set USB device descriptor value bcdDevice.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **bcd** – **[in]** bcdDevice value

Returns

0 on success, other values on fail.

int **usbd_device_set_code_triple**(struct *usbd_context* *const uds_ctx, const enum *usbd_speed* speed, const uint8_t base_class, const uint8_t subclass, const uint8_t protocol)

Set USB device descriptor code triple Base Class, SubClass, and Protocol.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **speed** – **[in]** Speed for which the code triple should be set
- **base_class** – **[in]** bDeviceClass value
- **subclass** – **[in]** bDeviceSubClass value
- **protocol** – **[in]** bDeviceProtocol value

Returns

0 on success, other values on fail.

int **usbd_config_attrib_rwup**(struct *usbd_context* *const uds_ctx, const enum *usbd_speed* speed, const uint8_t cfg, const bool enable)

Setup USB device configuration attribute Remote Wakeup.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **speed** – **[in]** Configuration speed
- **cfg** – **[in]** Configuration number
- **enable** – **[in]** Sets attribute if true, clears it otherwise

Returns
0 on success, other values on fail.

int **usbd_config_attrib_self**(struct *usbd_context* *const uds_ctx, const enum *usbd_speed* speed, const uint8_t cfg, const bool enable)

Setup USB device configuration attribute Self-powered.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **speed** – **[in]** Configuration speed
- **cfg** – **[in]** Configuration number
- **enable** – **[in]** Sets attribute if true, clears it otherwise

Returns
0 on success, other values on fail.

int **usbd_config_maxpower**(struct *usbd_context* *const uds_ctx, const enum *usbd_speed* speed, const uint8_t cfg, const uint8_t power)

Setup USB device configuration power consumption.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context
- **speed** – **[in]** Configuration speed
- **cfg** – **[in]** Configuration number
- **power** – **[in]** Maximum power consumption value (bMaxPower)

Returns
0 on success, other values on fail.

bool **usbd_can_detect_vbus**(struct *usbd_context* *const uds_ctx)

Check that the controller can detect the VBUS state change.

This can be used in a generic application to explicitly handle the VBUS detected event after *usbd_init()*. For example, to call *usbd_enable()* after a short delay to give the PMIC time to detect the bus, or to handle cases where *usbd_enable()* can only be called after a VBUS detected event.

Parameters

- **uds_ctx** – **[in]** Pointer to USB device support context

Returns
true if controller can detect VBUS state change, false otherwise

struct **usbd_str_desc_data**

#include <usbd.h> Used internally to keep descriptors in order.

USBD string descriptor data

Public Members

uint8_t **idx**

Descriptor index, required for string descriptors.

enum usbd_str_desc_utype **utype**

Descriptor usage type (not bDescriptorType)

unsigned int **ascii7**

The string descriptor is in ASCII7 format.

unsigned int **use_hwinfo**

Device stack obtains SerialNumber using the HWINFO API.

struct **usbd_bos_desc_data**

#include <*usbd.h*> USBD BOS Device Capability descriptor data.

Public Members

enum usbd_bos_desc_utype **utype**

Descriptor usage type (not bDescriptorType)

struct **usbd_desc_node**

#include <*usbd.h*> Descriptor node.

Descriptor node is used to manage descriptors that are not directly part of a structure, such as string or BOS capability descriptors.

Public Members

sys_dnode_t **node**

slist node struct

const void *const **ptr**

Opaque pointer to a descriptor payload.

uint8_t **bLength**

Descriptor size in bytes.

uint8_t **bDescriptorType**

Descriptor type.

struct **usbd_config_node**

#include <*usbd.h*> Device configuration node.

Configuration node is used to manage device configurations, at least one configuration is required. It does not have an index, instead bConfigurationValue of the descriptor is used for identification.

Public Members

sys_snode_t **node**

slist node struct

void *desc
: Pointer to configuration descriptor.

struct *usbd_desc_node* *str_desc_nd
: Optional pointer to string descriptor node.

sys_slist_t class_list
: List of registered classes (functions)

struct usbd_ch9_data
#include <usbd.h> USB device support middle layer runtime data.

Public Members

struct usb_setup_packet setup
: Setup packet, up-to-date for the respective control request.

int ctrl_type
: Control type, internally used for stage verification.

enum *usbd_ch9_state* state
: Protocol state of the USB device stack.

uint32_t ep_halt
: Halted endpoints bitmap.

uint8_t configuration
: USB device stack selected configuration.

bool post_status
: Post status stage work required, e.g.

  set new device address

uint8_t alternate[16U]
: Array to track interfaces alternate settings.

struct usbd_status
#include <usbd.h> USB device support status.

Public Members

unsigned int initialized
: USB device support is initialized.

unsigned int enabled
: USB device support is enabled.

unsigned int **suspended**
: USB device is suspended.

unsigned int **rwup**
: USB remote wake-up feature is enabled.

enum *usbd_speed* **speed**
: USB device speed.

struct **usbd_context**
: *#include <usbd.h>* USB device support runtime context.

Main structure that organizes all descriptors, configuration, and interfaces. An UDC device must be assigned to this structure.

Public Members

const char ***name**
: Name of the USB device.

struct *k_mutex* **mutex**
: Access mutex.

const struct *device* ***dev**
: Pointer to UDC device.

usbd_msg_cb_t **msg_cb**
: Notification message recipient callback.

struct *usbd_ch9_data* **ch9_data**
: Middle layer runtime data.

sys_dlist_t **descriptors**
: slist to manage descriptors like string, BOS

sys_slist_t **fs_configs**
: slist to manage Full-Speed device configurations

sys_slist_t **hs_configs**
: slist to manage High-Speed device configurations

struct *usbd_status* **status**
: Status of the USB device support.

void ***fs_desc**
: Pointer to Full-Speed device descriptor.

void ***hs_desc**
: Pointer to High-Speed device descriptor.

struct **usbd_cctx_vendor_req**

#include <usbd.h> Vendor Requests Table.

Public Members

const uint8_t ***reqs**

Array of vendor requests supported by the class.

uint8_t **len**

Length of the array.

struct **usbd_class_api**

#include <usbd.h> USB device support class instance API.

Public Members

void (***feature_halt**)(struct *usbd_class_data* *const c_data, uint8_t ep, bool halted)

Feature halt state update handler.

void (***update**)(struct *usbd_class_data* *const c_data, uint8_t iface, uint8_t alternate)

Configuration update handler.

int (***control_to_dev**)(struct *usbd_class_data* *const c_data, const struct usb_setup_packet *const setup, const struct *net_buf* *const buf)

USB control request handler to device.

int (***control_to_host**)(struct *usbd_class_data* *const c_data, const struct usb_setup_packet *const setup, struct *net_buf* *const buf)

USB control request handler to host.

int (***request**)(struct *usbd_class_data* *const c_data, struct *net_buf* *buf, int err)

Endpoint request completion event handler.

void (***suspended**)(struct *usbd_class_data* *const c_data)

USB power management handler suspended.

void (***resumed**)(struct *usbd_class_data* *const c_data)

USB power management handler resumed.

void (***sof**)(struct *usbd_class_data* *const c_data)

Start of Frame.

void (***enable**)(struct *usbd_class_data* *const c_data)

Class associated configuration is selected.

void (***disable**)(struct *usbd_class_data* *const c_data)

Class associated configuration is disabled.

int (*init)(struct *usbd_class_data* *const c_data)
Initialization of the class implementation.

void (*shutdown)(struct *usbd_class_data* *const c_data)
Shutdown of the class implementation.

void *(*get_desc)(struct *usbd_class_data* *const c_data, const enum *usbd_speed* speed)
Get function descriptor based on speed parameter.

struct usbd_class_data
#include <*usbd.h*> USB device support class data.

Public Members

const char *name
Name of the USB device class instance.

struct *usbd_context* *uds_ctx
Pointer to USB device stack context structure.

const struct *usbd_class_api* *api
Pointer to device support class API.

const struct *usbd_cctx_vendor_req* *v_reqs
Supported vendor request table, can be NULL.

void *priv
Pointer to private data.

group usbd_msg_api

Enums

enum usbd_msg_type
USB device support message types.
The first set of message types map to event types from the UDC driver API.
Values:

enumerator USBD_MSG_VBUS_READY
VBUS ready message (optional)

enumerator USBD_MSG_VBUS_REMOVED
VBUS removed message (optional)

enumerator USBD_MSG_RESUME
Device resume message.

enumerator USBD_MSG_SUSPEND
Device suspended message.

enumerator USBD_MSG_RESET
Bus reset detected.

enumerator USBD_MSG_UDC_ERROR
Non-correctable UDC error message

enumerator USBD_MSG_STACK_ERROR
Unrecoverable device stack error message

enumerator USBD_MSG_CDC_ACM_LINE_CODING
CDC ACM Line Coding update.

enumerator USBD_MSG_CDC_ACM_CONTROL_LINE_STATE
CDC ACM Line State update.

enumerator USBD_MSG_MAX_NUMBER
Maximum number of message types.

Functions

static inline const char *usbd_msg_type_string(const enum *usbd_msg_type* type)
Returns the message type as a constant string.

Parameters

- **type** – **[in]** USBD message type

Returns
Message type as a constant string

struct usbd_msg
#include <usbd_msg.h> USB device message.

Public Members

enum *usbd_msg_type* type
Message type.

union usbd_msg
Message status, value or data.

HID device API

HID device specific API defined in include/zephyr/usb/class/usbd_hid.h.

Related code samples

USB HID keyboard
Implement a basic HID keyboard device.

API Reference

group `usbd_hid_device`

USBD HID Device API.

Enums

HID report types Report types used in Get/Set Report requests.

Values:

enumerator `HID_REPORT_TYPE_INPUT` = 1

enumerator `HID_REPORT_TYPE_OUTPUT`

enumerator `HID_REPORT_TYPE_FEATURE`

Functions

int `hid_device_register`(const struct *device* *dev, const uint8_t *const rdesc, const uint16_t rsize, const struct *hid_device_ops* *const ops)

Register HID device report descriptor and user callbacks.

The device must register report descriptor and user callbacks before USB device support is initialized and enabled.

Parameters

- `dev` – **[in]** Pointer to HID device
- `rdesc` – **[in]** Pointer to HID report descriptor
- `rsize` – **[in]** Size of HID report descriptor
- `ops` – **[in]** Pointer to HID device callbacks

int `hid_device_submit_report`(const struct *device* *dev, const uint16_t size, const uint8_t *const report)

Submit new input report.

Submit a new input report to be sent via the interrupt IN pipe. If sync is true, the functions will block until the report is sent. If the device does not provide input_report_done() callback, *hid_device_submit_report()* will be processed synchronously.

Parameters

- `dev` – **[in]** Pointer to HID device
- `size` – **[in]** Size of the input report

- `report` – **[in]** Input report buffer. Report buffer must be aligned.

Returns
0 on success, negative errno code on fail.

struct `hid_device_ops`

#include <usbd_hid.h> HID device user callbacks.

Each device depends on a user part that handles feature, input, and output report processing according to the device functionality described by the report descriptor. Which callbacks must be implemented depends on the device functionality. The USB device part of the HID device, cannot interpret device specific report descriptor and only handles USB specific parts, transfers and validation of requests, all reports are opaque to it. Callbacks are called from the USB device stack thread and must not block.

Public Members

void (*`iface_ready`)(const struct *device* *dev, const bool ready)

The interface ready callback is called with the ready argument set to true when the corresponding interface is part of the active configuration and the device can e.g.

begin submitting input reports, and with the argument set to false when the interface is no longer active. This callback is optional.

int (*`get_report`)(const struct *device* *dev, const uint8_t type, const uint8_t id, const uint16_t len, uint8_t *const buf)

This callback is called for the HID Get Report request to get a feature, input, or output report, which is specified by the argument type.

If there is no report ID in the report descriptor, the id argument is zero. The callback implementation must check the arguments, such as whether the report type is supported and the report length, and return a negative value to indicate an unsupported type or an error, or return the length of the report written to the buffer.

int (*`set_report`)(const struct *device* *dev, const uint8_t type, const uint8_t id, const uint16_t len, const uint8_t *const buf)

This callback is called for the HID Set Report request to set a feature, input, or output report, which is specified by the argument type.

If there is no report ID in the report descriptor, the id argument is zero. The callback implementation must check the arguments, such as whether the report type is supported, and return a nonzero value to indicate an unsupported type or an error.

void (*`set_idle`)(const struct *device* *dev, const uint8_t id, const uint32_t duration)

Notification to limit input report frequency.

The device should mute an input report submission until a new event occurs or until the time specified by the duration value has elapsed. If a report ID is used in the report descriptor, the device must store the duration and handle the specified report accordingly. Duration time resolution is in milliseconds.

uint32_t (*`get_idle`)(const struct *device* *dev, const uint8_t id)

If a report ID is used in the report descriptor, the device must implement this callback and return the duration for the specified report ID.

Duration time resolution is in milliseconds.

void (*`set_protocol`)(const struct *device* *dev, const uint8_t proto)

Notification that the host has changed the protocol from Boot Protocol(0) to Report Protocol(1) or vice versa.

void (*`input_report_done`)(const struct *device* *dev)

Notification that input report submitted with *hid_device_submit_report()* has been sent.

If the device does not use the callback, *hid_device_submit_report()* will be processed synchronously.

void (*`output_report`)(const struct *device* *dev, const uint16_t len, const uint8_t *const buf)

New output report callback.

Callback will only be called for reports received through the optional interrupt OUT pipe. If there is no interrupt OUT pipe, output reports will be received using *set_report()*. If a report ID is used in the report descriptor, the host places the ID in the buffer first, followed by the report data.

void (*`sof`)(const struct *device* *dev)

Optional Start of Frame (SoF) event callback.

There will always be software and hardware dependent jitter and latency. This should be used very carefully, it should not block and the execution time should be quite short.

Audio Class 2 device API

USB Audio Class 2 device specific API defined in include/zephyr/usb/class/usbd_uac2.h.

Related code samples

USB Audio asynchronous explicit feedback sample
USB Audio 2 explicit feedback sample playing audio on I2S.

API Reference

group `uac2_device`

USB Audio Class 2 device API.

Defines

`UAC2_ENTITY_ID`(node)

Get entity ID.

Parameters

- `node` – node identifier

Functions

void **usbd_uac2_set_ops**(const struct *device* *dev, const struct *uac2_ops* *ops, void *user_data)

Register USB Audio 2 application callbacks.

Parameters

- **dev** – USB Audio 2 device instance
- **ops** – USB Audio 2 callback structure
- **user_data** – Opaque user data to pass to ops callbacks

int **usbd_uac2_send**(const struct *device* *dev, uint8_t terminal, void *data, uint16_t size)

Send audio data to output terminal.

Data buffer must be sufficiently aligned and otherwise suitable for use by UDC driver.

Parameters

- **dev** – USB Audio 2 device
- **terminal** – Output Terminal ID linked to AudioStreaming interface
- **data** – Buffer containing outgoing data
- **size** – Number of bytes to send

Returns

0 on success, negative value on error

struct **uac2_ops**

#include <usbd_uac2.h> USB Audio 2 application event handlers.

Public Members

void (***sof_cb**)(const struct *device* *dev, void *user_data)

Start of Frame callback.

Notifies application about SOF event on the bus.

Param dev
USB Audio 2 device
Param user_data
Opaque user data pointer

void (***terminal_update_cb**)(const struct *device* *dev, uint8_t terminal, bool enabled, bool microframes, void *user_data)

Terminal update callback.

Notifies application that host has enabled or disabled a terminal.

Param dev
USB Audio 2 device
Param terminal
Terminal ID linked to AudioStreaming interface
Param enabled
True if host enabled terminal, False otherwise
Param microframes
True if USB connection speed uses microframes
Param user_data
Opaque user data pointer

void *(*get_recv_buf)(const struct *device* *dev, uint8_t terminal, uint16_t size, void *user_data)

Get receive buffer address.

USB stack calls this function to obtain receive buffer address for AudioStreaming interface. The buffer is owned by USB stack until *data_recv_cb* callback is called. The buffer must be sufficiently aligned and otherwise suitable for use by UDC driver.

Param dev
USB Audio 2 device

Param terminal
Input Terminal ID linked to AudioStreaming interface

Param size
Maximum number of bytes USB stack will write to buffer.

Param user_data
Opaque user data pointer

void (*data_recv_cb)(const struct *device* *dev, uint8_t terminal, void *buf, uint16_t size, void *user_data)

Data received.

This function releases buffer obtained in *get_recv_buf* after USB has written data to the buffer and/or no longer needs it.

Param dev
USB Audio 2 device

Param terminal
Input Terminal ID linked to AudioStreaming interface

Param buf
Buffer previously obtained via *get_recv_buf*

Param size
Number of bytes written to buffer

Param user_data
Opaque user data pointer

void (*buf_release_cb)(const struct *device* *dev, uint8_t terminal, void *buf, void *user_data)

Transmit buffer release callback.

This function releases buffer provided in *usbd_uac2_send* when the class no longer needs it.

Param dev
USB Audio 2 device

Param terminal
Output Terminal ID linked to AudioStreaming interface

Param buf
Buffer previously provided via *usbd_uac2_send*

Param user_data
Opaque user data pointer

uint32_t (*feedback_cb)(const struct *device* *dev, uint8_t terminal, void *user_data)

Get Explicit Feedback value.

Explicit feedback value format depends terminal connection speed. If device is High-Speed capable, it must use Q16.16 format if and only if the *terminal_update_cb* was called with microframes parameter set to true. On Full-Speed only devices, or if High-Speed capable device is operating at Full-Speed (microframes was false), the format is Q10.14 stored on 24 least significant bits (i.e. 8 most significant bits are ignored).

Param dev
USB Audio 2 device
Param terminal
Input Terminal ID whose feedback should be returned
Param user_data
Opaque user data pointer

USB Mass Storage Class device API

USB Mass Storage Class device API defined in include/zephyr/usb/class/usbd_msc.h.

Related code samples

USB Mass Storage
Expose board's RAM or FLASH as a USB disk using USB Mass Storage driver.

API Reference

group `usbd_msc_device`
USB Mass Storage Class device API.

Defines

`USBD_DEFINE_MSC_LUN`(disk_name, t10_vendor, t10_product, t10_revision)
Define USB Mass Storage Class logical unit.

Use this macro to create Logical Unit mapping in USB MSC for selected disk. Up to `CONFIG_USBD_MSC_LUNS_PER_INSTANCE` disks can be registered on single USB MSC instance. Currently only one USB MSC instance is supported.

Parameters

- `disk_name` – Disk name as used in *Disk Access Interface*
- `t10_vendor` – T10 Vendor Indetification
- `t10_product` – T10 Product Identification
- `t10_revision` – T10 Product Revision Level

6.5.5 USB host support APIs

USB host controller (UHC) driver API

The USB host controller driver API is described in include/zephyr/drivers/usb/uhc.h and referred to as the `UHC driver` API.

UHC driver API is experimental and is subject to change without notice.

Driver API reference

group `uhc_api`
USB host controller (UHC) driver API.

Defines

UHC_STATUS_INITIALIZED

Controller is initialized by *uhc_init()*

UHC_STATUS_ENABLED

Controller is enabled and all API functions are available.

Typedefs

typedef int (*uhc_event_cb_t)(const struct *device* *dev, const struct *uhc_event* *const event)

Callback to submit UHC event to higher layer.

At the higher level, the event is to be inserted into a message queue.

Param dev
[in] Pointer to device struct of the driver instance

Param event
[in] Point to event structure

Return
0 on success, all other values should be treated as error.

Enums

enum uhc_control_stage

USB control transfer stage.

Values:

enumerator UHC_CONTROL_STAGE_SETUP = 0

enumerator UHC_CONTROL_STAGE_DATA

enumerator UHC_CONTROL_STAGE_STATUS

enum uhc_event_type

USB host controller event types.

Values:

enumerator UHC_EVT_DEV_CONNECTED_LS

Low speed device connected.

enumerator UHC_EVT_DEV_CONNECTED_FS

Full speed device connected.

enumerator UHC_EVT_DEV_CONNECTED_HS

High speed device connected.

enumerator UHC_EVT_DEV_REMOVED
Device (peripheral) removed.

enumerator UHC_EVT_RESETED
Bus reset operation finished.

enumerator UHC_EVT_SUSPENDED
Bus suspend operation finished.

enumerator UHC_EVT_RESUMED
Bus resume operation finished.

enumerator UHC_EVT_RWUP
Remote wakeup signal.

enumerator UHC_EVT_EP_REQUEST
Endpoint request result event.

enumerator UHC_EVT_ERROR
Non-correctable error event, requires attention from higher levels or application.

Functions

static inline bool uhc_is_initialized(const struct *device* *dev)
Checks whether the controller is initialized.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance

Returns
true if controller is initialized, false otherwise

static inline bool uhc_is_enabled(const struct *device* *dev)
Checks whether the controller is enabled.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance

Returns
true if controller is enabled, false otherwise

static inline int uhc_bus_reset(const struct *device* *dev)
Reset USB bus.

Perform USB bus reset, controller may emit UHC_EVT_RESETED at the end of reset signaling.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance

Return values
-EBUSY – if the controller is already performing a bus operation

Returns
0 on success, all other values should be treated as error.

static inline int **uhc_sof_enable**(const struct *device* *dev)

Enable Start of Frame generator.

Enable SOF generator.

Parameters

- **dev** – **[in]** Pointer to device struct of the driver instance

Return values

-EALREADY – if already enabled

Returns

0 on success, all other values should be treated as error.

static inline int **uhc_bus_suspend**(const struct *device* *dev)

Suspend USB bus.

Disable SOF generator and emit UHC_EVT_SUSPENDED event when USB bus is suspended.

Parameters

- **dev** – **[in]** Pointer to device struct of the driver instance

Return values

-EALREADY – if already suspended

Returns

0 on success, all other values should be treated as error.

static inline int **uhc_bus_resume**(const struct *device* *dev)

Resume USB bus.

Signal resume for at least 20ms, emit UHC_EVT_RESUMED at the end of USB bus resume signaling. The SoF generator should subsequently start within 3ms.

Parameters

- **dev** – **[in]** Pointer to device struct of the driver instance

Return values

-EBUSY – if the controller is already performing a bus operation

Returns

0 on success, all other values should be treated as error.

struct *uhc_transfer* ***uhc_xfer_alloc**(const struct *device* *dev, const uint8_t addr, const uint8_t ep, const uint8_t attrib, const uint16_t mps, const uint16_t timeout, void *const udev, void *const cb)

Allocate UHC transfer.

Allocate a new transfer from common transfer pool. Transfer has no buffer after allocation, but can be allocated and added from different pools.

Parameters

- **dev** – **[in]** Pointer to device struct of the driver instance
- **addr** – **[in]** Device (peripheral) address
- **ep** – **[in]** Endpoint address
- **attrib** – **[in]** Endpoint attributes
- **mps** – **[in]** Maximum packet size of the endpoint
- **timeout** – **[in]** Timeout in number of frames
- **udev** – **[in]** Opaque pointer to USB device

- `cb` – **[in]** Transfer completion callback

Returns
pointer to allocated transfer or NULL on error.

struct *uhc_transfer* *`uhc_xfer_alloc_with_buf`(const struct *device* *dev, const uint8_t addr, const uint8_t ep, const uint8_t attrib, const uint16_t mps, const uint16_t timeout, void *const udev, void *const cb, size_t size)

Allocate UHC transfer with buffer.

Allocate a new transfer from common transfer pool with buffer.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `addr` – **[in]** Device (peripheral) address
- `ep` – **[in]** Endpoint address
- `attrib` – **[in]** Endpoint attributes
- `mps` – **[in]** Maximum packet size of the endpoint
- `timeout` – **[in]** Timeout in number of frames
- `udev` – **[in]** Opaque pointer to USB device
- `cb` – **[in]** Transfer completion callback
- `size` – **[in]** Size of the buffer

Returns
pointer to allocated transfer or NULL on error.

int `uhc_xfer_free`(const struct *device* *dev, struct *uhc_transfer* *const xfer)

Free UHC transfer and any buffers.

Free any buffers and put the transfer back into the transfer pool.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `xfer` – **[in]** Pointer to UHC transfer

Returns
0 on success, all other values should be treated as error.

int `uhc_xfer_buf_add`(const struct *device* *dev, struct *uhc_transfer* *const xfer, struct *net_buf* *buf)

Add UHC transfer buffer.

Add a previously allocated buffer to the transfer.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance
- `xfer` – **[in]** Pointer to UHC transfer
- `buf` – **[in]** Pointer to UHC request buffer

Returns
pointer to allocated request or NULL on error.

struct *net_buf* *uhc_xfer_buf_alloc(const struct *device* *dev, const size_t size)

Allocate UHC transfer buffer.

Allocate a new buffer from common request buffer pool and assign it to the transfer if the xfer parameter is not NULL.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance
- size – **[in]** Size of the request buffer

Returns

pointer to allocated request or NULL on error.

void uhc_xfer_buf_free(const struct *device* *dev, struct *net_buf* *const buf)

Free UHC request buffer.

Put the buffer back into the request buffer pool.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance
- buf – **[in]** Pointer to UHC request buffer

int uhc_ep_enqueue(const struct *device* *dev, struct *uhc_transfer* *const xfer)

Queue USB host controller transfer.

Add transfer to the queue. If the queue is empty, the transfer can be claimed by the controller immediately.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance
- xfer – **[in]** Pointer to UHC transfer

Return values

-EPERM – controller is not initialized

Returns

0 on success, all other values should be treated as error.

int uhc_ep_dequeue(const struct *device* *dev, struct *uhc_transfer* *const xfer)

Remove a USB host controller transfers from queue.

Not implemented yet.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance
- xfer – **[in]** Pointer to UHC transfer

Return values

-EPERM – controller is not initialized

Returns

0 on success, all other values should be treated as error.

int uhc_init(const struct *device* *dev, *uhc_event_cb_t* event_cb)

Initialize USB host controller.

Initialize USB host controller.

Parameters

- dev – **[in]** Pointer to device struct of the driver instance
- event_cb – **[in]** Event callback from the higher layer (USB host stack)

Return values

- `-EINVAL` – on parameter error (no callback is passed)
- `-EALREADY` – already initialized

Returns
0 on success, all other values should be treated as error.

int `uhc_enable`(const struct *device* *dev)

Enable USB host controller.

Enable powered USB host controller and allow host stack to recognize and enumerate devices.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values

- `-EPERM` – controller is not initialized
- `-EALREADY` – already enabled

Returns
0 on success, all other values should be treated as error.

int `uhc_disable`(const struct *device* *dev)

Disable USB host controller.

Disable enabled USB host controller.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values
`-EALREADY` – already disabled

Returns
0 on success, all other values should be treated as error.

int `uhc_shutdown`(const struct *device* *dev)

Poweroff USB host controller.

Shut down the controller completely to reduce energy consumption or to change the role of the controller.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Return values
`-EALREADY` – controller is already uninitialized

Returns
0 on success, all other values should be treated as error.

static inline struct *uhc_device_caps* `uhc_caps`(const struct *device* *dev)

Get USB host controller capabilities.

Obtain the capabilities of the controller such as high speed (HS), and more.

Parameters

- `dev` – **[in]** Pointer to device struct of the driver instance

Returns
USB host controller capabilities.

struct **uhc_transfer**

#include <uhc.h> UHC endpoint buffer info.

This structure is mandatory for all UHC request. It contains the meta data about the request and FIFOs to store *net_buf* structures for each request.

The members of this structure should not be used directly by a higher layer (host stack).

Public Members

sys_dnode_t **node**

dlist node

uint8_t **setup_pkt**[8]

Control transfer setup packet.

struct *net_buf* ***buf**

Transfer data buffer.

uint8_t **addr**

Device (peripheral) address.

uint8_t **ep**

Endpoint to which request is associated.

uint8_t **attrib**

Endpoint attributes (TBD)

uint16_t **mps**

Maximum packet size.

uint16_t **timeout**

Timeout in number of frames.

unsigned int **queued**

Flag marks request buffer is queued.

unsigned int **stage**

Control stage status, up to the driver to use it or not.

void ***udev**

Pointer to USB device (opaque for the UHC)

void ***cb**

Pointer to transfer completion callback (opaque for the UHC)

int **err**

Transfer result, 0 on success, other values on error.

struct `uhc_event`

#include <*uhc.h*> USB host controller event.

Common structure for all events that originate from the UHC driver and are passed to higher layer using message queue and a callback (uhc_event_cb_t) provided by higher layer during controller initialization (uhc_init).

Public Members

sys_snode_t `node`

slist node for the message queue

enum *uhc_event_type* `type`

Event type.

int `status`

Event status value, if any.

struct *uhc_transfer* *`xfer`

Pointer to request used only for UHC_EVT_EP_REQUEST.

const struct *device* *`dev`

Pointer to controller's device struct.

struct `uhc_device_caps`

#include <*uhc.h*> USB host controller capabilities.

This structure is mainly intended for the USB host stack.

Public Members

uint32_t `hs`

USB high speed capable controller.

struct `uhc_data`

#include <*uhc.h*> Common UHC driver data structure.

Mandatory structure for each UHC controller driver. To be implemented as device's private data (device->data).

Public Members

struct *uhc_device_caps* `caps`

Controller capabilities.

struct *k_mutex* `mutex`

Driver access mutex.

sys_dlist_t **ctrl_xfers**
dlist for control transfers

sys_dlist_t **bulk_xfers**
dlist for bulk transfers

uhc_event_cb_t **event_cb**
Callback to submit an UHC event to upper layer.

atomic_t **status**
USB host controller status.

void ***priv**
Driver private data.

USB Power Delivery support

6.5.6 USB-C device stack

The USB-C device stack is a hardware independent interface between a Type-C Port Controller (TCPC) and customer applications. It is a port of the Google ChromeOS Type-C Port Manager (TCPM) stack. It provides the following functionalities:

- Uses the APIs provided by the Type-C Port Controller drivers to interact with the Type-C Port Controller.
- Provides a programming interface that's used by a customer applications. The APIs is described in include/zephyr/usb_c/usbc.h

Currently the device stack supports implementation of Sink only and Source only devices. Dual Role Power (DRP) devices are not yet supported.

List of samples for different purposes.

Implementing a Sink Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree.

The following devicetree, structures and callbacks need to be defined:

- Devicetree usb-c-connector node referencing a TCPC
- Devicetree vbus node referencing a VBUS measurement device
- User defined structure that encapsulates application specific data
- Policy callbacks

For example, for the Sample USB-C Sink application:

Each Physical Type-C port is represented in the devicetree by a usb-c-connector compatible node:

```
port1: usbc-port@1 {
        compatible = "usb-c-connector";
        reg = <1>;
        tcpc = <&ucpd1>;
        vbus = <&vbus1>;
        power-role = "sink";
        sink-pdos = <PDO_FIXED(5000, 100, 0)>;
};
```

VBUS is measured by a device that's referenced in the devicetree by a usb-c-vbus-adc compatible node:

```
        vbus1: vbus {
                compatible = "zephyr,usb-c-vbus-adc";
                io-channels = <&adc2 8>;
                output-ohms = <49900>;
                full-ohms = <(330000 + 49900)>;
        };
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```
/**
 * @brief A structure that encapsulates Port data.
 */
static struct port0_data_t {
        /** Sink Capabilities */
        uint32_t snk_caps[DT_PROP_LEN(USBC_PORT0_NODE, sink_pdos)];
        /** Number of Sink Capabilities */
        int snk_cap_cnt;
        /** Source Capabilities */
        uint32_t src_caps[PDO_MAX_DATA_OBJECTS];
        /** Number of Source Capabilities */
        int src_cap_cnt;
        /* Power Supply Ready flag */
        atomic_t ps_ready;
} port0_data = {
        .snk_caps = {DT_FOREACH_PROP_ELEM(USBC_PORT0_NODE, sink_pdos, SINK_PDO)},
        .snk_cap_cnt = DT_PROP_LEN(USBC_PORT0_NODE, sink_pdos),
        .src_caps = {0},
        .src_cap_cnt = 0,
        .ps_ready = 0
};

```

These callbacks are used by the subsystem to set or get application specific data:

```
static int port0_policy_cb_get_snk_cap(const struct device *dev,
                                       uint32_t **pdos,
                                       int *num_pdos)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        *pdos = dpm_data->snk_caps;
        *num_pdos = dpm_data->snk_cap_cnt;

        return 0;
}

static void port0_policy_cb_set_src_cap(const struct device *dev,
                                        const uint32_t *pdos,
                                        const int num_pdos)
{
        struct port0_data_t *dpm_data;
        int num;
        int i;

        dpm_data = usbc_get_dpm_data(dev);

        num = num_pdos;
        if (num > PDO_MAX_DATA_OBJECTS) {
                num = PDO_MAX_DATA_OBJECTS;
```

(continues on next page)

(continued from previous page)

```
        }

        for (i = 0; i < num; i++) {
                dpm_data->src_caps[i] = *(pdos + i);
        }

        dpm_data->src_cap_cnt = num;
}

static uint32_t port0_policy_cb_get_rdo(const struct device *dev)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        return build_rdo(dpm_data);
}
```

This callback is used by the subsystem to query if a certain action can be taken:

```
bool port0_policy_check(const struct device *dev,
                        const enum usbc_policy_check_t policy_check)
{
        switch (policy_check) {
        case CHECK_POWER_ROLE_SWAP:
                /* Reject power role swaps */
                return false;
        case CHECK_DATA_ROLE_SWAP_TO_DFP:
                /* Reject data role swap to DFP */
                return false;
        case CHECK_DATA_ROLE_SWAP_TO_UFP:
                /* Accept data role swap to UFP */
                return true;
        case CHECK_SNK_AT_DEFAULT_LEVEL:
                /* This device is always at the default power level */
                return true;
        default:
                /* Reject all other policy checks */
                return false;

        }
}
```

This callback is used by the subsystem to notify the application of an event:

```
static void port0_notify(const struct device *dev,
                         const enum usbc_policy_notify_t policy_notify)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        switch (policy_notify) {
        case PROTOCOL_ERROR:
                break;
        case MSG_DISCARDED:
                break;
        case MSG_ACCEPT_RECEIVED:
                break;
        case MSG_REJECTED_RECEIVED:
                break;
        case MSG_NOT_SUPPORTED_RECEIVED:
                break;
        case TRANSITION_PS:
                atomic_set_bit(&dpm_data->ps_ready, 0);
```

(continues on next page)

(continued from previous page)

```
                break;
        case PD_CONNECTED:
                break;
        case NOT_PD_CONNECTED:
                break;
        case POWER_CHANGE_0A0:
                LOG_INF("PWR 0A");
                break;
        case POWER_CHANGE_DEF:
                LOG_INF("PWR DEF");
                break;
        case POWER_CHANGE_1A5:
                LOG_INF("PWR 1A5");
                break;
        case POWER_CHANGE_3A0:
                LOG_INF("PWR 3A0");
                break;
        case DATA_ROLE_IS_UFP:
                break;
        case DATA_ROLE_IS_DFP:
                break;
        case PORT_PARTNER_NOT_RESPONSIVE:
                LOG_INF("Port Partner not PD Capable");
                break;
        case SNK_TRANSITION_TO_DEFAULT:
                break;
        case HARD_RESET_RECEIVED:
                break;
        case SENDER_RESPONSE_TIMEOUT:
                break;
        case SOURCE_CAPABILITIES_RECEIVED:
                break;
        }
}
```

Registering the callbacks:

```
        /* Register USB-C Callbacks */

        /* Register Policy Check callback */
        usbc_set_policy_cb_check(usbc_port0, port0_policy_check);
        /* Register Policy Notify callback */
        usbc_set_policy_cb_notify(usbc_port0, port0_notify);
        /* Register Policy Get Sink Capabilities callback */
        usbc_set_policy_cb_get_snk_cap(usbc_port0, port0_policy_cb_get_snk_cap);
        /* Register Policy Set Source Capabilities callback */
        usbc_set_policy_cb_set_src_cap(usbc_port0, port0_policy_cb_set_src_cap);
        /* Register Policy Get Request Data Object callback */
        usbc_set_policy_cb_get_rdo(usbc_port0, port0_policy_cb_get_rdo);
```

Register the user defined structure:

```
        /* Set Application port data object. This object is passed to the policy callbacks␣
↪*/
        port0_data.ps_ready = ATOMIC_INIT(0);
        usbc_set_dpm_data(usbc_port0, &port0_data);
```

Start the USB-C subsystem:

```
        /* Start the USB-C Subsystem */
        usbc_start(usbc_port0);
```

Implementing a Source Type-C and Power Delivery USB-C device

The configuration of a USB-C Device is done in the stack layer and devicetree.

Define the following devicetree, structures and callbacks:

- Devicetree `usb-c-connector` node referencing a TCPC
- Devicetree `vbus` node referencing a VBUS measurement device
- User defined structure that encapsulates application specific data
- Policy callbacks

For example, for the Sample USB-C Source application:

Each Physical Type-C port is represented in the devicetree by a `usb-c-connector` compatible node:

```
                port1: usbc-port@1 {
                        compatible = "usb-c-connector";
                        reg = <1>;
                        tcpc = <&ucpd1>;
                        vbus = <&vbus1>;
                        power-role = "source";
                        typec-power-opmode = "3.0A";
                        source-pdos = <PDO_FIXED(5000, 100, 0) PDO_FIXED(9000, 100, 0) PDO_
↪FIXED(15000, 100, 0)>;
                };
```

VBUS is measured by a device that's referenced in the devicetree by a `usb-c-vbus-adc` compatible node:

```
        vbus1: vbus {
                compatible = "zephyr,usb-c-vbus-adc";
                io-channels = <&adc1 9>;
                output-ohms = <49900>;
                full-ohms = <(330000 + 49900)>;

                /* Pin B13 is used to control VBUS Discharge for Port1 */
                discharge-gpios = <&gpiob 13 GPIO_ACTIVE_HIGH>;
        };
```

A user defined structure is defined and later registered with the subsystem and can be accessed from callback through an API:

```
/**
 * @brief A structure that encapsulates Port data.
 */
static struct port0_data_t {
        /** Source Capabilities */
        uint32_t src_caps[DT_PROP_LEN(USBC_PORT0_NODE, source_pdos)];
        /** Number of Source Capabilities */
        int src_cap_cnt;
        /** CC Rp value */
        int rp;
        /** Sink Request RDO */
        union pd_rdo sink_request;
        /** Requested Object Pos */
        int obj_pos;
        /** VCONN CC line*/
        enum tc_cc_polarity vconn_pol;
        /** True if power supply is ready */
        bool ps_ready;
```

(continues on next page)

(continued from previous page)

```
        /** True if power supply should transition to a new level */
        bool ps_tran_start;
        /** Log Sink Requested RDO to console */
        atomic_t show_sink_request;
} port0_data = {
        .rp = DT_ENUM_IDX(USBC_PORT0_NODE, typec_power_opmode),
        .src_caps = {DT_FOREACH_PROP_ELEM(USBC_PORT0_NODE, source_pdos, SOURCE_PDO)},
        .src_cap_cnt = DT_PROP_LEN(USBC_PORT0_NODE, source_pdos),
};

```

These callbacks are used by the subsystem to set or get application specific data:

```
/**
 * @brief PE calls this function when it needs to set the Rp on CC
 */
int port0_policy_cb_get_src_rp(const struct device *dev,
                               enum tc_rp_value *rp)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        *rp = dpm_data->rp;

        return 0;
}

/**
 * @brief PE calls this function to Enable (5V) or Disable (0V) the
 *          Power Supply
 */
int port0_policy_cb_src_en(const struct device *dev, bool en)
{
        source_ctrl_set(en ? SOURCE_5V : SOURCE_0V);

        return 0;
}

/**
 * @brief PE calls this function to Enable or Disable VCONN
 */
int port0_policy_cb_vconn_en(const struct device *dev, enum tc_cc_polarity pol, bool en)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        dpm_data->vconn_pol = pol;

        if (en == false) {
                /* Disable VCONN on CC1 and CC2 */
                vconn_ctrl_set(VCONN_OFF);
        } else if (pol == TC_POLARITY_CC1) {
                /* set VCONN on CC1 */
                vconn_ctrl_set(VCONN1_ON);
        } else {
                /* set VCONN on CC2 */
                vconn_ctrl_set(VCONN2_ON);
        }

        return 0;
}

/**
```

(continues on next page)

(continued from previous page)

```
 * @brief PE calls this function to get the Source Caps that will be sent
 *          to the Sink
 */
int port0_policy_cb_get_src_caps(const struct device *dev,
                         const uint32_t **pdos, uint32_t *num_pdos)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        *pdos = dpm_data->src_caps;
        *num_pdos = dpm_data->src_cap_cnt;

        return 0;
}

/**
 * @brief PE calls this function to verify that a Sink's request if valid
 */
static enum usbc_snk_req_reply_t port0_policy_cb_check_sink_request(const struct device *dev,
                                        const uint32_t request_msg)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);
        union pd_fixed_supply_pdo_source pdo;
        uint32_t obj_pos;
        uint32_t op_current;

        dpm_data->sink_request.raw_value = request_msg;
        obj_pos = dpm_data->sink_request.fixed.object_pos;
        op_current =
                PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(dpm_data->sink_request.fixed.operating_current);

        if (obj_pos == 0 || obj_pos > dpm_data->src_cap_cnt) {
                return SNK_REQUEST_REJECT;
        }

        pdo.raw_value = dpm_data->src_caps[obj_pos - 1];

}

```

This callback is used by the subsystem to query if a certain action can be taken:

```
bool port0_policy_check(const struct device *dev,
                        const enum usbc_policy_check_t policy_check)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        switch (policy_check) {
        case CHECK_POWER_ROLE_SWAP:
                /* Reject power role swaps */
                return false;
        case CHECK_DATA_ROLE_SWAP_TO_DFP:
                /* Accept data role swap to DFP */
                return true;
        case CHECK_DATA_ROLE_SWAP_TO_UFP:
                /* Reject data role swap to UFP */
                return false;
        case CHECK_SRC_PS_AT_DEFAULT_LEVEL:
                /*
                 * This check is sent from the PE_SRC_Transition_to_default
                 * state and requires the following:
                 *        1: Vconn should be turned ON
                 *        2: Return TRUE when Power Supply is at default level
```

(continues on next page)

(continued from previous page)

```
                 */

                /* Power on VCONN */
                vconn_ctrl_set(dpm_data->vconn_pol);

                /* PS should be at default level after receiving a Hard Reset */
                return true;
        default:
                /* Reject all other policy checks */
                return false;

        }
}
```

This callback is used by the subsystem to notify the application of an event:

```
static void port0_notify(const struct device *dev,
                         const enum usbc_policy_notify_t policy_notify)
{
        struct port0_data_t *dpm_data = usbc_get_dpm_data(dev);

        switch (policy_notify) {
        case PROTOCOL_ERROR:
                break;
        case MSG_DISCARDED:
                break;
        case MSG_ACCEPT_RECEIVED:
                break;
        case MSG_REJECTED_RECEIVED:
                break;
        case MSG_NOT_SUPPORTED_RECEIVED:
                break;
        case TRANSITION_PS:
                dpm_data->ps_tran_start = true;
                break;
        case PD_CONNECTED:
                break;
        case NOT_PD_CONNECTED:
                break;
        case DATA_ROLE_IS_UFP:
                break;
        case DATA_ROLE_IS_DFP:
                break;
        case PORT_PARTNER_NOT_RESPONSIVE:
                LOG_INF("Port Partner not PD Capable");
                break;
        case HARD_RESET_RECEIVED:
                /*
                 * This notification is sent from the PE_SRC_Transition_to_default
                 * state and requires the following:
                 *        1: Vconn should be turned OFF
                 *        2: Reset of the local hardware
                 */

                /* Power off VCONN */
                vconn_ctrl_set(VCONN_OFF);
                /* Transition PS to Default level */
                source_ctrl_set(SOURCE_5V);
                break;
        default:
        }
}
```

Registering the callbacks:

```
        /* Register USB-C Callbacks */

        /* Register Policy Check callback */
        usbc_set_policy_cb_check(usbc_port0, port0_policy_check);
        /* Register Policy Notify callback */
        usbc_set_policy_cb_notify(usbc_port0, port0_notify);
        /* Register Policy callback to set the Rp on CC lines */
        usbc_set_policy_cb_get_src_rp(usbc_port0, port0_policy_cb_get_src_rp);
        /* Register Policy callback to enable or disable power supply */
        usbc_set_policy_cb_src_en(usbc_port0, port0_policy_cb_src_en);
        /* Register Policy callback to enable or disable vconn */
        usbc_set_vconn_control_cb(usbc_port0, port0_policy_cb_vconn_en);
        /* Register Policy callback to send the source caps to the sink */
        usbc_set_policy_cb_get_src_caps(usbc_port0, port0_policy_cb_get_src_caps);
        /* Register Policy callback to check if the sink request is valid */
        usbc_set_policy_cb_check_sink_request(usbc_port0, port0_policy_cb_check_sink_
↪request);
        /* Register Policy callback to check if the power supply is ready */
        usbc_set_policy_cb_is_ps_ready(usbc_port0, port0_policy_cb_is_ps_ready);
        /* Register Policy callback to check if Present Contract is still valid */
        usbc_set_policy_cb_present_contract_is_valid(usbc_port0,
                                port0_policy_cb_present_contract_is_valid);

```

Register the user defined structure:

```
        /* Set Application port data object. This object is passed to the policy callbacks␣
↪*/
        usbc_set_dpm_data(usbc_port0, &port0_data);
```

Start the USB-C subsystem:

```
        /* Start the USB-C Subsystem */
        usbc_start(usbc_port0);
```

Defines

FIXED_5V_100MA_RDO

This Request Data Object (RDO) value can be returned from the policy_cb_get_rdo if 5V@100mA with the following options are sufficient for the Sink to operate.

The RDO is configured as follows: Maximum operating current 100mA Operating current 100mA Unchunked Extended Messages Not Supported No USB Suspend Not USB Communications Capable No capability mismatch Don't giveback Object position 1 (5V PDO)

Enums

enum usbc_policy_request_t

Device Policy Manager requests.

Values:

enumerator REQUEST_NOP

No request.

enumerator REQUEST_TC_DISABLED

Request Type-C layer to transition to Disabled State.

enumerator REQUEST_TC_ERROR_RECOVERY

Request Type-C layer to transition to Error Recovery State.

enumerator REQUEST_TC_END

End of Type-C requests.

enumerator REQUEST_PE_DR_SWAP

Request Policy Engine layer to perform a Data Role Swap.

enumerator REQUEST_PE_HARD_RESET_SEND

Request Policy Engine layer to send a hard reset.

enumerator REQUEST_PE_SOFT_RESET_SEND

Request Policy Engine layer to send a soft reset.

enumerator REQUEST_PE_GET_SRC_CAPS

Request Policy Engine layer to get Source Capabilities from port partner.

enumerator REQUEST_GET_SNK_CAPS

Request Policy Engine to get Sink Capabilities from port partner.

enumerator REQUEST_PE_GOTO_MIN

Request Policy Engine to request the port partner to source minimum power.

enum usbc_policy_notify_t

Device Policy Manager notifications.

Values:

enumerator MSG_ACCEPT_RECEIVED

Power Delivery Accept message was received.

enumerator MSG_REJECTED_RECEIVED

Power Delivery Reject message was received.

enumerator MSG_DISCARDED

Power Delivery discarded the message being transmitted.

enumerator MSG_NOT_SUPPORTED_RECEIVED

Power Delivery Not Supported message was received.

enumerator DATA_ROLE_IS_UFP

Data Role has been set to Upstream Facing Port (UFP)

enumerator DATA_ROLE_IS_DFP

Data Role has been set to Downstream Facing Port (DFP)

enumerator PD_CONNECTED

A PD Explicit Contract is in place.

enumerator NOT_PD_CONNECTED

No PD Explicit Contract is in place.

enumerator TRANSITION_PS

Transition the Power Supply.

enumerator PORT_PARTNER_NOT_RESPONSIVE

Port partner is not responsive.

enumerator PROTOCOL_ERROR

Protocol Error occurred.

enumerator SNK_TRANSITION_TO_DEFAULT

Transition the Sink to default.

enumerator HARD_RESET_RECEIVED

Hard Reset Received.

enumerator POWER_CHANGE_0A0

Sink SubPower state at 0V.

enumerator POWER_CHANGE_DEF

Sink SubPower state a 5V / 500mA.

enumerator POWER_CHANGE_1A5
Sink SubPower state a 5V / 1.5A.

enumerator POWER_CHANGE_3A0
Sink SubPower state a 5V / 3A.

enumerator SENDER_RESPONSE_TIMEOUT
Sender Response Timeout.

enumerator SOURCE_CAPABILITIES_RECEIVED
Source Capabilities Received.

enum usbc_policy_check_t
Device Policy Manager checks.
Values:

enumerator CHECK_POWER_ROLE_SWAP
Check if Power Role Swap is allowed.

enumerator CHECK_DATA_ROLE_SWAP_TO_DFP
Check if Data Role Swap to DFP is allowed.

enumerator CHECK_DATA_ROLE_SWAP_TO_UFP
Check if Data Role Swap to UFP is allowed.

enumerator CHECK_SNK_AT_DEFAULT_LEVEL
Check if Sink is at default level.

enumerator CHECK_VCONN_CONTROL
Check if should control VCONN.

enumerator CHECK_SRC_PS_AT_DEFAULT_LEVEL
Check if Source Power Supply is at default level.

enum usbc_policy_wait_t
Device Policy Manager Wait message notifications.
Values:

enumerator WAIT_SINK_REQUEST
The port partner is unable to meet the sink request at this time.

enumerator WAIT_POWER_ROLE_SWAP
The port partner is unable to do a Power Role Swap at this time.

enumerator WAIT_DATA_ROLE_SWAP
The port partner is unable to do a Data Role Swap at this time.

enumerator WAIT_VCONN_SWAP
The port partner is unable to do a VCONN Swap at this time.

enum usbc_snk_req_reply_t
Device Policy Manager's response to a Sink Request.

Values:

enumerator SNK_REQUEST_VALID
The sink port partner's request can be met.

enumerator SNK_REQUEST_REJECT
The sink port partner's request can not be met.

enumerator SNK_REQUEST_WAIT
The sink port partner's request can be met at a later time.

Functions

int usbc_start(const struct *device* *dev)
Start the USB-C Subsystem.

Parameters

- dev – Runtime device structure

Return values
0 – on success

int usbc_suspend(const struct *device* *dev)
Suspend the USB-C Subsystem.

Parameters

- dev – Runtime device structure

Return values
0 – on success

int usbc_request(const struct *device* *dev, const enum *usbc_policy_request_t* req)
Make a request of the USB-C Subsystem.

Parameters

- dev – Runtime device structure
- req – request

Return values
0 – on success

void usbc_bypass_next_sleep(const struct *device* *dev)

void usbc_set_dpm_data(const struct *device* *dev, void *dpm_data)
Set pointer to Device Policy Manager (DPM) data.

Parameters

- dev – Runtime device structure
- dpm_data – pointer to dpm data

void *usbc_get_dpm_data(const struct *device* *dev)

Get pointer to Device Policy Manager (DPM) data.

Parameters

- dev – Runtime device structure

Return values

- pointer – to dpm data that was set with usbc_set_dpm_data
- NULL – if dpm data was not set

void usbc_set_vconn_control_cb(const struct *device* *dev, const *tcpc_vconn_control_cb_t* cb)

Set the callback used to set VCONN control.

Parameters

- dev – Runtime device structure
- cb – VCONN control callback

void usbc_set_vconn_discharge_cb(const struct *device* *dev, const *tcpc_vconn_discharge_cb_t* cb)

Set the callback used to discharge VCONN.

Parameters

- dev – Runtime device structure
- cb – VCONN discharge callback

void usbc_set_policy_cb_check(const struct *device* *dev, const *policy_cb_check_t* cb)

Set the callback used to check a policy.

Parameters

- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_notify(const struct *device* *dev, const *policy_cb_notify_t* cb)

Set the callback used to notify Device Policy Manager of a policy change.

Parameters

- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_wait_notify(const struct *device* *dev, const *policy_cb_wait_notify_t* cb)

Set the callback used to notify Device Policy Manager of WAIT message reception.

Parameters

- dev – Runtime device structure
- cb – callback

void usbc_set_policy_cb_get_snk_cap(const struct *device* *dev, const *policy_cb_get_snk_cap_t* cb)

Set the callback used to get the Sink Capabilities.

Parameters

- dev – Runtime device structure
- cb – callback

void **usbc_set_policy_cb_set_src_cap**(const struct *device* *dev, const *policy_cb_set_src_cap_t* cb)

Set the callback used to store the received Port Partner's Source Capabilities.

Parameters

- **dev** – Runtime device structure
- **cb** – callback

void **usbc_set_policy_cb_get_rdo**(const struct *device* *dev, const *policy_cb_get_rdo_t* cb)

Set the callback used to get the Request Data Object (RDO)

Parameters

- **dev** – Runtime device structure
- **cb** – callback

void **usbc_set_policy_cb_is_snk_at_default**(const struct *device* *dev, const *policy_cb_is_snk_at_default_t* cb)

Set the callback used to check if the sink power supply is at the default level.

Parameters

- **dev** – Runtime device structure
- **cb** – callback

void **usbc_set_policy_cb_get_src_rp**(const struct *device* *dev, const *policy_cb_get_src_rp_t* cb)

Set the callback used to get the Rp value that should be placed on the CC lines.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_src_en**(const struct *device* *dev, const *policy_cb_src_en_t* cb)

Set the callback used to enable VBUS.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_get_src_caps**(const struct *device* *dev, const *policy_cb_get_src_caps_t* cb)

Set the callback used to get the Source Capabilities from the Device Policy Manager.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_check_sink_request**(const struct *device* *dev, const *policy_cb_check_sink_request_t* cb)

Set the callback used to check if Sink request is valid.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_is_ps_ready**(const struct *device* *dev, const *policy_cb_is_ps_ready_t* cb)

Set the callback used to check if Source Power Supply is ready.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_present_contract_is_valid**(const struct *device* *dev, const *policy_cb_present_contract_is_valid_t* cb)

Set the callback to check if present Contract is still valid.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_change_src_caps**(const struct *device* *dev, const *policy_cb_change_src_caps_t* cb)

Set the callback used to request that a different set of Source Caps be sent to the Sink.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

void **usbc_set_policy_cb_set_port_partner_snk_cap**(const struct *device* *dev, const *policy_cb_set_port_partner_snk_cap_t* cb)

Set the callback used to store the Capabilities received from a Sink Port Partner.

Parameters

- **dev** – USB-C Connector Instance
- **cb** – callback

SINK callback reference

group **sink_callbacks**

Typedefs

typedef int (***policy_cb_get_snk_cap_t**)(const struct *device* *dev, uint32_t **pdos, int *num_pdos)

Callback type used to get the Sink Capabilities.

Param dev
USB-C Connector Instance

Param pdos
pointer where pdos are stored

Param num_pdos
pointer where number of pdos is stored

Return
0 on success

typedef void (*`policy_cb_set_src_cap_t`)(const struct *device* *dev, const uint32_t *pdos, const int num_pdos)

Callback type used to report the received Port Partner's Source Capabilities.

Param dev
USB-C Connector Instance

Param pdos
pointer to the partner's source pdos

Param num_pdos
number of source pdos

typedef bool (*`policy_cb_check_t`)(const struct *device* *dev, const enum *usbc_policy_check_t* policy_check)

Callback type used to check a policy.

Param dev
USB-C Connector Instance

Param policy_check
policy to check

Return
true if policy is currently allowed by the device policy manager

typedef bool (*`policy_cb_wait_notify_t`)(const struct *device* *dev, const enum *usbc_policy_wait_t* wait_notify)

Callback type used to notify Device Policy Manager of WAIT message reception.

Param dev
USB-C Connector Instance

Param wait_notify
wait notification

Return
return true if the PE should wait and resend the message

typedef void (*`policy_cb_notify_t`)(const struct *device* *dev, const enum *usbc_policy_notify_t* policy_notify)

Callback type used to notify Device Policy Manager of a policy change.

Param dev
USB-C Connector Instance

Param policy_notify
policy notification

typedef uint32_t (*`policy_cb_get_rdo_t`)(const struct *device* *dev)

Callback type used to get the Request Data Object (RDO)

Param dev
USB-C Connector Instance

Return
RDO

typedef bool (*`policy_cb_is_snk_at_default_t`)(const struct *device* *dev)

Callback type used to check if the sink power supply is at the default level.

Param dev
USB-C Connector Instance

Return
true if power supply is at default level

SOURCE callback reference

group `source_callbacks`

Typedefs

typedef int (*`policy_cb_get_src_caps_t`)(const struct *device* *dev, const uint32_t **pdos, uint32_t *num_pdos)

Callback type used to get the Source Capabilities from the Device Policy Manager.

Param dev
USB-C Connector Instance

Param pdos
pointer to source capability pdos

Param num_pdos
pointer to number of source capability pdos

Return
0 on success

typedef enum *usbc_snk_req_reply_t* (*`policy_cb_check_sink_request_t`)(const struct *device* *dev, const uint32_t request_msg)

Callback type used to check if Sink request is valid.

Param dev
USB-C Connector Instance

Param request_msg
request message to check

Return
sink request reply

typedef bool (*`policy_cb_is_ps_ready_t`)(const struct *device* *dev)

Callback type used to check if Source Power Supply is ready.

Param dev
USB-C Connector Instance

Return
true if power supply is ready, else false

typedef bool (*`policy_cb_present_contract_is_valid_t`)(const struct *device* *dev, const uint32_t present_contract)

Callback type used to check if present Contract is still valid.

Param dev
USB-C Connector Instance

Param present_contract
present contract

Return
true if present contract is still valid

typedef bool (*`policy_cb_change_src_caps_t`)(const struct *device* *dev)

Callback type used to request that a different set of Source Caps be sent to the Sink.

Param dev
USB-C Connector Instance

Return
true if a different set of Source Caps is available

typedef void (*`policy_cb_set_port_partner_snk_cap_t`)(const struct *device* *dev, const uint32_t *pdos, const int num_pdos)

Callback type used to report the Capabilities received from a Sink Port Partner.

Param dev
USB-C Connector Instance

Param pdos
pointer to sink cap pdos

Param num_pdos
number of sink cap pdos

typedef int (*`policy_cb_get_src_rp_t`)(const struct *device* *dev, enum *tc_rp_value* *rp)

Callback type used to get the Rp value that should be placed on the CC lines.

Param dev
USB-C Connector Instance

Param rp
rp value

Return
0 on success

typedef int (*`policy_cb_src_en_t`)(const struct *device* *dev, bool en)

Callback type used to enable VBUS.

Param dev
USB-C Connector Instance

Param en
true if VBUS should be enabled, else false to disable it

Return
0 on success

: HID Physical Maximum item tag.

HID_ITEM_TAG_UNIT_EXPONENT
: HID Unit Exponent item tag.

HID_ITEM_TAG_UNIT
: HID Unit item tag.

HID_ITEM_TAG_REPORT_SIZE
: HID Report Size item tag.

HID_ITEM_TAG_REPORT_ID
: HID Report ID item tag.

HID_ITEM_TAG_REPORT_COUNT
: HID Report count item tag.

HID_ITEM_TAG_USAGE
: HID Usage item tag.

HID_ITEM_TAG_USAGE_MIN
: HID Usage Minimum item tag.

HID_ITEM_TAG_USAGE_MAX
: HID Usage Maximum item tag.

HID_COLLECTION_PHYSICAL
: Physical collection type.

HID_COLLECTION_APPLICATION
: Application collection type.

HID_COLLECTION_LOGICAL
: Logical collection type.

HID_COLLECTION_REPORT
: Report collection type.

HID_COLLECTION_NAMED_ARRAY
: Named Array collection type.

HID_COLLECTION_USAGE_SWITCH
: Usage Switch collection type.

HID_COLLECTION_MODIFIER
: Modifier collection type.

HID_USAGE_GEN_DESKTOP
: HID Generic Desktop Controls Usage page.

HID_USAGE_GEN_KEYBOARD
: HID Keyboard Usage page.

HID_USAGE_GEN_LEDS
: HID LEDs Usage page.

HID_USAGE_GEN_BUTTON
: HID Button Usage page.

HID_USAGE_GEN_DESKTOP_UNDEFINED
: HID Generic Desktop Undefined Usage ID.

HID_USAGE_GEN_DESKTOP_POINTER
: HID Generic Desktop Pointer Usage ID.

HID_USAGE_GEN_DESKTOP_MOUSE
: HID Generic Desktop Mouse Usage ID.

HID_USAGE_GEN_DESKTOP_JOYSTICK
: HID Generic Desktop Joystick Usage ID.

HID_USAGE_GEN_DESKTOP_GAMEPAD
: HID Generic Desktop Gamepad Usage ID.

HID_USAGE_GEN_DESKTOP_KEYBOARD
: HID Generic Desktop Keyboard Usage ID.

HID_USAGE_GEN_DESKTOP_KEYPAD
: HID Generic Desktop Keypad Usage ID.

HID_USAGE_GEN_DESKTOP_X
: HID Generic Desktop X Usage ID.

HID_USAGE_GEN_DESKTOP_Y
: HID Generic Desktop Y Usage ID.

HID_USAGE_GEN_DESKTOP_WHEEL
: HID Generic Desktop Wheel Usage ID.

HID items reference

group usb_hid_items

Defines

HID_ITEM(bTag, bType, bSize)
: Define HID short item.

  Parameters

  - bTag – Item tag
  - bType – Item type
  - bSize – Item data size

Returns
HID Input item

`HID_INPUT(a)`

Define HID Input item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- **a** – Input item data

Returns
HID Input item

`HID_OUTPUT(a)`

Define HID Output item with the data length of one byte.

For usage examples, see *HID_KEYBOARD_REPORT_DESC()*

Parameters

- **a** – Output item data

Returns
HID Output item

`HID_FEATURE(a)`

Define HID Feature item with the data length of one byte.

Parameters

- **a** – Feature item data

Returns
HID Feature item

`HID_COLLECTION(a)`

Define HID Collection item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- **a** – Collection item data

Returns
HID Collection item

`HID_END_COLLECTION`

Define HID End Collection (non-data) item.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Returns
HID End Collection item

`HID_USAGE_PAGE(page)`

Define HID Usage Page item.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- **page** – Usage Page

Returns
HID Usage Page item

`HID_LOGICAL_MIN8`(a)

Define HID Logical Minimum item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- `a` – Minimum value in logical units

Returns
HID Logical Minimum item

`HID_LOGICAL_MAX8`(a)

Define HID Logical Maximum item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- `a` – Maximum value in logical units

Returns
HID Logical Maximum item

`HID_LOGICAL_MIN16`(a, b)

Define HID Logical Minimum item with the data length of two bytes.

Parameters

- `a` – Minimum value lower byte
- `b` – Minimum value higher byte

Returns
HID Logical Minimum item

`HID_LOGICAL_MAX16`(a, b)

Define HID Logical Maximum item with the data length of two bytes.

Parameters

- `a` – Minimum value lower byte
- `b` – Minimum value higher byte

Returns
HID Logical Maximum item

`HID_LOGICAL_MIN32`(a, b, c, d)

Define HID Logical Minimum item with the data length of four bytes.

Parameters

- `a` – Minimum value lower byte
- `b` – Minimum value low middle byte
- `c` – Minimum value high middle byte
- `d` – Minimum value higher byte

Returns
HID Logical Minimum item

HID_LOGICAL_MAX32(a, b, c, d)

Define HID Logical Maximum item with the data length of four bytes.

Parameters

- a – Minimum value lower byte
- b – Minimum value low middle byte
- c – Minimum value high middle byte
- d – Minimum value higher byte

Returns
HID Logical Maximum item

HID_REPORT_SIZE(size)

Define HID Report Size item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- size – Report field size in bits

Returns
HID Report Size item

HID_REPORT_ID(id)

Define HID Report ID item with the data length of one byte.

Parameters

- id – Report ID

Returns
HID Report ID item

HID_REPORT_COUNT(count)

Define HID Report Count item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- count – Number of data fields included in the report

Returns
HID Report Count item

HID_USAGE(idx)

Define HID Usage Index item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- idx – Number of data fields included in the report

Returns
HID Usage Index item

HID_USAGE_MIN8(a)

Define HID Usage Minimum item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- a – Starting Usage

Returns
HID Usage Minimum item

HID_USAGE_MAX8(a)

Define HID Usage Maximum item with the data length of one byte.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- a – Ending Usage

Returns
HID Usage Maximum item

HID_USAGE_MIN16(a, b)

Define HID Usage Minimum item with the data length of two bytes.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- a – Starting Usage lower byte
- b – Starting Usage higher byte

Returns
HID Usage Minimum item

HID_USAGE_MAX16(a, b)

Define HID Usage Maximum item with the data length of two bytes.

For usage examples, see *HID_MOUSE_REPORT_DESC()*, *HID_KEYBOARD_REPORT_DESC()*

Parameters

- a – Ending Usage lower byte
- b – Ending Usage higher byte

Returns
HID Usage Maximum item

HID Mouse and Keyboard report descriptors

The pre-defined Mouse and Keyboard report descriptors can be used by a HID device implementation or simply as examples.

group usb_hid_mk_report_desc

Defines

HID_MOUSE_REPORT_DESC(bcnt)

Simple HID mouse report descriptor for n button mouse.

Parameters

- bcnt – Button count. Allowed values from 1 to 8.

HID_KEYBOARD_REPORT_DESC()
Simple HID keyboard report descriptor.

Enums

enum hid_kbd_code
HID keyboard button codes.
Values:

Hardware Support

7.1 Architecture-related Guides

7.1.1 Zephyr support status on ARC processors

Overview

This page describes current state of Zephyr for ARC processors and some future plans. Please note that

- plans are given without exact deadlines
- software features require corresponding hardware to be present and configured the proper way
- not all the features can be enabled at the same time

Support status

Legend: **Y** - yes, supported; **N** - no, not supported; **WIP** - Work In Progress; **TBD** - to be decided

	Processor families				
	EM	**HS3x/4x**	**VPX**	**HS5x**	**HS6x**
Port status	up-streamed	up-streamed	up-streamed	up-streamed	up-streamed
Features					
Closely coupled memories (ICCM, DCCM)[1]	Y	Y	Y	TBD	TBD
Execution with caches - Instruction/Data, L1/L2 caches	Y	Y	Y	Y	Y
Hardware-assisted unaligned memory access	Y[2]	Y	Y	Y	Y
Regular interrupts with multiple priority levels, direct interrupts	Y	Y	Y	Y	Y
Fast interrupts, separate register banks for fast interrupts	Y	Y	TBD	N	N
Hardware floating point unit (FPU)	Y	Y	TBD[6]	TBD	TBD
Symmetric multiprocessing (SMP) support, switch-based	N/A	Y	TBD	Y	Y
Hardware-assisted stack checking	Y	Y	Y	N	N
Hardware-assisted atomic operations	N/A	Y	Y	Y	Y
DSP ISA	Y	N[3]	TBD[6]	TBD	TBD
DSP AGU/XY extensions	Y	N[3]	N/A	TBD	TBD
Userspace	Y	Y	N	TBD	TBD
Memory protection unit (MPU)	Y	Y	TBD	N	N
Memory management unit (MMU)	N/A	N	TBD	N	N
SecureShield	Y	N/A	N/A	N/A	N/A
Single-thread kernel support[5]	Y	Y	Y	Y	Y

Notes

7.1.2 Arm Cortex-M Developer Guide

Overview

This page contains detailed information about the status of the Arm Cortex-M architecture porting in the Zephyr RTOS and describes key aspects when developing Zephyr applications for Arm Cortex-M-based platforms.

[6] currently only ARC VPX scalar port is supported. The support of VPX vector pipeline, VCCM, STU is not included in this port, and require additional development and / or other runtime integration.
[1] usage of CCMs is limited on SMP systems
[2] except the systems with secure features (SecureShield) due to HW limitation
[3] We only support save/restore ACCL/ACCH registers in task's context. Rest of DSP/AGU registers save/restore isn't implemented but kernel itself does not use these registers. This allows single task per core to use DSP/AGU safely.
[5] Single-thread kernel is support only for single core targets
[4] QEMU doesn't support all the ARC processor's HW features. For the detailed info please check the ARC QEMU documentation

Key supported features

The table below summarizes the status of key OS features in the different Arm Cortex-M implementation variants.

		Processor families							
Architecture variant		Arm v6-M		Arm v7-M			Arm v8-M		Arm v8.1-M
		M0/M	**M0+**	**M3**	**M4**	**M7**	**M23**	**M33**	**M55**
OS Features									
Programmable fault IRQ priorities		Y	N	Y	Y	Y	N	Y	Y
Single-thread kernel support		Y	Y	Y	Y	Y	Y	Y	Y
Thread local storage support		Y	Y	Y	Y	Y	Y	Y	Y
Interrupt handling									
	Regular interrupts	Y	Y	Y	Y	Y	Y	Y	Y
	Dynamic interrupts	Y	Y	Y	Y	Y	Y	Y	Y
	Direct interrupts	Y	Y	Y	Y	Y	Y	Y	Y
	Zero Latency interrupts	N	N	Y	Y	Y	Y	Y	Y
CPU idling		Y	Y	Y	Y	Y	Y	Y	Y
Native system timer (SysTick)		N[1]	Y	Y	Y	Y	Y	Y	Y
Memory protection									
	User mode	N	Y	Y	Y	Y	Y	Y	Y
	HW stack protection (MPU)	N	N	Y	Y	Y	Y	Y	Y
	HW-assisted stack limit checking	N	N	N	N	N	Y[2]	Y	Y
HW-assisted null-pointer dereference detection		N	N	Y	Y	Y	Y	Y	Y
HW-assisted atomic operations		N	N	Y	Y	Y	N	Y	Y
Support for non-cacheable regions		N	N	Y	Y	Y	N	Y	Y
Execute SRAM functions		N	N	Y	Y	Y	N	Y	Y
Floating Point Services		N	N	N	Y	Y	N	Y	Y
DSP ISA		N	N	N	Y	Y	N	Y	Y
Trusted-Execution									
	Native TrustZone-M support	N	N	N	N	N	Y	Y	Y
	TF-M integration	N	N	N	N	N	N	Y	N
Code relocation		Y	Y	Y	Y	Y	Y	Y	Y
SW-based vector table relaying		Y	Y	Y	Y	Y	Y	Y	Y
HW-assisted timing functions		N	N	Y	Y	Y	N	Y	Y

Notes

OS features

Threads

Thread stack alignment Each Zephyr thread is defined with its own stack memory. By default, Cortex-M enforces a double word thread stack alignment, see CONFIG_STACK_ALIGN_DOUBLE_WORD. If MPU-based HW-assisted stack overflow detection (CONFIG_MPU_STACK_GUARD) is enabled, thread stacks need to be aligned with a larger value, reflected by CONFIG_ARM_MPU_REGION_MIN_ALIGN_AND_SIZE. In Arm v6-M and Arm v7-M architecture variants, thread stacks are additionally required to align with a value equal to their size, in applications that need to support user mode (CONFIG_USERSPACE). The thread stack sizes in that case need to be a power of two. This is all reflected by CONFIG_MPU_REQUIRES_POWER_OF_TWO_ALIGNMENT, that is enforced in Arm v6-M and Arm v7-M builds with user mode support.

Stack pointers While executing in thread mode the processor is using the Process Stack Pointer (PSP). The processor uses the Main Stack Pointer (MSP) while executing in handler mode, that is, while servicing exceptions and HW interrupts. Using PSP in thread mode *facilitates thread stack pointer manipulation* during thread context switching, without affecting the current execution context flow in handler mode.

In Arm Cortex-M builds a single interrupt stack memory is shared among exceptions and interrupts. The size of the interrupt stack needs to be selected taking into consideration nested interrupts, each pushing an additional stack frame. Developers can modify the interrupt stack size using CONFIG_ISR_STACK_SIZE.

The interrupt stack is also used during early boot so the kernel can initialize the main thread's stack before switching to the main thread.

Thread context switching In Arm Cortex-M builds, the PendSV exception is used in order to trigger a context switch to a different thread. PendSV exception is always present in Cortex-M implementations. PendSV is configured with the lowest possible interrupt priority level, in all Cortex-M variants. The main reasons for that design are

- to utilize the tail chaining feature of Cortex-M processors, and thus limit the number of context switch operations that occur.
- to not impact the interrupt latency observed by HW interrupts.

As a result, context switch in Cortex-M is non-atomic, i.e. it may be *preempted* by HW interrupts, however, a context-switch operation must be completed before a new thread context-switch may start.

Typically a thread context-switch will perform the following operations

- When switching-out the current thread, the processor stores
  - the callee-saved registers (R4 - R11) in the thread's container for callee-saved registers, which is located in kernel memory
  - the thread's current operation *mode*
    - user or privileged execution mode
    - presence of an active floating point context

[1] SysTick is optional in Cortex-M1
[2] Stack limit checking only in Secure builds in Cortex-M23

    * the EXC_RETURN value of the current handler context (PendSV)
  - the floating point callee-saved registers (S16 - S31) in the thread's container for FP callee-saved registers, if the current thread has an active FP context
  - the PSP of the current thread which points to the beginning of the current thread's exception stack frame. The latter contains the caller-saved context and the return address of the switched-out thread.
- When switching-in a new thread the processor
  - restores the new thread's callee-saved registers from the thread's container for callee-saved registers
  - restores the new thread's operation *mode*
  - restores the FP callee-saved registers if the switched-in thread had an active FP context before being switched-out
  - re-programs the dynamic MPU regions to allow a user thread access its stack and application memories, and/or programs a stack-overflow MPU guard at the bottom of the thread's privileged stack
  - restores the PSP for the incoming thread and re-programs the stack pointer limit register (if applicable, see `CONFIG_BUILTIN_STACK_GUARD`)
  - optionally does a stack limit checking for the switched-in thread, if sentinel-based stack limit checking is enabled (see `CONFIG_STACK_SENTINEL`).

PendSV exception return sequence restores the new thread's caller-saved registers and the return address, as part of unstacking the exception stack frame.

The implementation of the context-switch mechanism is present in `arch/arm/core/cortex_m/swap_helper.S`.

Stack limit checking (Arm v8-M) Armv8-M and Armv8.1-M variants support stack limit checking using the MSPLIM and PSPLIM core registers. The feature is enabled when `CONFIG_BUILTIN_STACK_GUARD` is set. When stack limit checking is enabled, both the thread's privileged or user stack, as well as the interrupt stack are guarded by PSPLIM and MSPLIM registers, respectively. MSPLIM is configured *once* during kernel boot, while PSLIM is re-programmed during every thread context-switch or during system calls, when the thread switches from using its default stack to using its privileged stack, and vice versa. PSPLIM re-programming

- has a relatively low runtime overhead (programming is done with MSR instructions)
- does not impact interrupt latency
- does not require any memory areas to be reserved for stack guards
- does not make use of MPU regions

It is, therefore, considered as a lightweight but very efficient stack overflow detection mechanism in Cortex-M applications.

Stack overflows trigger the dedicated UsageFault exception provided by Arm v8-M.

Interrupt handling features This section describes certain aspects around exception and interrupt handling in Arm Cortex-M.

Interrupt priority levels The number of available (configurable) interrupt priority levels is determined by the number of implemented interrupt priority bits in NVIC; this needs to be described for each Cortex-M platform using DeviceTree:

```
&nvic {
        arm,num-irq-priority-bits = <#priority-bits>;
};
```

Reserved priority levels A number of interrupt priority levels are reserved for the OS.

By design, system fault exceptions have the highest priority level. In *Baseline* Cortex-M, this is actually enforced by hardware, as HardFault is the only available processor fault exception, and its priority is higher than any configurable exception priority.

In *Mainline* Cortex-M, the available fault exceptions (e.g. MemManage-Fault, UsageFault, etc.) are assigned the highest *configurable* priority level. (`CONFIG_CPU_CORTEX_M_HAS_PROGRAMMABLE_FAULT_PRIOS` signifies explicitly that the Cortex-M implementation supports configurable fault priorities.)

This priority level is never shared with HW interrupts (an exception to this rule is described below). As a result, processor faults occurring in regular ISRs will be handled by the corresponding fault handler and will not escalate to a HardFault, *similar to processor faults occurring in thread mode*.

SVC exception is normally configured with the highest configurable priority level (an exception to this rule will be described below). SVCs are used by the Zephyr kernel to dispatch system calls, trigger runtime system errors (e.g. Kernel oops or panic), or implement IRQ offloading.

In Baseline Cortex-M the priority level of SVC may be shared with other exceptions or HW interrupts that are also given the highest configurable priority level (As a result of this, kernel runtime errors during interrupt handling will escalate to HardFault. Additional logic in the fault handling routines ensures that such runtime errors are detected successfully).

In Mainline Cortex-M, however, the SVC priority level is *reserved*, thus normally it is only shared with the fault exceptions of configurable priority. This simplifies the fault handling routines in Mainline Cortex-M architecture, since runtime kernel errors are serviced by the SVC handler (i.e no HardFault escalation, even if the kernel errors occur in ISR context).

HW interrupts in Mainline Cortex-M builds are allocated a priority level lower than the SVC.

One exception to the above rules is when Zephyr applications support Zero Latency Interrupts (ZLIs). Such interrupts are designed to have a priority level higher than any HW or system interrupt. If the ZLI feature is enabled in Mainline Cortex-M builds (see `CONFIG_ZERO_LATENCY_IRQS`), then

- ZLIs are assigned the highest configurable priority level
- SVCs are assigned the second highest configurable priority level
- Regular HW interrupts are assigned priority levels lower than SVC.

The priority level configuration in Cortex-M is implemented in `include/zephyr/arch/arm/cortex_m/exception.h`.

Locking and unlocking IRQs In Baseline Cortex-M locking interrupts is implemented using the PRIMASK register.

```
arch_irq_lock()
```

will set the PRIMASK register to 1, eventually, masking all IRQs with configurable priority. While this fulfils the OS requirement of locking interrupts, the consequence is that kernel runtime errors (triggering SVCs) will escalate to HardFault.

In Mainline Cortex-M locking interrupts is implemented using the BASEPRI register (Mainline Cortex-M builds select `CONFIG_CPU_CORTEX_M_HAS_BASEPRI` to signify that BASEPRI register is im-

plemented.). By modifying BASEPRI (or BASEPRI_MAX) arch_irq_lock() masks all system and HW interrupts with the exception of

- SVCs
- processor faults
- ZLIs

This allows zero latency interrupts to be triggered inside OS critical sections. Additionally, this allows system (processor and kernel) faults to be handled by Zephyr in *exactly the same way*, regardless of whether IRQs have been locked or not when the error occurs. It also allows for system calls to be dispatched while IRQs are locked.

Note

Mainline Cortex-M fault handling is designed and configured in a way that all processor and kernel faults are handled by the corresponding exception handlers and never result in HardFault escalation. In other words, a HardFault may only occur in Zephyr applications that have modified the default fault handling configurations. The main reason for this design was to reserve the HardFault exception for handling exceptional error conditions in safety critical applications.

Dynamic direct interrupts Cortex-M builds support the installation of direct interrupt service routines during runtime. Direct interrupts are designed for performance-critical interrupt handling and do not go through all of the common Zephyr interrupt handling code.

Direct dynamic interrupts are enabled via switching on `CONFIG_DYNAMIC_DIRECT_INTERRUPTS`.

Note that enabling direct dynamic interrupts requires enabling support for dynamic interrupts in the kernel, as well (see `CONFIG_DYNAMIC_INTERRUPTS`).

Zero Latency interrupts As described above, in Mainline Cortex-M applications, the Zephyr kernel reserves the highest configurable interrupt priority level for its own use (SVC). SVCs will not be masked by interrupt locking. Zero-latency interrupt can be used to set up an interrupt at the highest interrupt priority which will not be blocked by interrupt locking. To use the ZLI feature `CONFIG_ZERO_LATENCY_IRQS` needs to be enabled.

Zero latency IRQs have minimal interrupt latency, as they will always preempt regular HW or system interrupts.

Note, however, that since ZLI ISRs will run at a priority level higher than the kernel exceptions they **cannot use** any kernel functionality. Additionally, since the ZLI interrupt priority level is equal to processor fault priority level, faults occurring in ZLI ISRs will escalate to HardFault and will not be handled in the same way as regular processor faults. Developers need to be aware of this limitation.

CPU Idling The Cortex-M architecture port implements both k_cpu_idle() and k_cpu_atomic_idle(). The implementation is present in `arch/arm/core/cortex_m/cpu_idle.c`.

In both implementations, the processor will attempt to put the core to low power mode. In k_cpu_idle() the processor ends up executing WFI (Wait For Interrupt) instruction, while in k_cpu_atomic_idle() the processor will execute a WFE (Wait For Event) instruction.

When using the CPU idling API in Cortex-M it is important to note the following:

- Both k_cpu_idle() and k_cpu_atomic_idle() are *assumed* to be invoked with interrupts locked. This is taken care of by the kernel if the APIs are called by the idle thread.

- After waking up from low power mode, both functions will *restore* interrupts unconditionally, that is, regardless of the interrupt lock status before the CPU idle API was called.

The Zephyr CPU Idling mechanism is detailed in *CPU Idling*.

Memory protection features This section describes certain aspects around memory protection features in Arm Cortex-M applications.

User mode system calls User mode is supported in Cortex-M platforms that implement the standard (Arm) MPU or a similar core peripheral logic for memory access policy configuration and control, such as the NXP MPU for Kinetis platforms. (Currently, `CONFIG_ARCH_HAS_USERSPACE` is selected if `CONFIG_ARM_MPU` is enabled by the user in the board default Kconfig settings).

A thread performs a system call by triggering a (synchronous) SVC exception, where

- up to 5 arguments are placed on registers R1 - R5
- system call ID is placed on register R6.

The SVC Handler will branch to the system call preparation logic, which will perform the following operations

- switch the thread's PSP to point to the beginning of the thread's privileged stack area, optionally reprogramming the PSPLIM if stack limit checking is enabled
- modify CONTROL register to switch to privileged mode
- modify the return address in the SVC exception stack frame, so that after exception return the system call dispatcher is executed (in thread privileged mode)

Once the system call execution is completed the system call dispatcher will restore the user's original PSP and PSPLIM and switch the CONTROL register back to unprivileged mode before returning back to the caller of the system call.

System calls execute in thread mode and can be preempted by interrupts at any time. A thread may also be context-switched-out while doing a system call; the system call will resume as soon as the thread is switched-in again.

The system call dispatcher executes at SVC priority, therefore it cannot be preempted by HW interrupts (with the exception of ZLIs), which may observe some additional interrupt latency if they occur during a system call preparation.

MPU-assisted stack overflow detection Cortex-M platforms with MPU may enable `CONFIG_MPU_STACK_GUARD` to enable the MPU-based stack overflow detection mechanism. The following points need to be considered when enabling the MPU stack guards

- stack overflows are triggering processor faults as soon as they occur
- the mechanism is essential for detecting stack overflows in supervisor threads, or user threads in privileged mode; stack overflows in threads in user mode will always be detected regardless of `CONFIG_MPU_STACK_GUARD` being set.
- stack overflows are always detected, however, the mechanism does not guarantee that no memory corruption occurs when supervisor threads overflow their stack memory
- `CONFIG_MPU_STACK_GUARD` will normally reserve one MPU region for programming the stack guard (in certain Arm v8-M configurations with `CONFIG_MPU_GAP_FILLING` enabled 2 MPU regions are required to implement the guard feature)
- MPU guards are re-programmed at every context-switch, adding a small overhead to the thread swap routine. Compared, however, to the `CONFIG_BUILTIN_STACK_GUARD` feature, no re-programming occurs during system calls.

- When CONFIG_HW_STACK_PROTECTION is enabled on Arm v8-M platforms the native stack limit checking mechanism is used by default instead of the MPU-based stack overflow detection mechanism; users may override this setting by manually enabling CONFIG_MPU_STACK_GUARD in these scenarios.

Memory map and MPU considerations

Fixed MPU regions By default, when CONFIG_ARM_MPU is enabled a set of *fixed* MPU regions are programmed during system boot.

- One MPU region programs the entire flash area as read-execute. User can override this setting by enabling CONFIG_MPU_ALLOW_FLASH_WRITE, which programs the flash with RWX permissions. If CONFIG_USERSPACE is enabled unprivileged access on the entire flash area is allowed.
- One MPU region programs the entire SRAM area with privileged-only RW permissions. That is, an MPU region is utilized to disallow execute permissions on SRAM. (An exception to this setting is when CONFIG_MPU_GAP_FILLING is disabled (Arm v8-M only); in that case no SRAM MPU programming is done so the access is determined by the default Arm memory map policies, allowing for privileged-only RWX permissions on SRAM).
- All the memory regions defined in the devicetree with the property zephyr,memory-attr defining the MPU permissions for the memory region. See the next section for more details.

The above MPU regions are defined in arch/arm/core/mpu/arm_mpu_regions.c. Alternative MPU configurations are allowed by enabling CONFIG_CPU_HAS_CUSTOM_FIXED_SOC_MPU_REGIONS. When enabled, this option signifies that the Cortex-M SoC will define and configure its own fixed MPU regions in the SoC definition.

Fixed MPU regions defined in devicetree When the property zephyr,memory-attr is present in a memory node, a new MPU region will be allocated and programmed during system boot. When used with the zephyr,memory-region devicetree compatible, it will result in a linker section being generated associated to that MPU region.

For example, to define a new non-cacheable memory region in devicetree:

```
sram_no_cache: memory@20300000 {
     compatible = "zephyr,memory-region", "mmio-sram";
     reg = <0x20300000 0x100000>;
     zephyr,memory-region = "SRAM_NO_CACHE";
     zephyr,memory-attr = <( DT_MEM_ARM(ATTR_MPU_RAM_NOCACHE) )>;
};
```

This will automatically create a new MPU entry in with the correct name, base, size and attributes gathered directly from the devicetree.

Static MPU regions Additional *static* MPU regions may be programmed once during system boot. These regions are required to enable certain features

- a RX region to allow execution from SRAM, when CONFIG_ARCH_HAS_RAMFUNC_SUPPORT is enabled and users have defined functions to execute from SRAM.
- a RX region for relocating text sections to SRAM, when CONFIG_CODE_DATA_RELOCATION_SRAM is enabled
- a no-cache region to allow for a none-cacheable SRAM area, when CONFIG_NOCACHE_MEMORY is enabled
- a possibly unprivileged RW region for GCOV code coverage accounting area, when CONFIG_COVERAGE_GCOV is enabled

- a no-access region to implement null pointer dereference detection, when CONFIG_NULL_POINTER_EXCEPTION_DETECTION_MPU is enabled

The boundaries of these static MPU regions are derived from symbols exposed by the linker, in include/linker/linker-defs.h.

Dynamic MPU regions Certain thread-specific MPU regions may be re-programmed dynamically, at each thread context switch:

- an unprivileged RW region for the current thread's stack area (for user threads)
- a read-only region for the MPU stack guard
- unprivileged RW regions for the partitions of the current thread's application memory domain.

Considerations The number of available MPU regions for a Cortex-M platform is a limited resource. Most platforms have 8 MPU regions, while some Cortex-M33 or Cortex-M7 platforms may have up to 16 MPU regions. Therefore there is a relatively strict limitation on how many fixed, static and dynamic MPU regions may be programmed simultaneously. For platforms with 8 available MPU regions it might not be possible to enable all the aforementioned features that require MPU region programming. In most practical applications, however, only a certain set of features is required and 8 MPU regions are, in many cases, sufficient.

In Arm v8-M processors the MPU architecture does not allow programmed MPU regions to overlap. CONFIG_MPU_GAP_FILLING controls whether the fixed MPU region covering the entire SRAM is programmed. When it does, a full SRAM area partitioning is required, in order to program the static and the dynamic MPU regions. This increases the total number of required MPU regions. When CONFIG_MPU_GAP_FILLING is not enabled the fixed MPU region covering the entire SRAM is not programmed, thus, the static and dynamic regions are simply programmed on top of the always-existing background region (full-SRAM partitioning is not required). Note, however, that the background SRAM region allows execution from SRAM, so when CONFIG_MPU_GAP_FILLING is not set Zephyr is not protected against attacks that attempt to execute malicious code from SRAM.

Floating point Services Both unshared and shared FP registers mode are supported in Cortex-M (see *Floating Point Services* for more details).

When FPU support is enabled in the build (CONFIG_FPU is enabled), the sharing FP registers mode (CONFIG_FPU_SHARING) is enabled by default. This is done as some compiler configurations may activate a floating point context by generating FP instructions for any thread, regardless of whether floating point calculations are performed, and that context must be preserved when switching such threads in and out.

The developers can still disable the FP sharing mode in their application projects, and switch to Unshared FP registers mode, if it is guaranteed that the image code does not generate FP instructions outside the single thread context that is allowed (and supposed) to do so.

Under FPU sharing mode, the callee-saved FPU registers are saved and restored in context-switch, if the corresponding threads have an active FP context. This adds some runtime overhead on the swap routine. In addition to the runtime overhead, the sharing FPU mode

- requires additional memory for each thread to save the callee-saved FP registers
- requires additional stack memory for each thread, to stack the caller-saved FP registers, upon exception entry, if an FP context is active. Note, however, that since lazy stacking is enabled, there is no runtime overhead of FP context stacking in regular interrupts (FP state preservation is only activated in the swap routine in PendSV interrupt).

Misc

Chain-loadable images Cortex-M applications may either be standalone images or chain-loadable, for instance, by a bootloader. Application images chain-loadable by bootloaders (or other applications) normally occupy a specific area in the flash denoted as their *code partition*. `CONFIG_USE_DT_CODE_PARTITION` will ensure that a Zephyr chain-loadable image will be linked into its code partition, specified in DeviceTree.

HW initialization at boot In order to boot properly, chain-loaded applications may require that the core Arm hardware registers and peripherals are initialized in their reset values. Enabling `CONFIG_INIT_ARCH_HW_AT_BOOT` Zephyr to force the initialization of the internal Cortex-M architectural state during boot to the reset values as specified by the corresponding Arm architecture manual.

Software vector relaying In Cortex-M platforms that implement the VTOR register (see `CONFIG_CPU_CORTEX_M_HAS_VTOR`), chain-loadable images relocate the Cortex-M vector table by updating the VTOR register with the offset of the image vector table.

Baseline Cortex-M platforms without VTOR register might not be able to relocate their vector table which remains at a fixed location. Therefore, a chain-loadable image will require an alternative way to route HW interrupts and system exceptions to its own vector table; this is achieved with software vector relaying.

When a bootloader image enables `CONFIG_SW_VECTOR_RELAY` it is able to relay exceptions and interrupts based on a vector table pointer that is set by the chain-loadable application. The latter sets the `CONFIG_SW_VECTOR_RELAY_CLIENT` option to instruct the boot sequence to set the vector table pointer in SRAM so that the bootloader can forward the exceptions and interrupts to the chain-loadable image's software vector table.

While this feature is intended for processors without VTOR register, it may also be used in Mainline Cortex-M platforms.

Code relocation Cortex-M support the code relocation feature. When `CONFIG_CODE_DATA_RELOCATION_SRAM` is selected, Zephyr will relocate .text, data and .bss sections from the specified files and place it in SRAM. It is possible to relocate only parts of the code sections into SRAM, without relocating the whole image text and data sections. More details on the code relocation feature can be found in *Code And Data Relocation*.

Linking Cortex-M applications

Most Cortex-M platforms make use of the default Cortex-M GCC linker script in `include/zephyr/arch/arm/cortex_m/scripts/linker.ld`, although it is possible for platforms to use a custom linker script as well.

CMSIS

Cortex-M CMSIS headers are hosted in a standalone module repository: zephyrproject-rtos/cmsis.

`CONFIG_CPU_CORTEX_M` selects `CONFIG_HAS_CMSIS_CORE` to signify that CMSIS headers are available for all supported Cortex-M variants.

Testing

A list of unit tests for the Cortex-M porting and miscellaneous features is present in `tests/arch/arm/`. The tests suites are continuously extended and new test suites are added, in an effort to increase the coverage of the Cortex-M architecture support in Zephyr.

QEMU

We use QEMU to verify the implemented features of the Cortex-M architecture port in Zephyr. Adequate coverage is achieved by defining and utilizing a list of QEMU targets, each with a specific architecture variant and Arm peripheral support list.

The table below lists the QEMU platform targets defined in Zephyr along with the corresponding Cortex-M implementation variant and the peripherals these targets emulate.

	QEMU target				
Architecture variant	Arm v6-M	Arm v7-M		Arm v8-M	Arm v8.1-M
	qemu_cortex_m	**qemu_cortex_m**	**mps2_an38**	**mps2_an52**	**mps3_an547**
Emulated features					
NVIC	Y	Y	Y	Y	Y
BASEPRI	N	Y	Y	Y	Y
SysTick	N	Y	Y	Y	Y
MPU	N	N	Y	Y	Y
FPU	N	N	N	Y	N
SPLIM	N	N	N	Y	Y
TrustZone-M	N	N	N	Y	N

Maintainers & Collaborators

The status of the Arm Cortex-M architecture port in Zephyr is: *maintained*. The updated list of maintainers and collaborators for Cortex-M can be found in `MAINTAINERS.yml`.

7.1.3 Zephyr support status on RISC-V processors

Overview

This page describes current state of Zephyr for RISC-V processors. Currently, there's support for some boards, as well as Qemu support and support for some FPGA implementations such as neorv32 and litex_vexriscv.

Zephyr support includes PMP, *user mode*, several ISA extensions as well as *semihosting*.

User mode and PMP support

When the platform has Physical Memory Protection (PMP) support, enabling it on Zephyr allows user space support and stack protection to be selected.

ISA extensions

It's possible to set in Zephyr which ISA extensions (RV32/64I(E)MAFD(G)QC) are available on a given platform, by setting the appropriate *RISCV_ISA_** kconfig. Look at `arch/riscv/Kconfig.isa` for more information.

Note that Zephyr SDK toolchain support may not be defined for all combinations.

SMP support

SMP is supported on RISC-V, but currently only on Qemu platforms. In order to test the SMP support, one can use *qemu_riscv32_smp* or *qemu_riscv64_smp* boards.

7.1.4 Semihosting Guide

Overview

Semihosting is a mechanism that enables code running on ARM and RISC-V targets to communicate and use the Input/Output facilities on a host computer that is running a debugger or emulator.

More complete documentation on the available functionality is available at the ARM Github documentation.

The RISC-V functionality borrows from the ARM definitions, as described at the RISC-V Github documentation.

File Operations

Semihosting enables files on the host computer to be opened, read, and modified by an application. This can be useful when attempting to validate the behaviour of code across datasets that are larger than what can fit into ROM of an emulated platform. File paths can be either absolute, or relative to the directory of the running process.

```
const char *path = "./data.bin";
long file_len, bytes_read, fd;
uint8_t buffer[16];

/* Open the data file for reading */
fd = semihost_open(path, SEMIHOST_OPEN_RB);
if (fd < 0) {
   return -ENOENT;
}
/* Read all data from the file */
file_len = semihost_flen(fd);
while(file_len > 0) {
   bytes_read = semihost_read(fd, buffer, MIN(file_len, sizeof(buffer)));
   if (bytes_read < 0) {
      break;
   }
   /* Process read data */
   do_data_processing(buffer, bytes_read);
   /* Update remaining length */
   file_len -= bytes_read;
}
/* Close the file */
semihost_close(fd);
```

7.1.5 Additional Functionality

Additional functionality is available by running semihosting instructions directly with *semihost_exec()* with one of the instructions defined in *semihost_instr*. For complete documentation on the required arguments and return codes, see the ARM Github documentation.

API Reference

group `semihost`

Enums

enum `semihost_instr`

Semihosting instructions.

Values:

enumerator `SEMIHOST_OPEN` = 0x01

Open a file or stream on the host system.

enumerator `SEMIHOST_ISTTY` = 0x09

Check whether a file is associated with a stream/terminal.

enumerator `SEMIHOST_WRITE` = 0x05

Write to a file or stream.

enumerator `SEMIHOST_READ` = 0x06

Read from a file at the current cursor position.

enumerator `SEMIHOST_CLOSE` = 0x02

Closes a file on the host which has been opened by SEMIHOST_OPEN.

enumerator `SEMIHOST_FLEN` = 0x0C

Get the length of a file.

enumerator `SEMIHOST_SEEK` = 0x0A

Set the file cursor to a given position in a file.

enumerator `SEMIHOST_TMPNAM` = 0x0D

Get a temporary absolute file path to create a temporary file.

enumerator `SEMIHOST_REMOVE` = 0x0E

Remove a file on the host system.

Possibly insecure!

enumerator `SEMIHOST_RENAME` = 0x0F

Rename a file on the host system.

Possibly insecure!

enumerator SEMIHOST_WRITEC = 0x03
Write one character to the debug terminal.

enumerator SEMIHOST_WRITE0 = 0x04
Write a NULL terminated string to the debug terminal.

enumerator SEMIHOST_READC = 0x07
Read one character from the debug terminal.

enumerator SEMIHOST_CLOCK = 0x10

enumerator SEMIHOST_ELAPSED = 0x30

enumerator SEMIHOST_TICKFREQ = 0x31

enumerator SEMIHOST_TIME = 0x11

enumerator SEMIHOST_ERRNO = 0x13
Retrieve the errno variable from semihosting operations.

enumerator SEMIHOST_GET_CMDLINE = 0x15
Get commandline parameters for the application to run with.

enumerator SEMIHOST_HEAPINFO = 0x16

enumerator SEMIHOST_ISERROR = 0x08

enumerator SEMIHOST_SYSTEM = 0x12

enum semihost_open_mode
Modes to open a file with.
Behaviour corresponds to equivalent fopen strings. i.e. SEMIHOST_OPEN_RB_PLUS == "rb+"
Values:

enumerator SEMIHOST_OPEN_R = 0

enumerator SEMIHOST_OPEN_RB = 1

enumerator SEMIHOST_OPEN_R_PLUS = 2

enumerator SEMIHOST_OPEN_RB_PLUS = 3

enumerator SEMIHOST_OPEN_W = 4

enumerator SEMIHOST_OPEN_WB = 5

enumerator SEMIHOST_OPEN_W_PLUS = 6

enumerator SEMIHOST_OPEN_WB_PLUS = 7

enumerator SEMIHOST_OPEN_A = 8

enumerator SEMIHOST_OPEN_AB = 9

enumerator SEMIHOST_OPEN_A_PLUS = 10

enumerator SEMIHOST_OPEN_AB_PLUS = 11

Functions

long **semihost_exec**(enum *semihost_instr* instr, void *args)

Manually execute a semihosting instruction.

Parameters

- **instr** – instruction code to run
- **args** – instruction specific arguments

Returns

integer return code of instruction

char **semihost_poll_in**(void)

Read a byte from the console.

Returns

char byte read from the console.

void **semihost_poll_out**(char c)

Write a byte to the console.

Parameters

- **c** – byte to write to console

long **semihost_open**(const char *path, long mode)

Open a file on the host system.

Parameters

- **path** – file path to open. Can be absolute or relative to current directory of the running process.
- **mode** – value from *semihost_open_mode*.

Return values

- **handle** – positive handle on success.
- **-1** – on failure.

long **semihost_close**(long fd)

Close a file.

Parameters

- **fd** – handle returned by *semihost_open*.

Return values

- `0` – on success.
- `-1` – on failure.

long `semihost_flen`(long fd)

Query the size of a file.

Parameters

- `fd` – handle returned by *semihost_open*.

Return values

- `positive` – file size on success.
- `-1` – on failure.

long `semihost_seek`(long fd, long offset)

Seeks to an absolute position in a file.

Parameters

- `fd` – handle returned by *semihost_open*.
- `offset` – offset from the start of the file in bytes.

Return values

- `0` – on success.
- `-errno` – negative error code on failure.

long `semihost_read`(long fd, void *buf, long len)

Read the contents of a file into a buffer.

Parameters

- `fd` – handle returned by *semihost_open*.
- `buf` – buffer to read data into.
- `len` – number of bytes to read.

Return values

- `read` – number of bytes read on success.
- `-errno` – negative error code on failure.

long `semihost_write`(long fd, const void *buf, long len)

Write the contents of a buffer into a file.

Parameters

- `fd` – handle returned by *semihost_open*.
- `buf` – buffer to write data from.
- `len` – number of bytes to write.

Return values

- `0` – on success.
- `-errno` – negative error code on failure.

7.1.6 x86 Developer Guide

Overview

This page contains information on certain aspects when developing for x86-based platforms.

Virtual Memory

During very early boot, page tables are loaded so technically the kernel is executing in virtual address space. By default, physical and virtual memory are identity mapped and thus giving the appearance of execution taking place in physical address space. The physical address space is marked by kconfig `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_SRAM_SIZE` while the virtual address space is marked by `CONFIG_KERNEL_VM_BASE` and `CONFIG_KERNEL_VM_SIZE`. Note that `CONFIG_SRAM_OFFSET` controls where the Zephyr kernel is being placed in the memory, and its counterpart `CONFIG_KERNEL_VM_OFFSET`.

Separate Virtual Address Space from Physical Address Space On 32-bit x86, it is possible to have separate physical and virtual address space. Code and data are linked in virtual address space, but are still loaded in physical memory. However, during boot, code and data must be available and also addressable in physical address space before `vm_enter` inside `arch/x86/core/ia32/crt0.S`. After `vm_enter`, code execution is done via virtual addresses and data can be referred via their virtual addresses. This is possible as the page table generation script (`arch/x86/gen_mmu.py`) identity maps the physical addresses at the page directory level, in addition to mapping virtual addresses to the physical memory. Later in the boot process, the entries for identity mapping at the page directory level are cleared in `z_x86_mmu_init()`, effectively removing the identity mapping of physical memory. This unmapping must be done for userspace isolation or else they would be able to access restricted memory via physical addresses. Since the identity mapping is done at the page directory level, there is no need to allocate additional space for the page table. However, additional space may still be required for additional page directory table.

There are restrictions on where virtual address space can be:

- Physical and virtual address spaces must be disjoint. This is required as the entries in page directory table will be cleared. If they are not disjoint, it would clear the entries needed for virtual addresses.
  - If `CONFIG_X86_PAE` is enabled (`=y`), each address space must reside in their own 1GB region, due to each entry of PDP (Page Directory Pointer) covers 1GB of memory. For example:
    - Assuming `CONFIG_SRAM_OFFSET` and `CONFIG_KERNEL_VM_OFFSET` are both `0x0`.
    - `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x40000000` is valid, while
    - `CONFIG_SRAM_BASE_ADDRESS == 0x00000000` and `CONFIG_KERNEL_VM_BASE = 0x20000000` is not.
  - If `CONFIG_X86_PAE` is disabled (`=n`), each address space must reside in their own 4MB region, due to each entry of PD (Page Directory) covers 4MB of memory.
  - Both `CONFIG_SRAM_BASE_ADDRESS` and `CONFIG_KERNEL_VM_BASE` must also align with the starting addresses of targeted regions.

Specifying Additional Memory Mappings at Build Time

The page table generation script (`arch/x86/gen_mmu.py`) generates the necessary multi-level page tables for code execution and data access using the kernel image produced by the first linker pass. Additional command line arguments can be passed to the script to generate additional

memory mappings. This is useful for static mappings and/or device MMIO access during very early boot. To pass extra command line arguments to the script, populate a CMake list named `X86_EXTRA_GEN_MMU_ARGUMENTS` in the board configuration file. Here is an example:

```
set(X86_EXTRA_GEN_MMU_ARGUMENTS
    --map 0xA0000000,0x2000
    --map 0x80000000,0x400000,LWUX,0xB0000000)
```

The argument `--map` takes the following value: `<physical address>,<size>[,<flags:LUWX>[,<virtual address>]]`, where:

- `<physical address>` is the physical address of the mapping. (Required)
- `<size>` is the size of the region to be mapped. (Required)
- `<flags>` is the flag associated with the mapping: (Optional)
  - `L`: Large page at the page directory level.
  - `U`: Allow userspace access.
  - `W`: Read/write.
  - `X`: Allow execution.
  - `D`: Cache disabled.
    - Default is small page (4KB), supervisor only, read only, and execution disabled.
- `<virtual address` is the virtual address of the mapping. (Optional)

Note that specifying additional memory mappings requires larger storage space for the pre-allocated page tables (both kernel and per-domain tables). `CONFIG_X86_EXTRA_PAGE_TABLE_PAGES` is needed to specify how many more memory pages to be reserved for the page tables. If the needed space is not exactly the same as required space, the `gen_mmu.py` script will print out a message indicating what needs to be the value for the kconfig.

7.1.7 Xtensa Developer Guide

Overview

This page contains information on certain aspects when developing for Xtensa-based platforms.

HiFi Audio Engine DSP

The kernel allows threads to use the HiFi Audio Engine DSP registers on boards that support these registers. The kernel only supports the use of the HiFi registers by threads and not ISRs.

> **Note**
>
> Presently, only the Intel ADSP ACE hardware platforms are configured for HiFi support by default.

Concepts The kernel can be configured for an application to leverage the services provided by the Xtensa HiFi Audio Engine DSP. Three modes of operation are supported, which are described below.

No HiFi registers mode This mode is used when the application has no threads that use the HiFi registers. It is the kernel's default HiFi services mode.

Unshared HiFi registers mode This mode is used when the application has only a single thread that uses the HiFi registers. The HiFi registers are left unchanged whenever a context switch occurs.

> **Note**
>
> The behavior is undefined, if two or more threads attempt to use the HiFi registers, as the kernel does not attempt to detect (nor prevent) multiple threads from using these registers.

Shared HiFi registers mode This mode is used when the application has two or more threads that use HiFi registers. When enabled, the kernel automatically allows all threads to use the HiFi registers. During each thread context switch, the kernel saves the outgoing thread's HiFi registers and loads the incoming thread's HiFi registers, regardless of whether the thread utilizes them or not.

Additional stack space may be required for each thread to account for the extra registers that must be saved.

Configuration Options The unshared HiFi registers mode is selected when configuration option `CONFIG_XTENSA_HIFI_SHARING` is disabled but configuration options `CONFIG_XTENSA_HIFI3` and/or `CONFIG_XTENSA_HIFI4` are enabled.

The shared HiFi registers mode is selected when the configuration option `CONFIG_XTENSA_HIFI_SHARING` is enabled in addition to configuration options `CONFIG_XTENSA_HIFI3` and/or `CONFIG_XTENSA_HIFI4`. Threads must have sufficient stack space for saving the HiFi register values during context switches as described above.

7.2 Barriers API

group `barrier_apis`

Since
3.4

Version
0.1.0

Functions

ALWAYS_INLINE static void **`barrier_dmem_fence_full`**(void)

Full/sequentially-consistent data memory barrier.

This routine acts as a synchronization fence between threads and prevents re-ordering of data accesses instructions across the barrier instruction.

ALWAYS_INLINE static void **barrier_dsync_fence_full**(void)

Full/sequentially-consistent data synchronization barrier.

This routine acts as a synchronization fence between threads and prevents reordering of data accesses instructions across the barrier instruction like *barrier_dmem_fence_full()*, but has the additional effect of blocking execution of any further instructions, not just loads or stores, or both, until synchronization is complete.

> **Note**
>
> When not supported by hardware or architecture, this instruction falls back to a full/sequentially-consistent data memory barrier.

ALWAYS_INLINE static void **barrier_isync_fence_full**(void)

Full/sequentially-consistent instruction synchronization barrier.

This routine is used to guarantee that any subsequent instructions are fetched and to ensure any previously executed context-changing operations, such as writes to system control registers, have completed by the time the routine completes. In hardware terms, this might mean that the instruction pipeline is flushed, for example.

> **Note**
>
> When not supported by hardware or architecture, this instruction falls back to a compiler barrier.

7.3 Cache Interface

This is a high-level guide to cache interface and Kconfig options related to cache controllers. See *Cache API* for API reference material.

Zephyr has different Kconfig options to control how the cache controller is implemented and controlled.

- `CONFIG_CPU_HAS_DCACHE` / `CONFIG_CPU_HAS_ICACHE`: these hidden options should be selected at SoC / platform level when the CPU actually supports a data or instruction cache. The cache controller can be in the core or can be an external cache controller for which a driver is provided.

  These options have the goal to document an available feature and should be set whether we plan to support and use the caches in Zephyr or not.

- `CONFIG_DCACHE` / `CONFIG_ICACHE`: these options must be selected when support for data or instruction cache is present and working in zephyr.

  All the code paths related to cache control must be conditionally enabled depending on these symbols. When the symbol is set the cache is considered enabled and used.

  These symbols say nothing about the actual API interface exposed to the user. For example a platform using the data cache can enable the `CONFIG_DCACHE` symbol and use some HAL exported function in some platform-specific code to enable and manage the d-cache.

- `CONFIG_CACHE_MANAGEMENT`: this option must be selected when the cache operations are exposed to the user through a standard API (see *Cache API*).

  When this option is enabled we assume that all the cache functions are implemented in the architectural code or in an external cache controller driver.

- CONFIG_ARCH_CACHE/CONFIG_EXTERNAL_CACHE: mutually exclusive options for CACHE_TYPE used to define whether the cache operations are implemented at arch level or using an external cache controller with a provided driver.
  - CONFIG_ARCH_CACHE: the cache API is implemented by the arch code
  - CONFIG_EXTERNAL_CACHE: the cache API is implemented by a driver that supports the external cache controller. In this case the driver must be located as usual in the drivers/cache/ directory

7.3.1 Cache API

group **cache_interface**

Functions

ALWAYS_INLINE static void **sys_cache_data_enable**(void)

Enable the d-cache.

Enable the data cache

ALWAYS_INLINE static void **sys_cache_data_disable**(void)

Disable the d-cache.

Disable the data cache

ALWAYS_INLINE static void **sys_cache_instr_enable**(void)

Enable the i-cache.

Enable the instruction cache

ALWAYS_INLINE static void **sys_cache_instr_disable**(void)

Disable the i-cache.

Disable the instruction cache

ALWAYS_INLINE static int **sys_cache_data_flush_all**(void)

Flush the d-cache.

Flush the whole data cache.

Return values

- **0** – If succeeded.
- **-ENOTSUP** – If not supported.
- **-errno** – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_instr_flush_all**(void)

Flush the i-cache.

Flush the whole instruction cache.

Return values

- **0** – If succeeded.
- **-ENOTSUP** – If not supported.
- **-errno** – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_data_invd_all**(void)

Invalidate the d-cache.

Invalidate the whole data cache.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_instr_invd_all**(void)

Invalidate the i-cache.

Invalidate the whole instruction cache.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_data_flush_and_invd_all**(void)

Flush and Invalidate the d-cache.

Flush and Invalidate the whole data cache.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_instr_flush_and_invd_all**(void)

Flush and Invalidate the i-cache.

Flush and Invalidate the whole instruction cache.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

int **sys_cache_data_flush_range**(void *addr, size_t size)

Flush an address range in the d-cache.

Flush the specified address range of the data cache.

> **Note**
>
> the cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded `size` is not strictly necessary.

Parameters

- `addr` – Starting address to flush.

- `size` – Range size.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

ALWAYS_INLINE static int `sys_cache_instr_flush_range`(void *addr, size_t size)

Flush an address range in the i-cache.

Flush the specified address range of the instruction cache.

> **Note**
>
> the cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded `size` is not strictly necessary.

Parameters

- `addr` – Starting address to flush.
- `size` – Range size.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

int `sys_cache_data_invd_range`(void *addr, size_t size)

Invalidate an address range in the d-cache.

Invalidate the specified address range of the data cache.

> **Note**
>
> the cache operations act on cache line. When multiple data structures share the same cache line being invalidated, all the portions of the non-read-only data structures sharing the same line will be invalidated as well. This is a destructive process that could lead to data loss and/or corruption. When `addr` is not aligned to the cache line and/or `size` is not a multiple of the cache line size the behaviour is undefined.

Parameters

- `addr` – Starting address to invalidate.
- `size` – Range size.

Return values

- `0` – If succeeded.
- `-ENOTSUP` – If not supported.
- `-errno` – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_instr_invd_range**(void *addr, size_t size)

Invalidate an address range in the i-cache.

Invalidate the specified address range of the instruction cache.

> **Note**
>
> the cache operations act on cache line. When multiple data structures share the same cache line being invalidated, all the portions of the non-read-only data structures sharing the same line will be invalidated as well. This is a destructive process that could lead to data loss and/or corruption. When `addr` is not aligned to the cache line and/or `size` is not a multiple of the cache line size the behaviour is undefined.

Parameters

- **addr** – Starting address to invalidate.
- **size** – Range size.

Return values

- **0** – If succeeded.
- **-ENOTSUP** – If not supported.
- **-errno** – Negative errno for other failures.

int **sys_cache_data_flush_and_invd_range**(void *addr, size_t size)

Flush and Invalidate an address range in the d-cache.

Flush and Invalidate the specified address range of the data cache.

> **Note**
>
> the cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed before being invalidated. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded `size` is not strictly necessary.

Parameters

- **addr** – Starting address to flush and invalidate.
- **size** – Range size.

Return values

- **0** – If succeeded.
- **-ENOTSUP** – If not supported.
- **-errno** – Negative errno for other failures.

ALWAYS_INLINE static int **sys_cache_instr_flush_and_invd_range**(void *addr, size_t size)

Flush and Invalidate an address range in the i-cache.

Flush and Invalidate the specified address range of the instruction cache.

Note

the cache operations act on cache line. When multiple data structures share the same cache line being flushed, all the portions of the data structures sharing the same line will be flushed before being invalidated. This is usually not a problem because writing back is a non-destructive process that could be triggered by hardware at any time, so having an aligned `addr` or a padded `size` is not strictly necessary.

Parameters

- **addr** – Starting address to flush and invalidate.
- **size** – Range size.

Return values

- **0** – If succeeded.
- **-ENOTSUP** – If not supported.
- **-errno** – Negative errno for other failures.

ALWAYS_INLINE static size_t **sys_cache_data_line_size_get**(void)

Get the d-cache line size.

The API is provided to get the data cache line.

The cache line size is calculated (in order of priority):

- At run-time when `CONFIG_DCACHE_LINE_SIZE_DETECT` is set.
- At compile time using the value set in `CONFIG_DCACHE_LINE_SIZE` .
- At compile time using the `d-cache-line-size` CPU0 property of the DT.
- 0 otherwise

Return values

- **size** – Size of the d-cache line.
- **0** – If the d-cache is not enabled.

ALWAYS_INLINE static size_t **sys_cache_instr_line_size_get**(void)

Get the i-cache line size.

The API is provided to get the instruction cache line.

The cache line size is calculated (in order of priority):

- At run-time when `CONFIG_ICACHE_LINE_SIZE_DETECT` is set.
- At compile time using the value set in `CONFIG_ICACHE_LINE_SIZE` .
- At compile time using the `i-cache-line-size` CPU0 property of the DT.
- 0 otherwise

Return values

- **size** – Size of the d-cache line.
- **0** – If the d-cache is not enabled.

ALWAYS_INLINE static bool **sys_cache_is_ptr_cached**(void *ptr)

Test if a pointer is in cached region.

Some hardware may map the same physical memory twice so that it can be seen in both (incoherent) cached mappings and a coherent "shared" area. This tests if a particular pointer is within the cached, coherent area.

Parameters

- **ptr** – Pointer

Return values

- **True** – if pointer is in cached region.
- **False** – if pointer is not in cached region.

ALWAYS_INLINE static bool **sys_cache_is_ptr_uncached**(void *ptr)

Test if a pointer is in un-cached region.

Some hardware may map the same physical memory twice so that it can be seen in both (incoherent) cached mappings and a coherent "shared" area. This tests if a particular pointer is within the un-cached, incoherent area.

Parameters

- **ptr** – Pointer

Return values

- **True** – if pointer is not in cached region.
- **False** – if pointer is in cached region.

ALWAYS_INLINE static void ***sys_cache_cached_ptr_get**(void *ptr)

Return cached pointer to a RAM address.

This function takes a pointer to any addressable object (either in cacheable memory or not) and returns a pointer that can be used to refer to the same memory through the L1 data cache. Data read through the resulting pointer will reflect locally cached values on the current CPU if they exist, and writes will go first into the cache and be written back later.

See also

arch_uncached_ptr()

Note

This API returns the same pointer if CONFIG_CACHE_DOUBLEMAP is not enabled.

Parameters

- **ptr** – A pointer to a valid C object

Returns

A pointer to the same object via the L1 dcache

ALWAYS_INLINE static void *sys_cache_uncached_ptr_get(void *ptr)

Return uncached pointer to a RAM address.

This function takes a pointer to any addressable object (either in cacheable memory or not) and returns a pointer that can be used to refer to the same memory while bypassing the L1 data cache. Data in the L1 cache will not be inspected nor modified by the access.

See also

arch_cached_ptr()

Note

This API returns the same pointer if CONFIG_CACHE_DOUBLEMAP is not enabled.

Parameters

- `ptr` – A pointer to a valid C object

Returns

A pointer to the same object bypassing the L1 dcache

7.4 Zephyr's device emulators/simulators

7.4.1 Overview

Zephyr includes in its codebase a set of device emulators/simulators. With this we refer to SW components which are built together with the embedded SW and present themselves as devices of a given class to the rest of the system.

These device emulators/simulators can be built for any target which has sufficient RAM and flash, even if some may have extra functionality which is only available in some targets.

Note

Zephyr also includes and uses many other types of simulators/emulators, including CPU and platform simulators, radio simulators, and several build targets which allow running the embedded code in the development host.
Some of Zephyr communication controllers/drivers include also either loopback modes or loopback devices.
This page does not cover any of these.

Note

Drivers which are specific to some platform, like for example the native_sim specific drivers which emulate a peripheral class by connecting to host APIs are not covered by this page.

7.4.2 Available Emulators

ADC emulator

- A fake driver which pretends to be actual ADC, and can be used for testing higher-level API for ADC devices.
- Main Kconfig option: `CONFIG_ADC_EMUL`
- DT binding: `zephyr,adc-emul`

DMA emulator

- Emulated DMA controller
- Main Kconfig option: `CONFIG_DMA_EMUL`
- DT binding: `zephyr,dma-emul`

EEPROM emulator

- Emulate an EEPROM on a flash partition
- Main Kconfig option: `CONFIG_EEPROM_EMULATOR`
- DT binding: `zephyr,emu-eeprom`

EEPROM simulator

- Emulate an EEPROM on RAM
- Main Kconfig option: `CONFIG_EEPROM_SIMULATOR`
- DT binding: `zephyr,sim-eeprom`
- Note: For native targets it is also possible to keep the content as a file on the host filesystem.

External bus and bus connected peripheral emulators

- *Documentation*
- Allow emulating external buses like I2C or SPI and peripherals connected to them.

Flash simulator

- Emulate a flash on RAM
- Main Kconfig option: `CONFIG_FLASH_SIMULATOR`
- DT binding: `zephyr,sim-flash`
- Note: For native targets it is also possible to keep the content as a file on the host filesystem. Check the native_sim flash simulator section.

GPIO emulator

- Emulated GPIO controllers which can be driven from SW
- Main Kconfig option: `CONFIG_GPIO_EMUL`
- DT binding: `zephyr,gpio-emul`

I2C emulator

- Emulated I2C bus. See *bus emulators*.
- Main Kconfig option: `CONFIG_I2C_EMUL`
- DT binding: `zephyr,i2c-emul-controller`

RTC emulator

- Emulated RTC peripheral. See *RTC emulated device section*

- Main Kconfig option: `CONFIG_RTC_EMUL`
- DT binding: `zephyr,rtc-emul`

SPI emulator

- Emulated SPI bus. See *bus emulators*.
- Main Kconfig option: `CONFIG_SPI_EMUL`
- DT binding: `zephyr,spi-emul-controller`

MSPI emulator

- Emulated MSPI bus. See *bus emulators*.
- Main Kconfig option: `CONFIG_MSPI_EMUL`
- DT binding: `zephyr,mspi-emul-controller`

UART emulator

- Emulated UART bus. See *bus emulators*.
- Main Kconfig option: `CONFIG_UART_EMUL`
- DT binding: `zephyr,uart-emul`

7.5 External Bus and Bus Connected Peripherals Emulators

7.5.1 Overview

Zephyr supports a simple emulator framework to support testing of external peripheral drivers without requiring real hardware.

Emulators are used to emulate external hardware devices, to support testing of various subsystems. For example, it is possible to write an emulator for an I2C compass such that it appears on the I2C bus and can be used just like a real hardware device.

Emulators often implement special features for testing. For example a compass may support returning bogus data if the I2C bus speed is too high, or may return invalid measurements if calibration has not yet been completed. This allows for testing that high-level code can handle these situations correctly. Test coverage can therefore approach 100% if all failure conditions are emulated.

7.5.2 Concept

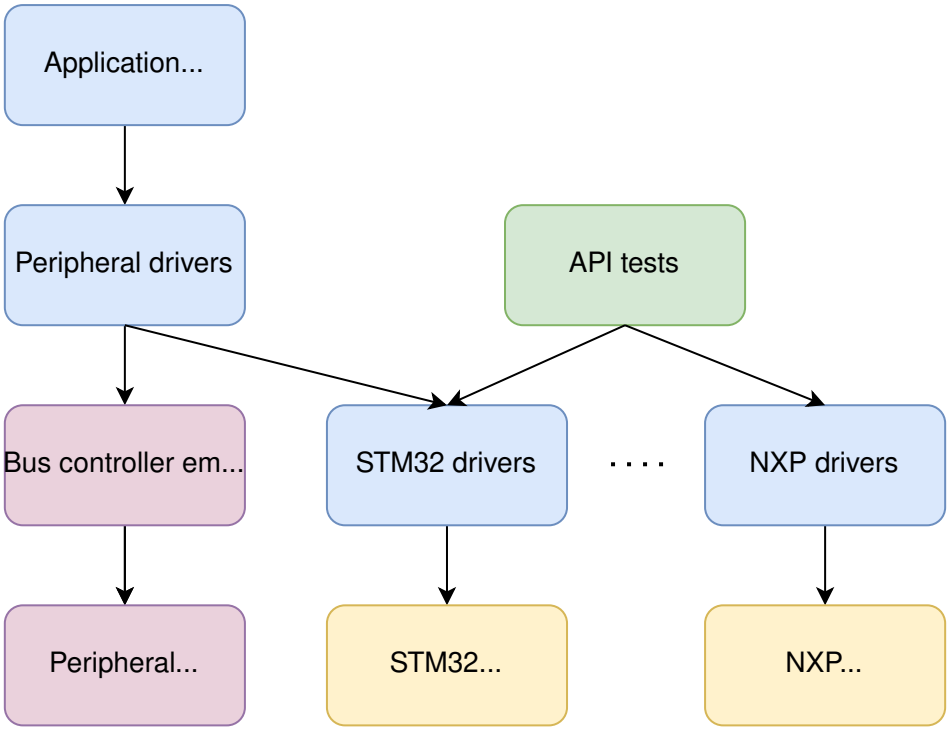
The diagram below shows application code / high-level tests at the top. This is the ultimate application we want to run.

Below that are peripheral drivers, such as the AT24 EEPROM driver. We can test peripheral drivers using an emulation driver connected via a emulated I2C controller/emulator which passes I2C traffic from the AT24 driver to the AT24 simulator.

Separately we can test the STM32 and NXP I2C drivers on real hardware using API tests. These require some sort of device attached to the bus, but with this, we can validate much of the driver functionality.

Putting the two together, we can test the application and peripheral code entirely on native_sim. Since we know that the I2C driver on the real hardware works, we should expect the application and peripheral drivers to work on the real hardware also.

Using the above framework we can test an entire application (e.g. Embedded Controller) on native_sim using emulators for all non-chip drivers.



Text is not SVG - cannot display

With this approach we can:

- Write individual tests for each driver (green), covering all failure modes, error conditions, etc.
- Ensure 100% test coverage for drivers (green)
- Write tests for combinations of drivers, such as GPIOs provided by an I2C GPIO expander driver talking over an I2C bus, with the GPIOs controlling a charger. All of this can work in the emulated environment or on real hardware.
- Write a complex application that ties together all of these pieces and runs on native_sim. We can develop on a host, use source-level debugging, etc.
- Transfer the application to any board which provides the required features (e.g. I2C, enough GPIOs), by adding Kconfig and devicetree fragments.

7.5.3 Creating a Device Driver Emulator

The emulator subsystem is modeled on the *Device Driver Model*. You create an emulator instance using one of the *EMUL_DT_DEFINE()* or *EMUL_DT_INST_DEFINE()* APIs.

Emulators for peripheral devices reuse the same devicetree node as the real device driver. This means that your emulator defines *DT_DRV_COMPAT* using the same `compat` value from the real driver.

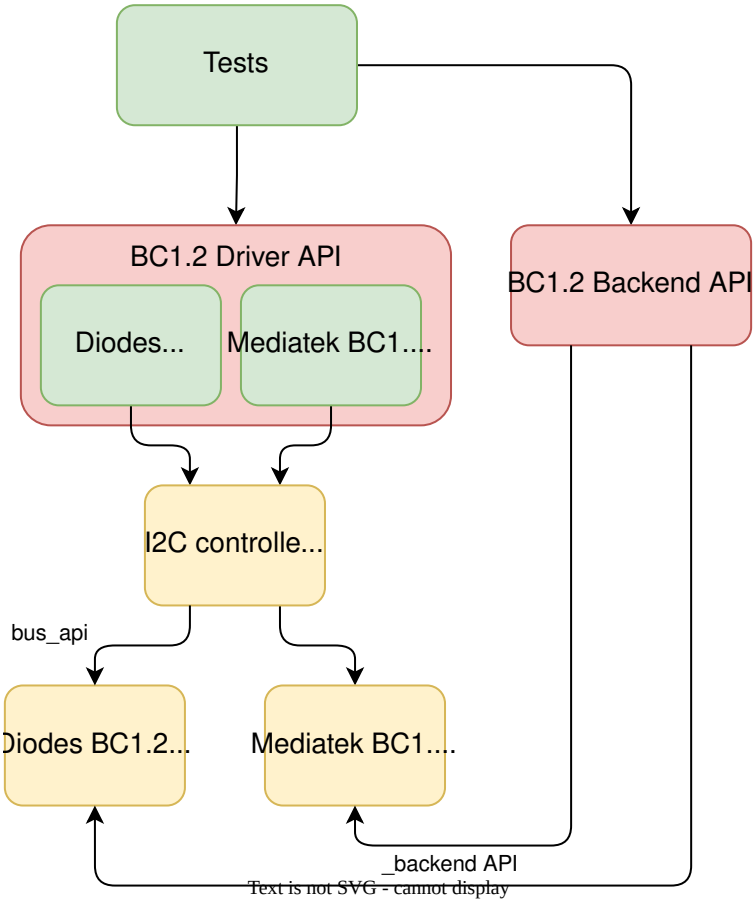
```
/* From drivers/sensor/bm160/bm160.c */
#define DT_DRV_COMPAT bosch_bmi160

/* From drivers/sensor/bmi160/emul_bmi160.c */
#define DT_DRV_COMPAT bosch_bmi160
```

The `EMUL_DT_DEFINE()` function accepts two API types:

1. `bus_api` - This points to the API for the upstream bus that the emulator connects to. The `bus_api` parameter is required. The supported emulated bus types include I2C, SPI, eSPI, and MSPI.
2. `_backend_api` - This points to the device-class specific backend API for the emulator. The `_backend_api` parameter is optional.

The diagram below demonstrates the logical organization of the `bus_api` and `_backend_api` using the BC1.2 charging detector driver as the model device-class.



The real code is shown in green, while the emulator code is shown in yellow.

The `bus_api` connects the BC1.2 emulators to the `native_sim` I2C controller. The real BC1.2 drivers are unchanged and operate exactly as if there was a physical I2C controller present in the system. The `native_sim` I2C controller uses the `bus_api` to initiate register reads and writes to the emulator.

The `_backend_api` provides a mechanism for tests to manipulate the emulator out of band. Each device class defines it's own API functions. The backend API functions focus on high-level behavior and do not provide hooks for specific emulators.

In the case of the BC1.2 charging detector the backend API provides functions to simulate connecting and disconnecting a charger to the emulated BC1.2 device. Each emulator is responsible for updating the correct vendor specific registers and potentially signalling an interrupt.

Example test flow:

1. Test registers BC1.2 detection callback using the Zephyr BC1.2 driver API.
2. Test connects a charger using the BC1.2 emulator backend.
3. Test verifies B1.2 detection callback invoked with correct charger type.
4. Test disconnects a charger using the BC1.2 emulator backend.

With this architecture, the same test can be used will all supported drivers in the same driver class.

7.5.4 Available Emulators

Zephyr includes the following emulators:

- I2C emulator driver, allowing drivers to be connected to an emulator so that tests can be performed without access to the real hardware
- SPI emulator driver, which does the same for SPI
- eSPI emulator driver, which does the same for eSPI. The emulator is being developed to support more functionalities.
- MSPI emulator driver, allowing drivers to be connected to an emulator so that tests can be performed without access to the real hardware.

7.5.5 Samples

Here are some examples present in Zephyr:

1. Bosch BMI160 sensor driver connected via both I2C and SPI to an emulator:

```
west build -b native_sim tests/drivers/sensor/accel/
```

2. The same test can be built with a second EEPROM which is an Atmel AT24 EEPROM driver connected via I2C an emulator:

```
west build -b native_sim tests/drivers/eeprom/api -- -DDTC_OVERLAY_FILE=at2x_emul.
↪overlay -DOVERLAY_CONFIG=at2x_emul.conf
```

API Reference

group `io_emulators`

Emulators used to test drivers and higher-level code that uses them.

Defines

`EMUL_DT_NAME_GET`(node_id)

Use the devicetree node identifier as a unique name.

Parameters

- `node_id` – A devicetree node identifier

`EMUL_DT_DEFINE`(node_id, init_fn, data_ptr, cfg_ptr, bus_api, _backend_api)

Define a new emulator.

This adds a new struct emul to the linker list of emulations. This is typically used in your emulator's *DT_INST_FOREACH_STATUS_OKAY()* clause.

Parameters

- `node_id` – Node ID of the driver to emulate (e.g. *DT_DRV_INST(n)*); the node_id *MUST* have a corresponding *DEVICE_DT_DEFINE()*.

- **init_fn** – function to call to initialise the emulator (see emul_init typedef)
- **data_ptr** – emulator-specific data
- **cfg_ptr** – emulator-specific configuration data
- **bus_api** – emulator-specific bus api
- **_backend_api** – emulator-specific backend api

EMUL_DT_INST_DEFINE(inst, ...)

Like *EMUL_DT_DEFINE()*, but uses an instance of a DT_DRV_COMPAT compatible instead of a node identifier.

Parameters

- **inst** – instance number. The node_id argument to EMUL_DT_DEFINE is set to *DT_DRV_INST(inst)*.
- **...** – other parameters as expected by EMUL_DT_DEFINE.

EMUL_DT_GET(node_id)

Get a const struct emul* from a devicetree node identifier.

Returns a pointer to an emulator object created from a devicetree node, if any device was allocated by an emulator implementation.

If no such device was allocated, this will fail at linker time. If you get an error that looks like undefined reference to __device_dts_ord_<N>, that is what happened. Check to make sure your emulator implementation is being compiled, usually by enabling the Kconfig options it requires.

Parameters

- **node_id** – A devicetree node identifier

Returns

A pointer to the emul object created for that node

EMUL_DT_GET_OR_NULL(node_id)

Utility macro to obtain an optional reference to an emulator.

If the node identifier refers to a node with status okay, this returns *EMUL_DT_GET(node_id)*. Otherwise, it returns NULL.

Parameters

- **node_id** – A devicetree node identifier

Returns

a *emul* reference for the node identifier, which may be NULL.

Typedefs

typedef int (***emul_init_t**)(const struct *emul* *emul, const struct *device* *parent)

Standard callback for emulator initialisation providing the initialiser record and the device that calls the emulator functions.

Param emul

Emulator to init

Param parent

Parent device that is using the emulator

Enums

enum **emul_bus_type**

The types of supported buses.

Values:

enumerator **EMUL_BUS_TYPE_I2C**

enumerator **EMUL_BUS_TYPE_ESPI**

enumerator **EMUL_BUS_TYPE_SPI**

enumerator **EMUL_BUS_TYPE_MSPI**

enumerator **EMUL_BUS_TYPE_UART**

enumerator **EMUL_BUS_TYPE_NONE**

Functions

int **emul_init_for_bus**(const struct *device* *dev)

Set up a list of emulators.

Parameters

- **dev** – Device the emulators are attached to (e.g. an I2C controller)

Returns
0 if OK

Returns
negative value on error

const struct *emul* ***emul_get_binding**(const char *name)

Retrieve the emul structure for an emulator by name.

Emulator objects are created via the *EMUL_DT_DEFINE()* macro and placed in memory by the linker. If the emulator structure is needed for custom API calls, it can be retrieved by the name that the emulator exposes to the system (this is the devicetree node's label by default).

Parameters

- **name** – Emulator name to search for. A null pointer, or a pointer to an empty string, will cause NULL to be returned.

Returns
pointer to emulator structure; NULL if not found or cannot be used.

struct **emul_link_for_bus**

#include <*emul.h*> Structure uniquely identifying a device to be emulated.

struct **emul_list_for_bus**

#include <*emul.h*> List of emulators attached to a bus.

Public Members

const struct *emul_link_for_bus* ***children**

Identifiers for children of the node.

unsigned int **num_children**

Number of children of the node.

struct **no_bus_emul**

#include <*emul.h*> Emulator API stub when an emulator is not actually placed on a bus.

struct **emul**

#include <*emul.h*> An emulator instance - represents the *target* emulated device/peripheral that is interacted with through an emulated bus.

Instances of emulated bus nodes (e.g. i2c_emul) and emulators (i.e. struct emul) are exactly 1..1

Public Members

emul_init_t **init**

function used to initialise the emulator state

const struct *device* ***dev**

handle to the device for which this provides low-level emulation

const void ***cfg**

Emulator-specific configuration data.

void ***data**

Emulator-specific data.

enum *emul_bus_type* **bus_type**

The bus type that the emulator is attached to.

const void ***backend_api**

Address of the API structure exposed by the emulator instance.

union **bus**

#include <*emul.h*> Pointer to the emulated bus node.

Public Members

struct i2c_emul ***i2c**

struct espi_emul ***espi**

struct spi_emul ***spi**

struct mspi_emul ***mspi**

struct uart_emul ***uart**

struct *no_bus_emul* ***none**

7.6 Peripherals

7.6.1 1-Wire Bus

Overview

1-Wire is a low speed half-duplex serial bus using only a single wire plus ground for both data transmission and device power supply. Similarly to I2C, 1-Wire uses a bidirectional open-collector data line, and is a single master multidrop bus. This means one master initiates all data exchanges with the slave devices. The 1-Wire bus supports longer bus lines than I2C, while it reaches speeds of up to 15.4 kbps in standard mode and up to 125 kbps in overdrive mode. Reliable communication in standard speed configuration is possible with 10 nodes over a bus length of 100 meters. Using overdrive speed, 3 nodes on a bus of 10 meters length are expected to work solid. Optimized timing parameters and fewer nodes on the bus may allow to reach larger bus extents.

The implementation details are specified in the BOOK OF IBUTTON STANDARDS.

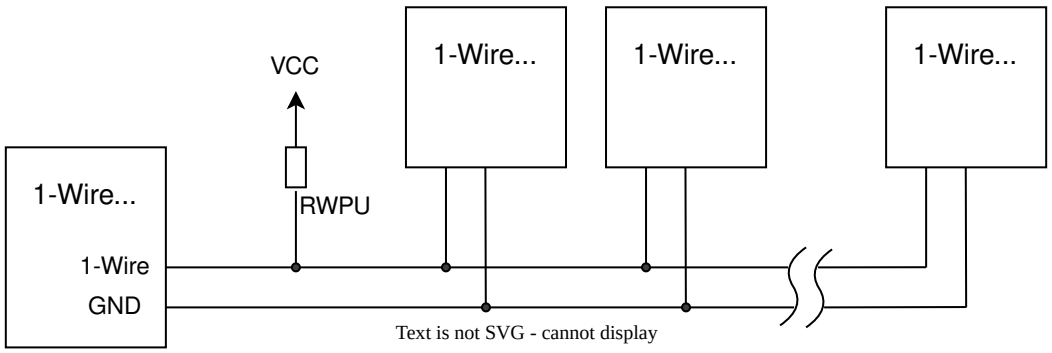


Fig. 1: A typical 1-Wire bus topology

W1 Master API Zephyr's 1-Wire Master API is used to interact with 1-Wire slave devices like temperature sensors and serial memories.

In Zephyr this API is split into the following layers.

- The link layer handles basic communication functions such as bus reset, presence detect and bit transfer operations. It is the only hardware-dependent layer in Zephyr. This layer is supported by a driver using the Zephyr *Universal Asynchronous Receiver-Transmitter (UART)* interface, which should work on most Zephyr platforms. In the future, a GPIO/Timer based driver and hardware specific drivers might be added.
- The 1-Wire network layer handles all means for slave identification and bus arbitration. This includes ROM commands like Match ROM, or Search ROM.

  - All slave devices have a unique 64-bit identification number, which includes a 8-bit 1-Wire Family Code and a 8-bit CRC.
  - In order to find slaves on the bus, the standard specifies an search algorithm which successively detects all slaves on the bus. This algorithm is described in detail by Maxim's Applicationnote 187.
- Transport layer and Presentation layer functions are not implemented in the generic 1-Wire driver and therefore must be handled in individual slave drivers.

The 1-Wire API is considered experimental.

Configuration Options

Related configuration options:

- `CONFIG_W1`
- `CONFIG_W1_NET`

API Reference

1-Wire data link layer

group `w1_data_link`

1-Wire data link layer

Functions

int `w1_reset_bus`(const struct *device* *dev)

Reset the 1-Wire bus to prepare slaves for communication.

This routine resets all 1-Wire bus slaves such that they are ready to receive a command. Connected slaves answer with a presence pulse once they are ready to receive data.

In case the driver supports both standard speed and overdrive speed, the reset routine takes care of sendig either a short or a long reset pulse depending on the current state. The speed can be changed using w1_configure().

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `0` – If no slaves answer with a present pulse.
- `1` – If at least one slave answers with a present pulse.
- `-errno` – Negative error code on error.

int `w1_read_bit`(const struct *device* *dev)

Read a single bit from the 1-Wire bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `rx_bit` – The read bit value on success.
- `-errno` – Negative error code on error.

int `w1_write_bit`(const struct *device* *dev, const bool bit)
Write a single bit to the 1-Wire bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `bit` – Transmitting bit value 1 or 0.

Return values

- `0` – If successful.
- `-errno` – Negative error code on error.

int `w1_read_byte`(const struct *device* *dev)
Read a single byte from the 1-Wire bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `rx_byte` – The read byte value on success.
- `-errno` – Negative error code on error.

int `w1_write_byte`(const struct *device* *dev, uint8_t byte)
Write a single byte to the 1-Wire bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `byte` – Transmitting byte.

Return values

- `0` – If successful.
- `-errno` – Negative error code on error.

int `w1_read_block`(const struct *device* *dev, uint8_t *buffer, size_t len)
Read a block of data from the 1-Wire bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `buffer` – **[out]** Pointer to receive buffer.
- `len` – Length of receiving buffer (in bytes).

Return values

- `0` – If successful.
- `-errno` – Negative error code on error.

int `w1_write_block`(const struct *device* *dev, const uint8_t *buffer, size_t len)
Write a block of data from the 1-Wire bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `buffer` – **[in]** Pointer to transmitting buffer.
- `len` – Length of transmitting buffer (in bytes).

Return values

- `0` – If successful.

- `-errno` – Negative error code on error.

size_t `w1_get_slave_count`(const struct *device* *dev)

Get the number of slaves on the bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `slave_count` – Positive Number of connected 1-Wire slaves on success.
- `-errno` – Negative error code on error.

int `w1_configure`(const struct *device* *dev, enum *w1_settings_type* type, uint32_t value)

Configure parameters of the 1-Wire master.

Allowed configuration parameters are defined in enum w1_settings_type, but master devices may not support all types.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `type` – Enum specifying the setting type.
- `value` – The new value for the passed settings type.

Return values

- `0` – If successful.
- `-ENOTSUP` – The master doesn't support the configuration of the supplied type.
- `-EIO` – General input / output error, failed to configure master devices.

1-Wire network layer

group `w1_network`

1-Wire network layer

1-Wire ROM Commands

`W1_CMD_SKIP_ROM`

This command allows the bus master to read the slave devices without providing their ROM code.

`W1_CMD_MATCH_ROM`

This command allows the bus master to address a specific slave device by providing its ROM code.

`W1_CMD_RESUME`

This command allows the bus master to resume a previous read out from where it left off.

`W1_CMD_READ_ROM`

This command allows the bus master to read the ROM code from a single slave device.

This command should be used when there is only a single slave device on the bus.

W1_CMD_SEARCH_ROM

This command allows the bus master to discover the addresses (i.e., ROM codes) of all slave devices on the bus.

W1_CMD_SEARCH_ALARM

This command allows the bus master to identify which devices have experienced an alarm condition.

W1_CMD_OVERDRIVE_SKIP_ROM

This command allows the bus master to address all devices on the bus and then switch them to overdrive speed.

W1_CMD_OVERDRIVE_MATCH_ROM

This command allows the bus master to address a specific device and switch it to overdrive speed.

CRC Defines

W1_CRC8_SEED

Seed value used to calculate the 1-Wire 8-bit crc.

W1_CRC8_POLYNOMIAL

Polynomial used to calculate the 1-Wire 8-bit crc.

W1_CRC16_SEED

Seed value used to calculate the 1-Wire 16-bit crc.

W1_CRC16_POLYNOMIAL

Polynomial used to calculate the 1-Wire 16-bit crc.

Defines

W1_SEARCH_ALL_FAMILIES

This flag can be passed to searches in order to not filter on family ID.

W1_ROM_INIT_ZERO

Initialize all *w1_rom* struct members to zero.

Typedefs

typedef void (*w1_search_callback_t)(struct *w1_rom* rom, void *user_data)

Define the application callback handler function signature for searches.

Param rom
found The ROM of the found slave.

Param user_data
User data provided to the *w1_search_bus()* call.

Functions

int `w1_read_rom`(const struct *device* *dev, struct *w1_rom* *rom)

Read Peripheral 64-bit ROM.

This procedure allows the 1-Wire bus master to read the peripherals' 64-bit ROM without using the Search ROM procedure. This command can be used as long as not more than a single peripheral is connected to the bus. Otherwise data collisions occur and a faulty ROM is read.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `rom` – **[out]** Pointer to the ROM structure.

Return values

- `0` – If successful.
- `-ENODEV` – In case no slave responds to reset.
- `-errno` – Other negative error code in case of invalid crc and communication errors.

int `w1_match_rom`(const struct *device* *dev, const struct *w1_slave_config* *config)

Select a specific slave by broadcasting a selected ROM.

This routine allows the 1-Wire bus master to select a slave identified by its unique ROM, such that the next command will target only this single selected slave.

This command is only necessary in multidrop environments, otherwise the Skip ROM command can be issued. Once a slave has been selected, to reduce the communication overhead, the resume command can be used instead of this command to communicate with the selected slave.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `config` – **[in]** Pointer to the slave specific 1-Wire config.

Return values

- `0` – If successful.
- `-ENODEV` – In case no slave responds to reset.
- `-errno` – Other negative error code on error.

int `w1_resume_command`(const struct *device* *dev)

Select the slave last addressed with a Match ROM or Search ROM command.

This routine allows the 1-Wire bus master to re-select a slave device that was already addressed using a Match ROM or Search ROM command.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `-ENODEV` – In case no slave responds to reset.
- `-errno` – Other negative error code on error.

int `w1_skip_rom`(const struct *device* *dev, const struct *w1_slave_config* *config)

Select all slaves regardless of ROM.

This routine sets up the bus slaves to receive a command. It is usually used when there is only one peripheral on the bus to avoid the overhead of the Match ROM command. But it can also be used to concurrently write to all slave devices.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `config` – **[in]** Pointer to the slave specific 1-Wire config.

Return values

- `0` – If successful.
- `-ENODEV` – In case no slave responds to reset.
- `-errno` – Other negative error code on error.

int `w1_reset_select`(const struct *device* *dev, const struct *w1_slave_config* *config)

In single drop configurations use Skip Select command, otherwise use Match ROM command.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `config` – **[in]** Pointer to the slave specific 1-Wire config.

Return values

- `0` – If successful.
- `-ENODEV` – In case no slave responds to reset.
- `-errno` – Other negative error code on error.

int `w1_write_read`(const struct *device* *dev, const struct *w1_slave_config* *config, const uint8_t *write_buf, size_t write_len, uint8_t *read_buf, size_t read_len)

Write then read data from the 1-Wire slave with matching ROM.

This routine uses w1_reset_select to select the given ROM. Then writes given data and reads the response back from the slave.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `config` – **[in]** Pointer to the slave specific 1-Wire config.
- `write_buf` – **[in]** Pointer to the data to be written.
- `write_len` – Number of bytes to write.
- `read_buf` – **[out]** Pointer to storage for read data.
- `read_len` – Number of bytes to read.

Return values

- `0` – If successful.
- `-ENODEV` – In case no slave responds to reset.
- `-errno` – Other negative error code on error.

int `w1_search_bus`(const struct *device* *dev, uint8_t command, uint8_t family, *w1_search_callback_t* callback, void *user_data)

Search 1-wire slaves on the bus.

This function searches slaves on the 1-wire bus, with the possibility to search either all slaves or only slaves that have an active alarm state. If a callback is passed, the callback is called for each found slave.

The algorithm mostly follows the suggestions of https://pdfserv.maximintegrated.com/en/an/AN187.pdf

Note: Filtering on families is not supported.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `command` – Can either be W1_SEARCH_ALARM or W1_SEARCH_ROM.
- `family` – W1_SEARCH_ALL_FAMILIES searcheas all families, filtering on a specific family is not yet supported.
- `callback` – Application callback handler function to be called for each found slave.
- `user_data` – **[in]** User data to pass to the application callback handler function.

Return values

- `slave_count` – Number of slaves found.
- `-errno` – Negative error code on error.

static inline int `w1_search_rom`(const struct *device* *dev, *w1_search_callback_t* callback, void *user_data)

Search for 1-Wire slave on bus.

This routine can discover unknown slaves on the bus by scanning for the unique 64-bit registration number.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `callback` – Application callback handler function to be called for each found slave.
- `user_data` – **[in]** User data to pass to the application callback handler function.

Return values

- `slave_count` – Number of slaves found.
- `-errno` – Negative error code on error.

static inline int `w1_search_alarm`(const struct *device* *dev, *w1_search_callback_t* callback, void *user_data)

Search for 1-Wire slaves with an active alarm.

This routine searches 1-Wire slaves on the bus, which currently have an active alarm.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `callback` – Application callback handler function to be called for each found slave.

- `user_data` – **[in]** User data to pass to the application callback handler function.

Return values

- `slave_count` – Number of slaves found.
- `-errno` – Negative error code on error.

static inline uint64_t `w1_rom_to_uint64`(const struct *w1_rom* *rom)

Function to convert a *w1_rom* struct to an uint64_t.

Parameters

- `rom` – **[in]** Pointer to the ROM struct.

Return values

`rom64` – The ROM converted to an unsigned integer in endianness.

static inline void `w1_uint64_to_rom`(const uint64_t rom64, struct *w1_rom* *rom)

Function to write an uint64_t to struct *w1_rom* pointer.

Parameters

- `rom64` – Unsigned 64 bit integer representing the ROM in host endianness.
- `rom` – **[out]** The ROM struct pointer.

static inline uint8_t `w1_crc8`(const uint8_t *src, size_t len)

Compute CRC-8 chacksum as defined in the 1-Wire specification.

The 1-Wire of CRC 8 variant is using 0x31 as its polynomial with the initial value set to 0x00. This CRC is used to check the correctness of the unique 56-bit ROM.

Parameters

- `src` – **[in]** Input bytes for the computation.
- `len` – Length of the input in bytes.

Return values

`crc` – The computed CRC8 value.

static inline uint16_t `w1_crc16`(const uint16_t seed, const uint8_t *src, const size_t len)

Compute 1-Wire variant of CRC 16.

The 16-bit 1-Wire crc variant is using the reflected polynomial function X^16 + X^15 * + X^2 + 1 with the initial value set to 0x0000. See also APPLICATION NOTE 27: “UNDERSTANDING AND USING CYCLIC REDUNDANCY CHECKS WITH MAXIM 1-WIRE AND IBUTTON PRODUCTS” https://www.maximintegrated.com/en/design/technical-documents/app-notes/2/27.html

Parameters

- `seed` – Init value for the CRC, it is usually set to 0x0000.
- `src` – **[in]** Input bytes for the computation.
- `len` – Length of the input in bytes.

Return values

`crc` – The computed CRC16 value.

struct `w1_rom`

#include <*w1.h*> *w1_rom* struct.

Public Members

uint8_t `family`

The 1-Wire family code identifying the slave device type.

An incomplete list of family codes is available at: https://www.maximintegrated.com/en/app-notes/index.mvp/id/155 others are documented in the respective device data sheet.

uint8_t `serial`[6]

The serial together with the family code composes the unique 56-bit id.

uint8_t `crc`

8-bit checksum of the 56-bit unique id.

struct `w1_slave_config`

#include <*w1.h*> Node specific 1-wire configuration struct.

This struct is passed to network functions, such that they can configure the bus to address the specific slave using the selected speed.

Public Members

struct *w1_rom* `rom`

Unique 1-Wire ROM.

uint32_t `overdrive`

overdrive speed is used if set to 1.

1-Wire generic functions and helpers Functions that are not directly related to any of the networking layers.

Enums

enum `w1_settings_type`

Defines the 1-Wire master settings types, which are runtime configurable.

Values:

enumerator `W1_SETTING_SPEED`

Overdrive speed is enabled in case a value of 1 is passed and disabled passing 0.

enumerator `W1_SETTING_STRONG_PULLUP`

The strong pullup resistor is activated immediately after the next written data block by passing a value of 1, and deactivated passing 0.

enumerator `W1_SETINGS_TYPE_COUNT`

Number of different settings types.

Functions

static inline int `w1_lock_bus`(const struct *device* *dev)

Lock the 1-wire bus to prevent simultaneous access.

This routine locks the bus to prevent simultaneous access from different threads. The calling thread waits until the bus becomes available. A thread is permitted to lock a mutex it has already locked.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `-errno` – Negative error code on error.

static inline int `w1_unlock_bus`(const struct *device* *dev)

Unlock the 1-wire bus.

This routine unlocks the bus to permit access to bus line.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `-errno` – Negative error code on error.

Version
1.0.0

Defines

`ADC_CHANNEL_CFG_DT`(node_id)

Get ADC channel configuration from a given devicetree node.

This returns a static initializer for a `struct` *adc_channel_cfg* filled with data from a given devicetree node.

Example devicetree fragment:

```
&adc {
   #address-cells = <1>;
   #size-cells = <0>;

   channel@0 {
       reg = <0>;
       zephyr,gain = "ADC_GAIN_1_6";
       zephyr,reference = "ADC_REF_INTERNAL";
       zephyr,acquisition-time = <ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20)>;
       zephyr,input-positive = <NRF_SAADC_AIN6>;
       zephyr,input-negative = <NRF_SAADC_AIN7>;
   };

   channel@1 {
       reg = <1>;
       zephyr,gain = "ADC_GAIN_1_6";
       zephyr,reference = "ADC_REF_INTERNAL";
       zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
       zephyr,input-positive = <NRF_SAADC_AIN0>;
   };
};
```

Example usage:

```
static const struct adc_channel_cfg ch0_cfg_dt =
    ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_0));
static const struct adc_channel_cfg ch1_cfg_dt =
    ADC_CHANNEL_CFG_DT(DT_CHILD(DT_NODELABEL(adc), channel_1));

// Initializes 'ch0_cfg_dt' to:
```

(continues on next page)

(continued from previous page)

```
// {
//     .channel_id = 0,
//     .gain = ADC_GAIN_1_6,
//     .reference = ADC_REF_INTERNAL,
//     .acquisition_time = ADC_ACQ_TIME(ADC_ACQ_TIME_MICROSECONDS, 20),
//     .differential = true,
//     .input_positive = NRF_SAADC_AIN6,
//     .input-negative = NRF_SAADC_AIN7,
// }
// and 'ch1_cfg_dt' to:
// {
//     .channel_id = 1,
//     .gain = ADC_GAIN_1_6,
//     .reference = ADC_REF_INTERNAL,
//     .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//     .input_positive = NRF_SAADC_AIN0,
// }
```

Parameters

- **node_id** – Devicetree node identifier.

Returns

Static initializer for an *adc_channel_cfg* structure.

ADC_DT_SPEC_GET_BY_NAME(node_id, name)

Get ADC io-channel information from devicetree by name.

This returns a static initializer for an *adc_dt_spec* structure given a devicetree node and a channel name. The node must have the “io-channels” property defined.

Example devicetree fragment:

```
/ {
    zephyr,user {
        io-channels = <&adc0 1>, <&adc0 3>;
        io-channel-names = "A0", "A1";
    };
};

&adc0 {
   #address-cells = <1>;
   #size-cells = <0>;

   channel@3 {
       reg = <3>;
       zephyr,gain = "ADC_GAIN_1_5";
       zephyr,reference = "ADC_REF_VDD_1_4";
       zephyr,vref-mv = <750>;
       zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
       zephyr,resolution = <12>;
       zephyr,oversampling = <4>;
   };
};
```

Example usage:

```
static const struct adc_dt_spec adc_chan0 =
    ADC_DT_SPEC_GET_BY_NAME(DT_PATH(zephyr_user), a0);
static const struct adc_dt_spec adc_chan1 =
    ADC_DT_SPEC_GET_BY_NAME(DT_PATH(zephyr_user), a1);
```

(continues on next page)

(continued from previous page)

```
// Initializes 'adc_chan0' to:
// {
//     .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//     .channel_id = 1,
// }
// and 'adc_chan1' to:
// {
//     .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//     .channel_id = 3,
//     .channel_cfg_dt_node_exists = true,
//     .channel_cfg = {
//         .channel_id = 3,
//         .gain = ADC_GAIN_1_5,
//         .reference = ADC_REF_VDD_1_4,
//         .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//     },
//     .vref_mv = 750,
//     .resolution = 12,
//     .oversampling = 4,
// }
```

Parameters

- `node_id` – Devicetree node identifier.
- `name` – Channel name.

Returns
Static initializer for an *adc_dt_spec* structure.

`ADC_DT_SPEC_INST_GET_BY_NAME`(inst, name)
Get ADC io-channel information from a DT_DRV_COMPAT devicetree instance by name.

See also

ADC_DT_SPEC_GET_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – Channel name.

Returns
Static initializer for an *adc_dt_spec* structure.

`ADC_DT_SPEC_GET_BY_IDX`(node_id, idx)
Get ADC io-channel information from devicetree.

This returns a static initializer for an *adc_dt_spec* structure given a devicetree node and a channel index. The node must have the “io-channels” property defined.

Example devicetree fragment:

```
/ {
    zephyr,user {
        io-channels = <&adc0 1>, <&adc0 3>;
    };
```

(continues on next page)

(continued from previous page)

```
};

&adc0 {
   #address-cells = <1>;
   #size-cells = <0>;

   channel@3 {
       reg = <3>;
       zephyr,gain = "ADC_GAIN_1_5";
       zephyr,reference = "ADC_REF_VDD_1_4";
       zephyr,vref-mv = <750>;
       zephyr,acquisition-time = <ADC_ACQ_TIME_DEFAULT>;
       zephyr,resolution = <12>;
       zephyr,oversampling = <4>;
   };
};
```

Example usage:

```
static const struct adc_dt_spec adc_chan0 =
    ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 0);
static const struct adc_dt_spec adc_chan1 =
    ADC_DT_SPEC_GET_BY_IDX(DT_PATH(zephyr_user), 1);

// Initializes 'adc_chan0' to:
// {
//     .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//     .channel_id = 1,
// }
// and 'adc_chan1' to:
// {
//     .dev = DEVICE_DT_GET(DT_NODELABEL(adc0)),
//     .channel_id = 3,
//     .channel_cfg_dt_node_exists = true,
//     .channel_cfg = {
//         .channel_id = 3,
//         .gain = ADC_GAIN_1_5,
//         .reference = ADC_REF_VDD_1_4,
//         .acquisition_time = ADC_ACQ_TIME_DEFAULT,
//     },
//     .vref_mv = 750,
//     .resolution = 12,
//     .oversampling = 4,
// }
```

See also

ADC_DT_SPEC_GET()

Parameters

- `node_id` – Devicetree node identifier.
- `idx` – Channel index.

Returns

Static initializer for an *adc_dt_spec* structure.

ADC_DT_SPEC_INST_GET_BY_IDX(inst, idx)

Get ADC io-channel information from a DT_DRV_COMPAT devicetree instance.

See also

ADC_DT_SPEC_GET_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – Channel index.

Returns

Static initializer for an *adc_dt_spec* structure.

ADC_DT_SPEC_GET(node_id)

Equivalent to *ADC_DT_SPEC_GET_BY_IDX(node_id, 0)*.

See also

ADC_DT_SPEC_GET_BY_IDX()

Parameters

- **node_id** – Devicetree node identifier.

Returns

Static initializer for an *adc_dt_spec* structure.

ADC_DT_SPEC_INST_GET(inst)

Equivalent to *ADC_DT_SPEC_INST_GET_BY_IDX(inst, 0)*.

See also

ADC_DT_SPEC_GET()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns

Static initializer for an *adc_dt_spec* structure.

Typedefs

typedef enum *adc_action* (***adc_sequence_callback**)(const struct *device* *dev, const struct *adc_sequence* *sequence, uint16_t sampling_index)

Type definition of the optional callback function to be called after a requested sampling is done.

Param dev
Pointer to the device structure for the driver instance.

Param sequence
Pointer to the sequence structure that triggered the sampling. This parameter points to a copy of the structure that was supplied to the call that started the sampling sequence, thus it cannot be used with the *CONTAINER_OF()* macro to retrieve some other data associated with the sequence. Instead, the *adc_sequence_options::user_data* field should be used for such purpose.

Param sampling_index
Index (0-65535) of the sampling done.

Return
Action to be performed by the driver. See *adc_action*.

typedef int (*`adc_api_channel_setup`)(const struct *device* *dev, const struct *adc_channel_cfg* *channel_cfg)

Type definition of ADC API function for configuring a channel.

See *adc_channel_setup()* for argument descriptions.

typedef int (*`adc_api_read`)(const struct *device* *dev, const struct *adc_sequence* *sequence)

Type definition of ADC API function for setting a read request.

See *adc_read()* for argument descriptions.

typedef int (*`adc_api_read_async`)(const struct *device* *dev, const struct *adc_sequence* *sequence, struct *k_poll_signal* *async)

Type definition of ADC API function for setting an asynchronous read request.

See *adc_read_async()* for argument descriptions.

Enums

enum `adc_gain`

ADC channel gain factors.

Values:

enumerator `ADC_GAIN_1_6`

x 1/6.

enumerator `ADC_GAIN_1_5`

x 1/5.

enumerator `ADC_GAIN_1_4`

x 1/4.

enumerator `ADC_GAIN_1_3`

x 1/3.

enumerator `ADC_GAIN_2_5`

x 2/5.

enumerator ADC_GAIN_1_2
x 1/2.

enumerator ADC_GAIN_2_3

x 3.

enumerator ADC_GAIN_4
x 4.

enumerator ADC_GAIN_6
x 6.

enumerator ADC_GAIN_8
x 8.

enumerator ADC_GAIN_12
x 12.

enumerator ADC_GAIN_16
x 16.

enumerator ADC_GAIN_24
x 24.

enumerator ADC_GAIN_32
x 32.

enumerator ADC_GAIN_64
x 64.

enumerator ADC_GAIN_128
x 128.

enum adc_reference
ADC references.
Values:

enumerator ADC_REF_VDD_1
VDD.

enumerator ADC_REF_VDD_1_2
VDD/2.

enumerator ADC_REF_VDD_1_3
VDD/3.

enumerator ADC_REF_VDD_1_4
VDD/4.

enumerator ADC_REF_INTERNAL
Internal.

enumerator ADC_REF_EXTERNAL0
External, input 0.

enumerator ADC_REF_EXTERNAL1
External, input 1.

enum adc_action
Action to be performed after a sampling is done.

Values:

enumerator ADC_ACTION_CONTINUE = 0
The sequence should be continued normally.

enumerator ADC_ACTION_REPEAT
The sampling should be repeated.

New samples or sample should be read from the ADC and written in the same place as the recent ones.

enumerator ADC_ACTION_FINISH
The sequence should be finished immediately.

Functions

int adc_gain_invert(enum *adc_gain* gain, int32_t *value)
Invert the application of gain to a measurement value.

For example, if the gain passed in is ADC_GAIN_1_6 and the referenced value is 10, the value after the function returns is 60.

Parameters

- gain – the gain used to amplify the input signal.
- value – a pointer to a value that initially has the effect of the applied gain but has that effect removed when this function successfully returns. If the gain cannot be reversed the value remains unchanged.

Return values

- `0` – if the gain was successfully reversed
- `-EINVAL` – if the gain could not be interpreted

int `adc_channel_setup`(const struct *device* *dev, const struct *adc_channel_cfg* *channel_cfg)

Configure an ADC channel.

It is required to call this function and configure each channel before it is selected for a read request.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel_cfg` – Channel configuration.

Return values

- `0` – On success.
- `-EINVAL` – If a parameter with an invalid value has been provided.

static inline int `adc_channel_setup_dt`(const struct *adc_dt_spec* *spec)

Configure an ADC channel from a struct *adc_dt_spec*.

See also

adc_channel_setup()

Parameters

- `spec` – ADC specification from Devicetree.

Returns

A value from *adc_channel_setup()* or -ENOTSUP if information from Devicetree is not valid.

int `adc_read`(const struct *device* *dev, const struct *adc_sequence* *sequence)

Set a read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `sequence` – Structure specifying requested sequence of samplings.

Return values

- `0` – On success.
- `-EINVAL` – If a parameter with an invalid value has been provided.
- `-ENOMEM` – If the provided buffer is to small to hold the results of all requested samplings.
- `-ENOTSUP` – If the requested mode of operation is not supported.

- **-EBUSY** – If another sampling was triggered while the previous one was still in progress. This may occur only when samplings are done with intervals, and it indicates that the selected interval was too small. All requested samples are written in the buffer, but at least some of them were taken with an extra delay compared to what was scheduled.

static inline int **adc_read_dt**(const struct *adc_dt_spec* *spec, const struct *adc_sequence* *sequence)

Set a read request from a struct *adc_dt_spec*.

See also

adc_read()

Parameters

- **spec** – ADC specification from Devicetree.
- **sequence** – Structure specifying requested sequence of samplings.

Returns

A value from *adc_read()*.

int **adc_read_async**(const struct *device* *dev, const struct *adc_sequence* *sequence, struct *k_poll_signal* *async)

Set an asynchronous read request.

If invoked from user mode, any sequence struct options for callback must be NULL.

Note

This function is available only if `CONFIG_ADC_ASYNC` is selected.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **sequence** – Structure specifying requested sequence of samplings.
- **async** – Pointer to a valid and ready to be signaled struct *k_poll_signal*. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

Returns

0 on success, negative error code otherwise. See *adc_read()* for a list of possible error codes.

static inline uint16_t **adc_ref_internal**(const struct *device* *dev)

Get the internal reference voltage.

Returns the voltage corresponding to *ADC_REF_INTERNAL*, measured in millivolts.

Returns

a positive value is the reference voltage value. Returns zero if reference voltage information is not available.

static inline int **adc_raw_to_millivolts**(int32_t ref_mv, enum *adc_gain* gain, uint8_t resolution, int32_t *valp)

Convert a raw ADC value to millivolts.

This function performs the necessary conversion to transform a raw ADC measurement to a voltage in millivolts.

Parameters

- `ref_mv` – the reference voltage used for the measurement, in millivolts. This may be from *adc_ref_internal()* or a known external reference.
- `gain` – the ADC gain configuration used to sample the input
- `resolution` – the number of bits in the absolute value of the sample. For differential sampling this needs to be one less than the resolution in struct *adc_sequence*.
- `valp` – pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

Return values

- `0` – on successful conversion
- `-EINVAL` – if the gain is not reversible

static inline int **adc_raw_to_millivolts_dt**(const struct *adc_dt_spec* *spec, int32_t *valp)

Convert a raw ADC value to millivolts using information stored in a struct *adc_dt_spec*.

See also

adc_raw_to_millivolts()

Parameters

- `spec` – **[in]** ADC specification from Devicetree.
- `valp` – **[inout]** Pointer to the raw measurement value on input, and the corresponding millivolt value on successful conversion. If conversion fails the stored value is left unchanged.

Returns

A value from *adc_raw_to_millivolts()* or -ENOTSUP if information from Devicetree is not valid.

static inline int **adc_sequence_init_dt**(const struct *adc_dt_spec* *spec, struct *adc_sequence* *seq)

Initialize a struct *adc_sequence* from information stored in struct *adc_dt_spec*.

Note that this function only initializes the following fields:

- *adc_sequence::channels*
- *adc_sequence::resolution*
- *adc_sequence::oversampling*

Other fields should be initialized by the caller.

Parameters

- **spec** – **[in]** ADC specification from Devicetree.
- **seq** – **[out]** Sequence to initialize.

Return values

- **0** – On success
- **-ENOTSUP** – If spec does not have valid channel configuration

static inline bool **adc_is_ready_dt**(const struct *adc_dt_spec* *spec)

Validate that the ADC device is ready.

Parameters

- **spec** – ADC specification from devicetree

Return values

true – if the ADC device is ready for use and false otherwise.

struct **adc_channel_cfg**

#include <*adc.h*> Structure for specifying the configuration of an ADC channel.

Public Members

enum *adc_gain* **gain**

Gain selection.

enum *adc_reference* **reference**

Reference selection.

uint16_t **acquisition_time**

Acquisition time.

Use the ADC_ACQ_TIME macro to compose the value for this field or pass ADC_ACQ_TIME_DEFAULT to use the default setting for a given hardware (e.g. when the hardware does not allow to configure the acquisition time). Particular drivers do not necessarily support all the possible units. Value range is 0-16383 for a given unit.

uint8_t **channel_id**

Channel identifier.

This value primarily identifies the channel within the ADC API - when a read request is done, the corresponding bit in the “channels” field of the “adc_sequence” structure must be set to include this channel in the sampling. For hardware that does not allow selection of analog inputs for given channels, but rather have dedicated ones, this value also selects the physical ADC input to be used in the sampling. Otherwise, when it is needed to explicitly select an analog input for the channel, or two inputs when the channel is a differential one, the selection is done in “input_positive” and “input_negative” fields. Particular drivers indicate which one of the above two cases they support by selecting or not a special hidden Kconfig option named ADC_CONFIGURABLE_INPUTS. If this option is not selected, the macro CONFIG_ADC_CONFIGURABLE_INPUTS is not defined and consequently the mentioned two fields are not present in this structure. While this API allows identifiers from range 0-31, particular drivers may support only a limited number of channel identifiers (dependent on the underlying hardware capabilities or configured via a dedicated Kconfig option).

uint8_t **differential**

Channel type: single-ended or differential.

struct **adc_dt_spec**

#include <*adc.h*> Container for ADC channel information specified in devicetree.

See also

ADC_DT_SPEC_GET_BY_IDX

See also

ADC_DT_SPEC_GET

Public Members

const struct *device* ***dev**

Pointer to the device structure for the ADC driver instance used by this io-channel.

uint8_t **channel_id**

ADC channel identifier used by this io-channel.

bool **channel_cfg_dt_node_exists**

Flag indicating whether configuration of the associated ADC channel is provided as a child node of the corresponding ADC controller in devicetree.

struct *adc_channel_cfg* **channel_cfg**

Configuration of the associated ADC channel specified in devicetree.

This field is valid only when *channel_cfg_dt_node_exists* is set to *true*.

uint16_t **vref_mv**

Voltage of the reference selected for the channel or 0 if this value is not provided in devicetree.

This field is valid only when *channel_cfg_dt_node_exists* is set to *true*.

uint8_t **resolution**

ADC resolution to be used for that channel.

This field is valid only when *channel_cfg_dt_node_exists* is set to *true*.

uint8_t **oversampling**

Oversampling setting to be used for that channel.

This field is valid only when *channel_cfg_dt_node_exists* is set to *true*.

struct **adc_sequence_options**

#include <*adc.h*> Structure defining additional options for an ADC sampling sequence.

Public Members

uint32_t **interval_us**

Interval between consecutive samplings (in microseconds), 0 means sample as fast as possible, without involving any timer.

The accuracy of this interval is dependent on the implementation of a given driver. The default routine that handles the intervals uses a kernel timer for this purpose, thus, it has the accuracy of the kernel's system clock. Particular drivers may use some dedicated hardware timers and achieve a better precision.

adc_sequence_callback **callback**

Callback function to be called after each sampling is done.

Optional - set to NULL if it is not needed.

void ***user_data**

Pointer to user data.

It can be used to associate the sequence with any other data that is needed in the callback function.

uint16_t **extra_samplings**

Number of extra samplings to perform (the total number of samplings is 1 + extra_samplings).

struct **adc_sequence**

#include <adc.h> Structure defining an ADC sampling sequence.

Public Members

const struct *adc_sequence_options* ***options**

Pointer to a structure defining additional options for the sequence.

If NULL, the sequence consists of a single sampling.

uint32_t **channels**

Bit-mask indicating the channels to be included in each sampling of this sequence.

All selected channels must be configured with *adc_channel_setup()* before they are used in a sequence. The least significant bit corresponds to channel 0.

void ***buffer**

Pointer to a buffer where the samples are to be written.

Samples from subsequent samplings are written sequentially in the buffer. The number of samples written for each sampling is determined by the number of channels selected in the "channels" field. The values written to the buffer represent a sample from each selected channel starting from the one with the lowest ID. The buffer must be of an appropriate size, taking into account the number of selected channels and the ADC resolution used, as well as the number of samplings contained in the sequence.

size_t **buffer_size**

Specifies the actual size of the buffer pointed by the “buffer” field (in bytes).

The driver must ensure that samples are not written beyond the limit and it must return an error if the buffer turns out to be not large enough to hold all the requested samples.

uint8_t **resolution**

ADC resolution.

For single-ended channels the sample values are from range: 0 .. 2^resolution - 1, for differential ones:

- 2^(resolution-1) .. 2^(resolution-1) - 1.

uint8_t **oversampling**

Oversampling setting.

Each sample is averaged from 2^oversampling conversion results. This feature may be unsupported by a given ADC hardware, or in a specific mode (e.g. when sampling multiple channels).

bool **calibrate**

Perform calibration before the reading is taken if requested.

The impact of channel configuration on the calibration process is specific to the underlying hardware. ADC implementations that do not support calibration should ignore this flag.

struct **adc_driver_api**

#include <*adc.h*> ADC driver API.

This is the mandatory API any ADC driver needs to expose.

7.6.3 Auxiliary Display (auxdisplay)

Overview

Auxiliary Displays are text-based displays that have simple interfaces for displaying textual, numeric or alphanumeric data, as opposed to the *Display Interface*, auxiliary displays do not support custom graphical output to displays (and most often monochrome), the most advanced custom feature supported is generation of custom characters. These inexpensive displays are commonly found with various configurations and sizes, a common display size is 16 characters by 2 lines.

This API is unstable and subject to change.

Configuration Options

Related configuration options:

- CONFIG_AUXDISPLAY
- CONFIG_AUXDISPLAY_INIT_PRIORITY

API Reference

Related code samples

Auxiliary display
Output ”Hello World” to an auxiliary display.

group `auxdisplay_interface`

Auxiliary (Text) Display Interface.

Since
3.4

Version
0.1.0

Defines

`AUXDISPLAY_LIGHT_NOT_SUPPORTED`

Used for minimum and maximum brightness/backlight values if not supported.

Typedefs

typedef uint32_t `auxdisplay_mode_t`

Used to describe the mode of an auxiliary (text) display.

Enums

enum `auxdisplay_position`

Used for moving the cursor or display position.

Values:

enumerator `AUXDISPLAY_POSITION_ABSOLUTE` = 0

Moves to specified X,Y position.

enumerator `AUXDISPLAY_POSITION_RELATIVE`

Shifts current position by +/- X,Y position, does not take display direction into consideration.

enumerator `AUXDISPLAY_POSITION_RELATIVE_DIRECTION`

Shifts current position by +/- X,Y position, takes display direction into consideration.

enumerator `AUXDISPLAY_POSITION_COUNT`

enum `auxdisplay_direction`

Used for setting character append position.

Values:

enumerator `AUXDISPLAY_DIRECTION_RIGHT` = 0

Each character will be placed to the right of existing characters.

enumerator `AUXDISPLAY_DIRECTION_LEFT`

Each character will be placed to the left of existing characters.

enumerator `AUXDISPLAY_DIRECTION_COUNT`

Functions

int `auxdisplay_display_on`(const struct *device* *dev)

Turn display on.

Parameters

- `dev` – Auxiliary display device instance

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_display_off`(const struct *device* *dev)

Turn display off.

Parameters

- `dev` – Auxiliary display device instance

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_cursor_set_enabled`(const struct *device* *dev, bool enabled)

Set cursor enabled status on an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `enabled` – True to enable cursor, false to disable

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-errno` – Negative errno code on other failure.

int **auxdisplay_position_blinking_set_enabled**(const struct *device* *dev, bool enabled)

Set cursor blinking status on an auxiliary display.

Parameters

- **dev** – Auxiliary display device instance
- **enabled** – Set to true to enable blinking position, false to disable

Return values

- **0** – on success.
- **-ENOSYS** – if not supported/implemented.
- **-errno** – Negative errno code on other failure.

int **auxdisplay_cursor_shift_set**(const struct *device* *dev, uint8_t direction, bool display_shift)

Set cursor shift after character write and display shift.

Parameters

- **dev** – Auxiliary display device instance
- **direction** – Sets the direction of the display when characters are written
- **display_shift** – If true, will shift the display when characters are written (which makes it look like the display is moving, not the cursor)

Return values

- **0** – on success.
- **-ENOSYS** – if not supported/implemented.
- **-EINVAL** – if provided argument is invalid.
- **-errno** – Negative errno code on other failure.

int **auxdisplay_cursor_position_set**(const struct *device* *dev, enum *auxdisplay_position* type, int16_t x, int16_t y)

Set cursor (and write position) on an auxiliary display.

Parameters

- **dev** – Auxiliary display device instance
- **type** – Type of move, absolute or offset
- **x** – Exact or offset X position
- **y** – Exact or offset Y position

Return values

- **0** – on success.
- **-ENOSYS** – if not supported/implemented.
- **-EINVAL** – if provided argument is invalid.
- **-errno** – Negative errno code on other failure.

int **auxdisplay_cursor_position_get**(const struct *device* *dev, int16_t *x, int16_t *y)

Get current cursor on an auxiliary display.

Parameters

- **dev** – Auxiliary display device instance
- **x** – Will be updated with the exact X position

- `y` – Will be updated with the exact Y position

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_display_position_set`(const struct *device* *dev, enum *auxdisplay_position* type, int16_t x, int16_t y)

Set display position on an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `type` – Type of move, absolute or offset
- `x` – Exact or offset X position
- `y` – Exact or offset Y position

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_display_position_get`(const struct *device* *dev, int16_t *x, int16_t *y)

Get current display position on an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `x` – Will be updated with the exact X position
- `y` – Will be updated with the exact Y position

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_capabilities_get`(const struct *device* *dev, struct *auxdisplay_capabilities* *capabilities)

Fetch capabilities (and details) of auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `capabilities` – Will be updated with the details of the auxiliary display

Return values

- `0` – on success.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_clear`(const struct *device* *dev)

Clear display of auxiliary display and return to home position (note that this does not reset the display configuration, e.g.

custom characters and display mode will persist).

Parameters

- `dev` – Auxiliary display device instance

Return values

- `0` – on success.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_brightness_get`(const struct *device* *dev, uint8_t *brightness)

Get the current brightness level of an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `brightness` – Will be updated with the current brightness

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_brightness_set`(const struct *device* *dev, uint8_t brightness)

Update the brightness level of an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `brightness` – The brightness level to set

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_backlight_get`(const struct *device* *dev, uint8_t *backlight)

Get the backlight level details of an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `backlight` – Will be updated with the current backlight level

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_backlight_set`(const struct *device* *dev, uint8_t backlight)

Update the backlight level of an auxiliary display.

Parameters

- `dev` – Auxiliary display device instance
- `backlight` – The backlight level to set

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_is_busy`(const struct *device* *dev)

Check if an auxiliary display driver is busy.

Parameters

- `dev` – Auxiliary display device instance

Return values

- `1` – on success and display busy.
- `0` – on success and display not busy.
- `-ENOSYS` – if not supported/implemented.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_custom_character_set`(const struct *device* *dev, struct *auxdisplay_character* *character)

Sets a custom character in the display, the custom character struct must contain the pixel data for the custom character to add and valid custom character index, if successful then the character_code variable in the struct will be set to the character code that can be used with the *auxdisplay_write()* function to show it.

A character must be valid for a display consisting of a uint8 array of size character width by character height, values should be 0x00 for pixel off or 0xff for pixel on, if a display supports shades then values between 0x00 and 0xff may be used (display driver dependent).

Parameters

- `dev` – Auxiliary display device instance
- `character` – Pointer to custom character structure

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_write`(const struct *device* *dev, const uint8_t *data, uint16_t len)

Write data to auxiliary display screen at current position.

Parameters

- `dev` – Auxiliary display device instance
- `data` – Text data to write

- `len` – Length of text data to write

Return values

- `0` – on success.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

int `auxdisplay_custom_command`(const struct *device* *dev, struct *auxdisplay_custom_data* *data)

Send a custom command to the display (if supported by driver)

Parameters

- `dev` – Auxiliary display device instance
- `data` – Custom command structure (this may be extended by specific drivers)

Return values

- `0` – on success.
- `-ENOSYS` – if not supported/implemented.
- `-EINVAL` – if provided argument is invalid.
- `-errno` – Negative errno code on other failure.

struct `auxdisplay_light`

#include <auxdisplay.h> Light levels for brightness and/or backlight.

If not supported by a display/driver, both minimum and maximum will be AUXDISPLAY_LIGHT_NOT_SUPPORTED.

Public Members

uint8_t `minimum`

Minimum light level supported.

uint8_t `maximum`

Maximum light level supported.

struct `auxdisplay_capabilities`

#include <auxdisplay.h> Structure holding display capabilities.

Public Members

uint16_t `columns`

Number of character columns.

uint16_t `rows`

Number of character rows.

auxdisplay_mode_t **mode**
Display-specific data (e.g.

4-bit or 8-bit mode for HD44780-based displays)

struct *auxdisplay_light* **brightness**
Brightness details for display (if supported)

struct *auxdisplay_light* **backlight**
Backlight details for display (if supported)

uint8_t **custom_characters**
Number of custom characters supported by display (0 if unsupported)

uint8_t **custom_character_width**
Width (in pixels) of a custom character, supplied custom characters should match.

uint8_t **custom_character_height**
Height (in pixels) of a custom character, supplied custom characters should match.

struct **auxdisplay_custom_data**
#include <*auxdisplay.h*> Structure for a custom command.

This may be extended by specific drivers.

Public Members

uint8_t ***data**
Raw command data to be sent.

uint16_t **len**
Length of supplied data.

uint32_t **options**
Display-driver specific options for command.

struct **auxdisplay_character**
#include <*auxdisplay.h*> Structure for a custom character.

Public Members

uint8_t **index**
Custom character index on the display.

uint8_t ***data**
Custom character pixel data, a character must be valid for a display consisting of a uint8 array of size character width by character height, values should be 0x00 for pixel off or 0xff for pixel on, if a display supports shades then values between 0x00 and 0xff may be used (display driver dependent).

uint8_t **character_code**

Will be updated with custom character index to use in the display write function to disaplay this custom character.

7.6.4 Audio

Audio Codec

Overview The Audio Codec API provides access to digital audio codecs.

Configuration Options Related configuration options:

- CONFIG_AUDIO_CODEC

API Reference

group **audio_codec_interface**

Abstraction for audio codecs.

Since
1.13

Version
0.1.0

Typedefs

typedef void (***audio_codec_error_callback_t**)(const struct *device* *dev, uint32_t errors)

Callback for error interrupt.

Param dev
Pointer to the codec device

Param errors
Device errors (bitmask of *audio_codec_error_type* values)

Enums

enum **audio_pcm_rate_t**

PCM audio sample rates.

Values:

enumerator **AUDIO_PCM_RATE_8K** = 8000

8 kHz sample rate

enumerator **AUDIO_PCM_RATE_16K** = 16000

16 kHz sample rate

enumerator AUDIO_PCM_RATE_24K = 24000
24 kHz sample rate

enumerator AUDIO_PCM_RATE_32K = 32000
32 kHz sample rate

enumerator AUDIO_PCM_RATE_44P1K = 44100
44.1 kHz sample rate

enumerator AUDIO_PCM_RATE_48K = 48000
48 kHz sample rate

enumerator AUDIO_PCM_RATE_96K = 96000
96 kHz sample rate

enumerator AUDIO_PCM_RATE_192K = 192000
192 kHz sample rate

enum audio_pcm_width_t
PCM audio sample bit widths.
Values:

enumerator AUDIO_PCM_WIDTH_16_BITS = 16
16-bit sample width

enumerator AUDIO_PCM_WIDTH_20_BITS = 20
20-bit sample width

enumerator AUDIO_PCM_WIDTH_24_BITS = 24
24-bit sample width

enumerator AUDIO_PCM_WIDTH_32_BITS = 32
32-bit sample width

enum audio_dai_type_t
Digital Audio Interface (DAI) type.
Values:

enumerator AUDIO_DAI_TYPE_I2S
I2S Interface.

enumerator AUDIO_DAI_TYPE_INVALID
Other interfaces can be added here.

enum audio_property_t
Codec properties that can be set by *audio_codec_set_property()*.
Values:

enumerator AUDIO_PROPERTY_OUTPUT_VOLUME
Output volume.

enumerator AUDIO_PROPERTY_OUTPUT_MUTE
Output mute/unmute.

enum audio_channel_t
Audio channel identifiers to use in *audio_codec_set_property()*.

Values:

enumerator AUDIO_CHANNEL_FRONT_LEFT
Front left channel.

enumerator AUDIO_CHANNEL_FRONT_RIGHT
Front right channel.

enumerator AUDIO_CHANNEL_LFE
Low frequency effect channel.

enumerator AUDIO_CHANNEL_FRONT_CENTER
Front center channel.

enumerator AUDIO_CHANNEL_REAR_LEFT
Rear left channel.

enumerator AUDIO_CHANNEL_REAR_RIGHT
Rear right channel.

enumerator AUDIO_CHANNEL_REAR_CENTER
Rear center channel.

enumerator AUDIO_CHANNEL_SIDE_LEFT
Side left channel.

enumerator AUDIO_CHANNEL_SIDE_RIGHT
Side right channel.

enumerator AUDIO_CHANNEL_ALL
All channels.

enum audio_codec_error_type
Codec error type.

Values:

enumerator AUDIO_CODEC_ERROR_OVERCURRENT = *BIT*(0)
Output over-current.

enumerator AUDIO_CODEC_ERROR_OVERTEMPERATURE = *BIT*(1)

Codec over-temperature.

enumerator AUDIO_CODEC_ERROR_UNDERVOLTAGE = *BIT*(2)

Power low voltage.

enumerator AUDIO_CODEC_ERROR_OVERVOLTAGE = *BIT*(3)

Power high voltage.

enumerator AUDIO_CODEC_ERROR_DC = *BIT*(4)

Output direct-current.

Functions

static inline int **audio_codec_configure**(const struct *device* *dev, struct *audio_codec_cfg* *cfg)

Configure the audio codec.

Configure the audio codec device according to the configuration parameters provided as input

Parameters

- **dev** – Pointer to the device structure for codec driver instance.
- **cfg** – Pointer to the structure containing the codec configuration.

Returns

0 on success, negative error code on failure

static inline void **audio_codec_start_output**(const struct *device* *dev)

Set codec to start output audio playback.

Setup the audio codec device to start the audio playback

Parameters

- **dev** – Pointer to the device structure for codec driver instance.

static inline void **audio_codec_stop_output**(const struct *device* *dev)

Set codec to stop output audio playback.

Setup the audio codec device to stop the audio playback

Parameters

- **dev** – Pointer to the device structure for codec driver instance.

static inline int **audio_codec_set_property**(const struct *device* *dev, *audio_property_t* property, *audio_channel_t* channel, *audio_property_value_t* val)

Set a codec property defined by audio_property_t.

Set a property such as volume level, clock configuration etc.

Parameters

- **dev** – Pointer to the device structure for codec driver instance.
- **property** – The codec property to set
- **channel** – The audio channel for which the property has to be set

- `val` – pointer to a property value of type audio_codec_property_value_t

Returns
0 on success, negative error code on failure

static inline int **audio_codec_apply_properties**(const struct *device* *dev)

Atomically apply any cached properties.

Following one or more invocations of audio_codec_set_property, that may have been cached by the driver, audio_codec_apply_properties can be invoked to apply all the properties as atomic as possible

Parameters

- `dev` – Pointer to the device structure for codec driver instance.

Returns
0 on success, negative error code on failure

static inline int **audio_codec_clear_errors**(const struct *device* *dev)

Clear any codec errors.

Clear all codec errors. If an error interrupt exists, it will be de-asserted.

Parameters

- `dev` – Pointer to the device structure for codec driver instance.

Returns
0 on success, negative error code on failure

static inline int **audio_codec_register_error_callback**(const struct *device* *dev, *audio_codec_error_callback_t* cb)

Register a callback function for codec error.

The callback will be called from a thread, so I2C or SPI operations are safe. However, the thread's stack is limited and defined by the driver. It is currently up to the caller to ensure that the callback does not overflow the stack.

Parameters

- `dev` – Pointer to the audio codec device
- `cb` – The function that should be called when an error is detected fires

Returns
0 if successful, negative errno code if failure.

union **audio_dai_cfg_t**

#include <*codec.h*> Digital Audio Interface Configuration.

Configuration is dependent on DAI type

Public Members

struct *i2s_config* **i2s**

I2S configuration.

struct **audio_codec_cfg**

#include <*codec.h*> Codec configuration parameters.

Public Members

uint32_t **mclk_freq**
MCLK input frequency in Hz.

Enums

enum dmic_state

DMIC driver states.

Values:

enumerator DMIC_STATE_UNINIT

Uninitialized.

enumerator DMIC_STATE_INITIALIZED

Initialized.

enumerator DMIC_STATE_CONFIGURED

Configured.

enumerator DMIC_STATE_ACTIVE

Active.

enumerator DMIC_STATE_PAUSED

Paused.

enumerator DMIC_STATE_ERROR

Error.

enum dmic_trigger

DMIC driver trigger commands.

Values:

enumerator DMIC_TRIGGER_STOP

Stop stream.

enumerator DMIC_TRIGGER_START

Start stream.

enumerator DMIC_TRIGGER_PAUSE

Pause stream.

enumerator DMIC_TRIGGER_RELEASE

Release paused stream.

enumerator DMIC_TRIGGER_RESET

Reset stream.

enum pdm_lr

PDM Channels LEFT / RIGHT.

Values:

enumerator PDM_CHAN_LEFT

Left channel.

enumerator PDM_CHAN_RIGHT

Right channel.

Functions

static inline uint32_t dmic_build_channel_map(uint8_t channel, uint8_t pdm, enum *pdm_lr* lr)

Build the channel map to populate struct *pdm_chan_cfg*.

Returns the map of PDM controller and LEFT/RIGHT channel shifted to the bit position corresponding to the input logical channel value

Parameters

- channel – The logical channel number
- pdm – The PDM hardware controller number
- lr – LEFT/RIGHT channel within the chosen PDM hardware controller

Returns

Bit-map containing the PDM and L/R channel information

static inline void dmic_parse_channel_map(uint32_t channel_map_lo, uint32_t channel_map_hi, uint8_t channel, uint8_t *pdm, enum *pdm_lr* *lr)

Helper function to parse the channel map in *pdm_chan_cfg*.

Returns the PDM controller and LEFT/RIGHT channel corresponding to the channel map and the logical channel provided as input

Parameters

- channel_map_lo – Lower order/significant bits of the channel map
- channel_map_hi – Higher order/significant bits of the channel map
- channel – The logical channel number
- pdm – Pointer to the PDM hardware controller number
- lr – Pointer to the LEFT/RIGHT channel within the PDM controller

static inline uint32_t dmic_build_clk_skew_map(uint8_t pdm, uint8_t skew)

Build a bit map of clock skew values for each PDM channel.

Returns the bit-map of clock skew value shifted to the bit position corresponding to the input PDM controller value

Parameters

- pdm – The PDM hardware controller number
- skew – The skew to apply for the clock output from the PDM controller

Returns

Bit-map containing the clock skew information

static inline int **dmic_configure**(const struct *device* *dev, struct *dmic_cfg* *cfg)

Configure the DMIC driver and controller(s)

Configures the DMIC driver device according to the number of channels, channel mapping, PDM I/O configuration, PCM stream configuration, etc.

Parameters

- **dev** – Pointer to the device structure for DMIC driver instance
- **cfg** – Pointer to the structure containing the DMIC configuration

Returns
0 on success, a negative error code on failure

static inline int **dmic_trigger**(const struct *device* *dev, enum *dmic_trigger* cmd)

Send a command to the DMIC driver.

Sends a command to the driver to perform a specific action

Parameters

- **dev** – Pointer to the device structure for DMIC driver instance
- **cmd** – The command to be sent to the driver instance

Returns
0 on success, a negative error code on failure

static inline int **dmic_read**(const struct *device* *dev, uint8_t stream, void **buffer, size_t *size, int32_t timeout)

Read received decimated PCM data stream.

Optionally waits for audio to be received and provides the received audio buffer from the requested stream

Parameters

- **dev** – Pointer to the device structure for DMIC driver instance
- **stream** – Stream identifier
- **buffer** – Pointer to the received buffer address
- **size** – Pointer to the received buffer size
- **timeout** – Timeout in milliseconds to wait in case audio is not yet received, or SYS_FOREVER_MS

Returns
0 on success, a negative error code on failure

struct **pdm_io_cfg**

#include <dmic.h> PDM Input/Output signal configuration.

Parameters common to all PDM controllers

uint32_t **min_pdm_clk_freq**

Minimum clock frequency supported by the mic.

uint32_t **max_pdm_clk_freq**

Maximum clock frequency supported by the mic.

uint8_t **min_pdm_clk_dc**
Minimum duty cycle in % supported by the mic.

uint8_t **max_pdm_clk_dc**
Maximum duty cycle in % supported by the mic.

Parameters unique to each PDM controller

uint8_t **pdm_clk_pol**
Bit mask to optionally invert PDM clock.

uint8_t **pdm_data_pol**
Bit mask to optionally invert mic data.

uint32_t **pdm_clk_skew**
Collection of clock skew values for each PDM port.

struct **pcm_stream_cfg**
#include <*dmic.h*> Configuration of the PCM streams to be output by the PDM hardware.

> **Note**
> if either *pcm_rate* or *pcm_width* is set to 0 for a stream, the stream would be disabled

Public Members

uint32_t **pcm_rate**
PCM sample rate of stream.

uint8_t **pcm_width**
PCM sample width of stream.

uint16_t **block_size**
PCM sample block size per transfer.

struct k_mem_slab ***mem_slab**
SLAB for DMIC driver to allocate buffers for stream.

struct **pdm_chan_cfg**
#include <*dmic.h*> Mapping/ordering of the PDM channels to logical PCM output channel.

Since each controller can have 2 audio channels (stereo), there can be a total of 8x2=16 channels. The actual number of channels shall be described in *act_num_chan*.

If 2 streams are enabled, the channel order will be the same for both streams.

Each channel is described as a 4-bit number, the least significant bit indicates LEFT/RIGHT selection of the PDM controller.

The most significant 3 bits indicate the PDM controller number:

- bits 0-3 are for channel 0, bit 0 indicates LEFT or RIGHT
- bits 4-7 are for channel 1, bit 4 indicates LEFT or RIGHT and so on.

CONSTRAINT: The LEFT and RIGHT channels of EACH PDM controller needs to be adjacent to each other.

Requested channel map

uint32_t **req_chan_map_lo**
: Channels 0 to 7.

uint32_t **req_chan_map_hi**
: Channels 8 to 15.

Actual channel map that the driver could configure

uint32_t **act_chan_map_lo**
: Channels 0 to 7.

uint32_t **act_chan_map_hi**
: Channels 8 to 15.

Public Members

uint8_t **req_num_chan**
: Requested number of channels.

uint8_t **act_num_chan**
: Actual number of channels that the driver could configure.

uint8_t **req_num_streams**
: Requested number of streams for each channel.

uint8_t **act_num_streams**
: Actual number of streams that the driver could configure.

struct **dmic_cfg**
: *#include* <*dmic.h*> Input configuration structure for the DMIC configuration API.

Public Members

struct *pcm_stream_cfg* ***streams**
: Array of *pcm_stream_cfg* for application to provide configuration for each stream.

Inter-IC Sound (I2S) Bus

Overview The I2S (Inter-IC Sound) API provides support for the standard I2S interface as well as common non-standard extensions such as PCM Short/Long Frame Sync and Left/Right Justified Data Formats.

Configuration Options Related configuration options:

- `CONFIG_I2S`

API Reference

group `i2s_interface`

I2S (Inter-IC Sound) Interface.

Since
1.9

Version
1.0.0

The I2S API provides support for the standard I2S interface standard as well as common non-standard extensions such as PCM Short/Long Frame Sync, Left/Right Justified Data Format.

Defines

`I2S_FMT_DATA_FORMAT_SHIFT`

Data Format bit field position.

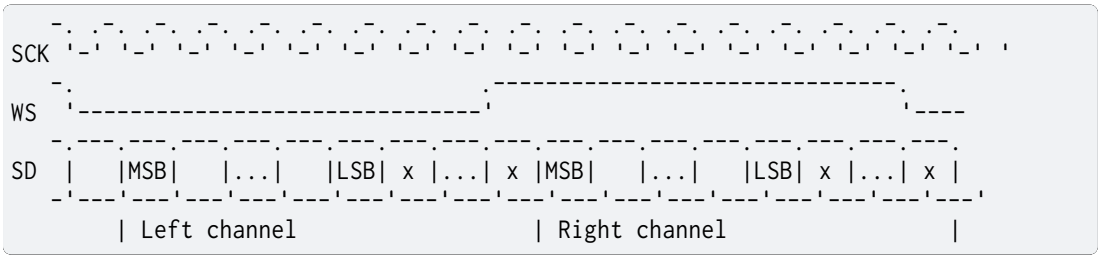
`I2S_FMT_DATA_FORMAT_MASK`

Data Format bit field mask.

`I2S_FMT_DATA_FORMAT_I2S`

Standard I2S Data Format.

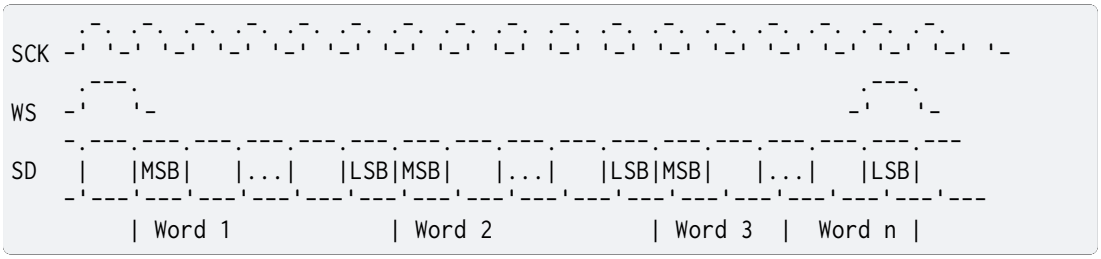
Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The MSB is always sent one clock period after the WS changes. Left channel data are sent first indicated by WS = 0, followed by right channel data indicated by WS = 1.



I2S_FMT_DATA_FORMAT_PCM_SHORT

PCM Short Frame Sync Data Format.

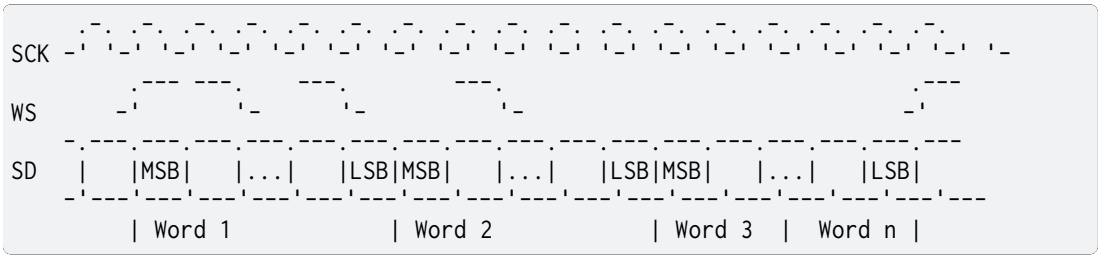
Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The falling edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync is one clock cycle long. An arbitrary number of data words can be sent in one frame.



I2S_FMT_DATA_FORMAT_PCM_LONG

PCM Long Frame Sync Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the falling edge of the clock signal (SCK). The rising edge of the frame sync signal (WS) indicates the start of the PCM word. The frame sync has an arbitrary length, however it has to fall before the start of the next frame. An arbitrary number of data words can be sent in one frame.



I2S_FMT_DATA_FORMAT_LEFT_JUSTIFIED

Left Justified Data Format.

Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are left justified such that the MSB is always sent in the clock period following the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

       | Left channel                  | Right channel                 |
```

I2S_FMT_DATA_FORMAT_RIGHT_JUSTIFIED
: Right Justified Data Format.

  Serial data is transmitted in two's complement with the MSB first. Both Word Select (WS) and Serial Data (SD) signals are sampled on the rising edge of the clock signal (SCK). The bits within the data word are right justified such that the LSB is always sent in the clock period preceding the WS transition. Left channel data are sent first indicated by WS = 1, followed by right channel data indicated by WS = 0.

```
     .-. .-. .-. .-. .-. .-. .-. .-. .-. .-. .-. .-. .-. .-. .-. .-.
SCK -' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-' '-
       .--------------------------------.                               .-

       | Left channel                  | Right channel                 |
```

I2S_FMT_DATA_ORDER_MSB
: Send MSB first.

I2S_FMT_DATA_ORDER_LSB
: Send LSB first.

I2S_FMT_DATA_ORDER_INV
: Invert bit ordering, send LSB first.

I2S_FMT_CLK_FORMAT_SHIFT
: Data Format bit field position.

I2S_FMT_CLK_FORMAT_MASK
: Data Format bit field mask.

I2S_FMT_BIT_CLK_INV
: Invert bit clock.

I2S_FMT_FRAME_CLK_INV
: Invert frame clock.

I2S_FMT_CLK_NF_NB
: Normal Frame, Normal Bit Clk.

I2S_FMT_CLK_NF_IB
: Normal Frame, Inverted Bit Clk.

I2S_FMT_CLK_IF_NB
: Inverted Frame, Normal Bit Clk.

I2S_FMT_CLK_IF_IB
: Inverted Frame, Inverted Bit Clk.

I2S_OPT_BIT_CLK_CONT
: Run bit clock continuously.

I2S_OPT_BIT_CLK_GATED
: Run bit clock when sending data only.

I2S_OPT_BIT_CLK_MASTER
: I2S driver is bit clock master.

I2S_OPT_BIT_CLK_SLAVE
: I2S driver is bit clock slave.

I2S_OPT_FRAME_CLK_MASTER
: I2S driver is frame clock master.

I2S_OPT_FRAME_CLK_SLAVE
: I2S driver is frame clock slave.

I2S_OPT_LOOPBACK
: Loop back mode.

  In loop back mode RX input will be connected internally to TX output. This is used primarily for testing.

I2S_OPT_PINGPONG
: Ping pong mode.

  In ping pong mode TX output will keep alternating between a ping buffer and a pong buffer. This is normally used in audio streams when one buffer is being populated while the other is being played (DMAed) and vice versa. So, in this mode, 2 sets of buffers fixed in size are used. Static Arrays are used to achieve this and hence they are never freed.

Typedefs

typedef uint8_t **i2s_fmt_t**
: I2S data stream format options.

typedef uint8_t **i2s_opt_t**
: I2S configuration options.

Enums

enum **i2s_dir**
: I2C Direction.

  Values:

enumerator I2S_DIR_RX

Receive data.

enumerator I2S_DIR_TX

Transmit data.

enumerator I2S_DIR_BOTH

Both receive and transmit data.

enum i2s_state

Interface state.

Values:

enumerator I2S_STATE_NOT_READY

The interface is not ready.

```
The interface was initialized but is not yet ready to receive /
transmit data. Call i2s_configure() to configure interface and change
its state to READY.
```

enumerator I2S_STATE_READY

The interface is ready to receive / transmit data.

enumerator I2S_STATE_RUNNING

The interface is receiving / transmitting data.

enumerator I2S_STATE_STOPPING

The interface is draining its transmit queue.

enumerator I2S_STATE_ERROR

TX buffer underrun or RX buffer overrun has occurred.

enum i2s_trigger_cmd

Trigger command.

Values:

enumerator I2S_TRIGGER_START

Start the transmission / reception of data.

```
If I2S_DIR_TX is set some data has to be queued for transmission by
the i2s_write() function. This trigger can be used in READY state
only and changes the interface state to RUNNING.
```

enumerator I2S_TRIGGER_STOP

Stop the transmission / reception of data.

```
Stop the transmission / reception of data at the end of the current
memory block. This trigger can be used in RUNNING state only and at
first changes the interface state to STOPPING. When the current TX /
RX block is transmitted / received the state is changed to READY.
```

(continues on next page)

(continued from previous page)

```
Subsequent START trigger will resume transmission / reception where
it stopped.
```

enumerator `I2S_TRIGGER_DRAIN`

Empty the transmit queue.

```
Send all data in the transmit queue and stop the transmission.
If the trigger is applied to the RX queue it has the same effect as
I2S_TRIGGER_STOP. This trigger can be used in RUNNING state only and
at first changes the interface state to STOPPING. When all TX blocks
are transmitted the state is changed to READY.
```

enumerator `I2S_TRIGGER_DROP`

Discard the transmit / receive queue.

```
Stop the transmission / reception immediately and discard the
contents of the respective queue. This trigger can be used in any
state other than NOT_READY and changes the interface state to READY.
```

enumerator `I2S_TRIGGER_PREPARE`

Prepare the queues after underrun/overrun error has occurred.

```
This trigger can be used in ERROR state only and changes the
interface state to READY.
```

Functions

int `i2s_configure`(const struct *device* *dev, enum *i2s_dir* dir, const struct *i2s_config* *cfg)

Configure operation of a host I2S controller.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by I2S_DIR_*. The I2S_DIR_BOTH value may not be supported by some drivers. For those, the RX and TX streams need to be configured separately.
- `cfg` – Pointer to the structure containing configuration parameters.

Return values

- `0` – If successful.
- `-EINVAL` – Invalid argument.
- `-ENOSYS` – I2S_DIR_BOTH value is not supported.

static inline const struct *i2s_config* ***i2s_config_get**(const struct *device* *dev, enum *i2s_dir* dir)

Fetch configuration information of a host I2S controller.

Parameters

- **dev** – Pointer to the device structure for the driver instance
- **dir** – Stream direction: RX or TX as defined by I2S_DIR_*

Return values

Pointer – to the structure containing configuration parameters, or NULL if un-configured

static inline int **i2s_read**(const struct *device* *dev, void **mem_block, size_t *size)

Read data from the RX queue.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Ownership of the RX memory block is passed on to the user application which has to release it.

The data is read in chunks equal to the size of the memory block. If the interface is in READY state the number of bytes read can be smaller.

If there is no data in the RX queue the function will block waiting for the next RX memory block to fill in. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Reading from the RX queue is possible in any state other than NOT_READY. If the interface is in the ERROR state it is still possible to read all the valid data stored in RX queue. Afterwards the function will return -EIO error.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **mem_block** – Pointer to the RX memory block containing received data.
- **size** – Pointer to the variable storing the number of bytes read.

Return values

- **0** – If successful.
- **-EIO** – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- **-EBUSY** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.

int **i2s_buf_read**(const struct *device* *dev, void *buf, size_t *size)

Read data from the RX queue into a provided buffer.

Data received by the I2S interface is stored in the RX queue consisting of memory blocks preallocated by this function from rx_mem_slab (as defined by i2s_configure). Calling this function removes one block from the queue which is copied into the provided buffer and then freed.

The provided buffer must be large enough to contain a full memory block of data, which is parameterized for the channel via *i2s_configure()*.

This function is otherwise equivalent to *i2s_read()*.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

- `buf` – Destination buffer for read data, which must be at least the as large as the configured memory block size for the RX channel.
- `size` – Pointer to the variable storing the number of bytes read.

Return values

- `0` – If successful.
- `-EIO` – The interface is in NOT_READY or ERROR state and there are no more data blocks in the RX queue.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.

static inline int `i2s_write`(const struct *device* *dev, void *mem_block, size_t size)

Write data to the TX queue.

Data to be sent by the I2S interface is stored first in the TX queue. TX queue consists of memory blocks preallocated by the user from tx_mem_slab (as defined by i2s_configure). This function takes ownership of the memory block and will release it when all data are transmitted.

If there are no free slots in the TX queue the function will block waiting for the next TX memory block to be send and removed from the queue. This operation can timeout as defined by i2s_configure. If the timeout value is set to K_NO_WAIT the function is non-blocking.

Writing to the TX queue is only possible if the interface is in READY or RUNNING state.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `mem_block` – Pointer to the TX memory block containing data to be sent.
- `size` – Number of bytes to write. This value has to be equal or smaller than the size of the memory block.

Return values

- `0` – If successful.
- `-EIO` – The interface is not in READY or RUNNING state.
- `-EBUSY` – Returned without waiting.
- `-EAGAIN` – Waiting period timed out.

int `i2s_buf_write`(const struct *device* *dev, void *buf, size_t size)

Write data to the TX queue from a provided buffer.

This function acquires a memory block from the I2S channel TX queue and copies the provided data buffer into it. It is otherwise equivalent to *i2s_write()*.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `buf` – Pointer to a buffer containing the data to transmit.
- `size` – Number of bytes to write. This value has to be equal or smaller than the size of the channel's TX memory block configuration.

Return values

- `0` – If successful.
- `-EIO` – The interface is not in READY or RUNNING state.
- `-EBUSY` – Returned without waiting.

- `-EAGAIN` – Waiting period timed out.
- `-ENOMEM` – No memory in TX slab queue.
- `-EINVAL` – Size parameter larger than TX queue memory block.

int `i2s_trigger`(const struct *device* *dev, enum *i2s_dir* dir, enum *i2s_trigger_cmd* cmd)

Send a trigger command.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by I2S_DIR_*. The I2S_DIR_BOTH value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

Return values

- `0` – If successful.
- `-EINVAL` – Invalid argument.
- `-EIO` – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- `-ENOMEM` – RX/TX memory block not available.
- `-ENOSYS` – I2S_DIR_BOTH value is not supported.

struct `i2s_config`

#include <i2s.h> Interface configuration options.

Memory slab pointed to by the mem_slab field has to be defined and initialized by the user. For I2S driver to function correctly number of memory blocks in a slab has to be at least 2 per queue. Size of the memory block should be multiple of frame_size where frame_size = (channels * word_size_bytes). As an example 16 bit word will occupy 2 bytes, 24 or 32 bit word will occupy 4 bytes.

Please check Zephyr Kernel Primer for more information on memory slabs.

Remark

When I2S data format is selected parameter channels is ignored, number of words in a frame is always 2.

Public Members

uint8_t `word_size`

Number of bits representing one data word.

uint8_t `channels`

Number of words per frame.

i2s_fmt_t `format`

Data stream format as defined by I2S_FMT_* constants.

i2s_opt_t **options**

Configuration options as defined by I2S_OPT_* constants.

uint32_t **frame_clk_freq**

Frame clock (WS) frequency, this is sampling rate.

struct k_mem_slab ***mem_slab**

Memory slab to store RX/TX data.

size_t **block_size**

Size of one RX/TX memory block (buffer) in bytes.

int32_t **timeout**

Read/Write timeout.

Number of milliseconds to wait in case TX queue is full or RX queue is empty, or 0, or SYS_FOREVER_MS.

Digital Audio Interface (DAI)

Overview The DAI (Digital Audio Interface) is a generic high level API for audio drivers. It can be configured with bespoke data for vendor specific configuration.

Configuration Options Related configuration options:

- CONFIG_DAI

API Reference

group **dai_interface**

DAI Interface.

Since
3.1

Version
0.1.0

The DAI API provides support for the standard I2S (SSP) and its common variants. It supports also DMIC, HDA and SDW backends. The API has a config function with bespoke data argument for device/vendor specific config. There are also optional timestamping functions to get device specific audio clock time.

Defines

DAI_FORMAT_CLOCK_PROVIDER_MASK

Used to extract the clock configuration from the format attribute of struct *dai_config*.

DAI_FORMAT_PROTOCOL_MASK

Used to extract the protocol from the format attribute of struct *dai_config*.

DAI_FORMAT_CLOCK_INVERSION_MASK

Used to extract the clock inversion from the format attribute of struct *dai_config*.

Enums

enum dai_clock_provider

DAI clock configurations.

This is used to describe all of the possible clock-related configurations w.r.t the DAI and the codec.

Values:

enumerator DAI_CBP_CFP = (0 « 12)

codec BLCK provider, codec FSYNC provider

codec BCLK consumer, codec FSYNC provider

enumerator DAI_CBC_CFP = (2 « 12)

codec BCLK provider, codec FSYNC consumer

enumerator DAI_CBP_CFC = (3 « 12)

codec BCLK consumer, codec FSYNC consumer

enumerator DAI_CBC_CFC = (4 « 12)

enum dai_protocol

DAI protocol.

The communication between the DAI and the CODEC may use different protocols depending on the scenario.

Values:

enumerator DAI_PROTO_I2S = 1

I2S.

enumerator DAI_PROTO_RIGHT_J

Right Justified.

enumerator DAI_PROTO_LEFT_J

Left Justified.

enumerator DAI_PROTO_DSP_A

TDM, FSYNC asserted 1 BCLK early.

enumerator DAI_PROTO_DSP_B

TDM, FSYNC asserted at the same time as MSB.

enumerator DAI_PROTO_PDM

Pulse Density Modulation.

enum dai_clock_inversion

DAI clock inversion.

Some applications may require a different clock polarity (FSYNC/BCLK) compared to the default one chosen based on the protocol.

Values:

enumerator DAI_INVERSION_NB_NF = 0

no BCLK inversion, no FSYNC inversion

no BCLK inversion, FSYNC inversion

enumerator DAI_INVERSION_NB_IF = (2 « 8)

BCLK inversion, no FSYNC inversion.

enumerator DAI_INVERSION_IB_NF = (3 « 8)

BCLK inversion, FSYNC inversion.

enumerator DAI_INVERSION_IB_IF = (4 « 8)

enum dai_type

Types of DAI.

The type of the DAI. This ID type is used to configure bespoke DAI HW settings.

DAIs have a lot of physical link feature variability and therefore need different configuration data to cater for different use cases. We usually need to pass extra bespoke configuration prior to DAI start.

Values:

enumerator DAI_LEGACY_I2S = 0

Legacy I2S compatible with i2s.h.

enumerator DAI_INTEL_SSP

Intel SSP.

enumerator DAI_INTEL_DMIC

Intel DMIC.

enumerator DAI_INTEL_HDA

Intel HD/A.

enumerator DAI_INTEL_ALH

Intel ALH.

enumerator DAI_IMX_SAI

i.MX SAI

enumerator DAI_IMX_ESAI

i.MX ESAI

enumerator DAI_AMD_BT
Amd BT.

enumerator DAI_AMD_SP
Amd SP.

enumerator DAI_AMD_DMIC
Amd DMIC.

enumerator DAI_MEDIATEK_AFE
Mtk AFE.

enumerator DAI_INTEL_SSP_NHLT
nhlt ssp

enumerator DAI_INTEL_DMIC_NHLT
nhlt ssp

enumerator DAI_INTEL_HDA_NHLT
nhlt Intel HD/A

enumerator DAI_INTEL_ALH_NHLT
nhlt Intel ALH

enum dai_dir
DAI Direction.
Values:

enumerator DAI_DIR_TX = 0
Transmit data.

enumerator DAI_DIR_RX
Receive data.

enumerator DAI_DIR_BOTH
Both receive and transmit data.

enum dai_state
Interface state.
Values:

enumerator DAI_STATE_NOT_READY = 0
The interface is not ready.

```
The interface was initialized but is not yet ready to receive /
transmit data. Call dai_config_set() to configure interface and change
its state to READY.
```

enumerator DAI_STATE_READY
The interface is ready to receive / transmit data.

enumerator DAI_STATE_RUNNING
The interface is receiving / transmitting data.

enumerator DAI_STATE_PRE_RUNNING
The interface is clocking but not receiving / transmitting data.

enumerator DAI_STATE_PAUSED
The interface paused.

enumerator DAI_STATE_STOPPING
The interface is draining its transmit queue.

enumerator DAI_STATE_ERROR
TX buffer underrun or RX buffer overrun has occurred.

enum dai_trigger_cmd
Trigger command.

Values:

enumerator DAI_TRIGGER_START = 0
Start the transmission / reception of data.

```
If DAI_DIR_TX is set some data has to be queued for transmission by
the dai_write() function. This trigger can be used in READY state
only and changes the interface state to RUNNING.
```

enumerator DAI_TRIGGER_PRE_START
Optional - Pre Start the transmission / reception of data.

```
Allows the DAI and downstream codecs to prepare for audio Tx/Rx by
starting any required clocks for downstream PLL/FLL locking.
```

enumerator DAI_TRIGGER_STOP
Stop the transmission / reception of data.

```
Stop the transmission / reception of data at the end of the current
memory block. This trigger can be used in RUNNING state only and at
first changes the interface state to STOPPING. When the current TX /
RX block is transmitted / received the state is changed to READY.
Subsequent START trigger will resume transmission / reception where
it stopped.
```

enumerator DAI_TRIGGER_PAUSE
Pause the transmission / reception of data.

```
Pause the transmission / reception of data at the end of the current
memory block. Behavior is implementation specific but usually this
state doesn't completely stop the clocks or transmission. The DAI could
be transmitting 0's (silence), but it is not consuming data from outside.
```

enumerator DAI_TRIGGER_POST_STOP

Optional - Post Stop the transmission / reception of data.

```
Allows the DAI and downstream codecs to shutdown cleanly after audio
Tx/Rx by stopping any required clocks for downstream audio completion.
```

enumerator DAI_TRIGGER_DRAIN

Empty the transmit queue.

```
Send all data in the transmit queue and stop the transmission.
If the trigger is applied to the RX queue it has the same effect as
DAI_TRIGGER_STOP. This trigger can be used in RUNNING state only and
at first changes the interface state to STOPPING. When all TX blocks
are transmitted the state is changed to READY.
```

enumerator DAI_TRIGGER_DROP

Discard the transmit / receive queue.

```
Stop the transmission / reception immediately and discard the
contents of the respective queue. This trigger can be used in any
state other than NOT_READY and changes the interface state to READY.
```

enumerator DAI_TRIGGER_PREPARE

Prepare the queues after underrun/overrun error has occurred.

```
This trigger can be used in ERROR state only and changes the
interface state to READY.
```

enumerator DAI_TRIGGER_RESET

Reset.

```
This trigger frees resources and moves the driver back to initial
state.
```

enumerator DAI_TRIGGER_COPY

Copy.

```
This trigger prepares for data copying.
```

Functions

static inline int **dai_probe**(const struct *device* *dev)

Probe operation of DAI driver.

The function will be called to power up the device and update for example possible reference count of the users. It can be used also to initialize internal variables and memory allocation.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Return values

0 – If successful.

static inline int **dai_remove**(const struct *device* *dev)

Remove operation of DAI driver.

The function will be called to unregister/unbind the device, for example to power down the device or decrease the usage reference count.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Return values

0 – If successful.

static inline int **dai_config_set**(const struct *device* *dev, const struct *dai_config* *cfg, const void *bespoke_cfg)

Configure operation of a DAI driver.

The dir parameter specifies if Transmit (TX) or Receive (RX) direction will be configured by data provided via cfg parameter.

The function can be called in NOT_READY or READY state only. If executed successfully the function will change the interface state to READY.

If the function is called with the parameter cfg->frame_clk_freq set to 0 the interface state will be changed to NOT_READY.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – Pointer to the structure containing configuration parameters.
- **bespoke_cfg** – Pointer to the structure containing bespoke config.

Return values

- **0** – If successful.
- **-EINVAL** – Invalid argument.
- **-ENOSYS** – DAI_DIR_BOTH value is not supported.

static inline int **dai_config_get**(const struct *device* *dev, struct *dai_config* *cfg, enum *dai_dir* dir)

Fetch configuration information of a DAI driver.

Parameters

- **dev** – Pointer to the device structure for the driver instance
- **cfg** – Pointer to the config structure to be filled by the instance
- **dir** – Stream direction: RX or TX as defined by DAI_DIR_*

Return values

0 – if success, negative if invalid parameters or DAI un-configured

static inline const struct *dai_properties* ***dai_get_properties**(const struct *device* *dev, enum *dai_dir* dir, int stream_id)

Fetch properties of a DAI driver.

Parameters

- **dev** – Pointer to the device structure for the driver instance
- **dir** – Stream direction: RX or TX as defined by DAI_DIR_*
- **stream_id** – Stream id: some drivers may have stream specific properties, this id specifies the stream.

Return values
`Pointer` – to the structure containing properties, or NULL if error or no properties

static inline int **dai_trigger**(const struct *device* *dev, enum *dai_dir* dir, enum *dai_trigger_cmd* cmd)

Send a trigger command.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `dir` – Stream direction: RX, TX, or both, as defined by DAI_DIR_*. The DAI_DIR_BOTH value may not be supported by some drivers. For those, triggering need to be done separately for the RX and TX streams.
- `cmd` – Trigger command.

Return values

- `0` – If successful.
- `-EINVAL` – Invalid argument.
- `-EIO` – The trigger cannot be executed in the current state or a DMA channel cannot be allocated.
- `-ENOMEM` – RX/TX memory block not available.
- `-ENOSYS` – DAI_DIR_BOTH value is not supported.

static inline int **dai_ts_config**(const struct *device* *dev, struct *dai_ts_cfg* *cfg)

Configures timestamping in attached DAI.

Optional method.

Parameters

- `dev` – Component device.
- `cfg` – Timestamp config.

Return values
`0` – If successful.

static inline int **dai_ts_start**(const struct *device* *dev, struct *dai_ts_cfg* *cfg)

Starts timestamping.

Optional method

Parameters

- `dev` – Component device.
- `cfg` – Timestamp config.

Return values
`0` – If successful.

static inline int **dai_ts_stop**(const struct *device* *dev, struct *dai_ts_cfg* *cfg)

Stops timestamping.

Optional method.

Parameters

- `dev` – Component device.
- `cfg` – Timestamp config.

Return values
`0` – If successful.

static inline int **dai_ts_get**(const struct *device* *dev, struct *dai_ts_cfg* *cfg, struct *dai_ts_data* *tsd)

Gets timestamp.

Optional method.

Parameters

- `dev` – Component device.
- `cfg` – Timestamp config.
- `tsd` – Receives timestamp data.

Return values
`0` – If successful.

static inline int **dai_config_update**(const struct *device* *dev, const void *bespoke_cfg, size_t size)

Update DAI configuration at runtime.

This function updates the configuration of a DAI interface at runtime. It allows setting bespoke configuration parameters that are specific to the DAI implementation, enabling updates outside of the regular flow with the full configuration blob. The details of the bespoke configuration are specific to each DAI implementation. This function should only be called when the DAI is in the READY state, ensuring that the configuration updates are applied before data transmission or reception begins.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `bespoke_cfg` – Pointer to the buffer containing bespoke configuration parameters.
- `size` – Size of the bespoke_cfg buffer in bytes.

Return values

- `0` – If successful.
- `-ENOSYS` – If the configuration update operation is not implemented.
- `Negative` – errno code if failure.

struct **dai_properties**

#include <*dai.h*> DAI properties.

This struct is used with APIs get_properties function to query DAI properties like fifo address and dma handshake. These are needed for example to setup dma outside the driver code.

Public Members

uint32_t **fifo_address**
Fifo hw address for e.g.
when connecting to dma.

uint32_t **fifo_depth**
Fifo depth.

uint32_t **dma_hs_id**
DMA handshake id.

uint32_t **reg_init_delay**
Delay for initializing registers.

int **stream_id**
Stream ID.

struct **dai_config**
#include <*dai.h*> Main DAI config structure.
Generic DAI interface configuration options.

Public Members

enum *dai_type* **type**
Type of the DAI.

uint32_t **dai_index**
Index of the DAI.

uint8_t **channels**
Number of audio channels, words in frame.

uint32_t **rate**
Frame clock (WS) frequency, sampling rate.

uint16_t **format**
DAI specific data stream format.

uint8_t **options**
DAI specific configuration options.

uint8_t **word_size**
Number of bits representing one data word.

size_t **block_size**
Size of one RX/TX memory block (buffer) in bytes.

uint16_t **link_config**

DAI specific link configuration.

tdm slot group number

struct **dai_ts_cfg**

#include <*dai.h*> DAI timestamp configuration.

Public Members

uint32_t **walclk_rate**

Rate in Hz, e.g.

19200000

int **type**

Type of the DAI (SSP, DMIC, HDA, etc.).

int **direction**

Direction (playback/capture)

int **index**

Index for SSPx to select correct timestamp register.

int **dma_id**

DMA instance id.

int **dma_chan_index**

Used DMA channel index.

int **dma_chan_count**

Number of channels in single DMA.

struct **dai_ts_data**

#include <*dai.h*> DAI timestamp data.

Public Members

uint64_t **walclk**

Wall clock.

uint64_t **sample**

Sample count.

uint32_t **walclk_rate**

Rate in Hz, e.g.

19200000

7.6.5 Battery Backed RAM (BBRAM)

The BBRAM APIs allow interfacing with the unique properties of this memory region. The following common types of BBRAM properties are easily accessed via this API:

- IBBR (invalid) state - check that the BBRAM is not corrupt.
- VSBY (voltage standby) state - check if the BBRAM is using standby voltage.
- VCC (active power) state - check if the BBRAM is on normal power.
- Size - get the size (in bytes) of the BBRAM region.

Along with these, the API provides a means for reading and writing to the memory region via *bbram_read()* and *bbram_write()* respectively. Both functions are expected to only succeed if the BBRAM is in a valid state and the operation is bounded to the memory region.

API Reference

group `bbram_interface`

BBRAM Interface.

Typedefs

typedef int (***bbram_api_check_invalid_t**)(const struct *device* *dev)

API template to check if the BBRAM is invalid.

> **See also**
>
> *bbram_check_invalid*

typedef int (***bbram_api_check_standby_power_t**)(const struct *device* *dev)

API template to check for standby power failure.

> **See also**
>
> *bbram_check_standby_power*

typedef int (***bbram_api_check_power_t**)(const struct *device* *dev)

API template to check for V CC1 power failure.

> **See also**
>
> *bbram_check_power*

typedef int (*bbram_api_get_size_t)(const struct *device* *dev, size_t *size)

API template to check the size of the BBRAM.

bbram_write

Functions

int bbram_check_invalid(const struct *device* *dev)

Check if BBRAM is invalid.

Check if “Invalid Battery-Backed RAM” status is set then reset the status bit. This may occur as a result to low voltage at the VBAT pin.

Parameters

- dev – **[in]** BBRAM device pointer.

Returns

0 if the Battery-Backed RAM data is valid, -EFAULT otherwise.

int bbram_check_standby_power(const struct *device* *dev)

Check for standby (Volt SBY) power failure.

Check if the V standby power domain is turned on after it was off then reset the status bit.

Parameters

- dev – **[in]** BBRAM device pointer.

Returns

0 if V SBY power domain is in normal operation.

int **bbram_check_power**(const struct *device* *dev)

Check for V CC1 power failure.

This will return an error if the V CC1 power domain is turned on after it was off and reset the status bit.

Parameters

- **dev** – **[in]** BBRAM device pointer.

Returns
0 if the V CC1 power domain is in normal operation, -EFAULT otherwise.

int **bbram_get_size**(const struct *device* *dev, size_t *size)

Get the size of the BBRAM (in bytes).

Parameters

- **dev** – **[in]** BBRAM device pointer.
- **size** – **[out]** Pointer to write the size to.

Returns
0 for success, -EFAULT otherwise.

int **bbram_read**(const struct *device* *dev, size_t offset, size_t size, uint8_t *data)

Read bytes from BBRAM.

Parameters

- **dev** – **[in]** The BBRAM device pointer to read from.
- **offset** – **[in]** The offset into the RAM address to start reading from.
- **size** – **[in]** The number of bytes to read.
- **data** – **[out]** The buffer to load the data into.

Returns
0 on success, -EFAULT if the address range is out of bounds.

int **bbram_write**(const struct *device* *dev, size_t offset, size_t size, const uint8_t *data)

Write bytes to BBRAM.

Parameters

- **dev** – **[in]** The BBRAM device pointer to write to.
- **offset** – **[in]** The offset into the RAM address to start writing to.
- **size** – **[in]** The number of bytes to write.
- **data** – **[out]** Pointer to the start of data to write.

Returns
0 on success, -EFAULT if the address range is out of bounds.

int **bbram_emul_set_invalid**(const struct *device* *dev, bool is_invalid)

Set the emulated BBRAM driver's invalid state.

Calling this will affect the emulated behavior of *bbram_check_invalid()*.

Parameters

- **dev** – **[in]** The emulated device to modify
- **is_invalid** – **[in]** The new invalid state

Returns
0 on success, negative values on error.

int **bbram_emul_set_standby_power_state**(const struct *device* *dev, bool failure)

Set the emulated BBRAM driver's standby power state.

Calling this will affect the emulated behavior of *bbram_check_standby_power()*.

Parameters

- **dev** – **[in]** The emulated device to modify
- **failure** – **[in]** Whether or not standby power failure should be emulated

Returns

0 on success, negative values on error.

int **bbram_emul_set_power_state**(const struct *device* *dev, bool failure)

Set the emulated BBRAM driver's power state.

Calling this will affect the emulated behavior of *bbram_check_power()*.

Parameters

- **dev** – **[in]** The emulated device to modify
- **failure** – **[in]** Whether or not a power failure should be emulated

Returns

0 on success, negative values on error.

struct **bbram_driver_api**

#include <bbram.h>

7.6.6 BC1.2 Devices (Experimental)

The Battery Charging specification, currently at revision 1.2, is commonly referred to as just BC1.2. BC1.2 defines limits and detection mechanisms for USB devices to draw current exceeding the USB 2.0 specification limit of 0.5A, 2.5W.

The BC1.2 specification uses the term Charging Port for the device that supplies VBUS on the USB connection and the term Portable Device for the device that sinks current from the USB connection.

Note that the BC1.2 Specification uses the acronym PD for Portable Device. This should not be confused with the USB-C Power Delivery, which also uses the acronym PD.

On many devices, BC1.2 is the fallback mechanism to determine the connected charger capability on USB type C ports when the attached type-C partner does not support Power Delivery.

Key parameters from the BC1.2 Specification include:

Parameter	Symbol	Range
Allowed PD (portable device) Current Draw from Charging Port	IDEV_CHG	1.5 A
Charging Downstream Port Rated Current	ICDP	1.5 - 5.0 A
Maximum Configured Current when connected to a SDP	ICFG_MAX	500 mA
Dedicated Charging Port Rated Current	IDCP	1.5 - 5.0 A
Suspend current	ISUSP	2.5 mA
Unit load current	IUNIT	100 mA

While the ICDP and IDCP rated currents go up to 5.0 A, the BC1.2 current is limited by the IDEV_CHG parameter. So the BC1.2 support is capped at 1.5 A in the Zephyr implementation when using portable-device mode.

Basic Operation

The BC1.2 device driver provides only two APIs, `bc12_set_role()` and `bc12_set_result_cb()`.

The application calls `bc12_set_role()` to transition the BC1.2 device to either a disconnected, portable-device, or charging port mode.

For the disconnected state, the BC1.2 driver powers down the detection chip. The power down operation is vendor specific.

The application calls `bc12_set_role()` with the type set to BC12_PORTABLE_DEVICE when both the following conditions are true:

- The application configured the port as an upstream facing port, i.e. a USB device port.
- The application detects VBUS on the USB connection.

For portable-device mode, the BC1.2 driver powers up the detection chip and starts charger detection. At completion of the charger detection, the BC1.2 driver notifies the callback registered with `bc12_set_result_cb()`. By default, the BC1.2 driver clamps the current to 1.5A to comply with the BC1.2 specification.

To comply with the USB 2.0 specification, when the driver detects a SDP (Standard Downstream Port) charging partner or if BC1.2 detection fails, the driver reports the available current as ISUSP (2.5 mA). The application may increase the current draw to IUNIT (100 mA) when the connected USB host resumes the USB bus and may increase the current draw to ICFG_MAX (500 mA) when the USB host configures the USB device.

Charging port mode is used by the application when the USB port is configured as a downstream facing port, i.e. a USB host port. For charging port mode, the BC1.2 driver powers up the detection chip and configures the charger type specified by a devicetree property. If the driver supports detection of plug and unplug events, the BC1.2 driver notifies the callback registered with `bc12_set_result_cb()` to indicate the current connection state of the portable device partner.

Configuration Options

Related configuration options:

- `CONFIG_USB_BC12`

API Reference

group `b12_interface`

BC1.2 driver APIs.

BC1.2 constants

`BC12_CHARGER_VOLTAGE_UV`

BC1.2 USB charger voltage.

`BC12_CHARGER_MIN_CURR_UA`

BC1.2 USB charger minimum current.

Set to match the Isusp of 2.5 mA parameter. This is returned by the driver when either BC1.2 detection fails, or the attached partner is a SDP (standard downstream port).

The application may increase the current draw after determining the USB device state of suspended/unconfigured/configured. Suspended: 2.5 mA Unconfigured: 100 mA Configured: 500 mA (USB 2.0)

BC12_CHARGER_MAX_CURR_UA

BC1.2 USB charger maximum current.

Typedefs

typedef void (*bc12_callback_t)(const struct *device* *dev, struct *bc12_partner_state* *state, void *user_data)

BC1.2 callback for charger configuration.

Param dev
BC1.2 device which is notifying of the new charger state.

Param state
Current state of the BC1.2 client, including BC1.2 type detected, voltage, and current limits. If NULL, then the partner charger is disconnected or the BC1.2 device is operating in host mode.

Param user_data
Requester supplied data which is passed along to the callback.

Enums

enum bc12_role

BC1.2 device role.

Values:

enumerator BC12_DISCONNECTED

enumerator BC12_PORTABLE_DEVICE

enumerator BC12_CHARGING_PORT

enum bc12_type

BC1.2 charging partner type.

Values:

enumerator BC12_TYPE_NONE
No partner connected.

enumerator BC12_TYPE_SDP
Standard Downstream Port.

enumerator BC12_TYPE_DCP
Dedicated Charging Port.

enumerator BC12_TYPE_CDP
Charging Downstream Port.

enumerator BC12_TYPE_PROPRIETARY
Proprietary charging port.

enumerator BC12_TYPE_UNKNOWN
Unknown charging port, BC1.2 detection failed.

enumerator BC12_TYPE_COUNT
Count of valid BC12 types.

Functions

int bc12_set_role(const struct *device* *dev, enum *bc12_role* role)
Set the BC1.2 role.

Parameters

- dev – Pointer to the device structure for the BC1.2 driver instance.
- role – New role for the BC1.2 device.

Return values

- 0 – If successful.
- -EIO – general input/output error.

int bc12_set_result_cb(const struct *device* *dev, *bc12_callback_t* cb, void *user_data)
Register a callback for BC1.2 results.

Parameters

- dev – Pointer to the device structure for the BC1.2 driver instance.
- cb – Function pointer for the result callback.
- user_data – Requester supplied data which is passed along to the callback.

Return values

- 0 – If successful.
- -EIO – general input/output error.

struct bc12_partner_state
#include <*usb_bc12.h*> BC1.2 detected partner state.

Param bc12_role
Current role of the BC1.2 device.

Param type
Charging partner type. Valid when bc12_role is BC12_PORTABLE_DEVICE.

Param current_ma
Current, in uA, that the charging partner provides. Valid when bc12_role is BC12_PORTABLE_DEVICE.

Param voltage_mv
Voltage, in uV, that the charging partner provides. Valid when bc12_role is BC12_PORTABLE_DEVICE.

Param pd_partner_connected
True if a PD partner is currently connected. Valid when bc12_role is BC12_CHARGING_PORT.

group `b12_emulator_backend`

BC1.2 backend emulator APIs.

Functions

static inline int **bc12_emul_set_charging_partner**(const struct *emul* *target, enum *bc12_type* partner_type)

Set the charging partner type connected to the BC1.2 device.

The corresponding BC1.2 emulator updates the vendor specific registers to simulate connection of the specified charging partner type. The emulator also generates an interrupt for processing by the real driver, if supported.

Parameters

- `target` – Pointer to the emulator structure for the BC1.2 emulator instance.
- `partner_type` – The simulated partner type. Set to BC12_TYPE_NONE to disconnect the charging partner.

Return values

- `0` – If successful.
- `-EINVAL` – if the partner type is not supported.

static inline int **bc12_emul_set_pd_partner**(const struct *emul* *target, bool connected)

Set the portable device partner state.

The corresponding BC1.2 emulator updates the vendor specific registers to simulate connection or disconnection of a portable device partner. The emulator also generates an interrupt for processing by the real driver, if supported.

Parameters

- `target` – Pointer to the emulator structure for the BC1.2 emulator instance.
- `connected` – If true, emulate a connection of a portable device partner. If false, emulate a disconnect event.

Return values

- `0` – If successful.
- `-EINVAL` – if the connection/disconnection of PD partner is not supported.

7.6.7 Clock Control

Overview

The clock control API provides access to clocks in the system, including the ability to turn them on and off.

Configuration Options

Related configuration options:

- CONFIG_CLOCK_CONTROL

enumerator CLOCK_CONTROL_STATUS_OFF

enumerator CLOCK_CONTROL_STATUS_ON

enumerator CLOCK_CONTROL_STATUS_UNKNOWN

Functions

static inline int clock_control_on(const struct *device* *dev, *clock_control_subsys_t* sys)

Enable a clock controlled by the device.

On success, the clock is enabled and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Use *clock_control_async_on()* for non-blocking operation.

Parameters

- dev – Device structure whose driver controls the clock.
- sys – Opaque data representing the clock.

Returns

0 on success, negative errno on failure.

static inline int **clock_control_off**(const struct *device* *dev, *clock_control_subsys_t* sys)

Disable a clock controlled by the device.

This function is non-blocking and can be called from any context. On success, the clock is disabled when this function returns.

Parameters

- `dev` – Device structure whose driver controls the clock
- `sys` – Opaque data representing the clock

Returns
0 on success, negative errno on failure.

static inline int **clock_control_async_on**(const struct *device* *dev, *clock_control_subsys_t* sys, *clock_control_cb_t* cb, void *user_data)

Request clock to start with notification when clock has been started.

Function is non-blocking and can be called from any context. User callback is called when clock is started.

Parameters

- `dev` – Device.
- `sys` – A pointer to an opaque data representing the sub-system.
- `cb` – Callback.
- `user_data` – User context passed to the callback.

Return values

- `0` – if start is successfully initiated.
- `-EALREADY` – if clock was already started and is starting or running.
- `-ENOTSUP` – If the requested mode of operation is not supported.
- `-ENOSYS` – if the interface is not implemented.
- `other` – negative errno on vendor specific error.

static inline enum *clock_control_status* **clock_control_get_status**(const struct *device* *dev, *clock_control_subsys_t* sys)

Get clock status.

Parameters

- `dev` – Device.
- `sys` – A pointer to an opaque data representing the sub-system.

Returns
Status.

static inline int **clock_control_get_rate**(const struct *device* *dev, *clock_control_subsys_t* sys, uint32_t *rate)

Obtain the clock rate of given sub-system.

Parameters

- `dev` – Pointer to the device structure for the clock controller driver instance
- `sys` – A pointer to an opaque data representing the sub-system
- `rate` – **[out]** Subsystem clock rate

Return values

- `0` – on successful rate reading.
- `-EAGAIN` – if rate cannot be read. Some drivers do not support returning the rate when the clock is off.
- `-ENOTSUP` – if reading the clock rate is not supported for the given subsystem.
- `-ENOSYS` – if the interface is not implemented.

static inline int **clock_control_set_rate**(const struct *device* *dev, *clock_control_subsys_t* sys, *clock_control_subsys_rate_t* rate)

Set the rate of the clock controlled by the device.

On success, the new clock rate is set and ready when this function returns. This function may sleep, and thus can only be called from thread context.

Parameters

- `dev` – Device structure whose driver controls the clock.
- `sys` – Opaque data representing the clock.
- `rate` – Opaque data representing the clock rate to be used.

Return values

- `-EALREADY` – if clock was already in the given rate.
- `-ENOTSUP` – If the requested mode of operation is not supported.
- `-ENOSYS` – if the interface is not implemented.
- `other` – negative errno on vendor specific error.

static inline int **clock_control_configure**(const struct *device* *dev, *clock_control_subsys_t* sys, void *data)

Configure a source clock.

This function is non-blocking and can be called from any context. On success, the selected clock is configured as per caller's request.

It is caller's responsibility to ensure that subsequent calls to the API provide the right information to allows clock_control driver to perform the right action (such as using the right clock source on clock_control_get_rate call).

`data` is implementation specific and could be used to convey supplementary information required for expected clock configuration.

Parameters

- `dev` – Device structure whose driver controls the clock
- `sys` – Opaque data representing the clock
- `data` – Opaque data providing additional input for clock configuration

Return values

- `0` – On success
- `-ENOSYS` – If the device driver does not implement this call
- `-errno` – Other negative errno on failure.

7.6.8 Controller Area Network (CAN)

CAN Controller

- *Overview*
- *Sending*
- *Receiving*
- *Setting the bitrate*
- *SocketCAN*
- *Samples*
- *CAN Controller API Reference*

Overview Controller Area Network is a two-wire serial bus specified by the Bosch CAN Specification, Bosch CAN with Flexible Data-Rate specification and the ISO 11898-1:2003 standard. CAN is mostly known for its application in the automotive domain. However, it is also used in home and industrial automation and other products.

Warning

CAN controllers can only initialize when the bus is in the idle (recessive) state for at least 11 recessive bits. Therefore you have to make sure that CAN RX is high, at least for a short time. This is also necessary for loopback mode.

The bit-timing as defined in ISO 11898-1:2003 looks as following:

Figure 2: CAN Timing. ©Alexander Wachter

A single bit is split into four segments.

- Sync_Seg: The nodes synchronize at the edge of the Sync_Seg. It is always one time quantum in length.
- Prop_Seg: The signal propagation delay of the bus and other delays of the transceiver and node.
- Phase_Seg1 and Phase_Seg2 :Define the sampling point. The bit is sampled at the end of Phase_Seg1.

The bit-rate is calculated from the time of a time quantum and the values defined above. A bit has the length of Sync_Seg plus Prop_Seg plus Phase_Seg1 plus Phase_Seg2 multiplied by the time of single time quantum. The bit-rate is the inverse of the length of a single bit.

A bit is sampled at the sampling point. The sample point is between Phase_Seg1 and PhaseSeg2 and therefore is a parameter that the user needs to choose. The CiA recommends setting the sample point to 87.5% of the bit.

The resynchronization jump width (SJW) defines the amount of time quantum the sample point can be moved. The sample point is moved when resynchronization is needed.

The timing parameters (SJW, bitrate and sampling point, or bitrate, Prop_Seg, Phase_Seg1and Phase_Seg2) are initially set from the device-tree and can be changed at run-time from the timing-API.

CAN uses so-called identifiers to identify the frame instead of addresses to identify a node. This identifier can either have 11-bit width (Standard or Basic Frame) or 29-bit in case of an Extended Frame. The Zephyr CAN API supports both Standard and Extended identifiers concurrently. A CAN frame starts with a dominant Start Of Frame bit. After that, the identifiers follow. This phase is called the arbitration phase. During the arbitration phase, write collisions are allowed. They resolve by the fact that dominant bits override recessive bits. Nodes monitor the bus and notice when their transmission is being overridden and in case, abort their transmission. This effectively gives lower number identifiers priority over higher number identifiers.

Filters are used to whitelist identifiers that are of interest for the specific node. An identifier that doesn't match any filter is ignored. Filters can either match exactly or a specified part of the identifier. This method is called masking. As an example, a mask with 11 bits set for standard or 29 bits set for extended identifiers must match perfectly. Bits that are set to zero in the mask are ignored when matching an identifier. Most CAN controllers implement a limited number of filters in hardware. The number of filters is also limited in Kconfig to save memory.

Errors may occur during transmission. In case a node detects an erroneous frame, it partially overrides the current frame with an error-frame. Error-frames can either be error passive or error active, depending on the state of the controller. In case the controller is in error active state, it sends six consecutive dominant bits, which is a violation of the stuffing rule that all nodes can detect. The sender may resend the frame right after.

An initialized node can be in one of the following states:

- Error-active
- Error-passive
- Bus-off

After initialization, the node is in the error-active state. In this state, the node is allowed to send active error frames, ACK, and overload frames. Every node has a receive- and transmit-error counter. If either the receive- or the transmit-error counter exceeds 127, the node changes to error-passive state. In this state, the node is not allowed to send error-active frames anymore. If the transmit-error counter increases further to 255, the node changes to the bus-off state. In this state, the node is not allowed to send any dominant bits to the bus. Nodes in the bus-off state may recover after receiving 128 occurrences of 11 concurrent recessive bits.

You can read more about CAN bus in this CAN Wikipedia article.

Zephyr supports following CAN features:

- Standard and Extended Identifiers
- Filters with Masking
- Loopback and Silent mode
- Remote Request

Sending The following code snippets show how to send data.

This basic sample sends a CAN frame with standard identifier 0x123 and eight bytes of data. When passing NULL as the callback, as shown in this example, the send function blocks until the frame is sent and acknowledged by at least one other node or an error occurred. The timeout only takes effect on acquiring a mailbox. When a transmitting mailbox is assigned, sending cannot be canceled.

```
struct can_frame frame = {
        .flags = 0,
```

(continues on next page)

(continued from previous page)

```
        .id = 0x123,
        .dlc = 8,
        .data = {1,2,3,4,5,6,7,8}
};
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;

ret = can_send(can_dev, &frame, K_MSEC(100), NULL, NULL);
if (ret != 0) {
        LOG_ERR("Sending failed [%d]", ret);
}
```

This example shows how to send a frame with extended identifier 0x1234567 and two bytes of data. The provided callback is called when the message is sent, or an error occurred. Passing *K_FOREVER* to the timeout causes the function to block until a transfer mailbox is assigned to the frame or an error occurred. It does not block until the message is sent like the example above.

```
void tx_callback(const struct device *dev, int error, void *user_data)
{
        char *sender = (char *)user_data;

        if (error != 0) {
                LOG_ERR("Sending failed [%d]\nSender: %s\n", error, sender);
        }
}

int send_function(const struct device *can_dev)
{
        struct can_frame frame = {
                .flags = CAN_FRAME_IDE,
                .id = 0x1234567,
                .dlc = 2
        };

        frame.data[0] = 1;
        frame.data[1] = 2;

        return can_send(can_dev, &frame, K_FOREVER, tx_callback, "Sender 1");
}
```

Receiving Frames are only received when they match a filter. The following code snippets show how to receive frames by adding filters.

Here we have an example for a receiving callback as used for *can_add_rx_filter()*. The user data argument is passed when the filter is added.

```
void rx_callback_function(const struct device *dev, struct can_frame *frame, void *user_
↪data)
{
        ... do something with the frame ...
}
```

The following snippet shows how to add a filter with a callback function. It is the most efficient but also the most critical way to receive messages. The callback function is called from an interrupt context, which means that the callback function should be as short as possible and must not block. Adding callback functions is not allowed from userspace context.

The filter for this example is configured to match the identifier 0x123 exactly.

```
const struct can_filter my_filter = {
        .flags = 0U,
        .id = 0x123,
        .mask = CAN_STD_ID_MASK
};
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));

filter_id = can_add_rx_filter(can_dev, rx_callback_function, callback_arg, &my_filter);
if (filter_id < 0) {
  LOG_ERR("Unable to add rx filter [%d]", filter_id);
}
```

Here an example for *can_add_rx_filter_msgq()* is shown. With this function, it is possible to receive frames synchronously. This function can be called from userspace context. The size of the message queue should be as big as the expected backlog.

The filter for this example is configured to match the extended identifier 0x1234567 exactly.

```
const struct can_filter my_filter = {
        .flags = CAN_FILTER_IDE,
        .id = 0x1234567,
        .mask = CAN_EXT_ID_MASK
};
CAN_MSGQ_DEFINE(my_can_msgq, 2);
struct can_frame rx_frame;
int filter_id;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));

filter_id = can_add_rx_filter_msgq(can_dev, &my_can_msgq, &my_filter);
if (filter_id < 0) {
  LOG_ERR("Unable to add rx msgq [%d]", filter_id);
  return;
}

while (true) {
  k_msgq_get(&my_can_msgq, &rx_frame, K_FOREVER);
  ... do something with the frame ...
}
```

can_remove_rx_filter() removes the given filter.

```
can_remove_rx_filter(can_dev, filter_id);
```

Setting the bitrate The bitrate and sampling point is initially set at runtime. To change it from the application, one can use the *can_set_timing()* API. The *can_calc_timing()* function can calculate timing from a bitrate and sampling point in permille. The following example sets the bitrate to 250k baud with the sampling point at 87.5%.

```
struct can_timing timing;
const struct device *const can_dev = DEVICE_DT_GET(DT_CHOSEN(zephyr_canbus));
int ret;

ret = can_calc_timing(can_dev, &timing, 250000, 875);
if (ret > 0) {
  LOG_INF("Sample-Point error: %d", ret);
}

if (ret < 0) {
  LOG_ERR("Failed to calc a valid timing");
```

(continues on next page)

(continued from previous page)

```
  return;
}

ret = can_stop(can_dev);
if (ret != 0) {
  LOG_ERR("Failed to stop CAN controller");
}

ret = can_set_timing(can_dev, &timing);
if (ret != 0) {
  LOG_ERR("Failed to set timing");
}

ret = can_start(can_dev);
if (ret != 0) {
  LOG_ERR("Failed to start CAN controller");
}
```

A similar API exists for calculating and setting the timing for the data phase for CAN FD capable controllers. See *can_set_timing_data()* and *can_calc_timing_data()*.

SocketCAN Zephyr additionally supports SocketCAN, a BSD socket implementation of the Zephyr CAN API. SocketCAN brings the convenience of the well-known BSD Socket API to Controller Area Networks. It is compatible with the Linux SocketCAN implementation, where many other high-level CAN projects build on top. Note that frames are routed to the network stack instead of passed directly, which adds some computation and memory overhead.

Samples We have two ready-to-build samples demonstrating use of the Zephyr CAN API: Zephyr CAN counter sample and SocketCAN sample.

Version
1.1.0

CAN controller configuration

int **can_get_core_clock**(const struct *device* *dev, uint32_t *rate)

Get the CAN core clock rate.

Returns the CAN core clock rate. One minimum time quantum (mtq) is 1/(core clock rate). The CAN core clock can be further divided by the CAN clock prescaler (see the can_timing struct), providing the time quantum (tq).

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **rate** – **[out]** CAN core clock rate in Hz.

Returns

0 on success, or a negative error code on error

uint32_t **can_get_bitrate_min**(const struct *device* *dev)

Get minimum supported bitrate.

Get the minimum supported bitrate for the CAN controller/transceiver combination.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Returns

Minimum supported bitrate in bits/s

static inline int **can_get_min_bitrate**(const struct *device* *dev, uint32_t *min_bitrate)

Get minimum supported bitrate.

Get the minimum supported bitrate for the CAN controller/transceiver combination.

Deprecated:

Use can_get_bitrate_min() instead.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **min_bitrate** – **[out]** Minimum supported bitrate in bits/s

Return values

- **-EIO** – General input/output error.
- **-ENOSYS** – If this function is not implemented by the driver.

uint32_t **can_get_bitrate_max**(const struct *device* *dev)

Get maximum supported bitrate.

Get the maximum supported bitrate for the CAN controller/transceiver combination.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Returns

Maximum supported bitrate in bits/s

static inline int **can_get_max_bitrate**(const struct *device* *dev, uint32_t *max_bitrate)

Get maximum supported bitrate.

Get the maximum supported bitrate for the CAN controller/transceiver combination.

Deprecated:
Use can_get_bitrate_max() instead.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `max_bitrate` – **[out]** Maximum supported bitrate in bits/s

Return values

- `0` – If successful.
- `-EIO` – General input/output error.
- `-ENOSYS` – If this function is not implemented by the driver.

const struct *can_timing* *`can_get_timing_min`(const struct *device* *dev)
Get the minimum supported timing parameter values.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns
Pointer to the minimum supported timing parameter values.

const struct *can_timing* *`can_get_timing_max`(const struct *device* *dev)
Get the maximum supported timing parameter values.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns
Pointer to the maximum supported timing parameter values.

int `can_calc_timing`(const struct *device* *dev, struct *can_timing* *res, uint32_t bitrate, uint16_t sample_pnt)
Calculate timing parameters from bitrate and sample point.

Calculate the timing parameters from a given bitrate in bits/s and the sampling point in permill (1/1000) of the entire bit time. The bitrate must always match perfectly. If no result can be reached for the given parameters, -EINVAL is returned.

If the sample point is set to 0, this function defaults to a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates.

Note

The requested `sample_pnt` will not always be matched perfectly. The algorithm calculates the best possible match.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `res` – **[out]** Result is written into the can_timing struct provided.
- `bitrate` – Target bitrate in bits/s.
- `sample_pnt` – Sample point in permille of the entire bit time or 0 for automatic sample point location.

Return values

- `0` – or positive sample point error on success.

- `-EINVAL` – if the requested bitrate or sample point is out of range.
- `-ENOTSUP` – if the requested bitrate is not supported.
- `-EIO` – if can_get_core_clock() is not available.

const struct *can_timing* *`can_get_timing_data_min`(const struct *device* *dev)

Get the minimum supported timing parameter values for the data phase.

Same as can_get_timing_min() but for the minimum values for the data phase.

> **Note**
>
> CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns

Pointer to the minimum supported timing parameter values, or NULL if CAN FD support is not implemented by the driver.

const struct *can_timing* *`can_get_timing_data_max`(const struct *device* *dev)

Get the maximum supported timing parameter values for the data phase.

Same as can_get_timing_max() but for the maximum values for the data phase.

> **Note**
>
> CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns

Pointer to the maximum supported timing parameter values, or NULL if CAN FD support is not implemented by the driver.

int `can_calc_timing_data`(const struct *device* *dev, struct *can_timing* *res, uint32_t bitrate, uint16_t sample_pnt)

Calculate timing parameters for the data phase.

Same as can_calc_timing() but with the maximum and minimum values from the data phase.

> **Note**
>
> CONFIG_CAN_FD_MODE must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `res` – **[out]** Result is written into the can_timing struct provided.
- `bitrate` – Target bitrate for the data phase in bits/s
- `sample_pnt` – Sample point for the data phase in permille of the entire bit time or 0 for automatic sample point location.

Return values

- `0` – or positive sample point error on success.
- `-EINVAL` – if the requested bitrate or sample point is out of range.
- `-ENOTSUP` – if the requested bitrate is not supported.
- `-EIO` – if can_get_core_clock() is not available.

int `can_set_timing_data`(const struct *device* *dev, const struct *can_timing* *timing_data)

Configure the bus timing for the data phase of a CAN FD controller.

See also

can_set_timing()

Note

`CONFIG_CAN_FD_MODE` must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `timing_data` – Bus timings for data phase

Return values

- `0` – If successful.
- `-EBUSY` – if the CAN controller is not in stopped state.
- `-EIO` – General input/output error, failed to configure device.
- `-ENOTSUP` – if the timing parameters are not supported by the driver.
- `-ENOSYS` – if CAN FD support is not implemented by the driver.

int `can_set_bitrate_data`(const struct *device* *dev, uint32_t bitrate_data)

Set the bitrate for the data phase of the CAN FD controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

See also

can_set_bitrate()

Note

`CONFIG_CAN_FD_MODE` must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `bitrate_data` – Desired data phase bitrate.

Return values

- `0` – If successful.
- `-EBUSY` – if the CAN controller is not in stopped state.
- `-EINVAL` – if the requested bitrate is out of range.
- `-ENOTSUP` – if the requested bitrate not supported by the CAN controller/transceiver combination.
- `-ERANGE` – if the resulting sample point is off by more than +/- 5%.
- `-EIO` – General input/output error, failed to set bitrate.

int `can_calc_prescaler`(const struct *device* *dev, struct *can_timing* *timing, uint32_t bitrate)

Fill in the prescaler value for a given bitrate and timing.

Fill the prescaler value in the timing struct. The sjw, prop_seg, phase_seg1 and phase_seg2 must be given.

The returned bitrate error is remainder of the division of the clock rate by the bitrate times the timing segments.

Deprecated:

This function allows for bitrate errors, but bitrate errors between nodes on the same network leads to them drifting apart after the start-of-frame (SOF) synchronization has taken place.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `timing` – Result is written into the *can_timing* struct provided.
- `bitrate` – Target bitrate.

Return values

- `0` – or positive bitrate error.
- `Negative` – error code on error.

int `can_set_timing`(const struct *device* *dev, const struct *can_timing* *timing)

Configure the bus timing of a CAN controller.

See also

can_set_timing_data()

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `timing` – Bus timings.

Return values

- `0` – If successful.
- `-EBUSY` – if the CAN controller is not in stopped state.
- `-ENOTSUP` – if the timing parameters are not supported by the driver.
- `-EIO` – General input/output error, failed to configure device.

int **can_get_capabilities**(const struct *device* *dev, *can_mode_t* *cap)

Get the supported modes of the CAN controller.

The returned capabilities may not necessarily be supported at the same time (e.g. some CAN controllers support both `CAN_MODE_LOOPBACK` and `CAN_MODE_LISTENONLY`, but not at the same time).

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cap` – **[out]** Supported capabilities.

Return values

- `0` – If successful.
- `-EIO` – General input/output error, failed to get capabilities.

const struct *device* ***can_get_transceiver**(const struct *device* *dev)

Get the CAN transceiver associated with the CAN controller.

Get a pointer to the device structure for the CAN transceiver associated with the CAN controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns

Pointer to the device structure for the associated CAN transceiver driver instance, or NULL if no transceiver is associated.

int **can_start**(const struct *device* *dev)

Start the CAN controller.

Bring the CAN controller out of `CAN_STATE_STOPPED`. This will reset the RX/TX error counters, enable the CAN controller to participate in CAN communication, and enable the CAN transceiver, if supported.

Starting the CAN controller resets all the CAN controller statistics.

See also

can_stop()

See also

can_transceiver_enable()

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – if successful.
- `-EALREADY` – if the device is already started.
- `-EIO` – General input/output error, failed to start device.

int `can_stop`(const struct *device* *dev)

Stop the CAN controller.

Bring the CAN controller into `CAN_STATE_STOPPED`. This will disallow the CAN controller from participating in CAN communication, abort any pending CAN frame transmissions, and disable the CAN transceiver, if supported.

See also

can_start()

See also

can_transceiver_disable()

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – if successful.
- `-EALREADY` – if the device is already stopped.
- `-EIO` – General input/output error, failed to stop device.

int `can_set_mode`(const struct *device* *dev, *can_mode_t* mode)

Set the CAN controller to the given operation mode.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `mode` – Operation mode.

Return values

- `0` – If successful.
- `-EBUSY` – if the CAN controller is not in stopped state.
- `-EIO` – General input/output error, failed to configure device.

can_mode_t `can_get_mode`(const struct *device* *dev)

Get the operation mode of the CAN controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns

Current operation mode.

int `can_set_bitrate`(const struct *device* *dev, uint32_t bitrate)

Set the bitrate of the CAN controller.

CAN in Automation (CiA) 301 v4.2.0 recommends a sample point location of 87.5% percent for all bitrates. However, some CAN controllers have difficulties meeting this for higher bitrates.

This function defaults to using a sample point of 75.0% for bitrates over 800 kbit/s, 80.0% for bitrates over 500 kbit/s, and 87.5% for all other bitrates. This is in line with the sample point locations used by the Linux kernel.

can_set_bitrate_data()

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `bitrate` – Desired arbitration phase bitrate.

Return values

- `0` – If successful.
- `-EBUSY` – if the CAN controller is not in stopped state.
- `-EINVAL` – if the requested bitrate is out of range.
- `-ENOTSUP` – if the requested bitrate not supported by the CAN controller/transceiver combination.
- `-ERANGE` – if the resulting sample point is off by more than +/- 5%.
- `-EIO` – General input/output error, failed to set bitrate.

Transmitting CAN frames

int `can_send`(const struct *device* *dev, const struct *can_frame* *frame, *k_timeout_t* timeout, *can_tx_callback_t* callback, void *user_data)

Queue a CAN frame for transmission on the CAN bus.

Queue a CAN frame for transmission on the CAN bus with optional timeout and completion callback function.

Queued CAN frames are transmitted in order according to the their priority:

- The lower the CAN-ID, the higher the priority.
- Data frames have higher priority than Remote Transmission Request (RTR) frames with identical CAN-IDs.
- Frames with standard (11-bit) identifiers have higher priority than frames with extended (29-bit) identifiers with identical base IDs (the higher 11 bits of the extended identifier).
- Transmission order for queued frames with the same priority is hardware dependent.

By default, the CAN controller will automatically retry transmission in case of lost bus arbitration or missing acknowledge. Some CAN controllers support disabling automatic retransmissions via CAN_MODE_ONE_SHOT.

Note

If transmitting segmented messages spanning multiple CAN frames with identical CAN-IDs, the sender must ensure to only queue one frame at a time if FIFO order is required.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **frame** – CAN frame to transmit.
- **timeout** – Timeout waiting for a empty TX mailbox or K_FOREVER.
- **callback** – Optional callback for when the frame was sent or a transmission error occurred. If NULL, this function is blocking until frame is sent. The callback must be NULL if called from user mode.
- **user_data** – User data to pass to callback function.

Return values

- **0** – if successful.
- **-EINVAL** – if an invalid parameter was passed to the function.
- **-ENOTSUP** – if an unsupported parameter was passed to the function.
- **-ENETDOWN** – if the CAN controller is in stopped state.
- **-ENETUNREACH** – if the CAN controller is in bus-off state.
- **-EBUSY** – if CAN bus arbitration was lost (only applicable if automatic retransmissions are disabled).
- **-EIO** – if a general transmit error occurred (e.g. missing ACK if automatic retransmissions are disabled).
- **-EAGAIN** – on timeout.

Receiving CAN frames

int **can_add_rx_filter**(const struct *device* *dev, *can_rx_callback_t* callback, void *user_data, const struct *can_filter* *filter)

Add a callback function for a given CAN filter.

Add a callback to CAN identifiers specified by a filter. When a received CAN frame matching the filter is received by the CAN controller, the callback function is called in interrupt context.

If a received frame matches more than one filter (i.e., the filter IDs/masks or flags overlap), the priority of the match is hardware dependent.

The same callback function can be used for multiple filters.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – This function is called by the CAN controller driver whenever a frame matching the filter is received.

- `user_data` – User data to pass to callback function.
- `filter` – Pointer to a can_filter structure defining the filter.

Return values

- `filter_id` – on success.
- `-ENOSPC` – if there are no free filters.
- `-EINVAL` – if the requested filter type is invalid.
- `-ENOTSUP` – if the requested filter type is not supported.

int `can_add_rx_filter_msgq`(const struct *device* *dev, struct *k_msgq* *msgq, const struct *can_filter* *filter)

Simple wrapper function for adding a message queue for a given filter.

Wrapper function for can_add_rx_filter() which puts received CAN frames matching the filter in a message queue instead of calling a callback.

If a received frame matches more than one filter (i.e., the filter IDs/masks or flags overlap), the priority of the match is hardware dependent.

The same message queue can be used for multiple filters.

Note

The message queue must be initialized before calling this function and the caller must have appropriate permissions on it.

Warning

Message queue overruns are silently ignored and overrun frames discarded. Custom error handling can be implemented by using can_add_rx_filter() and k_msgq_put() directly.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `msgq` – Pointer to the already initialized k_msgq struct.
- `filter` – Pointer to a can_filter structure defining the filter.

Return values

- `filter_id` – on success.
- `-ENOSPC` – if there are no free filters.
- `-ENOTSUP` – if the requested filter type is not supported.

void `can_remove_rx_filter`(const struct *device* *dev, int filter_id)

Remove a CAN RX filter.

This routine removes a CAN RX filter based on the filter ID returned by can_add_rx_filter() or can_add_rx_filter_msgq().

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `filter_id` – Filter ID

int `can_get_max_filters`(const struct *device* *dev, bool ide)

Get maximum number of RX filters.

Get the maximum number of concurrent RX filters for the CAN controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ide` – Get the maximum standard (11-bit) CAN ID filters if false, or extended (29-bit) CAN ID filters if true.

Return values

- `Positive` – number of maximum concurrent filters.
- `-EIO` – General input/output error.
- `-ENOSYS` – If this function is not implemented by the driver.

`CAN_MSGQ_DEFINE`(name, max_frames)

Statically define and initialize a CAN RX message queue.

The message queue's ring buffer contains space for *max_frames* CAN frames.

See also

can_add_rx_filter_msgq()

Parameters

- `name` – Name of the message queue.
- `max_frames` – Maximum number of CAN frames that can be queued.

CAN bus error reporting and handling

int `can_get_state`(const struct *device* *dev, enum *can_state* *state, struct *can_bus_err_cnt* *err_cnt)

Get current CAN controller state.

Returns the current state and optionally the error counter values of the CAN controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `state` – **[out]** Pointer to the state destination enum or NULL.
- `err_cnt` – **[out]** Pointer to the err_cnt destination structure or NULL.

Return values

- `0` – If successful.
- `-EIO` – General input/output error, failed to get state.

int `can_recover`(const struct *device* *dev, *k_timeout_t* timeout)

Recover from bus-off state.

Recover the CAN controller from bus-off state to error-active state.

> **Note**
>
> CONFIG_CAN_MANUAL_RECOVERY_MODE must be enabled for this function to be available.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **timeout** – Timeout for waiting for the recovery or K_FOREVER.

Return values

- **0** – on success.
- **-ENOTSUP** – if the CAN controller is not in manual recovery mode.
- **-ENETDOWN** – if the CAN controller is in stopped state.
- **-EAGAIN** – on timeout.
- **-ENOSYS** – If this function is not implemented by the driver.

static inline void **can_set_state_change_callback**(const struct *device* *dev, *can_state_change_callback_t* callback, void *user_data)

Set a callback for CAN controller state change events.

Set the callback for CAN controller state change events. The callback function will be called in interrupt context.

Only one callback can be registered per controller. Calling this function again overrides any previously registered callback.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – Callback function.
- **user_data** – User data to pass to callback function.

CAN statistics

uint32_t **can_stats_get_bit_errors**(const struct *device* *dev)

Get the bit error counter for a CAN device.

The bit error counter is incremented when the CAN controller is unable to transmit either a dominant or a recessive bit.

> **Note**
>
> CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Returns

bit error counter

uint32_t **can_stats_get_bit0_errors**(const struct *device* *dev)

Get the bit0 error counter for a CAN device.

The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

See also

can_stats_get_bit_errors()

Note

CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Returns

bit0 error counter

uint32_t **can_stats_get_bit1_errors**(const struct *device* *dev)

Get the bit1 error counter for a CAN device.

The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

See also

can_stats_get_bit_errors()

Note

CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Returns

bit1 error counter

uint32_t **can_stats_get_stuff_errors**(const struct *device* *dev)

Get the stuffing error counter for a CAN device.

The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.

Note

CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns
stuffing error counter

uint32_t `can_stats_get_crc_errors`(const struct *device* *dev)

Get the CRC error counter for a CAN device.

The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.

Note

`CONFIG_CAN_STATS` must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns
CRC error counter

uint32_t `can_stats_get_form_errors`(const struct *device* *dev)

Get the form error counter for a CAN device.

The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

Note

`CONFIG_CAN_STATS` must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns
form error counter

uint32_t `can_stats_get_ack_errors`(const struct *device* *dev)

Get the acknowledge error counter for a CAN device.

The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

Note

`CONFIG_CAN_STATS` must be selected for this function to be available.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Returns
acknowledge error counter

uint32_t **can_stats_get_rx_overruns**(const struct *device* *dev)

Get the RX overrun counter for a CAN device.

The RX overrun counter is incremented when the CAN controller receives a CAN frame matching an installed filter but lacks the capacity to store it (either due to an already full RX mailbox or a full RX FIFO).

> **Note**
>
> CONFIG_CAN_STATS must be selected for this function to be available.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Returns

RX overrun counter

CAN utility functions

static inline uint8_t **can_dlc_to_bytes**(uint8_t dlc)

Convert from Data Length Code (DLC) to the number of data bytes.

Parameters

- **dlc** – Data Length Code (DLC).

Return values

Number – of bytes.

static inline uint8_t **can_bytes_to_dlc**(uint8_t num_bytes)

Convert from number of bytes to Data Length Code (DLC)

Parameters

- **num_bytes** – Number of bytes.

Return values

Data – Length Code (DLC).

static inline bool **can_frame_matches_filter**(const struct *can_frame* *frame, const struct *can_filter* *filter)

Check if a CAN frame matches a CAN filter.

Parameters

- **frame** – CAN frame.
- **filter** – CAN filter.

Returns

true if the CAN frame matches the CAN filter, false otherwise

CAN frame definitions

CAN_STD_ID_MASK

Bit mask for a standard (11-bit) CAN identifier.

CAN_MAX_STD_ID
: Maximum value for a standard (11-bit) CAN identifier.

  Deprecated:
  Use CAN_STD_ID_MASK instead.

CAN_EXT_ID_MASK
: Bit mask for an extended (29-bit) CAN identifier.

CAN_MAX_EXT_ID
: Maximum value for an extended (29-bit) CAN identifier.

  Deprecated:
  Use CAN_EXT_ID_MASK instead.

CAN_MAX_DLC
: Maximum data length code for CAN 2.0A/2.0B.

CANFD_MAX_DLC
: Maximum data length code for CAN FD.

CAN controller mode flags

CAN_MODE_NORMAL
: Normal mode.

CAN_MODE_LOOPBACK
: Controller is in loopback mode (receives own frames).

CAN_MODE_LISTENONLY
: Controller is not allowed to send dominant bits.

CAN_MODE_FD
: Controller allows transmitting/receiving CAN FD frames.

CAN_MODE_ONE_SHOT
: Controller does not retransmit in case of lost arbitration or missing ACK.

CAN_MODE_3_SAMPLES
: Controller uses triple sampling mode.

CAN_MODE_MANUAL_RECOVERY
: Controller requires manual recovery after entering bus-off state.

CAN frame flags

`CAN_FRAME_IDE`
: Frame uses extended (29-bit) CAN ID.

`CAN_FRAME_RTR`
: Frame is a Remote Transmission Request (RTR)

`CAN_FRAME_FDF`
: Frame uses CAN FD format (FDF)

`CAN_FRAME_BRS`
: Frame uses CAN FD Baud Rate Switch (BRS).

  Only valid in combination with `CAN_FRAME_FDF`.

`CAN_FRAME_ESI`
: CAN FD Error State Indicator (ESI).

  Indicates that the transmitting node is in error-passive state. Only valid in combination with `CAN_FRAME_FDF`.

CAN filter flags

`CAN_FILTER_IDE`
: Filter matches frames with extended (29-bit) CAN IDs.

Defines

`CAN_STATS_BIT_ERROR_INC`(dev_)
: Increment the bit error counter for a CAN device.

  The bit error counter is incremented when the CAN controller is unable to transmit either a dominant or a recessive bit.

See also

CAN_STATS_BIT0_ERROR_INC()

See also

CAN_STATS_BIT1_ERROR_INC()

Note

This error counter should only be incremented if the CAN controller is unable to distinguish between failure to transmit a dominant versus failure to transmit a recessive bit. If the CAN controller supports distinguishing between the two, the `bit0` or `bit1` error counter shall be incremented instead.

Parameters

- `dev_` – Pointer to the device structure for the driver instance.

`CAN_STATS_BIT0_ERROR_INC`(dev_)

Increment the bit0 error counter for a CAN device.

The bit0 error counter is incremented when the CAN controller is unable to transmit a dominant bit.

Incrementing this counter will automatically increment the bit error counter.

See also

CAN_STATS_BIT_ERROR_INC()

Parameters

- `dev_` – Pointer to the device structure for the driver instance.

`CAN_STATS_BIT1_ERROR_INC`(dev_)

Increment the bit1 (recessive) error counter for a CAN device.

The bit1 error counter is incremented when the CAN controller is unable to transmit a recessive bit.

Incrementing this counter will automatically increment the bit error counter.

See also

CAN_STATS_BIT_ERROR_INC()

Parameters

- `dev_` – Pointer to the device structure for the driver instance.

`CAN_STATS_STUFF_ERROR_INC`(dev_)

Increment the stuffing error counter for a CAN device.

The stuffing error counter is incremented when the CAN controller detects a bit stuffing error.

Parameters

- `dev_` – Pointer to the device structure for the driver instance.

`CAN_STATS_CRC_ERROR_INC`(dev_)

Increment the CRC error counter for a CAN device.

The CRC error counter is incremented when the CAN controller detects a frame with an invalid CRC.

Parameters

- **dev_** – Pointer to the device structure for the driver instance.

CAN_STATS_FORM_ERROR_INC(dev_)

Increment the form error counter for a CAN device.

The form error counter is incremented when the CAN controller detects a fixed-form bit field containing illegal bits.

Parameters

- **dev_** – Pointer to the device structure for the driver instance.

CAN_STATS_ACK_ERROR_INC(dev_)

Increment the acknowledge error counter for a CAN device.

The acknowledge error counter is incremented when the CAN controller does not monitor a dominant bit in the ACK slot.

Parameters

- **dev_** – Pointer to the device structure for the driver instance.

CAN_STATS_RX_OVERRUN_INC(dev_)

Increment the RX overrun counter for a CAN device.

The RX overrun counter is incremented when the CAN controller receives a CAN frame matching an installed filter but lacks the capacity to store it (either due to an already full RX mailbox or a full RX FIFO).

Parameters

- **dev_** – Pointer to the device structure for the driver instance.

CAN_STATS_RESET(dev_)

Zero all statistics for a CAN device.

The driver is responsible for resetting the statistics before starting the CAN controller.

Parameters

- **dev_** – Pointer to the device structure for the driver instance.

CAN_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)

Like *DEVICE_DT_DEFINE()* with CAN device specifics.

Defines a device which implements the CAN API. May generate a custom *device_state* container struct and init_fn wrapper when needed depending on CONFIG_CAN_STATS.

Parameters

- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver.
- **pm** – PM device resources reference (NULL if device does not use PM).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

CAN_DEVICE_DT_INST_DEFINE(inst, ...)

Like *CAN_DEVICE_DT_DEFINE()* for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – Instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to *CAN_DEVICE_DT_DEFINE()*.
- ... – Other parameters as expected by *CAN_DEVICE_DT_DEFINE()*.

Typedefs

typedef uint32_t **can_mode_t**

Provides a type to hold CAN controller configuration flags.

The lower 24 bits are reserved for common CAN controller mode flags. The upper 8 bits are reserved for CAN controller/driver specific flags.

See also

CAN_MODE_FLAGS.

typedef void (***can_tx_callback_t**)(const struct *device* *dev, int error, void *user_data)

Defines the application callback handler function signature.

Param dev
Pointer to the device structure for the driver instance.

Param error
Status of the performed send operation. See the list of return values for can_send() for value descriptions.

Param user_data
User data provided when the frame was sent.

typedef void (***can_rx_callback_t**)(const struct *device* *dev, struct *can_frame* *frame, void *user_data)

Defines the application callback handler function signature for receiving.

Param dev
Pointer to the device structure for the driver instance.

Param frame
Received frame.

Param user_data
User data provided when the filter was added.

typedef void (***can_state_change_callback_t**)(const struct *device* *dev, enum *can_state* state, struct *can_bus_err_cnt* err_cnt, void *user_data)

Defines the state change callback handler function signature.

Param dev
Pointer to the device structure for the driver instance.

Param state
State of the CAN controller.

Param err_cnt
CAN controller error counter values.

Param user_data
User data provided the callback was set.

Enums

enum `can_state`

Defines the state of the CAN controller.

Values:

enumerator `CAN_STATE_ERROR_ACTIVE`

Error-active state (RX/TX error count < 96).

enumerator `CAN_STATE_ERROR_WARNING`

Error-warning state (RX/TX error count < 128).

enumerator `CAN_STATE_ERROR_PASSIVE`

Error-passive state (RX/TX error count < 256).

enumerator `CAN_STATE_BUS_OFF`

Bus-off state (RX/TX error count >= 256).

enumerator `CAN_STATE_STOPPED`

CAN controller is stopped and does not participate in CAN communication.

struct `can_frame`

#include <can.h> CAN frame structure.

Public Members

uint32_t `id`

Standard (11-bit) or extended (29-bit) CAN identifier.

uint8_t `dlc`

Data Length Code (DLC) indicating data length in bytes.

uint8_t `flags`

Flags.

See also

CAN_FRAME_FLAGS.

uint16_t **timestamp**

Captured value of the free-running timer in the CAN controller when this frame was received.

The timer is incremented every bit time and captured at the start of frame bit (SOF).

> **Note**
>
> `CONFIG_CAN_RX_TIMESTAMP` must be selected for this field to be available.

uint8_t **data**[CAN_MAX_DLEN]

Payload data accessed as unsigned 8 bit values.

uint32_t **data_32**[*DIV_ROUND_UP*(CAN_MAX_DLEN, sizeof(uint32_t))]

Payload data accessed as unsigned 32 bit values.

union can_frame

The frame payload data.

struct **can_filter**

#include <*can.h*> CAN filter structure.

Public Members

uint32_t **id**

CAN identifier to match.

uint32_t **mask**

CAN identifier matching mask.

If a bit in this mask is 0, the value of the corresponding bit in the `id` field is ignored by the filter.

uint8_t **flags**

Flags.

> **See also**
>
> *CAN_FILTER_FLAGS*.

struct **can_bus_err_cnt**

#include <*can.h*> CAN controller error counters.

Public Members

uint8_t **tx_err_cnt**

Value of the CAN controller transmit error counter.

uint8_t **rx_err_cnt**

Value of the CAN controller receive error counter.

struct **can_timing**

#include <*can.h*> CAN bus timing structure.

This struct is used to pass bus timing values to the configuration and bitrate calculation functions.

The propagation segment represents the time of the signal propagation. Phase segment 1 and phase segment 2 define the sampling point. The `prop_seg` and `phase_seg1` values affect the sampling point in the same way and some controllers only have a register for the sum of those two. The sync segment always has a length of 1 time quantum (see below).

```
+---------+----------+------------+------------+
|sync_seg | prop_seg | phase_seg1 | phase_seg2 |
+---------+----------+------------+------------+
                                  ^
                             Sampling-Point
```

1 time quantum (tq) has the length of 1/(core_clock / prescaler). The bitrate is defined by the core clock divided by the prescaler and the sum of the segments:

br = (core_clock / prescaler) / (1 + prop_seg + phase_seg1 + phase_seg2)

The Synchronization Jump Width (SJW) defines the amount of time quanta the sample point can be moved. The sample point is moved when resynchronization is needed.

Public Members

uint16_t **sjw**

Synchronisation jump width.

uint16_t **prop_seg**

Propagation segment.

uint16_t **phase_seg1**

Phase segment 1.

uint16_t **phase_seg2**

Phase segment 2.

uint16_t **prescaler**

Prescaler value.

struct **can_device_state**

#include <*can.h*> CAN specific device state which allows for CAN device class specific additions.

Public Members

struct *device_state* **devstate**
Common device state.

struct stats_can **stats**
CAN device statistics.

CAN Transceiver

- *Overview*
- *CAN Transceiver API Reference*

Overview A CAN transceiver is an external device that converts the logic level signals from the CAN controller to the bus-levels. The bus lines are called CAN High (CAN H) and CAN Low (CAN L). The transmit wire from the controller to the transceiver is called CAN TX, and the receive wire is called CAN RX. These wires use the logic levels whereas the bus-level is interpreted differentially between CAN H and CAN L. The bus can be either in the recessive (logical one) or dominant (logical zero) state. The recessive state is when both lines, CAN H and CAN L, are roughly at the same voltage level. This state is also the idle state. To write a dominant bit to the bus, open-drain transistors tie CAN H to Vdd and CAN L to ground. The first and last node use a 120-ohm resistor between CAN H and CAN L to terminate the bus. The dominant state always overrides the recessive state. This structure is called a wired-AND.

CAN Transceiver API Reference

group **can_transceiver**
CAN Transceiver Driver APIs.

Since
3.1

Version
0.1.0

Functions

static inline int **can_transceiver_enable**(const struct *device* *dev, *can_mode_t* mode)
Enable CAN transceiver.

Enable the CAN transceiver.

See also

can_start()

Note

The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `mode` – Operation mode.

Return values

- `0` – If successful.
- `-EIO` – General input/output error, failed to enable device.

static inline int **can_transceiver_disable**(const struct *device* *dev)
Disable CAN transceiver.

Disable the CAN transceiver.

See also

can_stop()

Note

The CAN transceiver is controlled by the CAN controller driver and should not normally be controlled by the application.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `-EIO` – General input/output error, failed to disable device.

CAN Shell

- *Overview*
- *Inspection*
- *Configuration*
- *Receiving*
- *Sending*
- *Bus Recovery*

Overview The CAN shell provides a `can` command with a set of subcommands for the *shell* module. It allows for testing and exploring the *CAN Controller* driver API through an interactive interface without having to write a dedicated application. The CAN shell can also be enabled in existing applications to aid in interactive debugging of CAN issues.

The CAN shell provides access to most CAN controller features, including inspection, configuration, sending and receiving of CAN frames, and bus recovery.

In order to enable the CAN shell, the following *Kconfig* options must be enabled:

- `CONFIG_SHELL`
- `CONFIG_CAN`
- `CONFIG_CAN_SHELL`

The following *Kconfig* options enable additional subcommands and features of the `can` command:

- `CONFIG_CAN_FD_MODE` enables CAN FD specific subcommands (e.g. for setting the timing for the CAN FD data phase).
- `CONFIG_CAN_RX_TIMESTAMP` enables printing of timestamps for received CAN frames.
- `CONFIG_CAN_STATS` enables printing of various statistics for the CAN controller in the `can show` subcommand. This depends on `CONFIG_STATS` being enabled as well.
- `CONFIG_CAN_MANUAL_RECOVERY_MODE` enables the `can recover` subcommand.

For example, building the hello_world sample for the frdm_k64f with the CAN shell and CAN statistics enabled:

```
# From the root of the zephyr repository
west build -b frdm_k64f samples/hello_world -- -DCONFIG_SHELL=y -DCONFIG_CAN=y -DCONFIG_CAN_
↪SHELL=y -DCONFIG_STATS=y -DCONFIG_CAN_STATS=y
```

See the *shell* documentation for general instructions on how to connect and interact with the shell. The CAN shell comes with built-in help (unless `CONFIG_SHELL_HELP` is disabled). The built-in help messages can be printed by passing `-h` or `--help` to the `can` command or any of its subcommands. All subcommands also support tab-completion of their arguments.

Tip

All of the CAN shell subcommands take the name of a CAN controller as their first argument, which also supports tab-completion. A list of all devices available can be obtained using the `device list` shell command when `CONFIG_DEVICE_SHELL` is enabled. The examples below all use the device name `can@0`.

Inspection The properties of a given CAN controller can be inspected using the `can show` subcommand as shown below. The properties include the core CAN clock rate, the maximum supported bitrate, the number of RX filters supported, capabilities, current mode, current state, error counters, timing limits, and more:

```
uart:~$ can show can@0
core clock:      144000000 Hz
max bitrate:     5000000 bps
max std filters: 15
max ext filters: 15
capabilities:    normal loopback listen-only fd
mode:            normal
state:           stopped
rx errors:       0
tx errors:       0
timing:          sjw 1..128, prop_seg 0..0, phase_seg1 2..256, phase_seg2 2..128, prescaler␣
↪1..512
timing data:     sjw 1..16, prop_seg 0..0, phase_seg1 1..32, phase_seg2 1..16, prescaler 1..
↪32
transceiver:     passive/none
statistics:
  bit errors:    0
    bit0 errors: 0
    bit1 errors: 0
  stuff errors:  0
  crc errors:    0
  form errors:   0
  ack errors:    0
  rx overruns:   0
```

Note

The statistics are only printed if `CONFIG_CAN_STATS` is enabled.

Configuration The CAN shell allows for configuring the CAN controller mode and timing, along with starting and stopping the processing of CAN frames.

Note

The CAN controller mode and timing can only be changed while the CAN controller is stopped, which is the initial setting upon boot-up. The initial CAN controller mode is set to `normal` and the initial timing is set according to the `bitrate`, `sample-point`, `bitrate-data`, and `sample-point-data` *Devicetree* properties.

Timing The classic CAN bitrate/CAN FD arbitration phase bitrate can be configured using the `can bitrate` subcommand as shown below. The bitrate is specified in bits per second.

```
uart:~$ can bitrate can@0 125000
setting bitrate to 125000 bps
```

If `CONFIG_CAN_FD_MODE` is enabled, the data phase bitrate can be configured using the `can dbitrate` subcommand as shown below. The bitrate is specified in bits per second.

```
uart:~$ can dbitrate can@0 1000000
setting data bitrate to 1000000 bps
```

Both of these subcommands allow specifying an optional sample point in per mille and a (Re)Synchronization Jump Width (SJW) in Time Quanta as positional arguments. Refer to the interactive help of the subcommands for more details.

It is also possible to configure the raw bit timing using the `can timing` and `can dtiming` subcommands. Refer to the interactive help output for these subcommands for details on the required arguments.

Mode The CAN shell allows for setting the mode of the CAN controller using the `can mode` subcommand. An example for enabling loopback mode is shown below.

```
uart:~$ can mode can@0 loopback
setting mode 0x00000001
```

The subcommand accepts multiple modes given on the same command line (e.g. `can mode can@0 fd loopback` for setting CAN FD and loopback mode). Vendor-specific modes can be specified in hexadecimal.

Starting and Stopping After the timing and mode has been configured as needed, the CAN controller can be started using the `can start` subcommand as shown below. This will enable reception and transmission of CAN frames.

```
uart:~$ can start can@0
starting can@0
```

Prior to reconfiguring the timing or mode, the CAN controller needs to be stopped using the `can stop` subcommand as shown below:

```
uart:~$ can stop can@0
stopping can@0
```

Receiving In order to receive CAN frames, one or more CAN RX filters need to be configured. CAN RX filters are added using the `can filter add` subcommand as shown below. The subcommand accepts a CAN ID in hexadecimal format along with an optional CAN ID mask, also in hexadecimal format, for setting which bits in the CAN ID are to be matched. Refer to the interactive help output for this subcommand for further details on the supported arguments.

```
uart:~$ can filter add can@0 010
adding filter with standard (11-bit) CAN ID 0x010, CAN ID mask 0x7ff, data frames 1, RTR␣
↪frames 0, CAN FD frames 0
filter ID: 0
```

The filter ID (0 in the example above) returned is to be used when removing the CAN RX filter.

Received CAN frames matching the added filter(s) are printed to the shell. A few examples are shown below:

```
# Dev Flags    ID   Size  Data bytes
can0  --       010   [8]  01 02 03 04 05 06 07 08
can0  B-       010  [08]  01 02 03 04 05 06 07 08
can0  BP       010  [03]  01 aa bb
can0  --  00000010   [0]
can0  --       010   [1]  20
can0  --       010   [8]  remote transmission request
```

The columns have the following meaning:

- Dev
  - Name of the device receiving the frame.

- Flags
  - `B`: The frame has the CAN FD Baud Rate Switch (BRS) flag set.
  - `P`: The frame has the CAN FD Error State Indicator (ESI) flag set. The transmitting node is in error-passive state.
  - `-`: Unset flag.
- ID
  - `010`: The standard (11-bit) CAN ID of the frame in hexadecimal format, here 10h.
  - `00000010`: The extended (29-bit) CAN ID of the frame in hexadecimal format, here 10h.
- Size
  - `[8]`: The number of frame data bytes in decimal format, here a classic CAN frame with 8 data bytes.
  - `[08]`: The number of frame data bytes in decimal format, here a CAN FD frame with 8 data bytes.
- Data bytes
  - `01 02 03 04 05 06 07 08`: The frame data bytes in hexadecimal format, here the numbers from 1 through 8.
  - `remote transmission request`: The frame is a Remote Transmission Request (RTR) frame and thus carries no data bytes.

Tip

If `CONFIG_CAN_RX_TIMESTAMP` is enabled, each line will be prepended with a timestamp from the free-running timestamp counter in the CAN controller.

Configured CAN RX filters can be removed again using the `can filter remove` subcommand as shown below. The filter ID is the ID returned by the `can filter add` subcommand (0 in the example below).

```
uart:~$ can filter remove can@0 0
removing filter with ID 0
```

Sending CAN frames can be queued for transmission using the `can send` subcommand as shown below. The subcommand accepts a CAN ID in hexadecimal format and optionally a number of data bytes, also specified in hexadecimal. Refer to the interactive help output for this subcommand for further details on the supported arguments.

```
uart:~$ can send can@0 010 1 2 3 4 5 6 7 8
enqueuing CAN frame #2 with standard (11-bit) CAN ID 0x010, RTR 0, CAN FD 0, BRS 0, DLC 8
CAN frame #2 successfully sent
```

Bus Recovery The `can recover` subcommand can be used for initiating manual recovery from a CAN bus-off event as shown below:

```
uart:~$ can recover can@0
recovering, no timeout
```

The subcommand accepts an optional bus recovery timeout in milliseconds. If no timeout is specified, the command will wait indefinitely for the bus recovery to succeed.

Note

The `recover` subcommand is only available if `CONFIG_CAN_MANUAL_RECOVERY_MODE` is enabled.

7.6.9 Chargers

The charger subsystem exposes an API to uniformly access battery charger devices.

A charger device, or charger peripheral, is a device used to take external power provided to the system as an input and provide power as an output downstream to the battery pack(s) and system. The charger device can exist as a module, an integrated circuit, or as a functional block in a power management integrated circuit (PMIC).

The action of charging a battery pack is referred to as a charge cycle. When the charge cycle is executed the battery pack is charged according to the charge profile configured on the charger device. The charge profile is defined in the battery pack's specification that is provided by the manufacturer. On charger devices with a control port, the charge profile can be configured by the host controller by setting the relevant properties, and can be adjusted at runtime to respond to environmental changes.

Basic Operation

Initiating a Charge Cycle A charge cycle is initiated or terminated using *charger_charge_enable()*.

Properties Fundamentally, a property is a configurable setting, state, or quantity that a charger device can measure.

Chargers typically support multiple properties, such as temperature readings of the battery-pack or present-time current/voltage.

Properties are fetched by the client one at a time using *charger_get_prop()*. Properties are set by the client one at a time using *charger_set_prop()*.

API Reference

Related code samples

Charger
Charge a battery using the charger driver API.

group `charger_interface`

Charger Interface.

Typedefs

typedef uint16_t **charger_prop_t**

A charger property's identifier.

See charger_property for a list of identifiers

typedef void (*charger_status_notifier_t)(enum *charger_status* status)

The charger status change callback to notify the system.

Param status
Current charging state

typedef void (*charger_online_notifier_t)(enum *charger_online* online)

The charger online change callback to notify the system.

Param online
Current external supply state

typedef int (*charger_get_property_t)(const struct *device* *dev, const *charger_prop_t* prop, union *charger_propval* *val)

Callback API for getting a charger property.

See charger_get_property() for argument description

typedef int (*charger_set_property_t)(const struct *device* *dev, const *charger_prop_t* prop, const union *charger_propval* *val)

Callback API for setting a charger property.

See charger_set_property() for argument description

typedef int (*charger_charge_enable_t)(const struct *device* *dev, const bool enable)

Callback API enabling or disabling a charge cycle.

See *charger_charge_enable()* for argument description

Enums

enum charger_property

Runtime Dynamic Battery Parameters.

Values:

enumerator CHARGER_PROP_ONLINE = 0

Indicates if external supply is present for the charger.

Value should be of type enum charger_online

enumerator CHARGER_PROP_PRESENT

Reports whether or not a battery is present.

Value should be of type bool

enumerator CHARGER_PROP_STATUS

Represents the charging status of the charger.

Value should be of type enum charger_status

enumerator CHARGER_PROP_CHARGE_TYPE

Represents the charging algo type of the charger.

Value should be of type enum charger_charge_type

enumerator CHARGER_PROP_HEALTH

Represents the health of the charger.

Value should be of type enum charger_health

enumerator CHARGER_PROP_CONSTANT_CHARGE_CURRENT_UA

Configuration of current sink used for charging in µA.

enumerator CHARGER_PROP_PRECHARGE_CURRENT_UA

Configuration of current sink used for conditioning in µA.

enumerator CHARGER_PROP_CHARGE_TERM_CURRENT_UA

Configuration of charge termination target in µA.

enumerator CHARGER_PROP_CONSTANT_CHARGE_VOLTAGE_UV

Configuration of charge voltage regulation target in µV.

enumerator CHARGER_PROP_INPUT_REGULATION_CURRENT_UA

Configuration of the input current regulation target in µA.

This value is a rising current threshold that is regulated by reducing the charge current output

enumerator CHARGER_PROP_INPUT_REGULATION_VOLTAGE_UV

Configuration of the input voltage regulation target in µV.

This value is a falling voltage threshold that is regulated by reducing the charge current output

enumerator CHARGER_PROP_INPUT_CURRENT_NOTIFICATION

Configuration to issue a notification to the system based on the input current level and timing.

Value should be of type struct *charger_current_notifier*

enumerator CHARGER_PROP_DISCHARGE_CURRENT_NOTIFICATION

Configuration to issue a notification to the system based on the battery discharge current level and timing.

Value should be of type struct *charger_current_notifier*

enumerator CHARGER_PROP_SYSTEM_VOLTAGE_NOTIFICATION_UV

Configuration of the falling system voltage threshold where a notification is issued to the system, measured in µV.

enumerator CHARGER_PROP_STATUS_NOTIFICATION

Configuration to issue a notification to the system based on the charger status change.

Value should be of type charger_status_notifier_t

enumerator CHARGER_PROP_ONLINE_NOTIFICATION

Configuration to issue a notification to the system based on the charger online change.

Value should be of type charger_online_notifier_t

enumerator CHARGER_PROP_COMMON_COUNT

Reserved to demark end of common charger properties.

enumerator CHARGER_PROP_CUSTOM_BEGIN = *CHARGER_PROP_COMMON_COUNT* + 1

Reserved to demark downstream custom properties - use this value as the actual value may change over future versions of this API.

enumerator CHARGER_PROP_MAX = UINT16_MAX

Reserved to demark end of valid enum properties.

enum charger_online

External supply states.

Values:

enumerator CHARGER_ONLINE_OFFLINE = 0

External supply not present.

enumerator CHARGER_ONLINE_FIXED

External supply is present and of fixed output.

enumerator CHARGER_ONLINE_PROGRAMMABLE

External supply is present and of programmable output.

enum charger_status

Charging states.

Values:

enumerator CHARGER_STATUS_UNKNOWN = 0

Charging device state is unknown.

enumerator CHARGER_STATUS_CHARGING

Charging device is charging a battery.

enumerator CHARGER_STATUS_DISCHARGING

Charging device is not able to charge a battery.

enumerator CHARGER_STATUS_NOT_CHARGING

Charging device is not charging a battery.

enumerator CHARGER_STATUS_FULL

The battery is full and the charging device will not attempt charging.

enum charger_charge_type

Charge algorithm types.

Values:

enumerator CHARGER_CHARGE_TYPE_UNKNOWN = 0

Charge type is unknown.

enumerator CHARGER_CHARGE_TYPE_NONE

Charging is not occurring.

enumerator CHARGER_CHARGE_TYPE_TRICKLE

Charging is occurring at the slowest desired charge rate, typically for battery detection or preconditioning.

enumerator CHARGER_CHARGE_TYPE_FAST

Charging is occurring at the fastest desired charge rate.

enumerator CHARGER_CHARGE_TYPE_STANDARD

Charging is occurring at a moderate charge rate.

enumerator CHARGER_CHARGE_TYPE_ADAPTIVE

enumerator CHARGER_CHARGE_TYPE_LONGLIFE

enumerator CHARGER_CHARGE_TYPE_BYPASS

enum charger_health

Charger health conditions.

These conditions determine the ability to, or the rate of, charge

Values:

enumerator CHARGER_HEALTH_UNKNOWN = 0

Charger health condition is unknown.

enumerator CHARGER_HEALTH_GOOD

Charger health condition is good.

enumerator CHARGER_HEALTH_OVERHEAT

The charger device is overheated.

enumerator CHARGER_HEALTH_OVERVOLTAGE

The battery voltage has exceeded its overvoltage threshold.

enumerator CHARGER_HEALTH_UNSPEC_FAILURE

The battery or charger device is experiencing an unspecified failure.

enumerator CHARGER_HEALTH_COLD

The battery temperature is below the “cold” threshold.

enumerator CHARGER_HEALTH_WATCHDOG_TIMER_EXPIRE

The charger device’s watchdog timer has expired.

enumerator CHARGER_HEALTH_SAFETY_TIMER_EXPIRE
The charger device's safety timer has expired.

enumerator CHARGER_HEALTH_CALIBRATION_REQUIRED
The charger device requires calibration.

enumerator CHARGER_HEALTH_WARM
The battery temperature is in the "warm" range.

enumerator CHARGER_HEALTH_COOL
The battery temperature is in the "cool" range.

enumerator CHARGER_HEALTH_HOT
The battery temperature is below the "hot" threshold.

enumerator CHARGER_HEALTH_NO_BATTERY
The charger device does not detect a battery.

enum charger_notification_severity
Charger severity levels for system notifications.
Values:

enumerator CHARGER_SEVERITY_PEAK = 0
Most severe level, typically triggered instantaneously.

enumerator CHARGER_SEVERITY_CRITICAL
More severe than the warning level, less severe than peak.

enumerator CHARGER_SEVERITY_WARNING
Base severity level.

Functions

int charger_get_prop(const struct *device* *dev, const *charger_prop_t* prop, union *charger_propval* *val)
Fetch a battery charger property.

Parameters

- dev – Pointer to the battery charger device
- prop – Charger property to get
- val – Pointer to *charger_propval* union

Return values

- 0 – if successful
- < – 0 if getting property failed

int `charger_set_prop`(const struct *device* *dev, const *charger_prop_t* prop, const union *charger_propval* *val)

Set a battery charger property.

Parameters

- `dev` – Pointer to the battery charger device
- `prop` – Charger property to set
- `val` – Pointer to *charger_propval* union

Return values

- `0` – if successful
- `<` – 0 if setting property failed

int `charger_charge_enable`(const struct *device* *dev, const bool enable)

Enable or disable a charge cycle.

Parameters

- `dev` – Pointer to the battery charger device
- `enable` – true enables a charge cycle, false disables a charge cycle

Return values

- `0` – if successful
- `-EIO` – if communication with the charger failed
- `-EINVAL` – if the conditions for initiating charging are invalid

struct `charger_current_notifier`

#include <*charger.h*> The input current thresholds for the charger to notify the system.

Public Members

uint8_t `severity`

The severity of the notification where CHARGER_SEVERITY_PEAK is the most severe.

uint32_t `current_ua`

The current threshold to be exceeded.

uint32_t `duration_us`

The duration of excess current before notifying the system.

union `charger_propval`

#include <*charger.h*> container for a charger_property value

Public Members

enum *charger_online* `online`

CHARGER_PROP_ONLINE.

bool **present**
CHARGER_PROP_PRESENT.

enum *charger_status* **status**
CHARGER_PROP_STATUS.

enum *charger_charge_type* **charge_type**
CHARGER_PROP_CHARGE_TYPE.

enum *charger_health* **health**
CHARGER_PROP_HEALTH.

uint32_t **const_charge_current_ua**
CHARGER_PROP_CONSTANT_CHARGE_CURRENT_UA.

uint32_t **precharge_current_ua**
CHARGER_PROP_PRECHARGE_CURRENT_UA.

uint32_t **charge_term_current_ua**
CHARGER_PROP_CHARGE_TERM_CURRENT_UA.

uint32_t **const_charge_voltage_uv**
CHARGER_PROP_CONSTANT_CHARGE_VOLTAGE_UV.

uint32_t **input_current_regulation_current_ua**
CHARGER_PROP_INPUT_REGULATION_CURRENT_UA.

uint32_t **input_voltage_regulation_voltage_uv**
CHARGER_PROP_INPUT_REGULATION_VOLTAGE_UV.

struct *charger_current_notifier* **input_current_notification**
CHARGER_PROP_INPUT_CURRENT_NOTIFICATION.

struct *charger_current_notifier* **discharge_current_notification**
CHARGER_PROP_DISCHARGE_CURRENT_NOTIFICATION.

uint32_t **system_voltage_notification**
CHARGER_PROP_SYSTEM_VOLTAGE_NOTIFICATION_UV.

charger_status_notifier_t **status_notification**
CHARGER_PROP_STATUS_NOTIFICATION.

charger_online_notifier_t **online_notification**
CHARGER_PROP_ONLINE_NOTIFICATION.

struct **charger_driver_api**
#include <charger.h> Charging device API.

Caching is entirely on the onus of the client

7.6.10 Coredump Device

Overview

The coredump device is a pseudo-device driver with two types.A COREDUMP_TYPE_MEMCPY type exposes device tree bindings for memory address/size values to be included in any dump. And the driver exposes an API to add/remove dump memory regions at runtime. A COREDUMP_TYPE_CALLBACK device requires exactly one entry in the memory-regions array with a size of 0 and a desired size. The driver will statically allocate memory of the desired size and provide an API to register a callback function to fill that memory when a dump occurs.

Configuration Options

Related configuration options:

- `CONFIG_COREDUMP_DEVICE`

API Reference

group `coredump_device_interface`

Coredump pseudo-device driver APIs.

Typedefs

typedef void (***coredump_dump_callback_t**)(uintptr_t dump_area, size_t dump_area_size)

Callback that occurs at dump time, data copied into dump_area will be included in the dump that is generated.

Param dump_area
Pointer to area to copy data into for inclusion in dump

Param dump_area_size
Size of available memory at dump_area

Functions

static inline bool **coredump_device_register_memory**(const struct *device* *dev, struct *coredump_mem_region_node* *region)

Register a region of memory to be stored in core dump at the time it is generated.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `region` – Struct describing memory to be collected

Returns
true if registration succeeded

Returns
false if registration failed

static inline bool **coredump_device_unregister_memory**(const struct *device* *dev, struct *coredump_mem_region_node* *region)

Unregister a region of memory to be stored in core dump at the time it is generated.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **region** – Struct describing memory to be collected

Returns
true if unregistration succeeded

Returns
false if unregistration failed

static inline bool **coredump_device_register_callback**(const struct *device* *dev, *coredump_dump_callback_t* callback)

Register a callback to be invoked at dump time.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **callback** – Callback to be invoked at dump time

Returns
true if registration succeeded

Returns
false if registration failed

struct **coredump_mem_region_node**

#include <coredump.h> Structure describing a region in memory that may be stored in core dump at the time it is generated.

Instances of this are passed to the *coredump_device_register_memory()* and *coredump_device_unregister_memory()* functions to indicate addition and removal of memory regions to be captured

Public Members

sys_snode_t **node**

Node of single-linked list, do not modify.

uintptr_t **start**

Address of start of memory region.

size_t **size**

Size of memory region.

7.6.11 Counter

Overview

API Reference

Related code samples

Counter Alarm
Implement an alarm application using the counter API.

DS3231 TCXO RTC
Interact with a DS3231 real-time clock using the counter API and dedicated driver API.

group `counter_interface`

Counter Interface.

Since
1.14

Version
0.8.0

Counter device capabilities

`COUNTER_CONFIG_INFO_COUNT_UP`

Counter count up flag.

Flags used by counter_top_cfg.

`COUNTER_TOP_CFG_DONT_RESET`

Flag preventing counter reset when top value is changed.

If flags is set then counter is free running while top value is updated, otherwise counter is reset (see *counter_set_top_value()*).

`COUNTER_TOP_CFG_RESET_WHEN_LATE`

Flag instructing counter to reset itself if changing top value results in counter going out of new top value bound.

See *COUNTER_TOP_CFG_DONT_RESET*.

Alarm configuration flags

Used in alarm configuration structure (*counter_alarm_cfg*).

`COUNTER_ALARM_CFG_ABSOLUTE`

Counter alarm absolute value flag.

Ticks relation to counter value. If set ticks are treated as absolute value, else it is relative to the counter reading performed during the call.

COUNTER_ALARM_CFG_EXPIRE_WHEN_LATE

Alarm flag enabling immediate expiration when driver detects that absolute alarm was set too late.

Alarm callback must be called from the same context as if it was set on time.

Counter guard period flags

Used by *counter_set_guard_period* and *counter_get_guard_period*.

COUNTER_GUARD_PERIOD_LATE_TO_SET

Identifies guard period needed for detection of late setting of absolute alarm (see *counter_set_channel_alarm*).

Typedefs

typedef void (*counter_alarm_callback_t)(const struct *device* *dev, uint8_t chan_id, uint32_t ticks, void *user_data)

Alarm callback.

Param dev
Pointer to the device structure for the driver instance.

Param chan_id
Channel ID.

Param ticks
Counter value that triggered the alarm.

Param user_data
User data.

typedef void (*counter_top_callback_t)(const struct *device* *dev, void *user_data)

Callback called when counter turns around.

Param dev
Pointer to the device structure for the driver instance.

Param user_data
User data provided in *counter_set_top_value*.

typedef int (*counter_api_start)(const struct *device* *dev)

typedef int (*counter_api_stop)(const struct *device* *dev)

typedef int (*counter_api_get_value)(const struct *device* *dev, uint32_t *ticks)

typedef int (*counter_api_get_value_64)(const struct *device* *dev, uint64_t *ticks)

typedef int (*counter_api_set_alarm)(const struct *device* *dev, uint8_t chan_id, const struct *counter_alarm_cfg* *alarm_cfg)

typedef int (*counter_api_cancel_alarm)(const struct *device* *dev, uint8_t chan_id)

typedef int (*`counter_api_set_top_value`)(const struct *device* *dev, const struct *counter_top_cfg* *cfg)

typedef uint32_t (*`counter_api_get_pending_int`)(const struct *device* *dev)

typedef uint32_t (*`counter_api_get_top_value`)(const struct *device* *dev)

typedef uint32_t (*`counter_api_get_guard_period`)(const struct *device* *dev, uint32_t flags)

typedef int (*`counter_api_set_guard_period`)(const struct *device* *dev, uint32_t ticks, uint32_t flags)

typedef uint32_t (*`counter_api_get_freq`)(const struct *device* *dev)

Functions

bool `counter_is_counting_up`(const struct *device* *dev)

Function to check if counter is counting up.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Return values

- `true` – if counter is counting up.
- `false` – if counter is counting down.

uint8_t `counter_get_num_of_channels`(const struct *device* *dev)

Function to get number of alarm channels.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Returns

Number of alarm channels.

uint32_t `counter_get_frequency`(const struct *device* *dev)

Function to get counter frequency.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Returns

Frequency of the counter in Hz, or zero if the counter does not have a fixed frequency.

uint32_t `counter_us_to_ticks`(const struct *device* *dev, uint64_t us)

Function to convert microseconds to ticks.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `us` – **[in]** Microseconds.

Returns

Converted ticks. Ticks will be saturated if exceed 32 bits.

uint64_t `counter_ticks_to_us`(const struct *device* *dev, uint32_t ticks)

Function to convert ticks to microseconds.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.
- `ticks` – **[in]** Ticks.

Returns

Converted microseconds.

uint32_t `counter_get_max_top_value`(const struct *device* *dev)

Function to retrieve maximum top value that can be set.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Returns

Max top value.

int `counter_start`(const struct *device* *dev)

Start counter device in free running mode.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `Negative` – errno code if failure.

int `counter_stop`(const struct *device* *dev)

Stop counter device.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `-ENOTSUP` – if the device doesn't support stopping the counter.

int `counter_get_value`(const struct *device* *dev, uint32_t *ticks)

Get current counter value.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ticks` – Pointer to where to store the current counter value

Return values

- `0` – If successful.
- `Negative` – error code on failure getting the counter value

int `counter_get_value_64`(const struct *device* *dev, uint64_t *ticks)

Get current counter 64-bit value.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ticks` – Pointer to where to store the current counter value

Return values

- `0` – If successful.
- `Negative` – error code on failure getting the counter value

int `counter_set_channel_alarm`(const struct *device* *dev, uint8_t chan_id, const struct *counter_alarm_cfg* *alarm_cfg)

Set a single shot alarm on a channel.

After expiration alarm can be set again, disabling is not needed. When alarm expiration handler is called, channel is considered available and can be set again in that context.

Note

API is not thread safe.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `chan_id` – Channel ID.
- `alarm_cfg` – Alarm configuration.

Return values

- `0` – If successful.
- `-ENOTSUP` – if request is not supported (device does not support interrupts or requested channel).
- `-EINVAL` – if alarm settings are invalid.
- `-ETIME` – if absolute alarm was set too late.
- `-EBUSY` – if alarm is already active.

int `counter_cancel_channel_alarm`(const struct *device* *dev, uint8_t chan_id)

Cancel an alarm on a channel.

Note

API is not thread safe.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `chan_id` – Channel ID.

Return values

- `0` – If successful.
- `-ENOTSUP` – if request is not supported or the counter was not started yet.

int `counter_set_top_value`(const struct *device* *dev, const struct *counter_top_cfg* *cfg)

Set counter top value.

Function sets top value and optionally resets the counter to 0 or top value depending on counter direction. On turnaround, counter can be reset and optional callback is periodically called. Top value can only be changed when there is no active channel alarm.

COUNTER_TOP_CFG_DONT_RESET prevents counter reset. When counter is running while top value is updated, it is possible that counter progresses outside the new top value. In that case, error is returned and optionally driver can reset the counter (see *COUNTER_TOP_CFG_RESET_WHEN_LATE*).

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cfg` – Configuration. Cannot be NULL.

Return values

- `0` – If successful.
- `-ENOTSUP` – if request is not supported (e.g. top value cannot be changed or counter cannot/must be reset during top value update).
- `-EBUSY` – if any alarm is active.
- `-ETIME` – if *COUNTER_TOP_CFG_DONT_RESET* was set and new top value is smaller than current counter value (counter counting up).

int `counter_get_pending_int`(const struct *device* *dev)

Function to get pending interrupts.

The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `1` – if any counter interrupt is pending.
- `0` – if no counter interrupt is pending.

uint32_t `counter_get_top_value`(const struct *device* *dev)

Function to retrieve current top value.

Parameters

- `dev` – **[in]** Pointer to the device structure for the driver instance.

Returns

Top value.

int `counter_set_guard_period`(const struct *device* *dev, uint32_t ticks, uint32_t flags)

Set guard period in counter ticks.

When setting an absolute alarm value close to the current counter value there is a risk that the counter will have counted past the given absolute value before the driver manages to activate the alarm. If this would go unnoticed then the alarm would only expire after the timer has wrapped and reached the given absolute value again after a full timer period. This could take a long time in case of a 32 bit timer. Setting a sufficiently large guard period will help the driver detect unambiguously whether it is late or not.

The guard period should be as many counter ticks as the driver will need at most to actually activate the alarm after the driver API has been called. If the driver finds that the counter has just passed beyond the given absolute tick value but is still close enough to fall within the guard period, it will assume that it is "late", i.e. that the intended expiry time has already passed. Depending on the *COUNTER_ALARM_CFG_EXPIRE_WHEN_LATE* flag the driver will either ignore the alarm or expire it immediately in such a case.

If, however, the counter is past the given absolute tick value but outside the guard period, then the driver will assume that this is intentional and let the counter wrap around to/from zero before it expires.

More precisely:

- When counting upwards (see *COUNTER_CONFIG_INFO_COUNT_UP*) the given absolute tick value must be above (now + guard_period) % top_value to be accepted by the driver.
- When counting downwards, the given absolute tick value must be less than (now + top_value - guard_period) % top_value to be accepted.

Examples:

- counting upwards, now = 4950, top value = 5000, guard period = 100: absolute tick value >= (4950 + 100) % 5000 = 50
- counting downwards, now = 50, top value = 5000, guard period = 100: absolute tick value <= (50 + 5000 - * 100) % 5000 = 4950

If you need only short alarm periods, you can set the guard period very high (e.g. half of the counter top value) which will make it highly unlikely that the counter will ever unintentionally wrap.

The guard period is set to 0 on initialization (no protection).

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ticks` – Guard period in counter ticks.
- `flags` – See *COUNTER_GUARD_PERIOD_FLAGS*.

Return values

- `0` – if successful.
- `-ENOTSUP` – if function or flags are not supported.
- `-EINVAL` – if ticks value is invalid.

uint32_t **counter_get_guard_period**(const struct *device* *dev, uint32_t flags)

Return guard period.

See also

counter_set_guard_period.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `flags` – See *COUNTER_GUARD_PERIOD_FLAGS*.

Returns

Guard period given in counter ticks or 0 if function or flags are not supported.

struct **counter_alarm_cfg**

#include <*counter.h*> Alarm callback structure.

Public Members

counter_alarm_callback_t **callback**

Callback called on alarm (cannot be NULL).

uint32_t **ticks**

Number of ticks that triggers the alarm.

It can be relative (to now) or an absolute value (see *COUNTER_ALARM_CFG_ABSOLUTE*). Both, relative and absolute, alarm values can be any value between zero and the current top value (see *counter_get_top_value*). When setting an absolute alarm value close to the current counter value there is a risk that the counter will have counted past the given absolute value before the driver manages to activate the alarm. Therefore a guard period can be defined that lets the driver decide unambiguously whether it is late or not (see *counter_set_guard_period*). If the counter is clock driven then ticks can be converted to microseconds (see *counter_ticks_to_us*). Alternatively, the counter implementation may count asynchronous events.

void ***user_data**

User data returned in callback.

uint32_t **flags**

Alarm flags (see *COUNTER_ALARM_FLAGS*).

struct **counter_top_cfg**

#include <*counter.h*> Top value configuration structure.

Public Members

uint32_t **ticks**

Top value.

counter_top_callback_t **callback**

Callback function (can be NULL).

void ***user_data**

User data passed to callback function (not valid if callback is NULL).

uint32_t **flags**

Flags (see *COUNTER_TOP_FLAGS*).

struct **counter_config_info**

#include <*counter.h*> Structure with generic counter features.

Public Members

uint32_t `max_top_value`
Maximal (default) top value on which counter is reset (cleared or reloaded).

uint32_t `freq`
Frequency of the source clock if synchronous events are counted.

uint8_t `flags`
Flags (see *COUNTER_FLAGS*).

uint8_t `channels`
Number of channels that can be used for setting alarm.

Functions

int **dac_channel_setup**(const struct *device* *dev, const struct *dac_channel_cfg* *channel_cfg)

Configure a DAC channel.

It is required to call this function and configure each channel before it is selected for a write request.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **channel_cfg** – Channel configuration.

Return values

- **0** – On success.
- **-EINVAL** – If a parameter with an invalid value has been provided.
- **-ENOTSUP** – If the requested resolution is not supported.

int **dac_write_value**(const struct *device* *dev, uint8_t channel, uint32_t value)

Write a single value to a DAC channel.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **channel** – Number of the channel to be used.
- **value** – Data to be written to DAC output registers.

Return values

- **0** – On success.
- **-EINVAL** – If a parameter with an invalid value has been provided.

struct **dac_channel_cfg**

#include <dac.h> Structure for specifying the configuration of a DAC channel.

Public Members

uint8_t **channel_id**

Channel identifier of the DAC that should be configured.

uint8_t **resolution**

Desired resolution of the DAC (depends on device capabilities).

bool **buffered**

Enable output buffer for this channel.

This is relevant for instance if the output is directly connected to the load, without an amplifierin between. The actual details on this are hardware dependent.

7.6.13 Direct Memory Access (DMA)

Overview

Direct Memory Access (Controller) is a commonly provided type of co-processor that can typically offload transferring data to and from peripherals and memory.

The DMA API is not a portable API and really cannot be as each DMA has unique memory requirements, peripheral interactions, and features. The API in effect provides a union of all useful DMA functionality drivers have needed in the tree. It can still be a good abstraction, with care, for peripheral devices for vendors where the DMA IP might be very similar but have slight variances.

Driver Implementation Expectations

Synchronization and Ownership From an API point of view, a DMA channel is a single-owner object, meaning the drivers should not attempt to wrap a channel with kernel synchronization primitives such as mutexes or semaphores. If DMA channels require mutating shared registers, those register updates should be wrapped in a spin lock.

This enables the entire API to be low-cost and callable from any call context, including ISRs where it may be very useful to start/stop/suspend/resume/reload a channel transfer.

Transfer Descriptor Memory Management Drivers should not attempt to use heap allocations of any kind. If object pools are needed for transfer descriptors then those should be setup in a way that does not break the promise of ISR-allowable calls. Many drivers choose to create a simple static descriptor array per channel with the size of the descriptor array adjustable using Kconfig.

Channel State Machine Expectations DMA channels should be viewed as state machines that the DMA API provides transition events for in the form of API calls. Every driver is expected to maintain its own channel state tracking. The busy state of the channel should be inspectable at any time with *dma_get_status()*.

A diagram showing those expectated possible state transitions and their API calls is provided here for reference.

API Reference

group `dma_interface`

DMA Interface.

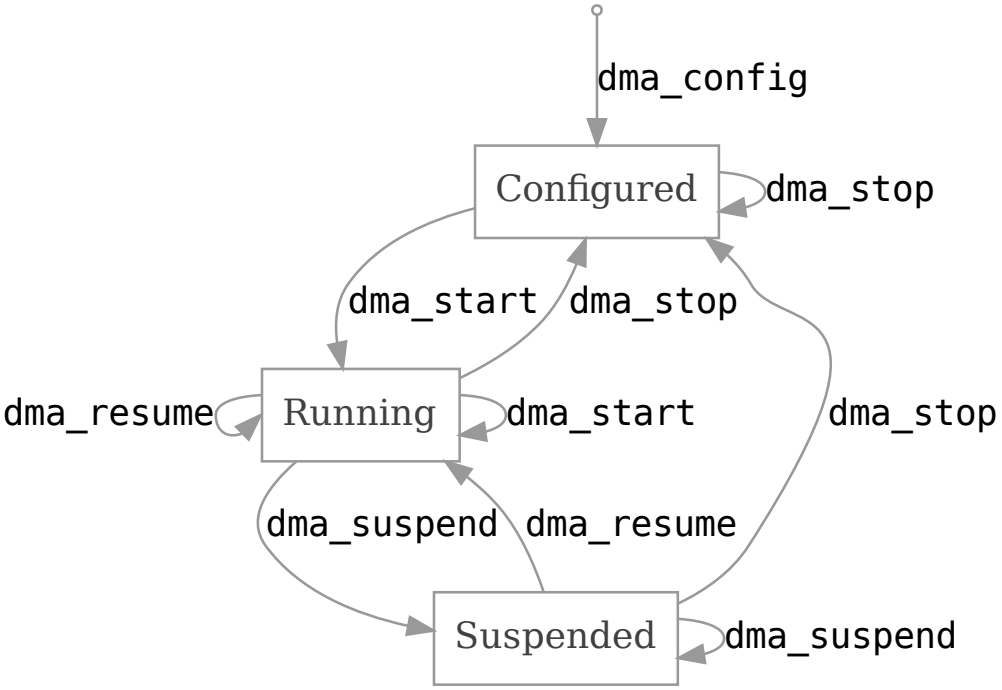

Fig. 2: DMA state finite state machine

DMA_STATUS_COMPLETE

The DMA callback event has occurred at the completion of a transfer list.

DMA_STATUS_BLOCK

The DMA callback has occurred at the completion of a single transfer block in a transfer list.

DMA_MAGIC

Magic code to identify context content.

DMA_BUF_ADDR_ALIGNMENT(node)

Get the device tree property describing the buffer address alignment.

Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters

- **node** – Node identifier, e.g. *DT_NODELABEL(dma_0)*

Returns

alignment Memory byte alignment required for DMA buffers

DMA_BUF_SIZE_ALIGNMENT(node)

Get the device tree property describing the buffer size alignment.

Useful when statically defining or allocating buffers for DMA usage where memory alignment often matters.

Parameters

- **node** – Node identifier, e.g. *DT_NODELABEL(dma_0)*

Returns

alignment Memory byte alignment required for DMA buffers

DMA_COPY_ALIGNMENT(node)

Get the device tree property describing the minimal chunk of data possible to be copied.

Parameters

- **node** – Node identifier, e.g. *DT_NODELABEL(dma_0)*

Returns

minimal Minimal chunk of data possible to be copied

Typedefs

typedef void (*dma_callback_t)(const struct *device* *dev, void *user_data, uint32_t channel, int status)

Callback function for DMA transfer completion.

If enabled, callback function will be invoked at transfer or block completion, or when an error happens. In circular mode, `status` indicates that the DMA device has reached either the end of the buffer (DMA_STATUS_COMPLETE) or a water mark (DMA_STATUS_BLOCK).

Param dev

Pointer to the DMA device calling the callback.

Param user_data
A pointer to some user data or NULL

Param channel
The channel number

Param status
Status of the transfer

- DMA_STATUS_COMPLETE buffer fully consumed
- DMA_STATUS_BLOCK buffer consumption reached a configured block or water mark
- A negative errno otherwise

Enums

enum `dma_channel_direction`

DMA channel direction.

Values:

enumerator `MEMORY_TO_MEMORY` = 0x0

Memory to memory.

enumerator `MEMORY_TO_PERIPHERAL`

Memory to peripheral.

enumerator `PERIPHERAL_TO_MEMORY`

Peripheral to memory.

enumerator `PERIPHERAL_TO_PERIPHERAL`

Peripheral to peripheral.

enumerator `HOST_TO_MEMORY`

Host to memory.

enumerator `MEMORY_TO_HOST`

Memory to host.

enumerator `DMA_CHANNEL_DIRECTION_COMMON_COUNT`

Number of all common channel directions.

enumerator `DMA_CHANNEL_DIRECTION_PRIV_START` = *DMA_CHANNEL_DIRECTION_COMMON_COUNT*

This and higher values are dma controller or soc specific.

Refer to the specified dma driver header file.

enumerator `DMA_CHANNEL_DIRECTION_MAX` = 0x7

Maximum allowed value (3 bit field!)

enum `dma_addr_adj`

DMA address adjustment.

Valid values for *source_addr_adj* and *dest_addr_adj*

Values:

enumerator `DMA_ADDR_ADJ_INCREMENT`

Increment the address.

enumerator `DMA_ADDR_ADJ_DECREMENT`

Decrement the address.

enumerator `DMA_ADDR_ADJ_NO_CHANGE`

No change the address.

enum `dma_channel_filter`

DMA channel attributes.

Values:

enumerator `DMA_CHANNEL_NORMAL`

enumerator `DMA_CHANNEL_PERIODIC`

enum `dma_attribute_type`

DMA attributes.

Values:

enumerator `DMA_ATTR_BUFFER_ADDRESS_ALIGNMENT`

enumerator `DMA_ATTR_BUFFER_SIZE_ALIGNMENT`

enumerator `DMA_ATTR_COPY_ALIGNMENT`

enumerator `DMA_ATTR_MAX_BLOCK_COUNT`

Functions

static inline int `dma_config`(const struct *device* *dev, uint32_t channel, struct *dma_config* *config)

Configure individual channel for DMA transfer.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Numeric identification of the channel to configure
- `config` – Data structure containing the intended configuration for the selected channel

Return values

- `0` – if successful.
- `Negative` – errno code if failure.

static inline int **dma_reload**(const struct *device* *dev, uint32_t channel, uint32_t src, uint32_t dst, size_t size)

Reload buffer(s) for a DMA channel.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Numeric identification of the channel to configure selected channel
- `src` – source address for the DMA transfer
- `dst` – destination address for the DMA transfer
- `size` – size of DMA transfer

Return values

- `0` – if successful.
- `Negative` – errno code if failure.

int **dma_start**(const struct *device* *dev, uint32_t channel)

Enables DMA channel and starts the transfer, the channel must be configured beforehand.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

Start is allowed on channels that have already been started and must report success.

Function properties (list may not be complete)

isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Numeric identification of the channel where the transfer will be processed

Return values

- `0` – if successful.
- `Negative` – errno code if failure.

int **dma_stop**(const struct *device* *dev, uint32_t channel)

Stops the DMA transfer and disables the channel.

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid.

Stop is allowed on channels that have already been stopped and must report success.

Function properties (list may not be complete)

isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.

- `channel` – Numeric identification of the channel where the transfer was being processed

Return values

- `0` – if successful.
- `Negative` – errno code if failure.

int `dma_suspend`(const struct *device* *dev, uint32_t channel)

Suspend a DMA channel transfer.

Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Function properties (list may not be complete)

isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Numeric identification of the channel to suspend

Return values

- `0` – If successful.
- `-ENOSYS` – If not implemented.
- `-EINVAL` – If invalid channel id or state.
- `-errno` – Other negative errno code failure.

int `dma_resume`(const struct *device* *dev, uint32_t channel)

Resume a DMA channel transfer.

Implementations must check the validity of the channel state and ID passed in and return -EINVAL if either are invalid.

Function properties (list may not be complete)

isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Numeric identification of the channel to resume

Return values

- `0` – If successful.
- `-ENOSYS` – If not implemented
- `-EINVAL` – If invalid channel id or state.
- `-errno` – Other negative errno code failure.

int `dma_request_channel`(const struct *device* *dev, void *filter_param)

request DMA channel.

request DMA channel resources return -EINVAL if there is no valid channel available.

Function properties (list may not be complete)
isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `filter_param` – filter function parameter

Return values

- `dma` – channel if successful.
- `Negative` – errno code if failure.

void `dma_release_channel`(const struct *device* *dev, uint32_t channel)

release DMA channel.

release DMA channel resources

Function properties (list may not be complete)
isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – channel number

int `dma_chan_filter`(const struct *device* *dev, int channel, void *filter_param)

DMA channel filter.

filter channel by attribute

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – channel number
- `filter_param` – filter attribute

Return values
`Negative` – errno code if not support

static inline int `dma_get_status`(const struct *device* *dev, uint32_t channel, struct *dma_status* *stat)

get current runtime status of DMA transfer

Implementations must check the validity of the channel ID passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Function properties (list may not be complete)
isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `channel` – Numeric identification of the channel where the transfer was being processed
- `stat` – a non-NULL *dma_status* object for storing DMA status

Return values

- `non-negative` – if successful.
- `Negative` – errno code if failure.

static inline int **dma_get_attribute**(const struct *device* *dev, uint32_t type, uint32_t *value)

get attribute of a dma controller

This function allows to get a device specific static or runtime attribute like required address and size alignment of a buffer. Implementations must check the validity of the type passed in and return -EINVAL if it is invalid or -ENOSYS if not supported.

Function properties (list may not be complete)

isr-ok

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `type` – Numeric identification of the attribute
- `value` – A non-NULL pointer to the variable where the read value is to be placed

Return values

- `non-negative` – if successful.
- `Negative` – errno code if failure.

static inline uint32_t **dma_width_index**(uint32_t size)

Look-up generic width index to be used in registers.

Warning

This look-up works for most controllers, but *may* not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

- `size` – width of bus (in bytes)

Return values

`common` – DMA index to be placed into registers.

static inline uint32_t **dma_burst_index**(uint32_t burst)

Look-up generic burst index to be used in registers.

Warning

This look-up works for most controllers, but *may* not work for yours. Ensure your controller expects the most common register bit values before using this convenience function. If your controller does not support these values, you will have to write your own look-up inside the controller driver.

Parameters

- `burst` – number of bytes to be sent in a single burst

Return values
`common` – DMA index to be placed into registers.

struct `dma_block_config`

#include <*dma.h*> DMA block configuration structure.

Aside from source address, destination address, and block size many of these options are hardware and driver dependent.

Public Members

uint32_t `source_address`
block starting address at source

uint32_t `dest_address`
block starting address at destination

uint32_t `source_gather_interval`
Address adjustment at gather boundary.

uint32_t `dest_scatter_interval`
Address adjustment at scatter boundary.

uint16_t `dest_scatter_count`
Continuous transfer count between scatter boundaries.

uint16_t `source_gather_count`
Continuous transfer count between gather boundaries.

uint32_t `block_size`
Number of bytes to be transferred for this block.

struct *dma_block_config* *`next_block`
Pointer to next block in a transfer list.

uint16_t `source_gather_en`
Enable source gathering when set to 1.

uint16_t `dest_scatter_en`
Enable destination scattering when set to 1.

uint16_t `source_addr_adj`
Source address adjustment option.

- 0b00 increment
- 0b01 decrement
- 0b10 no change

uint16_t **dest_addr_adj**

Destination address adjustment.

- 0b00 increment
- 0b01 decrement
- 0b10 no change

uint16_t **source_reload_en**

Reload source address at the end of block transfer.

uint16_t **dest_reload_en**

Reload destination address at the end of block transfer.

uint16_t **fifo_mode_control**

FIFO fill before starting transfer, HW specific meaning.

uint16_t **flow_control_mode**

Transfer flow control mode.

- 0b0 source request service upon data availability
- 0b1 source request postponed until destination request happens

struct **dma_config**

#include <*dma.h*> DMA configuration structure.

Public Members

uint32_t **dma_slot**

Which peripheral and direction, HW specific.

uint32_t **channel_direction**

Direction the transfers are occurring.

- 0b000 memory to memory,
- 0b001 memory to peripheral,
- 0b010 peripheral to memory,
- 0b011 peripheral to peripheral,
- 0b100 host to memory
- 0b101 memory to host
- others hardware specific

uint32_t **complete_callback_en**

Completion callback enable.

- 0b0 callback invoked at transfer list completion only
- 0b1 callback invoked at completion of each block

uint32_t **error_callback_dis**

Error callback disable.

- 0b0 error callback enabled
- 0b1 error callback disabled

uint32_t **source_handshake**

Source handshake, HW specific.

- 0b0 HW
- 0b1 SW

uint32_t **dest_handshake**

Destination handshake, HW specific.

- 0b0 HW
- 0b1 SW

uint32_t **channel_priority**

Channel priority for arbitration, HW specific.

uint32_t **source_chaining_en**

Source chaining enable, HW specific.

uint32_t **dest_chaining_en**

Destination chaining enable, HW specific.

uint32_t **linked_channel**

Linked channel, HW specific.

uint32_t **cyclic**

Cyclic transfer list, HW specific.

uint32_t **source_data_size**

Width of source data (in bytes)

uint32_t **dest_data_size**

Width of destination data (in bytes)

uint32_t **source_burst_length**

Source burst length in bytes.

uint32_t **dest_burst_length**

Destination burst length in bytes.

uint32_t **block_count**

Number of blocks in transfer list.

struct *dma_block_config* ***head_block**
Pointer to the first block in the transfer list.

void ***user_data**
Optional attached user data for callbacks.

dma_callback_t **dma_callback**
Optional callback for completion and error events.

struct **dma_status**
#include <*dma.h*> DMA runtime status structure.

Public Members

bool **busy**
Is the current DMA transfer busy or idle.

enum *dma_channel_direction* **dir**
Direction for the transfer.

uint32_t **pending_length**
Pending length to be transferred in bytes, HW specific.

uint32_t **free**
Available buffers space, HW specific.

uint32_t **write_position**
Write position in circular DMA buffer, HW specific.

uint32_t **read_position**
Read position in circular DMA buffer, HW specific.

uint64_t **total_copied**
Total copied, HW specific.

struct **dma_context**
#include <*dma.h*> DMA context structure Note: the *dma_context* shall be the first member of DMA client driver Data, got by dev->data.

Public Members

int32_t **magic**
magic code to identify the context

int **dma_channels**
number of dma channels

atomic_t *atomic

atomic holding bit flags for each channel to mark as used/unused

Callback API to set display brightness See *display_set_brightness()* for argument description.

typedef int (*display_set_contrast_api)(const struct *device* *dev, const uint8_t contrast)

Callback API to set display contrast See *display_set_contrast()* for argument description.

typedef void (*display_get_capabilities_api)(const struct *device* *dev, struct *display_capabilities* *capabilities)

Callback API to get display capabilities See *display_get_capabilities()* for argument description.

typedef int (*display_set_pixel_format_api)(const struct *device* *dev, const enum *display_pixel_format* pixel_format)

Callback API to set pixel format used by the display See *display_set_pixel_format()* for argument description.

typedef int (*display_set_orientation_api)(const struct *device* *dev, const enum *display_orientation* orientation)

Callback API to set orientation used by the display See *display_set_orientation()* for argument description.

Enums

enum display_pixel_format

Display pixel formats.

Display pixel format enumeration.

In case a pixel format consists out of multiple bytes the byte order is big endian.

Values:

enumerator PIXEL_FORMAT_RGB_888 = *BIT*(0)

24-bit RGB

enumerator PIXEL_FORMAT_MONO01 = *BIT*(1)

Monochrome (0=Black 1=White)

enumerator PIXEL_FORMAT_MONO10 = *BIT*(2)

Monochrome (1=Black 0=White)

enumerator PIXEL_FORMAT_ARGB_8888 = *BIT*(3)

32-bit ARGB

enumerator PIXEL_FORMAT_RGB_565 = *BIT*(4)

16-bit RGB

enumerator PIXEL_FORMAT_BGR_565 = *BIT*(5)

16-bit BGR

enum display_screen_info

Display screen information.

Values:

enumerator SCREEN_INFO_MONO_VTILED = *BIT*(0)

If selected, one octet represents 8 pixels ordered vertically, otherwise ordered horizontally.

enumerator SCREEN_INFO_MONO_MSB_FIRST = *BIT*(1)

If selected, the MSB represents the first pixel, otherwise MSB represents the last pixel.

enumerator SCREEN_INFO_EPD = *BIT*(2)

Electrophoretic Display.

enumerator SCREEN_INFO_DOUBLE_BUFFER = *BIT*(3)

Screen has two alternating ram buffers.

enumerator SCREEN_INFO_X_ALIGNMENT_WIDTH = *BIT*(4)

Screen has x alignment constrained to width.

enum display_orientation

Enumeration with possible display orientation.

Values:

enumerator DISPLAY_ORIENTATION_NORMAL

No rotation.

enumerator DISPLAY_ORIENTATION_ROTATED_90

Rotated 90 degrees clockwise.

enumerator DISPLAY_ORIENTATION_ROTATED_180

Rotated 180 degrees clockwise.

enumerator DISPLAY_ORIENTATION_ROTATED_270

Rotated 270 degrees clockwise.

Functions

static inline int **display_write**(const struct *device* *dev, const uint16_t x, const uint16_t y, const struct *display_buffer_descriptor* *desc, const void *buf)

Write data to display.

Parameters

- dev – Pointer to device structure
- x – x Coordinate of the upper left corner where to write the buffer
- y – y Coordinate of the upper left corner where to write the buffer
- desc – Pointer to a structure describing the buffer layout
- buf – Pointer to buffer array

Return values

0 – on success else negative errno code.

static inline int **display_read**(const struct *device* *dev, const uint16_t x, const uint16_t y, const struct *display_buffer_descriptor* *desc, void *buf)

Read data from display.

Parameters

- dev – Pointer to device structure
- x – x Coordinate of the upper left corner where to read from
- y – y Coordinate of the upper left corner where to read from
- desc – Pointer to a structure describing the buffer layout
- buf – Pointer to buffer array

Return values

- 0 – on success else negative errno code.
- -ENOSYS – if not implemented.

static inline void *__display_get_framebuffer__(const struct *device* *dev)

Get pointer to framebuffer for direct access.

Parameters

- dev – Pointer to device structure

Return values

Pointer – to frame buffer or NULL if direct framebuffer access is not supported

static inline int **display_blanking_on**(const struct *device* *dev)

Turn display blanking on.

This function blanks the complete display. The content of the frame buffer will be retained while blanking is enabled and the frame buffer will be accessible for read and write operations.

In case backlight control is supported by the driver the backlight is turned off. The backlight configuration is retained and accessible for configuration.

In case the driver supports display blanking the initial state of the driver would be the same as if this function was called.

Parameters

- `dev` – Pointer to device structure

Return values

- `0` – on success else negative errno code.
- `-ENOSYS` – if not implemented.

static inline int **display_blanking_off**(const struct *device* *dev)

Turn display blanking off.

Restore the frame buffer content to the display. In case backlight control is supported by the driver the backlight configuration is restored.

Parameters

- `dev` – Pointer to device structure

Return values

- `0` – on success else negative errno code.
- `-ENOSYS` – if not implemented.

static inline int **display_set_brightness**(const struct *device* *dev, uint8_t brightness)

Set the brightness of the display.

Set the brightness of the display in steps of 1/256, where 255 is full brightness and 0 is minimal.

Parameters

- `dev` – Pointer to device structure
- `brightness` – Brightness in steps of 1/256

Return values

- `0` – on success else negative errno code.
- `-ENOSYS` – if not implemented.

static inline int **display_set_contrast**(const struct *device* *dev, uint8_t contrast)

Set the contrast of the display.

Set the contrast of the display in steps of 1/256, where 255 is maximum difference and 0 is minimal.

Parameters

- `dev` – Pointer to device structure
- `contrast` – Contrast in steps of 1/256

Return values

- `0` – on success else negative errno code.
- `-ENOSYS` – if not implemented.

static inline void **display_get_capabilities**(const struct *device* *dev, struct *display_capabilities* *capabilities)

Get display capabilities.

Parameters

- `dev` – Pointer to device structure

- **capabilities** – Pointer to capabilities structure to populate

static inline int **display_set_pixel_format**(const struct *device* *dev, const enum *display_pixel_format* pixel_format)

Set pixel format used by the display.

Parameters

- **dev** – Pointer to device structure
- **pixel_format** – Pixel format to be used by display

Return values

- **0** – on success else negative errno code.
- **-ENOSYS** – if not implemented.

static inline int **display_set_orientation**(const struct *device* *dev, const enum *display_orientation* orientation)

Set display orientation.

Parameters

- **dev** – Pointer to device structure
- **orientation** – Orientation to be used by display

Return values

- **0** – on success else negative errno code.
- **-ENOSYS** – if not implemented.

struct **display_capabilities**

#include <*display.h*> Structure holding display capabilities.

Public Members

uint16_t **x_resolution**

Display resolution in the X direction.

uint16_t **y_resolution**

Display resolution in the Y direction.

uint32_t **supported_pixel_formats**

Bitwise or of pixel formats supported by the display.

uint32_t **screen_info**

Information about display panel.

enum *display_pixel_format* **current_pixel_format**

Currently active pixel format for the display.

enum *display_orientation* **current_orientation**

Current display orientation.

struct **display_buffer_descriptor**

#include <*display.h*> Structure to describe display data buffer layout.

Public Members

uint32_t **buf_size**
Data buffer size in bytes.

uint16_t **width**
Data buffer row width in pixels.

uint16_t **height**
Data buffer column height in pixels.

uint16_t **pitch**
Number of pixels between consecutive rows in the data buffer.

struct **display_driver_api**
#include <*display.h*> Display driver API API which a display driver should expose.

Functions

void **glcd_print**(const struct *device* *dev, char *data, uint32_t size)

Send text to the screen.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **data** – the ASCII text to display
- **size** – the length of the text in bytes

void **glcd_cursor_pos_set**(const struct *device* *dev, uint8_t col, uint8_t row)

Set text cursor position for next additions.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **col** – the column for the cursor to be moved to (0-15)
- **row** – the row it should be moved to (0 or 1)

void **glcd_clear**(const struct *device* *dev)

Clear the current display.

Parameters

- **dev** – Pointer to device structure for driver instance.

void **glcd_display_state_set**(const struct *device* *dev, uint8_t opt)

Function to change the display state.

This function provides the user the ability to change the state of the display as per needed. Controlling things like powering on or off the screen, the option to display the cursor or not, and the ability to blink the cursor.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **opt** – An 8bit bitmask of GLCD_DS_* options.

uint8_t **glcd_display_state_get**(const struct *device* *dev)

return the display feature set associated with the device

Parameters

- **dev** – the Grove LCD to get the display features set

Returns

the display feature set associated with the device.

void **glcd_input_state_set**(const struct *device* *dev, uint8_t opt)

Function to change the input state.

This function provides the user the ability to change the state of the text input. Controlling things like text entry from the left or right side, and how far to increment on new text

Parameters

- **dev** – Pointer to device structure for driver instance.
- **opt** – A bitmask of GLCD_IS_* options

uint8_t **glcd_input_state_get**(const struct *device* *dev)

return the input set associated with the device

Parameters

- **dev** – the Grove LCD to get the input features set

Returns

the input set associated with the device.

void **glcd_function_set**(const struct *device* *dev, uint8_t opt)

Function to set the functional state of the display.

This function provides the user the ability to change the state of the display as per needed. Controlling things like the number of rows, dot size, and text display quality.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **opt** – A bitmask of GLCD_FS_* options

uint8_t **glcd_function_get**(const struct *device* *dev)

return the function set associated with the device

Parameters

- **dev** – the Grove LCD to get the functions set

Returns

the function features set associated with the device.

void **glcd_color_select**(const struct *device* *dev, uint8_t color)

Set LCD background to a predefined color.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **color** – One of the predefined color options

void **glcd_color_set**(const struct *device* *dev, uint8_t r, uint8_t g, uint8_t b)

Set LCD background to custom RGB color value.

Parameters

- **dev** – Pointer to device structure for driver instance.
- **r** – A numeric value for the red color (max is 255)
- **g** – A numeric value for the green color (max is 255)
- **b** – A numeric value for the blue color (max is 255)

BBC micro:bit Display

group **mb_display**

BBC micro:bit display APIs.

Defines

MB_IMAGE(_rows...)

Generate an image object from a given array rows/columns.

This helper takes an array of 5 rows, each consisting of 5 0/1 values which correspond to the columns of that row. The value 0 means the pixel is disabled whereas a 1 means the pixel is enabled.

The pixels go from left to right and top to bottom, i.e. top-left corner is the first row's first value, top-right is the first rows last value, and bottom-right corner is the last value of the last (5th) row. As an example, the following would create a smiley face image:

Parameters

- **_rows** – Each of the 5 rows represented as a 5-value column array.

Returns

Image bitmap that can be passed e.g. to *mb_display_image()*.

Enums

enum **mb_display_mode**

Display mode.

First 16 bits are reserved for modes, last 16 for flags.

Values:

enumerator **MB_DISPLAY_MODE_DEFAULT**

Default mode ("single" for images, "scroll" for text).

enumerator MB_DISPLAY_MODE_SINGLE

Display images sequentially, one at a time.

enumerator MB_DISPLAY_MODE_SCROLL

Display images by scrolling.

enumerator MB_DISPLAY_FLAG_LOOP = *BIT*(16)

Loop back to the beginning when reaching the last image.

Functions

struct mb_display *mb_display_get(void)

Get a pointer to the BBC micro:bit display object.

Returns
Pointer to display object.

void mb_display_image(struct mb_display *disp, uint32_t mode, int32_t duration, const struct *mb_image* *img, uint8_t img_count)

Display one or more images on the BBC micro:bit LED display.

This function takes an array of one or more images and renders them sequentially on the micro:bit display. The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image being displayed it will be canceled and the new one takes over.

Parameters

- disp – Display object.
- mode – One of the MB_DISPLAY_MODE_* options.
- duration – Duration how long to show each image (in milliseconds), or SYS_FOREVER_MS.
- img – Array of image bitmaps (struct *mb_image* objects).
- img_count – Number of images in 'img' array.

void mb_display_print(struct mb_display *disp, uint32_t mode, int32_t duration, const char *fmt, ...)

Print a string of characters on the BBC micro:bit LED display.

This function takes a printf-style format string and outputs it in a scrolling fashion to the display.

The call is asynchronous, i.e. the processing of the display happens in the background. If there is another image or string being displayed it will be canceled and the new one takes over.

Parameters

- disp – Display object.
- mode – One of the MB_DISPLAY_MODE_* options.
- duration – Duration how long to show each character (in milliseconds), or SYS_FOREVER_MS.
- fmt – printf-style format string
- ... – Optional list of format arguments.

void `mb_display_stop`(struct mb_display *disp)

Stop the ongoing display of an image.

Parameters

- `disp` – Display object.

struct `mb_image`

#include <*mb_display.h*> Representation of a BBC micro:bit display image.

This struct should normally not be used directly, rather created using the *MB_IMAGE()* macro.

Monochrome Character Framebuffer

group `monochrome_character_framebuffer`

Public Monochrome Character Framebuffer API.

Defines

`FONT_ENTRY_DEFINE`(_name, _width, _height, _caps, _data, _fc, _lc)

Macro for creating a font entry.

Parameters

- `_name` – Name of the font entry.
- `_width` – Width of the font in pixels
- `_height` – Height of the font in pixels.
- `_caps` – Font capabilities.
- `_data` – Raw data of the font.
- `_fc` – Character mapped to first font element.
- `_lc` – Character mapped to last font element.

Enums

enum `cfb_display_param`

Values:

enumerator `CFB_DISPLAY_HEIGH` = 0

enumerator CFB_DISPLAY_WIDTH

enumerator CFB_DISPLAY_PPT

enumerator CFB_DISPLAY_ROWS

enumerator CFB_DISPLAY_COLS

enum cfb_font_caps

Values:

enumerator CFB_FONT_MONO_VPACKED = *BIT*(0)

enumerator CFB_FONT_MONO_HPACKED = *BIT*(1)

enumerator CFB_FONT_MSB_FIRST = *BIT*(2)

Functions

int cfb_print(const struct *device* *dev, const char *const str, uint16_t x, uint16_t y)

Print a string into the framebuffer.

Parameters

- dev – Pointer to device structure for driver instance
- str – String to print
- x – Position in X direction of the beginning of the string
- y – Position in Y direction of the beginning of the string

Returns

0 on success, negative value otherwise

int cfb_draw_text(const struct *device* *dev, const char *const str, int16_t x, int16_t y)

Print a string into the framebuffer.

For compare to cfb_print, cfb_draw_text accept non tile-aligned coords and not line wrapping.

Parameters

- dev – Pointer to device structure for driver instance
- str – String to print
- x – Position in X direction of the beginning of the string
- y – Position in Y direction of the beginning of the string

Returns

0 on success, negative value otherwise

int cfb_draw_point(const struct *device* *dev, const struct *cfb_position* *pos)

Draw a point.

Parameters

- dev – Pointer to device structure for driver instance

- `pos` – position of the point

Returns
0 on success, negative value otherwise

int `cfb_draw_line`(const struct *device* *dev, const struct *cfb_position* *start, const struct *cfb_position* *end)

Draw a line.

Parameters

- `dev` – Pointer to device structure for driver instance
- `start` – start position of the line
- `end` – end position of the line

Returns
0 on success, negative value otherwise

int `cfb_draw_rect`(const struct *device* *dev, const struct *cfb_position* *start, const struct *cfb_position* *end)

Draw a rectangle.

Parameters

- `dev` – Pointer to device structure for driver instance
- `start` – Top-Left position of the rectangle
- `end` – Bottom-Right position of the rectangle

Returns
0 on success, negative value otherwise

int `cfb_framebuffer_clear`(const struct *device* *dev, bool clear_display)

Clear framebuffer.

Parameters

- `dev` – Pointer to device structure for driver instance
- `clear_display` – Clear the display as well

Returns
0 on success, negative value otherwise

int `cfb_framebuffer_invert`(const struct *device* *dev)

Invert Pixels.

Parameters

- `dev` – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

int `cfb_invert_area`(const struct *device* *dev, uint16_t x, uint16_t y, uint16_t width, uint16_t height)

Invert Pixels in selected area.

Parameters

- `dev` – Pointer to device structure for driver instance
- `x` – Position in X direction of the beginning of area
- `y` – Position in Y direction of the beginning of area
- `width` – Width of area in pixels

- **height** – Height of area in pixels

Returns
0 on success, negative value otherwise

int **cfb_framebuffer_finalize**(const struct *device* *dev)

Finalize framebuffer and write it to display RAM, invert or reorder pixels if necessary.

Parameters

- **dev** – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

int **cfb_get_display_parameter**(const struct *device* *dev, enum *cfb_display_param*)

Get display parameter.

Parameters

- **dev** – Pointer to device structure for driver instance
- **cfb_display_param** – One of the display parameters

Returns
Display parameter value

int **cfb_framebuffer_set_font**(const struct *device* *dev, uint8_t idx)

Set font.

Parameters

- **dev** – Pointer to device structure for driver instance
- **idx** – Font index

Returns
0 on success, negative value otherwise

int **cfb_set_kerning**(const struct *device* *dev, int8_t kerning)

Set font kerning (spacing between individual letters).

Parameters

- **dev** – Pointer to device structure for driver instance
- **kerning** – Font kerning

Returns
0 on success, negative value otherwise

int **cfb_get_font_size**(const struct *device* *dev, uint8_t idx, uint8_t *width, uint8_t *height)

Get font size.

Parameters

- **dev** – Pointer to device structure for driver instance
- **idx** – Font index
- **width** – Pointers to the variable where the font width will be stored.
- **height** – Pointers to the variable where the font height will be stored.

Returns
0 on success, negative value otherwise

int **cfb_get_numof_fonts**(const struct *device* *dev)
Get number of fonts.

Parameters

- **dev** – Pointer to device structure for driver instance

Returns
number of fonts

int **cfb_framebuffer_init**(const struct *device* *dev)
Initialize Character Framebuffer.

Parameters

- **dev** – Pointer to device structure for driver instance

Returns
0 on success, negative value otherwise

void **cfb_framebuffer_deinit**(const struct *device* *dev)
Deinitialize Character Framebuffer.

Parameters

- **dev** – Pointer to device structure for driver instance

struct **cfb_font**
#include <cfb.h>

struct **cfb_position**
#include <cfb.h>

7.6.15 Electrically Erasable Programmable Read-Only Memory (EEPROM)

Overview

EEPROMs have an erase block size of 1 byte, a long lifetime, and allow overwriting data on byte-by-byte access.

EEPROM API

Overview The EEPROM API provides read and write access to Electrically Erasable Programmable Read-Only Memory (EEPROM) devices.

Configuration Options Related configuration options:

- CONFIG_EEPROM

Related code samples

EEPROM
Store a boot count value in EEPROM.

API Reference

group `eeprom_interface`

EEPROM Interface.

Since
2.1

Version
1.0.0

Functions

int `eeprom_read`(const struct *device* *dev, off_t offset, void *data, size_t len)

Read data from EEPROM.

Parameters

- `dev` – EEPROM device
- `offset` – Address offset to read from.
- `data` – Buffer to store read data.
- `len` – Number of bytes to read.

Returns
0 on success, negative errno code on failure.

int `eeprom_write`(const struct *device* *dev, off_t offset, const void *data, size_t len)

Write data to EEPROM.

Parameters

- `dev` – EEPROM device
- `offset` – Address offset to write data to.
- `data` – Buffer with data to write.
- `len` – Number of bytes to write.

Returns
0 on success, negative errno code on failure.

size_t `eeprom_get_size`(const struct *device* *dev)

Get the size of the EEPROM in bytes.

Parameters

- `dev` – EEPROM device.

Returns
EEPROM size in bytes.

EEPROM Shell

- *Overview*
- *EEPROM Size*
- *Writing Data*
- *Reading Data*

Overview The EEPROM shell provides an `eeprom` command with a set of subcommands for the *shell* module. It allows testing and exploring the *EEPROM* driver API through an interactive interface without having to write a dedicated application. The EEPROM shell can also be enabled in existing applications to aid in interactive debugging of EEPROM issues.

In order to enable the EEPROM shell, the following *Kconfig* options must be enabled:

- `CONFIG_SHELL`
- `CONFIG_EEPROM`
- `CONFIG_EEPROM_SHELL`

For example, building the hello_world sample for the native_sim with the EEPROM shell:

```
# From the root of the zephyr repository
west build -b native_sim samples/hello_world -- -DCONFIG_SHELL=y -DCONFIG_EEPROM=y -DCONFIG_
↪EEPROM_SHELL=y
```

See the *shell* documentation for general instructions on how to connect and interact with the shell. The EEPROM shell comes with built-in help (unless `CONFIG_SHELL_HELP` is disabled). The built-in help messages can be printed by passing `-h` or `--help` to the `eeprom` command or any of its subcommands. All subcommands also support tab-completion of their arguments.

Tip

All of the EEPROM shell subcommands take the name of an EEPROM peripheral as their first argument, which also supports tab-completion. A list of all devices available can be obtained using the `device list` shell command when `CONFIG_DEVICE_SHELL` is enabled. The examples below all use the device name `eeprom@0`.

EEPROM Size The size of an EEPROM can be inspected using the `eeprom size` subcommand as shown below:

```
uart:~$ eeprom size eeprom@0
32768 bytes
```

Writing Data Data can be written to an EEPROM using the `eeprom write` subcommand. This subcommand takes at least three arguments; the EEPROM device name, the offset to start writing to, and at least one data byte. In the following example, the hexadecimal sequence of bytes `0x0d 0x0e 0x0a 0x0d 0x0b 0x0e 0x0e 0x0f` is written to offset `0x0`:

```
uart:~$ eeprom write eeprom@0 0x0 0x0d 0x0e 0x0a 0x0d 0x0b 0x0e 0x0e 0x0f
Writing 8 bytes to EEPROM...
Verifying...
Verify OK
```

It is also possible to fill a portion of the EEPROM with the same pattern using the `eeprom fill` subcommand. In the following example, the pattern `0xaa` is written to 16 bytes starting at offset `0x8`:

```
uart:~$ eeprom fill eeprom@0 0x8 16 0xaa
Writing 16 bytes of 0xaa to EEPROM...
Verifying...
Verify OK
```

Reading Data Data can be read from an EEPROM using the `eeprom read` subcommand. This subcommand takes three arguments; the EEPROM device name, the offset to start reading from, and the number of bytes to read:

```
uart:~$ eeprom read eeprom@0 0x0 8
Reading 8 bytes from EEPROM, offset 0...
00000000: 0d 0e 0a 0d 0b 0e 0e 0f                          |........        |
```

7.6.16 Enhanced Serial Peripheral Interface (eSPI) Bus

Overview

The eSPI (enhanced serial peripheral interface) is a serial bus that is based on SPI. It also features a four-wire interface (receive, transmit, clock and target select) and three configurations: single IO, dual IO and quad IO.

The technical advancements include lower voltage signal levels (1.8V vs. 3.3V), lower pin count, and the frequency is twice as fast (66MHz vs. 33MHz) Because of its enhancements, the eSPI is used to replace the LPC (lower pin count) interface, SPI, SMBus and sideband signals.

See eSPI interface specification for additional details.

API Reference

Typedefs

typedef void (*espi_callback_handler_t)(const struct *device* *dev, struct espi_callback *cb, struct *espi_event* espi_evt)

Define the application callback handler function signature.

Param dev
Device struct for the eSPI device.

Param cb
Original struct espi_callback owning this handler.

Param espi_evt
event details that trigger the callback handler.

Enums

enum espi_io_mode

eSPI I/O mode capabilities

Values:

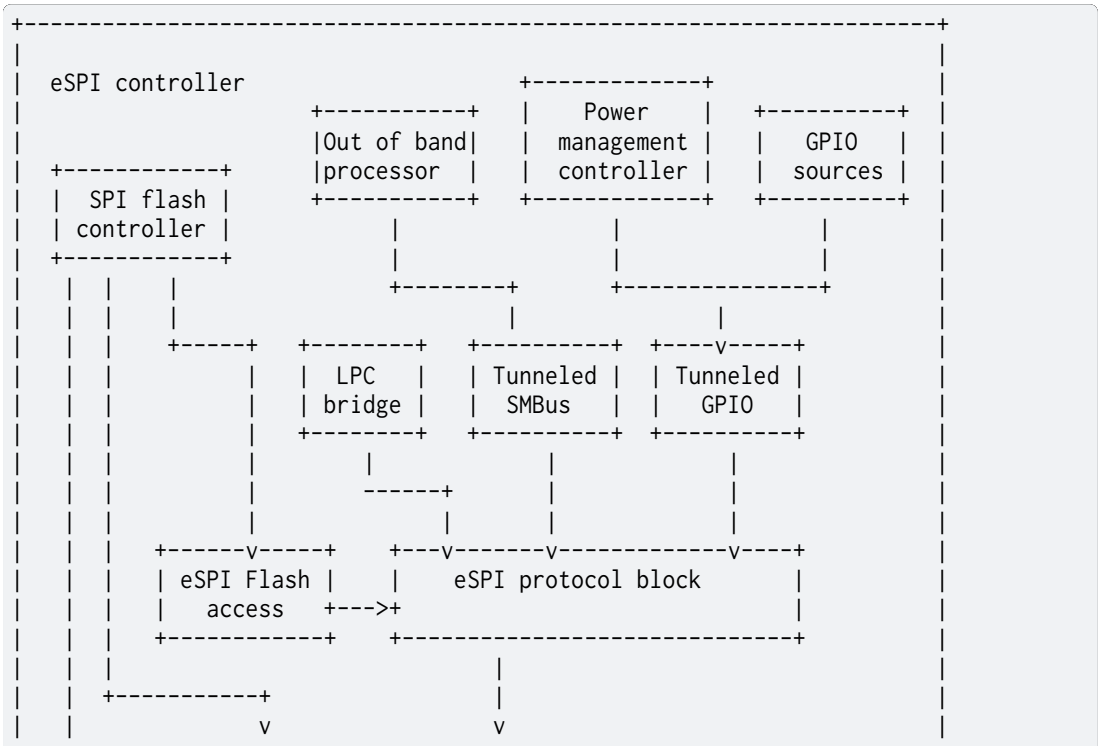
enumerator ESPI_IO_MODE_SINGLE_LINE = *BIT*(0)

enumerator ESPI_IO_MODE_DUAL_LINES = *BIT*(1)

enumerator ESPI_IO_MODE_QUAD_LINES = *BIT*(2)

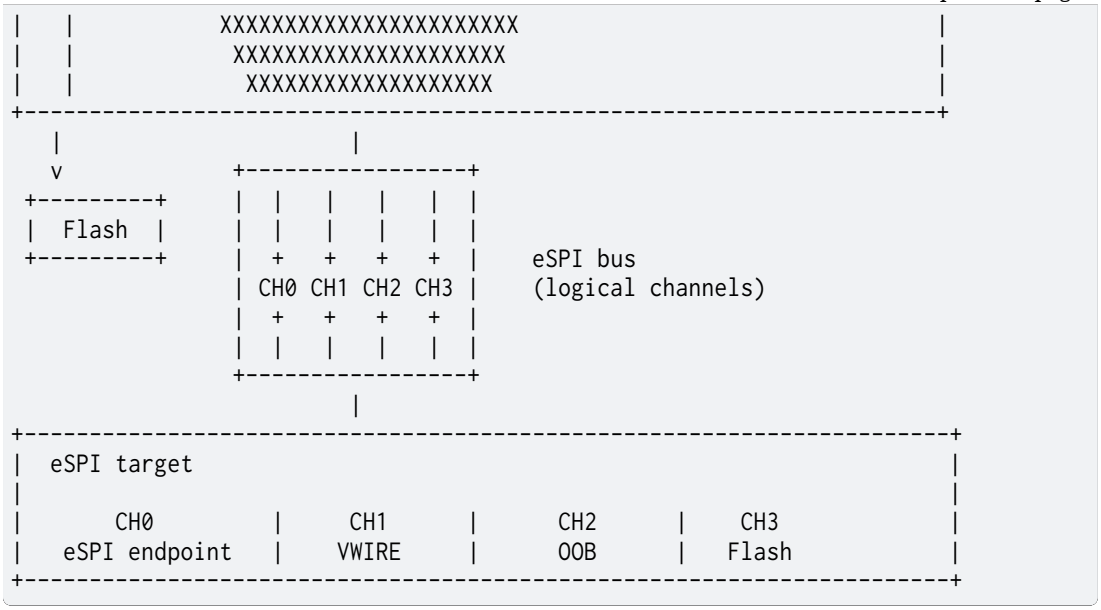
enum espi_channel

eSPI channel.



(continues on next page)

(continued from previous page)



Identifies each eSPI logical channel supported by eSPI controller Each channel allows independent traffic, but the assignment of channel type to channel number is fixed.

Note that generic commands are not associated with any channel, so traffic over eSPI can occur if all channels are disabled or not ready

Values:

enumerator **ESPI_CHANNEL_PERIPHERAL** = *BIT*(0)

enumerator **ESPI_CHANNEL_VWIRE** = *BIT*(1)

enumerator **ESPI_CHANNEL_OOB** = *BIT*(2)

enumerator **ESPI_CHANNEL_FLASH** = *BIT*(3)

enum **espi_bus_event**

eSPI bus event.

eSPI bus event to indicate events for which user can register callbacks

Values:

enumerator **ESPI_BUS_RESET** = *BIT*(0)

Indicates the eSPI bus was reset either via eSPI reset pin.

eSPI drivers should convey the eSPI reset status to eSPI driver clients following eSPI specification reset pin convention: 0-eSPI bus in reset, 1-eSPI bus out-of-reset

Note: There is no need to send this callback for in-band reset.

enumerator **ESPI_BUS_EVENT_CHANNEL_READY** = *BIT*(1)

Indicates the eSPI HW has received channel enable notification from eSPI host, once the eSPI channel is signal as ready to the eSPI host, eSPI drivers should convey the eSPI channel ready to eSPI driver client via this event.

enumerator ESPI_BUS_EVENT_VWIRE_RECEIVED = *BIT*(2)

Indicates the eSPI HW has received a virtual wire message from eSPI host.

eSPI drivers should convey the eSPI virtual wire latest status.

enumerator ESPI_BUS_EVENT_OOB_RECEIVED = *BIT*(3)

Indicates the eSPI HW has received a Out-of-band package from eSPI host.

enumerator ESPI_BUS_PERIPHERAL_NOTIFICATION = *BIT*(4)

Indicates the eSPI HW has received a peripheral eSPI host event.

eSPI drivers should convey the peripheral type.

enumerator ESPI_BUS_TAF_NOTIFICATION = *BIT*(5)

enum espi_pc_event

eSPI peripheral channel events.

eSPI peripheral channel event types to indicate users.

Values:

enumerator ESPI_PC_EVT_BUS_CHANNEL_READY = *BIT*(0)

enumerator ESPI_PC_EVT_BUS_MASTER_ENABLE = *BIT*(1)

Functions

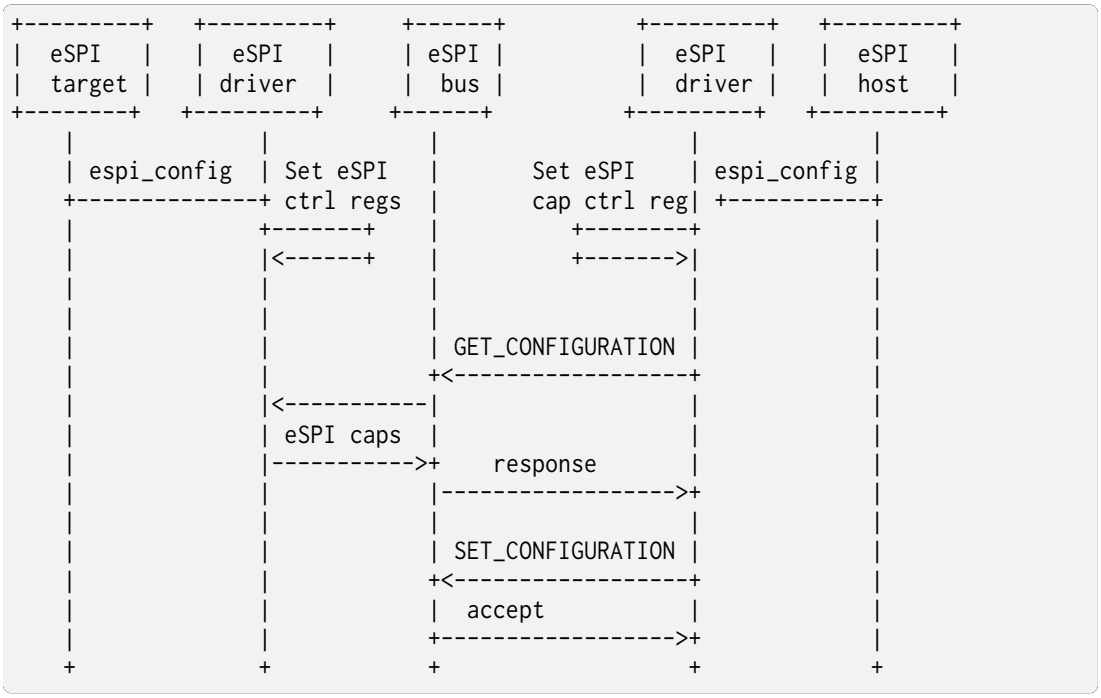
int **espi_config**(const struct *device* *dev, struct *espi_cfg* *cfg)

Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as target, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI controller during initialization.

If this eSPI controller is acting as controller, the values set here will be used by eSPI controller to determine minimum common capabilities with eSPI target then send via SET_CONFIGURATION command.



Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – the device runtime configuration for the eSPI controller.

Return values

- **0** – If successful.
- **-EIO** – General input / output error, failed to configure device.
- **-EINVAL** – invalid capabilities, failed to configure device.
- **-ENOTSUP** – capability not supported by eSPI target.

bool **espi_get_channel_status**(const struct *device* *dev, enum *espi_channel* ch)

Query to see if it a channel is ready.

This routine allows to check if logical channel is ready before use. Note that queries for channels not supported will always return false.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **ch** – the eSPI channel for which status is to be retrieved.

Return values

- `true` – If eSPI channel is ready.
- `false` – otherwise.

int `espi_read_request`(const struct *device* *dev, struct *espi_request_packet* *req)

Sends memory, I/O or message read request over eSPI.

This routines provides a generic interface to send a read request packet.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `req` – Address of structure representing a memory, I/O or message read request.

Return values

- `0` – If successful.
- `-ENOTSUP` – if eSPI controller doesn't support raw packets and instead low memory transactions are handled by controller hardware directly.
- `-EIO` – General input / output error, failed to send over the bus.

int `espi_write_request`(const struct *device* *dev, struct *espi_request_packet* *req)

Sends memory, I/O or message write request over eSPI.

This routines provides a generic interface to send a write request packet.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `req` – Address of structure representing a memory, I/O or message write request.

Return values

- `0` – If successful.
- `-ENOTSUP` – if eSPI controller doesn't support raw packets and instead low memory transactions are handled by controller hardware directly.
- `-EINVAL` – General input / output error, failed to send over the bus.

int `espi_read_lpc_request`(const struct *device* *dev, enum *lpc_peripheral_opcode* op, uint32_t *data)

Reads SOC data from a LPC peripheral with information updated over eSPI.

This routine provides a generic interface to read a block whose information was updated by an eSPI transaction. Reading may trigger a transaction. The eSPI packet is assembled by the HW block.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `op` – Enum representing opcode for peripheral type and read request.
- `data` – Parameter to be read from to the LPC peripheral.

Return values

- `0` – If successful.
- `-ENOTSUP` – if eSPI peripheral is off or not supported.
- `-EINVAL` – for unimplemented lpc opcode, but in range.

int **espi_write_lpc_request**(const struct *device* *dev, enum *lpc_peripheral_opcode* op, uint32_t *data)

Writes data to a LPC peripheral which generates an eSPI transaction.

This routine provides a generic interface to write data to a block which triggers an eSPI transaction. The eSPI packet is assembled by the HW block.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `op` – Enum representing an opcode for peripheral type and write request.
- `data` – Represents the parameter passed to the LPC peripheral.

Return values

- `0` – If successful.
- `-ENOTSUP` – if eSPI peripheral is off or not supported.
- `-EINVAL` – for unimplemented lpc opcode, but in range.

int **espi_send_vwire**(const struct *device* *dev, enum *espi_vwire_signal* signal, uint8_t level)

Sends system/platform signal as a virtual wire packet.

This routines provides a generic interface to send a virtual wire packet from target to controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `signal` – The signal to be send to eSPI controller.
- `level` – The level of signal requested LOW or HIGH.

Return values

- `0` – If successful.
- `-EIO` – General input / output error, failed to send over the bus.

int **espi_receive_vwire**(const struct *device* *dev, enum *espi_vwire_signal* signal, uint8_t *level)

Retrieves level status for a signal encapsulated in a virtual wire.

This routines provides a generic interface to request a virtual wire packet from eSPI controller and retrieve the signal level.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `signal` – the signal to be requested from eSPI controller.
- `level` – the level of signal requested 0b LOW, 1b HIGH.

Return values

`-EIO` – General input / output error, failed request to controller.

int **espi_send_oob**(const struct *device* *dev, struct *espi_oob_packet* *pckt)

Sends SMBus transaction (out-of-band) packet over eSPI bus.

This routines provides an interface to encapsulate a SMBus transaction and send into packet over eSPI bus

Parameters

- `dev` – Pointer to the device structure for the driver instance.

- `pckt` – Address of the packet representation of SMBus transaction.

Return values

`-EIO` – General input / output error, failed request to controller.

int `espi_receive_oob`(const struct *device* *dev, struct *espi_oob_packet* *pckt)

Receives SMBus transaction (out-of-band) packet from eSPI bus.

This routines provides an interface to receive and decoded a SMBus transaction from eSPI bus

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the packet representation of SMBus transaction.

Return values

`-EIO` – General input / output error, failed request to controller.

int `espi_read_flash`(const struct *device* *dev, struct *espi_flash_packet* *pckt)

Sends a read request packet for shared flash.

This routines provides an interface to send a request to read the flash component shared between the eSPI controller and eSPI targets.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of read flash transaction.

Return values

- `-ENOTSUP` – eSPI flash logical channel transactions not supported.
- `-EBUSY` – eSPI flash channel is not ready or disabled by controller.
- `-EIO` – General input / output error, failed request to controller.

int `espi_write_flash`(const struct *device* *dev, struct *espi_flash_packet* *pckt)

Sends a write request packet for shared flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI controller and eSPI targets.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of write flash transaction.

Return values

- `-ENOTSUP` – eSPI flash logical channel transactions not supported.
- `-EBUSY` – eSPI flash channel is not ready or disabled by controller.
- `-EIO` – General input / output error, failed request to controller.

int `espi_flash_erase`(const struct *device* *dev, struct *espi_flash_packet* *pckt)

Sends a write request packet for shared flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI controller and eSPI targets.

Parameters

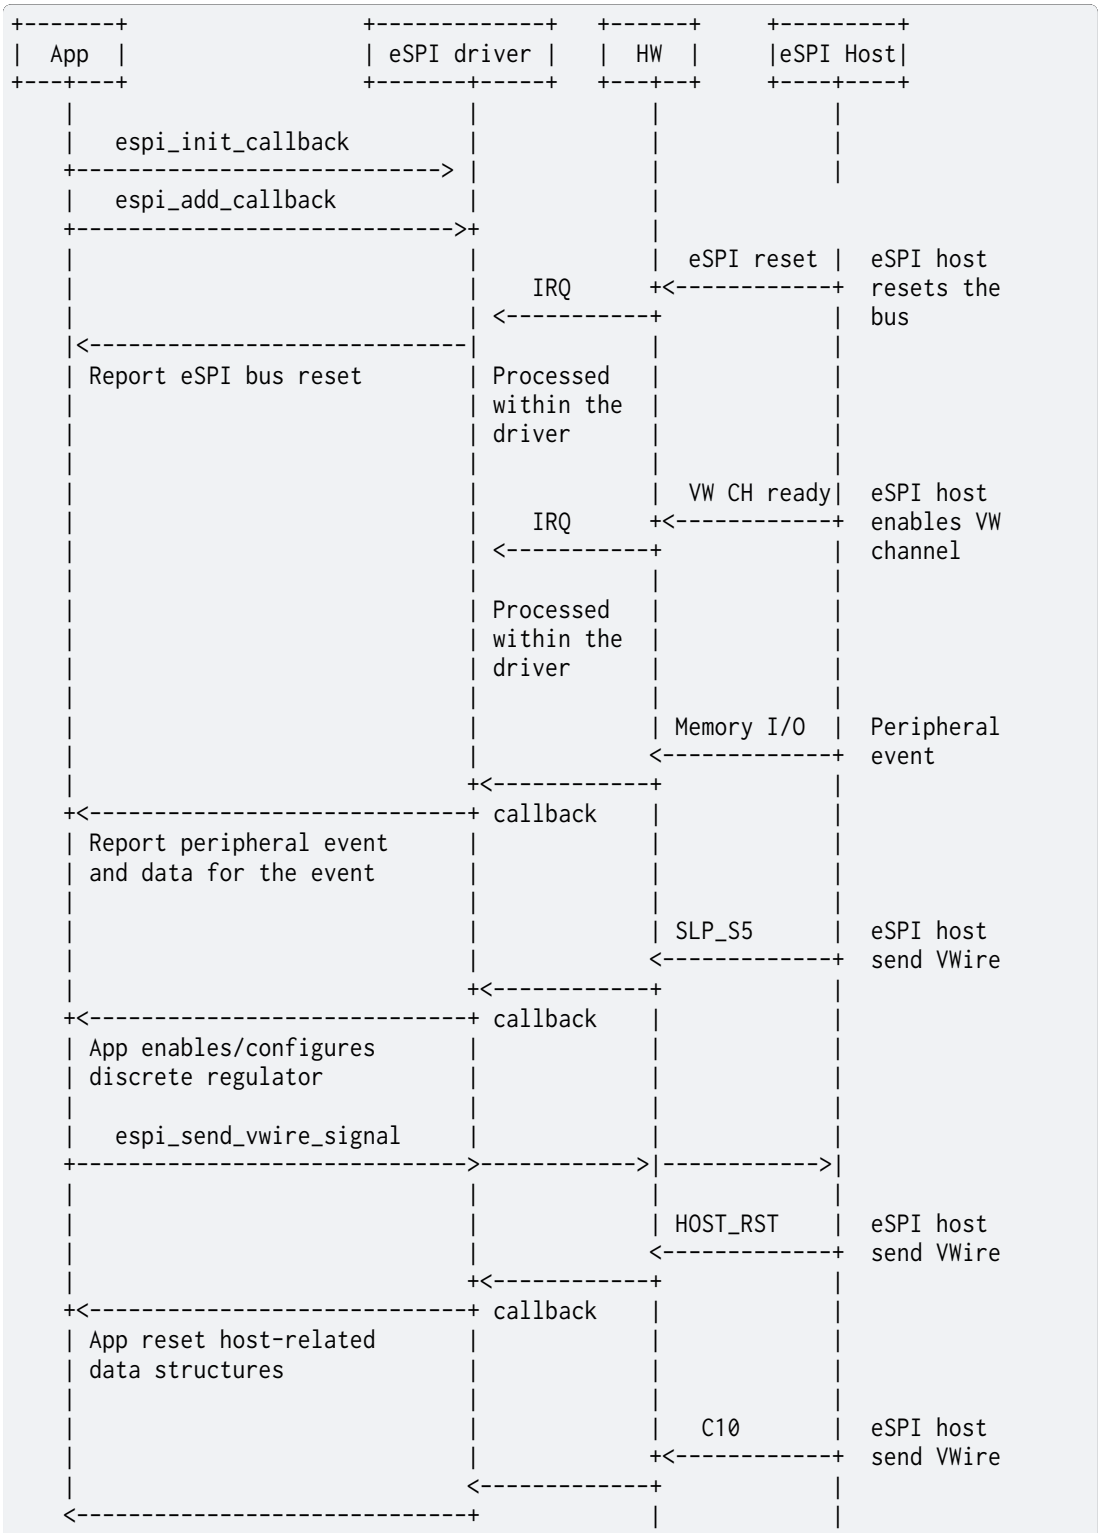
- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of write flash transaction.

Return values

- **-ENOTSUP** – eSPI flash logical channel transactions not supported.
- **-EBUSY** – eSPI flash channel is not ready or disabled by controller.
- **-EIO** – General input / output error, failed request to controller.

static inline void **espi_init_callback**(struct espi_callback *callback, *espi_callback_handler_t* handler, enum *espi_bus_event* evt_type)

Callback model.



(continues on next page)

(continued from previous page)

```
| App executes                  |             |             |
+ power mgmt policy             |             |             |
```

Helper to initialize a struct espi_callback properly.

Parameters

- `callback` – A valid Application's callback structure pointer.
- `handler` – A valid handler function pointer.
- `evt_type` – indicates the eSPI event relevant for the handler. for VWIRE_RECEIVED event the data will indicate the new level asserted

static inline int **espi_add_callback**(const struct *device* *dev, struct espi_callback *callback)

Add an application callback.

Note: enables to add as many callback as needed on the same device.

Note

Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – A valid Application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

static inline int **espi_remove_callback**(const struct *device* *dev, struct espi_callback *callback)

Remove an application callback.

Note: enables to remove as many callbacks as added through *espi_add_callback()*.

Warning

It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. `callback`. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – A valid application's callback structure pointer.

Returns

0 if successful, negative errno code on failure.

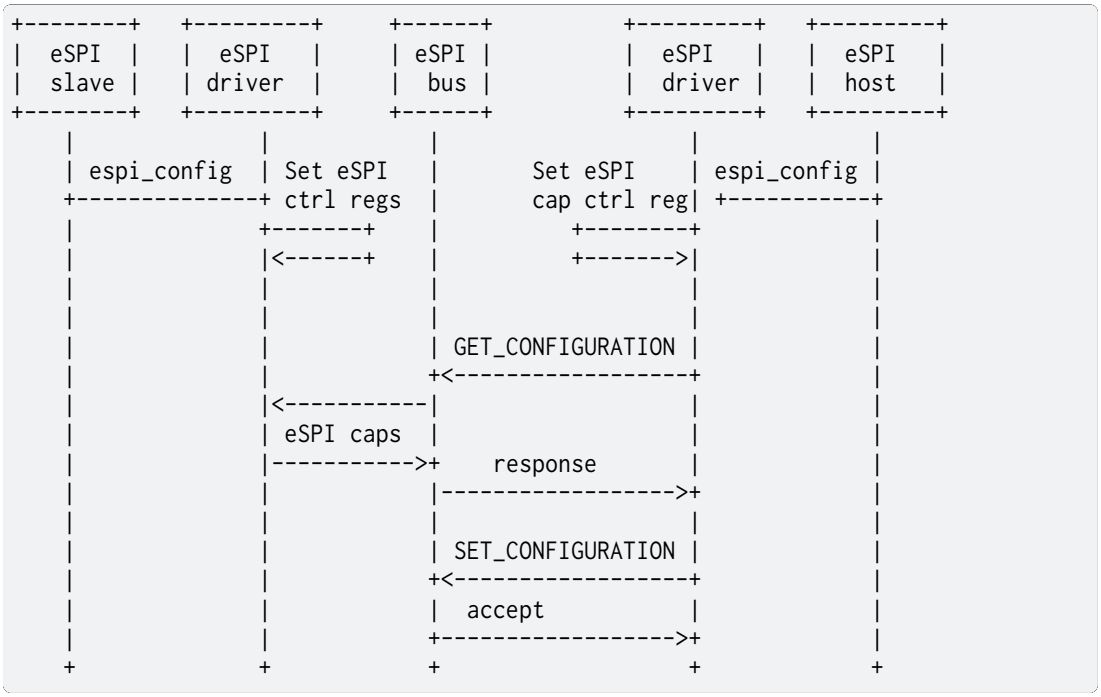
int **espi_saf_config**(const struct *device* *dev, const struct *espi_saf_cfg* *cfg)

Configure operation of a eSPI controller.

This routine provides a generic interface to override eSPI controller capabilities.

If this eSPI controller is acting as slave, the values set here will be discovered as part through the GET_CONFIGURATION command issued by the eSPI master during initialization.

If this eSPI controller is acting as master, the values set here will be used by eSPI master to determine minimum common capabilities with eSPI slave then send via SET_CONFIGURATION command.



Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **cfg** – the device runtime configuration for the eSPI controller.

Return values

- **0** – If successful.
- **-EIO** – General input / output error, failed to configure device.
- **-EINVAL** – invalid capabilities, failed to configure device.
- **-ENOTSUP** – capability not supported by eSPI slave.

int **espi_saf_set_protection_regions**(const struct *device* *dev, const struct espi_saf_protection *pr)

Set one or more SAF protection regions.

This routine provides an interface to override the default flash protection regions of the SAF controller.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **pr** – Pointer to the SAF protection region structure.

Return values

- `0` – If successful.
- `-EIO` – General input / output error, failed to configure device.
- `-EINVAL` – invalid capabilities, failed to configure device.
- `-ENOTSUP` – capability not supported by eSPI slave.

int **espi_saf_activate**(const struct *device* *dev)

Activate SAF block.

This routine activates the SAF block and should only be called after SAF has been configured and the eSPI Master has enabled the Flash Channel.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful
- `-EINVAL` – if failed to activate SAF.

bool **espi_saf_get_channel_status**(const struct *device* *dev)

Query to see if SAF is ready.

This routine allows to check if SAF is ready before use.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `true` – If eSPI SAF is ready.
- `false` – otherwise.

int **espi_saf_flash_read**(const struct *device* *dev, struct *espi_saf_packet* *pckt)

Sends a read request packet for slave attached flash.

This routines provides an interface to send a request to read the flash component shared between the eSPI master and eSPI slaves.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of read flash transaction.

Return values

- `-ENOTSUP` – eSPI flash logical channel transactions not supported.
- `-EBUSY` – eSPI flash channel is not ready or disabled by master.
- `-EIO` – General input / output error, failed request to master.

int **espi_saf_flash_write**(const struct *device* *dev, struct *espi_saf_packet* *pckt)

Sends a write request packet for slave attached flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `pckt` – Address of the representation of write flash transaction.

Return values

- `-ENOTSUP` – eSPI flash logical channel transactions not supported.

- **-EBUSY** – eSPI flash channel is not ready or disabled by master.
- **-EIO** – General input / output error, failed request to master.

int **espi_saf_flash_erase**(const struct *device* *dev, struct *espi_saf_packet* *pckt)

Sends a write request packet for slave attached flash.

This routines provides an interface to send a request to write to the flash components shared between the eSPI master and eSPI slaves.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **pckt** – Address of the representation of erase flash transaction.

Return values

- **-ENOTSUP** – eSPI flash logical channel transactions not supported.
- **-EBUSY** – eSPI flash channel is not ready or disabled by master.
- **-EIO** – General input / output error, failed request to master.

int **espi_saf_flash_unsuccess**(const struct *device* *dev, struct *espi_saf_packet* *pckt)

Response unsuccessful completion for slave attached flash.

This routines provides an interface to response that transaction is invalid and return unsuccessful completion from target to controller.

Parameters

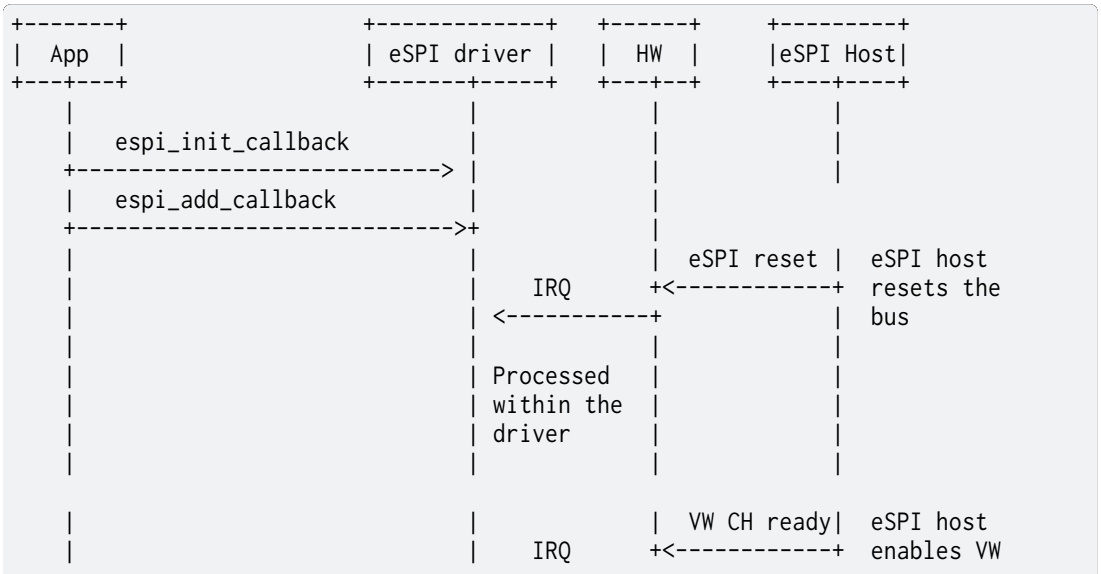
- **dev** – Pointer to the device structure for the driver instance.
- **pckt** – Address of the representation of flash transaction.

Return values

- **-ENOTSUP** – eSPI flash logical channel transactions not supported.
- **-EBUSY** – eSPI flash channel is not ready or disabled by master.
- **-EIO** – General input / output error, failed request to master.

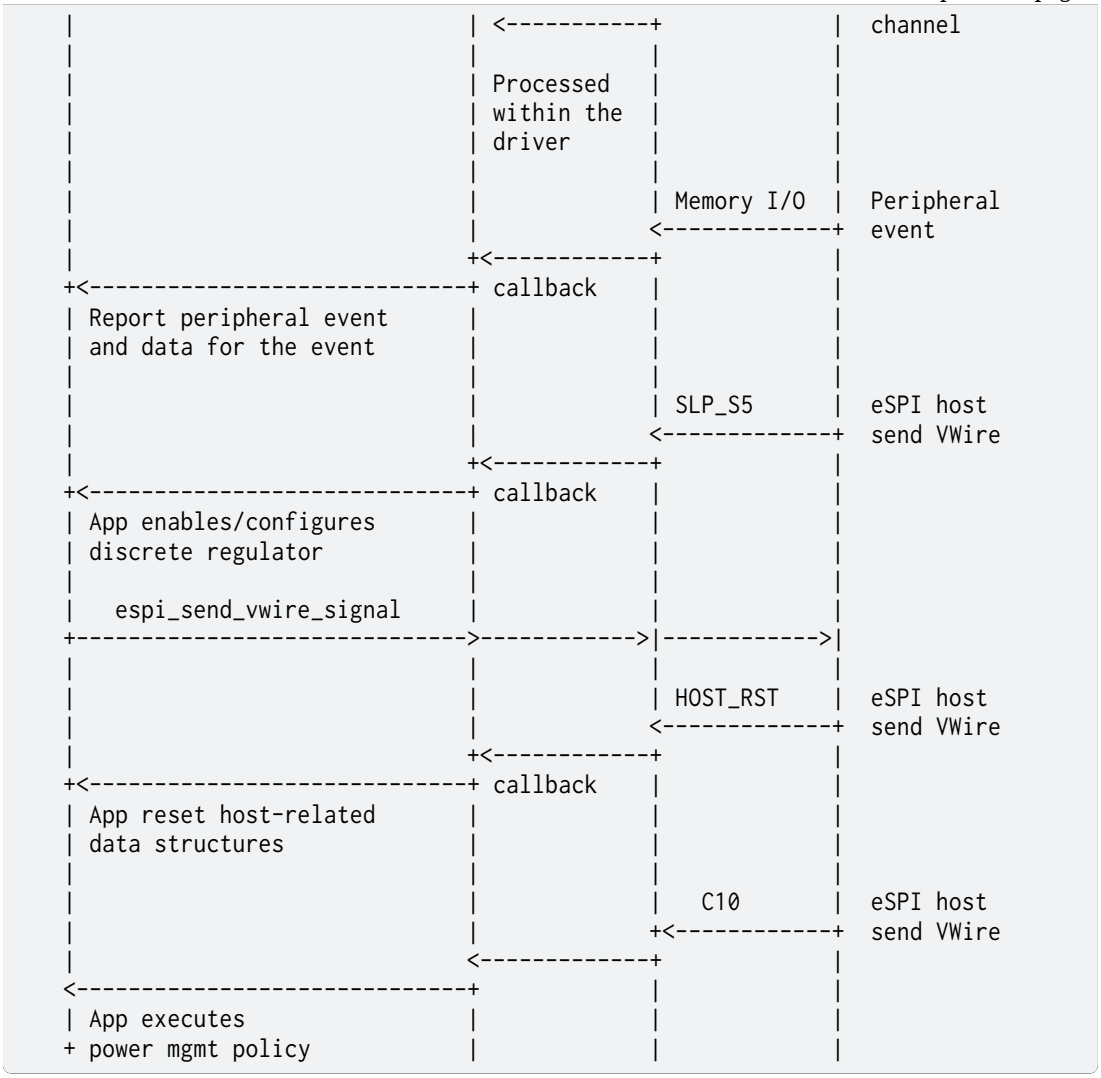
static inline void **espi_saf_init_callback**(struct espi_callback *callback, *espi_callback_handler_t* handler, enum *espi_bus_event* evt_type)

Callback model.



(continues on next page)

(continued from previous page)



Helper to initialize a struct espi_callback properly.

Parameters

- **callback** – A valid Application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **evt_type** – indicates the eSPI event relevant for the handler. for VWIRE_RECEIVED event the data will indicate the new level asserted

static inline int **espi_saf_add_callback**(const struct *device* *dev, struct espi_callback *callback)

Add an application callback.

Note: enables to add as many callback as needed on the same device.

Note

Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current eSPI event is not specified.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – A valid Application's callback structure pointer.

Returns
0 if successful, negative errno code on failure.

static inline int **espi_saf_remove_callback**(const struct *device* *dev, struct espi_callback *callback)

Remove an application callback.

Note: enables to remove as many callbacks as added through *espi_add_callback()*.

Warning

It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. `callback`. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – A valid application's callback structure pointer.

Returns
0 if successful, negative errno code on failure.

struct **espi_evt_data_kbc**

#include <*espi.h*> Bit field definition of evt_data in struct *espi_event* for KBC.

struct **espi_evt_data_acpi**

#include <*espi.h*> Bit field definition of evt_data in struct *espi_event* for ACPI.

struct **espi_event**

#include <*espi.h*> eSPI event

Public Members

enum *espi_bus_event* **evt_type**

Event type.

uint32_t **evt_details**

Additional details for bus event type.

uint32_t **evt_data**

Data associated to the event.

struct **espi_cfg**

#include <*espi.h*> eSPI bus configuration parameters

Public Members

enum *espi_io_mode* **io_caps**
Supported I/O mode.

enum *espi_channel* **channel_caps**
Supported channels.

uint8_t **max_freq**
Maximum supported frequency in MHz.

struct **espi_request_packet**
#include <*espi.h*> eSPI peripheral request packet format

struct **espi_oob_packet**
#include <*espi.h*> eSPI out-of-band transaction packet format

For Tx packet, eSPI driver client shall specify the OOB payload data and its length in bytes. For Rx packet, eSPI driver client shall indicate the maximum number of bytes that can receive, while the eSPI driver should update the length field with the actual data received/available.

In all cases, the length does not include OOB header size 3 bytes.

struct **espi_flash_packet**
#include <*espi.h*> eSPI flash transactions packet format

struct **espi_saf_cfg**
#include <*espi_saf.h*> eSPI SAF configuration parameters

struct **espi_saf_packet**
#include <*espi_saf.h*> eSPI SAF transaction packet format

7.6.17 Entropy

Overview

The entropy API provides functions to retrieve entropy values from entropy hardware present on the platform. The entropy APIs are provided for use by the random subsystem and cryptographic services. They are not suitable to be used as random number generation functions.

API Reference

group **entropy_interface**
Entropy Interface.

Since
1.10

Version
1.0.0

Defines

ENTROPY_BUSYWAIT

Driver is allowed to busy-wait for random data to be ready.

Typedefs

typedef int (*entropy_get_entropy_t)(const struct *device* *dev, uint8_t *buffer, uint16_t length)

Callback API to get entropy.

See *entropy_get_entropy()* for argument description

> **Note**
>
> This call has to be thread safe to satisfy requirements of the random subsystem.

typedef int (*entropy_get_entropy_isr_t)(const struct *device* *dev, uint8_t *buffer, uint16_t length, uint32_t flags)

Callback API to get entropy from an ISR.

See *entropy_get_entropy_isr()* for argument description

Functions

int entropy_get_entropy(const struct *device* *dev, uint8_t *buffer, uint16_t length)

Fills a buffer with entropy.

Blocks if required in order to generate the necessary random data.

Parameters

- dev – Pointer to the entropy device.
- buffer – Buffer to fill with entropy.
- length – Buffer length.

Return values

- 0 – on success.
- -ERRNO – errno code on error.

static inline int entropy_get_entropy_isr(const struct *device* *dev, uint8_t *buffer, uint16_t length, uint32_t flags)

Fills a buffer with entropy in a non-blocking or busy-wait manner.

Callable from ISRs.

Parameters

- dev – Pointer to the device structure.
- buffer – Buffer to fill with entropy.
- length – Buffer length.

- `flags` – Flags to modify the behavior of the call.

Return values
`number` – of bytes filled with entropy or -error.

struct `entropy_driver_api`

#include <*entropy.h*> Entropy driver API structure.

This is the mandatory API any Entropy driver needs to expose.

7.6.18 Error Detection And Correction (EDAC)

Error Detection And Correction is a mechanism used to detect and correct errors while storing or reading data.

In Band Error Correction Code (IBECC)

Overview The mechanism initially found in Intel Elkhart Lake SOCs and later boards is an integrated memory controller with IBECC.

The In-Band Error Correction Code (IBECC) improves reliability by providing error detection and correction. IBECC can work for all or for specific regions of physical memory space. The IBECC is useful for memory technologies that do not support the out-of-band ECC.

IBECC adds memory overhead of 1/32 of the memory. This memory is not accessible and used to store ECC syndrome data. IBECC converts read / write transactions to two separate transactions: one for actual data and another for cache line containing ECC value.

There is a debug feature IBECC Error Injection which helps to debug and verify IBECC functionality. ECC errors are injected on the write path and cause ECC errors on the read path.

IBECC Configuration There are three IBECC operation modes which can be selected by Bootloader. They are listed below:

- OPERATION_MODE = 0x0 sets functional mode to protect requests based on address range
- OPERATION_MODE = 0x1 sets functional mode to all requests not be protected and to ignore range checks
- OPERATION_MODE = 0x2 sets functional mode to protect all requests and ignore range checks

IBECC operational mode is configured through BIOS or Bootloader. For operation mode 0 there are more BIOS configuration options such as memory regions.

Due to high security risk Error Injection capability should not be enabled for production. Error Injection is only enabled for tests.

IBECC Logging IBECC logs the following fields:

- Error Address
- Error Syndrome
- Error Type
  - Correctable Error (CE) - error is detected and corrected by IBECC module.
  - Uncorrectable Error (UE) - error is detected by IBECC module and not automatically corrected.

The IBECC driver provides error type for the higher-level application to implement desired policy with respect for handling those memory errors. Error syndrome is not used in the IBECC driver but provided to higher-level application.

Usage notes Exceptional care needs to be taken with Non Maskable Interrupt (NMI). NMI will arrive at any time, even if the local CPU has disabled interrupts. That means that no locking mechanism can protect code against an NMI happening. Zephyr's IPC mechanisms universally use local IRQ locking as the base layer for all higher-level synchronization primitives. So, you cannot share anything that is "protected" by a lock with an NMI, because the protection does not work. The only tool you have available for synchronization in the Zephyr API that works against an NMI is the atomic layer. This also applies to callback function which is called by NMI handler.

Optional interfaces

EDAC Optional Interfaces

static inline int **`edac_inject_set_param1`**(const struct *device* *dev, uint64_t value)

Set injection parameter param1.

Set first error injection parameter value.

Parameters

- `dev` – Pointer to the device structure
- `value` – First injection parameter

Return values

- `-ENOSYS` – if the optional interface is not implemented

- `0` – on success, other error code otherwise

static inline int **edac_inject_get_param1**(const struct *device* *dev, uint64_t *value)

Get injection parameter param1.

Get first error injection parameter value.

Parameters

- `dev` – Pointer to the device structure
- `value` – Pointer to the first injection parameter

Return values

- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

static inline int **edac_inject_set_param2**(const struct *device* *dev, uint64_t value)

Set injection parameter param2.

Set second error injection parameter value.

Parameters

- `dev` – Pointer to the device structure
- `value` – Second injection parameter

Return values

- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

static inline int **edac_inject_get_param2**(const struct *device* *dev, uint64_t *value)

Get injection parameter param2.

Parameters

- `dev` – Pointer to the device structure
- `value` – Pointer to the second injection parameter

Return values

- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

static inline int **edac_inject_set_error_type**(const struct *device* *dev, uint32_t error_type)

Set error type value.

Set the value of error type to be injected

Parameters

- `dev` – Pointer to the device structure
- `error_type` – Error type value

Return values

- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

static inline int **edac_inject_get_error_type**(const struct *device* *dev, uint32_t *error_type)

Get error type value.

Get the value of error type to be injected

Parameters

- `dev` – Pointer to the device structure
- `error_type` – Pointer to error type value

Return values

- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

static inline int **edac_inject_error_trigger**(const struct *device* *dev)

Set injection control.

Trigger error injection.

Parameters

- `dev` – Pointer to the device structure

Return values

- `-ENOSYS` – if the optional interface is not implemented
- `0` – on success, error code otherwise

Mandatory interfaces

EDAC Mandatory Interfaces

static inline int **edac_ecc_error_log_get**(const struct *device* *dev, uint64_t *value)

Get ECC Error Log.

Read value of ECC Error Log.

Parameters

- `dev` – Pointer to the device structure
- `value` – Pointer to the ECC Error Log value

Return values

- `0` – on success, error code otherwise
- `-ENOSYS` – if the mandatory interface is not implemented

static inline int **edac_ecc_error_log_clear**(const struct *device* *dev)

Clear ECC Error Log.

Clear value of ECC Error Log.

Parameters

- `dev` – Pointer to the device structure

Return values

- `0` – on success, error code otherwise
- `-ENOSYS` – if the mandatory interface is not implemented

static inline int **edac_parity_error_log_get**(const struct *device* *dev, uint64_t *value)

Get Parity Error Log.

Read value of Parity Error Log.

Parameters

- `dev` – Pointer to the device structure
- `value` – Pointer to the parity Error Log value

Return values

- `0` – on success, error code otherwise
- `-ENOSYS` – if the mandatory interface is not implemented

static inline int **edac_parity_error_log_clear**(const struct *device* *dev)

Clear Parity Error Log.

Clear value of Parity Error Log.

Parameters

- `dev` – Pointer to the device structure

Return values

- `0` – on success, error code otherwise
- `-ENOSYS` – if the mandatory interface is not implemented

static inline int **edac_errors_cor_get**(const struct *device* *dev)

Get number of correctable errors.

Parameters

- `dev` – Pointer to the device structure

Return values

- `num` – Number of correctable errors
- `-ENOSYS` – if the mandatory interface is not implemented

static inline int **edac_errors_uc_get**(const struct *device* *dev)

Get number of uncorrectable errors.

Parameters

- `dev` – Pointer to the device structure

Return values

- `num` – Number of uncorrectable errors
- `-ENOSYS` – if the mandatory interface is not implemented

static inline int **edac_notify_callback_set**(const struct *device* *dev,
edac_notify_callback_f cb)

Register callback function for memory error exception.

This callback runs in interrupt context

Parameters

- `dev` – EDAC driver device to install callback
- `cb` – Callback function pointer

Return values

- `0` – on success, error code otherwise

- `-ENOSYS` – if the mandatory interface is not implemented

Enums

enum `edac_error_type`

EDAC error type.

Values:

enumerator `EDAC_ERROR_TYPE_DRAM_COR` = *BIT*(0)

Correctable error type.

enumerator `EDAC_ERROR_TYPE_DRAM_UC` = *BIT*(1)

Uncorrectable error type.

7.6.19 Flash

Overview

Flash offset concept

Offsets used by the user API are expressed in relation to the flash memory beginning address. This rule shall be applied to all flash controller regular memory that layout is accessible via API for retrieving the layout of pages (see `CONFIG_FLASH_PAGE_LAYOUT`).

An exception from the rule may be applied to a vendor-specific flash dedicated-purpose region (such a region obviously can't be covered under API for retrieving the layout of pages).

User API Reference

Typedefs

typedef bool (*`flash_page_cb`)(const struct *flash_pages_info* *info, void *data)

Callback type for iterating over flash pages present on a device.

The callback should return true to continue iterating, and false to halt.

See also

flash_page_foreach()

Param info
Information for current page

Param data
Private data for callback

Return
True to continue iteration, false to halt iteration.

Enums

enum `flash_ex_op_types`

Enumeration for extra flash operations.

Values:

enumerator `FLASH_EX_OP_RESET` = 0

Functions

static inline int `flash_params_get_erase_cap`(const struct *flash_parameters* *p)

int `flash_read`(const struct *device* *dev, off_t offset, void *data, size_t len)

Read data from flash.

All flash drivers support reads without alignment restrictions on the read offset, the read size, or the destination address.

Parameters

- `dev` – : flash dev
- `offset` – : Offset (byte aligned) to read
- `data` – : Buffer to store read data
- `len` – : Number of bytes to read.

Returns

0 on success, negative errno code on fail.

int `flash_write`(const struct *device* *dev, off_t offset, const void *data, size_t len)

Write buffer into flash memory.

All flash drivers support a source buffer located either in RAM or SoC flash, without alignment restrictions on the source address. Write size and offset must be multiples of the minimum write block size supported by the driver.

Any necessary write protection management is performed by the driver write implementation itself.

Parameters

- `dev` – : flash device
- `offset` – : starting offset for the write
- `data` – : data to write
- `len` – : Number of bytes to write

Returns

0 on success, negative errno code on fail.

int `flash_erase`(const struct *device* *dev, off_t offset, size_t size)

Erase part or all of a flash memory.

Acceptable values of erase size and offset are subject to hardware-specific multiples of page size and offset. Please check the API implemented by the underlying sub driver, for example by using *flash_get_page_info_by_offs()* if that is supported by your flash driver.

Any necessary erase protection management is performed by the driver erase implementation itself.

The function should be used only for devices that are really explicit erase devices; in case when code relies on erasing device, i.e. setting it to erase-value, prior to some operations, but should work with explicit erase and RAM non-volatile devices, then flash_flatten should rather be used.

See also

flash_flatten()

See also

flash_get_page_info_by_offs()

See also

flash_get_page_info_by_idx()

Parameters

- `dev` – : flash device
- `offset` – : erase area starting offset
- `size` – : size of area to be erased

Returns

0 on success, negative errno code on fail.

int `flash_fill`(const struct *device* *dev, uint8_t val, off_t offset, size_t size)

Fill selected range of device with specified value.

Utility function that allows to fill specified range on a device with provided value. The `offset` and `size` of range need to be aligned to a write block size of a device.

Parameters

- `dev` – : flash device
- `val` – : value to use for filling the range
- `offset` – : offset of the range to fill
- `size` – : size of the range

Returns

0 on success, negative errno code on fail.

int `flash_flatten`(const struct *device* *dev, off_t offset, size_t size)

Erase part or all of a flash memory or level it.

If device is explicit erase type device or device driver provides erase callback, the callback of the device is called, in which it behaves the same way as flash_erase. If a device does not require explicit erase, either because it has no erase at all or has auto-erase/erase-on-write, and does not provide erase callback then erase is emulated by leveling selected device memory area with erase_value assigned to device.

Erase page offset and size are constrains of paged, explicit erase devices, but can be relaxed with devices without such requirement, which means that it is up to user code to make sure they are correct as the function will return on, if these constrains are

not met, -EINVAL for paged device, but may succeed on non-explicit erase devices. For RAM non-volatile devices the erase pages are emulated, at this point, to allow smooth transition for code relying on device being paged to function properly; but this is completely software constrain.

Generally: if your code previously required device to be erase prior to some actions to work, replace flash_erase calls with this function; but if your code can work with non-volatile RAM type devices, without emulating erase, you should rather have different path of execution for page-erase, i.e. Flash, devices and call flash_erase for them.

See also

flash_erase()

Parameters

- `dev` – : flash device
- `offset` – : erase area starting offset
- `size` – : size of area to be erased

Returns
0 on success, negative errno code on fail.

int `flash_get_page_info_by_offs`(const struct *device* *dev, off_t offset, struct *flash_pages_info* *info)

Get the size and start offset of flash page at certain flash offset.

Parameters

- `dev` – flash device
- `offset` – Offset within the page
- `info` – Page Info structure to be filled

Returns
0 on success, -EINVAL if page of the offset doesn't exist.

int `flash_get_page_info_by_idx`(const struct *device* *dev, uint32_t page_index, struct *flash_pages_info* *info)

Get the size and start offset of flash page of certain index.

Parameters

- `dev` – flash device
- `page_index` – Index of the page. Index are counted from 0.
- `info` – Page Info structure to be filled

Returns
0 on success, -EINVAL if page of the index doesn't exist.

size_t `flash_get_page_count`(const struct *device* *dev)

Get the total number of flash pages.

Parameters

- `dev` – flash device

Returns
Number of flash pages.

void **flash_page_foreach**(const struct *device* *dev, *flash_page_cb* cb, void *data)

Iterate over all flash pages on a device.

This routine iterates over all flash pages on the given device, ordered by increasing start offset. For each page, it invokes the given callback, passing it the page's information and a private data object.

Parameters

- **dev** – Device whose pages to iterate over
- **cb** – Callback to invoke for each flash page
- **data** – Private data for callback function

int **flash_sfdp_read**(const struct *device* *dev, off_t offset, void *data, size_t len)

Read data from Serial Flash Discoverable Parameters.

This routine reads data from a serial flash device compatible with the JEDEC JESD216 standard for encoding flash memory characteristics.

Availability of this API is conditional on selecting `CONFIG_FLASH_JESD216_API` and support of that functionality in the driver underlying `dev`.

Parameters

- **dev** – device from which parameters will be read
- **offset** – address within the SFDP region containing data of interest
- **data** – where the data to be read will be placed
- **len** – the number of bytes of data to be read

Return values

- **0** – on success
- **-ENOTSUP** – if the flash driver does not support SFDP access
- **negative** – values for other errors.

int **flash_read_jedec_id**(const struct *device* *dev, uint8_t *id)

Read the JEDEC ID from a compatible flash device.

Parameters

- **dev** – device from which id will be read
- **id** – pointer to a buffer of at least 3 bytes into which id will be stored

Return values

- **0** – on successful store of 3-byte JEDEC id
- **-ENOTSUP** – if flash driver doesn't support this function
- **negative** – values for other errors

size_t **flash_get_write_block_size**(const struct *device* *dev)

Get the minimum write block size supported by the driver.

The write block size supported by the driver might differ from the write block size of memory used because the driver might implements write-modify algorithm.

Parameters

- **dev** – flash device

Returns

write block size in bytes.

const struct *flash_parameters* *`flash_get_parameters`(const struct *device* *dev)

Get pointer to *flash_parameters* structure.

Returned pointer points to a structure that should be considered constant through a runtime, regardless if it is defined in RAM or Flash. Developer is free to cache the structure pointer or copy its contents.

Returns
pointer to *flash_parameters* structure characteristic for the device.

int `flash_ex_op`(const struct *device* *dev, uint16_t code, const uintptr_t in, void *out)

Execute flash extended operation on given device.

Besides of standard flash operations like write or erase, flash controllers also support additional features like write protection or readout protection. These features are not available in every flash controller, what's more controllers can implement it in a different way.

It doesn't make sense to add a separate flash API function for every flash controller feature, because it could be unique (supported on small number of flash controllers) or the API won't be able to represent the same feature on every flash controller.

Parameters

- `dev` – Flash device
- `code` – Operation which will be executed on the device.
- `in` – Pointer to input data used by operation. If operation doesn't need any input data it could be NULL.
- `out` – Pointer to operation output data. If operation doesn't produce any output it could be NULL.

Return values

- `0` – on success.
- `-ENOTSUP` – if given device doesn't support extended operation.
- `-ENOSYS` – if support for extended operations is not enabled in Kconfig
- `negative` – value on extended operation errors.

struct `flash_parameters`

#include <flash.h> Flash memory parameters.

Contents of this structure suppose to be filled in during flash device initialization and stay constant through a runtime.

Public Members

const size_t `write_block_size`

Minimal write alignment and size.

uint8_t `erase_value`

Value the device is filled in erased areas.

struct `flash_pages_info`

#include <flash.h>

Implementation interface API Reference

group `flash_internal_interface`

FLASH internal Interface.

Typedefs

typedef int (*`flash_api_read`)(const struct *device* *dev, off_t offset, void *data, size_t len)

typedef int (*`flash_api_write`)(const struct *device* *dev, off_t offset, const void *data, size_t len)

Flash write implementation handler type.

> **Note**
>
> Any necessary write protection management must be performed by the driver, with the driver responsible for ensuring the "write-protect" after the operation completes (successfully or not) matches the write-protect state when the operation was started.

typedef int (*`flash_api_erase`)(const struct *device* *dev, off_t offset, size_t size)

Flash erase implementation handler type.

The callback is optional for RAM non-volatile devices, which do not require erase by design, but may be provided if it allows device to work more effectively, or if device has a support for internal fill operation the erase in driver uses.

> **Note**
>
> Any necessary erase protection management must be performed by the driver, with the driver responsible for ensuring the "erase-protect" after the operation completes (successfully or not) matches the erase-protect state when the operation was started.

typedef const struct *flash_parameters* *(*`flash_api_get_parameters`)(const struct *device* *dev)

typedef void (*`flash_api_pages_layout`)(const struct *device* *dev, const struct *flash_pages_layout* **layout, size_t *layout_size)

Retrieve a flash device's layout.

A flash device layout is a run-length encoded description of the pages on the device. (Here, "page" means the smallest erasable area on the flash device.)

For flash memories which have uniform page sizes, this routine returns an array of length 1, which specifies the page size and number of pages in the memory.

Layouts for flash memories with nonuniform page sizes will be returned as an array with multiple elements, each of which describes a group of pages that all have the same size. In this case, the sequence of array elements specifies the order in which these groups occur on the device.

Param dev
Flash device whose layout to retrieve.

Param layout
The flash layout will be returned in this argument.

Param layout_size
The number of elements in the returned layout.

typedef int (*`flash_api_sfdp_read`)(const struct *device* *dev, off_t offset, void *data, size_t len)

typedef int (*`flash_api_read_jedec_id`)(const struct *device* *dev, uint8_t *id)

typedef int (*`flash_api_ex_op`)(const struct *device* *dev, uint16_t code, const uintptr_t in, void *out)

struct `flash_pages_layout`
#include <flash.h>

struct `flash_driver_api`
#include <flash.h>

7.6.20 Fuel Gauge

The fuel gauge subsystem exposes an API to uniformly access battery fuel gauge devices. Currently, only reading data is supported.

Note: This API is currently experimental and this doc will be significantly changed as new features are added to the API.

Basic Operation

Properties Fundamentally, a property is a quantity that a fuel gauge device can measure.

Fuel gauges typically support multiple properties, such as temperature readings of the battery-pack or present-time current/voltage.

Properties are fetched by the client one at a time using *`fuel_gauge_get_prop()`*, or fetched in a batch using *`fuel_gauge_get_props()`*.

Properties are set by the client one at a time using *`fuel_gauge_set_prop()`*, or set in a batch using *`fuel_gauge_set_props()`*.

Battery Cutoff Many fuel gauges embedded within battery packs expose a register address that when written to with a specific payload will do a battery cutoff. This battery cutoff is often referred to as ship, shelf, or sleep mode due to its utility in reducing battery drain while devices are stored or shipped.

The fuel gauge API exposes battery cutoff with the *`fuel_gauge_battery_cutoff()`* function.

Caching The Fuel Gauge API explicitly provides no caching for its clients.

API Reference

group `fuel_gauge_interface`

Fuel Gauge Interface.

typedef int (***`fuel_gauge_set_property_t`**)(const struct *device* *dev, *fuel_gauge_prop_t* prop, union *fuel_gauge_prop_val* val)

Callback API for setting a fuel_gauge property.

See fuel_gauge_set_property() for argument description

typedef int (***`fuel_gauge_get_buffer_property_t`**)(const struct *device* *dev, *fuel_gauge_prop_t* prop_type, void *dst, size_t dst_len)

Callback API for getting a fuel_gauge buffer property.

See fuel_gauge_get_buffer_property() for argument description

typedef int (***`fuel_gauge_battery_cutoff_t`**)(const struct *device* *dev)

Callback API for doing a battery cutoff.

See *fuel_gauge_battery_cutoff()* for argument description

Enums

enum fuel_gauge_prop_type

Values:

enumerator FUEL_GAUGE_AVG_CURRENT = 0

Runtime Dynamic Battery Parameters.

Provide a 1 minute average of the current on the battery. Does not check for flags or whether those values are bad readings. See driver instance header for details on implementation and how the average is calculated. Units in uA negative=discharging

enumerator FUEL_GAUGE_BATTERY_CUTOFF

Used to cutoff the battery from the system - useful for storage/shipping of devices.

enumerator FUEL_GAUGE_CURRENT

Battery current (uA); negative=discharging.

enumerator FUEL_GAUGE_CHARGE_CUTOFF

Whether the battery underlying the fuel-gauge is cut off from charge.

enumerator FUEL_GAUGE_CYCLE_COUNT

Cycle count in 1/100ths (number of charge/discharge cycles)

enumerator FUEL_GAUGE_CONNECT_STATE

Connect state of battery.

enumerator FUEL_GAUGE_FLAGS

General Error/Runtime Flags.

enumerator FUEL_GAUGE_FULL_CHARGE_CAPACITY

Full Charge Capacity in uAh (might change in some implementations to determine wear)

enumerator FUEL_GAUGE_PRESENT_STATE

Is the battery physically present.

enumerator FUEL_GAUGE_REMAINING_CAPACITY

Remaining capacity in uAh.

enumerator FUEL_GAUGE_RUNTIME_TO_EMPTY

Remaining battery life time in minutes.

enumerator FUEL_GAUGE_RUNTIME_TO_FULL

Remaining time in minutes until battery reaches full charge.

enumerator FUEL_GAUGE_SBS_MFR_ACCESS

Retrieve word from SBS1.1 ManufactuerAccess.

enumerator FUEL_GAUGE_ABSOLUTE_STATE_OF_CHARGE
Absolute state of charge (percent, 0-100) - expressed as % of design capacity.

enumerator FUEL_GAUGE_RELATIVE_STATE_OF_CHARGE
Relative state of charge (percent, 0-100) - expressed as % of full charge capacity.

enumerator FUEL_GAUGE_TEMPERATURE
Temperature in 0.1 K.

enumerator FUEL_GAUGE_VOLTAGE
Battery voltage (uV)

enumerator FUEL_GAUGE_SBS_MODE
Battery Mode (flags)

enumerator FUEL_GAUGE_CHARGE_CURRENT
Battery desired Max Charging Current (uA)

enumerator FUEL_GAUGE_CHARGE_VOLTAGE
Battery desired Max Charging Voltage (uV)

enumerator FUEL_GAUGE_STATUS
Alarm, Status and Error codes (flags)

enumerator FUEL_GAUGE_DESIGN_CAPACITY
Design Capacity (mAh or 10mWh)

enumerator FUEL_GAUGE_DESIGN_VOLTAGE
Design Voltage (mV)

enumerator FUEL_GAUGE_SBS_ATRATE
AtRate (mA or 10 mW)

enumerator FUEL_GAUGE_SBS_ATRATE_TIME_TO_FULL
AtRateTimeToFull (minutes)

enumerator FUEL_GAUGE_SBS_ATRATE_TIME_TO_EMPTY
AtRateTimeToEmpty (minutes)

enumerator FUEL_GAUGE_SBS_ATRATE_OK
AtRateOK (boolean)

enumerator FUEL_GAUGE_SBS_REMAINING_CAPACITY_ALARM
Remaining Capacity Alarm (mAh or 10mWh)

enumerator FUEL_GAUGE_SBS_REMAINING_TIME_ALARM
Remaining Time Alarm (minutes)

enumerator FUEL_GAUGE_MANUFACTURER_NAME

Manufacturer of pack (1 byte length + 20 bytes data)

enumerator FUEL_GAUGE_DEVICE_NAME

Name of pack (1 byte length + 20 bytes data)

enumerator FUEL_GAUGE_DEVICE_CHEMISTRY

Chemistry (1 byte length + 4 bytes data)

enumerator FUEL_GAUGE_COMMON_COUNT

Reserved to demark end of common fuel gauge properties.

enumerator FUEL_GAUGE_CUSTOM_BEGIN

Reserved to demark downstream custom properties - use this value as the actual value may change over future versions of this API.

enumerator FUEL_GAUGE_PROP_MAX = UINT16_MAX

Reserved to demark end of valid enum properties.

Functions

int **fuel_gauge_get_prop**(const struct *device* *dev, *fuel_gauge_prop_t* prop, union *fuel_gauge_prop_val* *val)

Fetch a battery fuel-gauge property.

Parameters

- **dev** – Pointer to the battery fuel-gauge device
- **prop** – Type of property to be fetched from device
- **val** – pointer to a union *fuel_gauge_prop_val* where the property is read into from the fuel gauge device.

Returns

0 if successful, negative errno code if failure.

int **fuel_gauge_get_props**(const struct *device* *dev, *fuel_gauge_prop_t* *props, union *fuel_gauge_prop_val* *vals, size_t len)

Fetch multiple battery fuel-gauge properties.

The default implementation is the same as calling *fuel_gauge_get_prop()* multiple times. A driver may implement the `get_properties` field of the fuel gauge driver APIs struct to override this implementation.

Parameters

- **dev** – Pointer to the battery fuel-gauge device
- **props** – Array of the type of property to be fetched from device, each index corresponds to the same index of the vals input array.
- **vals** – Pointer to array of union *fuel_gauge_prop_val* where the property is read into from the fuel gauge device. The vals array is not permuted.
- **len** – number of properties in props & vals array

Returns

0 if successful, negative errno code of first failing property

int `fuel_gauge_set_prop`(const struct *device* *dev, *fuel_gauge_prop_t* prop, union *fuel_gauge_prop_val* val)

Set a battery fuel-gauge property.

Parameters

- `dev` – Pointer to the battery fuel-gauge device
- `prop` – Type of property that's being set
- `val` – Value to set associated prop property.

Returns

0 if successful, negative errno code of first failing property

int `fuel_gauge_set_props`(const struct *device* *dev, *fuel_gauge_prop_t* *props, union *fuel_gauge_prop_val* *vals, size_t len)

Set a battery fuel-gauge property.

Parameters

- `dev` – Pointer to the battery fuel-gauge device
- `props` – Array of the type of property to be set, each index corresponds to the same index of the vals input array.
- `vals` – Pointer to array of union *fuel_gauge_prop_val* where the property is written the fuel gauge device. The vals array is not permuted.
- `len` – number of properties in props array

Returns

return=0 if successful. Otherwise, return array index of failing property.

int `fuel_gauge_get_buffer_prop`(const struct *device* *dev, *fuel_gauge_prop_t* prop_type, void *dst, size_t dst_len)

Fetch a battery fuel-gauge buffer property.

Parameters

- `dev` – Pointer to the battery fuel-gauge device
- `prop_type` – Type of property to be fetched from device
- `dst` – byte array or struct that will hold the buffer data that is read from the fuel gauge
- `dst_len` – the length of the destination array in bytes

Returns

return=0 if successful, return < 0 if getting property failed, return 0 on success

int `fuel_gauge_battery_cutoff`(const struct *device* *dev)

Have fuel gauge cutoff its associated battery.

Parameters

- `dev` – Pointer to the battery fuel-gauge device

Returns

return=0 if successful and battery cutoff is now in process, return < 0 if failed to do battery cutoff.

union `fuel_gauge_prop_val`

#include <fuel_gauge.h> Property field to value/type union.

Public Members

fuel_gauge_get_property_t **get_property**
Note: Historically this API allowed drivers to implement a custom multi-get/set property function, this was added so drivers could potentially optimize batch read with their specific chip.

However, it was removed because of no existing concrete case upstream. If this need is demonstrated, we can add this back in as an API field.

group `fuel_gauge_emulator_backend`

Fuel gauge backend emulator APIs.

Functions

int `emul_fuel_gauge_set_battery_charging`(const struct *emul* *target, uint32_t uV, int uA)

Set charging for fuel gauge associated battery.

Set how much the battery associated with a fuel gauge IC is charging or discharging. Where voltage is always positive and a positive or negative current denotes charging or discharging, respectively.

Parameters

- `target` – Pointer to the emulator structure for the fuel gauge emulator instance.
- `uV` – Microvolts describing the battery voltage.
- `uA` – Microamps describing the battery current where negative is discharging.

Return values

- `0` – If successful.
- `-EINVAL` – if mV or mA are 0.

int `emul_fuel_gauge_is_battery_cutoff`(const struct *emul* *target, bool *cutoff)

Check if the battery has been cut off.

Parameters

- `target` – Pointer to the emulator structure for the fuel gauge emulator instance.
- `cutoff` – Pointer to bool storing variable.

Return values

- `0` – If successful.
- `-ENOTSUP` – if not supported by emulator.

7.6.21 GNSS (Global Navigation Satellite System)

Overview

GNSS is a general term which covers satellite systems used for navigation, like GPS (Global Positioning System). GNSS services are usually accessed through GNSS modems which receive and process GNSS signals to determine their position, or more specifically, their antennas position. They usually additionally provide a precise time synchronization mechanism, commonly named PPS (Pulse-Per-Second).

Subsystem support

The GNSS subsystem is based on the *Modem modules*. The GNSS subsystem covers everything from sending and receiving commands to and from the modem, to parsing, creating and processing NMEA0183 messages.

Adding support for additional NMEA0183 based GNSS modems requires little more than implementing power management and configuration for the specific GNSS modem.

Adding support for GNSS modems which use other protocols and/or buses than the usual NMEA0183 over UART is possible, but will require a bit more work from the driver developer.

Configuration Options

Related configuration options:

- `CONFIG_GNSS`
- `CONFIG_GNSS_SATELLITES`
- `CONFIG_GNSS_DUMP_TO_LOG`

Navigation Reference

Related code samples

GNSS
Connect to a GNSS device to obtain time, navigation data, and satellite information.

group `navigation`

Navigation utilities.

Functions

int `navigation_distance`(uint64_t *distance, const struct *navigation_data* *p1, const struct *navigation_data* *p2)

Calculate the distance between two navigation points along the surface of the sphere they are relative to.

Parameters

- `distance` – Destination for calculated distance in millimeters
- `p1` – First navigation point
- `p2` – Second navigation point

Returns
0 if successful

Returns
-EINVAL if either navigation point is invalid

int `navigation_bearing`(uint32_t *bearing, const struct *navigation_data* *from, const struct *navigation_data* *to)

Calculate the bearing from one navigation point to another.

Parameters

- `bearing` – Destination for calculated bearing angle in millidegrees
- `from` – First navigation point
- `to` – Second navigation point

Returns
0 if successful

Returns
-EINVAL if either navigation point is invalid

struct `navigation_data`

#include <*navigation.h*> Navigation data structure.

The structure describes the momentary navigation details of a point relative to a sphere (commonly Earth)

Public Members

int64_t `latitude`

Latitudal position in nanodegrees (0 to +-180E9)

int64_t `longitude`

Longitudal position in nanodegrees (0 to +-180E9)

uint32_t `bearing`

Bearing angle in millidegrees (0 to 360E3)

uint32_t `speed`

Speed in millimeters per second.

int32_t `altitude`

Altitude in millimeters.

Defines

GNSS_DATA_CALLBACK_DEFINE(_dev, _callback)

Register a callback structure for GNSS data published.

Parameters

- **_dev** – Device pointer
- **_callback** – The callback function

GNSS_SATELLITES_CALLBACK_DEFINE(_dev, _callback)

Register a callback structure for GNSS satellites published.

Parameters

- **_dev** – Device pointer
- **_callback** – The callback function

Typedefs

typedef int (*gnss_set_fix_rate_t)(const struct *device* *dev, uint32_t fix_interval_ms)

API for setting fix rate.

typedef int (*gnss_get_fix_rate_t)(const struct *device* *dev, uint32_t *fix_interval_ms)

API for getting fix rate.

typedef int (*gnss_set_periodic_config_t)(const struct *device* *dev, const struct *gnss_periodic_config* *periodic_config)

API for setting periodic tracking configuration.

typedef int (*gnss_get_periodic_config_t)(const struct *device* *dev, struct *gnss_periodic_config* *periodic_config)

API for setting periodic tracking configuration.

typedef int (*gnss_set_navigation_mode_t)(const struct *device* *dev, enum *gnss_navigation_mode* mode)

API for setting navigation mode.

typedef int (*gnss_get_navigation_mode_t)(const struct *device* *dev, enum *gnss_navigation_mode* *mode)

API for getting navigation mode.

typedef uint32_t gnss_systems_t

Type storing bitmask of GNSS systems.

typedef int (*gnss_set_enabled_systems_t)(const struct *device* *dev, *gnss_systems_t* systems)

API for enabling systems.

typedef int (*gnss_get_enabled_systems_t)(const struct *device* *dev, *gnss_systems_t* *systems)

API for getting enabled systems.

typedef int (*gnss_get_supported_systems_t)(const struct *device* *dev, *gnss_systems_t* *systems)

API for getting enabled systems.

typedef void (*gnss_data_callback_t)(const struct *device* *dev, const struct *gnss_data* *data)

Template for GNSS data callback.

typedef void (*gnss_satellites_callback_t)(const struct *device* *dev, const struct *gnss_satellite* *satellites, uint16_t size)

Template for GNSS satellites callback.

Enums

enum gnss_pps_mode

GNSS PPS modes.

Values:

enumerator GNSS_PPS_MODE_DISABLED = 0

PPS output disabled.

enumerator GNSS_PPS_MODE_ENABLED = 1

PPS output always enabled.

enumerator GNSS_PPS_MODE_ENABLED_AFTER_LOCK = 2

PPS output enabled from first lock.

enumerator GNSS_PPS_MODE_ENABLED_WHILE_LOCKED = 3

PPS output enabled while locked.

enum gnss_navigation_mode

GNSS navigation modes.

Values:

enumerator GNSS_NAVIGATION_MODE_ZERO_DYNAMICS = 0

Dynamics have no impact on tracking.

enumerator GNSS_NAVIGATION_MODE_LOW_DYNAMICS = 1

Low dynamics have higher impact on tracking.

enumerator GNSS_NAVIGATION_MODE_BALANCED_DYNAMICS = 2

Low and high dynamics have equal impact on tracking.

enumerator GNSS_NAVIGATION_MODE_HIGH_DYNAMICS = 3

High dynamics have higher impact on tracking.

enum **gnss_system**

Systems contained in gnss_systems_t.

Values:

enumerator **GNSS_SYSTEM_GPS** = *BIT*(0)

Global Positioning System (GPS)

enumerator **GNSS_SYSTEM_GLONASS** = *BIT*(1)

GLObal NAvigation Satellite System (GLONASS)

enumerator **GNSS_SYSTEM_GALILEO** = *BIT*(2)

Galileo.

enumerator **GNSS_SYSTEM_IMES** = *BIT*(7)

Indoor Messaging System (IMES)

enum **gnss_fix_status**

GNSS fix status.

Values:

enumerator **GNSS_FIX_STATUS_NO_FIX** = 0

No GNSS fix acquired.

enumerator **GNSS_FIX_STATUS_GNSS_FIX** = 1

GNSS fix acquired.

enumerator **GNSS_FIX_STATUS_DGNSS_FIX** = 2

Differential GNSS fix acquired.

enumerator **GNSS_FIX_STATUS_ESTIMATED_FIX** = 3

Estimated fix acquired.

enum **gnss_fix_quality**

GNSS fix quality.

Values:

enumerator GNSS_FIX_QUALITY_INVALID = 0
Invalid fix.

enumerator GNSS_FIX_QUALITY_GNSS_SPS = 1
Standard positioning service.

enumerator GNSS_FIX_QUALITY_DGNSS = 2
Differential GNSS.

enumerator GNSS_FIX_QUALITY_GNSS_PPS = 3
Precise positioning service.

enumerator GNSS_FIX_QUALITY_RTK = 4
Real-time kinematic.

enumerator GNSS_FIX_QUALITY_FLOAT_RTK = 5
Floating real-time kinematic.

enumerator GNSS_FIX_QUALITY_ESTIMATED = 6
Estimated fix.

Functions

int gnss_set_fix_rate(const struct *device* *dev, uint32_t fix_interval_ms)
Set the GNSS fix rate.

Parameters

- dev – Device instance
- fix_interval_ms – Fix interval to set in milliseconds

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_get_fix_rate(const struct *device* *dev, uint32_t *fix_interval_ms)
Get the GNSS fix rate.

Parameters

- dev – Device instance
- fix_interval_ms – Destination for fix interval in milliseconds

Returns
0 if successful

Returns
-errno negative errno code on failure

int gnss_set_periodic_config(const struct *device* *dev, const struct *gnss_periodic_config* *config)
Set the GNSS periodic tracking configuration.

Parameters

- **dev** – Device instance
- **config** – Periodic tracking configuration to set

Returns
0 if successful

Returns
-errno negative errno code on failure

int **gnss_get_periodic_config**(const struct *device* *dev, struct *gnss_periodic_config* *config)

Get the GNSS periodic tracking configuration.

Parameters

- **dev** – Device instance
- **config** – Destination for periodic tracking configuration

Returns
0 if successful

Returns
-errno negative errno code on failure

int **gnss_set_navigation_mode**(const struct *device* *dev, enum *gnss_navigation_mode* mode)

Set the GNSS navigation mode.

Parameters

- **dev** – Device instance
- **mode** – Navigation mode to set

Returns
0 if successful

Returns
-errno negative errno code on failure

int **gnss_get_navigation_mode**(const struct *device* *dev, enum *gnss_navigation_mode* *mode)

Get the GNSS navigation mode.

Parameters

- **dev** – Device instance
- **mode** – Destination for navigation mode

Returns
0 if successful

Returns
-errno negative errno code on failure

int **gnss_set_enabled_systems**(const struct *device* *dev, *gnss_systems_t* systems)

Set enabled GNSS systems.

Parameters

- **dev** – Device instance
- **systems** – Systems to enable

Returns
0 if successful

Returns
-errno negative errno code on failure

int **gnss_get_enabled_systems**(const struct *device* *dev, *gnss_systems_t* *systems)

Get enabled GNSS systems.

Parameters

- **dev** – Device instance
- **systems** – Destination for enabled systems

Returns
0 if successful

Returns
-errno negative errno code on failure

int **gnss_get_supported_systems**(const struct *device* *dev, *gnss_systems_t* *systems)

Get supported GNSS systems.

Parameters

- **dev** – Device instance
- **systems** – Destination for supported systems

Returns
0 if successful

Returns
-errno negative errno code on failure

struct **gnss_periodic_config**

#include <*gnss.h*> GNSS periodic tracking configuration.

> **Note**
>
> Setting either active_time or inactive_time to 0 will disable periodic function.

Public Members

uint32_t **active_time_ms**

The time the GNSS will spend in the active state in ms.

uint32_t **inactive_time_ms**

The time the GNSS will spend in the inactive state in ms.

struct **gnss_info**

#include <*gnss.h*> GNSS info data structure.

Public Members

uint16_t **satellites_cnt**

Number of satellites being tracked.

uint32_t **hdop**
Horizontal dilution of precision in 1/1000.

enum *gnss_fix_status* **fix_status**
The fix status.

enum *gnss_fix_quality* **fix_quality**
The fix quality.

struct **gnss_time**
#include <*gnss.h*> GNSS time data structure.

Public Members

uint8_t **hour**
Hour [0, 23].

uint8_t **minute**
Minute [0, 59].

uint16_t **millisecond**
Millisecond [0, 60999].

uint8_t **month_day**
Day of month [1, 31].

uint8_t **month**
Month [1, 12].

uint8_t **century_year**
Year [0, 99].

struct **gnss_driver_api**
#include <*gnss.h*> GNSS API structure.

struct **gnss_data**
#include <*gnss.h*> GNSS data structure.

Public Members

struct *navigation_data* **nav_data**
Navigation data acquired.

struct *gnss_info* **info**
GNSS info when navigation data was acquired.

struct *gnss_time* **utc**
UTC time when data was acquired.

struct **gnss_data_callback**
#include <*gnss.h*> GNSS callback structure.

Public Members

const struct *device* ***dev**
Filter callback to GNSS data from this device if not NULL.

gnss_data_callback_t **callback**
Callback called when GNSS data is published.

struct **gnss_satellite**
#include <*gnss.h*> GNSS satellite structure.

Public Members

uint8_t **prn**
Pseudo-random noise sequence.

uint8_t **snr**
Signal-to-noise ratio in dB.

uint8_t **elevation**
Elevation in degrees [0, 90].

uint16_t **azimuth**
Azimuth relative to True North in degrees [0, 359].

enum *gnss_system* **system**
System of satellite.

uint8_t **is_tracked**
True if satellite is being tracked.

struct **gnss_satellites_callback**
#include <*gnss.h*> GNSS callback structure.

Public Members

const struct *device* ***dev**
Filter callback to GNSS data from this device if not NULL.

gnss_satellites_callback_t `callback`
Callback called when GNSS satellites is published.

Since
1.0

Version
1.0.0

GPIO input/output configuration flags

`GPIO_INPUT`
Enables pin as input.

`GPIO_OUTPUT`
Enables pin as output, no change to the output state.

GPIO_DISCONNECTED
: Disables pin for both input and output.

GPIO_OUTPUT_LOW
: Configures GPIO pin as output and initializes it to a low state.

GPIO_OUTPUT_HIGH
: Configures GPIO pin as output and initializes it to a high state.

GPIO_OUTPUT_INACTIVE
: Configures GPIO pin as output and initializes it to a logic 0.

GPIO_OUTPUT_ACTIVE
: Configures GPIO pin as output and initializes it to a logic 1.

GPIO interrupt configuration flags

The GPIO_INT_* flags are used to specify how input GPIO pins will trigger interrupts.

The interrupts can be sensitive to pin physical or logical level. Interrupts sensitive to pin logical level take into account GPIO_ACTIVE_LOW flag. If a pin was configured as Active Low, physical level low will be considered as logical level 1 (an active state), physical level high will be considered as logical level 0 (an inactive state). The GPIO controller should reset the interrupt status, such as clearing the pending bit, etc, when configuring the interrupt triggering properties. Applications should use the GPIO_INT_MODE_ENABLE_ONLY and GPIO_INT_MODE_DISABLE_ONLY flags to enable and disable interrupts on the pin without changing any GPIO settings.

GPIO_INT_DISABLE
: Disables GPIO pin interrupt.

GPIO_INT_EDGE_RISING
: Configures GPIO interrupt to be triggered on pin rising edge and enables it.

GPIO_INT_EDGE_FALLING
: Configures GPIO interrupt to be triggered on pin falling edge and enables it.

GPIO_INT_EDGE_BOTH
: Configures GPIO interrupt to be triggered on pin rising or falling edge and enables it.

GPIO_INT_LEVEL_LOW
: Configures GPIO interrupt to be triggered on pin physical level low and enables it.

GPIO_INT_LEVEL_HIGH
: Configures GPIO interrupt to be triggered on pin physical level high and enables it.

GPIO_INT_EDGE_TO_INACTIVE
: Configures GPIO interrupt to be triggered on pin state change to logical level 0 and enables it.

`GPIO_INT_EDGE_TO_ACTIVE`
: Configures GPIO interrupt to be triggered on pin state change to logical level 1 and enables it.

`GPIO_INT_LEVEL_INACTIVE`
: Configures GPIO interrupt to be triggered on pin logical level 0 and enables it.

`GPIO_INT_LEVEL_ACTIVE`
: Configures GPIO interrupt to be triggered on pin logical level 1 and enables it.

GPIO pin active level flags

`GPIO_ACTIVE_LOW`
: GPIO pin is active (has logical value '1') in low state.

`GPIO_ACTIVE_HIGH`
: GPIO pin is active (has logical value '1') in high state.

GPIO pin drive flags

`GPIO_OPEN_DRAIN`
: Configures GPIO output in open drain mode (wired AND).

> **Note**
>
> 'Open Drain' mode also known as 'Open Collector' is an output configuration which behaves like a switch that is either connected to ground or disconnected.

`GPIO_OPEN_SOURCE`
: Configures GPIO output in open source mode (wired OR).

> **Note**
>
> 'Open Source' is a term used by software engineers to describe output mode opposite to 'Open Drain'. It behaves like a switch that is either connected to power supply or disconnected. There exist no corresponding hardware schematic and the term is generally unknown to hardware engineers.

GPIO pin bias flags

`GPIO_PULL_UP`
: Enables GPIO pin pull-up.

`GPIO_PULL_DOWN`
: Enable GPIO pin pull-down.

Unnamed Group

`STM32_GPIO_WKUP`

STM32 GPIO specific flags.

The driver flags are encoded in the 8 upper bits of *gpio_dt_flags_t* as follows:

- Bit 8: Configure a GPIO pin to power on the system after Poweroff. Configures a GPIO pin to power on the system after Poweroff. This flag is reserved to GPIO pins that are associated with wake-up pins in STM32 PWR devicetree node, through the property “wkup-gpios”.

Defines

`GPIO_DT_SPEC_GET_BY_IDX`(node_id, prop, idx)

Static initializer for a *gpio_dt_spec*.

This returns a static initializer for a *gpio_dt_spec* structure given a devicetree node identifier, a property specifying a GPIO and an index.

Example devicetree fragment:

```
n: node {
   foo-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>,
               <&gpio1 2 GPIO_ACTIVE_LOW>;
}
```

Example usage:

```
const struct gpio_dt_spec spec = GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n),
                                                         foo_gpios, 1);
// Initializes 'spec' to:
// {
//         .port = DEVICE_DT_GET(DT_NODELABEL(gpio1)),
//         .pin = 2,
//         .dt_flags = GPIO_ACTIVE_LOW
// }
```

The ‘gpio’ field must still be checked for readiness, e.g. using *device_is_ready()*. It is an error to use this macro unless the node exists, has the given property, and that property specifies a GPIO controller, pin number, and flags as shown above.

Parameters

- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”

Returns

static initializer for a struct *gpio_dt_spec* for the property

`GPIO_DT_SPEC_GET_BY_IDX_OR`(node_id, prop, idx, default_value)

Like *GPIO_DT_SPEC_GET_BY_IDX()*, with a fallback to a default value.

If the devicetree node identifier ‘node_id’ refers to a node with a property ‘prop’, this expands to *GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, idx)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”
- `default_value` – fallback value to expand to

Returns
static initializer for a struct *gpio_dt_spec* for the property, or default_value if the node or property do not exist

`GPIO_DT_SPEC_GET`(node_id, prop)

Equivalent to *GPIO_DT_SPEC_GET_BY_IDX(node_id, prop, 0)*.

See also

GPIO_DT_SPEC_GET_BY_IDX()

Parameters

- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name

Returns
static initializer for a struct *gpio_dt_spec* for the property

`GPIO_DT_SPEC_GET_OR`(node_id, prop, default_value)

Equivalent to *GPIO_DT_SPEC_GET_BY_IDX_OR(node_id, prop, 0, default_value)*.

See also

GPIO_DT_SPEC_GET_BY_IDX_OR()

Parameters

- `node_id` – devicetree node identifier
- `prop` – lowercase-and-underscores property name
- `default_value` – fallback value to expand to

Returns
static initializer for a struct *gpio_dt_spec* for the property

`GPIO_DT_SPEC_INST_GET_BY_IDX`(inst, prop, idx)

Static initializer for a *gpio_dt_spec* from a DT_DRV_COMPAT instance’s GPIO property at an index.

See also

GPIO_DT_SPEC_GET_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”

Returns
static initializer for a struct *gpio_dt_spec* for the property

`GPIO_DT_SPEC_INST_GET_BY_IDX_OR`(inst, prop, idx, default_value)

Static initializer for a *gpio_dt_spec* from a DT_DRV_COMPAT instance’s GPIO property at an index, with fallback.

See also

GPIO_DT_SPEC_GET_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `prop` – lowercase-and-underscores property name
- `idx` – logical index into “prop”
- `default_value` – fallback value to expand to

Returns
static initializer for a struct *gpio_dt_spec* for the property

`GPIO_DT_SPEC_INST_GET`(inst, prop)

Equivalent to *GPIO_DT_SPEC_INST_GET_BY_IDX(inst, prop, 0)*.

See also

GPIO_DT_SPEC_INST_GET_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `prop` – lowercase-and-underscores property name

Returns
static initializer for a struct *gpio_dt_spec* for the property

`GPIO_DT_SPEC_INST_GET_OR`(inst, prop, default_value)

Equivalent to *GPIO_DT_SPEC_INST_GET_BY_IDX_OR(inst, prop, 0, default_value)*.

See also

GPIO_DT_SPEC_INST_GET_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **prop** – lowercase-and-underscores property name
- **default_value** – fallback value to expand to

Returns
static initializer for a struct *gpio_dt_spec* for the property

GPIO_DT_RESERVED_RANGES_NGPIOS(node_id, ngpios)

Makes a bitmask of reserved GPIOs from DT "gpio-reserved-ranges" property and "ngpios" argument.

This macro returns the value as a bitmask of the "gpio-reserved-ranges" property. This property defines the disabled (or 'reserved') GPIOs in the range 0...ngpios-1 and is specified as an array of value's pairs that define the start offset and size of the reserved ranges.

For example, setting "gpio-reserved-ranges = <3 2>, <10 1>;" means that GPIO offsets 3, 4 and 10 cannot be used even if ngpios = <18>.

The implementation constraint is inherited from common DT limitations: a maximum of 64 pairs can be used (with result limited to bitsize of gpio_port_pins_t type).

NB: Due to the nature of C macros, some incorrect tuple definitions (for example, overlapping or out of range) will produce undefined results.

Also be aware that if ngpios is less than 32 (bit size of DT int type), then all unused MSBs outside the range defined by ngpios will be marked as reserved too.

Example devicetree fragment:

```
a {
        compatible = "some,gpio-controller";
        ngpios = <32>;
        gpio-reserved-ranges = <0  4>, <5  3>, <9  5>, <11 2>, <15 2>,
                               <18 2>, <21 1>, <23 1>, <25 4>, <30 2>;
};

b {
        compatible = "some,gpio-controller";
        ngpios = <18>;
        gpio-reserved-ranges = <3 2>, <10 1>;
};
```

Example usage:

```
struct some_config {
        uint32_t ngpios;
        uint32_t gpios_reserved;
};

static const struct some_config dev_cfg_a = {
        .ngpios = DT_PROP_OR(DT_LABEL(a), ngpios, 0),
        .gpios_reserved = GPIO_DT_RESERVED_RANGES_NGPIOS(DT_LABEL(a),
                                DT_PROP(DT_LABEL(a), ngpios)),
};

static const struct some_config dev_cfg_b = {
        .ngpios = DT_PROP_OR(DT_LABEL(b), ngpios, 0),
        .gpios_reserved = GPIO_DT_RESERVED_RANGES_NGPIOS(DT_LABEL(b),
                                DT_PROP(DT_LABEL(b), ngpios)),
};
```

This expands to:

```
struct some_config {
        uint32_t ngpios;
        uint32_t gpios_reserved;
};

static const struct some_config dev_cfg_a = {
        .ngpios = 32,
        .gpios_reserved = 0xdeadbeef,
                        // 0b1101 1110 1010 1101 1011 1110 1110 1111

static const struct some_config dev_cfg_b = {
        .ngpios = 18,
        .gpios_reserved = 0xfffc0418,
                        // 0b1111 1111 1111 1100 0000 0100 0001 1000
                        // unused MSBs were marked as reserved too
};
```

Parameters

- **node_id** – GPIO controller node identifier.
- **ngpios** – number of GPIOs.

Returns
the bitmask of reserved gpios

GPIO_DT_RESERVED_RANGES(node_id)

Makes a bitmask of reserved GPIOs from the "gpio-reserved-ranges" and "ngpios" DT properties values.

Parameters

- **node_id** – GPIO controller node identifier.

Returns
the bitmask of reserved gpios

GPIO_DT_INST_RESERVED_RANGES_NGPIOS(inst, ngpios)

Makes a bitmask of reserved GPIOs from a DT_DRV_COMPAT instance's "gpio-reserved-ranges" property and "ngpios" argument.

See also

GPIO_DT_RESERVED_RANGES()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **ngpios** – number of GPIOs

Returns
the bitmask of reserved gpios

GPIO_DT_INST_RESERVED_RANGES(inst)

Make a bitmask of reserved GPIOs from a DT_DRV_COMPAT instance's GPIO "gpio-reserved-ranges" and "ngpios" properties.

See also

GPIO_DT_RESERVED_RANGES()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns
the bitmask of reserved gpios

GPIO_DT_PORT_PIN_MASK_NGPIOS_EXC(node_id, ngpios)

Makes a bitmask of allowed GPIOs from DT "gpio-reserved-ranges" property and "ngpios" argument.

This macro is paired with *GPIO_DT_RESERVED_RANGES_NGPIOS()*, however unlike the latter, it returns a bitmask of ALLOWED gpios.

Example devicetree fragment:

```
a {
   compatible = "some,gpio-controller";
   ngpios = <32>;
   gpio-reserved-ranges = <0 8>, <9 5>, <15 16>;
};
```

Example usage:

```
struct some_config {
   uint32_t port_pin_mask;
};

static const struct some_config dev_cfg = {
   .port_pin_mask = GPIO_DT_PORT_PIN_MASK_NGPIOS_EXC(
                           DT_LABEL(a), 32),
};
```

This expands to:

```
struct some_config {
   uint32_t port_pin_mask;
};

static const struct some_config dev_cfg = {
   .port_pin_mask = 0x80004100,
                   // 0b1000 0000 0000 0000 0100 0001 00000 000
};
```

Parameters

- **node_id** – GPIO controller node identifier.
- **ngpios** – number of GPIOs

Returns
the bitmask of allowed gpios

GPIO_DT_INST_PORT_PIN_MASK_NGPIOS_EXC(inst, ngpios)

Makes a bitmask of allowed GPIOs from a DT_DRV_COMPAT instance's "gpio-reserved-ranges" property and "ngpios" argument.

See also

GPIO_DT_NGPIOS_PORT_PIN_MASK_EXC()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `ngpios` – number of GPIOs

Returns
the bitmask of allowed gpios

`GPIO_MAX_PINS_PER_PORT`

Maximum number of pins that are supported by `gpio_port_pins_t`.

`GPIO_DT_FLAGS_MASK`

Mask for DT GPIO flags.

`GPIO_INT_WAKEUP`

Configures GPIO interrupt to wakeup the system from low power mode.

Typedefs

typedef uint32_t **gpio_port_pins_t**

Identifies a set of pins associated with a port.

The pin with index n is present in the set if and only if the bit identified by (1U « n) is set.

typedef uint32_t **gpio_port_value_t**

Provides values for a set of pins associated with a port.

The value for a pin with index n is high (physical mode) or active (logical mode) if and only if the bit identified by (1U « n) is set. Otherwise the value for the pin is low (physical mode) or inactive (logical mode).

Values of this type are often paired with a `gpio_port_pins_t` value that specifies which encoded pin values are valid for the operation.

typedef uint8_t **gpio_pin_t**

Provides a type to hold a GPIO pin index.

This reduced-size type is sufficient to record a pin number, e.g. from a devicetree GPIOS property.

typedef uint16_t **gpio_dt_flags_t**

Provides a type to hold GPIO devicetree flags.

All GPIO flags that can be expressed in devicetree fit in the low 16 bits of the full flags field, so use a reduced-size type to record that part of a GPIOS property.

The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

typedef uint32_t **gpio_flags_t**

Provides a type to hold GPIO configuration flags.

This type is sufficient to hold all flags used to control GPIO configuration, whether pin or interrupt.

typedef void (***gpio_callback_handler_t**)(const struct *device* *port, struct *gpio_callback* *cb, *gpio_port_pins_t* pins)

Define the application callback handler function signature.

Note: cb pointer can be used to retrieve private data through *CONTAINER_OF()* if original struct *gpio_callback* is stored in another private structure.

Param port
Device struct for the GPIO device.

Param cb
Original struct *gpio_callback* owning this handler

Param pins
Mask of pins that triggers the callback handler

Functions

static inline bool **gpio_is_ready_dt**(const struct *gpio_dt_spec* *spec)

Validate that GPIO port is ready.

Parameters

- **spec** – GPIO specification from devicetree

Return values

- **true** – if the GPIO spec is ready for use.
- **false** – if the GPIO spec is not ready for use.

int **gpio_pin_interrupt_configure**(const struct *device* *port, *gpio_pin_t* pin, *gpio_flags_t* flags)

Configure pin interrupt.

> **Note**
>
> This function can also be used to configure interrupts on pins not controlled directly by the GPIO module. That is, pins which are routed to other modules such as I2C, SPI, UART.

Parameters

- **port** – Pointer to device structure for the driver instance.
- **pin** – Pin number.
- **flags** – Interrupt configuration flags as defined by GPIO_INT_*.

Return values

- **0** – If successful.
- **-ENOSYS** – If the operation is not implemented by the driver.

- **-ENOTSUP** – If any of the configuration options is not supported (unless otherwise directed by flag documentation).
- **-EINVAL** – Invalid argument.
- **-EBUSY** – Interrupt line required to configure pin interrupt is already in use.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_interrupt_configure_dt**(const struct *gpio_dt_spec* *spec, *gpio_flags_t* flags)

Configure pin interrupts from a *gpio_dt_spec*.

This is equivalent to:

```
gpio_pin_interrupt_configure(spec->port, spec->pin, flags);
```

The spec->dt_flags value is not used.

Parameters

- **spec** – GPIO specification from devicetree
- **flags** – interrupt configuration flags

Returns

a value from *gpio_pin_interrupt_configure()*

int **gpio_pin_configure**(const struct *device* *port, *gpio_pin_t* pin, *gpio_flags_t* flags)

Configure a single pin.

Parameters

- **port** – Pointer to device structure for the driver instance.
- **pin** – Pin number to configure.
- **flags** – Flags for pin configuration: 'GPIO input/output configuration flags', 'GPIO pin drive flags', 'GPIO pin bias flags'.

Return values

- **0** – If successful.
- **-ENOTSUP** – if any of the configuration options is not supported (unless otherwise directed by flag documentation).
- **-EINVAL** – Invalid argument.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_configure_dt**(const struct *gpio_dt_spec* *spec, *gpio_flags_t* extra_flags)

Configure a single pin from a *gpio_dt_spec* and some extra flags.

This is equivalent to:

```
gpio_pin_configure(spec->port, spec->pin, spec->dt_flags | extra_flags);
```

Parameters

- **spec** – GPIO specification from devicetree
- **extra_flags** – additional flags

Returns
a value from *gpio_pin_configure()*

int **gpio_port_get_direction**(const struct *device* *port, *gpio_port_pins_t* map, *gpio_port_pins_t* *inputs, *gpio_port_pins_t* *outputs)

Get direction of select pins in a port.

Retrieve direction of each pin specified in `map`.

If `inputs` or `outputs` is NULL, then this function does not get the respective input or output direction information.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **map** – Bitmap of pin directions to query.
- **inputs** – Pointer to a variable where input directions will be stored.
- **outputs** – Pointer to a variable where output directions will be stored.

Return values

- **0** – If successful.
- **-ENOSYS** – if the underlying driver does not support this call.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_is_input**(const struct *device* *port, *gpio_pin_t* pin)

Check if `pin` is configured for input.

Parameters

- **port** – Pointer to device structure for the driver instance.
- **pin** – Pin number to query the direction of

Return values

- **1** – if `pin` is configured as *GPIO_INPUT*.
- **0** – if `pin` is not configured as *GPIO_INPUT*.
- **-ENOSYS** – if the underlying driver does not support this call.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_is_input_dt**(const struct *gpio_dt_spec* *spec)

Check if a single pin from *gpio_dt_spec* is configured for input.

This is equivalent to:

```
gpio_pin_is_input(spec->port, spec->pin);
```

Parameters

- **spec** – GPIO specification from devicetree.

Returns
A value from *gpio_pin_is_input()*.

static inline int **gpio_pin_is_output**(const struct *device* *port, *gpio_pin_t* pin)

Check if `pin` is configured for output.

Parameters

- **port** – Pointer to device structure for the driver instance.
- **pin** – Pin number to query the direction of

Return values

- **1** – if `pin` is configured as *GPIO_OUTPUT*.
- **0** – if `pin` is not configured as *GPIO_OUTPUT*.
- **-ENOSYS** – if the underlying driver does not support this call.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_is_output_dt**(const struct *gpio_dt_spec* *spec)

Check if a single pin from *gpio_dt_spec* is configured for output.

This is equivalent to:

```
gpio_pin_is_output(spec->port, spec->pin);
```

Parameters

- **spec** – GPIO specification from devicetree.

Returns

A value from *gpio_pin_is_output()*.

int **gpio_pin_get_config**(const struct *device* *port, *gpio_pin_t* pin, *gpio_flags_t* *flags)

Get a configuration of a single pin.

Parameters

- **port** – Pointer to device structure for the driver instance.
- **pin** – Pin number which configuration is get.
- **flags** – Pointer to variable in which the current configuration will be stored if function is successful.

Return values

- **0** – If successful.
- **-ENOSYS** – if getting current pin configuration is not implemented by the driver.
- **-EINVAL** – Invalid argument.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_get_config_dt**(const struct *gpio_dt_spec* *spec, *gpio_flags_t* *flags)

Get a configuration of a single pin from a *gpio_dt_spec*.

This is equivalent to:

```
gpio_pin_get_config(spec->port, spec->pin, flags);
```

Parameters

- **spec** – GPIO specification from devicetree
- **flags** – Pointer to variable in which the current configuration will be stored if function is successful.

Returns
a value from *gpio_pin_configure()*

int **gpio_port_get_raw**(const struct *device* *port, *gpio_port_value_t* *value)

Get physical level of all input pins in a port.

A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

Value of a pin with index n will be represented by bit n in the returned port value.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **value** – Pointer to a variable where pin values will be stored.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_port_get**(const struct *device* *port, *gpio_port_value_t* *value)

Get logical level of all input pins in a port.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Value of a pin with index n will be represented by bit n in the returned port value.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **value** – Pointer to a variable where pin values will be stored.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

int **gpio_port_set_masked_raw**(const struct *device* *port, *gpio_port_pins_t* mask, *gpio_port_value_t* value)

Set physical level of output pins in a port.

Writing value 0 to the pin will set it to a low physical level. Writing value 1 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Pin with index n is represented by bit n in mask and value parameter.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **mask** – Mask indicating which pins will be modified.
- **value** – Value assigned to the output pins.

Return values

- `0` – If successful.
- `-EIO` – I/O error when accessing an external GPIO chip.
- `-EWOULDBLOCK` – if operation would block.

static inline int **gpio_port_set_masked**(const struct *device* *port, *gpio_port_pins_t* mask, *gpio_port_value_t* value)

Set logical level of output pins in a port.

Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Value 1 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Pin with index n is represented by bit n in mask and value parameter.

Parameters

- `port` – Pointer to the device structure for the driver instance.
- `mask` – Mask indicating which pins will be modified.
- `value` – Value assigned to the output pins.

Return values

- `0` – If successful.
- `-EIO` – I/O error when accessing an external GPIO chip.
- `-EWOULDBLOCK` – if operation would block.

int **gpio_port_set_bits_raw**(const struct *device* *port, *gpio_port_pins_t* pins)

Set physical level of selected output pins to high.

Parameters

- `port` – Pointer to the device structure for the driver instance.
- `pins` – Value indicating which pins will be modified.

Return values

- `0` – If successful.
- `-EIO` – I/O error when accessing an external GPIO chip.
- `-EWOULDBLOCK` – if operation would block.

static inline int **gpio_port_set_bits**(const struct *device* *port, *gpio_port_pins_t* pins)

Set logical level of selected output pins to active.

Parameters

- `port` – Pointer to the device structure for the driver instance.
- `pins` – Value indicating which pins will be modified.

Return values

- `0` – If successful.
- `-EIO` – I/O error when accessing an external GPIO chip.
- `-EWOULDBLOCK` – if operation would block.

int **gpio_port_clear_bits_raw**(const struct *device* *port, *gpio_port_pins_t* pins)

Set physical level of selected output pins to low.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_port_clear_bits**(const struct *device* *port, *gpio_port_pins_t* pins)

Set logical level of selected output pins to inactive.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

int **gpio_port_toggle_bits**(const struct *device* *port, *gpio_port_pins_t* pins)

Toggle level of selected output pins.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pins** – Value indicating which pins will be modified.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_port_set_clr_bits_raw**(const struct *device* *port, *gpio_port_pins_t* set_pins, *gpio_port_pins_t* clear_pins)

Set physical level of selected output pins.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **set_pins** – Value indicating which pins will be set to high.
- **clear_pins** – Value indicating which pins will be set to low.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_port_set_clr_bits**(const struct *device* *port, *gpio_port_pins_t* set_pins, *gpio_port_pins_t* clear_pins)

Set logical level of selected output pins.

Parameters

- **port** – Pointer to the device structure for the driver instance.

- **set_pins** – Value indicating which pins will be set to active.
- **clear_pins** – Value indicating which pins will be set to inactive.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_get_raw**(const struct *device* *port, *gpio_pin_t* pin)

Get physical level of an input pin.

A low physical level on the pin will be interpreted as value 0. A high physical level will be interpreted as value 1. This function ignores GPIO_ACTIVE_LOW flag.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.

Return values

- **1** – If pin physical level is high.
- **0** – If pin physical level is low.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_get**(const struct *device* *port, *gpio_pin_t* pin)

Get logical level of an input pin.

Get logical level of an input pin taking into account GPIO_ACTIVE_LOW flag. If pin is configured as Active High, a low physical level will be interpreted as logical value 0. If pin is configured as Active Low, a low physical level will be interpreted as logical value 1.

Note: If pin is configured as Active High, the default, *gpio_pin_get()* function is equivalent to *gpio_pin_get_raw()*.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.

Return values

- **1** – If pin logical value is 1 / active.
- **0** – If pin logical value is 0 / inactive.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_get_dt**(const struct *gpio_dt_spec* *spec)

Get logical level of an input pin from a *gpio_dt_spec*.

This is equivalent to:

```
gpio_pin_get(spec->port, spec->pin);
```

Parameters

- **spec** – GPIO specification from devicetree

Returns
a value from *gpio_pin_get()*

static inline int **gpio_pin_set_raw**(const struct *device* *port, *gpio_pin_t* pin, int value)

Set physical level of an output pin.

Writing value 0 to the pin will set it to a low physical level. Writing any value other than 0 will set it to a high physical level. This function ignores GPIO_ACTIVE_LOW flag.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.
- **value** – Value assigned to the pin.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_set**(const struct *device* *port, *gpio_pin_t* pin, int value)

Set logical level of an output pin.

Set logical level of an output pin taking into account GPIO_ACTIVE_LOW flag. Value 0 sets the pin in logical 0 / inactive state. Any value other than 0 sets the pin in logical 1 / active state. If pin is configured as Active High, the default, setting it in inactive state will force the pin to a low physical level. If pin is configured as Active Low, setting it in inactive state will force the pin to a high physical level.

Note: If pin is configured as Active High, *gpio_pin_set()* function is equivalent to *gpio_pin_set_raw()*.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.
- **value** – Value assigned to the pin.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_set_dt**(const struct *gpio_dt_spec* *spec, int value)

Set logical level of a output pin from a *gpio_dt_spec*.

This is equivalent to:

```
gpio_pin_set(spec->port, spec->pin, value);
```

Parameters

- **spec** – GPIO specification from devicetree
- **value** – Value assigned to the pin.

Returns
a value from *gpio_pin_set()*

static inline int **gpio_pin_toggle**(const struct *device* *port, *gpio_pin_t* pin)

Toggle pin level.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **pin** – Pin number.

Return values

- **0** – If successful.
- **-EIO** – I/O error when accessing an external GPIO chip.
- **-EWOULDBLOCK** – if operation would block.

static inline int **gpio_pin_toggle_dt**(const struct *gpio_dt_spec* *spec)

Toggle pin level from a *gpio_dt_spec*.

This is equivalent to:

```
gpio_pin_toggle(spec->port, spec->pin);
```

Parameters

- **spec** – GPIO specification from devicetree

Returns

a value from *gpio_pin_toggle()*

static inline void **gpio_init_callback**(struct *gpio_callback* *callback, *gpio_callback_handler_t* handler, *gpio_port_pins_t* pin_mask)

Helper to initialize a struct *gpio_callback* properly.

Parameters

- **callback** – A valid Application's callback structure pointer.
- **handler** – A valid handler function pointer.
- **pin_mask** – A bit mask of relevant pins for the handler

static inline int **gpio_add_callback**(const struct *device* *port, struct *gpio_callback* *callback)

Add an application callback.

Note: enables to add as many callback as needed on the same port.

Note

Callbacks may be added to the device from within a callback handler invocation, but whether they are invoked for the current GPIO event is not specified.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **callback** – A valid Application's callback structure pointer.

Return values

- **0** – If successful

- **-ENOSYS** – If driver does not implement the operation
- **-errno** – Other negative errno code on failure.

static inline int **gpio_add_callback_dt**(const struct *gpio_dt_spec* *spec, struct *gpio_callback* *callback)

Add an application callback.

This is equivalent to:

```
gpio_add_callback(spec->port, callback);
```

Parameters

- **spec** – GPIO specification from devicetree.
- **callback** – A valid application's callback structure pointer.

Returns
a value from *gpio_add_callback()*.

static inline int **gpio_remove_callback**(const struct *device* *port, struct *gpio_callback* *callback)

Remove an application callback.

Note: enables to remove as many callbacks as added through *gpio_add_callback()*.

Warning

It is explicitly permitted, within a callback handler, to remove the registration for the callback that is running, i.e. `callback`. Attempts to remove other registrations on the same device may result in undefined behavior, including failure to invoke callbacks that remain registered and unintended invocation of removed callbacks.

Parameters

- **port** – Pointer to the device structure for the driver instance.
- **callback** – A valid application's callback structure pointer.

Return values

- **0** – If successful
- **-ENOSYS** – If driver does not implement the operation
- **-errno** – Other negative errno code on failure.

static inline int **gpio_remove_callback_dt**(const struct *gpio_dt_spec* *spec, struct *gpio_callback* *callback)

Remove an application callback.

This is equivalent to:

```
gpio_remove_callback(spec->port, callback);
```

Parameters

- **spec** – GPIO specification from devicetree.
- **callback** – A valid application's callback structure pointer.

Returns
a value from *gpio_remove_callback()*.

int **gpio_get_pending_int**(const struct *device* *dev)

Function to get pending interrupts.

The purpose of this function is to return the interrupt status register for the device. This is especially useful when waking up from low power states to check the wake up source.

Parameters

- **dev** – Pointer to the device structure for the driver instance.

Return values

- **status** – != 0 if at least one gpio interrupt is pending.
- **0** – if no gpio interrupt is pending.
- **-ENOSYS** – If driver does not implement the operation

struct **gpio_dt_spec**

#include <*gpio.h*> Container for GPIO pin information specified in devicetree.

This type contains a pointer to a GPIO device, pin number for a pin controlled by that device, and the subset of pin configuration flags which may be given in devicetree.

GPIO_DT_SPEC_GET_OR

Public Members

const struct *device* ***port**

GPIO device controlling the pin.

gpio_pin_t **pin**

The pin's number on the device.

gpio_dt_flags_t **dt_flags**

The pin's configuration flags as specified in devicetree.

struct **gpio_driver_config**

#include <*gpio.h*> This structure is common to all GPIO drivers and is expected to be the first element in the object pointed to by the config field in the device structure.

Public Members

gpio_port_pins_t **port_pin_mask**

Mask identifying pins supported by the controller.

Initialization of this mask is the responsibility of device instance generation in the driver.

struct **gpio_driver_data**

#include <*gpio.h*> This structure is common to all GPIO drivers and is expected to be the first element in the driver's struct driver_data declaration.

Public Members

gpio_port_pins_t **invert**

Mask identifying pins that are configured as active low.

Management of this mask is the responsibility of the wrapper functions in this header.

struct **gpio_callback**

#include <*gpio.h*> GPIO callback structure.

Used to register a callback in the driver instance callback list. As many callbacks as needed can be added as long as each of them are unique pointers of struct *gpio_callback*. Beware such structure should not be allocated on stack.

Note: To help setting it, see *gpio_init_callback()* below

Public Members

sys_snode_t **node**

This is meant to be used in the driver and the user should not mess with it (see drivers/gpio/gpio_utils.h)

gpio_callback_handler_t **handler**

Actual callback function being called when relevant.

gpio_port_pins_t **pin_mask**

A mask of pins the callback is interested in, if 0 the callback will never be called.

Such pin_mask can be modified whenever necessary by the owner, and thus will affect the handler being called or not. The selected pins must be configured to trigger an interrupt.

7.6.23 Hardware Information

Overview

The HW Info API provides access to hardware information such as device identifiers and reset cause flags.

Reset cause flags can be used to determine why the device was reset; for example due to a watchdog timeout or due to power cycling. Different devices support different subset of flags. Use *hwinfo_get_supported_reset_cause()* to retrieve the flags that are supported by that device.

Configuration Options

Related configuration options:

- CONFIG_HWINFO

API Reference

group hwinfo_interface

Hardware Information Interface.

Since
1.14

Version
1.0.0

Reset cause flags

RESET_PIN
External pin.

RESET_SOFTWARE
Software reset.

RESET_BROWNOUT
Brownout (drop in voltage)

RESET_POR
Power-on reset (POR)

RESET_WATCHDOG
Watchdog timer expiration.

RESET_DEBUG
Debug event.

`RESET_SECURITY`
: Security violation.

`RESET_LOW_POWER_WAKE`
: Waking up from low power mode.

`RESET_CPU_LOCKUP`
: CPU lock-up detected.

`RESET_PARITY`
: Parity error.

`RESET_PLL`
: PLL error.

`RESET_CLOCK`
: Clock error.

`RESET_HARDWARE`
: Hardware reset.

`RESET_USER`
: User reset.

`RESET_TEMPERATURE`
: Temperature reset.

Functions

ssize_t **hwinfo_get_device_id**(uint8_t *buffer, size_t length)

Copy the device id to a buffer.

This routine copies "length" number of bytes of the device ID to the buffer. If the device ID is smaller than length, the rest of the buffer is left unchanged. The ID depends on the hardware and is not guaranteed unique.

Drivers are responsible for ensuring that the ID data structure is a sequence of bytes. The returned ID value is not supposed to be interpreted based on vendor-specific assumptions of byte order. It should express the identifier as a raw byte sequence, doing any endian conversion necessary so that a hex representation of the bytes produces the intended serial number.

Parameters

- `buffer` – Buffer to write the ID to.
- `length` – Max length of the buffer.

Return values

- `size` – of the device ID copied.
- `-ENOSYS` – if there is no implementation for the particular device.
- `any` – negative value on driver specific errors.

int **hwinfo_get_device_eui64**(uint8_t *buffer)

Copy the device EUI64 to a buffer.

This routine copies the device EUI64 (8 bytes) to the buffer. The EUI64 depends on the hardware and is guaranteed unique.

Parameters

- **buffer** – Buffer of 8 bytes to write the ID to.

Return values

- **zero** – if successful.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.

int **hwinfo_get_reset_cause**(uint32_t *cause)

Retrieve cause of device reset.

This routine retrieves the flags that indicate why the device was reset.

On some platforms the reset cause flags accumulate between successive resets and this routine may return multiple flags indicating all reset causes since the device was powered on. If you need to retrieve the cause only for the most recent reset call `hwinfo_clear_reset_cause` after calling this routine to clear the hardware flags before the next reset event.

Successive calls to this routine will return the same value, unless `hwinfo_clear_reset_cause` has been called.

Parameters

- **cause** – OR'd *reset cause* flags

Return values

- **zero** – if successful.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.

int **hwinfo_clear_reset_cause**(void)

Clear cause of device reset.

Clears reset cause flags.

Return values

- **zero** – if successful.
- **-ENOSYS** – if there is no implementation for the particular device.
- **any** – negative value on driver specific errors.

int **hwinfo_get_supported_reset_cause**(uint32_t *supported)

Get supported reset cause flags.

Retrieves all `reset_cause` flags that are supported by this device.

Parameters

- **supported** – OR'd *reset cause* flags that are supported

Return values

- **zero** – if successful.

- `-ENOSYS` – if there is no implementation for the particular device.
- `any` – negative value on driver specific errors.

7.6.24 I2C EEPROM Target

Overview

API Reference

group `i2c_eeprom_target_api`

I2C EEPROM Target Driver API.

Since
1.13

Version
1.0.0

Functions

int `eeprom_target_program`(const struct *device* *dev, const uint8_t *eeprom_data, unsigned int length)

Program memory of the virtual EEPROM.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `eeprom_data` – Pointer of data to program into the virtual eeprom memory
- `length` – Length of data to program into the virtual eeprom memory

Return values

- `0` – If successful.
- `-EINVAL` – Invalid data size

int `eeprom_target_read`(const struct *device* *dev, uint8_t *eeprom_data, unsigned int offset)

Read single byte of virtual EEPROM memory.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `eeprom_data` – Pointer of byte where to store the virtual eeprom memory
- `offset` – Offset into EEPROM memory where to read the byte

Return values

- `0` – If successful.
- `-EINVAL` – Invalid data pointer or offset

int **eeprom_target_set_addr**(const struct *device* *dev, uint8_t addr)

Change the address of eeprom target at runtime.

Parameters

- **dev** – Pointer to the device structure for the driver instance.
- **addr** – New address to assign to the eeprom target device

Return values

- **0** – Is successful
- **-EINVAL** – If parameters are invalid
- **-EIO** – General input / output error during i2c_taget_register
- **-ENOSYS** – If target mode is not implemented

7.6.25 Improved Inter-Integrated Circuit (I3C) Bus

I3C (Improved Inter-Integrated Circuit) is a two-signal shared peripheral interface bus. Devices on the bus can operate in two roles: as a "controller" that initiates transactions and controls the clock, or as a "target" that responds to transaction commands.

Currently, the API is based on I3C Specification version 1.1.1.

- *I3C Controller API*
  - *In-Band Interrupt (IBI)*
  - *Device Tree*
  - *Device Drivers for I3C Devices*
  - *I^2C Devices under I3C Bus*
- *Configuration Options*
- *API Reference*

I3C Controller API

Zephyr's I3C controller API is used when an I3C controller controls the bus, in particularly the start and stop conditions and the clock. This is the most common mode, used to interact with I3C target devices such as sensors.

Due to the nature of the I3C, there are devices on the bus where they may not have addresses when powered on. Therefore, an additional dynamic address assignment needs to be carried out by the I3C controller. Because of this, the controller needs to maintain separate structures to keep track of device status. This can be done at build time, for example, by creating arrays of device descriptors for both I3C and I^2C devices:

```
static struct i3c_device_desc i3c_device_array[] = I3C_DEVICE_ARRAY_DT_INST(inst);
static struct i3c_i2c_device_desc i2c_device_array[] = I3C_I2C_DEVICE_ARRAY_DT_INST(inst);
```

The macros `I3C_DEVICE_ARRAY_DT_INST` and `I3C_I2C_DEVICE_ARRAY_DT_INST` are helper macros to aid in create arrays of device descriptors corresponding to the devicetree nodes under the I3C controller.

Here is a list of generic steps for initializing the I3C controller and the I3C bus inside the device driver initialization function:

1. Initialize the data structure of the I3C controller device driver instance. The usual device defining macros such as *DEVICE_DT_INST_DEFINE* can be used, and the initialization function provided as a parameter to the macro.
    - The *i3c_addr_slots* and *i3c_dev_list* are structures to aid in address assignments and device list management. If this is being used, this struct needs to be initialized by calling *i3c_addr_slots_init()*. These two structures can also be used with various helper functions.
    - Initialize the device descriptors if needed by the controller driver.
2. Initialize the hardware, including but not limited to:
    - Setup pin mux and directions.
    - Setup the clock for the controller.
    - Power on the hardware.
    - Configure the hardware (e.g. SCL clock frequency).
3. Perform bus initialization. There is a generic helper function, *i3c_bus_init()*, which performs the following steps. This function can be used if the controller does not require any special handling during bus initialization.
    1. Do RSTDAA to reset dynamic addresses of connected devices. If any connected devices have already been assigned an address, the bookkeeping data structures do not have records of these, for example, at power-on. So it is a good idea to reset and assign them new addresses.
    2. Do DISEC to disable any events from devices.
    3. Do SETDASA to use static addresses as dynamic address if so desired.
        - SETAASA may not be supported for all connected devices to assign static addresses as dynamic addresses.
        - BCR and DCR need to be obtained separately to populate the relevant fields in the I3C target device descriptor struct.
    4. Do ENTDAA to start dynamic address assignment, if there are still devices without addresses.
        - If there is a device waiting for address, it will send its Provisioned ID, BCR, and DCR back. Match the received Provisioned ID to the list of registered I3C devices.
            - If there is a match, assign an address (either from the stated static address if SETDASA has not been done, or use a free address).
                * Also, set the BCR and DCR fields in the device descriptor struct.
            - If there is no match, depending on policy, it can be assigned a free address, or the device driver can stop the assignment process and errors out.
                * Note that the I3C API requires device descriptor to function. A device without a device descriptor cannot be accessed through the API.
        - This step can be skipped if there is no connected devices requiring DAA.
    5. These are optional but highly recommended:
        - Do GETMRL and GETMWL to get maximum read/write length.
        - Do GETMXDS to get maximum read/write speed and maximum read turnaround time.
        - The helper function, *i3c_bus_init()*, would retrieve basic device information such as BCR, DCR, MRL and MWL.
    6. Do ENEC to re-enable events from devices.

- The helper function, *i3c_bus_init()*, only re-enables hot-join events. IBI event should only be enabled when enabling IBI of a device.

In-Band Interrupt (IBI) If a target device can generate In-Band Interrupt (IBI), the controller needs to be made aware of it.

- `i3c_ibi_enable()` to enable IBI of a target device.
  - Some controller hardware have IBI slots which need to be programmed so that the controller can recognize incoming IBIs from a particular target device.
    - If the hardware has IBI slots, `i3c_ibi_enable()` needs to program those IBI slots.
    - Note that there are usually limited IBI slots on the controller so this operation may fail.
  - The implementation in driver should also send the `ENEC` command to enable interrupt of this target device.
- `i3c_ibi_disable()` to disable IBI of a target device.
  - If controller hardware makes use of IBI slots, this will remove description of the target device from the slots.
  - The implementation in driver should also send the `DISEC` command to disable interrupt of this target device.

Device Tree Here is an example for defining a I3C controller in device tree:

```
i3c0: i3c@10000 {
        compatible = "vendor,i3c";

        #address-cells = < 0x3 >;
        #size-cells = < 0x0 >;

        reg = < 0x10000 0x1000 >;
        interrupts = < 0x1F 0x0 >;

        pinctrl-0 = < &pinmux-i3c >;
        pinctrl-names = "default";

        i2c-scl-hz = < 400000 >;

        i3c-scl-hz = < 12000000 >;

        status = "okay";

        i3c-dev0: i3c-dev0@420000ABCD12345678 {
                compatible = "vendor,i3c-dev";

                reg = < 0x42 0xABCD 0x12345678 >;

                status = "okay";
        };

        i2c-dev0: i2c-dev0@380000000000000050 {
                compatible = "vendor-i2c-dev";

                reg = < 0x38 0x0 0x50 >;

                status = "okay";
        };
};
```

I3C Devices For I3C devices, the `reg` property has 3 elements:

- The first one is the static address of the device.
  - Can be zero if static address is not used. Address will be assigned during DAA (Dynamic Address Assignment).
  - If non-zero and property `assigned-address` is not set, this will be the address of the device after SETDASA (Set Dynamic Address from Static Address) is issued.
- Second element is the upper 16-bit of the Provisioned ID (PID) which contains the manufacturer ID left-shifted by 1. This is the bits 33-47 (zero-based) of the 48-bit Provisioned ID.
- Third element contains the lower 32-bit of the Provisioned ID which is a combination of the part ID (left-shifted by 16, bits 16-31 of the PID) and the instance ID (left-shifted by 12, bits 12-15 of the PID).

Note that the unit-address (the part after `@`) must match the `reg` property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer. This is required for properly generating device tree macros.

I^{2}C Devices For I^{2}C devices where the device driver has support for working under I3C bus, the device node can be described as a child of the I3C controller. If the device driver is written to only work with I^{2}C controllers, define the node under the I^{2}C virtual controller as described below. Otherwise, the `reg` property, similar to I3C devices, has 3 elements:

- The first one is the static address of the device. This must be a valid address as I^{2}C devices do not support dynamic address assignment.
- Second element is always zero.
  - This is used by various helper macros to determine whether the device tree entry corresponds to a I^{2}C device.
- Third element is the LVR (Legacy Virtual Register):
  - bit[31:8] are unused.
  - bit[7:5] are the I^{2}C device index:
    - Index `0`
      - I3C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
    - Index `1`
      - I^{2}C device does not have a 50 ns spike filter but can work with high frequency on SCL.
    - Index `2`
      - I3C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
  - bit[4] is the I^{2}C mode indicator:
    - `0` is FM+ mode.
    - `1` is FM mode.

Similar to I3C devices, the unit-address must match the `reg` property fully where each element is treated as 32-bit integer, combining to form a 96-bit integer.

Device Drivers for I3C Devices All of the transfer functions of I3C controller API require the use of device descriptors, *i3c_device_desc*. This struct contains runtime information about a I3C device, such as, its dynamic address, BCR, DCR, MRL and MWL. Therefore, the device driver of a I3C device should grab a pointer to this device descriptor from the controller using *i3c_device_find()*. This function takes an ID parameter of type *i3c_device_id* for matching. The returned pointer can then be used in subsequent API calls to the controller.

I²C Devices under I3C Bus Since I3C is backward compatible with I²C, the I3C controller API can accommodate I2C API calls without modifications if the controller device driver implements the I2C API. This has the advantage of using existing I2C devices without any modifications to their device drivers. However, since the I3C controller API works on device descriptors, any calls to I2C API will need to look up the corresponding device descriptor from the I2C device address. This adds a bit of processing cost to any I2C API calls.

On the other hand, a device driver can be extended to utilize native I2C device support via the I3C controller API. During device initialization, `i3c_i2c_device_find()` needs to be called to retrieve the pointer to the device descriptor. This pointer can be used in subsequent API calls.

Note that, with either methods mentioned above, the devicetree node of the I2C device must be declared according to I3C standard:

The I²C virtual controller device driver provides a way to interface I²C devices on the I3C bus where the associated device drivers can be used as-is without modifications. This requires adding an intermediate node in the device tree:

```
i3c0: i3c@10000 {
        <... I3C controller related properties ...>
        <... Nodes of I3C devices, if any ...>

        i2c-dev0: i2c-dev0@42000000000000050 {
                compatible = "vendor-i2c-dev";

                reg = < 0x42 0x0 0x50 >;

                status = "okay";
        };
};
```

Configuration Options

Bus Characteristic Register (BCR)

- BCR[7:6]: Device Role
  - 0: I3C Target
  - 1: I3C Controller capable
  - 2: Reserved
  - 3: Reserved
- BCR[5]: Advanced Capabilities
  - 0: Does not support optional advanced capabilities.
  - 1: Supports optional advanced capabilities which can be viewed via GETCAPS CCC.
- BCR[4]: Virtual Target Support
  - 0: Is not a virtual target.
  - 1: Is a virtual target.
- BCR[3]: Offline Capable
  - 0: Will always response to I3C commands.
  - 1: Will not always response to I3C commands.
- BCR[2]: IBI Payload
  - 0: No data bytes following the accepted IBI.
  - 1: One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.
- BCR[1]: IBI Request Capable
  - 0: Not capable
  - 1: Capable
- BCR[0]: Max Data Speed Limitation
  - 0: No Limitation
  - 1: Limitation obtained via GETMXDS CCC.

`I3C_BCR_MAX_DATA_SPEED_LIMIT`
Max Data Speed Limitation bit.

0 - No Limitation. 1 - Limitation obtained via GETMXDS CCC.

`I3C_BCR_IBI_REQUEST_CAPABLE`
IBI Request Capable bit.

I3C_BCR_IBI_PAYLOAD_HAS_DATA_BYTE

IBI Payload bit.

0 - No data bytes following the accepted IBI. 1 - One data byte (MDB, Mandatory Data Byte) follows the accepted IBI. Additional data bytes may also follows.

I3C_BCR_OFFLINE_CAPABLE

Offline Capable bit.

0 - Will always respond to I3C commands. 1 - Will not always respond to I3C commands.

I3C_BCR_VIRTUAL_TARGET

Virtual Target Support bit.

0 - Is not a virtual target. 1 - Is a virtual target.

I3C_BCR_ADV_CAPABILITIES

Advanced Capabilities bit.

0 - Does not support optional advanced capabilities. 1 - Supports optional advanced capabilities which can be viewed via GETCAPS CCC.

I3C_BCR_DEVICE_ROLE_I3C_TARGET

Device Role - I3C Target.

I3C_BCR_DEVICE_ROLE_I3C_CONTROLLER_CAPABLE

Device Role - I3C Controller Capable.

I3C_BCR_DEVICE_ROLE_MASK

Device Role bit shift mask.

I3C_BCR_DEVICE_ROLE(bcr)

Device Role.

Obtain Device Role value from the BCR value obtained via GETBCR.

Parameters

- bcr – BCR value

Legacy Virtual Register (LVR)

Legacy Virtual Register (LVR)

- LVR[7:5]: I2C device index:
  - 0: I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.
  - 1: I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.
  - 2: I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.
- LVR[4]: I2C mode indicator:
  - 0: FM+ mode
  - 1: FM mode

- LVR[3:0]: Reserved.

I3C_LVR_I2C_FM_PLUS_MODE
: I2C FM+ Mode.

I3C_LVR_I2C_FM_MODE
: I2C FM Mode.

I3C_LVR_I2C_MODE_MASK
: I2C Mode Indicator bitmask.

I3C_LVR_I2C_MODE(lvr)
: I2C Mode.

  Obtain I2C Mode value from the LVR value.

  Parameters

  - `lvr` – LVR value

I3C_LVR_I2C_DEV_IDX_0
: I2C Device Index 0.

  I2C device has a 50 ns spike filter where it is not affected by high frequency on SCL.

I3C_LVR_I2C_DEV_IDX_1
: I2C Device Index 1.

  I2C device does not have a 50 ns spike filter but can work with high frequency on SCL.

I3C_LVR_I2C_DEV_IDX_2
: I2C Device Index 2.

  I2C device does not have a 50 ns spike filter and cannot work with high frequency on SCL.

I3C_LVR_I2C_DEV_IDX_MASK
: I2C Device Index bitmask.

I3C_LVR_I2C_DEV_IDX(lvr)
: I2C Device Index.

  Obtain I2C Device Index value from the LVR value.

  Parameters

  - `lvr` – LVR value

Defines

I3C_DEVICE_ID(pid)
: Structure initializer for *i3c_device_id* from PID.

  This helper macro expands to a static initializer for a *i3c_device_id* by populating the PID (Provisioned ID) field.

  Parameters

  - `pid` – Provisioned ID.

Enums

enum `i3c_bus_mode`

I3C bus mode.

Values:

enumerator `I3C_BUS_MODE_PURE`

Only I3C devices are on the bus.

enumerator `I3C_BUS_MODE_MIXED_FAST`

Both I3C and legacy I2C devices are on the bus.

The I2C devices have 50ns spike filter on SCL.

enumerator `I3C_BUS_MODE_MIXED_LIMITED`

Both I3C and legacy I2C devices are on the bus.

The I2C devices do not have 50ns spike filter on SCL and can tolerate maximum SDR SCL clock frequency.

enumerator `I3C_BUS_MODE_MIXED_SLOW`

Both I3C and legacy I2C devices are on the bus.

The I2C devices do not have 50ns spike filter on SCL but cannot tolerate maximum SDR SCL clock frequency.

enumerator `I3C_BUS_MODE_MAX` = *I3C_BUS_MODE_MIXED_SLOW*

enumerator `I3C_BUS_MODE_INVALID`

enum `i3c_i2c_speed_type`

I2C bus speed under I3C bus.

Only FM and FM+ modes are supported for I2C devices under I3C bus.

Values:

enumerator `I3C_I2C_SPEED_FM`

I2C FM mode.

enumerator `I3C_I2C_SPEED_FMPLUS`

I2C FM+ mode.

enumerator `I3C_I2C_SPEED_MAX` = *I3C_I2C_SPEED_FMPLUS*

enumerator `I3C_I2C_SPEED_INVALID`

enum `i3c_data_rate`

I3C data rate.

I3C data transfer rate defined by the I3C specification.

Values:

enumerator I3C_DATA_RATE_SDR
Single Data Rate messaging.

enumerator I3C_DATA_RATE_HDR_DDR
High Data Rate - Double Data Rate messaging.

enumerator I3C_DATA_RATE_HDR_TSL
High Data Rate - Ternary Symbol Legacy-inclusive-Bus.

enumerator I3C_DATA_RATE_HDR_TSP
High Data Rate - Ternary Symbol for Pure Bus.

enumerator I3C_DATA_RATE_HDR_BT
High Data Rate - Bulk Transport.

enumerator I3C_DATA_RATE_MAX = *I3C_DATA_RATE_HDR_BT*

enumerator I3C_DATA_RATE_INVALID

enum i3c_sdr_controller_error_codes
I3C SDR Controller Error Codes.

These are error codes defined by the I3C specification.

I3C_ERROR_CE_UNKNOWN and *I3C_ERROR_CE_NONE* are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.

Values:

enumerator I3C_ERROR_CE0
Transaction after sending CCC.

enumerator I3C_ERROR_CE1
Monitoring Error.

enumerator I3C_ERROR_CE2
No response to broadcast address (0x7E)

enumerator I3C_ERROR_CE3
Failed Controller Handoff.

enumerator I3C_ERROR_CE_UNKNOWN
Unknown error (not official error code)

enumerator I3C_ERROR_CE_NONE
No error (not official error code)

enumerator I3C_ERROR_CE_MAX = *I3C_ERROR_CE_UNKNOWN*

enumerator I3C_ERROR_CE_INVALID

enum i3c_sdr_target_error_codes

I3C SDR Target Error Codes.

These are error codes defined by the I3C specification.

I3C_ERROR_TE_UNKNOWN and *I3C_ERROR_TE_NONE* are not official error codes according to the specification. These are there simply to aid in error handling during interactions with the I3C drivers and subsystem.

Values:

enumerator I3C_ERROR_TE0

Invalid Broadcast Address or Dynamic Address after DA assignment.

enumerator I3C_ERROR_TE1

CCC Code.

enumerator I3C_ERROR_TE2

Write Data.

enumerator I3C_ERROR_TE3

Assigned Address during Dynamic Address Arbitration.

enumerator I3C_ERROR_TE4

0x7E/R missing after RESTART during Dynamic Address Arbitration

enumerator I3C_ERROR_TE5

Transaction after detecting CCC.

enumerator I3C_ERROR_TE6

Monitoring Error.

enumerator I3C_ERROR_DBR

Dead Bus Recovery.

enumerator I3C_ERROR_TE_UNKNOWN

Unknown error (not official error code)

enumerator I3C_ERROR_TE_NONE

No error (not official error code)

enumerator I3C_ERROR_TE_MAX = *I3C_ERROR_TE_UNKNOWN*

enumerator I3C_ERROR_TE_INVALID

enum i3c_config_type

Type of configuration being passed to configure function.

Values:

enumerator I3C_CONFIG_CONTROLLER

enumerator I3C_CONFIG_TARGET

enumerator I3C_CONFIG_CUSTOM

Functions

struct *i3c_device_desc* *i3c_dev_list_find(const struct *i3c_dev_list* *dev_list, const struct *i3c_device_id* *id)

Find a I3C target device descriptor by ID.

This finds the I3C target device descriptor in the device list matching the provided ID struct (id).

Parameters

- dev_list – Pointer to the device list struct.
- id – Pointer to I3C device ID struct.

Returns

Pointer to the I3C target device descriptor, or NULL if none is found.

struct *i3c_device_desc* *i3c_dev_list_i3c_addr_find(struct *i3c_dev_attached_list* *dev_list, uint8_t addr)

Find a I3C target device descriptor by dynamic address.

This finds the I3C target device descriptor in the attached device list matching the dynamic address (addr)

Parameters

- dev_list – Pointer to the device list struct.
- addr – Dynamic address to be matched.

Returns

Pointer to the I3C target device descriptor, or NULL if none is found.

struct *i3c_i2c_device_desc* *i3c_dev_list_i2c_addr_find(struct *i3c_dev_attached_list* *dev_list, uint16_t addr)

Find a I2C target device descriptor by address.

This finds the I2C target device descriptor in the attached device list matching the address (addr)

Parameters

- dev_list – Pointer to the device list struct.
- addr – Address to be matched.

Returns

Pointer to the I2C target device descriptor, or NULL if none is found.

int i3c_determine_default_addr(struct *i3c_device_desc* *target, uint8_t *addr)

Helper function to find the default address an i3c device is attached with.

This is a helper function to find the default address the device will be loaded with. This could be either it's static address, a requested dynamic address, or just a dynamic address that is available

Parameters

- `target` – **[in]** The pointer of the device descriptor
- `addr` – **[out]** Address to be assigned to target device.

Return values

- `0` – if successful.
- `-EINVAL` – if the expected default address is already in use

int `i3c_dev_list_daa_addr_helper`(struct *i3c_addr_slots* *addr_slots, const struct *i3c_dev_list* *dev_list, uint64_t pid, bool must_match, bool assigned_okay, struct *i3c_device_desc* **target, uint8_t *addr)

Helper function to find a usable address during ENTDAA.

This is a helper function to find a usable address during Dynamic Address Assignment. Given the PID (`pid`), it will search through the device list for the matching device descriptor. If the device descriptor indicates that there is a preferred address (i.e. assigned-address in device tree, *i3c_device_desc::init_dynamic_addr*), this preferred address will be returned if this address is still available. If it is not available, another free address will be returned.

If `must_match` is true, the PID (`pid`) must match one of the device in the device list.

If `must_match` is false, this will return an arbitrary address. This is useful when not all devices are described in device tree. Or else, the DAA process cannot proceed since there is no address to be assigned.
