Value exposed by ONOFF_STATE_MASK when the service is in an error state (and not in the process of resetting its state).

`ONOFF_STATE_TO_ON`

Value exposed by ONOFF_STATE_MASK when service is transitioning to on.

`ONOFF_STATE_TO_OFF`

Value exposed by ONOFF_STATE_MASK when service is transitioning to off.

`ONOFF_STATE_RESETTING`

Value exposed by ONOFF_STATE_MASK when service is in the process of resetting.

`ONOFF_TRANSITIONS_INITIALIZER`(_start, _stop, _reset)

Initializer for a *onoff_transitions* object.

Parameters

- **`_start`** – a function used to transition from off to on state.
- **`_stop`** – a function used to transition from on to off state.
- **`_reset`** – a function used to clear errors and force the service to an off state. Can be null.

`ONOFF_CLIENT_EXTENSION_POS`

Identify region of *sys_notify* flags available for containing services.

Bits of the flags field of the *sys_notify* structure contained within the queued_operation structure at and above this position may be used by extensions to the *onoff_client* structure.

These bits are intended for use by containing service implementations to record client-specific information and are subject to other conditions of use specified on the *sys_notify* API.

Typedefs

typedef void (*`onoff_notify_fn`)(struct *onoff_manager* *mgr, int res)

Signature used to notify an on-off manager that a transition has completed.

Functions of this type are passed to service-specific transition functions to be used to report the completion of the operation. The functions may be invoked from any context.

Param mgr
the manager for which transition was requested.

Param res
the result of the transition. This shall be non-negative on success, or a negative error code. If an error is indicated the service shall enter an error state.

typedef void (*`onoff_transition_fn`)(struct *onoff_manager* *mgr, *onoff_notify_fn* notify)

Signature used by service implementations to effect a transition.

Service definitions use two required function pointers of this type to be notified that a transition is required, and a third optional one to reset the service when it is in an error state.

The start function will be called only from the off state.

The stop function will be called only from the on state.

The reset function (where supported) will be called only when *onoff_has_error()* returns true.

Note

All transitions functions must be isr-ok.

Param mgr
the manager for which transition was requested.

Param notify
the function to be invoked when the transition has completed. If the transition is synchronous, notify shall be invoked by the implementation before the transition function returns. Otherwise the implementation shall capture this parameter and invoke it when the transition completes.

typedef void (*`onoff_client_callback`)(struct *onoff_manager* *mgr, struct *onoff_client* *cli, uint32_t state, int res)

Signature used to notify an on-off service client of the completion of an operation.

These functions may be invoked from any context including pre-kernel, ISR, or cooperative or pre-emptible threads. Compatible functions must be isr-ok and not sleep.

Param mgr
the manager for which the operation was initiated. This may be null if the on-off service uses synchronous transitions.

Param cli
the client structure passed to the function that initiated the operation.

Param state
the state of the machine at the time of completion, restricted by ONOFF_STATE_MASK. ONOFF_FLAG_ERROR must be checked independently of whether res is negative as a machine error may indicate that all future operations except *onoff_reset()* will fail.

Param res
the result of the operation. Expected values are service-specific, but the value shall be non-negative if the operation succeeded, and negative if the operation failed. If res is negative ONOFF_FLAG_ERROR will be set in state, but if res is non-negative ONOFF_FLAG_ERROR may still be set in state.

typedef void (*`onoff_monitor_callback`)(struct *onoff_manager* *mgr, struct *onoff_monitor* *mon, uint32_t state, int res)

Signature used to notify a monitor of an onoff service of errors or completion of a state transition.

This is similar to onoff_client_callback but provides information about all transitions, not just ones associated with a specific client. Monitor callbacks are invoked before any completion notifications associated with the state change are made.

These functions may be invoked from any context including pre-kernel, ISR, or cooperative or pre-emptible threads. Compatible functions must be isr-ok and not sleep.

The callback is permitted to unregister itself from the manager, but must not register or unregister any other monitors.

Param mgr
the manager for which a transition has completed.

Param mon
the monitor instance through which this notification arrived.

Param state
the state of the machine at the time of completion, restricted by ONOFF_STATE_MASK. All valid states may be observed.

Param res
the result of the operation. Expected values are service- and state-specific, but the value shall be non-negative if the operation succeeded, and negative if the operation failed.

Functions

int `onoff_manager_init`(struct *onoff_manager* *mgr, const struct *onoff_transitions* *transitions)

Initialize an on-off service to off state.

This function must be invoked exactly once per service instance, by the infrastructure that provides the service, and before any other on-off service API is invoked on the service.

This function should never be invoked by clients of an on-off service.

Parameters

- `mgr` – the manager definition object to be initialized.
- `transitions` – pointer to a structure providing transition functions. The referenced object must persist as long as the manager can be referenced.

Return values

- `0` – on success
- `-EINVAL` – if start, stop, or flags are invalid

static inline bool `onoff_has_error`(const struct *onoff_manager* *mgr)

Test whether an on-off service has recorded an error.

This function can be used to determine whether the service has recorded an error. Errors may be cleared by invoking *onoff_reset()*.

This is an unlocked convenience function suitable for use only when it is known that no other process might invoke an operation that transitions the service between an error and non-error state.

Returns
true if and only if the service has an uncleared error.

int `onoff_request`(struct *onoff_manager* *mgr, struct *onoff_client* *cli)

Request a reservation to use an on-off service.

The return value indicates the success or failure of an attempt to initiate an operation to request the resource be made available. If initiation of the operation succeeds the result of the request operation is provided through the configured client notification method, possibly before this call returns.

Note that the call to this function may succeed in a case where the actual request fails. Always check the operation completion result.

Parameters

- `mgr` – the manager that will be used.
- `cli` – a non-null pointer to client state providing instructions on synchronous expectations and how to notify the client when the request completes. Behavior is undefined if client passes a pointer object associated with an incomplete service operation.

Return values

- `non-negative` – the observed state of the machine at the time the request was processed, if successful.
- `-EIO` – if service has recorded an error.
- `-EINVAL` – if the parameters are invalid.
- `-EAGAIN` – if the reference count would overflow.

int `onoff_release`(struct *onoff_manager* *mgr)

Release a reserved use of an on-off service.

This synchronously releases the caller's previous request. If the last request is released the manager will initiate a transition to off, which can be observed by registering an *onoff_monitor*.

> **Note**
>
> Behavior is undefined if this is not paired with a preceding *onoff_request()* call that completed successfully.

Parameters

- `mgr` – the manager for which a request was successful.

Return values

- `non-negative` – the observed state (ONOFF_STATE_ON) of the machine at the time of the release, if the release succeeds.
- `-EIO` – if service has recorded an error.
- `-ENOTSUP` – if the machine is not in a state that permits release.

int `onoff_cancel`(struct *onoff_manager* *mgr, struct *onoff_client* *cli)

Attempt to cancel an in-progress client operation.

It may be that a client has initiated an operation but needs to shut down before the operation has completed. For example, when a request was made and the need is no longer present.

Cancelling is supported only for *onoff_request()* and *onoff_reset()* operations, and is a synchronous operation. Be aware that any transition that was initiated on behalf of the client will continue to progress to completion: it is only notification of transition

completion that may be eliminated. If there are no active requests when a transition to on completes the manager will initiate a transition to off.

Client notification does not occur for cancelled operations.

Parameters

- `mgr` – the manager for which an operation is to be cancelled.
- `cli` – a pointer to the same client state that was provided when the operation to be cancelled was issued.

Return values

- `non-negative` – the observed state of the machine at the time of the cancellation, if the cancellation succeeds. On successful cancellation ownership of `*cli` reverts to the client.
- `-EINVAL` – if the parameters are invalid.
- `-EALREADY` – if cli was not a record of an uncompleted notification at the time the cancellation was processed. This likely indicates that the operation and client notification had already completed.

static inline int **onoff_cancel_or_release**(struct *onoff_manager* *mgr, struct *onoff_client* *cli)

Helper function to safely cancel a request.

Some applications may want to issue requests on an asynchronous event (such as connection to a USB bus) and to release on a paired event (such as loss of connection to a USB bus). Applications cannot precisely determine that an in-progress request is still pending without using *onoff_monitor* and carefully avoiding race conditions.

This function is a helper that attempts to cancel the operation and issues a release if cancellation fails because the request was completed. This synchronously ensures that ownership of the client data reverts to the client so is available for a future request.

Parameters

- `mgr` – the manager for which an operation is to be cancelled.
- `cli` – a pointer to the same client state that was provided when *onoff_request()* was invoked. Behavior is undefined if this is a pointer to client data associated with an *onoff_reset()* request.

Return values

- `ONOFF_STATE_TO_ON` – if the cancellation occurred before the transition completed.
- `ONOFF_STATE_ON` – if the cancellation occurred after the transition completed.
- `-EINVAL` – if the parameters are invalid.
- `negative` – other errors produced by *onoff_release()*.

int **onoff_reset**(struct *onoff_manager* *mgr, struct *onoff_client* *cli)

Clear errors on an on-off service and reset it to its off state.

A service can only be reset when it is in an error state as indicated by *onoff_has_error()*.

The return value indicates the success or failure of an attempt to initiate an operation to reset the resource. If initiation of the operation succeeds the result of the reset operation itself is provided through the configured client notification method, possibly before this call returns. Multiple clients may request a reset; all are notified when it is complete.

Note that the call to this function may succeed in a case where the actual reset fails. Always check the operation completion result.

> **Note**
>
> Due to the conditions on state transition all incomplete asynchronous operations will have been informed of the error when it occurred. There need be no concern about dangling requests left after a reset completes.

Parameters

- `mgr` – the manager to be reset.
- `cli` – pointer to client state, including instructions on how to notify the client when reset completes. Behavior is undefined if cli references an object associated with an incomplete service operation.

Return values

- `non-negative` – the observed state of the machine at the time of the reset, if the reset succeeds.
- `-ENOTSUP` – if reset is not supported by the service.
- `-EINVAL` – if the parameters are invalid.
- `-EALREADY` – if the service does not have a recorded error.

int `onoff_monitor_register`(struct *onoff_manager* *mgr, struct *onoff_monitor* *mon)

Add a monitor of state changes for a manager.

Parameters

- `mgr` – the manager for which a state changes are to be monitored.
- `mon` – a linkable node providing a non-null callback to be invoked on state changes.

Returns

non-negative on successful addition, or a negative error code.

int `onoff_monitor_unregister`(struct *onoff_manager* *mgr, struct *onoff_monitor* *mon)

Remove a monitor of state changes from a manager.

Parameters

- `mgr` – the manager for which a state changes are to be monitored.
- `mon` – a linkable node providing the callback to be invoked on state changes.

Returns

non-negative on successful removal, or a negative error code.

int `onoff_sync_lock`(struct *onoff_sync_service* *srv, *k_spinlock_key_t* *keyp)

Lock a synchronous onoff service and provide its state.

> **Note**
>
> If an error state is returned it is the caller's responsibility to decide whether to preserve it (finalize with the same error state) or clear the error (finalize with a non-error result).

Parameters

- `srv` – pointer to the synchronous service state.
- `keyp` – pointer to where the lock key should be stored

Returns
negative if the service is in an error state, otherwise the number of active requests at the time the lock was taken. The lock is held on return regardless of whether a negative state is returned.

int `onoff_sync_finalize`(struct *onoff_sync_service* *srv, *k_spinlock_key_t* key, struct *onoff_client* *cli, int res, bool on)

Process the completion of a transition in a synchronous service and release lock.

This function updates the service state on the `res` and `on` parameters then releases the lock. If `cli` is not null it finalizes the client notification using `res`.

If the service was in an error state when locked, and `res` is non-negative when finalized, the count is reset to zero before completing finalization.

Parameters

- `srv` – pointer to the synchronous service state
- `key` – the key returned by the preceding invocation of *onoff_sync_lock()*.
- `cli` – pointer to the onoff client through which completion information is returned. If a null pointer is passed only the state of the service is updated. For compatibility with the behavior of callbacks used with the manager API `cli` must be null when `on` is false (the manager does not support callbacks when turning off devices).
- `res` – the result of the transition. A negative value places the service into an error state. A non-negative value increments or decrements the reference count as specified by `on`.
- `on` – Only when `res` is non-negative, the service reference count will be incremented if`on` is `true`, and decremented if `on` is `false`.

Returns
negative if the service is left or put into an error state, otherwise the number of active requests at the time the lock was released.

struct `onoff_transitions`

#include <*onoff.h*> On-off service transition functions.

Public Members

onoff_transition_fn `start`

Function to invoke to transition the service to on.

onoff_transition_fn `stop`

Function to invoke to transition the service to off.

onoff_transition_fn `reset`

Function to force the service state to reset, where supported.

struct `onoff_manager`

#include <*onoff.h*> State associated with an on-off manager.

No fields in this structure are intended for use by service providers or clients. The state is to be initialized once, using *onoff_manager_init()*, when the service provider is initialized. In case of error it may be reset through the *onoff_reset()* API.

Public Members

sys_slist_t **clients**

List of clients waiting for request or reset completion notifications.

sys_slist_t **monitors**

List of monitors to be notified of state changes including errors and transition completion.

const struct *onoff_transitions* ***transitions**

Transition functions.

struct *k_spinlock* **lock**

Mutex protection for other fields.

int **last_res**

The result of the last transition.

uint16_t **flags**

Flags identifying the service state.

uint16_t **refs**

Number of active clients for the service.

struct **onoff_client**

#include <*onoff.h*> State associated with a client of an on-off service.

Objects of this type are allocated by a client, which is responsible for zero-initializing the node field and invoking the appropriate *sys_notify* init function to configure notification.

Control of the object content transfers to the service provider when a pointer to the object is passed to any on-off manager function. While the service provider controls the object the client must not change any object fields. Control reverts to the client concurrent with release of the owned *sys_notify* structure, or when indicated by an *onoff_cancel()* return value.

After control has reverted to the client the notify field must be reinitialized for the next operation.

Public Members

struct *sys_notify* **notify**

Notification configuration.

struct **onoff_monitor**

#include <onoff.h> Registration state for notifications of onoff service transitions.

Any given *onoff_monitor* structure can be associated with at most one *onoff_manager* instance.

Public Members

sys_snode_t **node**

Links the client into the set of waiting service users.

This must be zero-initialized.

onoff_monitor_callback **callback**

Callback to be invoked on state change.

This must not be null.

struct **onoff_sync_service**

#include <onoff.h> State used when a driver uses the on-off service API for synchronous operations.

This is useful when a subsystem API uses the on-off API to support asynchronous operations but the transitions required by a particular driver are isr-ok and not sleep. It serves as a substitute for *onoff_manager*, with locking and persisted state updates supported by *onoff_sync_lock()* and *onoff_sync_finalize()*.

Public Members

struct *k_spinlock* **lock**

Mutex protection for other fields.

int32_t **count**

Negative is error, non-negative is reference count.

4.15 Memory Attributes

It is possible in the devicetree to mark the memory regions with attributes by using the `zephyr,memory-attr` property. This property and the related memory region can then be retrieved at run-time by leveraging a provided helper library.

The set of general attributes that can be specified in the property are defined and explained in include/zephyr/dt-bindings/memory-attr/memory-attr.h.

For example, to mark a memory region in the devicetree as non-volatile, cacheable, out-of-order:

```
mem: memory@10000000 {
    compatible = "mmio-sram";
    reg = <0x10000000 0x1000>;
    zephyr,memory-attr = <( DT_MEM_NON_VOLATILE | DT_MEM_CACHEABLE | DT_MEM_OOO )>;
};
```

Note

The `zephyr,memory-attr` usage does not result in any memory region actually created. When it is needed to create an actual section out of the devicetree defined memory region, it is possible to use the compatible `zephyr,memory-region` that will result (only when supported by the architecture) in a new linker section and region.

The `zephyr,memory-attr` property can also be used to set architecture-specific and software-specific custom attributes that can be interpreted at run time. This is leveraged, among other things, to create MPU regions out of devicetree defined memory regions, for example:

```
mem: memory@10000000 {
    compatible = "mmio-sram";
    reg = <0x10000000 0x1000>;
    zephyr,memory-region = "NOCACHE_REGION";
    zephyr,memory-attr = <( DT_MEM_ARM(ATTR_MPU_RAM_NOCACHE) )>;
};
```

See include/zephyr/dt-bindings/memory-attr/memory-attr-arm.h and *Arm Cortex-M Developer Guide* for more details about MPU usage.

The conventional and recommended way to deal and manage with memory regions marked with attributes is by using the provided `mem-attr` helper library by enabling `CONFIG_MEM_ATTR`. When this option is enabled the list of memory regions and their attributes are compiled in a user-accessible array and a set of functions is made available that can be used to query, probe and act on regions and attributes (see next section for more details).

Note

The `zephyr,memory-attr` property is only a descriptive property of the capabilities of the associated memory region, but it does not result in any actual setting for the memory to be set. The user, code or subsystem willing to use this information to do some work (for example creating an MPU region out of the property) must use either the provided `mem-attr` library or the usual devicetree helpers to perform the required work / setting.

A test for the `mem-attr` library and its usage is provided in `tests/subsys/mem_mgmt/mem_attr/`.

4.15.1 Migration guide from *zephyr,memory-region-mpu*

When the `zephyr,memory-attr` property was introduced, the `zephyr,memory-region-mpu` property was removed and deprecated.

The developers that are still using the deprecated property can move to the new one by renaming the property and changing its value according to the following list:

```
"RAM"         -> <( DT_ARM_MPU(ATTR_MPU_RAM) )>
"RAM_NOCACHE" -> <( DT_ARM_MPU(ATTR_MPU_RAM_NOCACHE) )>
"FLASH"       -> <( DT_ARM_MPU(ATTR_MPU_FLASH) )>
"PPB"         -> <( DT_ARM_MPU(ATTR_MPU_PPB) )>
"IO"          -> <( DT_ARM_MPU(ATTR_MPU_IO) )>
"EXTMEM"      -> <( DT_ARM_MPU(ATTR_MPU_EXTMEM) )>
```

4.15.2 Memory Attributes Heap Allocator

It is possible to leverage the memory attribute property `zephyr,memory-attr` to define and create a set of memory heaps from which the user can allocate memory from with certain attributes /

capabilities.

When the CONFIG_MEM_ATTR_HEAP is set, every region marked with one of the memory attributes listed in include/zephyr/dt-bindings/memory-attr/memory-attr-sw.h is added to a pool of memory heaps used for dynamic allocation of memory buffers with certain attributes.

Here a non exhaustive list of possible attributes:

```
DT_MEM_SW_ALLOC_CACHE
DT_MEM_SW_ALLOC_NON_CACHE
DT_MEM_SW_ALLOC_DMA
```

For example we can define several memory regions with different attributes and use the appropriate attribute to indicate that it is possible to dynamically allocate memory from those regions:

```
mem_cacheable: memory@10000000 {
    compatible = "mmio-sram";
    reg = <0x10000000 0x1000>;
    zephyr,memory-attr = <( DT_MEM_CACHEABLE | DT_MEM_SW_ALLOC_CACHE )>;
};

mem_non_cacheable: memory@20000000 {
    compatible = "mmio-sram";
    reg = <0x20000000 0x1000>;
    zephyr,memory-attr = <( DT_MEM_NON_CACHEABLE | ATTR_SW_ALLOC_NON_CACHE )>;
};

mem_cacheable_big: memory@30000000 {
    compatible = "mmio-sram";
    reg = <0x30000000 0x10000>;
    zephyr,memory-attr = <( DT_MEM_CACHEABLE | DT_MEM_OOO | DT_MEM_SW_ALLOC_CACHE )>;
};

mem_cacheable_dma: memory@40000000 {
    compatible = "mmio-sram";
    reg = <0x40000000 0x10000>;
    zephyr,memory-attr = <( DT_MEM_CACHEABLE      | DT_MEM_DMA |
                            DT_MEM_SW_ALLOC_CACHE | DT_MEM_SW_ALLOC_DMA )>;
};
```

The user can then dynamically carve memory out of those regions using the provided functions, the library will take care of allocating memory from the correct heap depending on the provided attribute and size:

```
// Init the pool
mem_attr_heap_pool_init();

// Allocate 0x100 bytes of cacheable memory from `mem_cacheable`
block = mem_attr_heap_alloc(DT_MEM_SW_ALLOC_CACHE, 0x100);

// Allocate 0x200 bytes of non-cacheable memory aligned to 32 bytes
// from `mem_non_cacheable`
block = mem_attr_heap_aligned_alloc(ATTR_SW_ALLOC_NON_CACHE, 0x100, 32);

// Allocate 0x100 bytes of cacheable and dma-able memory from `mem_cacheable_dma`
block = mem_attr_heap_alloc(DT_MEM_SW_ALLOC_CACHE | DT_MEM_SW_ALLOC_DMA, 0x100);
```

When several regions are marked with the same attributes, the memory is allocated:

1. From the regions where the zephyr,memory-attr property has the requested property (or properties).
2. Among the regions as at point 1, from the smallest region if there is any unallocated space left for the requested size

3. If there is not enough space, from the next bigger region able to accommodate the requested size

The following example shows the point 3:

```
// This memory is allocated from `mem_non_cacheable`
block = mem_attr_heap_alloc(DT_MEM_SW_ALLOC_NON_CACHE, 0x100);

// This memory is allocated from `mem_cacheable_big`
block = mem_attr_heap_alloc(DT_MEM_SW_ALLOC_CACHE, 0x5000);
```

Note

The framework is assuming that the memory regions used to create the heaps are usable by the code and available at init time. The user must take of initializing and setting the memory area before calling *mem_attr_heap_pool_init()*.

That means that the region must be correctly configured in terms of MPU / MMU (if needed) and that an actual heap can be created out of it, for example by leveraging the `zephyr,memory-region` property to create a proper linker section to accommodate the heap.

4.15.3 API Reference

group **memory_attr_interface**

Memory-Attr Interface.

Defines

DT_MEMORY_ATTR_FOREACH_STATUS_OKAY_NODE(fn)

Invokes `fn` for every status `okay` node in the tree with property `zephyr,memory-attr`

The macro `fn` must take one parameter, which will be a node identifier with the `zephyr,memory-attr` property. The macro is expanded once for each node in the tree with status `okay`. The order that nodes are visited in is not specified.

Parameters

- **fn** – macro to invoke

Functions

size_t **mem_attr_get_regions**(const struct *mem_attr_region_t* **region)

Get the list of memory regions.

Get the list of enabled memory regions with their memory-attribute as gathered by DT.

Parameters

- **region** – Pointer to pointer to the list of memory regions.

Return values

Number – of memory regions returned in the parameter.

int **mem_attr_check_buf**(void *addr, size_t size, uint32_t attr)

Check if a buffer has correct size and attributes.

This function is used to check if a given buffer with a given set of attributes fully match a memory region in terms of size and attributes.

This is usually used to verify that a buffer has the expected attributes (for example the buffer is cacheable / non-cacheable or belongs to RAM / FLASH, etc...) and it has been correctly allocated.

The expected set of attributes for the buffer is and-matched against the full set of attributes for the memory region it belongs to (bitmask). So the buffer is considered matching when at least that set of attributes are valid for the memory region (but the region can be marked also with other attributes besides the one passed as parameter).

Parameters

- **addr** – Virtual address of the user buffer.
- **size** – Size of the user buffer.
- **attr** – Expected / desired attribute for the buffer.

Return values

- **0** – if the buffer has the correct size and attribute.
- **-ENOSYS** – if the operation is not supported (for example if the MMU is enabled).
- **-ENOTSUP** – if the wrong parameters were passed.
- **-EINVAL** – if the buffer has the wrong set of attributes.
- **-ENOSPC** – if the buffer is too big for the region it belongs to.
- **-ENOBUFS** – if the buffer is entirely allocated outside a memory region.

struct **mem_attr_region_t**

#include <*mem_attr.h*> memory-attr region structure.

This structure represents the data gathered from DT about a memory-region marked with memory attributes.

Public Members

const char ***dt_name**

Memory node full name.

uintptr_t **dt_addr**

Memory region physical address.

size_t **dt_size**

Memory region size.

uint32_t **dt_attr**

Memory region attributes.

group **memory_attr_heap**

Memory heaps based on memory attributes.

Functions

int `mem_attr_heap_pool_init`(void)

Init the memory pool.

This must be the first function to be called to initialize the memory pools from all the memory regions with the a software attribute.

Return values

- `0` – on success.
- `-EALREADY` – if the pool was already initialized.
- `-ENOMEM` – too many regions already allocated.

void *`mem_attr_heap_alloc`(uint32_t attr, size_t bytes)

Allocate memory with a specified attribute and size.

Allocates a block of memory of the specified size in bytes and with a specified capability / attribute. The attribute is used to select the correct memory heap to allocate memory from.

Parameters

- `attr` – capability / attribute requested for the memory block.
- `bytes` – requested size of the allocation in bytes.

Return values

- `ptr` – a valid pointer to the allocated memory.
- `NULL` – if no memory is available with that attribute and size.

void *`mem_attr_heap_aligned_alloc`(uint32_t attr, size_t align, size_t bytes)

Allocate aligned memory with a specified attribute, size and alignment.

Allocates a block of memory of the specified size in bytes and with a specified capability / attribute. Takes an additional parameter specifying a power of two alignment in bytes.

Parameters

- `attr` – capability / attribute requested for the memory block.
- `align` – power of two alignment for the returned pointer in bytes.
- `bytes` – requested size of the allocation in bytes.

Return values

- `ptr` – a valid pointer to the allocated memory.
- `NULL` – if no memory is available with that attribute and size.

void `mem_attr_heap_free`(void *block)

Free the allocated memory.

Used to free the passed block of memory that must be the return value of a previously call to *mem_attr_heap_alloc* or *mem_attr_heap_aligned_alloc*.

Parameters

- `block` – block to free, must be a pointer to a block allocated by *mem_attr_heap_alloc* or *mem_attr_heap_aligned_alloc*.

const struct *mem_attr_region_t* ***mem_attr_heap_get_region**(void *addr)

Get a specific memory region descriptor for a provided address.

Finds the memory region descriptor struct controlling the provided pointer.

Parameters

- **addr** – address to be found, must be a pointer to a block allocated by *mem_attr_heap_alloc* or *mem_attr_heap_aligned_alloc*.

Return values

str – pointer to a memory region structure the address belongs to.

4.16 Modbus

Modbus is an industrial messaging protocol. The protocol is specified for different types of networks or buses. Zephyr OS implementation supports communication over serial line and may be used with different physical interfaces, like RS485 or RS232. TCP support is not implemented directly, but there are helper functions to realize TCP support according to the application's needs.

Modbus communication is based on client/server model. Only one client may be present on the bus. Client can communicate with several server devices. Server devices themselves are passive and must not send requests or unsolicited responses. Services requested by the client are specified by function codes (FCxx), and can be found in the specification or documentation of the API below.

Zephyr RTOS implementation supports both client and server roles.

More information about Modbus and Modbus RTU can be found on the website MODBUS Protocol Specifications.

4.16.1 Samples

- modbus-rtu-server and modbus-rtu-client samples give the possibility to try out RTU server and RTU client implementation with an evaluation board.
- modbus-tcp-server sample is a simple Modbus TCP server.
- modbus-gateway sample shows how to build a TCP to serial line gateway with Zephyr OS.

4.16.2 API Reference

Related code samples

Modbus RTU client
Communicate with a Modbus RTU server.

Modbus RTU server
Implement a Modbus RTU server exposing Modbus commands to control LEDs.

Modbus TCP server
Implement a Modbus TCP server exposing Modbus commands to control LEDs.

Modbus TCP-to-serial gateway
Implement a gateway between an Ethernet TCP-IP network and a Modbus serial line.

group modbus

MODBUS transport protocol API.

Modbus exception codes

MODBUS_EXC_NONE
: No exception.

MODBUS_EXC_ILLEGAL_FC
: Illegal function code.

MODBUS_EXC_ILLEGAL_DATA_ADDR
: Illegal data address.

MODBUS_EXC_ILLEGAL_DATA_VAL
: Illegal data value.

MODBUS_EXC_SERVER_DEVICE_FAILURE
: Server device failure.

MODBUS_EXC_ACK
: Acknowledge.

MODBUS_EXC_SERVER_DEVICE_BUSY
: Server device busy.

MODBUS_EXC_MEM_PARITY_ERROR
: Memory parity error.

MODBUS_EXC_GW_PATH_UNAVAILABLE
: Gateway path unavailable.

MODBUS_EXC_GW_TARGET_FAILED_TO_RESP
: Gateway target device failed to respond.

Defines

MODBUS_MBAP_LENGTH
: Length of MBAP Header.

MODBUS_MBAP_AND_FC_LENGTH
: Length of MBAP Header plus function code.

MODBUS_CUSTOM_FC_DEFINE(name, user_cb, user_fc, userdata)
: INTERNAL_HIDDEN.

  Helper macro for initializing custom function code structs

Typedefs

typedef int (*`modbus_raw_cb_t`)(const int iface, const struct *modbus_adu* *adu, void *user_data)

ADU raw callback function signature.

Param iface
Modbus RTU interface index

Param adu
Pointer to the RAW ADU struct to send

Param user_data
Pointer to the user data

Retval 0
If transfer was successful

typedef bool (*`modbus_custom_cb_t`)(const int iface, const struct *modbus_adu* *const rx_adu, struct *modbus_adu* *const tx_adu, uint8_t *const excep_code, void *const user_data)

Custom function code handler function signature.

Modbus allows user defined function codes which can be used to extend the base protocol. These callbacks can also be used to implement function codes currently not supported by Zephyr's Modbus subsystem.

If an error occurs during the handling of the request, the handler should signal this by setting excep_code to a modbus exception code.

User data pointer can be used to pass state between subsequent calls to the handler.

Param iface
Modbus interface index

Param rx_adu
Pointer to the received ADU struct

Param tx_adu
Pointer to the outgoing ADU struct

Param excep_code
Pointer to possible exception code

Param user_data
Pointer to user data

Retval true
If response should be sent, false otherwise

Enums

enum `modbus_mode`

Modbus interface mode.

Values:

enumerator `MODBUS_MODE_RTU`

Modbus over serial line RTU mode.

enumerator MODBUS_MODE_ASCII

Modbus over serial line ASCII mode.

enumerator MODBUS_MODE_RAW

Modbus raw ADU mode.

Functions

int modbus_read_coils(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint8_t *const coil_tbl, const uint16_t num_coils)

Coil read (FC01)

Sends a Modbus message to read the status of coils from a server.

Parameters

- iface – Modbus interface index
- unit_id – Modbus unit ID of the server
- start_addr – Coil starting address
- coil_tbl – Pointer to an array of bytes containing the value of the coils read. The format is:

```
               MSB                                 LSB
               B7   B6   B5   B4   B3   B2   B1   B0
               -------------------------------------
coil_tbl[0]    #8   #7                            #1
coil_tbl[1]    #16  #15                           #9
     :
     :
```

  Note that the array that will be receiving the coil values must be greater than or equal to: (num_coils - 1) / 8 + 1

- num_coils – Quantity of coils to read

Return values

0 – If the function was successful

int modbus_read_dinputs(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint8_t *const di_tbl, const uint16_t num_di)

Read discrete inputs (FC02)

Sends a Modbus message to read the status of discrete inputs from a server.

Parameters

- iface – Modbus interface index
- unit_id – Modbus unit ID of the server
- start_addr – Discrete input starting address
- di_tbl – Pointer to an array that will receive the state of the discrete inputs. The format of the array is as follows:

```
              MSB                                 LSB
              B7   B6   B5   B4   B3   B2   B1   B0
              -------------------------------------
di_tbl[0]     #8   #7                            #1
di_tbl[1]     #16  #15                           #9
```

(continues on next page)

(continued from previous page)

```
:
:
```

Note that the array that will be receiving the discrete input values must be greater than or equal to: (num_di - 1) / 8 + 1

- `num_di` – Quantity of discrete inputs to read

Return values
`0` – If the function was successful

int `modbus_read_holding_regs`(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint16_t *const reg_buf, const uint16_t num_regs)

Read holding registers (FC03)

Sends a Modbus message to read the value of holding registers from a server.

Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array that will receive the current values of the holding registers from the server. The array pointed to by 'reg_buf' needs to be able to hold at least 'num_regs' entries.
- `num_regs` – Quantity of registers to read

Return values
`0` – If the function was successful

int `modbus_read_input_regs`(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint16_t *const reg_buf, const uint16_t num_regs)

Read input registers (FC04)

Sends a Modbus message to read the value of input registers from a server.

Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array that will receive the current value of the holding registers from the server. The array pointed to by 'reg_buf' needs to be able to hold at least 'num_regs' entries.
- `num_regs` – Quantity of registers to read

Return values
`0` – If the function was successful

int `modbus_write_coil`(const int iface, const uint8_t unit_id, const uint16_t coil_addr, const bool coil_state)

Write single coil (FC05)

Sends a Modbus message to write the value of single coil to a server.

Parameters

- `iface` – Modbus interface index

- **unit_id** – Modbus unit ID of the server
- **coil_addr** – Coils starting address
- **coil_state** – Is the desired state of the coil

Return values
0 – If the function was successful

int **modbus_write_holding_reg**(const int iface, const uint8_t unit_id, const uint16_t start_addr, const uint16_t reg_val)

Write single holding register (FC06)

Sends a Modbus message to write the value of single holding register to a server unit.

Parameters

- **iface** – Modbus interface index
- **unit_id** – Modbus unit ID of the server
- **start_addr** – Coils starting address
- **reg_val** – Desired value of the holding register

Return values
0 – If the function was successful

int **modbus_request_diagnostic**(const int iface, const uint8_t unit_id, const uint16_t sfunc, const uint16_t data, uint16_t *const data_out)

Read diagnostic (FC08)

Sends a Modbus message to perform a diagnostic function of a server unit.

Parameters

- **iface** – Modbus interface index
- **unit_id** – Modbus unit ID of the server
- **sfunc** – Diagnostic sub-function code
- **data** – Sub-function data
- **data_out** – Pointer to the data value

Return values
0 – If the function was successful

int **modbus_write_coils**(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint8_t *const coil_tbl, const uint16_t num_coils)

Write coils (FC15)

Sends a Modbus message to write to coils on a server unit.

Parameters

- **iface** – Modbus interface index
- **unit_id** – Modbus unit ID of the server
- **start_addr** – Coils starting address
- **coil_tbl** – Pointer to an array of bytes containing the value of the coils to write. The format is:

```
                MSB                                 LSB
                B7   B6   B5   B4   B3   B2   B1   B0
                -------------------------------------
coil_tbl[0]     #8   #7                             #1
```

(continues on next page)

(continued from previous page)

```
coil_tbl[1]     #16  #15                              #9
     :
     :
```

Note that the array that will be receiving the coil values must be greater than or equal to: (num_coils - 1) / 8 + 1

- `num_coils` – Quantity of coils to write

Return values

`0` – If the function was successful

int `modbus_write_holding_regs`(const int iface, const uint8_t unit_id, const uint16_t start_addr, uint16_t *const reg_buf, const uint16_t num_regs)

Write holding registers (FC16)

Sends a Modbus message to write to integer holding registers to a server unit.

Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array containing the value of the holding registers to write. Note that the array containing the register values must be greater than or equal to 'num_regs'
- `num_regs` – Quantity of registers to write

Return values

`0` – If the function was successful

int `modbus_read_holding_regs_fp`(const int iface, const uint8_t unit_id, const uint16_t start_addr, float *const reg_buf, const uint16_t num_regs)

Read floating-point holding registers (FC03)

Sends a Modbus message to read the value of floating-point holding registers from a server unit.

Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array that will receive the current values of the holding registers from the server. The array pointed to by 'reg_buf' needs to be able to hold at least 'num_regs' entries.
- `num_regs` – Quantity of registers to read

Return values

`0` – If the function was successful

int `modbus_write_holding_regs_fp`(const int iface, const uint8_t unit_id, const uint16_t start_addr, float *const reg_buf, const uint16_t num_regs)

Write floating-point holding registers (FC16)

Sends a Modbus message to write to floating-point holding registers to a server unit.

Parameters

- `iface` – Modbus interface index
- `unit_id` – Modbus unit ID of the server
- `start_addr` – Register starting address
- `reg_buf` – Is a pointer to an array containing the value of the holding registers to write. Note that the array containing the register values must be greater than or equal to 'num_regs'
- `num_regs` – Quantity of registers to write

Return values

`0` – If the function was successful

int `modbus_iface_get_by_name`(const char *iface_name)

Get Modbus interface index according to interface name.

If there is more than one interface, it can be used to clearly identify interfaces in the application.

Parameters

- `iface_name` – Modbus interface name

Return values

`Modbus` – interface index or negative error value.

int `modbus_init_server`(const int iface, struct *modbus_iface_param* param)

Configure Modbus Interface as raw ADU server.

Parameters

- `iface` – Modbus RTU interface index
- `param` – Configuration parameter of the server interface

Return values

`0` – If the function was successful

int `modbus_init_client`(const int iface, struct *modbus_iface_param* param)

Configure Modbus Interface as raw ADU client.

Parameters

- `iface` – Modbus RTU interface index
- `param` – Configuration parameter of the client interface

Return values

`0` – If the function was successful

int `modbus_disable`(const uint8_t iface)

Disable Modbus Interface.

This function is called to disable Modbus interface.

Parameters

- `iface` – Modbus interface index

Return values

`0` – If the function was successful

int `modbus_raw_submit_rx`(const int iface, const struct *modbus_adu* *adu)

Submit raw ADU.

Parameters

- `iface` – Modbus RTU interface index
- `adu` – Pointer to the RAW ADU struct that is received

Return values
`0` – If transfer was successful

void `modbus_raw_put_header`(const struct *modbus_adu* *adu, uint8_t *header)

Put MBAP header into a buffer.

Parameters

- `adu` – Pointer to the RAW ADU struct
- `header` – Pointer to the buffer in which MBAP header will be placed.

void `modbus_raw_get_header`(struct *modbus_adu* *adu, const uint8_t *header)

Get MBAP header from a buffer.

Parameters

- `adu` – Pointer to the RAW ADU struct
- `header` – Pointer to the buffer containing MBAP header

void `modbus_raw_set_server_failure`(struct *modbus_adu* *adu)

Set Server Device Failure exception.

This function modifies ADU passed by the pointer.

Parameters

- `adu` – Pointer to the RAW ADU struct

int `modbus_raw_backend_txn`(const int iface, struct *modbus_adu* *adu)

Use interface as backend to send and receive ADU.

This function overwrites ADU passed by the pointer and generates exception responses if backend interface is misconfigured or target device is unreachable.

Parameters

- `iface` – Modbus client interface index
- `adu` – Pointer to the RAW ADU struct

Return values
`0` – If transfer was successful

int `modbus_register_user_fc`(const int iface, struct modbus_custom_fc *custom_fc)

Register a user-defined function code handler.

The Modbus specification allows users to define standard function codes missing from Zephyr's Modbus implementation as well as add non-standard function codes in the ranges 65 to 72 and 100 to 110 (decimal), as per specification.

This function registers a new handler at runtime for the given function code.

Parameters

- `iface` – Modbus client interface index
- `custom_fc` – User defined function code and callback pair

Return values
`0` – on success

struct `modbus_adu`

#include <*modbus.h*> Frame struct used internally and for raw ADU support.

Public Members

uint16_t **trans_id**
Transaction Identifier.

uint16_t **proto_id**
Protocol Identifier.

uint16_t **length**
Length of the data only (not the length of unit ID + PDU)

uint8_t **unit_id**
Unit Identifier.

uint8_t **fc**
Function Code.

uint8_t **data**[CONFIG_MODBUS_BUFFER_SIZE - 4]
Transaction Data.

uint16_t **crc**
RTU CRC.

struct **modbus_user_callbacks**
#include <*modbus.h*> Modbus Server User Callback structure.

Public Members

int (***coil_rd**)(uint16_t addr, bool *state)
Coil read callback.

int (***coil_wr**)(uint16_t addr, bool state)
Coil write callback.

int (***discrete_input_rd**)(uint16_t addr, bool *state)
Discrete Input read callback.

int (***input_reg_rd**)(uint16_t addr, uint16_t *reg)
Input Register read callback.

int (***input_reg_rd_fp**)(uint16_t addr, float *reg)
Floating Point Input Register read callback.

int (***holding_reg_rd**)(uint16_t addr, uint16_t *reg)
Holding Register read callback.

int (***holding_reg_wr**)(uint16_t addr, uint16_t reg)
Holding Register write callback.

int (*holding_reg_rd_fp)(uint16_t addr, float *reg)

Floating Point Holding Register read callback.

int (*holding_reg_wr_fp)(uint16_t addr, float reg)

Floating Point Holding Register write callback.

struct modbus_serial_param

#include <*modbus.h*> Modbus serial line parameter.

Public Members

uint32_t baud

Baudrate of the serial line.

enum *uart_config_parity* parity

parity UART's parity setting: UART_CFG_PARITY_NONE, UART_CFG_PARITY_EVEN, UART_CFG_PARITY_ODD

enum *uart_config_stop_bits* stop_bits_client

stop_bits_client UART's stop bits setting if in client mode: UART_CFG_STOP_BITS_0_5, UART_CFG_STOP_BITS_1, UART_CFG_STOP_BITS_1_5, UART_CFG_STOP_BITS_2,

struct modbus_server_param

#include <*modbus.h*> Modbus server parameter.

Public Members

struct *modbus_user_callbacks* *user_cb

Pointer to the User Callback structure.

uint8_t unit_id

Modbus unit ID of the server.

struct modbus_raw_cb

#include <*modbus.h*>

struct modbus_iface_param

#include <*modbus.h*> User parameter structure to configure Modbus interface as client or server.

Public Members

enum *modbus_mode* mode

Mode of the interface.

uint32_t **rx_timeout**

Amount of time client will wait for a response from the server.

struct *modbus_serial_param* **serial**

Serial support parameter of the interface.

struct *modbus_raw_cb* **rawcb**

Pointer to raw ADU callback function.

4.17 Modem modules

This service provides modules necessary to communicate with modems.

Modems are self-contained devices that implement the hardware and software necessary to perform RF (Radio-Frequency) communication, including GNSS, Cellular, WiFi etc.

The modem modules are inter-connected dynamically using data-in/data-out pipes making them independently testable and highly flexible, ensuring stability and scalability.

4.17.1 Modem pipe

This module is used to abstract data-in/data-out communication over a variety of mechanisms, like UART and CMUX DLCI channels, in a thread-safe manner.

A modem backend will internally contain an instance of a modem_pipe structure, alongside any buffers and additional structures required to abstract away its underlying mechanism.

The modem backend will return a pointer to its internal modem_pipe structure when initialized, which will be used to interact with the backend through the modem pipe API.

group **modem_pipe**

Modem Pipe.

Typedefs

typedef void (***modem_pipe_api_callback**)(struct modem_pipe *pipe, enum *modem_pipe_event* event, void *user_data)

Enums

enum **modem_pipe_event**

Modem pipe event.

Values:

enumerator **MODEM_PIPE_EVENT_OPENED** = 0

enumerator **MODEM_PIPE_EVENT_RECEIVE_READY**

enumerator MODEM_PIPE_EVENT_TRANSMIT_IDLE

enumerator MODEM_PIPE_EVENT_CLOSED

Functions

int **modem_pipe_open**(struct modem_pipe *pipe, *k_timeout_t* timeout)

Open pipe.

> **Warning**
>
> Be cautious when using this synchronous version of the call. It may block the calling thread, which in the case of the system workqueue can result in a deadlock until this call times out waiting for the pipe to be open.

Parameters

- **pipe** – Pipe instance
- **timeout** – Timeout waiting for pipe to open

Return values

- **0** – if pipe was successfully opened or was already open
- **-errno** – code otherwise

int **modem_pipe_open_async**(struct modem_pipe *pipe)

Open pipe asynchronously.

> **Note**
>
> The MODEM_PIPE_EVENT_OPENED event is invoked immediately if pipe is already opened.

Parameters

- **pipe** – Pipe instance

Return values

- **0** – if pipe open was called successfully or pipe was already open
- **-errno** – code otherwise

void **modem_pipe_attach**(struct modem_pipe *pipe, *modem_pipe_api_callback* callback, void *user_data)

Attach pipe to callback.

> **Note**
>
> The MODEM_PIPE_EVENT_RECEIVE_READY event is invoked immediately if pipe has pending data ready to receive.

Parameters

- **pipe** – Pipe instance
- **callback** – Callback called when pipe event occurs
- **user_data** – Free to use user data passed with callback

int **modem_pipe_transmit**(struct modem_pipe *pipe, const uint8_t *buf, size_t size)

Transmit data through pipe.

Warning

This call must be non-blocking

Parameters

- **pipe** – Pipe to transmit through
- **buf** – Data to transmit
- **size** – Number of bytes to transmit

Return values

- **Number** – of bytes placed in pipe
- **-EPERM** – if pipe is closed
- **-errno** – code on error

int **modem_pipe_receive**(struct modem_pipe *pipe, uint8_t *buf, size_t size)

Receive data through pipe.

Warning

This call must be non-blocking

Parameters

- **pipe** – Pipe to receive from
- **buf** – Destination for received data; must not be already in use in a modem module.
- **size** – Capacity of destination for received data

Return values

- **Number** – of bytes received from pipe
- **-EPERM** – if pipe is closed
- **-errno** – code on error

void **modem_pipe_release**(struct modem_pipe *pipe)

Clear callback.

Parameters

- **pipe** – Pipe instance

int `modem_pipe_close`(struct modem_pipe *pipe, *k_timeout_t* timeout)

Close pipe.

Warning

Be cautious when using this synchronous version of the call. It may block the calling thread, which in the case of the system workqueue can result in a deadlock until this call times out waiting for the pipe to be closed.

Parameters

- `pipe` – Pipe instance
- `timeout` – Timeout waiting for pipe to close

Return values

- `0` – if pipe open was called closed or pipe was already closed
- `-errno` – code otherwise

int `modem_pipe_close_async`(struct modem_pipe *pipe)

Close pipe asynchronously.

Note

The MODEM_PIPE_EVENT_CLOSED event is invoked immediately if pipe is already closed.

Parameters

- `pipe` – Pipe instance

Return values

- `0` – if pipe close was called successfully or pipe was already closed
- `-errno` – code otherwise

4.17.2 Modem PPP

This module defines and binds a L2 PPP network interface, described in *L2 Layer Management*, to a modem backend. The L2 PPP interface sends and receives network packets. These network packets have to be wrapped in PPP frames before being transported via a modem backend. This module performs said wrapping.

group `modem_ppp`

Modem PPP.

Defines

`MODEM_PPP_DEFINE`(_name, _init_iface, _prio, _mtu, _buf_size)

Define a modem PPP module and bind it to a network interface.

This macro defines the modem_ppp instance, initializes a PPP L2 network device instance, and binds the modem_ppp instance to the PPP L2 instance.

Parameters

- **_name** – Name of the statically defined modem_ppp instance
- **_init_iface** – Hook for the PPP L2 network interface init function
- **_prio** – Initialization priority of the PPP L2 net iface
- **_mtu** – Max size of *net_pkt* data sent and received on PPP L2 net iface
- **_buf_size** – Size of partial PPP frame transmit and receive buffers

Typedefs

typedef void (***modem_ppp_init_iface**)(struct *net_if* *iface)

L2 network interface init callback.

Functions

int **modem_ppp_attach**(struct modem_ppp *ppp, struct modem_pipe *pipe)

Attach pipe to instance and connect.

Parameters

- **ppp** – Modem PPP instance
- **pipe** – Pipe to attach to modem PPP instance

struct *net_if* ***modem_ppp_get_iface**(struct modem_ppp *ppp)

Get network interface modem PPP instance is bound to.

Parameters

- **ppp** – Modem PPP instance

Returns

Pointer to network interface modem PPP instance is bound to

void **modem_ppp_release**(struct modem_ppp *ppp)

Release pipe from instance.

Parameters

- **ppp** – Modem PPP instance

4.17.3 Modem CMUX

This module is an implementation of CMUX following the 3GPP 27.010 specification. CMUX is a multiplexing protocol, allowing for multiple bi-directional streams of data, called DLCI channels. The module attaches to a single modem backend, exposing multiple modem backends, each representing a DLCI channel.

group **modem_cmux**

Modem CMUX.

Typedefs

typedef void (***modem_cmux_callback**)(struct modem_cmux *cmux, enum *modem_cmux_event* event, void *user_data)

Enums

enum **modem_cmux_event**

Values:

enumerator **MODEM_CMUX_EVENT_CONNECTED** = 0

enumerator **MODEM_CMUX_EVENT_DISCONNECTED**

Functions

void **modem_cmux_init**(struct modem_cmux *cmux, const struct *modem_cmux_config* *config)

Initialize CMUX instance.

Parameters

- **cmux** – CMUX instance
- **config** – Configuration to apply to CMUX instance

struct modem_pipe ***modem_cmux_dlci_init**(struct modem_cmux *cmux, struct modem_cmux_dlci *dlci, const struct *modem_cmux_dlci_config* *config)

Initialize DLCI instance and register it with CMUX instance.

Parameters

- **cmux** – CMUX instance which the DLCI will be registered to
- **dlci** – DLCI instance which will be registered and configured
- **config** – Configuration to apply to DLCI instance

int **modem_cmux_attach**(struct modem_cmux *cmux, struct modem_pipe *pipe)

Attach CMUX instance to pipe.

Parameters

- **cmux** – CMUX instance
- **pipe** – Pipe instance to attach CMUX instance to

int **modem_cmux_connect**(struct modem_cmux *cmux)

Connect CMUX instance.

This will send a CMUX connect request to target on the serial bus. If successful, DLCI channels can be now be opened using *modem_pipe_open()*

> **Note**
>
> When connected, the bus pipe must not be used directly

Parameters

- **cmux** – CMUX instance

int `modem_cmux_connect_async`(struct modem_cmux *cmux)

Connect CMUX instance asynchronously.

This will send a CMUX connect request to target on the serial bus. If successful, DLCI channels can be now be opened using *modem_pipe_open()*.

Note

When connected, the bus pipe must not be used directly

Parameters

- `cmux` – CMUX instance

int `modem_cmux_disconnect`(struct modem_cmux *cmux)

Close down and disconnect CMUX instance.

This will close all open DLCI channels, and close down the CMUX connection.

Note

The bus pipe must be released using *modem_cmux_release()* after disconnecting before being reused.

Parameters

- `cmux` – CMUX instance

int `modem_cmux_disconnect_async`(struct modem_cmux *cmux)

Close down and disconnect CMUX instance asynchronously.

This will close all open DLCI channels, and close down the CMUX connection.

Note

The bus pipe must be released using *modem_cmux_release()* after disconnecting before being reused.

Parameters

- `cmux` – CMUX instance

void `modem_cmux_release`(struct modem_cmux *cmux)

Release CMUX instance from pipe.

Releases the pipe and hard resets the CMUX instance internally. CMUX should be disconnected using *modem_cmux_disconnect()*.

Note

The bus pipe can be used directly again after CMUX instance is released.

Parameters

- `cmux` – CMUX instance

struct **modem_cmux_config**

#include <*cmux.h*> Contains CMUX instance configuration data.

Public Members

modem_cmux_callback **callback**

Invoked when event occurs.

void ***user_data**

Free to use pointer passed to event handler when invoked.

uint8_t ***receive_buf**

Receive buffer.

uint16_t **receive_buf_size**

Size of receive buffer in bytes [127, ...].

uint8_t ***transmit_buf**

Transmit buffer.

uint16_t **transmit_buf_size**

Size of transmit buffer in bytes [149, ...].

struct **modem_cmux_dlci_config**

#include <*cmux.h*> CMUX DLCI configuration.

Public Members

uint8_t **dlci_address**

DLCI channel address.

uint8_t ***receive_buf**

Receive buffer used by pipe.

uint16_t **receive_buf_size**

Size of receive buffer used by pipe [127, ...].

4.17.4 Modem pipelink

This module is used to share modem pipes globally. This module aims to decouple the creation and setup of modem pipes in device drivers from the users of said pipes. See drivers/modem/modem_at_shell.c and drivers/modem/modem_cellular.c for examples of how to use the modem pipelink between device driver and application.

group **modem_pipelink**

Modem pipelink.

MODEM_PIPELINK_DT_INST macros

Device driver instance variants of MODEM_PIPELINK_DT macros

`MODEM_PIPELINK_DT_INST_DECLARE`(inst, name)

`MODEM_PIPELINK_DT_INST_DEFINE`(inst, name)

`MODEM_PIPELINK_DT_INST_GET`(inst, name)

Defines

`MODEM_PIPELINK_DT_DECLARE`(node_id, name)

Declare pipelink from devicetree node identifier and name.

Parameters

- `node_id` – Devicetree node identifier
- `name` – Pipelink name

`MODEM_PIPELINK_DT_DEFINE`(node_id, name)

Define pipelink from devicetree node identifier and name.

Parameters

- `node_id` – Devicetree node identifier
- `name` – Pipelink name

`MODEM_PIPELINK_DT_GET`(node_id, name)

Get pointer to pipelink from devicetree node identifier and name.

Parameters

- `node_id` – Devicetree node identifier
- `name` – Pipelink name

Typedefs

typedef void (*`modem_pipelink_callback`)(struct modem_pipelink *link, enum *modem_pipelink_event* event, void *user_data)

Pipelink callback definition.

Param link
Modem pipelink instance

Param event
Modem pipelink event

Param user_data
User data passed to *modem_pipelink_attach()*

Enums

enum `modem_pipelink_event`

Pipelink event.

Values:

enumerator `MODEM_PIPELINK_EVENT_CONNECTED` = 0

Modem pipe has been connected and can be opened.

enumerator `MODEM_PIPELINK_EVENT_DISCONNECTED`

Modem pipe has been disconnected and can't be opened.

Functions

void `modem_pipelink_attach`(struct modem_pipelink *link, *modem_pipelink_callback* callback, void *user_data)

Attach callback to pipelink.

Parameters

- `link` – Pipelink instance
- `callback` – Pipelink callback
- `user_data` – User data passed to pipelink callback

bool `modem_pipelink_is_connected`(struct modem_pipelink *link)

Check whether pipelink pipe is connected.

Parameters

- `link` – Pipelink instance

Return values

- `true` – if pipe is connected
- `false` – if pipe is not connected

struct modem_pipe *`modem_pipelink_get_pipe`(struct modem_pipelink *link)

Get pipe from pipelink.

Parameters

- `link` – Pipelink instance

Return values

- `Pointer` – to pipe if pipelink has been initialized
- `NULL` – if pipelink has not been initialized

void `modem_pipelink_release`(struct modem_pipelink *link)

Clear callback.

Parameters

- `link` – Pipelink instance

4.18 Asynchronous Notifications

Zephyr APIs often include *async* functions where an operation is initiated and the application needs to be informed when it completes, and whether it succeeded. Using *k_poll()* is often a good method, but some application architectures may be more suited to a callback notification, and operations like enabling clocks and power rails may need to be invoked before kernel functions are available so a busy-wait for completion may be needed.

This API is intended to be embedded within specific subsystems such as *On-Off Manager* and other APIs that support async transactions. The subsystem wrappers are responsible for extracting operation-specific data from requests that include a notification element, and for invoking callbacks with the parameters required by the API.

A limitation is that this API is not suitable for *System Calls* because:

- *sys_notify* is not a kernel object;
- copying the notification content from userspace will break use of *CONTAINER_OF* in the implementing function;
- neither the spin-wait nor callback notification methods can be accepted from userspace callers.

Where a notification is required for an asynchronous operation invoked from a user mode thread the subsystem or driver should provide a syscall API that uses *k_poll_signal* for notification.

4.18.1 API Reference

group sys_notify_apis

Typedefs

typedef void (*sys_notify_generic_callback)()

Generic signature used to notify of result completion by callback.

Functions with this role may be invoked from any context including pre-kernel, ISR, or cooperative or pre-emptible threads. Compatible functions must be isr-ok and not sleep.

Parameters that should generally be passed to such functions include:

- a pointer to a specific client request structure, i.e. the one that contains the *sys_notify* structure.
- the result of the operation, either as passed to *sys_notify_finalize()* or extracted afterwards using *sys_notify_fetch_result()*. Expected values are service-specific, but the value shall be non-negative if the operation succeeded, and negative if the operation failed.

Functions

static inline uint32_t sys_notify_get_method(const struct *sys_notify* *notify)

int **sys_notify_validate**(struct *sys_notify* *notify)

Validate and initialize the notify structure.

This should be invoked at the start of any service-specific configuration validation. It ensures that the basic asynchronous notification configuration is consistent, and clears the result.

Note that this function does not validate extension bits (zeroed by async notify API init functions like *sys_notify_init_callback()*). It may fail to recognize that an uninitialized structure has been passed because only method bits of flags are tested against method settings. To reduce the chance of accepting an uninitialized operation service validation of structures that contain an *sys_notify* instance should confirm that the extension bits are set or cleared as expected.

Return values

- **0** – on successful validation and reinitialization
- **-EINVAL** – if the configuration is not valid.

sys_notify_generic_callback **sys_notify_finalize**(struct *sys_notify* *notify, int res)

Record and signal the operation completion.

Parameters

- **notify** – pointer to the notification state structure.
- **res** – the result of the operation. Expected values are service-specific, but the value shall be non-negative if the operation succeeded, and negative if the operation failed.

Returns

If the notification is to be done by callback this returns the generic version of the function to be invoked. The caller must immediately invoke that function with whatever arguments are expected by the callback. If notification is by spin-wait or signal, the notification has been completed by the point this function returns, and a null pointer is returned.

static inline int **sys_notify_fetch_result**(const struct *sys_notify* *notify, int *result)

Check for and read the result of an asynchronous operation.

Parameters

- **notify** – pointer to the object used to specify asynchronous function behavior and store completion information.
- **result** – pointer to storage for the result of the operation. The result is stored only if the operation has completed.

Return values

- **0** – if the operation has completed.
- **-EAGAIN** – if the operation has not completed.

static inline void **sys_notify_init_spinwait**(struct *sys_notify* *notify)

Initialize a notify object for spin-wait notification.

Clients that use this initialization receive no asynchronous notification, and instead must periodically check for completion using *sys_notify_fetch_result()*.

On completion of the operation the client object must be reinitialized before it can be re-used.

Parameters

- **notify** – pointer to the notification configuration object.

static inline void **sys_notify_init_signal**(struct *sys_notify* *notify, struct *k_poll_signal* *sigp)

Initialize a notify object for (k_poll) signal notification.

Clients that use this initialization will be notified of the completion of operations through the provided signal.

On completion of the operation the client object must be reinitialized before it can be re-used.

Note

This capability is available only when `CONFIG_POLL` is selected.

Parameters

- **notify** – pointer to the notification configuration object.
- **sigp** – pointer to the signal to use for notification. The value must not be null. The signal must be reset before the client object is passed to the on-off service API.

static inline void **sys_notify_init_callback**(struct *sys_notify* *notify, *sys_notify_generic_callback* handler)

Initialize a notify object for callback notification.

Clients that use this initialization will be notified of the completion of operations through the provided callback. Note that callbacks may be invoked from various contexts depending on the specific service; see *sys_notify_generic_callback*.

On completion of the operation the client object must be reinitialized before it can be re-used.

Parameters

- **notify** – pointer to the notification configuration object.
- **handler** – a function pointer to use for notification.

static inline bool **sys_notify_uses_callback**(const struct *sys_notify* *notify)

Detect whether a particular notification uses a callback.

The generic handler does not capture the signature expected by the callback, and the translation to a service-specific callback must be provided by the service. This check allows abstracted services to reject callback notification requests when the service doesn't provide a translation function.

Returns

true if and only if a callback is to be used for notification.

struct **sys_notify**

#include <notify.h> State associated with notification for an asynchronous operation.

Objects of this type are allocated by a client, which must use an initialization function (e.g. *sys_notify_init_signal()*) to configure them. Generally the structure is a member of a service-specific client structure, such as *onoff_client*.

Control of the containing object transfers to the service provider when a pointer to the object is passed to a service function that is documented to take control of the object, such as onoff_service_request(). While the service provider controls the object the client must not change any object fields. Control reverts to the client:

- if the call to the service API returns an error;

- when operation completion is posted. This may occur before the call to the service API returns.

Operation completion is technically posted when the flags field is updated so that *sys_notify_fetch_result()* returns success. This will happen before the signal is posted or callback is invoked. Note that although the manager will no longer reference the *sys_notify* object past this point, the containing object may have state that will be referenced within the callback. Where callbacks are used control of the containing object does not revert to the client until the callback has been invoked. (Re-use within the callback is explicitly permitted.)

After control has reverted to the client the notify object must be reinitialized for the next operation.

The content of this structure is not public API to clients: all configuration and inspection should be done with functions like *sys_notify_init_callback()* and *sys_notify_fetch_result()*. However, services that use this structure may access certain fields directly.

union `method`

#include <notify.h>

4.19 Power Management

Zephyr RTOS power management subsystem provides several means for a system integrator to implement power management support that can take full advantage of the power saving features of SOCs.

4.19.1 Overview

The interfaces and APIs provided by the power management subsystem are designed to be architecture and SOC independent. This enables power management implementations to be easily adapted to different SOCs and architectures.

The architecture and SOC independence is achieved by separating the core PM infrastructure from implementations of the SOC specific components. Thus a coherent abstraction is presented to the rest of the OS and the application layer.

The power management features are classified into the following categories.

- System Power Management
- Device Power Management

4.19.2 System Power Management

Introduction

The kernel enters the idle state when it has nothing to schedule. Enabling `CONFIG_PM` allows the kernel to call upon the power management subsystem to put an idle system into one of the supported power states. The kernel requests an amount of time it would like to suspend, then the PM subsystem decides the appropriate power state to transition to based on the configured power management policy.

It is the application's responsibility to set up a wake-up event. A wake-up event will typically be an interrupt triggered by an SoC peripheral module. Examples include a SysTick, RTC, counter, or GPIO. Keep in mind that depending on the SoC and the power mode in question, not all peripherals may be active, and therefore some wake-up sources may not be usable in all power modes.

The following diagram describes system power management:

Power States The power management subsystem defines a set of states described by the power consumption and context retention associated with each of them.

The set of power states is defined by *pm_state*. In general, lower power states (higher index in the enum) will offer greater power savings and have higher wake latencies.

Power Management Policies The power management subsystem supports the following power management policies:

- Residency based
- Application defined

The policy manager is the component of the power management subsystem responsible for deciding which power state the system should transition to. The policy manager can only choose between states that have been defined for the platform. Other constraints placed upon the decision may include locks disallowing certain power states, or various kinds of minimum and maximum latency values, depending on the policy.

More details on the states definition can be found in the `zephyr,power-state` binding documentation.

Residency Under the residency policy, the system will enter the power state which offers the highest power savings, with the constraint that the sum of the minimum residency value (see `zephyr,power-state`) and the latency to exit the mode must be less than or equal to the system idle time duration scheduled by the kernel.

Thus the core logic can be summarized with the following expression:

```
if (time_to_next_scheduled_event >= (state.min_residency_us + state.exit_latency)) {
   return state
}
```

Application The application defines the power management policy by implementing the `pm_policy_next_state()` function. In this policy, the application is free to decide which power state the system should transition to based on the remaining time until the next scheduled timeout.

An example of an application that defines its own policy can be found in tests/subsys/pm/power_mgmt/.

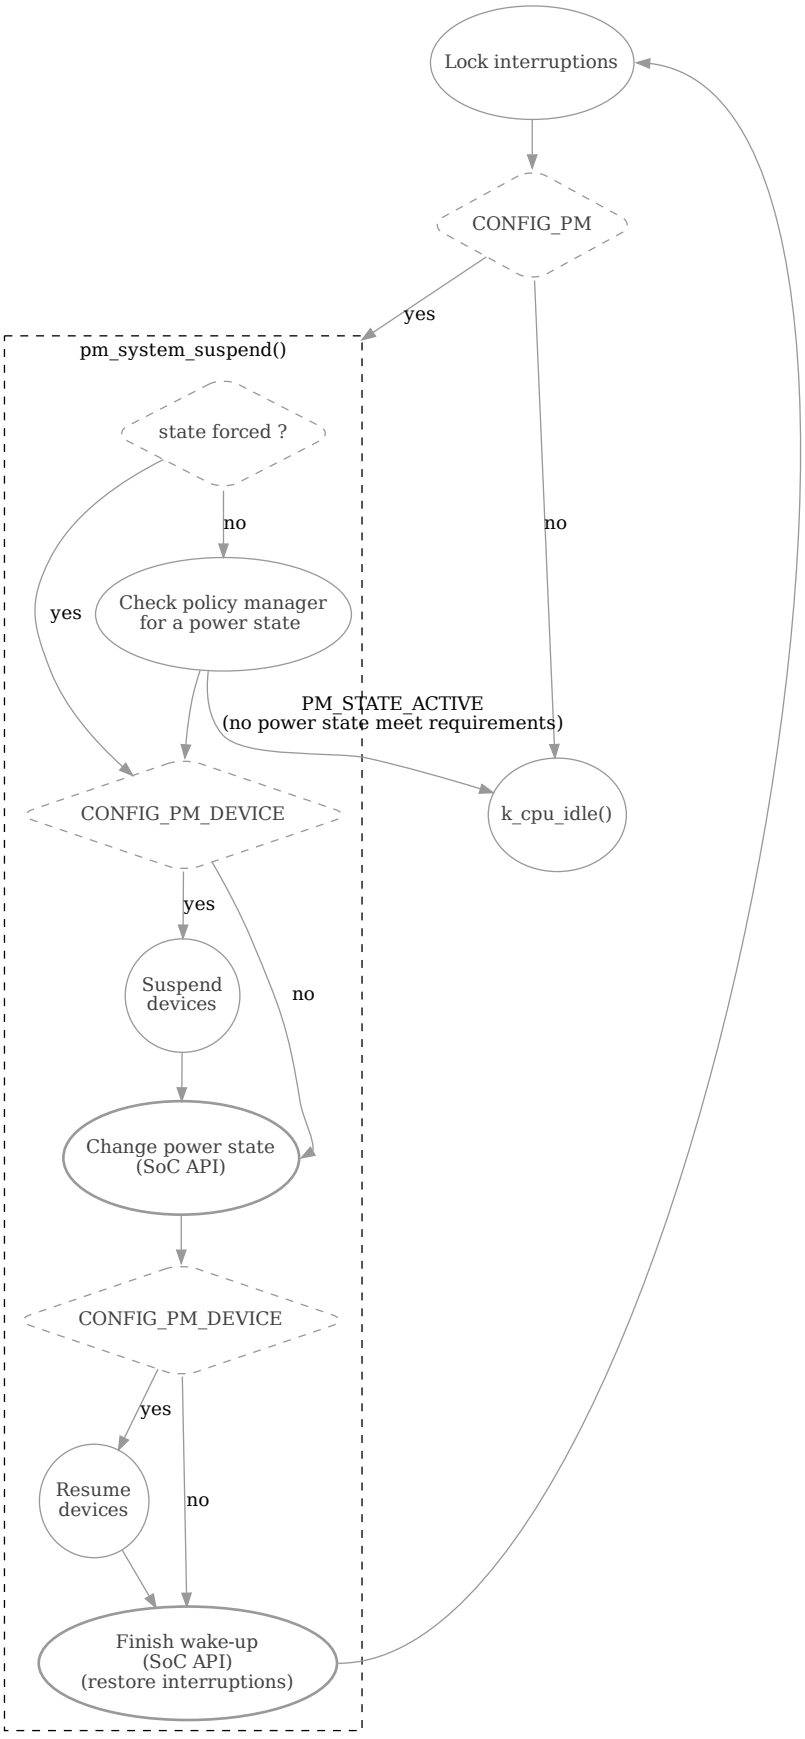

Fig. 7: System power management

Policy and Power States The power management subsystem allows different Zephyr components and applications to configure the policy manager to block the system from transitioning into certain power states. This can be used by devices when executing tasks in background to prevent the system from going to a specific state where it would lose context. See *pm_policy_state_lock_get()*.

Examples Some helpful examples showing different power management features:

- samples/boards/stm32/power_mgmt/blinky/
- samples/boards/esp32/deep_sleep/
- samples/subsys/pm/device_pm/
- tests/subsys/pm/power_mgmt/
- tests/subsys/pm/power_mgmt_soc/
- tests/subsys/pm/power_states_api/

4.19.3 Device Power Management

Introduction

Device power management (PM) on Zephyr is a feature that enables devices to save energy when they are not being used. This feature can be enabled by setting `CONFIG_PM_DEVICE` to `y`. When this option is selected, device drivers implementing power management will be able to take advantage of the device power management subsystem.

Zephyr supports two methods of device power management:

- *Device Runtime Power Management*
- *System-Managed Device Power Management*

Device Runtime Power Management Device runtime power management involves coordinated interaction between device drivers, subsystems, and applications. While device drivers play a crucial role in directly controlling the power state of devices, the decision to suspend or resume a device can also be influenced by higher layers of the software stack.

Each layer—device drivers, subsystems, and applications—can operate independently without needing to know about the specifics of the other layers because the subsystem uses reference count to check when it needs to suspend or resume a device.

- **Device drivers** are responsible for managing the power state of devices. They interact directly with the hardware to put devices into low-power states (suspend) when they are not in use, and bring them back (resume) when needed. Drivers should use the *device runtime power management APIs* provided by Zephyr to control the power state of devices.
- **Subsystems**, such as sensors, file systems, and network, can also influence device power management. Subsystems may have better knowledge about the overall system state and workload, allowing them to make informed decisions about when to suspend or resume devices. For example, a networking subsystem may decide to keep a network interface powered on if it expects network activity in the near future.
- **Applications** running on Zephyr can impact device power management as well. An application may have specific requirements regarding device usage and power consumption. For example, an application that streams data over a network may need to keep the network interface powered on continuously.

Coordination between device drivers, subsystems, and applications is key to efficient device power management. For example, a device driver may not know that a subsystem will perform a series of sequential operations that require a device to remain powered on. In such cases, the subsystem can use device runtime power management to ensure that the device remains in an active state until the operations are complete.

When using this Device Runtime Power Management, the System Power Management subsystem is able to change power states quickly because it does not need to spend time suspending and resuming devices that are runtime enabled.

For more information, see *Device Runtime Power Management*.

System-Managed Device Power Management The system managed device power management (PM) framework is a method where devices are suspended along with the system entering a CPU (or SoC) power state. It can be enabled by setting `CONFIG_PM_DEVICE_SYSTEM_MANAGED`. When using this method, device power management is mostly done inside `pm_system_suspend()`.

If a decision to enter a CPU lower power state is made, the power management subsystem will check if the selected low power state triggers device power management and then suspend devices before changing state. The subsystem takes care of suspending devices following their initialization order, ensuring that possible dependencies between them are satisfied. As soon as the CPU wakes up from a sleep state, devices are resumed in the opposite order that they were suspended.

The decision about suspending devices when entering a low power state is done based on the state and if it has set the property `zephyr,pm-device-disabled`. Here is an example of a target with two low power states with only one triggering device power management:

```
/* Node in a DTS file */
cpus {
     power-states {
             state0: state0 {
                     compatible = "zephyr,power-state";
                     power-state-name = "standby";
                     min-residency-us = <5000>;
                     exit-latency-us = <240>;
                     zephyr,pm-device-disabled;
             };
             state1: state1 {
                     compatible = "zephyr,power-state";
                     power-state-name = "suspend-to-ram";
                     min-residency-us = <8000>;
                     exit-latency-us = <360>;
             };
     };
};
```

Note

When using *System Power Management*, device transitions can be run from the idle thread. As functions in this context cannot block, transitions that intend to use blocking APIs **must** check whether they can do so with *k_can_yield()*.

This method of device power management can be useful in the following scenarios:

- Systems with no device requiring any blocking operations when suspending and resuming. This implementation is reasonably simpler than device runtime power management.
- For devices that can not make any power management decision and have to be always active. For example a firmware using Zephyr that is controlled by an external entity (e.g

Host CPU). In this scenario, some devices have to be always active and should be suspended together with the SoC when requested by this external entity.

It is important to emphasize that this method has drawbacks (see above) and *Device Runtime Power Management* is the **preferred** method for implementing device power management.

Note

When using this method of device power management, the CPU will not enter a low-power state if a device cannot be suspended. For example, if a device returns an error such as `-EBUSY` in response to the `PM_DEVICE_ACTION_SUSPEND` action, indicating it is in the middle of a transaction that cannot be interrupted. Another condition that prevents the CPU from entering a low-power state is if the option `CONFIG_PM_NEED_ALL_DEVICES_IDLE` is set and a device is marked as busy.

Note

Devices are suspended only when the last active core is entering a low power state and devices are resumed by the first core that becomes active.

Device Power Management States

The power management subsystem defines device states in *pm_device_state*. This method is used to track power states of a particular device. It is important to emphasize that, although the state is tracked by the subsystem, it is the responsibility of each device driver to handle device actions(*pm_device_action*) which change device state.

Each *pm_device_action* have a direct an unambiguous relationship with a *pm_device_state*.

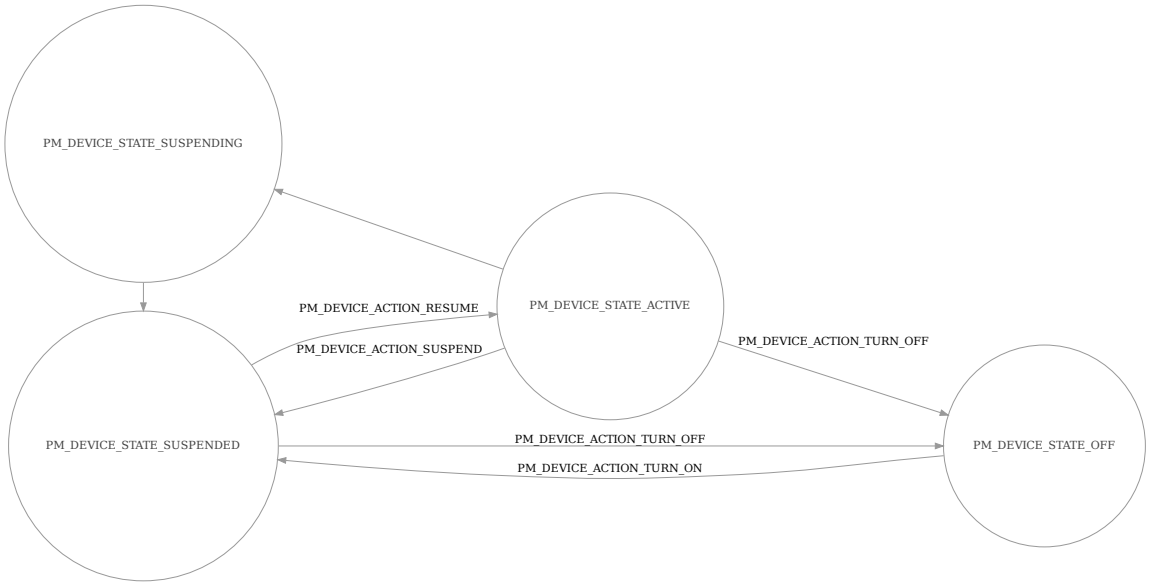

Fig. 8: Device actions x states

As mentioned above, device drivers do not directly change between these states. This is entirely done by the power management subsystem. Instead, drivers are responsible for implementing any hardware-specific tasks needed to handle state changes.

Device Model with Power Management Support

Drivers initialize devices using macros. See *Device Driver Model* for details on how these macros are used. A driver which implements device power management support must provide these macros with arguments that describe its power management implementation.

Use *PM_DEVICE_DEFINE* or *PM_DEVICE_DT_DEFINE* to define the power management resources required by a driver. These macros allocate the driver-specific state which is required by the power management subsystem.

Drivers can use *PM_DEVICE_GET* or *PM_DEVICE_DT_GET* to get a pointer to this state. These pointers should be passed to DEVICE_DEFINE or DEVICE_DT_DEFINE to initialize the power management field in each *device*.

Here is some example code showing how to implement device power management support in a device driver.

```
#define DT_DRV_COMPAT dummy_device

static int dummy_driver_pm_action(const struct device *dev,
                                  enum pm_device_action action)
{
    switch (action) {
    case PM_DEVICE_ACTION_SUSPEND:
        /* suspend the device */
        ...
        break;
    case PM_DEVICE_ACTION_RESUME:
        /* resume the device */
        ...
        break;
    case PM_DEVICE_ACTION_TURN_ON:
        /*
         * powered on the device, used when the power
         * domain this device belongs is resumed.
         */
        ...
        break;
    case PM_DEVICE_ACTION_TURN_OFF:
        /*
         * power off the device, used when the power
         * domain this device belongs is suspended.
         */
        ...
        break;
    default:
        return -ENOTSUP;
    }

    return 0;
}

PM_DEVICE_DT_INST_DEFINE(0, dummy_driver_pm_action);

DEVICE_DT_INST_DEFINE(0, &dummy_init,
    PM_DEVICE_DT_INST_GET(0), NULL, NULL, POST_KERNEL,
    CONFIG_KERNEL_INIT_PRIORITY_DEFAULT, NULL);
```

Shell Commands

Power management actions can be triggered from shell commands for testing purposes. To do that, enable the CONFIG_PM_DEVICE_SHELL option and issue a pm command on a device from the

shell, for example:

```
uart:~$ device list
- buttons (active)
uart:~$ pm suspend buttons
uart:~$ device list
devices:
- buttons (suspended)
```

To print the power management state of a device, enable `CONFIG_DEVICE_SHELL` and use the `device list` command, for example:

```
uart:~$ device list
devices:
- i2c@40003000 (active)
- buttons (active, usage=1)
- leds (READY)
```

In this case, `leds` does not support PM, `i2c` supports PM with manual suspend and resume actions and it's currently active, `buttons` supports runtime PM and it's currently active with one user.

Busy Status Indication

When the system is idle and the SoC is going to sleep, the power management subsystem can suspend devices, as described in *System-Managed Device Power Management*. This can cause device hardware to lose some states. Suspending a device which is in the middle of a hardware transaction, such as writing to a flash memory, may lead to undefined behavior or inconsistent states. This API guards such transactions by indicating to the kernel that the device is in the middle of an operation and should not be suspended.

When *pm_device_busy_set()* is called, the device is marked as busy and the system will not do power management on it. After the device is no longer doing an operation and can be suspended, it should call *pm_device_busy_clear()*.

Device Power Management X System Power Management

When managing power in embedded systems, it's crucial to understand the interplay between device power state and the overall system power state. Some devices may have dependencies on the system power state. For example, certain low-power states of the SoC might not supply power to peripheral devices, leading to problems if the device is in the middle of an operation. Proper coordination is essential to maintain system stability and data integrity.

To avoid this sort of problem, devices must *get and release lock* power states that cause power loss during an operation.

Zephyr provides a mechanism for devices to declare which power states cause power loss and an API that automatically get and put lock on them. This feature is enabled setting `CONFIG_PM_POLICY_DEVICE_CONSTRAINTS` to `y`.

Once this feature is enabled, devices must declare in devicetree which states cause power loss. In the following example, device `test_dev` says that power states `state1` and `state2` cause power loss.

```
power-states {
        state0: state0 {
                compatible = "zephyr,power-state";
                power-state-name = "suspend-to-idle";
                min-residency-us = <10000>;
                exit-latency-us = <100>;
```

(continues on next page)

(continued from previous page)

```
        };

        state1: state1 {
                compatible = "zephyr,power-state";
                power-state-name = "standby";
                min-residency-us = <20000>;
                exit-latency-us = <200>;
        };

        state2: state2 {
                compatible = "zephyr,power-state";
                power-state-name = "suspend-to-ram";
                min-residency-us = <50000>;
                exit-latency-us = <500>;
        };

        state3: state3 {
                compatible = "zephyr,power-state";
                power-state-name = "suspend-to-ram";
                status = "disabled";
        };
};

test_dev: test_dev {
        compatible = "test-device-pm";
        status = "okay";
        zephyr,disabling-power-states = <&state1 &state2>;
};
```

After that devices can lock these state calling *pm_policy_device_power_lock_get()* and release with *pm_policy_device_power_lock_put()*. For example:

```
static void timer_expire_cb(struct k_timer *timer)
{
       struct test_driver_data *data = k_timer_user_data_get(timer);

       data->ongoing = false;
       k_timer_stop(timer);
       pm_policy_device_power_lock_put(data->self);
}

void test_driver_async_operation(const struct device *dev)
{
       struct test_driver_data *data = dev->data;

       data->ongoing = true;
       pm_policy_device_power_lock_get(dev);

       /** Lets set a timer big enough to ensure that any deep
        *  sleep state would be suitable but constraints will
        *  make only state0 (suspend-to-idle) will be used.
        */
       k_timer_start(&data->timer, K_MSEC(500), K_NO_WAIT);
}
```

Wakeup capability

Some devices are capable of waking the system up from a sleep state. When a device has such capability, applications can enable or disable this feature on a device dynamically using *pm_device_wakeup_enable()*.

This property can be set on device declaring the property `wakeup-source` in the device node in devicetree. For example, this devicetree fragment sets the `gpio0` device as a "wakeup" source:

```
gpio0: gpio@40022000 {
        compatible = "ti,cc13xx-cc26xx-gpio";
        reg = <0x40022000 0x400>;
        interrupts = <0 0>;
        status = "disabled";
        label = "GPIO_0";
        gpio-controller;
        wakeup-source;
        #gpio-cells = <2>;
};
```

By default, "wakeup" capable devices do not have this functionality enabled during the device initialization. Applications can enable this functionality later calling *pm_device_wakeup_enable()*.

Note

This property is **only** used by the system power management to identify devices that should not be suspended. It is responsibility of driver or the application to do any additional configuration required by the device to support it.

Examples

Some helpful examples showing device power management features:

4.19.4 Device Runtime Power Management

Introduction

The device runtime power management (PM) framework is an active power management mechanism which reduces the overall system power consumption by suspending the devices which are idle or not used independently of the system state. It can be enabled by setting `CONFIG_PM_DEVICE_RUNTIME`. In this model the device driver is responsible to indicate when it needs the device and when it does not. This information is used to determine when to suspend or resume a device based on usage count.

When device runtime power management is enabled on a device, its state will be initially set to a *PM_DEVICE_STATE_SUSPENDED* indicating it is not used. On the first device request, it will be resumed and so put into the *PM_DEVICE_STATE_ACTIVE* state. The device will remain in this state until it is no longer used. At this point, the device will be suspended until the next device request. If the suspension is performed synchronously the device will be immediately put into the *PM_DEVICE_STATE_SUSPENDED* state, whereas if it is performed asynchronously, it will be put into the *PM_DEVICE_STATE_SUSPENDING* state first and then into the *PM_DEVICE_STATE_SUSPENDED* state when the action is run.

For devices on a power domain (via the devicetree 'power-domain' property), device runtime power management automatically attempts to request and release the dependent domain in response to *pm_device_runtime_get()* and *pm_device_runtime_put()* calls on the child device.

For the previous to automatically control the power domain state, device runtime PM must be enabled on the power domain device (either through the *zephyr,pm-device-runtime-auto* device-tree property or `pm_device_runtime_enable()`).

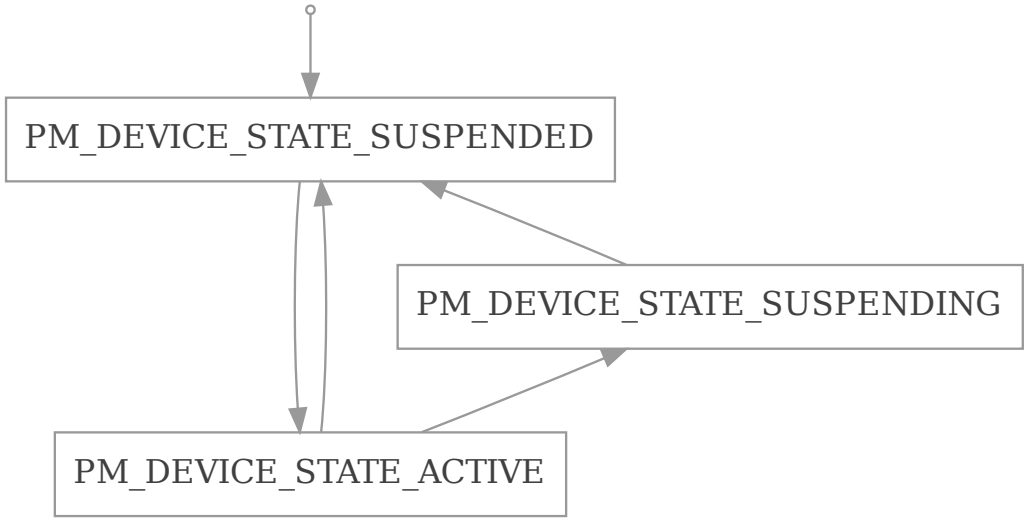

Fig. 9: Device states and transitions

The device runtime power management framework has been designed to minimize devices power consumption with minimal application work. Device drivers are responsible for indicating when they need the device to be operational and when they do not. Therefore, applications can not manually suspend or resume a device. An application can, however, decide when to disable or enable runtime power management for a device. This can be useful, for example, if an application wants a particular device to be always active.

Design principles

When runtime PM is enabled on a device it will no longer be resumed or suspended during system power transitions. Instead, the device is fully responsible to indicate when it needs a device and when it does not. The device runtime PM API uses reference counting to keep track of device's usage. This allows the API to determine when a device needs to be resumed or suspended. The API uses the *get* and *put* terminology to indicate when a device is needed or not, respectively. This mechanism plays a key role when we account for device dependencies. For example, if a bus device is used by multiple sensors, we can keep the bus active until the last sensor has finished using it.

Note

As of today, the device runtime power management API does not manage device dependencies. This effectively means that, if a device depends on other devices to operate (e.g. a sensor may depend on a bus device), the bus will be resumed and suspended on every transaction. In general, it is more efficient to keep parent devices active when their children are used, since the children may perform multiple transactions in a short period of time. Until this feature is added, devices can manually *get* or *put* their dependencies.

The *pm_device_runtime_get()* function can be used by a device driver to indicate it *needs* the device to be active or operational. This function will increase device usage count and resume the device if necessary. Similarly, the *pm_device_runtime_put()* function can be used to indicate that the device is no longer needed. This function will decrease the device usage count and suspend the device if necessary. It is worth to note that in both cases, the operation is carried out synchronously. The sequence diagram shown below illustrates how a device can use this API and the expected sequence of events.

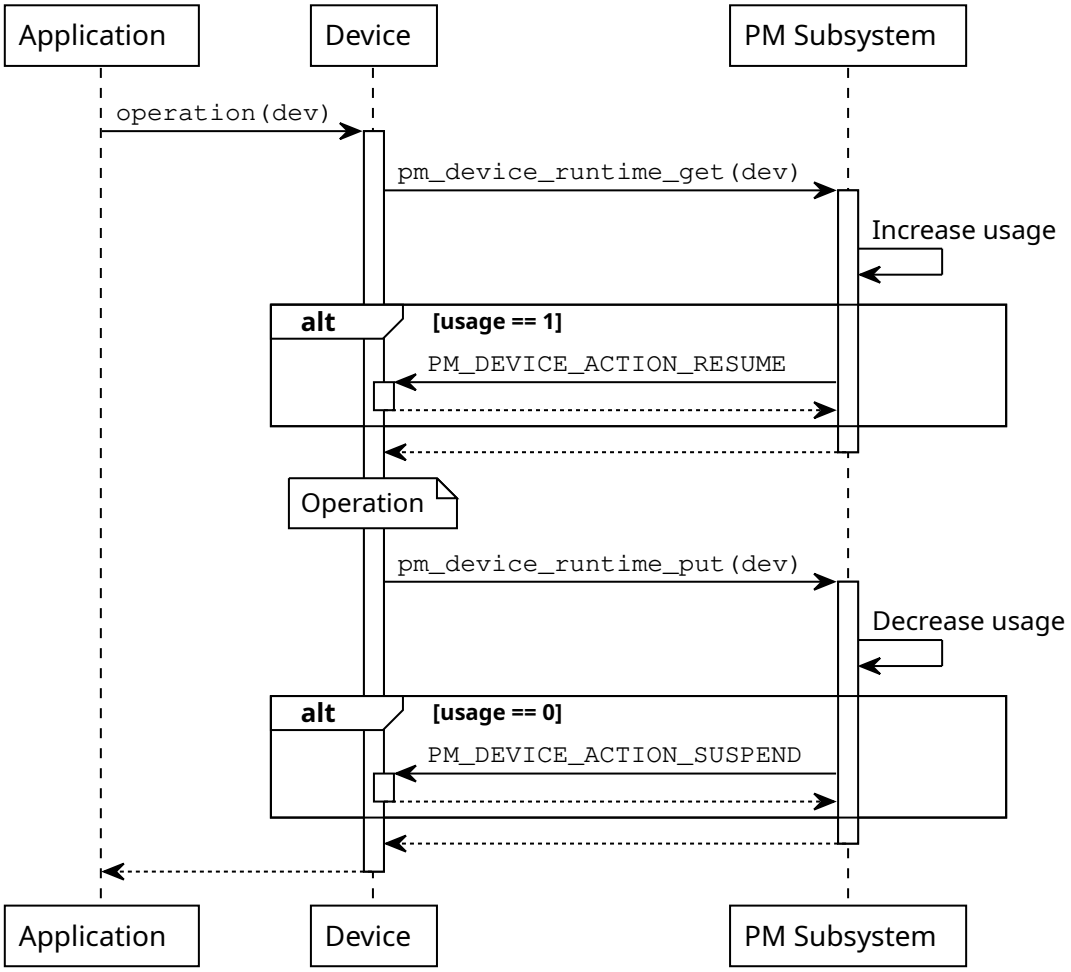

Fig. 10: Synchronous operation on a single device

The synchronous model is as simple as it gets. However, it may introduce unnecessary delays since the application will not get the operation result until the device is suspended (in case device is no longer used). It will likely not be a problem if the operation is fast, e.g. a register toggle. However, the situation will not be the same if suspension involves sending packets through a slow bus. For this reason the device drivers can also make use of the *pm_device_runtime_put_async()* function. This function will schedule the suspend operation, again, if device is no longer used. The suspension will then be carried out when the system work queue gets the chance to run. The sequence diagram shown below illustrates this scenario.

Implementation guidelines

In a first place, a device driver needs to implement the PM action callback used by the PM subsystem to suspend or resume devices.

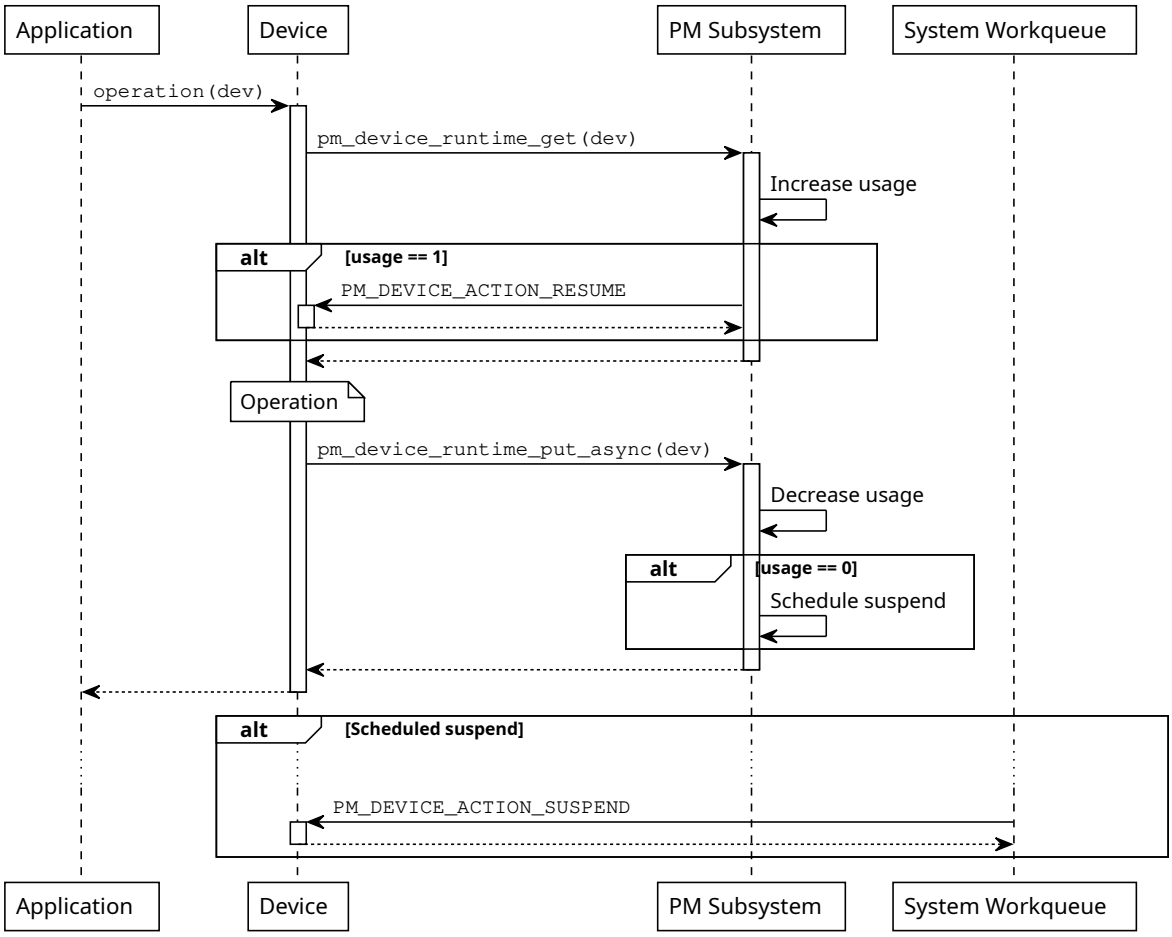

Fig. 11: Asynchronous operation on a single device

```
static int mydev_pm_action(const struct device *dev,
                           enum pm_device_action *action)
{
    switch (action) {
    case PM_DEVICE_ACTION_SUSPEND:
        /* suspend the device */
        ...
        break;
    case PM_DEVICE_ACTION_RESUME:
        /* resume the device */
        ...
        break;
    default:
        return -ENOTSUP;
    }

    return 0;
}
```

The PM action callback calls are serialized by the PM subsystem, therefore, no special synchronization is required.

To enable device runtime power management on a device, the driver needs to call *pm_device_runtime_enable()* at initialization time. Note that this function will suspend the device if its state is *PM_DEVICE_STATE_ACTIVE*. In case the device is physically suspended, the init function should call *pm_device_init_suspended()* before calling *pm_device_runtime_enable()*.

```
/* device driver initialization function */
static int mydev_init(const struct device *dev)
{
    int ret;
    ...

    /* OPTIONAL: mark device as suspended if it is physically suspended */
    pm_device_init_suspended(dev);

    /* enable device runtime power management */
    ret = pm_device_runtime_enable(dev);
    if ((ret < 0) && (ret != -ENOSYS)) {
        return ret;
    }
}
```

Device runtime power management can also be automatically enabled on a device instance by adding the `zephyr,pm-device-runtime-auto` flag onto the corresponding devicetree node. If enabled, *pm_device_runtime_enable()* is called immediately after the `init` function of the device runs and returns successfully.

```
foo {
    /* ... */
    zephyr,pm-device-runtime-auto;
};
```

Assuming an example device driver that implements an `operation` API call, the *get* and *put* operations could be carried out as follows:

```
static int mydev_operation(const struct device *dev)
{
    int ret;

    /* "get" device (increases usage count, resumes device if suspended) */
    ret = pm_device_runtime_get(dev);
```

(continues on next page)

(continued from previous page)

```
    if (ret < 0) {
        return ret;
    }

    /* do something with the device */
    ...

    /* "put" device (decreases usage count, suspends device if no more users) */
    return pm_device_runtime_put(dev);
}
```

In case the suspend operation is *slow*, the device driver can use the asynchronous API:

```
static int mydev_operation(const struct device *dev)
{
    int ret;

    /* "get" device (increases usage count, resumes device if suspended) */
    ret = pm_device_runtime_get(dev);
    if (ret < 0) {
        return ret;
    }

    /* do something with the device */
    ...

    /* "put" device (decreases usage count, schedule suspend if no more users) */
    return pm_device_runtime_put_async(dev, K_NO_WAIT);
}
```

Examples

Some helpful examples showing device runtime power management features:

- tests/subsys/pm/device_runtime_api/
- tests/subsys/pm/device_power_domains/
- tests/subsys/pm/power_domain/

4.19.5 Power Domain

Introduction

The Zephyr power domain abstraction is designed to support groupings of devices powered by a common source to be notified of power source state changes in a generic fashion. Application code that is using device A does not need to know that device B is on the same power domain and should also be configured into a low power state.

Power domains are optional on Zephyr, to enable this feature the option `CONFIG_PM_DEVICE_POWER_DOMAIN` has to be set.

When a power domain turns itself on or off, it is the responsibility of the power domain to notify all devices using it through their power management callback called with *PM_DEVICE_ACTION_TURN_ON* or *PM_DEVICE_ACTION_TURN_OFF* respectively. This work flow is illustrated in the diagram below.

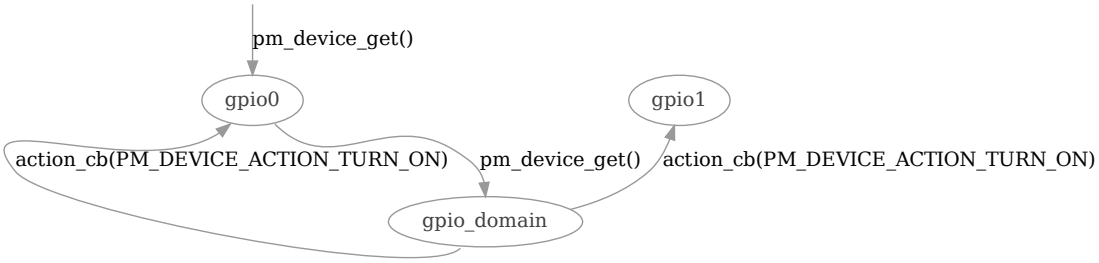

Fig. 12: Power domain work flow

Internal Power Domains Most of the devices in an SoC have independent power control that can be turned on or off to reduce power consumption. But there is a significant amount of static current leakage that can't be controlled only using device power management. To solve this problem, SoCs normally are divided into several regions grouping devices that are generally used together, so that an unused region can be completely powered off to eliminate this leakage. These regions are called "power domains", can be present in a hierarchy and can be nested.

External Power Domains Devices external to a SoC can be powered from sources other than the main power source of the SoC. These external sources are typically a switch, a regulator, or a dedicated power IC. Multiple devices can be powered from the same source, and this grouping of devices is typically called a "power domain".

Placing devices on power domains can be done for a variety of reasons, including to enable devices with high power consumption in low power mode to be completely turned off when not in use.

Implementation guidelines

In a first place, a device that acts as a power domain needs to declare compatible with `power-domain`. Taking *Power domain work flow* as example, the following code defines a domain called `gpio_domain`.

```
gpio_domain: gpio_domain@4 {
        compatible = "power-domain";
        ...
};
```

A power domain needs to implement the PM action callback used by the PM subsystem to turn devices on and off.

```
static int mydomain_pm_action(const struct device *dev,
                              enum pm_device_action *action)
{
    switch (action) {
    case PM_DEVICE_ACTION_RESUME:
        /* resume the domain */
        ...
        /* notify children domain is now powered */
        pm_device_children_action_run(dev, PM_DEVICE_ACTION_TURN_ON, NULL);
        break;
    case PM_DEVICE_ACTION_SUSPEND:
```

(continues on next page)

(continued from previous page)

```
        /* notify children domain is going down */
        pm_device_children_action_run(dev, PM_DEVICE_ACTION_TURN_OFF, NULL);
        /* suspend the domain */
        ...
        break;
    case PM_DEVICE_ACTION_TURN_ON:
        /* turn on the domain (e.g. setup control pins to disabled) */
        ...
        break;
    case PM_DEVICE_ACTION_TURN_OFF:
        /* turn off the domain (e.g. reset control pins to default state) */
        ...
        break;
    default:
        return -ENOTSUP;
    }

    return 0;
}
```

Devices belonging to this device can be declared referring it in the `power-domain` node's property. The example below declares devices `gpio0` and `gpio1` belonging to domain `gpio_domain`.

```
&gpio0 {
        compatible = "zephyr,gpio-emul";
        gpio-controller;
        power-domain = <&gpio_domain>;
};

&gpio1 {
        compatible = "zephyr,gpio-emul";
        gpio-controller;
        power-domain = <&gpio_domain>;
};
```

All devices under a domain will be notified when the domain changes state. These notifications are sent as actions in the device PM action callback and can be used by them to do any additional work required. They can safely be ignored though.

```
static int mydev_pm_action(const struct device *dev,
                           enum pm_device_action *action)
{
    switch (action) {
    case PM_DEVICE_ACTION_SUSPEND:
        /* suspend the device */
        ...
        break;
    case PM_DEVICE_ACTION_RESUME:
        /* resume the device */
        ...
        break;
    case PM_DEVICE_ACTION_TURN_ON:
        /* configure the device into low power mode */
        ...
        break;
    case PM_DEVICE_ACTION_TURN_OFF:
        /* prepare the device for power down */
        ...
        break;
    default:
        return -ENOTSUP;
```

(continues on next page)

(continued from previous page)

```
    }

    return 0;
}
```

Note

It is responsibility of driver or the application to set the domain as “wakeup” source if a device depending on it is used as “wakeup” source.

Examples

Some helpful examples showing power domain features:

- tests/subsys/pm/device_power_domains/
- tests/subsys/pm/power_domain/

4.19.6 Power Management APIs

System PM APIs

group `subsys_pm_sys`

System Power Management API.

Since

1.2

Functions

bool `pm_state_force`(uint8_t cpu, const struct *pm_state_info* *info)

Force usage of given power state.

This function overrides decision made by PM policy forcing usage of given power state upon next entry of the idle thread.

Note

This function can only run in thread context

Parameters

- `cpu` – CPU index.
- `info` – Power state which should be used in the ongoing suspend operation.

void `pm_notifier_register`(struct *pm_notifier* *notifier)

Register a power management notifier.

Register the given notifier from the power management notification list.

Parameters

- `notifier` – *pm_notifier* object to be registered.

int `pm_notifier_unregister`(struct *pm_notifier* *notifier)

Unregister a power management notifier.

Remove the given notifier from the power management notification list. After that this object callbacks will not be called.

Parameters

- `notifier` – *pm_notifier* object to be unregistered.

Returns

0 if the notifier was successfully removed, a negative value otherwise.

const struct *pm_state_info* *`pm_state_next_get`(uint8_t cpu)

Gets the next power state that will be used.

This function returns the next power state that will be used by the SoC.

Parameters

- `cpu` – CPU index.

Returns

next *pm_state_info* that will be used

void `pm_system_resume`(void)

Notify exit from kernel sleep.

This function would notify exit from kernel idling if a corresponding pm_system_suspend() notification was handled and did not return PM_STATE_ACTIVE.

This function should be called from the ISR context of the event that caused the exit from kernel idling.

This is required for cpu power states that would require interrupts to be enabled while entering low power states. e.g. C1 in x86. In those cases, the ISR would be invoked immediately after the event wakes up the CPU, before code following the CPU wait, gets a chance to execute. This can be ignored if no operation needs to be done at the wake event notification.

struct `pm_notifier`

#include <*pm.h*> Power management notifier struct.

This struct contains callbacks that are called when the target enters and exits power states.

As currently implemented the entry callback is invoked when transitioning from PM_STATE_ACTIVE to another state, and the exit callback is invoked when transitioning from a non-active state to PM_STATE_ACTIVE. This behavior may change in the future.

Note

These callbacks can be called from the ISR of the event that caused the kernel exit from idling.

> **Note**
>
> It is not allowed to call *pm_notifier_unregister* or *pm_notifier_register* from these callbacks because they are called with the spin locked in those functions.

Public Members

void (*`state_entry`)(enum *pm_state* state)

Application defined function for doing any target specific operations for power state entry.

void (*`state_exit`)(enum *pm_state* state)

Application defined function for doing any target specific operations for power state exit.

States

group `subsys_pm_states`

System Power Management States.

Defines

`PM_STATE_INFO_DT_INIT`(node_id)

Initializer for struct *pm_state_info* given a DT node identifier with zephyr,power-state compatible.

Parameters

- `node_id` – A node identifier with compatible zephyr,power-state

`PM_STATE_DT_INIT`(node_id)

Initializer for enum pm_state given a DT node identifier with zephyr,power-state compatible.

Parameters

- `node_id` – A node identifier with compatible zephyr,power-state

`DT_NUM_CPU_POWER_STATES`(node_id)

Obtain number of CPU power states supported and enabled by the given CPU node identifier.

Parameters

- `node_id` – A CPU node identifier.

Returns

Number of supported and enabled CPU power states.

`PM_STATE_INFO_LIST_FROM_DT_CPU`(node_id)

Initialize an array of struct *pm_state_info* with information from all the states present and enabled in the given CPU node identifier.

Example devicetree fragment:

```
cpus {
   ...
   cpu0: cpu@0 {
           device_type = "cpu";
           ...
           cpu-power-states = <&state0 &state1>;
   };

   power-states {
           state0: state0 {
                   compatible = "zephyr,power-state";
                   power-state-name = "suspend-to-idle";
                   min-residency-us = <10000>;
                   exit-latency-us = <100>;
           };

           state1: state1 {
                   compatible = "zephyr,power-state";
                   power-state-name = "suspend-to-ram";
                   min-residency-us = <50000>;
                   exit-latency-us = <500>;
                   zephyr,pm-device-disabled;
           };
   };
};
```

Example usage:

```
const struct pm_state_info states[] =
     PM_STATE_INFO_LIST_FROM_DT_CPU(DT_NODELABEL(cpu0));
```

Parameters

- **node_id** – A CPU node identifier.

PM_STATE_LIST_FROM_DT_CPU(node_id)

Initialize an array of struct pm_state with information from all the states present and enabled in the given CPU node identifier.

Example devicetree fragment:

```
cpus {
   ...
   cpu0: cpu@0 {
           device_type = "cpu";
           ...
           cpu-power-states = <&state0 &state1>;
   };

   power-states {
           state0: state0 {
                   compatible = "zephyr,power-state";
                   power-state-name = "suspend-to-idle";
                   min-residency-us = <10000>;
                   exit-latency-us = <100>;
           };

           state1: state1 {
                   compatible = "zephyr,power-state";
                   power-state-name = "suspend-to-ram";
                   min-residency-us = <50000>;
                   exit-latency-us = <500>;
```

(continues on next page)

(continued from previous page)

```
            };
    };
};
```

Example usage:

```
const enum pm_state states[] = PM_STATE_LIST_FROM_DT_CPU(DT_NODELABEL(cpu0));
```

Parameters

- `node_id` – A CPU node identifier.

Enums

enum `pm_state`

Power management state.

Values:

enumerator `PM_STATE_ACTIVE`

Runtime active state.

The system is fully powered and active.

> **Note**
>
> This state is correlated with ACPI G0/S0 state

enumerator `PM_STATE_RUNTIME_IDLE`

Runtime idle state.

Runtime idle is a system sleep state in which all of the cores enter deepest possible idle state and wait for interrupts, no requirements for the devices, leaving them at the states where they are.

> **Note**
>
> This state is correlated with ACPI S0ix state

enumerator `PM_STATE_SUSPEND_TO_IDLE`

Suspend to idle state.

The system goes through a normal platform suspend where it puts all of the cores in deepest possible idle state and *may* puts peripherals into low-power states. No operating state is lost (ie. the cpu core does not lose execution context), so the system can go back to where it left off easily enough.

> **Note**
>
> This state is correlated with ACPI S1 state

enumerator PM_STATE_STANDBY

Standby state.

In addition to putting peripherals into low-power states all non-boot CPUs are powered off. It should allow more energy to be saved relative to suspend to idle, but the resume latency will generally be greater than for that state. But it should be the same state with suspend to idle state on uniprocessor system.

> **Note**
>
> This state is correlated with ACPI S2 state

enumerator PM_STATE_SUSPEND_TO_RAM

Suspend to ram state.

This state offers significant energy savings by powering off as much of the system as possible, where memory should be placed into the self-refresh mode to retain its contents. The state of devices and CPUs is saved and held in memory, and it may require some boot- strapping code in ROM to resume the system from it.

> **Note**
>
> This state is correlated with ACPI S3 state

enumerator PM_STATE_SUSPEND_TO_DISK

Suspend to disk state.

This state offers significant energy savings by powering off as much of the system as possible, including the memory. The contents of memory are written to disk or other non-volatile storage, and on resume it's read back into memory with the help of boot-strapping code, restores the system to the same point of execution where it went to suspend to disk.

> **Note**
>
> This state is correlated with ACPI S4 state

enumerator PM_STATE_SOFT_OFF

Soft off state.

This state consumes a minimal amount of power and requires a large latency in order to return to runtime active state. The contents of system(CPU and memory) will not be preserved, so the system will be restarted as if from initial power-up and kernel boot.

> **Note**
>
> This state is correlated with ACPI G2/S5 state

enumerator PM_STATE_COUNT

Number of power management states (internal use)

Functions

uint8_t **pm_state_cpu_get_all**(uint8_t cpu, const struct *pm_state_info* **states)

Obtain information about all supported states by a CPU.

Parameters

- **cpu** – CPU index.
- **states** – Where to store the list of supported states.

Returns

Number of supported states.

struct **pm_state_info**

#include <*state.h*> Information about a power management state.

Public Members

uint8_t **substate_id**

Some platforms have multiple states that map to one Zephyr power state.

This property allows the platform distinguish them. e.g:

```
power-states {
   state0: state0 {
           compatible = "zephyr,power-state";
           power-state-name = "suspend-to-idle";
           substate-id = <1>;
           min-residency-us = <10000>;
           exit-latency-us = <100>;
   };
   state1: state1 {
           compatible = "zephyr,power-state";
           power-state-name = "suspend-to-idle";
           substate-id = <2>;
           min-residency-us = <20000>;
           exit-latency-us = <200>;
           zephyr,pm-device-disabled;
   };
};
```

bool **pm_device_disabled**

Whether or not this state triggers device power management.

When this property is false the power management subsystem will suspend devices before entering this state and will properly resume them when leaving it.

uint32_t **min_residency_us**

Minimum residency duration in microseconds.

It is the minimum time for a given idle state to be worthwhile energywise.

> **Note**
>
> 0 means that this property is not available for this state.

uint32_t **exit_latency_us**

Worst case latency in microseconds required to exit the idle state.

> **Note**
>
> 0 means that this property is not available for this state.

struct **pm_state_constraint**

#include <*state.h*> Power state information needed to lock a power state.

Public Members

enum *pm_state* **state**

Power management state.

> **See also**
>
> *pm_state*

uint8_t **substate_id**

Power management sub-state.

> **See also**
>
> *pm_state*

Policy

group **subsys_pm_sys_policy**

System Power Management Policy API.

Defines

PM_ALL_SUBSTATES

Special value for 'all substates'.

Typedefs

typedef void (***pm_policy_latency_changed_cb_t**)(int32_t latency)

Callback to notify when maximum latency changes.

Param latency
New maximum latency. Positive value represents latency in microseconds. SYS_FOREVER_US value lifts the latency constraint. Other values are forbidden.

Functions

void **pm_policy_state_lock_get**(enum *pm_state* state, uint8_t substate_id)

Increase a power state lock counter.

A power state will not be allowed on the first call of *pm_policy_state_lock_get()*. Subsequent calls will just increase a reference count, thus meaning this API can be safely used concurrently. A state will be allowed again after *pm_policy_state_lock_put()* is called as many times as *pm_policy_state_lock_get()*.

Note that the PM_STATE_ACTIVE state is always allowed, so calling this API with PM_STATE_ACTIVE will have no effect.

See also

pm_policy_state_lock_put()

Parameters

- **state** – Power state.
- **substate_id** – Power substate ID. Use PM_ALL_SUBSTATES to affect all the substates in the given power state.

void **pm_policy_state_lock_put**(enum *pm_state* state, uint8_t substate_id)

Decrease a power state lock counter.

See also

pm_policy_state_lock_get()

Parameters

- **state** – Power state.
- **substate_id** – Power substate ID. Use PM_ALL_SUBSTATES to affect all the substates in the given power state.

bool **pm_policy_state_lock_is_active**(enum *pm_state* state, uint8_t substate_id)

Check if a power state lock is active (not allowed).

Parameters

- **state** – Power state.
- **substate_id** – Power substate ID. Use PM_ALL_SUBSTATES to affect all the substates in the given power state.

Return values

- **true** – if power state lock is active.

- `false` – if power state lock is not active.

void **pm_policy_latency_request_add**(struct *pm_policy_latency_request* *req, uint32_t value_us)

Add a new latency requirement.

The system will not enter any power state that would make the system to exceed the given latency value.

Parameters

- `req` – Latency request.
- `value_us` – Maximum allowed latency in microseconds.

void **pm_policy_latency_request_update**(struct *pm_policy_latency_request* *req, uint32_t value_us)

Update a latency requirement.

Parameters

- `req` – Latency request.
- `value_us` – New maximum allowed latency in microseconds.

void **pm_policy_latency_request_remove**(struct *pm_policy_latency_request* *req)

Remove a latency requirement.

Parameters

- `req` – Latency request.

void **pm_policy_latency_changed_subscribe**(struct *pm_policy_latency_subscription* *req, *pm_policy_latency_changed_cb_t* cb)

Subscribe to maximum latency changes.

Parameters

- `req` – Subscription request.
- `cb` – Callback function (NULL to disable).

void **pm_policy_latency_changed_unsubscribe**(struct *pm_policy_latency_subscription* *req)

Unsubscribe to maximum latency changes.

Parameters

- `req` – Subscription request.

void **pm_policy_event_register**(struct *pm_policy_event* *evt, uint32_t time_us)

Register an event.

Events in the power-management policy context are defined as any source that will wake up the system at a known time in the future. By registering such event, the policy manager will be able to decide whether certain power states are worth entering or not.

See also

pm_policy_event_unregister

Note

It is mandatory to unregister events once they have happened by using *pm_policy_event_unregister()*. Not doing so is an API contract violation, because the system would continue to consider them as valid events in the *far* future, that is, after the cycle counter rollover.

Parameters

- **evt** – Event.
- **time_us** – When the event will occur, in microseconds from now.

void **pm_policy_event_update**(struct *pm_policy_event* *evt, uint32_t time_us)

Update an event.

See also

pm_policy_event_register

Parameters

- **evt** – Event.
- **time_us** – When the event will occur, in microseconds from now.

void **pm_policy_event_unregister**(struct *pm_policy_event* *evt)

Unregister an event.

See also

pm_policy_event_register

Parameters

- **evt** – Event.

void **pm_policy_device_power_lock_get**(const struct *device* *dev)

Increase power state locks.

Set power state locks in all power states that disable power in the given device.

See also

pm_policy_device_power_lock_put()

See also

pm_policy_state_lock_get()

Parameters

- `dev` – Device reference.

void `pm_policy_device_power_lock_put`(const struct *device* *dev)

Decrease power state locks.

Remove power state locks in all power states that disable power in the given device.

See also

pm_policy_device_power_lock_get()

See also

pm_policy_state_lock_put()

Parameters

- `dev` – Device reference.

struct `pm_policy_latency_subscription`

#include <*policy.h*> Latency change subscription.

Note

All fields in this structure are meant for private usage.

struct `pm_policy_latency_request`

#include <*policy.h*> Latency request.

Note

All fields in this structure are meant for private usage.

struct `pm_policy_event`

#include <*policy.h*> Event.

Note

All fields in this structure are meant for private usage.

Hooks

group `subsys_pm_sys_hooks`

System Power Management Hooks.

Functions

void **pm_state_set**(enum *pm_state* state, uint8_t substate_id)

Put processor into a power state.

This function implements the SoC specific details necessary to put the processor into available power states.

Parameters

- **state** – Power state.
- **substate_id** – Power substate id.

void **pm_state_exit_post_ops**(enum *pm_state* state, uint8_t substate_id)

Do any SoC or architecture specific post ops after sleep state exits.

This function is a place holder to do any operations that may be needed to be done after sleep state exits. Currently it enables interrupts after resuming from sleep state. In future, the enabling of interrupts may be moved into the kernel.

Parameters

- **state** – Power state.
- **substate_id** – Power substate id.

Device PM APIs

group **subsys_pm_device**

Device Power Management API.

Defines

PM_DEVICE_ISR_SAFE

Flag indicating that runtime PM API for the device can be called from any context.

If *PM_DEVICE_ISR_SAFE* flag is used for device definition, it indicates that PM actions are synchronous and can be executed from any context. This approach can be used for cases where suspending and resuming is short as it is executed in the critical section. This mode requires less resources (~80 byte less RAM) and allows to use device runtime PM from any context (including interrupts).

PM_DEVICE_DEFINE(dev_id, pm_action_cb, ...)

Define device PM resources for the given device name.

See also

PM_DEVICE_DT_DEFINE, *PM_DEVICE_DT_INST_DEFINE*

Note

This macro is a no-op if CONFIG_PM_DEVICE is not enabled.

Parameters

- `dev_id` – Device id.
- `pm_action_cb` – PM control callback.
- `...` – Optional flag to indicate that ISR safe. Use *PM_DEVICE_ISR_SAFE* or 0.

`PM_DEVICE_DT_DEFINE`(node_id, pm_action_cb, ...)

Define device PM resources for the given node identifier.

See also

PM_DEVICE_DT_INST_DEFINE, *PM_DEVICE_DEFINE*

Note

This macro is a no-op if `CONFIG_PM_DEVICE` is not enabled.

Parameters

- `node_id` – Node identifier.
- `pm_action_cb` – PM control callback.
- `...` – Optional flag to indicate that device is isr_ok. Use *PM_DEVICE_ISR_SAFE* or 0.

`PM_DEVICE_DT_INST_DEFINE`(idx, pm_action_cb, ...)

Define device PM resources for the given instance.

See also

PM_DEVICE_DT_DEFINE, *PM_DEVICE_DEFINE*

Note

This macro is a no-op if `CONFIG_PM_DEVICE` is not enabled.

Parameters

- `idx` – Instance index.
- `pm_action_cb` – PM control callback.
- `...` – Optional flag to indicate that device is isr_ok. Use *PM_DEVICE_ISR_SAFE* or 0.

`PM_DEVICE_GET`(dev_id)

Obtain a reference to the device PM resources for the given device.

Parameters

- `dev_id` – Device id.

Returns
Reference to the device PM resources (NULL if device CONFIG_PM_DEVICE is disabled).

PM_DEVICE_DT_GET(node_id)
Obtain a reference to the device PM resources for the given node.

Parameters
- node_id – Node identifier.

Returns
Reference to the device PM resources (NULL if device CONFIG_PM_DEVICE is disabled).

PM_DEVICE_DT_INST_GET(idx)
Obtain a reference to the device PM resources for the given instance.

Parameters
- idx – Instance index.

Returns
Reference to the device PM resources (NULL if device CONFIG_PM_DEVICE is disabled).

Typedefs

typedef int (*pm_device_action_cb_t)(const struct *device* *dev, enum *pm_device_action* action)
Device PM action callback.

Param dev
Device instance.

Param action
Requested action.

Retval 0
If successful.

Retval -ENOTSUP
If the requested action is not supported.

Retval Errno
Other negative errno on failure.

typedef bool (*pm_device_action_failed_cb_t)(const struct *device* *dev, int err)
Device PM action failed callback.

Param dev
Device that failed the action.

Param err
Return code of action failure.

Return
True to continue iteration, false to halt iteration.

Enums

enum `pm_device_state`

Device power states.

Values:

enumerator `PM_DEVICE_STATE_ACTIVE`

Device is in active or regular state.

enumerator `PM_DEVICE_STATE_SUSPENDED`

Device is suspended.

> **Note**
>
> Device context may be lost.

enumerator `PM_DEVICE_STATE_SUSPENDING`

Device is being suspended.

enumerator `PM_DEVICE_STATE_OFF`

Device is turned off (power removed).

> **Note**
>
> Device context is lost.

enum `pm_device_action`

Device PM actions.

Values:

enumerator `PM_DEVICE_ACTION_SUSPEND`

Suspend.

enumerator `PM_DEVICE_ACTION_RESUME`

Resume.

enumerator `PM_DEVICE_ACTION_TURN_OFF`

Turn off.

> **Note**
>
> Action triggered only by a power domain.

enumerator `PM_DEVICE_ACTION_TURN_ON`

Turn on.

> **Note**
>
> Action triggered only by a power domain.

Functions

const char *`pm_device_state_str`(enum *pm_device_state* state)

Get name of device PM state.

Parameters

- `state` – State id which name should be returned

int `pm_device_action_run`(const struct *device* *dev, enum *pm_device_action* action)

Run a pm action on a device.

This function calls the device PM control callback so that the device does the necessary operations to execute the given action.

Parameters

- `dev` – Device instance.
- `action` – Device pm action.

Return values

- `0` – If successful.
- `-ENOTSUP` – If requested state is not supported.
- `-EALREADY` – If device is already at the requested state.
- `-EBUSY` – If device is changing its state.
- `-ENOSYS` – If device does not support PM.
- `-EPERM` – If device has power state locked.
- `Errno` – Other negative errno on failure.

void `pm_device_children_action_run`(const struct *device* *dev, enum *pm_device_action* action, *pm_device_action_failed_cb_t* failure_cb)

Run a pm action on all children of a device.

This function calls all child devices PM control callback so that the device does the necessary operations to execute the given action.

Parameters

- `dev` – Device instance.
- `action` – Device pm action.
- `failure_cb` – Function to call if a child fails the action, can be NULL.

int `pm_device_state_get`(const struct *device* *dev, enum *pm_device_state* *state)

Obtain the power state of a device.

Parameters

- `dev` – Device instance.
- `state` – Pointer where device power state will be stored.

Return values

- `0` – If successful.

- `-ENOSYS` – If device does not implement power management.

static inline void `pm_device_init_suspended`(const struct *device* *dev)

Initialize a device state to *PM_DEVICE_STATE_SUSPENDED*.

By default device state is initialized to *PM_DEVICE_STATE_ACTIVE*. However in order to save power some drivers may choose to only initialize the device to the suspended state, or actively put the device into the suspended state. This function can therefore be used to notify the PM subsystem that the device is in *PM_DEVICE_STATE_SUSPENDED* instead of the default.

Parameters

- `dev` – Device instance.

static inline void `pm_device_init_off`(const struct *device* *dev)

Initialize a device state to *PM_DEVICE_STATE_OFF*.

By default device state is initialized to *PM_DEVICE_STATE_ACTIVE*. In general, this makes sense because the device initialization function will resume and configure a device, leaving it operational. However, when power domains are enabled, the device may be connected to a switchable power source, in which case it won't be powered at boot. This function can therefore be used to notify the PM subsystem that the device is in *PM_DEVICE_STATE_OFF* instead of the default.

Parameters

- `dev` – Device instance.

void `pm_device_busy_set`(const struct *device* *dev)

Mark a device as busy.

Devices marked as busy will not be suspended when the system goes into low-power states. This can be useful if, for example, the device is in the middle of a transaction.

See also

pm_device_busy_clear()

Parameters

- `dev` – Device instance.

void `pm_device_busy_clear`(const struct *device* *dev)

Clear a device busy status.

See also

pm_device_busy_set()

Parameters

- `dev` – Device instance.

bool `pm_device_is_any_busy`(void)

Check if any device is busy.

Return values

- `false` – If no device is busy
- `true` – If one or more devices are busy

bool `pm_device_is_busy`(const struct *device* *dev)

Check if a device is busy.

Parameters

- `dev` – Device instance.

Return values

- `false` – If the device is not busy
- `true` – If the device is busy

bool `pm_device_wakeup_enable`(const struct *device* *dev, bool enable)

Enable or disable a device as a wake up source.

A device marked as a wake up source will not be suspended when the system goes into low-power modes, thus allowing to use it as a wake up source for the system.

Parameters

- `dev` – Device instance.
- `enable` – `true` to enable or `false` to disable

Return values

- `true` – If the wakeup source was successfully enabled.
- `false` – If the wakeup source was not successfully enabled.

bool `pm_device_wakeup_is_enabled`(const struct *device* *dev)

Check if a device is enabled as a wake up source.

Parameters

- `dev` – Device instance.

Return values

- `true` – if the wakeup source is enabled.
- `false` – if the wakeup source is not enabled.

bool `pm_device_wakeup_is_capable`(const struct *device* *dev)

Check if a device is wake up capable.

Parameters

- `dev` – Device instance.

Return values

- `true` – If the device is wake up capable.
- `false` – If the device is not wake up capable.

bool `pm_device_on_power_domain`(const struct *device* *dev)

Check if the device is on a switchable power domain.

Parameters

- `dev` – Device instance.

Return values

- `true` – If device is on a switchable power domain.
- `false` – If device is not on a switchable power domain.

int `pm_device_power_domain_add`(const struct *device* *dev, const struct *device* *domain)

Add a device to a power domain.

This function adds a device to a given power domain.

Parameters

- `dev` – Device to be added to the power domain.
- `domain` – Power domain.

Return values

- `0` – If successful.
- `-EALREADY` – If device is already part of the power domain.
- `-ENOSYS` – If the application was built without power domain support.
- `-ENOSPC` – If there is no space available in the power domain to add the device.

int `pm_device_power_domain_remove`(const struct *device* *dev, const struct *device* *domain)

Remove a device from a power domain.

This function removes a device from a given power domain.

Parameters

- `dev` – Device to be removed from the power domain.
- `domain` – Power domain.

Return values

- `0` – If successful.
- `-ENOSYS` – If the application was built without power domain support.
- `-ENOENT` – If device is not in the given domain.

bool `pm_device_is_powered`(const struct *device* *dev)

Check if the device is currently powered.

Parameters

- `dev` – Device instance.

Return values

- `true` – If device is currently powered, or is assumed to be powered (i.e. it does not support PM or is not under a PM domain)
- `false` – If device is not currently powered

int `pm_device_driver_init`(const struct *device* *dev, *pm_device_action_cb_t* action_cb)

Setup a device driver into the lowest valid power mode.

This helper function is intended to be called at the end of a driver init function to automatically setup the device into the lowest power mode. It assumes that the device has been configured as if it is in *PM_DEVICE_STATE_OFF*.

Parameters

- `dev` – Device instance.
- `action_cb` – Device PM control callback function.

Return values

- `0` – On success.

- `-errno` – Error code from *action_cb* on failure.

struct `pm_device_base`

#include <*device.h*> Device PM info.

Structure holds fields which are common for two PM devices: generic and synchronous.

Public Members

atomic_t `flags`

Device PM status flags.

enum *pm_device_state* `state`

Device power state.

pm_device_action_cb_t `action_cb`

Device PM action callback.

uint32_t `usage`

Device usage count.

struct `pm_device`

#include <*device.h*> Runtime PM info for device with generic PM.

Generic PM involves suspending and resuming operations which can be blocking, long lasting or asynchronous. Runtime PM API is limited when used from interrupt context.

Public Members

struct *pm_device_base* `base`

Base info.

const struct *device* *`dev`

Pointer to the device.

struct k_sem `lock`

Lock to synchronize the get/put operations.

struct *k_event* `event`

Event var to listen to the sync request events.

struct *k_work_delayable* `work`

Work object for asynchronous calls.

struct `pm_device_isr`

#include <*device.h*> Runtime PM info for device with synchronous PM.

Synchronous PM can be used with devices which suspend and resume operations can be performed in the critical section as they are short and non-blocking. Runtime PM API can be used from any context in that case.

Public Members

struct *pm_device_base* **base**
Base info.

struct *k_spinlock* **lock**
Lock to synchronize the synchronous get/put operations.

Device Runtime PM APIs

group **subsys_pm_device_runtime**
Device Runtime Power Management API.

Functions

int **pm_device_runtime_auto_enable**(const struct *device* *dev)
Automatically enable device runtime based on devicetree properties.

> **Note**
> Must not be called from application code. See the zephyr,pm-device-runtime-auto property in pm.yaml and z_sys_init_run_level.

Parameters
- **dev** – Device instance.

Return values
- **0** – If the device runtime PM is enabled successfully or it has not been requested for this device in devicetree.
- **-errno** – Other negative errno, result of enabled device runtime PM.

int **pm_device_runtime_enable**(const struct *device* *dev)
Enable device runtime PM.

This function will enable runtime PM on the given device. If the device is in *PM_DEVICE_STATE_ACTIVE* state, the device will be suspended.

> **See also**
> *pm_device_init_suspended()*

Function properties (list may not be complete)
pre-kernel-ok

Parameters
- **dev** – Device instance.

Return values

- `0` – If the device runtime PM is enabled successfully.
- `-EBUSY` – If device is busy.
- `-ENOTSUP` – If the device does not support PM.
- `-errno` – Other negative errno, result of suspending the device.

int `pm_device_runtime_disable`(const struct *device* *dev)

Disable device runtime PM.

If the device is currently suspended it will be resumed.

Function properties (list may not be complete)

pre-kernel-ok

Parameters

- `dev` – Device instance.

Return values

- `0` – If the device runtime PM is disabled successfully.
- `-ENOTSUP` – If the device does not support PM.
- `-errno` – Other negative errno, result of resuming the device.

int `pm_device_runtime_get`(const struct *device* *dev)

Resume a device based on usage count.

This function will resume the device if the device is suspended (usage count equal to 0). In case of a resume failure, usage count and device state will be left unchanged. In all other cases, usage count will be incremented.

If the device is still being suspended as a result of calling *pm_device_runtime_put_async()*, this function will wait for the operation to finish to then resume the device.

Function properties (list may not be complete)

pre-kernel-ok

Note

It is safe to use this function in contexts where blocking is not allowed, e.g. ISR, provided the device PM implementation does not block.

Parameters

- `dev` – Device instance.

Return values

- `0` – If it succeeds. In case device runtime PM is not enabled or not available this function will be a no-op and will also return 0.
- `-EWOUDBLOCK` – If call would block but it is not allowed (e.g. in ISR).
- `-errno` – Other negative errno, result of the PM action callback.

int `pm_device_runtime_put`(const struct *device* *dev)

Suspend a device based on usage count.

This function will suspend the device if the device is no longer required (usage count equal to 0). In case of suspend failure, usage count and device state will be left unchanged. In all other cases, usage count will be decremented (down to 0).

See also

pm_device_runtime_put_async()

Function properties (list may not be complete)

pre-kernel-ok

Parameters

- `dev` – Device instance.

Return values

- `0` – If it succeeds. In case device runtime PM is not enabled or not available this function will be a no-op and will also return 0.
- `-EALREADY` – If device is already suspended (can only happen if get/put calls are unbalanced).
- `-errno` – Other negative errno, result of the action callback.

int `pm_device_runtime_put_async`(const struct *device* *dev, *k_timeout_t* delay)

Suspend a device based on usage count (asynchronously).

This function will schedule the device suspension if the device is no longer required (usage count equal to 0). In all other cases, usage count will be decremented (down to 0).

See also

pm_device_runtime_put()

Function properties (list may not be complete)

pre-kernel-ok , *async* , *isr-ok*

Note

Asynchronous operations are not supported when in pre-kernel mode. In this case, the function will be blocking (equivalent to *pm_device_runtime_put()*).

Parameters

- `dev` – Device instance.
- `delay` – Minimum amount of time before triggering the action.

Return values

- `0` – If it succeeds. In case device runtime PM is not enabled or not available this function will be a no-op and will also return 0.
- `-EBUSY` – If the device is busy.
- `-EALREADY` – If device is already suspended (can only happen if get/put calls are unbalanced).

bool `pm_device_runtime_is_enabled`(const struct *device* *dev)

Check if device runtime is enabled for a given device.

See also

pm_device_runtime_enable()

Function properties (list may not be complete)

pre-kernel-ok

Parameters

- `dev` – Device instance.

Return values

- `true` – If device has device runtime PM enabled.
- `false` – If the device has device runtime PM disabled.

int `pm_device_runtime_usage`(const struct *device* *dev)

Return the current device usage counter.

Parameters

- `dev` – Device instance.

Return values

- `-ENOTSUP` – If the device is not using runtime PM.
- `-ENOSYS` – If the runtime PM is not enabled at all.

Returns

the current usage counter.

4.20 OS Abstraction

OS abstraction layers (OSAL) provide wrapper function APIs that encapsulate common system functions offered by any operating system. These APIs make it easier and quicker to develop for, and port code to multiple software and hardware platforms.

These sections describe the software and hardware abstraction layers supported by the Zephyr RTOS.

4.20.1 POSIX

Overview

The Portable Operating System Interface (POSIX) is a family of standards specified by the IEEE Computer Society for maintaining compatibility between operating systems. Zephyr implements a subset of the standard POSIX API specified by IEEE 1003.1-2017 (also known as POSIX-1.2017).

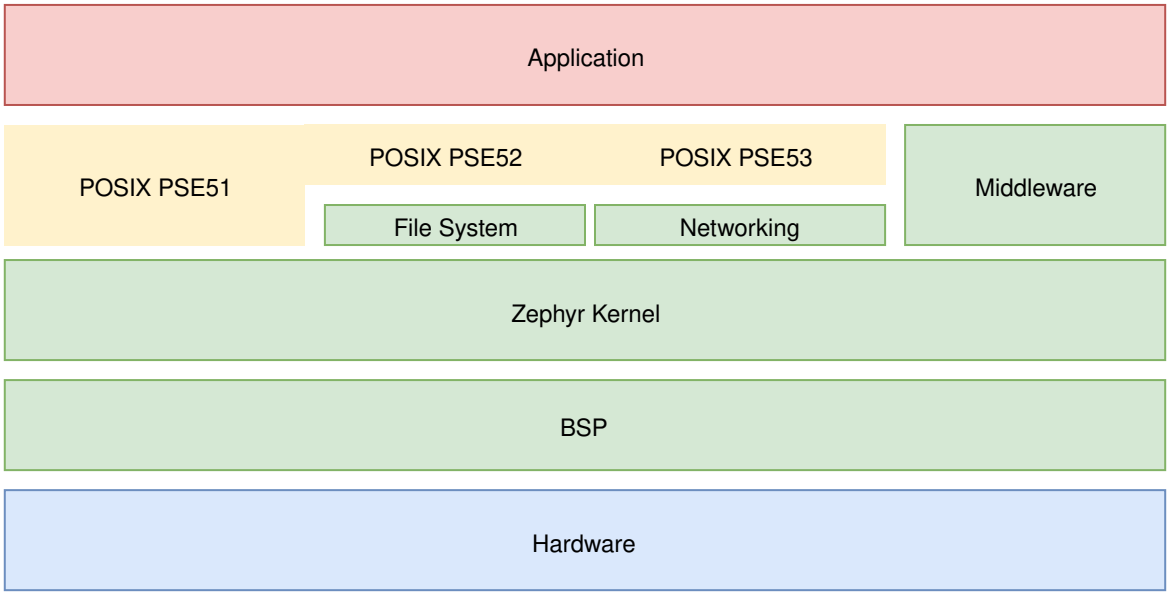

Fig. 13: POSIX support in Zephyr

Note

This page does not document Zephyr's POSIX architecture, which is used to run Zephyr as a native application under the host operating system for prototyping, test, and diagnostic purposes.

With the POSIX support available in Zephyr, an existing POSIX conformant application can be ported to run on the Zephyr kernel, and therefore leverage Zephyr features and functionality. Additionally, a library designed to be POSIX conformant can be ported to Zephyr kernel based applications with no changes.

The POSIX API is an increasingly popular OSAL (operating system abstraction layer) for IoT and embedded applications, as can be seen in Zephyr, AWS:FreeRTOS, TI-RTOS, and NuttX.

Benefits of POSIX support in Zephyr include:

- Offering a familiar API to non-embedded programmers, especially from Linux
- Enabling reuse (portability) of existing libraries based on POSIX APIs
- Providing an efficient API subset appropriate for small (MCU) embedded systems

POSIX Subprofiles While Zephyr supports running multiple *threads* (possibly in an *SMP* configuration), as well as *Virtual Memory and MMUs*, Zephyr code and data normally share a common address space that is partitioned into separate *Memory Domains*. The Zephyr kernel executable code and the application executable code are typically compiled into the same binary artifact. From that perspective, Zephyr apps can be seen as running in the context of a single process.

While multi-purpose operating systems (OS) offer full POSIX conformance, Real-Time Operating Systems (RTOS) such as Zephyr typically serve a fixed-purpose, have limited hardware resources,

and experience limited user interaction. In such systems, full POSIX conformance can be impractical and unnecessary.

For that reason, POSIX defined the following *Application Environment Profiles (AEP)* as part of IEEE 1003.13-2003 (also known as POSIX.13-2003). Each AEP adds incrementally more features over the required *POSIX System Interfaces*.

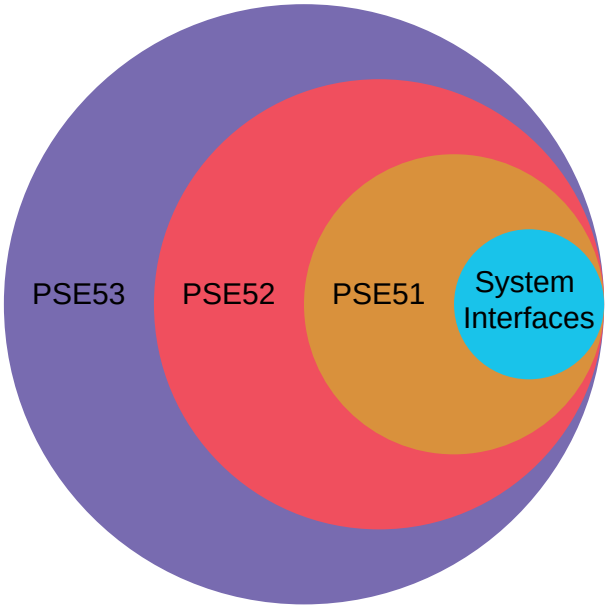

Fig. 14: POSIX Application Environment Profiles (AEP)

- Minimal Realtime System Profile (*PSE51*)
- Realtime Controller System Profile (*PSE52*)
- Dedicated Realtime System Profile (*PSE53*)
- Multi-Purpose Realtime System (PSE54)

POSIX.13-2003 AEP were formalized in 2003 via "Units of Functionality" but the specification is now inactive (for reference only). Nevertheless, the intent is still captured as part of POSIX-1.2017 via *Options* and *Option Groups*.

For more information, please see IEEE 1003.1-2017, Section E, Subprofiling Considerations.

POSIX Applications in Zephyr A POSIX app in Zephyr is *built like any other app* and therefore requires the usual `prj.conf`, `CMakeLists.txt`, and source code. For example, the app below leverages the `nanosleep()` and `perror()` POSIX functions.

Listing 1: *prj.conf* for a simple POSIX app in Zephyr

```
CONFIG_POSIX_API=y
```

Listing 2: A simple app that uses Zephyr's POSIX API

```
#include <stddef.h>
#include <stdio.h>
#include <time.h>

void megasleep(size_t megaseconds)
```

(continues on next page)

(continued from previous page)

```
{
    struct timespec ts = {
        .tv_sec = megaseconds * 1000000,
        .tv_nsec = 0,
    };

    printf("See you in a while!\n");
    if (nanosleep(&ts, NULL) == -1) {
        perror("nanosleep");
    }
}

int main()
{
    megasleep(42);
    return 0;
}
```

For more examples of POSIX applications, please see the POSIX sample applications.

Configuration Like most features in Zephyr, POSIX features are *highly configurable* but disabled by default. Users must explicitly choose to enable POSIX options via *Kconfig* selection.

Subprofiles Enable one of the Kconfig options below to quickly configure a pre-defined *POSIX subprofile*.

- CONFIG_POSIX_AEP_CHOICE_BASE (*Base*)
- CONFIG_POSIX_AEP_CHOICE_PSE51 (*PSE51*)
- CONFIG_POSIX_AEP_CHOICE_PSE52 (*PSE52*)
- CONFIG_POSIX_AEP_CHOICE_PSE53 (*PSE53*)

Additional POSIX *Options and Option Groups* may be enabled as needed via Kconfig (e.g. CONFIG_POSIX_C_LIB_EXT=y). Further fine-tuning may be accomplished via *additional POSIX-related Kconfig options*.

Subprofiles, Options, and Option Groups should be considered the preferred way to configure POSIX in Zephyr going forward.

Legacy Historically, Zephyr used CONFIG_POSIX_API to configure a set of POSIX features that was overloaded and always increasing in size.

- CONFIG_POSIX_API

The option is now frozen, and can be considered equivalent to the following:

- CONFIG_POSIX_AEP_CHOICE_PSE51
- CONFIG_POSIX_FD_MGMT
- CONFIG_POSIX_MESSAGE_PASSING
- CONFIG_POSIX_NETWORKING

However, CONFIG_POSIX_API should be considered legacy and should not be used for new Zephyr applications.

POSIX Conformance

As per *IEEE 1003.1-2017*, this section details Zephyr's POSIX conformance.

POSIX System Interfaces

Table 5: POSIX System Interfaces

Symbol	Support	Remarks
_POSIX_CHOWN_RESTRICTED	0	
_POSIX_NO_TRUNC	0	
_POSIX_VDISABLE	'\0'	

Table 6: POSIX System Interfaces

Symbol	Support	Remarks
_POSIX_VERSION	200809L	
_POSIX_ASYNCHRONOUS_IO	200809L	CONFIG_POSIX_ASYNCHRONOUS_IO†
_POSIX_BARRIERS	200809L	CONFIG_POSIX_BARRIERS
_POSIX_CLOCK_SELECTION	200809L	CONFIG_POSIX_CLOCK_SELECTION

_POSIX_THREAD_ATTR_STACKADDR	200809	CONFIG_POSIX_THREAD_ATTR_STACKADDR
_POSIX_THREAD_ATTR_STACKSIZE	200809	CONFIG_POSIX_THREAD_ATTR_STACKSIZE
_POSIX_THREAD_PROCESS_SHARED	-1	

Note

Some features may exhibit undefined behaviour as they fall beyond the scope of Zephyr's current design and capabilities. For example, multi-processing, ad-hoc memory-mapping, multiple users, or regular expressions are features that are uncommon in low-footprint embedded systems. Such undefined behaviour is denoted with the † (obelus) symbol. Additional details *here*.

Note

Features listed in various POSIX Options or Option Groups may be provided in whole or in part by a conformant C library implementation. This includes (but is not limited to) POSIX Extensions to the ISO C Standard (CX).

POSIX Application Environment Profiles (AEP)

Although inactive, IEEE 1003.13-2003 defined a number of AEP that inspired the modern subprofiling options of IEEE 1003.1-2017. The single-purpose realtime system profiles are listed below, for reference, in terms that agree with the current POSIX-1 standard. PSE54 is not considered at this time.

System Interfaces The required POSIX *System Interfaces* are supported for each Application Environment Profile.

Minimal Realtime System Profile (PSE51) The *Minimal Realtime System Profile* (PSE51) includes all of the *System Interfaces* along with several additional features.

Table 11: PSE51 System Interfaces

_POSIX_SPAWN	-1	†
_POSIX_SPORADIC_SERVER	-1	†

Implementation Details

In many ways, Zephyr provides support like any POSIX OS; API bindings are provided in the C programming language, POSIX headers are available in the standard include path, when configured.

Unlike other multi-purpose POSIX operating systems

- Zephyr is not "a POSIX OS". The Zephyr kernel was not designed around the POSIX standard, and POSIX support is an opt-in feature
- Zephyr apps are not linked separately, nor do they execute as subprocesses
- Zephyr, libraries, and application code are compiled and linked together, running similarly to a single-process application, in a single (possibly virtual) address space
- Zephyr does not provide a POSIX shell, compiler, utilities, and is not self-hosting.

Note

Unlike the Linux kernel or FreeBSD, Zephyr does not maintain a static table of system call

numbers for each supported architecture, but instead generates system calls dynamically at build time. See *System Calls* for more information.

Design As a library, Zephyr's POSIX API implementation makes an effort to be a thin abstraction layer between the application, middleware, and the Zephyr kernel.

Some general design considerations:

- The POSIX interface and implementations should be part of Zephyr's POSIX library, and not elsewhere, unless required both by the POSIX API implementation and some other feature. An example where the implementation should remain part of the POSIX implementation is `getopt()`. Examples where the implementation should be part of separate libraries are multithreading and networking.
- When the POSIX API and another Zephyr subsystem both rely on a feature, the implementation of that feature should be as a separate Zephyr library that can be used by both the POSIX API and the other library or subsystem. This reduces the likelihood of dependency cycles in code. When practical, that rule should expand to include macros. In the example below, `libposix` depends on `libzfoo` for the implementation of some functionality "foo" in Zephyr. If `libzfoo` also depends on `libposix`, then there is a dependency cycle. The cycle can be removed via mutual dependency, `libcommon`.

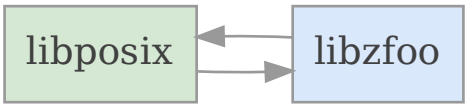

Fig. 19: Dependency cycle between POSIX and another Zephyr library

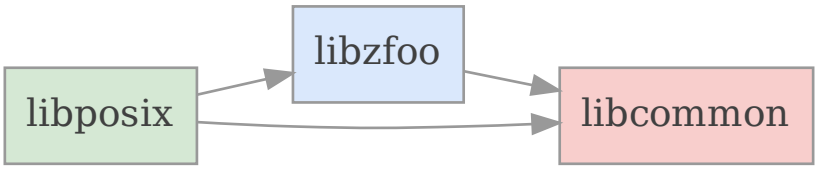

Fig. 20: Mutual dependencies between POSIX and other Zephyr libraries

- POSIX API calls should be provided as regular callable C functions; if a Zephyr *System Call* is needed as part of the implementation, the declaration and the implementation of that system call should be hidden behind the POSIX API.

POSIX Option and Option Group Details

POSIX Option Groups

POSIX_BARRIERS Enable this option group with `CONFIG_POSIX_BARRIERS`.

Table 20: POSIX_BARRIERS

API	Supported
pthread_barrier_destroy()	yes
pthread_barrier_init()	yes
pthread_barrier_wait()	yes
pthread_barrierattr_destroy()	yes
pthread_barrierattr_init()	yes

POSIX_C_LANG_JUMP The `POSIX_C_LANG_JUMP` Option Group is included in the ISO C standard.

> **Note**
>
> When using Newlib, Picolibc, or other C libraries conforming to the ISO C Standard, the `POSIX_C_LANG_JUMP` Option Group is considered supported.

Table 21: POSIX_C_LANG_JUMP

API	Supported
setjmp()	yes
longjmp()	yes

POSIX_C_LANG_MATH The `POSIX_C_LANG_MATH` Option Group is included in the ISO C standard.

> **Note**
>
> When using Newlib, Picolibc, or other C libraries conforming to the ISO C Standard, the `POSIX_C_LANG_MATH` Option Group is considered supported.

Please refer to Subprofiling Considerations for details on the `POSIX_C_LANG_MATH` Option Group.

POSIX_C_LANG_SUPPORT The POSIX_C_LANG_SUPPORT option group contains the general ISO C Library.

> **Note**
>
> When using Newlib, Picolibc, or other C libraries conforming to the ISO C Standard, the entire `POSIX_C_LANG_SUPPORT` Option Group is considered supported.

Please refer to Subprofiling Considerations for details on the `POSIX_C_LANG_SUPPORT` Option Group.

For more information on developing Zephyr applications in the C programming language, please refer to *details*.

POSIX_C_LIB_EXT Enable this option group with `CONFIG_POSIX_C_LIB_EXT`.

Table 22: POSIX_C_LIB_EXT

API	Supported
fnmatch()	yes
getopt()	yes
getsubopt()	
optarg	yes
opterr	yes
optind	yes
optopt	yes
stpcpy()	
stpncpy()	
strcasecmp()	
strdup()	
strfmon()	
strncasecmp()	yes
strndup()	
strnlen()	yes

POSIX_CLOCK_SELECTION Enable this option group with `CONFIG_POSIX_CLOCK_SELECTION`.

Table 23: POSIX_CLOCK_SELECTION

API	Supported
pthread_condattr_getclock()	yes
pthread_condattr_setclock()	yes
clock_nanosleep()	yes

POSIX_DEVICE_IO Enable this option group with `CONFIG_POSIX_DEVICE_IO`.

Table 24: POSIX_DEVICE_IO

API	Supported
FD_CLR()	yes
FD_ISSET()	yes
FD_SET()	yes
FD_ZERO()	yes
clearerr()	yes
close()	yes
fclose()	
fdopen()	
feof()	
ferror()	
fflush()	
fgetc()	
fgets()	
fileno()	
fopen()	
fprintf()	yes
fputc()	yes
fputs()	yes
fread()	

continues on next page

Table 24 – continued from previous page

API	Supported
freopen()	
fscanf()	
fwrite()	yes
getc()	
getchar()	
gets()	
open()	yes
perror()	yes
poll()	yes
printf()	yes
pread()	
pselect()	
putc()	yes
putchar()	yes
puts()	yes
pwrite()	
read()	yes
scanf()	
select()	yes
setbuf()	
setvbuf()	
stderr	
stdin	
stdout	
ungetc()	
vfprintf()	yes
vfscanf()	
vprintf()	yes
vscanf()	
write()	yes

POSIX_FD_MGMT Enable this option group with `CONFIG_POSIX_FD_MGMT`.

Table 25: POSIX_FD_MGMT

API	Supported
dup()	
dup2()	
fcntl()	
fgetpos()	
fseek()	
fseeko()	
fsetpos()	
ftell()	
ftello()	
ftruncate()	yes
lseek()	
rewind()	

POSIX_FILE_LOCKING

Table 26: POSIX_FILE_LOCKING

API	Supported
flockfile()	
ftrylockfile()	
funlockfile()	
getc_unlocked()	
getchar_unlocked()	
putc_unlocked()	
putchar_unlocked()	

POSIX_FILE_SYSTEM Enable this option group with `CONFIG_POSIX_FILE_SYSTEM`.

Table 27: POSIX_FILE_SYSTEM

API	Supported
access()	
chdir()	
closedir()	yes
creat()	
fchdir()	
fpathconf()	
fstat()	yes
fstatvfs()	
getcwd()	
link()	
mkdir()	yes
mkstemp()	
opendir()	yes
pathconf()	
readdir()	yes
remove()	
rename()	yes
rewinddir()	
rmdir()	
stat()	yes
statvfs()	
tmpfile()	
tmpnam()	
truncate()	
unlink()	yes
utime()	

POSIX_MAPPED_FILES Enable this option group with `CONFIG_POSIX_MAPPED_FILES`.

Table 28: POSIX_MAPPED_FILES

API	Supported
mmap()	yes
msync()	yes
munmap()	yes

POSIX_MEMORY_PROTECTION Enable this option group with `CONFIG_POSIX_MEMORY_PROTECTION`.

Table 29: POSIX_MEMORY_PROTECTION

API	Supported
mprotect()	yes †

POSIX_MULTI_PROCESS Enable this option group with `CONFIG_POSIX_MULTI_PROCESS`.

Table 30: POSIX_MULTI_PROCESS

API	Supported
_Exit()	yes
_exit()	yes
assert()	yes
atexit()	†
clock()	
execl()	†
execle()	†
execlp()	†
execv()	†
execve()	†
execvp()	†
exit()	yes
fork()	†

getpgid()	†
getpid()	yes †
getppid()	†
getsid()	†
setsid()	†
sleep()	yes
times()	
wait()	†
waitid()	†
waitpid()	†

POSIX_NETWORKING The function `sockatmark()` is not yet supported and is expected to fail setting `errno` to `ENOSYS` †.

Enable this option group with `CONFIG_POSIX_NETWORKING`.

Table 31: POSIX_NETWORKING

API	Supported
accept()	yes
bind()	yes
connect()	yes
endhostent()	yes
endnetent()	yes
endprotoent()	yes
endservent()	yes
freeaddrinfo()	yes

continues on next page

Table 31 – continued from previous page

API	Supported
gai_strerror()	yes
getaddrinfo()	yes
gethostent()	yes
gethostname()	yes
getnameinfo()	yes
getnetbyaddr()	yes
getnetbyname()	yes
getnetent()	yes
getpeername()	yes
getprotobyname()	yes
getprotobynumber()	yes
getprotoent()	yes
getservbyname()	yes
getservbyport()	yes
getservent()	yes

setservent()	yes
setsockopt()	yes
shutdown()	yes
socket()	yes
sockatmark()	yes †
socketpair()	yes

POSIX_PIPE

Table 32: POSIX_PIPE

API	Supported
pipe()	

POSIX_REALTIME_SIGNALS Enable this option group with `CONFIG_POSIX_REALTIME_SIGNALS`.

Table 33: POSIX_REALTIME_SIGNALS

API	Supported
sigqueue()	
sigtimedwait()	
sigwaitinfo()	

POSIX_SEMAPHORES Enable this option group with `CONFIG_POSIX_SEMAPHORES`.

Table 34: POSIX_SEMAPHORES

API	Supported
sem_close()	yes
sem_destroy()	yes
sem_getvalue()	yes
sem_init()	yes
sem_open()	yes
sem_post()	yes
sem_trywait()	yes
sem_unlink()	yes
sem_wait()	yes

POSIX_SIGNAL_JUMP

Table 35: POSIX_SIGNAL_JUMP

API	Supported
siglongjmp()	
sigsetjmp()	

POSIX_SIGNALS Signal services are a basic mechanism within POSIX-based systems and are required for error and event handling.

Enable this option group with `CONFIG_POSIX_SIGNALS`.

Table 36: POSIX_SIGNALS

API	Supported
abort()	yes
alarm()	
kill()	
pause()	
raise()	
sigaction()	
sigaddset()	yes
sigdelset()	yes
sigemptyset()	yes
sigfillset()	yes
sigismember()	yes
signal()	
sigpending()	
sigprocmask()	yes
sigsuspend()	
sigwait()	
strsignal()	yes

POSIX_SINGLE_PROCESS The POSIX_SINGLE_PROCESS option group contains services for single process applications.

Enable this option group with `CONFIG_POSIX_SINGLE_PROCESS`.

Table 37: POSIX_SINGLE_PROCESS

API	Supported
confstr()	yes
environ	yes
errno	yes
getenv()	yes
setenv()	yes
sysconf()	yes
uname()	yes
unsetenv()	yes

POSIX_SPIN_LOCKS Enable this option group with `CONFIG_POSIX_SPIN_LOCKS`.

Table 38: POSIX_SPIN_LOCKS

API	Supported
pthread_spin_destroy()	yes
pthread_spin_init()	yes
pthread_spin_lock()	yes
pthread_spin_trylock()	yes
pthread_spin_unlock()	yes

POSIX_THREADS_BASE The basic assumption in this profile is that the system consists of a single (implicit) process with multiple threads. Therefore, the standard requires all basic thread services, except those related to multiple processes.

Enable this option group with `CONFIG_POSIX_THREADS`.

Table 39: POSIX_THREADS_BASE

API	Supported
pthread_atfork()	yes
pthread_attr_destroy()	yes
pthread_attr_getdetachstate()	yes
pthread_attr_getschedparam()	yes
pthread_attr_init()	yes
pthread_attr_setdetachstate()	yes
pthread_attr_setschedparam()	yes
pthread_barrier_destroy()	yes
pthread_barrier_init()	yes
pthread_barrier_wait()	yes
pthread_barrierattr_destroy()	yes
pthread_barrierattr_getpshared()	yes
pthread_barrierattr_init()	yes
pthread_barrierattr_setpshared()	yes
pthread_cancel()	yes
pthread_cleanup_pop()	yes
pthread_cleanup_push()	yes
pthread_cond_broadcast()	yes
pthread_cond_destroy()	yes
pthread_cond_init()	yes
pthread_cond_signal()	yes
pthread_cond_timedwait()	yes
pthread_cond_wait()	yes
pthread_condattr_destroy()	yes
pthread_condattr_init()	yes
pthread_create()	yes
pthread_detach()	yes
pthread_equal()	yes
pthread_exit()	yes
pthread_getspecific()	yes
pthread_join()	yes
pthread_key_create()	yes
pthread_key_delete()	yes
pthread_kill()	
pthread_mutex_destroy()	yes
pthread_mutex_init()	yes
pthread_mutex_lock()	yes
pthread_mutex_trylock()	yes
pthread_mutex_unlock()	yes
pthread_mutexattr_destroy()	yes
pthread_mutexattr_init()	yes
pthread_once()	yes
pthread_self()	yes
pthread_setcancelstate()	yes
pthread_setcanceltype()	yes
pthread_setspecific()	yes
pthread_sigmask()	yes
pthread_testcancel()	yes

POSIX_THREADS_EXT Enable this option group with `CONFIG_POSIX_THREADS_EXT`.

Table 40: POSIX_THREADS_EXT

API	Supported
pthread_attr_getguardsize()	yes
pthread_attr_setguardsize()	yes
pthread_mutexattr_gettype()	yes
pthread_mutexattr_settype()	yes

POSIX_TIMERS Enable this option group with `CONFIG_POSIX_TIMERS`.

Table 41: POSIX_TIMERS

API	Supported
clock_getres()	yes
clock_gettime()	yes
clock_settime()	yes
nanosleep()	yes
timer_create()	yes
timer_delete()	yes
timer_gettime()	yes
timer_getoverrun()	yes
timer_settime()	yes

XSI_SYSTEM_LOGGING Enable this option group with `CONFIG_XSI_SYSTEM_LOGGING`.

Table 42: XSI_SYSTEM_LOGGING

API	Supported
closelog()	yes
openlog()	yes
setlogmask()	yes
syslog()	yes

XSI_THREADS_EXT The XSI_THREADS_EXT option group is required because it provides functions to control a thread's stack. This is considered useful for any real-time application.

Enable this option group with `CONFIG_XSI_THREADS_EXT`.

Table 43: XSI_THREADS_EXT

API	Supported
pthread_attr_getstack()	yes
pthread_attr_setstack()	yes
pthread_getconcurrency()	yes
pthread_setconcurrency()	yes

POSIX Options

_POSIX_ASYNCHRONOUS_IO Functions part of the `_POSIX_ASYNCHRONOUS_IO` Option are not implemented in Zephyr but are provided so that conformant applications can still link. These functions will fail, setting `errno` to `ENOSYS`†.

Enable this option with CONFIG_POSIX_ASYNCHRONOUS_IO.

Table 44: _POSIX_ASYNCHRONOUS_IO

API	Supported
aio_cancel()	yes †
aio_error()	yes †
aio_fsync()	yes †
aio_read()	yes †
aio_return()	yes †
aio_suspend()	yes †
aio_write()	yes †
lio_listio()	yes †

_POSIX_CPUTIME Enable this option with CONFIG_POSIX_CPUTIME.

Table 45: _POSIX_CPUTIME

API	Supported
CLOCK_PROCESS_CPUTIME_ID	yes

_POSIX_FSYNC Enable this option with CONFIG_POSIX_FSYNC.

Table 46: _POSIX_FSYNC

API	Supported
fsync()	yes

_POSIX_IPV6 Internet Protocol Version 6 is supported.

For more information, please refer to *Networking*.

Enable this option with CONFIG_POSIX_IPV6.

_POSIX_MEMLOCK Zephyr's *Demand Paging API* does not yet support pinning or unpinning all virtual memory regions. The functions below are expected to fail and set errno to ENOSYS †.

Enable this option with CONFIG_POSIX_MEMLOCK.

Table 47: _POSIX_MEMLOCK

API	Supported
mlockall()	yes
munlockall()	yes

_POSIX_MEMLOCK_RANGE Enable this option with CONFIG_POSIX_MEMLOCK_RANGE.

Table 48: _POSIX_MEMLOCK_RANGE

API	Supported
mlock()	yes
munlock()	yes

_POSIX_MESSAGE_PASSING Enable this option with CONFIG_POSIX_MESSAGE_PASSING.

Table 49: _POSIX_MESSAGE_PASSING

API	Supported
mq_close()	yes
mq_getattr()	yes
mq_notify()	yes
mq_open()	yes
mq_receive()	yes
mq_send()	yes
mq_setattr()	yes
mq_unlink()	yes

_POSIX_MONOTONIC_CLOCK Enable this option with CONFIG_POSIX_MONOTONIC_CLOCK.

Table 50: _POSIX_MONOTONIC_CLOCK

API	Supported
CLOCK_MONOTONIC	yes

_POSIX_PRIORITY_SCHEDULING As processes are not yet supported in Zephyr, the functions sched_rr_get_interval(), sched_setparam(), and sched_setscheduler() are expected to fail setting errno to ENOSYS†.

Enable this option with CONFIG_POSIX_PRIORITY_SCHEDULING.

Table 51: _POSIX_PRIORITY_SCHEDULING

API	Supported
sched_get_priority_max()	yes
sched_get_priority_min()	yes
sched_getparam()	yes
sched_getscheduler()	yes
sched_rr_get_interval()	yes †
sched_setparam()	yes †
sched_setscheduler()	yes †
sched_yield()	yes

_POSIX_RAW_SOCKETS Raw sockets are supported.

For more information, please refer to CONFIG_NET_SOCKETS_PACKET.

Enable this option with CONFIG_POSIX_RAW_SOCKETS.

_POSIX_READER_WRITER_LOCKS Enable this option with CONFIG_POSIX_READER_WRITER_LOCKS.

Table 52: _POSIX_READER_WRITER_LOCKS

API	Supported
pthread_rwlock_destroy()	yes
pthread_rwlock_init()	yes
pthread_rwlock_rdlock()	yes
pthread_rwlock_tryrdlock()	yes
pthread_rwlock_trywrlock()	yes
pthread_rwlock_unlock()	yes
pthread_rwlock_wrlock()	yes
pthread_rwlockattr_destroy()	yes
pthread_rwlockattr_getpshared()	yes
pthread_rwlockattr_init()	yes
pthread_rwlockattr_setpshared()	yes

_POSIX_SHARED_MEMORY_OBJECTS Enable this option with `CONFIG_POSIX_SHARED_MEMORY_OBJECTS`.

Table 53: _POSIX_SHARED_MEMORY_OBJECTS

API	Supported
mmap()	yes
munmap()	yes
shm_open()	yes
shm_unlink()	yes

_POSIX_SYNCHRONIZED_IO Enable this option with `CONFIG_POSIX_SYNCHRONIZED_IO`.

Table 54: _POSIX_SYNCHRONIZED_IO

API	Supported
fdatasync()	yes
fsync()	yes
msync()	yes

_POSIX_THREAD_ATTR_STACKADDR Enable this option with `CONFIG_POSIX_THREAD_ATTR_STACKADDR`.

Table 55: _POSIX_THREAD_ATTR_STACKADDR

API	Supported
pthread_attr_getstackaddr()	yes
pthread_attr_setstackaddr()	yes

_POSIX_THREAD_ATTR_STACKSIZE Enable this option with `CONFIG_POSIX_THREAD_ATTR_STACKSIZE`.

Table 56: _POSIX_THREAD_ATTR_STACKSIZE

API	Supported
pthread_attr_getstacksize()	yes
pthread_attr_setstacksize()	yes

_POSIX_THREAD_CPUTIME Enable this option with `CONFIG_POSIX_THREAD_CPUTIME`.

Table 57: _POSIX_THREAD_CPUTIME

API	Supported
CLOCK_THREAD_CPUTIME_ID	yes
pthread_getcpuclockid()	yes

_POSIX_THREAD_PRIO_INHERIT Enable this option with `CONFIG_POSIX_THREAD_PRIO_INHERIT`.

Table 58: _POSIX_THREAD_PRIO_INHERIT

API	Supported
pthread_mutexattr_getprotocol()	yes
pthread_mutexattr_setprotocol()	yes

_POSIX_THREAD_PRIO_PROTECT Enable this option with `CONFIG_POSIX_THREAD_PRIO_PROTECT`.

Table 59: _POSIX_THREAD_PRIO_PROTECT

API	Supported
pthread_mutex_getprioceiling()	
pthread_mutex_setprioceiling()	
pthread_mutexattr_getprioceiling()	
pthread_mutexattr_getprotocol()	yes
pthread_mutexattr_setprioceiling()	
pthread_mutexattr_setprotocol()	yes

_POSIX_THREAD_PRIORITY_SCHEDULING Enable this option with `CONFIG_POSIX_THREAD_PRIORITY_SCHEDULING`.

Table 60: _POSIX_THREAD_PRIORITY_SCHEDULING

API	Supported
pthread_attr_getinheritsched()	yes
pthread_attr_getschedpolicy()	yes
pthread_attr_getscope()	yes
pthread_attr_setinheritsched()	yes
pthread_attr_setschedpolicy()	yes
pthread_attr_setscope()	yes
pthread_getschedparam()	yes
pthread_setschedparam()	yes
pthread_setschedprio()	yes

_POSIX_THREAD_SAFE_FUNCTIONS Enable this option with CONFIG_POSIX_THREAD_SAFE_FUNCTIONS.

Table 61: _POSIX_THREAD_SAFE_FUNCTIONS

API	Supported
asctime_r()	
ctime_r()	
flockfile()	
ftrylockfile()	
funlockfile()	
getc_unlocked()	
getchar_unlocked()	
getgrgid_r()	
getgrnam_r()	
getpwnam_r()	
getpwuid_r()	
gmtime_r()	yes
localtime_r()	
putc_unlocked()	
putchar_unlocked()	
rand_r()	yes
readdir_r()	
strerror_r()	yes
strtok_r()	yes

_POSIX_TIMEOUTS Enable this option with CONFIG_POSIX_TIMEOUTS.

Table 62: _POSIX_TIMEOUTS

API	Supported
mq_timedreceive()	yes
mq_timedsend()	yes
pthread_mutex_timedlock()	yes
pthread_rwlock_timedrdlock()	yes
pthread_rwlock_timedwrlock()	yes
sem_timedwait()	yes
posix_trace_timedgetnext_event()	

_XOPEN_STREAMS With the exception of ioctl(), functions in the _XOPEN_STREAMS option group are not implemented in Zephyr but are provided so that conformant applications can still link. Unimplemented functions in this option group will fail, setting errno to ENOSYS †.

Enable this option with CONFIG_XOPEN_STREAMS.

Table 63: _XOPEN_STREAMS

API	Supported
fattach()	yes †
fdetach()	yes †
getmsg()	yes †
getpmsg()	yes †
ioctl()	yes
isastream()	yes †
putmsg()	yes †
putpmsg()	yes †

Additional Configuration Options

Below is a non-exhaustive list of additional *Configuration System (Kconfig)* options relating to Zephyr's implementation of the POSIX API.

- CONFIG_DYNAMIC_THREAD
- CONFIG_DYNAMIC_THREAD_POOL_SIZE
- CONFIG_EVENTFD
- CONFIG_FDTABLE
- CONFIG_GETOPT_LONG
- CONFIG_MAX_PTHREAD_SPINLOCK_COUNT
- CONFIG_MQUEUE_NAMELEN_MAX
- CONFIG_POSIX_MQ_OPEN_MAX
- CONFIG_MSG_SIZE_MAX
- CONFIG_NET_SOCKETPAIR
- CONFIG_NET_SOCKETS
- CONFIG_NET_SOCKETS_POLL_MAX
- CONFIG_ZVFS_OPEN_MAX
- CONFIG_POSIX_API
- CONFIG_POSIX_OPEN_MAX
- CONFIG_POSIX_PTHREAD_ATTR_GUARDSIZE_BITS
- CONFIG_POSIX_PTHREAD_ATTR_GUARDSIZE_DEFAULT
- CONFIG_POSIX_PTHREAD_ATTR_STACKSIZE_BITS
- CONFIG_POSIX_RTSIG_MAX
- CONFIG_POSIX_SIGNAL_STRING_DESC
- CONFIG_POSIX_THREAD_KEYS_MAX
- CONFIG_POSIX_THREAD_THREADS_MAX
- CONFIG_POSIX_UNAME_NODENAME_LEN
- CONFIG_POSIX_UNAME_VERSION_LEN
- CONFIG_PTHREAD_CREATE_BARRIER
- CONFIG_PTHREAD_RECYCLER_DELAY_MS

- CONFIG_POSIX_SEM_NAMELEN_MAX
- CONFIG_POSIX_SEM_NSEMS_MAX
- CONFIG_POSIX_SEM_VALUE_MAX
- CONFIG_TIMER_CREATE_WAIT
- CONFIG_THREAD_STACK_INFO
- CONFIG_ZVFS_EVENTFD_MAX

4.20.2 CMSIS RTOS v1

Cortex-M Software Interface Standard (CMSIS) RTOS is a vendor-independent hardware abstraction layer for the ARM Cortex-M processor series and defines generic tool interfaces. Though it was originally defined for ARM Cortex-M microcontrollers alone, it could be easily extended to other microcontrollers making it generic. For more information on CMSIS RTOS v1, please refer http://www.keil.com/pack/doc/CMSIS/RTOS/html/index.html

4.20.3 CMSIS RTOS v2

Cortex-M Software Interface Standard (CMSIS) RTOS is a vendor-independent hardware abstraction layer for the ARM Cortex-M processor series and defines generic tool interfaces. Though it was originally defined for ARM Cortex-M microcontrollers alone, it could be easily extended to other microcontrollers making it generic. For more information on CMSIS RTOS v2, please refer to the CMSIS-RTOS2 Documentation.

Features not supported in Zephyr implementation

Kernel
: `osKernelGetState`, `osKernelSuspend`, `osKernelResume`, `osKernelInitialize` and `osKernelStart` are not supported.

Mutex
: `osMutexPrioInherit` is supported by default and is not configurable, you cannot select/unselect this attribute.

  `osMutexRecursive` is also supported by default. If this attribute is not set, an error is thrown when the same thread tries to acquire it the second time.

  `osMutexRobust` is not supported in Zephyr.

Return values not supported in the Zephyr implementation

`osKernelUnlock`, `osKernelLock`, `osKernelRestoreLock`
: `osError` (Unspecified error) is not supported.

`osSemaphoreDelete`
: `osErrorResource` (the semaphore specified by parameter semaphore_id is in an invalid semaphore state) is not supported.

`osMutexDelete`
: `osErrorResource` (mutex specified by parameter mutex_id is in an invalid mutex state) is not supported.

`osTimerDelete`
: `osErrorResource` (the timer specified by parameter timer_id is in an invalid timer state) is not supported.

osMessageQueueReset
: osErrorResource (the message queue specified by parameter msgq_id is in an invalid message queue state) is not supported.

osMessageQueueDelete
: osErrorResource (the message queue specified by parameter msgq_id is in an invalid message queue state) is not supported.

osMemoryPoolFree
: osErrorResource (the memory pool specified by parameter mp_id is in an invalid memory pool state) is not supported.

osMemoryPoolDelete
: osErrorResource (the memory pool specified by parameter mp_id is in an invalid memory pool state) is not supported.

osEventFlagsSet, osEventFlagsClear
: osFlagsErrorUnknown (Unspecified error) and osFlagsErrorResource (Event flags object specified by parameter ef_id is not ready to be used) are not supported.

osEventFlagsDelete
: osErrorParameter (the value of the parameter ef_id is incorrect) is not supported.

osThreadFlagsSet
: osFlagsErrorUnknown (Unspecified error) and osFlagsErrorResource (Thread specified by parameter thread_id is not active to receive flags) are not supported.

osThreadFlagsClear
: osFlagsErrorResource (Running thread is not active to receive flags) is not supported.

osDelayUntil
: osParameter (the time cannot be handled) is not supported.

4.21 Power off

group sys_poweroff

Functions

FUNC_NORETURN void **sys_poweroff**(void)

Perform a system power off.

This function will perform an immediate power off of the system. It is the responsibility of the caller to ensure that the system is in a safe state to be powered off. Any required wake up sources must be enabled before calling this function.

CONFIG_POWEROFF needs to be enabled to use this API.

4.22 Shell

- *Overview*
- *Backends*
  - *Telnet*

  - *USB CDC ACM*
  - *Bluetooth LE (NUS)*
  - *Segget RTT*
- *Commands*
  - *Commonly-used command groups*
  - *Creating commands*
  - *Dictionary commands*
  - *Commands execution*
  - *Built-in commands*
- *Tab Feature*
- *History Feature*
- *Wildcards Feature*
- *Meta Keys Feature*
- *Getopt Feature*
- *Obscured Input Feature*
- *Shell Logger Backend Feature*
- *RTT Backend Channel Selection*
- *Usage*
- *API Reference*

4.22.1 Overview

This module allows you to create and handle a shell with a user-defined command set. You can use it in examples where more than simple button or LED user interaction is required. This module is a Unix-like shell with these features:

- Support for multiple instances.
- Advanced cooperation with the *Logging*.
- Support for static and dynamic commands.
- Support for dictionary commands.
- Smart command completion with the `Tab` key.
- Built-in commands: **`clear`**, **`shell`**, **`colors`**, **`echo`**, **`history`** and **`resize`**.
- Viewing recently executed commands using keys: ↑ ↓ or meta keys.
- Text edition using keys: ←, →, `Backspace`, `Delete`, `End`, `Home`, `Insert`.
- Support for ANSI escape codes: `VT100` and `ESC[n~` for cursor control and color printing.
- Support for editing multiline commands.
- Built-in handler to display help for the commands.
- Support for wildcards: `*` and `?`.
- Support for meta keys.
- Support for getopt and getopt_long.

- Kconfig configuration to optimize memory usage.

Note

Some of these features have a significant impact on RAM and flash usage, but many can be disabled when not needed. To default to options which favor reduced RAM and flash requirements instead of features, you should enable `CONFIG_SHELL_MINIMAL` and selectively enable just the features you want.

4.22.2 Backends

The module can be connected to any transport for command input and output. At this point, the following transport layers are implemented:

- MQTT
- Segger RTT
- SMP
- Telnet
- UART
- USB
- Bluetooth LE (NUS)
- RPMSG
- DUMMY - not a physical transport layer.

Telnet

Enabling `CONFIG_SHELL_BACKEND_TELNET` will allow users to use telnet as a shell backend. Connecting to it can be done using PuTTY or any `telnet` client. For example:

```
telnet <ip address> <port>
```

By default the telnet client won't handle telnet commands and configuration. Although command support can be enabled with `CONFIG_SHELL_TELNET_SUPPORT_COMMAND`. This will give the telnet client access to a very limited set of supported commands but still can be turned on if needed. One of the command options it supports is the `ECHO` option. This will allow the client to be in character mode (character at a time), similar to a UART backend in that regard. This will make the client send a character as soon as it is typed having the effect of increasing the network traffic considerably. For that cost, it will enable the line editing, *tab completion*, and *history* features of the shell.

USB CDC ACM

To configure Shell USB CDC ACM backend, simply add the snippet `cdc-acm-console` to your build:

```
west build -S cdc-acm-console [...]
```

Details on the configuration settings are captured in the following files:

- snippets/cdc-acm-console/cdc-acm-console.conf.
- snippets/cdc-acm-console/cdc-acm-console.overlay.

Bluetooth LE (NUS)

To configure Bluetooth LE (NUS) backend, simply add the snippet `nus-console` to your build:

```
west build -S nus-console [...]
```

Details on the configuration settings are captured in the following files:

- snippets/nus-console/nus-console.conf.
- snippets/nus-console/nus-console.overlay.

Segget RTT

To configure Segger RTT backend, add the following configurations to your build:

- `CONFIG_USE_SEGGER_RTT`
- `CONFIG_SHELL_BACKEND_RTT`
- `CONFIG_SHELL_BACKEND_SERIAL`

Details on additional configuration settings are captured in: samples/subsys/shell/shell_module/prj_minimal_rtt.conf.

Connecting to Segger RTT via TCP (on macOS, for example) On macOS JLinkRTTClient won't let you enter input. Instead, please use following procedure:

- Open up a first Terminal window and enter:

  ```
  JLinkRTTLogger -Device NRF52840_XXAA -RTTChannel 1 -if SWD -Speed 4000 ~/rtt.log
  ```

  (change device if required)

- Open up a second Terminal window and enter:

  ```
  nc localhost 19021
  ```

- Now you should have a network connection to RTT that will let you enter input to the shell.

4.22.3 Commands

Shell commands are organized in a tree structure and grouped into the following types:

- Root command (level 0): Gathered and alphabetically sorted in a dedicated memory section.
- Static subcommand (level > 0): Number and syntax must be known during compile time. Created in the software module.
- Dynamic subcommand (level > 0): Number and syntax does not need to be known during compile time. Created in the software module.

Commonly-used command groups

The following list is a set of useful command groups and how to enable them:

GPIO

- CONFIG_GPIO
- CONFIG_GPIO_SHELL

I2C

- CONFIG_I2C
- CONFIG_I2C_SHELL

Sensor

- CONFIG_SENSOR
- CONFIG_SENSOR_SHELL

Flash

- CONFIG_FLASH
- CONFIG_FLASH_SHELL

File-System

- CONFIG_FILE_SYSTEM
- CONFIG_FILE_SYSTEM_SHELL

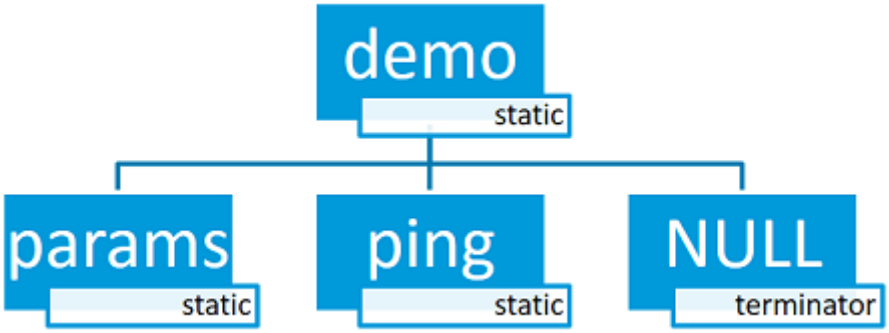
Creating commands

Use the following macros for adding shell commands:

- *SHELL_CMD_REGISTER* - Create root command. All root commands must have different name.
- *SHELL_COND_CMD_REGISTER* - Conditionally (if compile time flag is set) create root command. All root commands must have different name.
- *SHELL_CMD_ARG_REGISTER* - Create root command with arguments. All root commands must have different name.
- *SHELL_COND_CMD_ARG_REGISTER* - Conditionally (if compile time flag is set) create root command with arguments. All root commands must have different name.
- *SHELL_CMD* - Initialize a command.
- *SHELL_COND_CMD* - Initialize a command if compile time flag is set.
- *SHELL_EXPR_CMD* - Initialize a command if compile time expression is non-zero.
- *SHELL_CMD_ARG* - Initialize a command with arguments.
- *SHELL_COND_CMD_ARG* - Initialize a command with arguments if compile time flag is set.
- *SHELL_EXPR_CMD_ARG* - Initialize a command with arguments if compile time expression is non-zero.
- *SHELL_STATIC_SUBCMD_SET_CREATE* - Create a static subcommands array.
- *SHELL_SUBCMD_DICT_SET_CREATE* - Create a dictionary subcommands array.
- *SHELL_DYNAMIC_CMD_CREATE* - Create a dynamic subcommands array.

Commands can be created in any file in the system that includes include/zephyr/shell/shell.h. All created commands are available for all shell instances.

Static commands Example code demonstrating how to create a root command with static subcommands.



```
/* Creating subcommands (level 1 command) array for command "demo". */
SHELL_STATIC_SUBCMD_SET_CREATE(sub_demo,
        SHELL_CMD(params, NULL, "Print params command.",
                                                cmd_demo_params),
        SHELL_CMD(ping,   NULL, "Ping command.", cmd_demo_ping),
        SHELL_SUBCMD_SET_END
);
/* Creating root (level 0) command "demo" */
SHELL_CMD_REGISTER(demo, &sub_demo, "Demo commands", NULL);
```

Example implementation can be found under following location: samples/subsys/shell/shell_module/src/main.c.

Dictionary commands

This is a special kind of static commands. Dictionary commands can be used every time you want to use a pair: (string <-> corresponding data) in a command handler. The string is usually a verbal description of a given data. The idea is to use the string as a command syntax that can be prompted by the shell and corresponding data can be used to process the command.

Let's use an example. Suppose you created a command to set an ADC gain. It is a perfect place where a dictionary can be used. The dictionary would be a set of pairs: (string: gain_value, int: value) where int value could be used with the ADC driver API.

Abstract code for this task would look like this:

```
static int gain_cmd_handler(const struct shell *sh,
                            size_t argc, char **argv, void *data)
{
        int gain;

        /* data is a value corresponding to called command syntax */
        gain = (int)data;
        adc_set_gain(gain);

        shell_print(sh, "ADC gain set to: %s\n"
                        "Value send to ADC driver: %d",
                        argv[0],
                        gain);

        return 0;
}

SHELL_SUBCMD_DICT_SET_CREATE(sub_gain, gain_cmd_handler,
        (gain_1, 1, "gain 1"), (gain_2, 2, "gain 2"),
```

(continues on next page)

(continued from previous page)

```
        (gain_1_2, 3, "gain 1/2"), (gain_1_4, 4, "gain 1/4")
);
SHELL_CMD_REGISTER(gain, &sub_gain, "Set ADC gain", NULL);
```

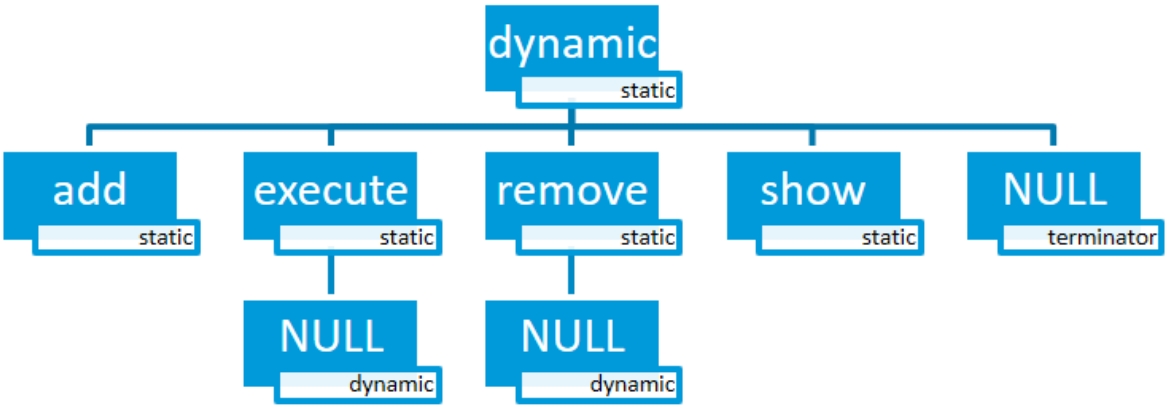
This is how it would look like in the shell:

```
uart:~$ gain ga
  gain_1    gain_2    gain_1_2  gain_1_4
uart:~$ gain gain_1
ADC gain set to: gain_1
Value send to ADC driver: 1
uart:~$ gain gain_2
ADC gain set to: gain_2
Value send to ADC driver: 2
uart:~$ gain gain_1_2
ADC gain set to: gain_1_2
Value send to ADC driver: 3
uart:~$ gain gain_1_4
ADC gain set to: gain_1_4
Value send to ADC driver: 4
uart:~$
```

Dynamic commands Example code demonstrating how to create a root command with static and dynamic subcommands. At the beginning dynamic command list is empty. New commands can be added by typing:

```
dynamic add <new_dynamic_command>
```

Newly added commands can be prompted or autocompleted with the Tab key.



```
/* Buffer for 10 dynamic commands */
static char dynamic_cmd_buffer[10][50];
```

(continues on next page)

(continued from previous page)

```
/* commands counter */
static uint8_t dynamic_cmd_cnt;

/* Function returning command dynamically created
 * in  dynamic_cmd_buffer.
 */
static void dynamic_cmd_get(size_t idx,
                            struct shell_static_entry *entry)
{
        if (idx < dynamic_cmd_cnt) {
                entry->syntax = dynamic_cmd_buffer[idx];
                entry->handler  = NULL;
                entry->subcmd = NULL;
                entry->help = "Show dynamic command name.";
        } else {
                /* if there are no more dynamic commands available
                 * syntax must be set to NULL.
                 */
                entry->syntax = NULL;
        }
}

SHELL_DYNAMIC_CMD_CREATE(m_sub_dynamic_set, dynamic_cmd_get);
SHELL_STATIC_SUBCMD_SET_CREATE(m_sub_dynamic,
        SHELL_CMD(add, NULL,"Add new command to dynamic_cmd_buffer and"
                  " sort them alphabetically.",
                  cmd_dynamic_add),
        SHELL_CMD(execute, &m_sub_dynamic_set,
                  "Execute a command.", cmd_dynamic_execute),
        SHELL_CMD(remove, &m_sub_dynamic_set,
                  "Remove a command from dynamic_cmd_buffer.",
                  cmd_dynamic_remove),
        SHELL_CMD(show, NULL,
                  "Show all commands in dynamic_cmd_buffer.",
                  cmd_dynamic_show),
        SHELL_SUBCMD_SET_END
);
SHELL_CMD_REGISTER(dynamic, &m_sub_dynamic,
           "Demonstrate dynamic command usage.", cmd_dynamic);
```

Example implementation can be found under following location: samples/subsys/shell/shell_module/src/dynamic_cmd.c.

Commands execution

Each command or subcommand may have a handler. The shell executes the handler that is found deepest in the command tree and further subcommands (without a handler) are passed as arguments. Characters within parentheses are treated as one argument. If shell won't find a handler it will display an error message.

Commands can be also executed from a user application using any active backend and a function *shell_execute_cmd()*, as shown in this example:

```
int main(void)
{
        /* Below code will execute "clear" command on a DUMMY backend */
        shell_execute_cmd(NULL, "clear");

        /* Below code will execute "shell colors off" command on
```

(continues on next page)

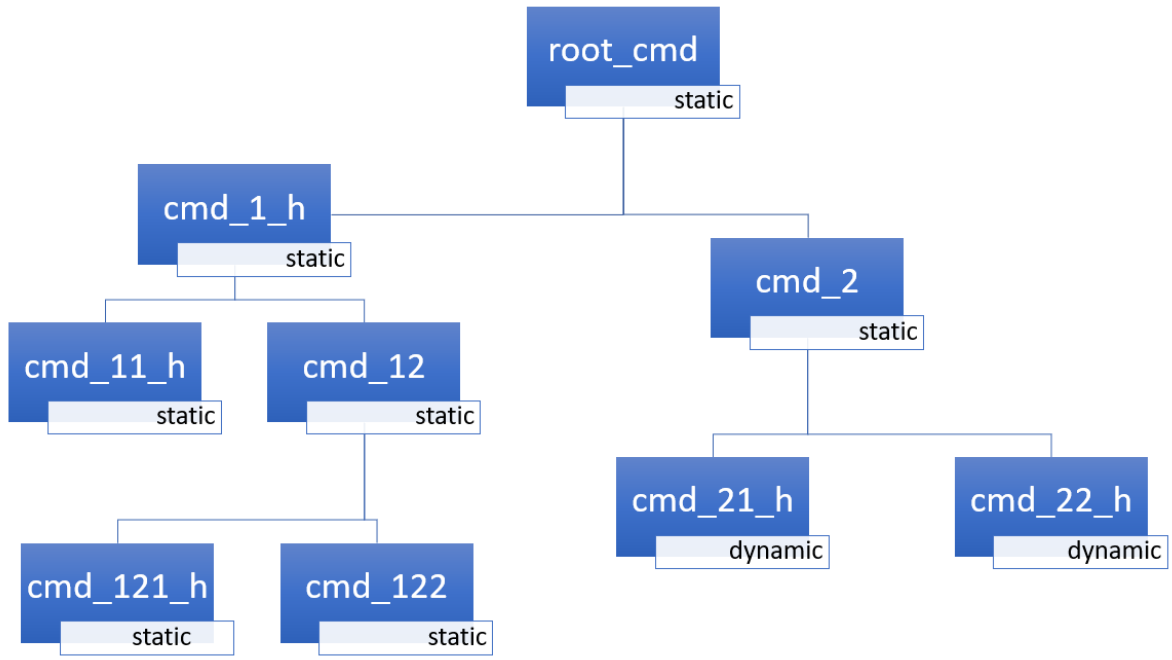
(continued from previous page)

```
         * an UART backend
         */
        shell_execute_cmd(shell_backend_uart_get_ptr(),
                          "shell colors off");
}
```

Enable the DUMMY backend by setting the Kconfig `CONFIG_SHELL_BACKEND_DUMMY` option.

Commands execution example Let's assume a command structure as in the following figure, where:

- `root_cmd` - root command without a handler
- `cmd_xxx_h` - command has a handler
- `cmd_xxx` - command does not have a handler



Example 1 Sequence: `root_cmd cmd_1_h cmd_12_h cmd_121_h parameter` will execute command `cmd_121_h` and `parameter` will be passed as an argument.

Example 2 Sequence: `root_cmd cmd_2 cmd_22_h parameter1 parameter2` will execute command `cmd_22_h` and `parameter1 parameter2` will be passed as an arguments.

Example 3 Sequence: `root_cmd cmd_1_h parameter1 cmd_121_h parameter2` will execute command `cmd_1_h` and `parameter1`, `cmd_121_h` and `parameter2` will be passed as an arguments.

Example 4 Sequence: `root_cmd parameter cmd_121_h parameter2` will not execute any command.

Command handler Simple command handler implementation:

```
static int cmd_handler(const struct shell *sh, size_t argc,
                       char **argv)
{
        ARG_UNUSED(argc);
        ARG_UNUSED(argv);

        shell_fprintf(shell, SHELL_INFO, "Print info message\n");

        shell_print(sh, "Print simple text.");

        shell_warn(sh, "Print warning text.");

        shell_error(sh, "Print error text.");

        return 0;
}
```

Function *shell_fprintf()* or the shell print macros: *shell_print*, *shell_info*, *shell_warn* and *shell_error* can be used from the command handler or from threads, but not from an interrupt context. Instead, interrupt handlers should use *Logging* for printing.

Command help Every user-defined command or subcommand can have its own help description. The help for commands and subcommands can be created with respective macros: *SHELL_CMD_REGISTER*, *SHELL_CMD_ARG_REGISTER*, *SHELL_CMD*, and *SHELL_CMD_ARG*.

Shell prints this help message when you call a command or subcommand with `-h` or `--help` parameter.

Parent commands In the subcommand handler, you can access both the parameters passed to commands or the parent commands, depending on how you index `argv`.

- When indexing `argv` with positive numbers, you can access the parameters.
- When indexing `argv` with negative numbers, you can access the parent commands.
- The subcommand to which the handler belongs has the `argv` index of 0.

```
static int cmd_handler(const struct shell *sh, size_t argc,
                       char **argv)
{
        ARG_UNUSED(argc);

        /* If it is a subcommand handler parent command syntax
         * can be found using argv[-1].
         */
        shell_print(sh, "This command has a parent command: %s",
                    argv[-1]);

        /* Print this command syntax */
        shell_print(sh, "This command syntax is: %s", argv[0]);

        /* Print first argument */
        shell_print(sh, "%s", argv[1]);

        return 0;
}
```

Built-in commands

These commands are activated by CONFIG_SHELL_CMDS set to y.

- **clear** - Clears the screen.
- **history** - Shows the recently entered commands.
- **resize** - Must be executed when terminal width is different than 80 characters or after each change of terminal width. It ensures proper multiline text display and ←, →, End, Home keys handling. Currently this command works only with UART flow control switched on. It can be also called with a subcommand:
  - **default** - Shell will send terminal width = 80 to the terminal and assume successful delivery.

  These command needs extra activation: CONFIG_SHELL_CMDS_RESIZE set to y.
- **select** - It can be used to set new root command. Exit to main command tree is with alt+r. This command needs extra activation: CONFIG_SHELL_CMDS_SELECT set to y.
- **shell** - Root command with useful shell-related subcommands like:
  - **echo** - Toggles shell echo.
  - **colors** - Toggles colored syntax. This might be helpful in case of Bluetooth shell to limit the amount of transferred bytes.
  - **stats** - Shows shell statistics.

4.22.4 Tab Feature

The Tab button can be used to suggest commands or subcommands. This feature is enabled by CONFIG_SHELL_TAB set to y. It can also be used for partial or complete auto-completion of commands. This feature is activated by CONFIG_SHELL_TAB_AUTOCOMPLETION set to y. When user starts writing a command and presses the Tab button then the shell will do one of 3 possible things:

- Autocomplete the command.
- Prompts available commands and if possible partly completes the command.
- Will not do anything if there are no available or matching commands.

```
uart:~$ log
  backend        disable        enable         go             halt
  list_backends  status
uart:~$ log enable
  dbg   err   inf   none  wrn
uart:~$ log enable err
  app               app_test          log              os
  shell.shell_uart  shell_uart
uart:~$ log enable err shell
  shell.shell_uart  shell_uart
uart:~$ log enable err shell
```

4.22.5 History Feature

This feature enables commands history in the shell. It is activated by: CONFIG_SHELL_HISTORY set to y. History can be accessed using keys: ↑ ↓ or Ctrl+n and Ctrl+p if meta keys are active. Number of commands that can be stored depends on size of CONFIG_SHELL_HISTORY_BUFFER parameter.

4.22.6 Wildcards Feature

The shell module can handle wildcards. Wildcards are interpreted correctly when expanded command and its subcommands do not have a handler. For example, if you want to set logging level to `err` for the `app` and `app_test` modules you can execute the following command:

```
log enable err a*
```

```
uart:~$ log status
module_name                                     | current | built-in
------------------------------------------------------------------
app                                             | inf     | inf
app_test                                        | inf     | inf
shell.uart_shell                                | inf     | inf
uart:~$ log enable err a*
uart:~$ log status
module_name                                     | current | built-in
------------------------------------------------------------------
app                                             | err     | inf
app_test                                        | err     | inf
shell.uart_shell                                | inf     | inf
uart:~$
```

This feature is activated by `CONFIG_SHELL_WILDCARD` set to `y`.

4.22.7 Meta Keys Feature

The shell module supports the following meta keys:

Table 64: Implemented meta keys

Meta keys	Action
`Ctrl+a`	Moves the cursor to the beginning of the line.
`Ctrl+b`	Moves the cursor backward one character.
`Ctrl+c`	Preserves the last command on the screen and starts a new command in a new line.
`Ctrl+d`	Deletes the character under the cursor.
`Ctrl+e`	Moves the cursor to the end of the line.
`Ctrl+f`	Moves the cursor forward one character.
`Ctrl+k`	Deletes from the cursor to the end of the line.
`Ctrl+l`	Clears the screen and leaves the currently typed command at the top of the screen.
`Ctrl+n`	Moves in history to next entry.
`Ctrl+p`	Moves in history to previous entry.
`Ctrl+u`	Clears the currently typed command.
`Ctrl+w`	Removes the word or part of the word to the left of the cursor. Words separated by period instead of space are treated as one word.
`Alt+b`	Moves the cursor backward one word.
`Alt+f`	Moves the cursor forward one word.

This feature is activated by `CONFIG_SHELL_METAKEYS` set to `y`.

4.22.8 Getopt Feature

Some shell users apart from subcommands might need to use options as well. the arguments string, looking for supported options. Typically, this task is accomplished by the `getopt` family functions.

For this purpose shell supports the getopt and getopt_long libraries available in the FreeBSD project. This feature is activated by: `CONFIG_POSIX_C_LIB_EXT` set to `y` and `CONFIG_GETOPT_LONG` set to `y`.

This feature can be used in thread safe as well as non thread safe manner. The former is full compatible with regular getopt usage while the latter a bit differs.

An example non-thread safe usage:

```
char *cvalue = NULL;
while ((char c = getopt(argc, argv, "abhc:")) != -1) {
      switch (c) {
      case 'c':
              cvalue = optarg;
              break;
      default:
              break;
      }
}
```

An example thread safe usage:

```
char *cvalue = NULL;
struct getopt_state *state;
while ((char c = getopt(argc, argv, "abhc:")) != -1) {
      state = getopt_state_get();
      switch (c) {
      case 'c':
              cvalue = state->optarg;
              break;
      default:
              break;
      }
}
```

Thread safe getopt functionality is activated by `CONFIG_SHELL_GETOPT` set to `y`.

4.22.9 Obscured Input Feature

With the obscured input feature, the shell can be used for implementing a login prompt or other user interaction whereby the characters the user types should not be revealed on screen, such as when entering a password.

Once the obscured input has been accepted, it is normally desired to return the shell to normal operation. Such runtime control is possible with the `shell_obscure_set` function.

An example of login and logout commands using this feature is located in samples/subsys/shell/shell_module/src/main.c and the config file samples/subsys/shell/shell_module/prj_login.conf.

This feature is activated upon startup by `CONFIG_SHELL_START_OBSCURED` set to `y`. With this set either way, the option can still be controlled later at runtime. `CONFIG_SHELL_CMDS_SELECT` is useful to prevent entry of any other command besides a login command, by means of the `shell_set_root_cmd` function. Likewise, `CONFIG_SHELL_PROMPT_UART` allows you to set the prompt upon startup, but it can be changed later with the `shell_prompt_change` function.

4.22.10 Shell Logger Backend Feature

Shell instance can act as the *Logging* backend. Shell ensures that log messages are correctly multiplexed with shell output. Log messages from logger thread are enqueued and processed in the shell thread. Logger thread will block for configurable amount of time if queue is full, blocking logger thread context for that time. Oldest log message is removed from the queue after timeout and new message is enqueued. Use the `shell stats show` command to retrieve number of log messages dropped by the shell instance. Log queue size and timeout are *SHELL_DEFINE* arguments.

This feature is activated by: `CONFIG_SHELL_LOG_BACKEND` set to `y`.

Warning

Enqueuing timeout must be set carefully when multiple backends are used in the system. The shell instance could have a slow transport or could block, for example, by a UART with hardware flow control. If timeout is set too high, the logger thread could be blocked and impact other logger backends.

Warning

As the shell is a complex logger backend, it can not output logs if the application crashes before the shell thread is running. In this situation, you can enable one of the simple logging backends instead, such as UART (`CONFIG_LOG_BACKEND_UART`) or RTT (`CONFIG_LOG_BACKEND_RTT`), which are available earlier during system initialization.

4.22.11 RTT Backend Channel Selection

Instead of using the shell as a logger backend, RTT shell backend and RTT log backend can also be used simultaneously, but over different channels. By separating them, the log can be captured or monitored without shell output or the shell may be scripted without log interference. Enabling both the Shell RTT backend and the Log RTT backend does not work by default, because both default to channel `0`. There are two options:

1. The Shell buffer can use an alternate channel, for example using `CONFIG_SHELL_BACKEND_RTT_BUFFER` set to `1`. This allows monitoring the log using JLinkRTTViewer while a script interfaces over channel 1.

2. The Log buffer can use an alternate channel, for example using `CONFIG_LOG_BACKEND_RTT_BUFFER` set to `1`. This allows interactive use of the shell through JLinkRTTViewer, while the log is written to file.

See *shell backends* for details on how to enable RTT as a Shell backend.

4.22.12 Usage

The following code shows a simple use case of this library:

```
int main(void)
{

}

static int cmd_demo_ping(const struct shell *sh, size_t argc,
                         char **argv)
```

(continues on next page)

(continued from previous page)

```
{
        ARG_UNUSED(argc);
        ARG_UNUSED(argv);

        shell_print(sh, "pong");
        return 0;
}

static int cmd_demo_params(const struct shell *sh, size_t argc,
                           char **argv)
{
        int cnt;

        shell_print(sh, "argc = %d", argc);
        for (cnt = 0; cnt < argc; cnt++) {
                shell_print(sh, "  argv[%d] = %s", cnt, argv[cnt]);
        }
        return 0;
}

/* Creating subcommands (level 1 command) array for command "demo". */
SHELL_STATIC_SUBCMD_SET_CREATE(sub_demo,
        SHELL_CMD(params, NULL, "Print params command.",
                                                cmd_demo_params),
        SHELL_CMD(ping,   NULL, "Ping command.", cmd_demo_ping),
        SHELL_SUBCMD_SET_END
);
/* Creating root (level 0) command "demo" without a handler */
SHELL_CMD_REGISTER(demo, &sub_demo, "Demo commands", NULL);

/* Creating root (level 0) command "version" */
SHELL_CMD_REGISTER(version, NULL, "Show kernel version", cmd_version);
```

Users may use the Tab key to complete a command/subcommand or to see the available subcommands for the currently entered command level. For example, when the cursor is positioned at the beginning of the command line and the Tab key is pressed, the user will see all root (level 0) commands:

```
clear  demo  shell  history  log  resize  version
```

Note

To view the subcommands that are available for a specific command, you must first type a space after this command and then hit Tab.

These commands are registered by various modules, for example:

- **clear**, **shell**, **history**, and **resize** are built-in commands which have been registered by subsys/shell/shell.c
- **demo** and **version** have been registered in example code above by main.c
- **log** has been registered by subsys/logging/log_cmds.c

Then, if a user types a **demo** command and presses the Tab key, the shell will only print the subcommands registered for this command:

```
params  ping
```

Defines

`SHELL_CMD_ARG_REGISTER`(syntax, subcmd, help, handler, mandatory, optional)

Macro for defining and adding a root command (level 0) with required number of arguments.

Note

Each root command shall have unique syntax. If a command will be called with wrong number of arguments shell will print an error message and command handler will not be called.

Parameters

- `syntax` – **[in]** Command syntax (for example: history).
- `subcmd` – **[in]** Pointer to a subcommands array.
- `help` – **[in]** Pointer to a command help string.
- `handler` – **[in]** Pointer to a function handler.
- `mandatory` – **[in]** Number of mandatory arguments including command name.
- `optional` – **[in]** Number of optional arguments.

`SHELL_COND_CMD_ARG_REGISTER`(flag, syntax, subcmd, help, handler, mandatory, optional)

Macro for defining and adding a conditional root command (level 0) with required number of arguments.

Macro can be used to create a command which can be conditionally present. It is and alternative to #ifdefs around command registration and command handler. If command is disabled handler and subcommands are removed from the application.

See also

SHELL_CMD_ARG_REGISTER for details.

Parameters

- `flag` – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
- `syntax` – **[in]** Command syntax (for example: history).
- `subcmd` – **[in]** Pointer to a subcommands array.
- `help` – **[in]** Pointer to a command help string.
- `handler` – **[in]** Pointer to a function handler.
- `mandatory` – **[in]** Number of mandatory arguments including command name.
- `optional` – **[in]** Number of optional arguments.

`SHELL_CMD_REGISTER`(syntax, subcmd, help, handler)

Macro for defining and adding a root command (level 0) with arguments.

Note

All root commands must have different name.

Parameters

- `syntax` – **[in]** Command syntax (for example: history).
- `subcmd` – **[in]** Pointer to a subcommands array.
- `help` – **[in]** Pointer to a command help string.
- `handler` – **[in]** Pointer to a function handler.

`SHELL_COND_CMD_REGISTER`(flag, syntax, subcmd, help, handler)

Macro for defining and adding a conditional root command (level 0) with arguments.

See also

SHELL_COND_CMD_ARG_REGISTER.

Parameters

- `flag` – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
- `syntax` – **[in]** Command syntax (for example: history).
- `subcmd` – **[in]** Pointer to a subcommands array.
- `help` – **[in]** Pointer to a command help string.
- `handler` – **[in]** Pointer to a function handler.

SHELL_STATIC_SUBCMD_SET_CREATE(name, ...)

Macro for creating a subcommand set.

It must be used outside of any function body.

Example usage:

```
SHELL_STATIC_SUBCMD_SET_CREATE(
   foo,
   SHELL_CMD(abc, ...),
   SHELL_CMD(def, ...),
   SHELL_SUBCMD_SET_END
)
```

Parameters

- **name** – **[in]** Name of the subcommand set.
- **...** – **[in]** List of commands created with *SHELL_CMD_ARG* or or *SHELL_CMD*

SHELL_SUBCMD_SET_CREATE(_name, _parent)

Create set of subcommands.

Commands to this set are added using *SHELL_SUBCMD_ADD* and *SHELL_SUBCMD_COND_ADD*. Commands can be added from multiple files.

Parameters

- **_name** – **[in]** Name of the set. _name is used to refer the set in the parent command.
- **_parent** – **[in]** Set of comma separated parent commands in parenthesis, e.g. (foo_cmd) if subcommands are for the root command "foo_cmd".

SHELL_SUBCMD_COND_ADD(_flag, _parent, _syntax, _subcmd, _help, _handler, _mand, _opt)

Conditionally add command to the set of subcommands.

Add command to the set created with *SHELL_SUBCMD_SET_CREATE*.

Note

The name of the section is formed as concatenation of number of parent commands, names of all parent commands and own syntax. Number of parent commands is added to ensure that section prefix is unique. Without it subcommands of (foo) and (foo, cmd1) would mix.

Parameters

- **_flag** – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
- **_parent** – **[in]** Parent command sequence. Comma separated in parenthesis.
- **_syntax** – **[in]** Command syntax (for example: history).
- **_subcmd** – **[in]** Pointer to a subcommands array.
- **_help** – **[in]** Pointer to a command help string.
- **_handler** – **[in]** Pointer to a function handler.
- **_mand** – **[in]** Number of mandatory arguments including command name.

- **_opt** – **[in]** Number of optional arguments.

SHELL_SUBCMD_ADD(_parent, _syntax, _subcmd, _help, _handler, _mand, _opt)

Add command to the set of subcommands.

Add command to the set created with *SHELL_SUBCMD_SET_CREATE*.

Parameters

- **_parent** – **[in]** Parent command sequence. Comma separated in parenthesis.
- **_syntax** – **[in]** Command syntax (for example: history).
- **_subcmd** – **[in]** Pointer to a subcommands array.
- **_help** – **[in]** Pointer to a command help string.
- **_handler** – **[in]** Pointer to a function handler.
- **_mand** – **[in]** Number of mandatory arguments including command name.
- **_opt** – **[in]** Number of optional arguments.

SHELL_SUBCMD_SET_END

Define ending subcommands set.

SHELL_DYNAMIC_CMD_CREATE(name, get)

Macro for creating a dynamic entry.

Parameters

- **name** – **[in]** Name of the dynamic entry.
- **get** – **[in]** Pointer to the function returning dynamic commands array

SHELL_CMD_ARG(syntax, subcmd, help, handler, mand, opt)

Initializes a shell command with arguments.

> **Note**
>
> If a command will be called with wrong number of arguments shell will print an error message and command handler will not be called.

Parameters

- **syntax** – **[in]** Command syntax (for example: history).
- **subcmd** – **[in]** Pointer to a subcommands array.
- **help** – **[in]** Pointer to a command help string.
- **handler** – **[in]** Pointer to a function handler.
- **mand** – **[in]** Number of mandatory arguments including command name.
- **opt** – **[in]** Number of optional arguments.

SHELL_COND_CMD_ARG(flag, syntax, subcmd, help, handler, mand, opt)

Initializes a conditional shell command with arguments.

See also

SHELL_CMD_ARG. Based on the flag, creates a valid entry or an empty command which is ignored by the *shell*. It is an alternative to #ifdefs around command registration and command handler. However, empty structure is present in the flash even if command is disabled (subcommands and handler are removed). Macro internally handles case if flag is not defined so flag must be provided without any wrapper, e.g.: *SHELL_COND_CMD_ARG(CONFIG_FOO, ...)*

Parameters

- `flag` – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
- `syntax` – **[in]** Command syntax (for example: history).
- `subcmd` – **[in]** Pointer to a subcommands array.
- `help` – **[in]** Pointer to a command help string.
- `handler` – **[in]** Pointer to a function handler.
- `mand` – **[in]** Number of mandatory arguments including command name.
- `opt` – **[in]** Number of optional arguments.

`SHELL_EXPR_CMD_ARG`(_expr, _syntax, _subcmd, _help, _handler, _mand, _opt)

Initializes a conditional shell command with arguments if expression gives non-zero result at compile time.

See also

SHELL_CMD_ARG. Based on the expression, creates a valid entry or an empty command which is ignored by the *shell*. It should be used instead of *SHELL_COND_CMD_ARG* if condition is not a single configuration flag, e.g.: *SHELL_EXPR_CMD_ARG*(*IS_ENABLED(CONFIG_FOO)* && *IS_ENABLED(CONFIG_FOO_SETTING_1)*, ...)

Parameters

- `_expr` – **[in]** Expression.
- `_syntax` – **[in]** Command syntax (for example: history).
- `_subcmd` – **[in]** Pointer to a subcommands array.
- `_help` – **[in]** Pointer to a command help string.
- `_handler` – **[in]** Pointer to a function handler.
- `_mand` – **[in]** Number of mandatory arguments including command name.
- `_opt` – **[in]** Number of optional arguments.

`SHELL_CMD`(_syntax, _subcmd, _help, _handler)

Initializes a shell command.

Parameters

- `_syntax` – **[in]** Command syntax (for example: history).

- **_subcmd** – **[in]** Pointer to a subcommands array.
- **_help** – **[in]** Pointer to a command help string.
- **_handler** – **[in]** Pointer to a function handler.

SHELL_COND_CMD(_flag, _syntax, _subcmd, _help, _handler)

Initializes a conditional shell command.

See also

SHELL_COND_CMD_ARG.

Parameters

- **_flag** – **[in]** Compile time flag. Command is present only if flag exists and equals 1.
- **_syntax** – **[in]** Command syntax (for example: history).
- **_subcmd** – **[in]** Pointer to a subcommands array.
- **_help** – **[in]** Pointer to a command help string.
- **_handler** – **[in]** Pointer to a function handler.

SHELL_EXPR_CMD(_expr, _syntax, _subcmd, _help, _handler)

Initializes shell command if expression gives non-zero result at compile time.

See also

SHELL_EXPR_CMD_ARG.

Parameters

- **_expr** – **[in]** Compile time expression. Command is present only if expression is non-zero.
- **_syntax** – **[in]** Command syntax (for example: history).
- **_subcmd** – **[in]** Pointer to a subcommands array.
- **_help** – **[in]** Pointer to a command help string.
- **_handler** – **[in]** Pointer to a function handler.

SHELL_CMD_DICT_CREATE(_data, _handler)

SHELL_SUBCMD_DICT_SET_CREATE(_name, _handler, ...)

Initializes shell dictionary commands.

This is a special kind of static commands. Dictionary commands can be used every time you want to use a pair: (string <-> corresponding data) in a command handler. The string is usually a verbal description of a given data. The idea is to use the string as a command syntax that can be prompted by the shell and corresponding data can be used to process the command.

Example usage:

```
static int my_handler(const struct shell *sh,
                      size_t argc, char **argv, void *data)
{
   int val = (int)data;

   shell_print(sh, "(syntax, value) : (%s, %d)", argv[0], val);
   return 0;
}

SHELL_SUBCMD_DICT_SET_CREATE(sub_dict_cmds, my_handler,
   (value_0, 0, "value 0"), (value_1, 1, "value 1"),
   (value_2, 2, "value 2"), (value_3, 3, "value 3")
);
SHELL_CMD_REGISTER(dictionary, &sub_dict_cmds, NULL, NULL);
```

See also

shell_dict_cmd_handler

Parameters

- **_name** – **[in]** Name of the dictionary subcommand set
- **_handler** – **[in]** Command handler common for all dictionary commands.
- **...** – **[in]** Dictionary triplets: (command_syntax, value, helper). Value will be passed to the _handler as user data.

SHELL_DEFAULT_BACKEND_CONFIG_FLAGS

SHELL_DEFINE(_name, _prompt, _transport_iface, _log_queue_size, _log_timeout, _shell_flag)

Macro for defining a shell instance.

Parameters

- **_name** – **[in]** Instance name.
- **_prompt** – **[in]** Shell default prompt string.
- **_transport_iface** – **[in]** Pointer to the transport interface.
- **_log_queue_size** – **[in]** Logger processing queue size.
- **_log_timeout** – **[in]** Logger thread timeout in milliseconds on full log queue. If queue is full logger thread is blocked for given amount of time before log message is dropped.
- **_shell_flag** – **[in]** Shell output newline sequence.

SHELL_NORMAL

Terminal default text color for shell_fprintf function.

SHELL_INFO

Green text color for shell_fprintf function.

SHELL_OPTION

Cyan text color for shell_fprintf function.

SHELL_WARNING

Yellow text color for shell_fprintf function.

SHELL_ERROR

Red text color for shell_fprintf function.

shell_fprintf(sh, color, fmt, ...)

shell_info(_sh, _ft, ...)

Print info message to the shell.

See shell_fprintf.

Parameters

- **_sh** – **[in]** Pointer to the shell instance.
- **_ft** – **[in]** Format string.
- **...** – **[in]** List of parameters to print.

shell_print(_sh, _ft, ...)

Print normal message to the shell.

See shell_fprintf.

Parameters

- **_sh** – **[in]** Pointer to the shell instance.
- **_ft** – **[in]** Format string.
- **...** – **[in]** List of parameters to print.

shell_warn(_sh, _ft, ...)

Print warning message to the shell.

See shell_fprintf.

Parameters

- **_sh** – **[in]** Pointer to the shell instance.
- **_ft** – **[in]** Format string.
- **...** – **[in]** List of parameters to print.

shell_error(_sh, _ft, ...)

Print error message to the shell.

See shell_fprintf.

Parameters

- **_sh** – **[in]** Pointer to the shell instance.
- **_ft** – **[in]** Format string.
- **...** – **[in]** List of parameters to print.

SHELL_CMD_HELP_PRINTED

Command's help has been printed.

Typedefs

typedef void (*`shell_dynamic_get`)(size_t idx, struct *shell_static_entry* *entry)

Shell dynamic command descriptor.

Function shall fill the received *shell_static_entry* structure with requested (idx) dynamic subcommand data. If there is more than one dynamic subcommand available, the function shall ensure that the returned commands: entry->syntax are sorted in alphabetical order. If idx exceeds the available dynamic subcommands, the function must write to entry->syntax NULL value. This will indicate to the shell module that there are no more dynamic commands to read.

typedef bool (*`shell_device_filter_t`)(const struct *device* *dev)

Filter callback type, for use with shell_device_lookup_filter.

This is used as an argument of shell_device_lookup_filter to only return devices that match a specific condition, implemented by the filter.

Param dev
pointer to a struct device.

Return
bool, true if the filter matches the device type.

typedef int (*`shell_cmd_handler`)(const struct *shell* *sh, size_t argc, char **argv)

Shell command handler prototype.

Param sh
Shell instance.

Param argc
Arguments count.

Param argv
Arguments.

Retval 0
Successful command execution.

Retval 1
Help printed and command not executed.

Retval -EINVAL
Argument validation failed.

Retval -ENOEXEC
Command not executed.

typedef int (*`shell_dict_cmd_handler`)(const struct *shell* *sh, size_t argc, char **argv, void *data)

Shell dictionary command handler prototype.

Param sh
Shell instance.

Param argc
Arguments count.

Param argv
Arguments.

Param data
Pointer to the user data.

Retval 0
Successful command execution.

Retval 1
Help printed and command not executed.

Retval -EINVAL
Argument validation failed.

Retval -ENOEXEC
Command not executed.

typedef void (*`shell_transport_handler_t`)(enum *shell_transport_evt* evt, void *context)

typedef void (*`shell_uninit_cb_t`)(const struct *shell* *sh, int res)

typedef void (*`shell_bypass_cb_t`)(const struct *shell* *sh, uint8_t *data, size_t len)

Bypass callback.

Param sh
Shell instance.

Param data
Raw data from transport.

Param len
Data length.

Enums

enum `shell_receive_state`

Values:

enumerator `SHELL_RECEIVE_DEFAULT`

enumerator `SHELL_RECEIVE_ESC`

enumerator `SHELL_RECEIVE_ESC_SEQ`

enumerator `SHELL_RECEIVE_TILDE_EXP`

enum `shell_state`

Values:

enumerator `SHELL_STATE_UNINITIALIZED`

enumerator `SHELL_STATE_INITIALIZED`

enumerator `SHELL_STATE_ACTIVE`

enumerator `SHELL_STATE_PANIC_MODE_ACTIVE`

Panic activated.

enumerator SHELL_STATE_PANIC_MODE_INACTIVE
Panic requested, not supported.

enum shell_transport_evt
Shell transport event.

Values:

enumerator SHELL_TRANSPORT_EVT_RX_RDY

enumerator SHELL_TRANSPORT_EVT_TX_RDY

enum shell_signal
Values:

enumerator SHELL_SIGNAL_RXRDY

enumerator SHELL_SIGNAL_LOG_MSG

enumerator SHELL_SIGNAL_KILL

enumerator SHELL_SIGNAL_TXDONE

enumerator SHELL_SIGNALS

enum shell_flag
Flags for setting shell output newline sequence.

Values:

enumerator SHELL_FLAG_CRLF_DEFAULT = (1 « 0)
Do not map CR or LF.

enumerator SHELL_FLAG_OLF_CRLF = (1 « 1)
Map LF to CRLF on output.

Functions

const struct *device* *shell_device_lookup(size_t idx, const char *prefix)
Get by index a device that matches .

This can be used, for example, to identify I2C_1 as the second I2C device.

Devices that failed to initialize or do not have a non-empty name are excluded from the candidates for a match.

Parameters

- idx – the device number starting from zero.
- prefix – optional name prefix used to restrict candidate devices. Indexing is done relative to devices with names that start with this text. Pass null if no prefix match is required.

const struct *device* *`shell_device_filter`(size_t idx, *shell_device_filter_t* filter)

Get a device by index and filter.

This can be used to return devices matching a specific type.

Devices that the filter returns false for, failed to initialize or do not have a non-empty name are excluded from the candidates for a match.

Parameters

- `idx` – the device number starting from zero.
- `filter` – a pointer to a shell_device_filter_t function that returns true if the device matches the filter.

int `shell_init`(const struct *shell* *sh, const void *transport_config, struct *shell_backend_config_flags* cfg_flags, bool log_backend, uint32_t init_log_level)

Function for initializing a transport layer and internal shell state.

Parameters

- `sh` – **[in]** Pointer to shell instance.
- `transport_config` – **[in]** Transport configuration during initialization.
- `cfg_flags` – **[in]** Initial backend configuration flags. Shell will copy this data.
- `log_backend` – If true, the console will be used as logger backend.
- `init_log_level` – **[in]** Default severity level for the logger.

Returns

Standard error code.

void `shell_uninit`(const struct *shell* *sh, *shell_uninit_cb_t* cb)

Uninitializes the transport layer and the internal shell state.

Parameters

- `sh` – Pointer to shell instance.
- `cb` – Callback called when uninitialization is completed.

int `shell_start`(const struct *shell* *sh)

Function for starting shell processing.

Parameters

- `sh` – Pointer to the shell instance.

Returns

Standard error code.

int `shell_stop`(const struct *shell* *sh)

Function for stopping shell processing.

Parameters

- `sh` – Pointer to shell instance.

Returns

Standard error code.

void `shell_fprintf_impl`(const struct *shell* *sh, enum shell_vt100_color color, const char *fmt, ...)

printf-like function which sends formatted data stream to the shell.

This function can be used from the command handler or from threads, but not from an interrupt context.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `color` – **[in]** Printed text color.
- `fmt` – **[in]** Format string.
- `...` – **[in]** List of parameters to print.

void `shell_vfprintf`(const struct *shell* *sh, enum shell_vt100_color color, const char *fmt, va_list args)

vprintf-like function which sends formatted data stream to the shell.

This function can be used from the command handler or from threads, but not from an interrupt context. It is similar to *shell_fprintf()* but takes a va_list instead of variable arguments.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `color` – **[in]** Printed text color.
- `fmt` – **[in]** Format string.
- `args` – **[in]** List of parameters to print.

void `shell_hexdump_line`(const struct *shell* *sh, unsigned int offset, const uint8_t *data, size_t len)

Print a line of data in hexadecimal format.

Each line shows the offset, bytes and then ASCII representation.

For example:

00008010: 20 25 00 20 2f 48 00 08 80 05 00 20 af 46 00 | %. /H.. ... .F. |

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `offset` – **[in]** Offset to show for this line.
- `data` – **[in]** Pointer to data.
- `len` – **[in]** Length of data.

void `shell_hexdump`(const struct *shell* *sh, const uint8_t *data, size_t len)

Print data in hexadecimal format.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `data` – **[in]** Pointer to data.
- `len` – **[in]** Length of data.

void `shell_info_impl`(const struct *shell* *sh, const char *fmt, ...)

void `shell_print_impl`(const struct *shell* *sh, const char *fmt, ...)

void `shell_warn_impl`(const struct *shell* *sh, const char *fmt, ...)

void **shell_error_impl**(const struct *shell* *sh, const char *fmt, ...)

void **shell_process**(const struct *shell* *sh)

Process function, which should be executed when data is ready in the transport interface.

To be used if shell thread is disabled.

Parameters

- **sh** – **[in]** Pointer to the shell instance.

int **shell_prompt_change**(const struct *shell* *sh, const char *prompt)

Change displayed shell prompt.

Parameters

- **sh** – **[in]** Pointer to the shell instance.
- **prompt** – **[in]** New shell prompt.

Returns

0 Success.

Returns

-EINVAL Pointer to new prompt is not correct.

void **shell_help**(const struct *shell* *sh)

Prints the current command help.

Function will print a help string with: the currently entered command and subcommands (if they exist).

Parameters

- **sh** – **[in]** Pointer to the shell instance.

int **shell_execute_cmd**(const struct *shell* *sh, const char *cmd)

Execute command.

Pass command line to shell to execute.

Note: This by no means makes any of the commands a stable interface, so this function should only be used for debugging/diagnostic.

This function must not be called from shell command context!

Parameters

- **sh** – **[in]** Pointer to the shell instance. It can be NULL when the CONFIG_SHELL_BACKEND_DUMMY option is enabled.
- **cmd** – **[in]** Command to be executed.

Returns

Result of the execution

int **shell_set_root_cmd**(const char *cmd)

Set root command for all shell instances.

It allows setting from the code the root command. It is an equivalent of calling select command with one of the root commands as the argument (e.g “select log”) except it sets command for all shell instances.

Parameters

- **cmd** – String with one of the root commands or null pointer to reset.

Return values

- **0** – if root command is set.

- `-EINVAL` – if invalid root command is provided.

void `shell_set_bypass`(const struct *shell* *sh, *shell_bypass_cb_t* bypass)

Set bypass callback.

Bypass callback is called whenever data is received. Shell is bypassed and data is passed directly to the callback. Use null to disable bypass functionality.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `bypass` – **[in]** Bypass callback or null to disable.

bool `shell_ready`(const struct *shell* *sh)

Get shell readiness to execute commands.

Parameters

- `sh` – **[in]** Pointer to the shell instance.

Return values

- `true` – Shell backend is ready to execute commands.
- `false` – Shell backend is not initialized or not started.

int `shell_insert_mode_set`(const struct *shell* *sh, bool val)

Allow application to control text insert mode.

Value is modified atomically and the previous value is returned.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `val` – **[in]** Insert mode.

Return values

- `0` – or 1: previous value
- `-EINVAL` – if shell is NULL.

int `shell_use_colors_set`(const struct *shell* *sh, bool val)

Allow application to control whether terminal output uses colored syntax.

Value is modified atomically and the previous value is returned.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `val` – **[in]** Color mode.

Return values

- `0` – or 1: previous value
- `-EINVAL` – if shell is NULL.

int `shell_use_vt100_set`(const struct *shell* *sh, bool val)

Allow application to control whether terminal is using vt100 commands.

Value is modified atomically and the previous value is returned.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `val` – **[in]** vt100 mode.

Return values

- `0` – or 1: previous value
- `-EINVAL` – if shell is NULL.

int `shell_echo_set`(const struct *shell* *sh, bool val)

Allow application to control whether user input is echoed back.

Value is modified atomically and the previous value is returned.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `val` – **[in]** Echo mode.

Return values

- `0` – or 1: previous value
- `-EINVAL` – if shell is NULL.

int `shell_obscure_set`(const struct *shell* *sh, bool obscure)

Allow application to control whether user input is obscured with asterisks — useful for implementing passwords.

Value is modified atomically and the previous value is returned.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `obscure` – **[in]** Obscure mode.

Return values

- `0` – or 1: previous value.
- `-EINVAL` – if shell is NULL.

int `shell_mode_delete_set`(const struct *shell* *sh, bool val)

Allow application to control whether the delete key backspaces or deletes.

Value is modified atomically and the previous value is returned.

Parameters

- `sh` – **[in]** Pointer to the shell instance.
- `val` – **[in]** Delete mode.

Return values

- `0` – or 1: previous value
- `-EINVAL` – if shell is NULL.

int `shell_get_return_value`(const struct *shell* *sh)

Retrieve return value of most recently executed shell command.

Parameters

- `sh` – **[in]** Pointer to the shell instance

Return values

`return` – value of previous command

Variables

const struct *log_backend_api* `log_backend_shell_api`

union **shell_cmd_entry**

#include <*shell.h*> Shell command descriptor.

Public Members

shell_dynamic_get **dynamic_get**

Pointer to function returning dynamic commands.

const struct *shell_static_entry* ***entry**

Pointer to array of static commands.

struct **shell_static_args**

#include <*shell.h*>

Public Members

uint8_t **mandatory**

Number of mandatory arguments.

uint8_t **optional**

Number of optional arguments.

struct **shell_static_entry**

#include <*shell.h*>

Public Members

const char ***syntax**

Command syntax strings.

const char ***help**

Command help string.

const union *shell_cmd_entry* ***subcmd**

Pointer to subcommand.

shell_cmd_handler **handler**

Command handler.

struct *shell_static_args* **args**

Command arguments.

struct **shell_transport_api**

#include <*shell.h*> Unified shell transport interface.

Public Members

int (*`init`)(const struct *shell_transport* *transport, const void *config, *shell_transport_handler_t* evt_handler, void *context)

Function for initializing the shell transport interface.

Param transport
[in] Pointer to the transfer instance.
Param config
[in] Pointer to instance configuration.
Param evt_handler
[in] Event handler.
Param context
[in] Pointer to the context passed to event handler.
Return
Standard error code.

int (*`uninit`)(const struct *shell_transport* *transport)

Function for uninitializing the shell transport interface.

Param transport
[in] Pointer to the transfer instance.
Return
Standard error code.

int (*`enable`)(const struct *shell_transport* *transport, bool blocking_tx)

Function for enabling transport in given TX mode.

Function can be used to reconfigure TX to work in blocking mode.

Param transport
Pointer to the transfer instance.
Param blocking_tx
If true, the transport TX is enabled in blocking mode.
Return
NRF_SUCCESS on successful enabling, error otherwise (also if not supported).

int (*`write`)(const struct *shell_transport* *transport, const void *data, size_t length, size_t *cnt)

Function for writing data to the transport interface.

Param transport
[in] Pointer to the transfer instance.
Param data
[in] Pointer to the source buffer.
Param length
[in] Source buffer length.
Param cnt
[out] Pointer to the sent bytes counter.
Return
Standard error code.

int (*`read`)(const struct *shell_transport* *transport, void *data, size_t length, size_t *cnt)

Function for reading data from the transport interface.

Param transport
[in] Pointer to the transfer instance.
Param data
[in] Pointer to the destination buffer.

Param length
[in] Destination buffer length.
Param cnt
[out] Pointer to the received bytes counter.
Return
Standard error code.

void (*update)(const struct *shell_transport* *transport)

Function called in shell thread loop.

Can be used for backend operations that require longer execution time
Param transport
[in] Pointer to the transfer instance.

struct shell_transport

#include <shell.h>

struct shell_stats

#include <shell.h> Shell statistics structure.

Public Members

atomic_t log_lost_cnt

Lost log counter.

struct shell_backend_config_flags

#include <shell.h>

Public Members

uint32_t insert_mode

Controls insert mode for text introduction.

uint32_t echo

Controls shell echo.

uint32_t obscure

If echo on, print asterisk instead.

uint32_t mode_delete

Operation mode of backspace key.

uint32_t use_colors

Controls colored syntax.

uint32_t use_vt100

Controls VT100 commands usage in shell.

struct shell_backend_ctx_flags

#include <shell.h>

Public Members

uint32_t **processing**
Shell is executing process function.

uint32_t **history_exit**
Request to exit history mode.

uint32_t **last_nl**
Last received new line character.

uint32_t **cmd_ctx**
Shell is executing command.

uint32_t **print_noinit**
Print request from not initialized shell.

uint32_t **sync_mode**
Shell in synchronous mode.

uint32_t **handle_log**
Shell is handling logger backend.

union **shell_backend_cfg**
#include <*shell.h*>

Public Members

atomic_t **value**

struct *shell_backend_config_flags* **flags**

union **shell_backend_ctx**
#include <*shell.h*>

Public Members

uint32_t **value**

struct *shell_backend_ctx_flags* **flags**

struct **shell_ctx**
#include <*shell.h*> Shell instance context.

Public Members

enum *shell_state* **state**

Internal module state.

enum *shell_receive_state* **receive_state**

Escape sequence indicator.

struct *shell_static_entry* **active_cmd**

Currently executed command.

const struct *shell_static_entry* ***selected_cmd**

New root command.

If NULL shell uses default root commands.

struct shell_vt100_ctx **vt100_ctx**

VT100 color and cursor position, terminal width.

shell_uninit_cb_t **uninit_cb**

Callback called from shell thread context when unitialization is completed just before aborting shell thread.

shell_bypass_cb_t **bypass**

When bypass is set, all incoming data is passed to the callback.

Logging level for a backend.

uint16_t **cmd_buff_len**

Command length.

uint16_t **cmd_buff_pos**

Command buffer cursor position.

uint16_t **cmd_tmp_buff_len**

Command length in tmp buffer.

char **cmd_buff**[0]

Command input buffer.

char **temp_buff**[0]

Command temporary buffer.

char **printf_buff**[0]

Printf buffer size.

struct *k_poll_event* **events**[*SHELL_SIGNALS*]

Events that should be used only internally by shell thread.

Event for SHELL_SIGNAL_TXDONE is initialized but unused.

struct **shell**

#include <shell.h> Shell instance internals.

Public Members

const char ***default_prompt**

shell default prompt.

const struct *shell_transport* ***iface**

Transport interface.

struct *shell_ctx* ***ctx**

Internal context.

4.23 Serialization

Zephyr has support for several data serialization subsystems. These can be used to encode/decode structured data with a known format on-the-wire.

4.23.1 Nanopb

Nanopb is a C implementation of Google's Protocol Buffers.

Requirements

Nanopb uses the protocol buffer compiler to generate source and header files, make sure the `protoc` executable is installed and available.

Ubuntu

Use `apt` to install dependency:

```
sudo apt install protobuf-compiler
```

macOS

Use `brew` to install dependency:

```
brew install protobuf
```

Windows

Use `choco` to install dependency:

```
choco install protoc
```

Additionally, Nanopb is an optional module and needs to be added explicitly to the workspace:

```
west config manifest.project-filter -- +nanopb
west update
```

Configuration

Make sure to include nanopb within your CMakeLists.txt file as follows:

```
list(APPEND CMAKE_MODULE_PATH ${ZEPHYR_BASE}/modules/nanopb)
include(nanopb)
```

Adding proto files can be done with the zephyr_nanopb_sources() CMake function which ensures the generated header and source files are created before building the specified target.

Nanopb has generator options that can be used to configure messages or fields. This allows to set fixed sizes or skip fields entirely.

The internal CMake generator has an extension to configure *.options.in files automatically with CMake variables.

See samples/modules/nanopb/src/simple.options.in and samples/modules/nanopb/CMakeLists.txt for usage example.

4.24 Settings

The settings subsystem gives modules a way to store persistent per-device configuration and runtime state. A variety of storage implementations are provided behind a common API using FCB, NVS, or a file system. These different implementations give the application developer flexibility to select an appropriate storage medium, and even change it later as needs change. This subsystem is used by various Zephyr components and can be used simultaneously by user applications.

Settings items are stored as key-value pair strings. By convention, the keys can be organized by the package and subtree defining the key, for example the key id/serial would define the serial configuration element for the package id.

Convenience routines are provided for converting a key value to and from a string type.

For an example of the settings subsystem refer to settings sample.

> **Note**
>
> As of Zephyr release 2.1 the recommended backend for non-filesystem storage is *NVS*.

4.24.1 Handlers

Settings handlers for subtree implement a set of handler functions. These are registered using a call to settings_register().

h_get
: This gets called when asking for a settings element value by its name using settings_runtime_get() from the runtime backend.

h_set
: This gets called when the value is loaded from persisted storage with settings_load(), or when using settings_runtime_set() from the runtime backend.

h_commit
: This gets called after the settings have been loaded in full. Sometimes you don't want an individual setting value to take effect right away, for example if there are multiple settings which are interdependent.

h_export
This gets called to write all current settings. This happens when `settings_save()` tries to save the settings or transfer to any user-implemented back-end.

4.24.2 Backends

Backends are meant to load and save data to/from setting handlers, and implement a set of handler functions. These are registered using a call to `settings_src_register()` for backends that can load data, and/or `settings_dst_register()` for backends that can save data. The current implementation allows for multiple source backends but only a single destination backend.

csi_load
This gets called when loading values from persistent storage using `settings_load()`.

csi_save
This gets called when saving a single setting to persistent storage using `settings_save_one()`.

csi_save_start
This gets called when starting a save of all current settings using `settings_save()`.

csi_save_end
This gets called after having saved of all current settings using `settings_save()`.

4.24.3 Zephyr Storage Backends

Zephyr has three storage backends: a Flash Circular Buffer (`CONFIG_SETTINGS_FCB`), a file in the filesystem (`CONFIG_SETTINGS_FILE`), or non-volatile storage (`CONFIG_SETTINGS_NVS`).

You can declare multiple sources for settings; settings from all of these are restored when `settings_load()` is called.

There can be only one target for writing settings; this is where data is stored when you call `settings_save()`, or `settings_save_one()`.

FCB read target is registered using `settings_fcb_src()`, and write target using `settings_fcb_dst()`. As a side-effect, `settings_fcb_src()` initializes the FCB area, so it must be called before calling `settings_fcb_dst()`. File read target is registered using `settings_file_src()`, and write target by using `settings_file_dst()`. Non-volatile storage read target is registered using `settings_nvs_src()`, and write target by using `settings_nvs_dst()`.

4.24.4 Storage Location

The FCB and non-volatile storage (NVS) backends both look for a fixed partition with label "storage" by default. A different partition can be selected by setting the `zephyr,settings-partition` property of the chosen node in the devicetree.

The file path used by the file backend to store settings is selected via the option `CONFIG_SETTINGS_FILE_PATH`.

4.24.5 Loading data from persisted storage

A call to `settings_load()` uses an `h_set` implementation to load settings data from storage to volatile memory. After all data is loaded, the `h_commit` handler is issued, signalling the application that the settings were successfully retrieved.

Technically FCB and file backends may store some history of the entities. This means that the newest data entity is stored after any older existing data entities. Starting with Zephyr 2.1, the back-end must filter out all old entities and call the callback with only the newest entity.

4.24.6 Storing data to persistent storage

A call to `settings_save_one()` uses a backend implementation to store settings data to the storage medium. A call to `settings_save()` uses an `h_export` implementation to store different data in one operation using `settings_save_one()`. A key need to be covered by a `h_export` only if it is supposed to be stored by `settings_save()` call.

For both FCB and file back-end only storage requests with data which changes most actual key's value are stored, therefore there is no need to check whether a value changed by the application. Such a storage mechanism implies that storage can contain multiple value assignments for a key , while only the last is the current value for the key.

Garbage collection

When storage becomes full (FCB) or consumes too much space (file), the backend removes non-recent key-value pairs records and unnecessary key-delete records.

4.24.7 Secure domain settings

Currently settings doesn't provide scheme of being secure, and non-secure configuration storage simultaneously for the same instance. It is recommended that secure domain uses its own settings instance and it might provide data for non-secure domain using dedicated interface if needed (case dependent).

4.24.8 Example: Device Configuration

This is a simple example, where the settings handler only implements `h_set` and `h_export`. `h_set` is called when the value is restored from storage (or when set initially), and `h_export` is used to write the value to storage thanks to `storage_func()`. The user can also implement some other export functionality, for example, writing to the shell console).

```
#define DEFAULT_FOO_VAL_VALUE 1

static int8 foo_val = DEFAULT_FOO_VAL_VALUE;

static int foo_settings_set(const char *name, size_t len,
                            settings_read_cb read_cb, void *cb_arg)
{
    const char *next;
    int rc;

    if (settings_name_steq(name, "bar", &next) && !next) {
        if (len != sizeof(foo_val)) {
            return -EINVAL;
        }

        rc = read_cb(cb_arg, &foo_val, sizeof(foo_val));
        if (rc >= 0) {
            /* key-value pair was properly read.
             * rc contains value length.
             */
```

(continues on next page)

(continued from previous page)

```
            return 0;
        }
        /* read-out error */
        return rc;
    }

    return -ENOENT;
}

static int foo_settings_export(int (*storage_func)(const char *name,
                                                   const void *value,
                                                   size_t val_len))
{
    return storage_func("foo/bar", &foo_val, sizeof(foo_val));
}

struct settings_handler my_conf = {
    .name = "foo",
    .h_set = foo_settings_set,
    .h_export = foo_settings_export
};
```

4.24.9 Example: Persist Runtime State

This is a simple example showing how to persist runtime state. In this example, only `h_set` is defined, which is used when restoring value from persisted storage.

In this example, the `main` function increments `foo_val`, and then persists the latest number. When the system restarts, the application calls `settings_load()` while initializing, and `foo_val` will continue counting up from where it was before restart.

```
#include <zephyr/kernel.h>
#include <zephyr/sys/reboot.h>
#include <zephyr/settings/settings.h>
#include <zephyr/sys/printk.h>
#include <inttypes.h>

#define DEFAULT_FOO_VAL_VALUE 0

static uint8_t foo_val = DEFAULT_FOO_VAL_VALUE;

static int foo_settings_set(const char *name, size_t len,
                            settings_read_cb read_cb, void *cb_arg)
{
    const char *next;
    int rc;

    if (settings_name_steq(name, "bar", &next) && !next) {
        if (len != sizeof(foo_val)) {
            return -EINVAL;
        }

        rc = read_cb(cb_arg, &foo_val, sizeof(foo_val));
        if (rc >= 0) {
            return 0;
        }

        return rc;
    }
```

(continues on next page)

(continued from previous page)

```
    return -ENOENT;
}

struct settings_handler my_conf = {
    .name = "foo",
    .h_set = foo_settings_set
};

int main(void)
{
    settings_subsys_init();
    settings_register(&my_conf);
    settings_load();

    foo_val++;
    settings_save_one("foo/bar", &foo_val, sizeof(foo_val));

    printk("foo: %d\n", foo_val);

    k_msleep(1000);
    sys_reboot(SYS_REBOOT_COLD);
}
```

4.24.10 Example: Custom Backend Implementation

This is a simple example showing how to register a simple custom backend handler (CONFIG_SETTINGS_CUSTOM).

```
static int settings_custom_load(struct settings_store *cs,
                                const struct settings_load_arg *arg)
{
    //...
}

static int settings_custom_save(struct settings_store *cs, const char *name,
                                const char *value, size_t val_len)
{
    //...
}

/* custom backend interface */
static struct settings_store_itf settings_custom_itf = {
    .csi_load = settings_custom_load,
    .csi_save = settings_custom_save,
};

/* custom backend node */
static struct settings_store settings_custom_store = {
    .cs_itf = &settings_custom_itf
};

int settings_backend_init(void)
{
    /* register custom backend */
    settings_dst_register(&settings_custom_store);
    settings_src_register(&settings_custom_store);
    return 0;
```

(continues on next page)

(continued from previous page)

```
}
```

4.24.11 API Reference

The Settings subsystem APIs are provided by `settings.h`:

API for general settings usage

Defines

`SETTINGS_MAX_DIR_DEPTH`

`SETTINGS_MAX_NAME_LEN`

`SETTINGS_MAX_VAL_LEN`

`SETTINGS_NAME_SEPARATOR`

`SETTINGS_NAME_END`

`SETTINGS_EXTRA_LEN`

`SETTINGS_STATIC_HANDLER_DEFINE`(_hname, _tree, _get, _set, _commit, _export)
Define a static handler for settings items.

This creates a variable *hname prepended by* settings_handler.

Parameters

- **`_hname`** – handler name
- **`_tree`** – subtree name
- **`_get`** – get routine (can be NULL)
- **`_set`** – set routine (can be NULL)

- `_commit` – commit routine (can be NULL)
- `_export` – export routine (can be NULL)

Typedefs

typedef ssize_t (*`settings_read_cb`)(void *cb_arg, void *data, size_t len)

Function used to read the data from the settings storage in h_set handler implementations.

Param cb_arg
[in] arguments for the read function. Appropriate cb_arg is transferred to h_set handler implementation by the backend.

Param data
[out] the destination buffer

Param len
[in] length of read

Return
positive: Number of bytes read, 0: key-value pair is deleted. On error returns -ERRNO code.

typedef int (*`settings_load_direct_cb`)(const char *key, size_t len, *settings_read_cb* read_cb, void *cb_arg, void *param)

Callback function used for direct loading.

Used by *settings_load_subtree_direct* function.

Param key
[in] the name with skipped part that was used as name in handler registration

Param len
[in] the size of the data found in the backend.

Param read_cb
[in] function provided to read the data from the backend.

Param cb_arg
[inout] arguments for the read function provided by the backend.

Param param
[inout] parameter given to the *settings_load_subtree_direct* function.

Return
When nonzero value is returned, further subtree searching is stopped.

Functions

int `settings_subsys_init`(void)

Initialization of settings and backend.

Can be called at application startup. In case the backend is a FS Remember to call it after the FS was mounted. For FCB backend it can be called without such a restriction.

Returns
0 on success, non-zero on failure.

int `settings_register`(struct *settings_handler* *cf)

Register a handler for settings items stored in RAM.

Parameters

- `cf` – Structure containing registration info.

Returns

0 on success, non-zero on failure.

int `settings_load`(void)

Load serialized items from registered persistence sources.

Handlers for serialized item subtrees registered earlier will be called for encountered values.

Returns

0 on success, non-zero on failure.

int `settings_load_subtree`(const char *subtree)

Load limited set of serialized items from registered persistence sources.

Handlers for serialized item subtrees registered earlier will be called for encountered values that belong to the subtree.

Parameters

- `subtree` – **[in]** name of the subtree to be loaded.

Returns

0 on success, non-zero on failure.

int `settings_load_subtree_direct`(const char *subtree, *settings_load_direct_cb* cb, void *param)

Load limited set of serialized items using given callback.

This function bypasses the normal data workflow in settings module. All the settings values that are found are passed to the given callback.

Note

This function does not call commit function. It works as a blocking function, so it is up to the user to call any kind of commit function when this operation ends.

Parameters

- `subtree` – **[in]** subtree name of the subtree to be loaded.
- `cb` – **[in]** pointer to the callback function.
- `param` – **[inout]** parameter to be passed when callback function is called.

Returns

0 on success, non-zero on failure.

int `settings_save`(void)

Save currently running serialized items.

All serialized items which are different from currently persisted values will be saved.

Returns

0 on success, non-zero on failure.

int `settings_save_subtree`(const char *subtree)

Save limited set of currently running serialized items.

All serialized items that belong to subtree and which are different from currently persisted values will be saved.

Parameters

- `subtree` – **[in]** name of the subtree to be loaded.

Returns

0 on success, non-zero on failure.

int `settings_save_one`(const char *name, const void *value, size_t val_len)

Write a single serialized value to persisted storage (if it has changed value).

Parameters

- `name` – Name/key of the settings item.
- `value` – Pointer to the value of the settings item. This value will be transferred to the *settings_handler::h_export* handler implementation.
- `val_len` – Length of the value.

Returns

0 on success, non-zero on failure.

int `settings_delete`(const char *name)

Delete a single serialized in persisted storage.

Deleting an existing key-value pair in the settings mean to set its value to NULL.

Parameters

- `name` – Name/key of the settings item.

Returns

0 on success, non-zero on failure.

int `settings_commit`(void)

Call commit for all settings handler.

This should apply all settings which has been set, but not applied yet.

Returns

0 on success, non-zero on failure.

int `settings_commit_subtree`(const char *subtree)

Call commit for settings handler that belong to subtree.

This should apply all settings which has been set, but not applied yet.

Parameters

- `subtree` – **[in]** name of the subtree to be committed.

Returns

0 on success, non-zero on failure.

struct `settings_handler`

#include <*settings.h*> Config handlers for subtree implement a set of handler functions.

These are registered using a call to *settings_register*.

Public Members

const char *name

Name of subtree.

int (*h_get)(const char *key, char *val, int val_len_max)

Get values handler of settings items identified by keyword names.

Parameters:
- key[in] the name with skipped part that was used as name in handler registration
- val[out] buffer to receive value.
- val_len_max[in] size of that buffer.

Return: length of data read on success, negative on failure.

int (*h_set)(const char *key, size_t len, *settings_read_cb* read_cb, void *cb_arg)

Set value handler of settings items identified by keyword names.

Parameters:
- key[in] the name with skipped part that was used as name in handler registration
- len[in] the size of the data found in the backend.
- read_cb[in] function provided to read the data from the backend.
- cb_arg[in] arguments for the read function provided by the backend.

Return: 0 on success, non-zero on failure.

int (*h_commit)(void)

This handler gets called after settings has been loaded in full.

User might use it to apply setting to the application.

Return: 0 on success, non-zero on failure.

int (*h_export)(int (*export_func)(const char *name, const void *val, size_t val_len))

This gets called to dump all current settings items.

This happens when *settings_save* tries to save the settings. Parameters:
- export_func: the pointer to the internal function which appends a single key-value pair to persisted settings. Don't store duplicated value. The name is subtree/key string, val is the string with value.

Return: 0 on success, non-zero on failure.

> **Remark**
>
> The User might limit a implementations of handler to serving only one keyword at one call - what will impose limit to get/set values using full subtree/key name.

sys_snode_t node

Linked list node info for module internal usage.

struct settings_handler_static

#include <*settings.h*> Config handlers without the node element, used for static handlers.

These are registered using a call to *SETTINGS_STATIC_HANDLER_DEFINE()*.

Public Members

const char *`name`

Name of subtree.

int (*`h_get`)(const char *key, char *val, int val_len_max)

Get values handler of settings items identified by keyword names.

Parameters:
- key[in] the name with skipped part that was used as name in handler registration
- val[out] buffer to receive value.
- val_len_max[in] size of that buffer.

Return: length of data read on success, negative on failure.

int (*`h_set`)(const char *key, size_t len, *settings_read_cb* read_cb, void *cb_arg)

Set value handler of settings items identified by keyword names.

Parameters:
- key[in] the name with skipped part that was used as name in handler registration
- len[in] the size of the data found in the backend.
- read_cb[in] function provided to read the data from the backend.
- cb_arg[in] arguments for the read function provided by the backend.

Return: 0 on success, non-zero on failure.

int (*`h_commit`)(void)

This handler gets called after settings has been loaded in full.

User might use it to apply setting to the application.

int (*`h_export`)(int (*export_func)(const char *name, const void *val, size_t val_len))

This gets called to dump all current settings items.

This happens when *settings_save* tries to save the settings. Parameters:
- export_func: the pointer to the internal function which appends a single key-value pair to persisted settings. Don't store duplicated value. The name is subtree/key string, val is the string with value.

Return: 0 on success, non-zero on failure.

Remark

The User might limit a implementations of handler to serving only one keyword at one call - what will impose limit to get/set values using full subtree/key name.

API for key-name processing

Related code samples

Settings API
Load and save configuration values using the settings API.

group `settings_name_proc`

API for const name processing.

Functions

int `settings_name_steq`(const char *name, const char *key, const char **next)

Compares the start of name with a key.

Some examples: settings_name_steq("bt/btmesh/iv", "b", &next) returns 1, next="t/btmesh/iv" settings_name_steq("bt/btmesh/iv", "bt", &next) returns 1, next="btmesh/iv" settings_name_steq("bt/btmesh/iv", "bt/", &next) returns 0, next=NULL settings_name_steq("bt/btmesh/iv", "bta", &next) returns 0, next=NULL

REMARK: This routine could be simplified if the *settings_handler* names would include a separator at the end.

Parameters

- `name` – **[in]** in string format
- `key` – **[in]** comparison string
- `next` – **[out]** pointer to remaining of name, when the remaining part starts with a separator the separator is removed from next

Returns
0: no match 1: match, next can be used to check if match is full

int `settings_name_next`(const char *name, const char **next)

determine the number of characters before the first separator

Parameters

- `name` – **[in]** in string format
- `next` – **[out]** pointer to remaining of name (excluding separator)

Returns
index of the first separator, in case no separator was found this is the size of name

API for runtime settings manipulation

Related code samples

Settings API
Load and save configuration values using the settings API.

group `settings_rt`

API for runtime settings.

Functions

int **settings_runtime_set**(const char *name, const void *data, size_t len)

Set a value with a specific key to a module handler.

Parameters

- **name** – Key in string format.
- **data** – Binary value.
- **len** – Value length in bytes.

Returns

0 on success, non-zero on failure.

int **settings_runtime_get**(const char *name, void *data, size_t len)

Get a value corresponding to a key from a module handler.

Parameters

- **name** – Key in string format.
- **data** – Returned binary value.
- **len** – requested value length in bytes.

Returns

length of data read on success, negative on failure.

int **settings_runtime_commit**(const char *name)

Apply settings in a module handler.

Parameters

- **name** – Key in string format.

Returns

0 on success, non-zero on failure.

API of backend interface

group **settings_backend**

settings

Functions

void **settings_src_register**(struct *settings_store* *cs)

Register a backend handler acting as source.

Parameters

- **cs** – Backend handler node containing handler information.

void **settings_dst_register**(struct *settings_store* *cs)

Register a backend handler acting as destination.

Parameters

- **cs** – Backend handler node containing handler information.

struct settings_handler_ *settings_parse_and_lookup(const char *name, const char **next)

Parses a key to an array of elements and locate corresponding module handler.

Parameters

- name – **[in]** in string format
- next – **[out]** remaining of name after matched handler

Returns
settings_handler_static on success, NULL on failure.

int settings_call_set_handler(const char *name, size_t len, *settings_read_cb* read_cb, void *read_cb_arg, const struct *settings_load_arg* *load_arg)

Calls settings handler.

Parameters

- name – **[in]** The name of the data found in the backend.
- len – **[in]** The size of the data found in the backend.
- read_cb – **[in]** Function provided to read the data from the backend.
- read_cb_arg – **[inout]** Arguments for the read function provided by the backend.
- load_arg – **[inout]** Arguments for data loading.

Returns
0 or negative error code

struct settings_store

#include <*settings.h*> Backend handler node for storage handling.

Public Members

sys_snode_t cs_next

Linked list node info for internal usage.

const struct *settings_store_itf* *cs_itf

Backend handler structure.

struct settings_load_arg

#include <*settings.h*> Arguments for data loading.

Holds all parameters that changes the way data should be loaded from backend.

Public Members

const char *subtree

Name of the subtree to be loaded.

If NULL, all values would be loaded.

settings_load_direct_cb **cb**

Pointer to the callback function.

If NULL then matching registered function would be used.

void ***param**

Parameter for callback function.

Parameter to be passed to the callback function.

struct **settings_store_itf**

#include <*settings.h*> Backend handler functions.

Sources are registered using a call to *settings_src_register*. Destinations are registered using a call to *settings_dst_register*.

Public Members

int (***csi_load**)(struct *settings_store* *cs, const struct *settings_load_arg* *arg)

Loads values from storage limited to subtree defined by subtree.

Parameters:
- cs - Corresponding backend handler node,
- arg - Structure that holds additional data for data loading.

Note

Backend is expected not to provide duplicates of the entities. It means that if the backend does not contain any functionality to really delete old keys, it has to filter out old entities and call load callback only on the final entity.

int (***csi_save_start**)(struct *settings_store* *cs)

Handler called before an export operation.

Parameters:
- cs - Corresponding backend handler node

int (***csi_save**)(struct *settings_store* *cs, const char *name, const char *value, size_t val_len)

Save a single key-value pair to storage.

Parameters:
- cs - Corresponding backend handler node
- name - Key in string format
- value - Binary value
- val_len - Length of value in bytes.

int (***csi_save_end**)(struct *settings_store* *cs)

Handler called after an export operation.

Parameters:
- cs - Corresponding backend handler node Get pointer to the storage instance used by the backend.

Parameters:
- cs - Corresponding backend handler node

4.25 State Machine Framework

4.25.1 Overview

The State Machine Framework (SMF) is an application agnostic framework that provides an easy way for developers to integrate state machines into their application. The framework can be added to any project by enabling the CONFIG_SMF option.

4.25.2 State Creation

A state is represented by three functions, where one function implements the Entry actions, another function implements the Run actions, and the last function implements the Exit actions. The prototype for these functions is as follows: `void funct(void *obj)`, where the `obj` parameter is a user defined structure that has the state machine context, *smf_ctx*, as its first member. For example:

```
struct user_object {
   struct smf_ctx ctx;
   /* All User Defined Data Follows */
};
```

The *smf_ctx* member must be first because the state machine framework's functions casts the user defined object to the *smf_ctx* type with the *SMF_CTX* macro.

For example instead of doing this `(struct smf_ctx *)&user_obj`, you could use `SMF_CTX(&user_obj)`.

By default, a state can have no ancestor states, resulting in a flat state machine. But to enable the creation of a hierarchical state machine, the CONFIG_SMF_ANCESTOR_SUPPORT option must be enabled.

By default, the hierarchical state machines do not support initial transitions to child states on entering a superstate. To enable them the CONFIG_SMF_INITIAL_TRANSITION option must be enabled.

The following macro can be used for easy state creation:

- *SMF_CREATE_STATE* Create a state

4.25.3 State Machine Creation

A state machine is created by defining a table of states that's indexed by an enum. For example, the following creates three flat states:

```
enum demo_state { S0, S1, S2 };

const struct smf_state demo_states[] = {
   [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit, NULL, NULL),
   [S1] = SMF_CREATE_STATE(s1_entry, s1_run, s1_exit, NULL, NULL),
   [S2] = SMF_CREATE_STATE(s2_entry, s2_run, s2_exit, NULL, NULL)
};
```

And this example creates three hierarchical states:

```
enum demo_state { S0, S1, S2 };

const struct smf_state demo_states[] = {
   [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit, parent_s0, NULL),
```

(continues on next page)

(continued from previous page)

```
   [S1] = SMF_CREATE_STATE(s1_entry, s1_run, s1_exit, parent_s12, NULL),
   [S2] = SMF_CREATE_STATE(s2_entry, s2_run, s2_exit, parent_s12, NULL)
};
```

This example creates three hierarchical states with an initial transition from parent state S0 to child state S2:

```
enum demo_state { S0, S1, S2 };

/* Forward declaration of state table */
const struct smf_state demo_states[];

const struct smf_state demo_states[] = {
   [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit, NULL, demo_states[S2]),
   [S1] = SMF_CREATE_STATE(s1_entry, s1_run, s1_exit, demo_states[S0], NULL),
   [S2] = SMF_CREATE_STATE(s2_entry, s2_run, s2_exit, demo_states[S0], NULL)
};
```

To set the initial state, the *smf_set_initial()* function should be called.

To transition from one state to another, the *smf_set_state()* function is used.

Note

If CONFIG_SMF_INITIAL_TRANSITION is not set, *smf_set_initial()* and *smf_set_state()* function should not be passed a parent state as the parent state does not know which child state to transition to. Transitioning to a parent state is OK if an initial transition to a child state is defined. A well-formed HSM should have initial transitions defined for all parent states.

Note

While the state machine is running, *smf_set_state()* should only be called from the Entry or Run function. Calling *smf_set_state()* from Exit functions will generate a warning in the log and no transition will occur.

4.25.4 State Machine Execution

To run the state machine, the *smf_run_state()* function should be called in some application dependent way. An application should cease calling smf_run_state if it returns a non-zero value.

4.25.5 Preventing Parent Run Actions

Calling *smf_set_handled()* prevents calling the run action of parent states. It is not required to call *smf_set_handled()* if the state calls *smf_set_state()*.

4.25.6 State Machine Termination

To terminate the state machine, the *smf_set_terminate()* function should be called. It can be called from the entry, run, or exit actions. The function takes a non-zero user defined value that will be returned by the *smf_run_state()* function.

4.25.7 UML State Machines

SMF follows UML hierarchical state machine rules for transitions i.e., the entry and exit actions of the least common ancestor are not executed on transition, unless said transition is a transition to self.

The UML Specification for StateMachines may be found in chapter 14 of the UML specification available here: https://www.omg.org/spec/UML/

SMF breaks from UML rules in:

1. Executing the actions associated with the transition within the context of the source state, rather than after the exit actions are performed.
2. Only allowing external transitions to self, not to sub-states. A transition from a superstate to a child state is treated as a local transition.
3. Prohibiting transitions using *smf_set_state()* in exit actions.

SMF also does not provide any pseudostates except the Initial Pseudostate. Terminate pseudostates can be modelled by calling *smf_set_terminate()* from the entry action of a 'terminate' state. Orthogonal regions are modelled by calling *smf_run_state()* for each region.

4.25.8 State Machine Examples

Flat State Machine Example

This example turns the following state diagram into code using the SMF, where the initial state is S0.

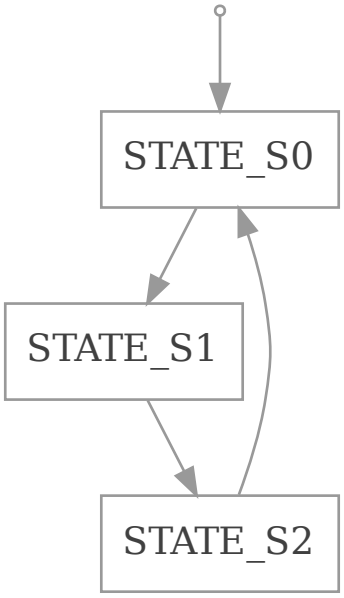

Fig. 21: Flat state machine diagram

Code:

```c
#include <zephyr/smf.h>

/* Forward declaration of state table */
static const struct smf_state demo_states[];

/* List of demo states */
enum demo_state { S0, S1, S2 };

/* User defined object */
struct s_object {
        /* This must be first */
        struct smf_ctx ctx;

        /* Other state specific data add here */
} s_obj;

/* State S0 */
static void s0_entry(void *o)
{
        /* Do something */
}
static void s0_run(void *o)
{
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S1]);
}
static void s0_exit(void *o)
{
        /* Do something */
}

/* State S1 */
static void s1_run(void *o)
{
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S2]);
}
static void s1_exit(void *o)
{
        /* Do something */
}

/* State S2 */
static void s2_entry(void *o)
{
        /* Do something */
}
static void s2_run(void *o)
{
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S0]);
}

/* Populate state table */
static const struct smf_state demo_states[] = {
        [S0] = SMF_CREATE_STATE(s0_entry, s0_run, s0_exit, NULL, NULL),
        /* State S1 does not have an entry action */
        [S1] = SMF_CREATE_STATE(NULL, s1_run, s1_exit, NULL, NULL),
        /* State S2 does not have an exit action */
        [S2] = SMF_CREATE_STATE(s2_entry, s2_run, NULL, NULL, NULL),
};

int main(void)
{
        int32_t ret;
```

(continues on next page)

(continued from previous page)

```
        /* Set initial state */
        smf_set_initial(SMF_CTX(&s_obj), &demo_states[S0]);

        /* Run the state machine */
        while(1) {
                /* State machine terminates if a non-zero value is returned */
                ret = smf_run_state(SMF_CTX(&s_obj));
                if (ret) {
                        /* handle return code and terminate state machine */
                        break;
                }
                k_msleep(1000);
        }
}
```

Hierarchical State Machine Example

This example turns the following state diagram into code using the SMF, where S0 and S1 share a parent state and S0 is the initial state.

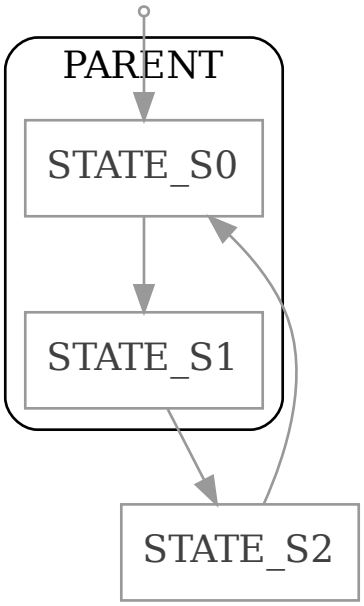

Fig. 22: Hierarchical state machine diagram

Code:

```
#include <zephyr/smf.h>

/* Forward declaration of state table */
static const struct smf_state demo_states[];
```

(continues on next page)

(continued from previous page)

```
/* List of demo states */
enum demo_state { PARENT, S0, S1, S2 };

/* User defined object */
struct s_object {
        /* This must be first */
        struct smf_ctx ctx;

        /* Other state specific data add here */
} s_obj;

/* Parent State */
static void parent_entry(void *o)
{
        /* Do something */
}
static void parent_exit(void *o)
{
        /* Do something */
}

/* State S0 */
static void s0_run(void *o)
{
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S1]);
}

/* State S1 */
static void s1_run(void *o)
{
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S2]);
}

/* State S2 */
static void s2_run(void *o)
{
        smf_set_state(SMF_CTX(&s_obj), &demo_states[S0]);
}

/* Populate state table */
static const struct smf_state demo_states[] = {
        /* Parent state does not have a run action */
        [PARENT] = SMF_CREATE_STATE(parent_entry, NULL, parent_exit, NULL, NULL),
        /* Child states do not have entry or exit actions */
        [S0] = SMF_CREATE_STATE(NULL, s0_run, NULL, &demo_states[PARENT], NULL),
        [S1] = SMF_CREATE_STATE(NULL, s1_run, NULL, &demo_states[PARENT], NULL),
        /* State S2 do ot have entry or exit actions and no parent */
        [S2] = SMF_CREATE_STATE(NULL, s2_run, NULL, NULL, NULL),
};

int main(void)
{
        int32_t ret;

        /* Set initial state */
        smf_set_initial(SMF_CTX(&s_obj), &demo_states[S0]);

        /* Run the state machine */
        while(1) {
                /* State machine terminates if a non-zero value is returned */
                ret = smf_run_state(SMF_CTX(&s_obj));
```

(continues on next page)

(continued from previous page)

```
                if (ret) {
                        /* handle return code and terminate state machine */
                        break;
                }
                k_msleep(1000);
        }
}
```

When designing hierarchical state machines, the following should be considered:

- Ancestor entry actions are executed before the sibling entry actions. For example, the parent_entry function is called before the s0_entry function.
- Transitioning from one sibling to another with a shared ancestry does not re-execute the ancestor's entry action or execute the exit action. For example, the parent_entry function is not called when transitioning from S0 to S1, nor is the parent_exit function called.
- Ancestor exit actions are executed after the exit action of the current state. For example, the s1_exit function is called before the parent_exit function is called.
- The parent_run function only executes if the child_run function does not call either *smf_set_state()* or *smf_set_handled()*.

Event Driven State Machine Example

Events are not explicitly part of the State Machine Framework but an event driven state machine can be implemented using Zephyr *Events*.

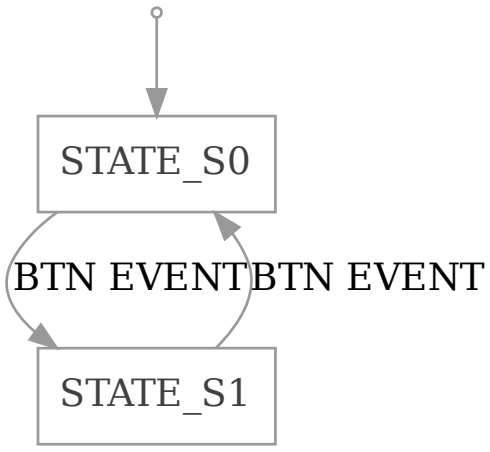

Fig. 23: Event driven state machine diagram

Code:

```
#include <zephyr/kernel.h>
#include <zephyr/drivers/gpio.h>
#include <zephyr/smf.h>
```

(continues on next page)

(continued from previous page)

```

                }
        }
}
```

State Machine Example With Initial Transitions And Transition To Self

tests/lib/smf/src/test_lib_self_transition_smf.c defines a state machine for testing the initial transitions and transitions to self in a parent state. The statechart for this test is below.

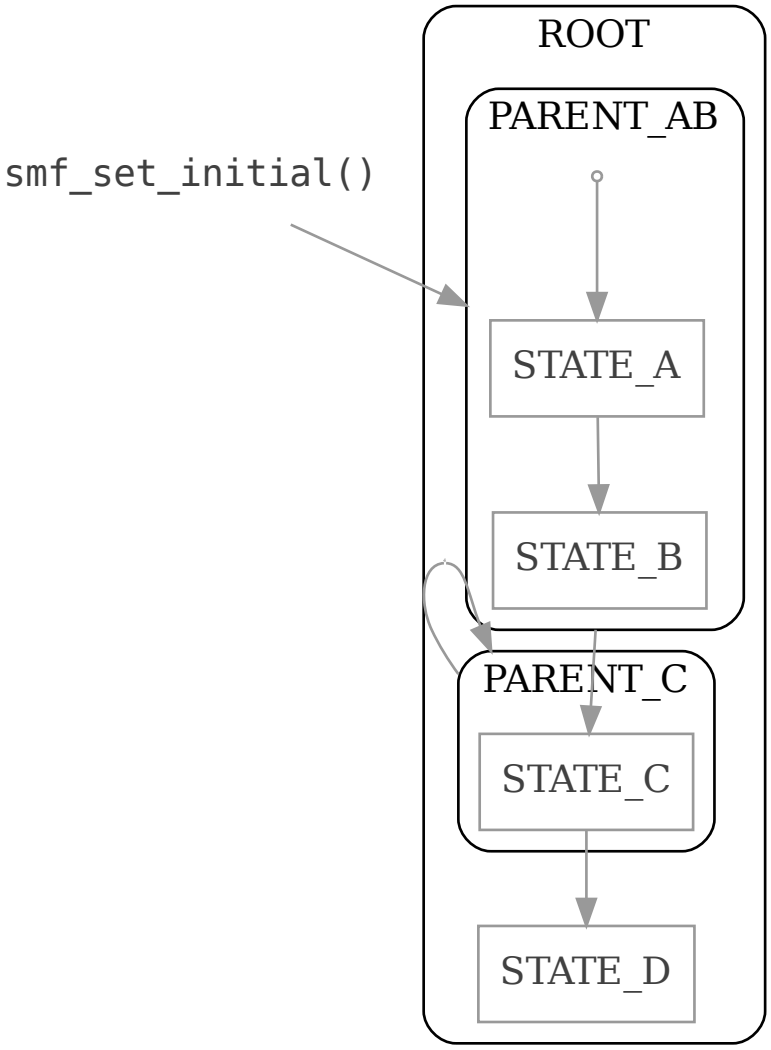

Fig. 24: Test state machine for UML State Transitions

4.25.9 API Reference

Related code samples

Hierarchical State Machine Demo based on example from PSiCC2
Implement an event-driven hierarchical state machine using State Machine Framework

(SMF).

group `smf`

State Machine Framework API.

Version
0.1.0

Defines

`SMF_CREATE_STATE`(_entry, _run, _exit, _parent, _initial)

Macro to create a hierarchical state with initial transitions.

Parameters

- `_entry` – State entry function or NULL
- `_run` – State run function or NULL
- `_exit` – State exit function or NULL
- `_parent` – State parent object or NULL
- `_initial` – State initial transition object or NULL

`SMF_CTX`(o)

Macro to cast user defined object to state machine context.

Parameters

- `o` – A pointer to the user defined object

Typedefs

typedef void (*`state_execution`)(void *obj)

Function pointer that implements a portion of a state.

Param obj
pointer user defined object

Functions

void `smf_set_initial`(struct *smf_ctx* *ctx, const struct *smf_state* *init_state)

Initializes the state machine and sets its initial state.

Parameters

- `ctx` – State machine context
- `init_state` – Initial state the state machine starts in.

void `smf_set_state`(struct *smf_ctx* *ctx, const struct *smf_state* *new_state)

Changes a state machines state.

This handles exiting the previous state and entering the target state. For HSMs the entry and exit actions of the Least Common Ancestor will not be run.

Parameters

- **ctx** – State machine context
- **new_state** – State to transition to (NULL is valid and exits all states)

void **smf_set_terminate**(struct *smf_ctx* *ctx, int32_t val)

Terminate a state machine.

Parameters

- **ctx** – State machine context
- **val** – Non-Zero termination value that's returned by the smf_run_state function.

void **smf_set_handled**(struct *smf_ctx* *ctx)

Tell the SMF to stop propagating the event to ancestors.

This allows HSMs to implement 'programming by difference' where substates can handle events on their own or propagate up to a common handler.

Parameters

- **ctx** – State machine context

int32_t **smf_run_state**(struct *smf_ctx* *ctx)

Runs one iteration of a state machine (including any parent states)

Parameters

- **ctx** – State machine context

Returns

A non-zero value should terminate the state machine. This non-zero value could represent a terminal state being reached or the detection of an error that should result in the termination of the state machine.

struct **smf_state**

#include <*smf.h*> General state that can be used in multiple state machines.

Public Members

const *state_execution* **entry**

Optional method that will be run when this state is entered.

const *state_execution* **run**

Optional method that will be run repeatedly during state machine loop.

const *state_execution* **exit**

Optional method that will be run when this state exists.

struct **smf_ctx**

#include <*smf.h*> Defines the current context of the state machine.

Public Members

const struct *smf_state* ***current**

Current state the state machine is executing.

const struct *smf_state* **previous**

Previous state the state machine executed.

int32_t **terminate_val**

This value is set by the set_terminate function and should terminate the state machine when its set to a value other than zero when it's returned by the run_state function.

uint32_t **internal**

The state machine casts this to a "struct internal_ctx" and it's used to track state machine context.

4.26 Storage

4.26.1 Non-Volatile Storage (NVS)

Elements, represented as id-data pairs, are stored in flash using a FIFO-managed circular buffer. The flash area is divided into sectors. Elements are appended to a sector until storage space in the sector is exhausted. Then a new sector in the flash area is prepared for use (erased). Before erasing the sector it is checked that identifier - data pairs exist in the sectors in use, if not the id-data pair is copied.

The id is a 16-bit unsigned number. NVS ensures that for each used id there is at least one id-data pair stored in flash at all time.

NVS allows storage of binary blobs, strings, integers, longs, and any combination of these.

Each element is stored in flash as metadata (8 byte) and data. The metadata is written in a table starting from the end of a nvs sector, the data is written one after the other from the start of the sector. The metadata consists of: id, data offset in sector, data length, part (unused), and a CRC. This CRC is only calculated over the metadata and only ensures that a write has been completed. The actual data of the element can be protected by a different (and optional) CRC-32. Use the `CONFIG_NVS_DATA_CRC` configuration item to enable the data part CRC.

Note

The data CRC is checked only when the whole data of the element is read. The data CRC is not checked for a partial read, as it is stored at the end of the element data area.

Note

Enabling the data CRC feature on a previously existing NVS content without data CRC will make all existing data invalid.

A write of data to nvs always starts with writing the data, followed by a write of the metadata. Data that is written in flash without metadata is ignored during initialization.

During initialization NVS will verify the data stored in flash, if it encounters an error it will ignore any data with missing/incorrect metadata.

NVS checks the id-data pair before writing data to flash. If the id-data pair is unchanged no write to flash is performed.

To protect the flash area against frequent erases it is important that there is sufficient free space. NVS has a protection mechanism to avoid getting in a endless loop of flash page erases when there is limited free space. When such a loop is detected NVS returns that there is no more space available.

For NVS the file system is declared as:

```
static struct nvs_fs fs = {
.flash_device = NVS_FLASH_DEVICE,
.sector_size = NVS_SECTOR_SIZE,
.sector_count = NVS_SECTOR_COUNT,
.offset = NVS_STORAGE_OFFSET,
};
```

where

- NVS_FLASH_DEVICE is a reference to the flash device that will be used. The device needs to be operational.
- NVS_SECTOR_SIZE is the sector size, it has to be a multiple of the flash erase page size and a power of 2.
- NVS_SECTOR_COUNT is the number of sectors, it is at least 2, one sector is always kept empty to allow copying of existing data.
- NVS_STORAGE_OFFSET is the offset of the storage area in flash.

Flash wear

When writing data to flash a study of the flash wear is important. Flash has a limited life which is determined by the number of times flash can be erased. Flash is erased one page at a time and the pagesize is determined by the hardware. As an example a nRF51822 device has a pagesize of 1024 bytes and each page can be erased about 20,000 times.

Calculating expected device lifetime Suppose we use a 4 bytes state variable that is changed every minute and needs to be restored after reboot. NVS has been defined with a sector_size equal to the pagesize (1024 bytes) and 2 sectors have been defined.

Each write of the state variable requires 12 bytes of flash storage: 8 bytes for the metadata and 4 bytes for the data. When storing the data the first sector will be full after 1024/12 = 85.33 minutes. After another 85.33 minutes, the second sector is full. When this happens, because we're using only two sectors, the first sector will be used for storage and will be erased after 171 minutes of system time. With the expected device life of 20,000 writes, with two sectors writing every 171 minutes, the device should last about 171 * 20,000 minutes, or about 6.5 years.

More generally then, with

- NS as the number of storage requests per minute,
- DS as the data size in bytes,
- SECTOR_SIZE in bytes, and
- PAGE_ERASES as the number of times the page can be erased,

the expected device life (in minutes) can be calculated as:

```
SECTOR_COUNT * SECTOR_SIZE * PAGE_ERASES / (NS * (DS+8)) minutes
```

From this formula it is also clear what to do in case the expected life is too short: increase SECTOR_COUNT or SECTOR_SIZE.

Flash write block size migration

It is possible that during a DFU process, the flash driver used by the NVS changes the supported minimal write block size. The NVS in-flash image will stay compatible unless the physical ATE size changes. Especially, migration between 1,2,4,8-bytes write block sizes is allowed.

Sample

A sample of how NVS can be used is supplied in `samples/subsys/nvs`.

Troubleshooting

MPU fault while using NVS, or `-ETIMEDOUT` error returned
NVS can use the internal flash of the SoC. While the MPU is enabled, the flash driver requires MPU RWX access to flash memory, configured using `CONFIG_MPU_ALLOW_FLASH_WRITE`. If this option is disabled, the NVS application will get an MPU fault if it references the internal SoC flash and it's the only thread running. In a multi-threaded application, another thread might intercept the fault and the NVS API will return an `-ETIMEDOUT` error.

API Reference

The NVS subsystem APIs are provided by `nvs.h`:

group **nvs_data_structures**
Non-volatile Storage Data Structures.

struct **nvs_fs**
#include <*nvs.h*> Non-volatile Storage File system structure.

Public Members

off_t **offset**
File system offset in flash.

uint32_t **ate_wra**
Allocation table entry write address.

Addresses are stored as uint32_t:
- high 2 bytes correspond to the sector
- low 2 bytes are the offset in the sector

uint32_t **data_wra**
Data write address.

uint16_t **sector_size**
File system is split into sectors, each sector must be multiple of erase-block-size.

uint16_t **sector_count**
Number of sectors in the file system.

bool `ready`
: Flag indicating if the file system is initialized.

struct *k_mutex* `nvs_lock`
: Mutex.

const struct *device* *`flash_device`
: Flash device runtime structure.

const struct *flash_parameters* *`flash_parameters`
: Flash memory parameters structure.

Related code samples

Non-Volatile Storage (NVS)
: Store and retrieve data from flash using the NVS API.

group `nvs_high_level_api`
: Non-volatile Storage APIs.

Functions

int `nvs_mount`(struct *nvs_fs* *fs)
: Mount an NVS file system onto the flash device specified in `fs`.

Parameters

- `fs` – Pointer to file system

Return values

- `0` – Success
- `-ERRNO` – errno code if error

int `nvs_clear`(struct *nvs_fs* *fs)
: Clear the NVS file system from flash.

Parameters

- `fs` – Pointer to file system

Return values

- `0` – Success
- `-ERRNO` – errno code if error

ssize_t `nvs_write`(struct *nvs_fs* *fs, uint16_t id, const void *data, size_t len)
: Write an entry to the file system.

Note

When `len` parameter is equal to `0` then entry is effectively removed (it is equivalent to calling of nvs_delete). Any calls to nvs_read for entries with data of length `0` will return error.

It is not possible to distinguish between deleted entry and entry with data of length 0.

Parameters

- `fs` – Pointer to file system
- `id` – Id of the entry to be written
- `data` – Pointer to the data to be written
- `len` – Number of bytes to be written

Returns

Number of bytes written. On success, it will be equal to the number of bytes requested to be written. When a rewrite of the same data already stored is attempted, nothing is written to flash, thus 0 is returned. On error, returns negative value of errno.h defined error codes.

int `nvs_delete`(struct *nvs_fs* *fs, uint16_t id)

Delete an entry from the file system.

Parameters

- `fs` – Pointer to file system
- `id` – Id of the entry to be deleted

Return values

- `0` – Success
- `-ERRNO` – errno code if error

ssize_t `nvs_read`(struct *nvs_fs* *fs, uint16_t id, void *data, size_t len)

Read an entry from the file system.

Parameters

- `fs` – Pointer to file system
- `id` – Id of the entry to be read
- `data` – Pointer to data buffer
- `len` – Number of bytes to be read

Returns

Number of bytes read. On success, it will be equal to the number of bytes requested to be read. When the return value is larger than the number of bytes requested to read this indicates not all bytes were read, and more data is available. On error, returns negative value of errno.h defined error codes.

ssize_t `nvs_read_hist`(struct *nvs_fs* *fs, uint16_t id, void *data, size_t len, uint16_t cnt)

Read a history entry from the file system.

Parameters

- `fs` – Pointer to file system
- `id` – Id of the entry to be read
- `data` – Pointer to data buffer
- `len` – Number of bytes to be read
- `cnt` – History counter: 0: latest entry, 1: one before latest ...

Returns
Number of bytes read. On success, it will be equal to the number of bytes requested to be read. When the return value is larger than the number of bytes requested to read this indicates not all bytes were read, and more data is available. On error, returns negative value of errno.h defined error codes.

ssize_t `nvs_calc_free_space`(struct *nvs_fs* *fs)
Calculate the available free space in the file system.

Parameters
- `fs` – Pointer to file system

Returns
Number of bytes free. On success, it will be equal to the number of bytes that can still be written to the file system. Calculating the free space is a time consuming operation, especially on spi flash. On error, returns negative value of errno.h defined error codes.

size_t `nvs_sector_max_data_size`(struct *nvs_fs* *fs)
Tell how many contiguous free space remains in the currently active NVS sector.

Parameters
- `fs` – Pointer to the file system.

Returns
Number of free bytes.

int `nvs_sector_use_next`(struct *nvs_fs* *fs)
Close the currently active sector and switch to the next one.

Note
The garbage collector is called on the new sector.

Warning
This routine is made available for specific use cases. It breaks the aim of the NVS to avoid any unnecessary flash erases. Using this routine extensively can result in premature failure of the flash device.

Parameters
- `fs` – Pointer to the file system.

Returns
0 on success. On error, returns negative value of errno.h defined error codes.

4.26.2 Disk Access

Overview

The disk access API provides access to storage devices.

Initializing Disks

Since many disk devices (such as SD cards) are hotpluggable, the disk access API provides IOCTLs to initialize and de-initialize the disk. They are as follows:

- *DISK_IOCTL_CTRL_INIT*: Initialize the disk. Must be called before additional I/O operations can be run on the disk device. Equivalent to calling the legacy function *disk_access_init()*.
- *DISK_IOCTL_CTRL_DEINIT*: De-initialize the disk. Once this IOCTL is issued, the *DISK_IOCTL_CTRL_INIT* must be issued before the disk can be used for addition I/O operations.

Init/deinit IOCTL calls are balanced, so a disk will not de-initialize until an equal number of deinit IOCTLs have been issued as init IOCTLs.

It is also possible to force a disk de-initialization by passing a pointer to a boolean set to `true` as a parameter to the *DISK_IOCTL_CTRL_DEINIT* IOCTL. This is an unsafe operation which each disk driver may handle differently, but it will always return a value indicating success.

Note that de-initializing a disk is a low level operation- typically the de-initialization and initialization calls should be left to the filesystem implementation, and the user application should not need to manually de-initialize the disk and can instead call *fs_unmount()*

SD Card support

Zephyr has support for some SD card controllers and support for interfacing SD cards via SPI. These drivers use disk driver interface and a file system can access the SD cards via disk access API. Both standard and high-capacity SD cards are supported.

> **Note**
>
> FAT filesystems are not power safe so the filesystem may become corrupted if power is lost or if the card is removed without unmounting the filesystem

SD Memory Card subsystem Zephyr supports SD memory cards via the disk driver API, or via the SDMMC subsystem. This subsystem can be used transparently via the disk driver API, but also supports direct block level access to cards. The SDMMC subsystem interacts with the *sd host controller api* to communicate with attached SD cards.

SD Card support via SPI Example devicetree fragment below shows how to add SD card node to `spi1` interface. Example uses pin `PA27` for chip select, and runs the SPI bus at 24 MHz once the SD card has been initialized:

```
&spi1 {
        status = "okay";
        cs-gpios = <&porta 27 GPIO_ACTIVE_LOW>;

        sdhc0: sdhc@0 {
                compatible = "zephyr,sdhc-spi-slot";
                reg = <0>;
                status = "okay";
                mmc {
                    compatible = "zephyr,sdmmc-disk";
                    status = "okay";
                };
                spi-max-frequency = <24000000>;
```

(continues on next page)

(continued from previous page)

```
        };
};
```

The SD card will be automatically detected and initialized by the filesystem driver when the board boots.

To read and write files and directories, see the *File Systems* in include/zephyr/fs/fs.h such as *fs_open()*, *fs_read()*, and *fs_write()*.

eMMC Device Support

Zephyr also has support for eMMC devices using the Disk Access API. MMC in zephyr is implemented using the SD subsystem because the MMC bus shares a lot of similarity with the SD bus. MMC controllers also use the SDHC device driver API.

Emulated block device on flash partition support

Zephyr flashdisk driver makes it possible to use flash memory partition as a block device. The flashdisk instances are defined in devicetree:

```
/ {
    msc_disk0 {
        compatible = "zephyr,flash-disk";
        partition = <&storage_partition>;
        disk-name = "NAND";
        cache-size = <4096>;
    };
};
```

The cache size specified in `zephyr,flash-disk` node should be equal to backing partition minimum erasable block size.

NVMe disk support

NVMe disks are also supported

NVMe

NVMe is a standardized logical device interface on PCIe bus exposing storage devices.

NVMe controllers and disks are supported. Disks can be accessed via the *Disk Access API* they expose and thus be used through the *File System API*.

Driver design

The driver is sliced up in 3 main parts:

- NVMe controller: drivers/disk/nvme/nvme_controller.c
- NVMe commands: drivers/disk/nvme/nvme_cmd.c
- NVMe namespace: drivers/disk/nvme/nvme_namespace.c

Where the NVMe controller is the root of the device driver. This is the one that will get device driver instances. Note that this is only what DTS describes: the NVMe controller, and none of its namespaces (disks). The NVMe command is the generic logic used to communicate with the controller and the namespaces it exposes. Finally the NVMe namespace is the dedicated part to deal with an actual namespace which, in turn, enables applications accessing each ones through the Disk Access API drivers/disk/nvme/nvme_disk.c.

If a controller exposes more than 1 namespace (disk), it will be possible to raise the amount of built-in namespace support by tweaking the configuration option CONFIG_NVME_MAX_NAMESPACES (see below).

Each exposed disk, via it's related disk_info structure, will be distinguished by its name which is inherited from it's related namespace. As such, the disk name follows NVMe naming which is nvme<k>n<n> where k is the controller number and n the namespame number. Most of the time, if only one NVMe disk is plugged into the system, one will see 'nvme0n0' as an exposed disk.

NVMe configuration

DTS Any board exposing an NVMe disk should provide a DTS overlay to enable its use within Zephyr

```
#include <zephyr/dt-bindings/pcie/pcie.h>
/ {
    pcie0 {
        nvme0: nvme0 {
            compatible = "nvme-controller";
            vendor-id = <VENDOR_ID>;
            device-id = <DEVICE_ID>;
            status = "okay";
        };
    };
};
```

Where VENDOR_ID and DEVICE_ID are the ones from the exposed NVMe controller.

Options

- CONFIG_NVME

Note that NVME requires the target to support PCIe multi-vector MSI-X in order to function.

- CONFIG_NVME_MAX_NAMESPACES

Important note for users NVMe specifications mandate the data buffer to be placed in a dword (4 bytes) aligned address. While this is not a problem for advanced OS managing virtual memory and dynamic allocations below the user processes, this can become an issue in Zephyr as soon as buffer addresses map directly to physical memory.

At this stage then, it is up to the user to make sure the buffer address being provided to *disk_access_read()* and *disk_access_write()* are dword aligned.

Disk Access API Configuration Options

Related configuration options:

- CONFIG_DISK_ACCESS

API Reference

Related code samples

File system manipulation
Use file system API with various filesystems and storage devices.

group `disk_access_interface`

Disk Access APIs.

Functions

int `disk_access_init`(const char *pdrv)

perform any initialization

This call is made by the consumer before doing any IO calls so that the disk or the backing device can do any initialization. Although still supported for legacy compatibility, users should instead call *disk_access_ioctl* with the IOCTL *DISK_IOCTL_CTRL_INIT*.

Disk initialization is reference counted, so only the first successful call to initialize a uninitialized (or previously de-initialized) disk will actually initialize the disk

Parameters

- `pdrv` – **[in]** Disk name

Returns

0 on success, negative errno code on fail

int `disk_access_status`(const char *pdrv)

Get the status of disk.

This call is used to get the status of the disk

Parameters

- `pdrv` – **[in]** Disk name

Returns

DISK_STATUS_OK or other DISK_STATUS_*s

int `disk_access_read`(const char *pdrv, uint8_t *data_buf, uint32_t start_sector, uint32_t num_sector)

read data from disk

Function to read data from disk to a memory buffer.

Note: if he disk is of NVMe type, user will need to ensure data_buf pointer is 4-bytes aligned.

Parameters

- `pdrv` – **[in]** Disk name
- `data_buf` – **[in]** Pointer to the memory buffer to put data.
- `start_sector` – **[in]** Start disk sector to read from
- `num_sector` – **[in]** Number of disk sectors to read

Returns

0 on success, negative errno code on fail

int `disk_access_write`(const char *pdrv, const uint8_t *data_buf, uint32_t start_sector, uint32_t num_sector)

write data to disk

Function write data from memory buffer to disk.

Note: if he disk is of NVMe type, user will need to ensure data_buf pointer is 4-bytes aligned.

Parameters

- `pdrv` – **[in]** Disk name
- `data_buf` – **[in]** Pointer to the memory buffer
- `start_sector` – **[in]** Start disk sector to write to
- `num_sector` – **[in]** Number of disk sectors to write

Returns
0 on success, negative errno code on fail

int `disk_access_ioctl`(const char *pdrv, uint8_t cmd, void *buff)
Get/Configure disk parameters.

Function to get disk parameters and make any special device requests.

Parameters

- `pdrv` – **[in]** Disk name
- `cmd` – **[in]** DISK_IOCTL_* code describing the request
- `buff` – **[in]** Command data buffer

Returns
0 on success, negative errno code on fail

Disk Driver Configuration Options

Related driver configuration options:

- `CONFIG_DISK_DRIVERS`

Disk Driver Interface

group `disk_driver_interface`
Disk Driver Interface.

Since
1.6

Version
1.0.0

Defines

`DISK_IOCTL_GET_SECTOR_COUNT`
Possible Cmd Codes for disk_ioctl()

Get the number of sectors in the disk

`DISK_IOCTL_GET_SECTOR_SIZE`
Get the size of a disk SECTOR in bytes.

`DISK_IOCTL_RESERVED`
reserved.

It used to be DISK_IOCTL_GET_DISK_SIZE

DISK_IOCTL_GET_ERASE_BLOCK_SZ
: How many sectors constitute a FLASH Erase block.

DISK_IOCTL_CTRL_SYNC
: Commit any cached read/writes to disk.

DISK_IOCTL_CTRL_INIT
: Initialize the disk.

  This IOCTL must be issued before the disk can be used for I/O. It is reference counted, so only the first successful invocation of this macro on an uninitialized disk will initialize the IO device

DISK_IOCTL_CTRL_DEINIT
: Deinitialize the disk.

  This IOCTL can be used to de-initialize the disk, enabling it to be removed from the system if the disk is hot-pluggable. Disk usage is reference counted, so for a given disk the DISK_IOCTL_CTRL_DEINIT IOCTL must be issued as many times as the DISK_IOCTL_CTRL_INIT IOCTL was issued in order to de-initialize it.

  This macro optionally accepts a pointer to a boolean as the buf parameter, which if true indicates the disk should be forcibly stopped, ignoring all reference counts. The disk driver must report success if a forced stop is requested, but this operation is inherently unsafe.

DISK_STATUS_OK
: Possible return bitmasks for disk_status()

  Disk status okay

DISK_STATUS_UNINIT
: Disk status uninitialized.

DISK_STATUS_NOMEDIA
: Disk status no media.

DISK_STATUS_WR_PROTECT
: Disk status write protected.

Functions

int **disk_access_register**(struct *disk_info* *disk)
: Register disk.

  Parameters

  - **disk** – **[in]** Pointer to the disk info structure

  Returns
  0 on success, negative errno code on fail

int **disk_access_unregister**(struct *disk_info* *disk)
: Unregister disk.

  Parameters

- **disk** – **[in]** Pointer to the disk info structure

Returns
0 on success, negative errno code on fail

struct **disk_info**
#include <*disk.h*> Disk info.

Public Members

sys_dnode_t **node**
Internally used list node.

const char ***name**
Disk name.

const struct *disk_operations* ***ops**
Disk operations.

const struct *device* ***dev**
Device associated to this disk.

uint16_t **refcnt**
Internally used disk reference count.

struct **disk_operations**
#include <*disk.h*> Disk operations.

4.26.3 Flash map

The <zephyr/storage/flash_map.h> API allows accessing information about device flash partitions via *flash_area* structures.

Each *flash_area* describes a flash partition. The API provides access to a "flash map", which contains predefined flash areas accessible via globally unique ID numbers. The map is created from "fixed-partition" compatible entries in DTS file. Users may also create *flash_area* objects at runtime for application-specific purposes.

This documentation uses "flash area" when referencing single "fixed-partition" entities.

The *flash_area* contains a pointer to a *device*, which can be used to access the flash device an area is placed on directly with the *flash API*. Each flash area is characterized by a device it is placed on, offset from the beginning of the device and size on the device. An additional identifier parameter is used by the *flash_area_open()* function to find flash area in flash map.

The flash_map.h API provides functions for operating on a *flash_area*. The main examples are *flash_area_read()* and *flash_area_write()*. These functions are basically wrappers around the flash API with additional offset and size checks, to limit flash operations to a predefined area.

Most <zephyr/storage/flash_map.h> API functions require a *flash_area* object pointer characterizing the flash area they will be working on. There are two possible methods to obtain such a pointer:

- obtain it using *flash_area_open*;

- defining a *flash_area* type object, which requires providing a valid *device* object pointer with offset and size of the area within the flash device.

flash_area_open() uses numeric identifiers to search flash map for *flash_area* objects and returns, if found, a pointer to an object representing area with given ID. The ID number for a flash area can be obtained from a fixed-partition DTS node label using *FIXED_PARTITION_ID()*; these labels are obtained from the devicetree as described below.

Relationship with Devicetree

The flash_map.h API uses data generated from the *Devicetree API*, in particular its *Fixed flash partitions*. Zephyr additionally has some partitioning conventions used for *Device Firmware Upgrade* via the MCUboot bootloader, as well as defining partitions usable by *file systems* or other nonvolatile *storage*.

Here is an example devicetree fragment which uses fixed flash partitions for both MCUboot and a storage partition. Some details were left out for clarity.

```
/ {
        soc {
                flashctrl: flash-controller@deadbeef {
                        flash0: flash@0 {
                                compatible = "soc-nv-flash";
                                reg = <0x0 0x100000>;

                                partitions {
                                        compatible = "fixed-partitions";
                                        #address-cells = <0x1>;
                                        #size-cells = <0x1>;

                                        boot_partition: partition@0 {
                                                reg = <0x0 0x10000>;
                                                read-only;
                                        };
                                        storage_partition: partition@1e000 {
                                                reg = <0x1e000 0x2000>;
                                        };
                                        slot0_partition: partition@20000 {
                                                reg = <0x20000 0x60000>;
                                        };
                                        slot1_partition: partition@80000 {
                                                reg = <0x80000 0x60000>;
                                        };
                                        scratch_partition: partition@e0000 {
                                                reg = <0xe0000 0x20000>;
                                        };
                                };
                        };
                };
        };
};
```

Partition offset shall be expressed in relation to the flash memory beginning address, to which the partition belongs to.

The `boot_partition`, `slot0_partition`, `slot1_partition`, and `scratch_partition` node labels are defined for MCUboot, though not all MCUboot configurations require all of them to be defined. See the MCUboot documentation for more details.

The `storage_partition` node is defined for use by a file system or other nonvolatile storage API.

Numeric flash area ID is obtained by passing DTS node label to *FIXED_PARTITION_ID()*; for example to obtain ID number for `slot0_partition`, user would invoke

`FIXED_PARTITION_ID(slot0_partition)`.

All `FIXED_PARTITION_*` macros take DTS node labels as partition identifiers.

Users do not have to obtain a *flash_area* object pointer using `flash_map_open()` to get information on flash area size, offset or device, if such area is defined in DTS file. Knowing the DTS node label of an area, users may use *FIXED_PARTITION_OFFSET()*, *FIXED_PARTITION_SIZE()* or *FIXED_PARTITION_DEVICE()* respectively to obtain such information directly from DTS node definition. For example to obtain offset of `storage_partition` it is enough to invoke `FIXED_PARTITION_OFFSET(storage_partition)`.

Below example shows how to obtain a *flash_area* object pointer using *flash_area_open()* and DTS node label:

```
const struct flash_area *my_area;
int err = flash_area_open(FIXED_PARTITION_ID(slot0_partition), &my_area);

if (err != 0) {
     handle_the_error(err);
} else {
     flash_area_read(my_area, ...);
}
```

Use the flash API to interact with the SoC flash.

group `flash_area_api`

Abstraction over flash partitions/areas and their drivers.

Since
1.11

Version
1.0.0

Defines

`SOC_FLASH_0_ID`

Provided for compatibility with MCUboot.

`SPI_FLASH_0_ID`

Provided for compatibility with MCUboot.

`FIXED_PARTITION_EXISTS`(label)

Returns non-0 value if fixed-partition of given DTS node label exists.

Parameters

- `label` – DTS node label

Returns
non-0 if fixed-partition node exists and is enabled; 0 if node does not exist, is not enabled or is not fixed-partition.

`FIXED_PARTITION_ID`(label)

Get flash area ID from fixed-partition DTS node label.

Parameters

- `label` – DTS node label of a partition

Returns
flash area ID

`FIXED_PARTITION_OFFSET`(label)

Get fixed-partition offset from DTS node label.

Parameters

- `label` – DTS node label of a partition

Returns
fixed-partition offset, as defined for the partition in DTS.

`FIXED_PARTITION_NODE_OFFSET`(node)

Get fixed-partition offset from DTS node.

Parameters

- `node` – DTS node of a partition

Returns
fixed-partition offset, as defined for the partition in DTS.

`FIXED_PARTITION_SIZE`(label)

Get fixed-partition size for DTS node label.

Parameters

- `label` – DTS node label

Returns
fixed-partition offset, as defined for the partition in DTS.

`FIXED_PARTITION_NODE_SIZE`(node)

Get fixed-partition size for DTS node.

Parameters

- `node` – DTS node of a partition

Returns
fixed-partition size, as defined for the partition in DTS.

`FLASH_AREA_DEVICE`(label)

Get device pointer for device the area/partition resides on.

Parameters

- `label` – DTS node label of a partition

Returns
const struct device type pointer

`FIXED_PARTITION_DEVICE`(label)

Get device pointer for device the area/partition resides on.

Parameters

- `label` – DTS node label of a partition

Returns
Pointer to a device.

`FIXED_PARTITION_NODE_DEVICE`(node)
Get device pointer for device the area/partition resides on.

Parameters

- `node` – DTS node of a partition

Returns
Pointer to a device.

Typedefs

typedef void (*`flash_area_cb_t`)(const struct *flash_area* *fa, void *user_data)
Flash map iteration callback.

Param fa
flash area

Param user_data
User supplied data

Functions

int `flash_area_open`(uint8_t id, const struct *flash_area* **fa)
Retrieve partitions flash area from the flash_map.

Function Retrieves *flash_area* from flash_map for given partition.

Parameters

- `id` – **[in]** ID of the flash partition.
- `fa` – **[out]** Pointer which has to reference *flash_area*. If `ID` is unknown, it will be NULL on output.

Returns
0 on success, -EACCES if the flash_map is not available , -ENOENT if `ID` is unknown, -ENODEV if there is no driver attached to the area.

void `flash_area_close`(const struct *flash_area* *fa)
Close *flash_area*.

Reserved for future usage and external projects compatibility reason. Currently is NOP.

Parameters

- `fa` – **[in]** Flash area to be closed.

int `flash_area_read`(const struct *flash_area* *fa, off_t off, void *dst, size_t len)
Read flash area data.

Read data from flash area. Area readout boundaries are asserted before read request. API has the same limitation regard read-block alignment and size as wrapped flash driver.

Parameters

- `fa` – **[in]** Flash area
- `off` – **[in]** Offset relative from beginning of flash area to read

- `dst` – **[out]** Buffer to store read data
- `len` – **[in]** Number of bytes to read

Returns
0 on success, negative errno code on fail.

int `flash_area_write`(const struct *flash_area* *fa, off_t off, const void *src, size_t len)

Write data to flash area.

Write data to flash area. Area write boundaries are asserted before write request. API has the same limitation regard write-block alignment and size as wrapped flash driver.

Parameters

- `fa` – **[in]** Flash area
- `off` – **[in]** Offset relative from beginning of flash area to write
- `src` – **[in]** Buffer with data to be written
- `len` – **[in]** Number of bytes to write

Returns
0 on success, negative errno code on fail.

int `flash_area_erase`(const struct *flash_area* *fa, off_t off, size_t len)

Erase flash area.

Erase given flash area range. Area boundaries are asserted before erase request. API has the same limitation regard erase-block alignment and size as wrapped flash driver.

Parameters

- `fa` – **[in]** Flash area
- `off` – **[in]** Offset relative from beginning of flash area.
- `len` – **[in]** Number of bytes to be erase

Returns
0 on success, negative errno code on fail.

int `flash_area_flatten`(const struct *flash_area* *fa, off_t off, size_t len)

Erase flash area or fill with erase-value.

On program-erase devices this function behaves exactly like flash_area_erase. On RAM non-volatile device it will call erase, if driver provides such callback, or will fill given range with erase-value defined by driver. This function should be only used by code that has not been written to directly support devices that do not require erase and rely on device being erased prior to some operations. Note that emulated erase, on devices that do not require, is done via write, which affects endurance of device.

See also

flash_area_erase()

See also

flash_flatten()

Parameters

- `fa` – **[in]** Flash area
- `off` – **[in]** Offset relative from beginning of flash area.
- `len` – **[in]** Number of bytes to be erase

Returns
0 on success, negative errno code on fail.

uint32_t `flash_area_align`(const struct *flash_area* *fa)

Get write block size of the flash area.

Currently write block size might be treated as read block size, although most of drivers supports unaligned readout.

Parameters

- `fa` – **[in]** Flash area

Returns
Alignment restriction for flash writes in [B].

int `flash_area_get_sectors`(int fa_id, uint32_t *count, struct *flash_sector* *sectors)

Retrieve info about sectors within the area.

Parameters

- `fa_id` – **[in]** Given flash area ID
- `sectors` – **[out]** buffer for sectors data
- `count` – **[inout]** On input Capacity of `sectors`, on output number of sectors Retrieved.

Returns
0 on success, negative errno code on fail. Especially returns -ENOMEM if There are too many flash pages on the *flash_area* to fit in the array.

void `flash_area_foreach`(*flash_area_cb_t* user_cb, void *user_data)

Iterate over flash map.

Parameters

- `user_cb` – User callback
- `user_data` – User supplied data

int `flash_area_has_driver`(const struct *flash_area* *fa)

Check whether given flash area has supporting flash driver in the system.

Parameters

- `fa` – **[in]** Flash area.

Returns
1 On success. -ENODEV if no driver match.

const struct *device* *`flash_area_get_device`(const struct *flash_area* *fa)

Get driver for given flash area.

Parameters

- `fa` – **[in]** Flash area.

Returns
device driver.

uint8_t `flash_area_erased_val`(const struct *flash_area* *fa)

Get the value expected to be read when accessing any erased flash byte.

This API is compatible with the MCUBoot's porting layer.

Parameters

- `fa` – Flash area.

Returns

Byte value of erase memory.

struct `flash_area`

#include <flash_map.h> Flash partition.

This structure represents a fixed-size partition on a flash device. Each partition contains one or more flash sectors.

Public Members

uint8_t `fa_id`

ID number.

off_t `fa_off`

Start offset from the beginning of the flash device.

size_t `fa_size`

Total size.

const struct *device* *`fa_dev`

Backing flash device.

struct `flash_sector`

#include <flash_map.h> Structure for transfer flash sector boundaries.

This template is used for presentation of flash memory structure. It consumes much less RAM than *flash_area*

Public Members

off_t `fs_off`

Sector offset from the beginning of the flash device.

size_t `fs_size`

Sector size in bytes.

4.26.4 Flash Circular Buffer (FCB)

Flash circular buffer provides an abstraction through which you can treat flash like a FIFO. You append entries to the end, and read data from the beginning.

Note

As of Zephyr release 2.1 the *NVS* storage API is recommended over FCB for use as a back-end for the *settings API*.

Description

Entries in the flash contain the length of the entry, the data within the entry, and checksum over the entry contents.

Storage of entries in flash is done in a FIFO fashion. When you request space for the next entry, space is located at the end of the used area. When you start reading, the first entry served is the oldest entry in flash.

Entries can be appended to the end of the area until storage space is exhausted. You have control over what happens next; either erase oldest block of data, thereby freeing up some space, or stop writing new data until existing data has been collected. FCB treats underlying storage as an array of flash sectors; when it erases old data, it does this a sector at a time.

Entries in the flash are checksummed. That is how FCB detects whether writing entry to flash completed ok. It will skip over entries which don't have a valid checksum.

Usage

To add an entry to circular buffer:

- Call *fcb_append()* to get the location where data can be written. If this fails due to lack of space, you can call *fcb_rotate()* to erase the oldest sector which will make the space. And then call *fcb_append()* again.
- Use *flash_area_write()* to write entry contents.
- Call *fcb_append_finish()* when done. This completes the writing of the entry by calculating the checksum.

To read contents of the circular buffer:

- Call *fcb_walk()* with a pointer to your callback function.
- Within callback function copy in data from the entry using *flash_area_read()*. You can tell when all data from within a sector has been read by monitoring the returned entry's area pointer. Then you can call *fcb_rotate()*, if you're done with that data.

Alternatively:

- Call *fcb_getnext()* with 0 in entry offset to get the pointer to the oldest entry.
- Use *flash_area_read()* to read entry contents.
- Call *fcb_getnext()* with pointer to current entry to get the next one. And so on.

API Reference

The FCB subsystem APIs are provided by `fcb.h`:

Data structures

group `fcb_data_structures`

Defines

FCB_MAX_LEN

Max length of element (16,383)

FCB_ENTRY_FA_DATA_OFF(entry)

Helper macro for calculating the data offset related to the fcb *flash_area* start offset.

Parameters

- `entry` – fcb entry structure

FCB_FLAGS_CRC_DISABLED

Flag to disable CRC for the fcb_entries in flash.

struct `fcb_entry`

#include <fcb.h> FCB entry info structure.

This data structure describes the element location in the flash.

You would use it to figure out what parameters to pass to *flash_area_read()* to read element contents. Or to *flash_area_write()* when adding a new element. Entry location is pointer to area (within fcb->f_sectors), and offset within that area.

Public Members

struct *flash_sector* *`fe_sector`

Pointer to info about sector where data are placed.

uint32_t `fe_elem_off`

Offset from the start of the sector to beginning of element.

uint32_t `fe_data_off`

Offset from the start of the sector to the start of element.

uint16_t `fe_data_len`

Size of data area in fcb entry.

struct `fcb_entry_ctx`

#include <fcb.h> Structure for transferring complete information about FCB entry location within flash memory.

Public Members

struct *fcb_entry* `loc`

FCB entry info.

const struct *flash_area* *`fap`

Flash area where the entry is placed.

struct `fcb`

#include <fcb.h> FCB instance structure.

The following data structure describes the FCB itself. First part should be filled in by the user before calling *fcb_init*. The second part is used by FCB for its internal bookkeeping.

Public Members

uint32_t `f_magic`

Magic value, should not be 0xFFFFFFFF.

It is xored with inversion of f_erase_value and placed in the beginning of FCB flash sector. FCB uses this when determining whether sector contains valid data or not. Giving it value of 0xFFFFFFFF means leaving bytes of the filed in “erased” state.

uint8_t `f_version`

Current version number of the data.

uint8_t `f_sector_cnt`

Number of elements in sector array.

uint8_t `f_scratch_cnt`

Number of sectors to keep empty.

This can be used if you need to have scratch space for garbage collecting when FCB fills up.

struct *flash_sector* *`f_sectors`

Array of sectors, must be contiguous.

struct *k_mutex* `f_mtx`

Locking for accessing the FCB data, internal state.

struct *flash_sector* *`f_oldest`

Pointer to flash sector containing the oldest data, internal state.

struct *fcb_entry* `f_active`

internal state

uint16_t `f_active_id`

Flash location where the newest data is, internal state.

uint8_t `f_align`

writes to flash have to aligned to this, internal state

const struct *flash_area* *`fap`

Flash area used by the fcb instance, internal state.

This can be transfer to FCB user

uint8_t `f_erase_value`

The value flash takes when it is erased.

This is read from flash parameters and initialized upon call to fcb_init.

API functions

group `fcb_api`

Flash Circular Buffer APIs.

Typedefs

typedef int (*`fcb_walk_cb`)(struct *fcb_entry_ctx* *loc_ctx, void *arg)

FCB Walk callback function type.

Type of function which is expected to be called while walking over fcb entries thanks to a *fcb_walk* call.

Entry data can be read using *flash_area_read()*, using loc_ctx fields as arguments. If cb wants to stop the walk, it should return non-zero value.

Param loc_ctx
[in] entry location information (full context)

Param arg
[inout] callback context, transferred from *fcb_walk*.

Return
0 continue walking, non-zero stop walking.

Functions

int `fcb_init`(int f_area_id, struct *fcb* *fcbp)

Initialize FCB instance.

Parameters

- `f_area_id` – **[in]** ID of flash area where fcb storage resides.
- `fcbp` – **[inout]** FCB instance structure.

Returns
0 on success, non-zero on failure.

int `fcb_append`(struct *fcb* *fcbp, uint16_t len, struct *fcb_entry* *loc)

Appends an entry to circular buffer.

When writing the contents for the entry, use loc->fe_sector and loc->fe_data_off with *flash_area_write()* to fcb *flash_area*. When you're finished, call *fcb_append_finish()* with loc as argument.

Parameters

- `fcbp` – **[in]** FCB instance structure.
- `len` – **[in]** Length of data which are expected to be written as the entry payload.
- `loc` – **[out]** entry location information

Returns
0 on success, non-zero on failure.

int `fcb_append_finish`(struct *fcb* *fcbp, struct *fcb_entry* *append_loc)

Finishes entry append operation.

Parameters

- `fcbp` – **[in]** FCB instance structure.
- `append_loc` – **[in]** entry location information

Returns
0 on success, non-zero on failure.

int `fcb_walk`(struct *fcb* *fcbp, struct *flash_sector* *sector, *fcb_walk_cb* cb, void *cb_arg)

Walk over all entries in the FCB sector.

Parameters

- `sector` – **[in]** fcb sector to be walked. If null, traverse entire storage.
- `fcbp` – **[in]** FCB instance structure.
- `cb` – **[in]** pointer to the function which gets called for every entry. If cb wants to stop the walk, it should return non-zero value.
- `cb_arg` – **[inout]** callback context, transferred to the callback implementation.

Returns
0 on success, negative on failure (or transferred form callback return-value), positive transferred form callback return-value

int `fcb_getnext`(struct *fcb* *fcbp, struct *fcb_entry* *loc)

Get next fcb entry location.

Function to obtain fcb entry location in relation to entry pointed by

loc. If loc->fe_sector is set and loc->fe_elem_off is not 0 function fetches next fcb entry location. If loc->fe_sector is NULL function fetches the oldest entry location within FCB storage. loc->fe_sector is set and loc->fe_elem_off is 0 function fetches the first entry location in the fcb sector.

Parameters

- `fcbp` – **[in]** FCB instance structure.
- `loc` – **[inout]** entry location information

Returns
0 on success, non-zero on failure.

int `fcb_rotate`(struct *fcb* *fcbp)

Rotate fcb sectors.

Function erases the data from oldest sector. Upon that the next sector becomes the oldest. Active sector is also switched if needed.

Parameters

- `fcbp` – **[in]** FCB instance structure.

int `fcb_append_to_scratch`(struct *fcb* *fcbp)

Start using the scratch block.

Take one of the scratch blocks into use. So a scratch sector becomes active sector to which entries can be appended.

Parameters

- `fcbp` – **[in]** FCB instance structure.

Returns
0 on success, non-zero on failure.

int `fcb_free_sector_cnt`(struct *fcb* *fcbp)
Get free sector count.

Parameters

- `fcbp` – **[in]** FCB instance structure.

Returns
Number of free sectors.

int `fcb_is_empty`(struct *fcb* *fcbp)
Check whether FCB has any data.

Parameters

- `fcbp` – **[in]** FCB instance structure.

Returns
Positive value if fcb is empty, otherwise 0.

int `fcb_offset_last_n`(struct *fcb* *fcbp, uint8_t entries, struct *fcb_entry* *last_n_entry)
Finds the fcb entry that gives back up to n entries at the end.

Parameters

- `fcbp` – **[in]** FCB instance structure.
- `entries` – **[in]** number of fcb entries the user wants to get
- `last_n_entry` – **[out]** last_n_entry the *fcb_entry* to be returned

Returns
0 on there are any fcbs available; -ENOENT otherwise

int `fcb_clear`(struct *fcb* *fcbp)
Clear fcb instance storage.

Parameters

- `fcbp` – **[in]** FCB instance structure.

Returns
0 on success; non-zero on failure

4.26.5 Stream Flash

The Stream Flash module takes contiguous fragments of a stream of data (e.g. from radio packets), aggregates them into a user-provided buffer, then when the buffer fills (or stream ends) writes it to a raw flash partition. It supports providing the read-back buffer to the client to use in validating the persisted stream content.

One typical use of a stream write operation is when receiving a new firmware image to be used in a DFU operation.

There are several reasons why one might want to use buffered writes instead of writing the data directly as it is made available. Some devices have hardware limitations which does not allow flash writes to be performed in parallel with other operations, such as radio RX and TX. Also, fewer write operations result in faster response times seen from the application.

Persistent stream write progress

Some stream write operations, such as DFU operations, may run for a long time. When performing such long running operations it can be useful to be able to save the stream write progress to persistent storage so that the operation can resume at the same point after an unexpected interruption.

The Stream Flash module offers an API for loading, saving and clearing stream write progress to persistent storage using the *Settings* module. The API can be enabled using `CONFIG_STREAM_FLASH_PROGRESS`.

API Reference

group `stream_flash`

Abstraction over stream writes to flash.

Since
2.3

Version
0.1.0

Typedefs

typedef int (***stream_flash_callback_t**)(uint8_t *buf, size_t len, size_t offset)

Signature for callback invoked after flash write completes.

Functions of this type are invoked with a buffer containing data read back from the flash after a flash write has completed. This enables verifying that the data has been correctly stored (for instance by using a SHA function). The write buffer 'buf' provided in stream_flash_init is used as a read buffer for this purpose.

Param buf
Pointer to the data read.

Param len
The length of the data read.

Param offset
The offset the data was read from.

Functions

int **stream_flash_init**(struct *stream_flash_ctx* *ctx, const struct *device* *fdev, uint8_t *buf, size_t buf_len, size_t offset, size_t size, *stream_flash_callback_t* cb)

Initialize context needed for stream writes to flash.

Parameters

- `ctx` – context to be initialized
- `fdev` – Flash device to operate on
- `buf` – Write buffer
- `buf_len` – Length of write buffer. Can not be larger than the page size. Must be multiple of the flash device write-block-size.

- **offset** – Offset within flash device to start writing to
- **size** – Number of bytes available for performing buffered write. If this is '0', the size will be set to the total size of the flash device minus the offset.
- **cb** – Callback to be invoked on completed flash write operations.

Returns
non-negative on success, negative errno code on fail

size_t **stream_flash_bytes_written**(struct *stream_flash_ctx* *ctx)

Read number of bytes written to the flash.

> **Note**
>
> api-tags: pre-kernel-ok isr-ok

Parameters

- **ctx** – context

Returns
Number of payload bytes written to flash.

int **stream_flash_buffered_write**(struct *stream_flash_ctx* *ctx, const uint8_t *data, size_t len, bool flush)

Process input buffers to be written to flash device in single blocks.

Will store remainder between calls.

A write with the `flush` set to true has to be issued as the last write request for a given context, as it concludes write of a stream, and flushes buffers to storage device.

> **Warning**
>
> There must not be any additional write requests issued for a flushed context, unless it is re-initialized, as such write attempts may result in the function failing and returning error. Once context has been flushed, it can be re-initialized and re-used for new stream flash session.

Parameters

- **ctx** – context
- **data** – data to write
- **len** – Number of bytes to write
- **flush** – when true this forces any buffered data to be written to flash

Returns
non-negative on success, negative errno code on fail

int **stream_flash_erase_page**(struct *stream_flash_ctx* *ctx, off_t off)

Erase the flash page to which a given offset belongs.

This function erases a flash page to which an offset belongs if this page is not the page previously erased by the provided ctx (ctx->last_erased_page_start_offset).

Parameters

- **ctx** – context
- **off** – offset from the base address of the flash device

Returns
non-negative on success, negative errno code on fail

int **stream_flash_progress_load**(struct *stream_flash_ctx* *ctx, const char *settings_key)

Load persistent stream write progress stored with key `settings_key` .

This function should be called directly after *stream_flash_init* to load previous stream write progress before writing any data. If the loaded progress has fewer bytes written than `ctx` then it will be ignored.

Parameters

- **ctx** – context
- **settings_key** – key to use with the settings module for loading the stream write progress

Returns
non-negative on success, negative errno code on fail

int **stream_flash_progress_save**(struct *stream_flash_ctx* *ctx, const char *settings_key)

Save persistent stream write progress using key `settings_key` .

Parameters

- **ctx** – context
- **settings_key** – key to use with the settings module for storing the stream write progress

Returns
non-negative on success, negative errno code on fail

int **stream_flash_progress_clear**(struct *stream_flash_ctx* *ctx, const char *settings_key)

Clear persistent stream write progress stored with key `settings_key` .

Parameters

- **ctx** – context
- **settings_key** – key previously used for storing the stream write progress

Returns
non-negative on success, negative errno code on fail

struct **stream_flash_ctx**

#include <stream_flash.h> Structure for stream flash context.

Users should treat these structures as opaque values and only interact with them through the below API.

4.27 Sensing Subsystem

- *Overview*
- *Configurability*
- *Main Features*
- *Major Flows*
- *Sensor Types And Instance*

- *Sensor Instance Handler*
- *Sensor Sample Value*
- *Device Tree Configuration*
- *API Reference*

4.27.1 Overview

Sensing Subsystem is a high level sensor framework inside the OS user space service layer. It is a framework focused on sensor fusion, client arbitration, sampling, timing, scheduling and sensor based power management.

Key concepts in Sensing Subsystem include physical sensor and virtual sensor objects, and a scheduling framework over sensor object relationships. Physical sensors do not depend on any other sensor objects for input, and will directly interact with existing zephyr sensor device drivers. Virtual sensors rely on other sensor objects (physical or virtual) as report inputs.

The sensing subsystem relies on Zephyr sensor device APIs (existing version or update in future) to leverage Zephyr's large library of sensor device drivers (100+).

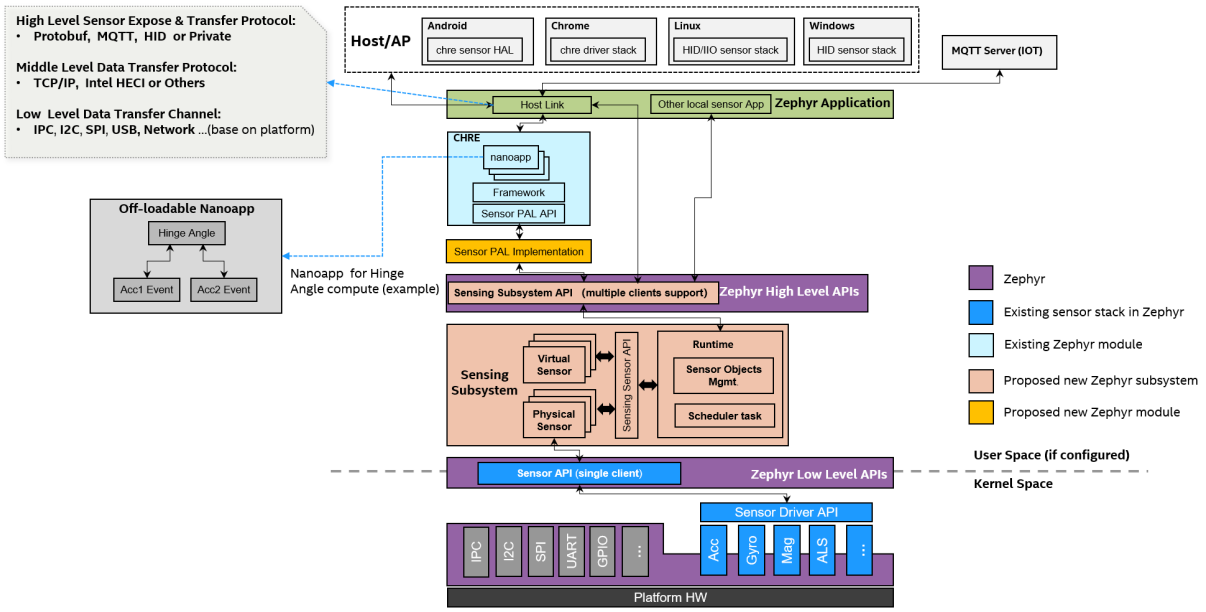
Use of the sensing subsystem is optional. Applications that only need to access simple sensors devices can use the Zephyr *Sensors* API directly.

Since the sensing subsystem is separated from device driver layer or kernel space and could support various customizations and sensor algorithms in user space with virtual sensor concepts. The existing sensor device driver can focus on low layer device side works, can keep simple as much as possible, just provide device HW abstraction and operations etc. This is very good for system stability.

The sensing subsystem is decoupled with any sensor expose/transfer protocols, the target is to support various up-layer frameworks and Applications with different sensor expose/transfer protocols, such as CHRE, HID sensors Applications, MQTT sensor Applications according different products requirements. Or even support multiple Applications with different up-layer sensor protocols at the same time with it's multiple clients support design.

Sensing subsystem can help build a unified Zephyr sensing architecture for cross host OSes support and as well as IoT sensor solutions.

The diagram below illustrates how the Sensing Subsystem integrates with up-layer frameworks.



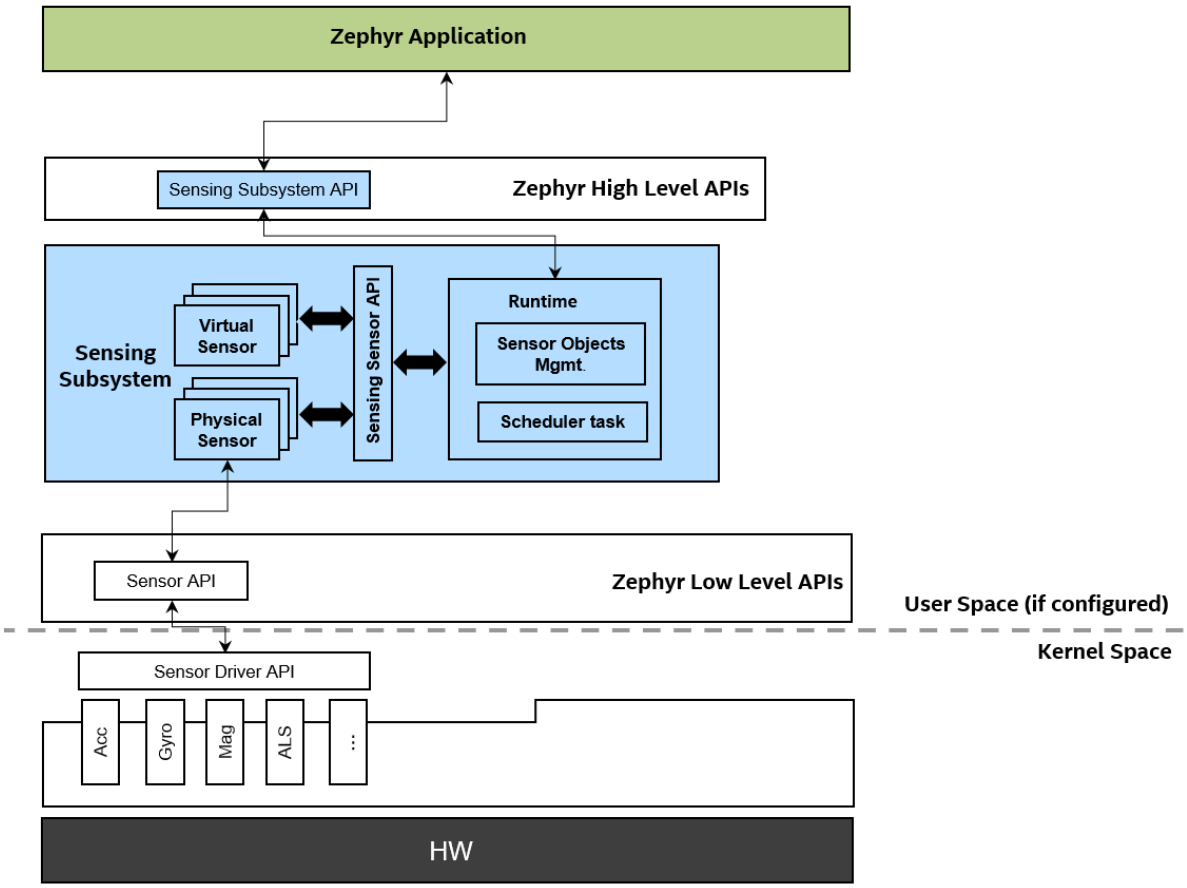
4.27.2 Configurability

- Reusable and configurable standalone subsystem.
- Based on Zephyr existing low-level Sensor API (reuse 100+ existing sensor device drivers)
- Provide Zephyr high-level Sensing Subsystem API for Applications.
- Separate option CHRE Sensor PAL Implementation module to support CHRE.
- Decoupled with any host link protocols, it's Zephyr Application's role to handle different protocols (MQTT, HID or Private, all configurable)

4.27.3 Main Features

- **Scope**
  - Focus on framework for sensor fusion, multiple clients, arbitration, data sampling, timing management and scheduling.
- **Sensor Abstraction**
  - `Physical sensor`: interacts with Zephyr sensor device drivers, focus on data collecting.
  - `Virtual sensor`: relies on other sensor(s), `physical` or `virtual`, focus on data fusion.
- **Data Driven Model**
  - `Polling mode`: periodical sampling rate
  - `Interrupt mode`: data ready, threshold interrupt etc.
- **Scheduling**
  - single thread main loop for all sensor objects sampling and process.
- Buffer Mode for Batching
- Configurable Via Device Tree

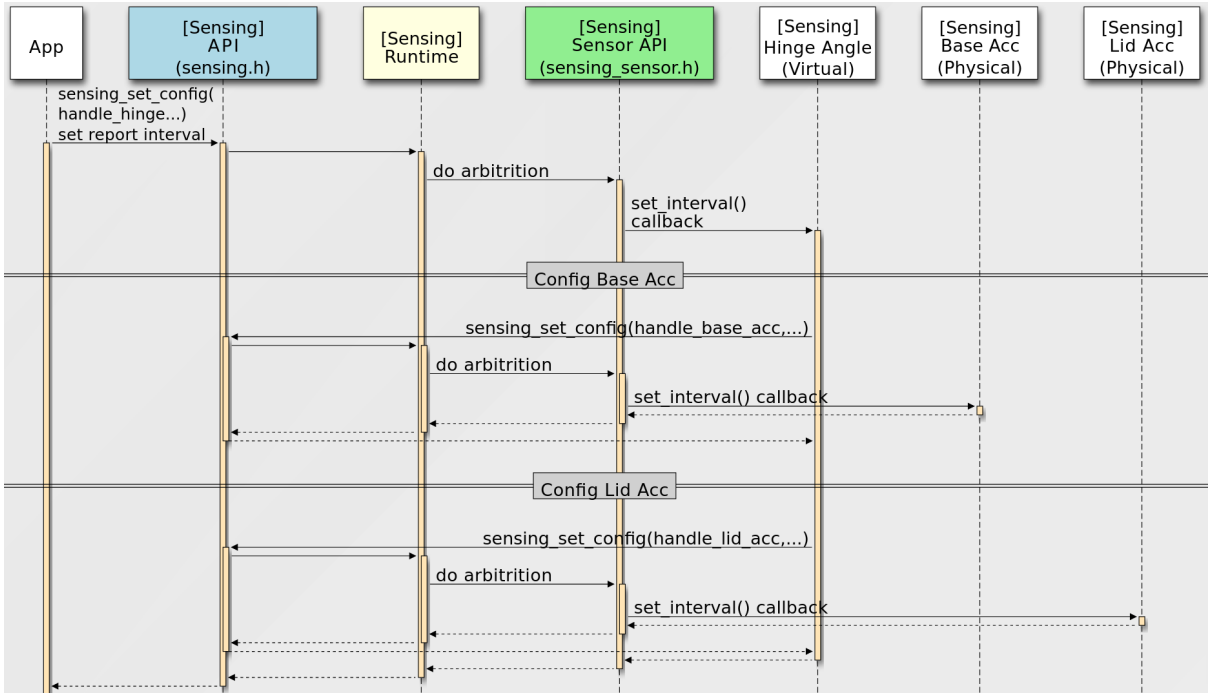
Below diagram shows the API position and scope:



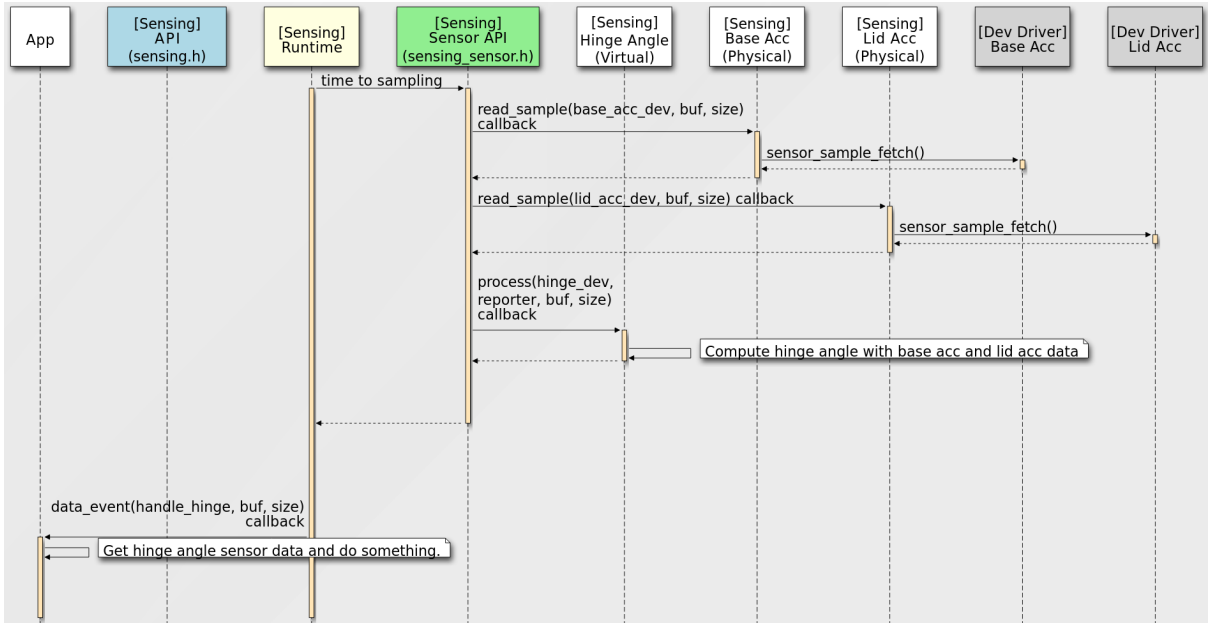
`Sensing Subsystem API` is for Applications. `Sensing Sensor API` is for development sensors.

4.27.4 Major Flows

- Sensor Configuration Flow



- Sensor Data Flow



4.27.5 Sensor Types And Instance

The `Sensing Subsystem` supports multiple instances of the same sensor type, there're two methods for Applications to identify and open an unique sensor instance:

- Enumerate all sensor instances

  `sensing_get_sensors()` returns all current board configuration supported sensor instances' information in a *`sensing_sensor_info`* pointer array .

  Then Applications can use *`sensing_open_sensor()`* to open specific sensor instance for future accessing, configuration and receive sensor data etc.

This method is suitable for supporting some up-layer frameworks like `CHRE`, `HID` which need to dynamically enumerate the underlying platform's sensor instances.

- Open the sensor instance by devicetree node directly

  Applications can use *`sensing_open_sensor_by_dt()`* to open a sensor instance directly with sensor devicetree node identifier.

  For example:

```
sensing_open_sensor_by_dt(DEVICE_DT_GET(DT_NODELABEL(base_accel)), cb_list, handle);
sensing_open_sensor_by_dt(DEVICE_DT_GET(DT_CHOSEN(zephyr_sensing_base_accel)), cb_list,␣
↪handle);
```

This method is useful and easy use for some simple Application which just want to access specific sensor(s).

`Sensor type` follows the HID standard sensor types definition.

See include/zephyr/sensing/sensing_sensor_types.h

4.27.6 Sensor Instance Handler

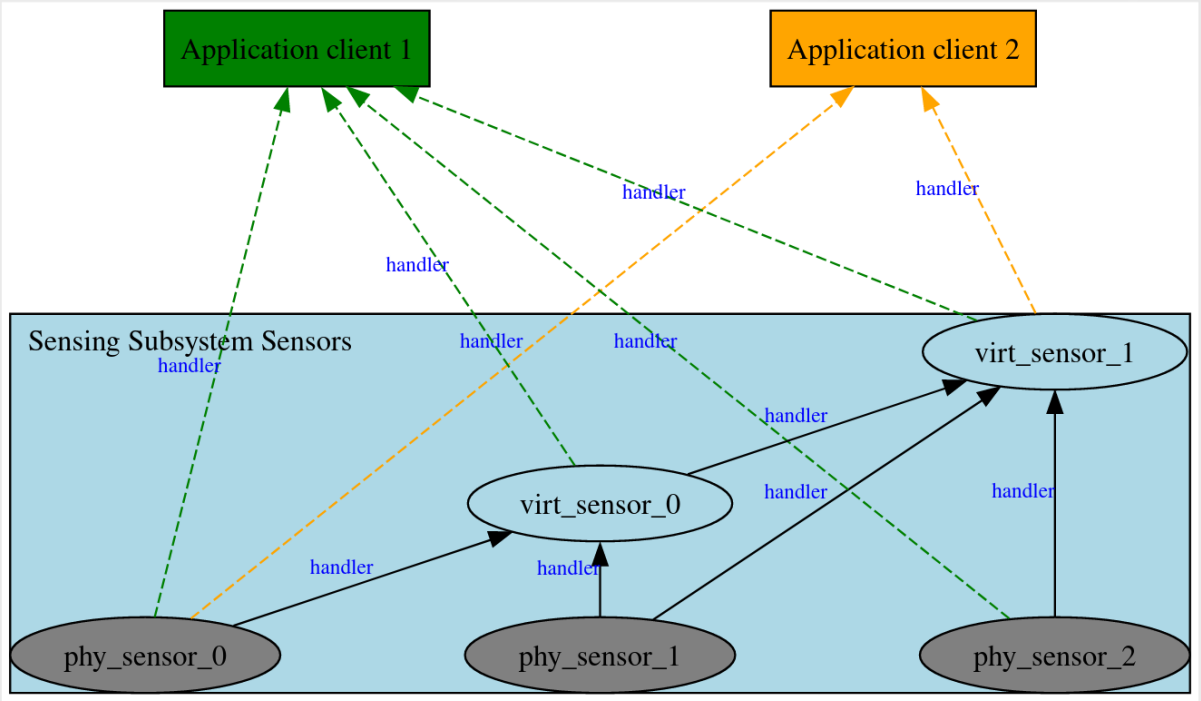
Clients using a *`sensing_sensor_handle_t`* type handler to handle a opened sensor instance, and all subsequent operations on this sensor instance need use this handler, such as set configurations, read sensor sample data, etc.

For a sensor instance, could have two kinds of clients: `Application clients` and `Sensor clients`.

`Application clients` can use *`sensing_open_sensor()`* to open a sensor instance and get it's handler.

For `Sensor clients`, there is no open API for opening a reporter, because the client-report relationship is built at the sensor's registration stage with devicetree.

The `Sensing Subsystem` will auto open and create `handlers` for client sensor to it's reporter sensors. `Sensor clients` can get it's reporters' handlers via *`sensing_sensor_get_reporters()`*.



Note

Sensors inside the Sensing Subsystem, the reporting relationship between them are all auto generated by Sensing Subsystem according devicetree definitions, handlers between client sensor and reporter sensors are auto created. Application(s) need to call *sensing_open_sensor()* to explicitly open the sensor instance.

4.27.7 Sensor Sample Value

- Data Structure

  Each sensor sample value defines as a common `header + readings[]` data structure, like *sensing_sensor_value_3d_q31*, *sensing_sensor_value_q31*, and *sensing_sensor_value_uint32*.

  The `header` definition *sensing_sensor_value_header()*.

- Time Stamp

  Time stamp unit in sensing subsystem is `micro seconds`.

  The `header` defines a **base_timestamp**, and each element in the **readings[]** array defines **timestamp_delta**.

  The **timestamp_delta** is in relation to the previous **readings** (or the **base_timestamp**)

  For example:

  – timestamp of `readings[0]` is `header.base_timestamp + readings[0].timestamp_delta`.

  – timestamp of `readings[1]` is `timestamp of readings[0] + readings[1].timestamp_delta`.

  Since timestamp unit is micro seconds, the max **timestamp_delta** (`uint32_t`) is `4295` seconds.

  If a sensor has batched data where two consecutive readings differ by more than `4295` seconds, the sensing subsystem runtime will split them across multiple instances of the readings structure, and send multiple events.

  This concept is referred from CHRE Sensor API.

- Data Format

  `Sensing Subsystem` uses per sensor type defined data format structure, and support `Q Format` defined in include/zephyr/dsp/types.h for `zdsp` lib support.

  For example *sensing_sensor_value_3d_q31* can be used by 3D IMU sensors like *SENSING_SENSOR_TYPE_MOTION_ACCELEROMETER_3D*, *SENSING_SENSOR_TYPE_MOTION_UNCALIB_ACCELEROMETER_3D*, and *SENSING_SENSOR_TYPE_MOTION_GYROMETER_3D*.

  sensing_sensor_value_uint32 can be used by *SENSING_SENSOR_TYPE_LIGHT_AMBIENTLIGHT* sensor,

  and *sensing_sensor_value_q31* can be used by *SENSING_SENSOR_TYPE_MOTION_HINGE_ANGLE* sensor

  See include/zephyr/sensing/sensing_datatypes.h

4.27.8 Device Tree Configuration

Sensing subsystem using device tree to configuration all sensor instances and their properties, reporting relationships.

See the example samples/subsys/sensing/simple/boards/native_sim.overlay

4.27.9 API Reference

group `sensing_sensor_types`

Sensor Types Definition.

Sensor types definition followed HID standard. https://usb.org/sites/default/files/hutrr39b_0.pdf

TODO: will add more types

Sensor type for all sensors.

This macro defines the sensor type for all sensors.

group `sensing_datatypes`

Data Types.

struct `sensing_sensor_value_header`

#include <*sensing_datatypes.h*> sensor value header

Each sensor value data structure should have this header

Here use 'base_timestamp' (uint64_t) and 'timestamp_delta' (uint32_t) to save memory usage in batching mode.

The 'base_timestamp' is for readings[0], the 'timestamp_delta' is relation to the previous 'readings'. So, timestamp of readings[0] is header.base_timestamp + readings[0].timestamp_delta. timestamp of readings[1] is timestamp of readings[0] + readings[1].timestamp_delta.

Since timestamp unit is micro seconds, the max 'timestamp_delta' (uint32_t) is 4295 seconds.

If a sensor has batched data where two consecutive readings differ by more than 4295 seconds, the sensor subsystem core will split them across multiple instances of the readings structure, and send multiple events.

This concept is borrowed from CHRE: https://cs.android.com/android/platform/superproject/+/master:\ system/chre/chre_api/include/chre_api/chre/sensor_types.h

Public Members

uint64_t **base_timestamp**

Base timestamp of this data readings, unit is micro seconds.

uint16_t **reading_count**

Count of this data readings.

struct **sensing_sensor_value_3d_q31**

#include <sensing_datatypes.h> Sensor value data structure types based on common data types.

Suitable for common sensors, such as IMU, Light sensors and orientation sensors.

Sensor value data structure for 3-axis sensors. struct *sensing_sensor_value_3d_q31* can be used by 3D IMU sensors like: SENSING_SENSOR_TYPE_MOTION_ACCELEROMETER_3D, SENSING_SENSOR_TYPE_MOTION_UNCALIB_ACCELEROMETER_3D, SENSING_SENSOR_TYPE_MOTION_GYROMETER_3D, q31 version

Public Members

struct *sensing_sensor_value_header* **header**

Header of the sensor value data structure.

int8_t **shift**

The shift value for the q31_t v[3] reading.

uint32_t **timestamp_delta**

Timestamp delta of the reading.

Unit is micro seconds.

q31_t v[3]

3D vector of the reading represented as an array.

For SENSING_SENSOR_TYPE_MOTION_ACCELEROMETER_3D and SENSING_SENSOR_TYPE_MOTION_UNCALIB_ACCELEROMETER_3D, the unit is Gs (gravitational force). For SENSING_SENSOR_TYPE_MOTION_GYROMETER_3D, the unit is degrees.

q31_t **x**

X value of the 3D vector.

q31_t **y**

Y value of the 3D vector.

q31_t **z**

Z value of the 3D vector.

struct *sensing_sensor_value_3d_q31* **readings**[1]

Array of readings.

struct **sensing_sensor_value_uint32**

#include <*sensing_datatypes.h*> Sensor value data structure for single 1-axis value.

struct *sensing_sensor_value_uint32* can be used by SENSING_SENSOR_TYPE_LIGHT_AMBIENTLIGHT sensor uint32_t version

Public Members

struct *sensing_sensor_value_header* **header**

Header of the sensor value data structure.

uint32_t **timestamp_delta**

Timestamp delta of the reading.

Unit is micro seconds.

uint32_t v

Value of the reading.

For SENSING_SENSOR_TYPE_LIGHT_AMBIENTLIGHT, the unit is luxs.

struct *sensing_sensor_value_uint32* **readings**[1]

Array of readings.

struct **sensing_sensor_value_q31**

#include <*sensing_datatypes.h*> Sensor value data structure for single 1-axis value.

struct *sensing_sensor_value_q31* can be used by SENSING_SENSOR_TYPE_MOTION_HINGE_ANGLE sensor q31 version

Public Members

struct *sensing_sensor_value_header* **header**

Header of the sensor value data structure.

int8_t **shift**

The shift value for the q31_t v reading.

uint32_t **timestamp_delta**

Timestamp delta of the reading.

Unit is micro seconds.

q31_t **v**

Value of the reading.

For SENSING_SENSOR_TYPE_MOTION_HINGE_ANGLE, the unit is degrees.

struct *sensing_sensor_value_q31* **readings**[1]

Array of readings.

Related code samples

Sensing subsystem
Get high-level sensor data in defined intervals.

group **sensing_api**

Sensing Subsystem API.

Defines

SENSING_SENSOR_VERSION(_major, _minor, _hotfix, _build)

Macro to create a sensor version value.

SENSING_SENSOR_FLAG_REPORT_ON_EVENT

Sensor flag indicating if this sensor is on event reporting data.

Reporting sensor data when the sensor event occurs, such as a motion detect sensor reporting a motion or motionless detected event.

SENSING_SENSOR_FLAG_REPORT_ON_CHANGE

Sensor flag indicating if this sensor is on change reporting data.

Reporting sensor data when the sensor data changes.

Exclusive with *SENSING_SENSOR_FLAG_REPORT_ON_EVENT*

SENSING_SENSITIVITY_INDEX_ALL

SENSING_SENSITIVITY_INDEX_ALL indicating sensitivity of each data field should be set.

Typedefs

typedef void ***sensing_sensor_handle_t**

Define Sensing subsystem sensor handle.

typedef void (***sensing_data_event_t**)(*sensing_sensor_handle_t* handle, const void *buf, void *context)

Sensor data event receive callback.

Param handle
The sensor instance handle.

Param buf
The data buffer with sensor data.

Param context
User provided context pointer.

Enums

enum `sensing_sensor_state`

Sensing subsystem sensor state.

Values:

enumerator `SENSING_SENSOR_STATE_READY` = 0

The sensor is ready.

enumerator `SENSING_SENSOR_STATE_OFFLINE` = 1

The sensor is offline.

enum `sensing_sensor_attribute`

Sensing subsystem sensor config attribute.

Values:

enumerator `SENSING_SENSOR_ATTRIBUTE_INTERVAL` = 0

The interval attribute of a sensor configuration.

enumerator `SENSING_SENSOR_ATTRIBUTE_SENSITIVITY` = 1

The sensitivity attribute of a sensor configuration.

enumerator `SENSING_SENSOR_ATTRIBUTE_LATENCY` = 2

The latency attribute of a sensor configuration.

enumerator `SENSING_SENSOR_ATTRIBUTE_MAX`

The maximum number of attributes that a sensor configuration can have.

Functions

int `sensing_get_sensors`(int *num_sensors, const struct *sensing_sensor_info* **info)

Get all supported sensor instances' information.

This API just returns read only information of sensor instances, pointer info will directly point to internal buffer, no need for caller to allocate buffer, no side effect to sensor instances.

Parameters

- `num_sensors` – Get number of sensor instances.
- `info` – For receiving sensor instances' information array pointer.

Returns
0 on success or negative error value on failure.

int **sensing_open_sensor**(const struct *sensing_sensor_info* *info, struct *sensing_callback_list* *cb_list, *sensing_sensor_handle_t* *handle)

Open sensor instance by sensing sensor info.

Application clients use it to open a sensor instance and get its handle. Support multiple Application clients for open same sensor instance, in this case, the returned handle will different for different clients. meanwhile, also register sensing callback list

Parameters

- **info** – The sensor info got from *sensing_get_sensors*
- **cb_list** – callback list to be registered to sensing, must have a static lifetime.
- **handle** – The opened instance handle, if failed will be set to NULL.

Returns
0 on success or negative error value on failure.

int **sensing_open_sensor_by_dt**(const struct *device* *dev, struct *sensing_callback_list* *cb_list, *sensing_sensor_handle_t* *handle)

Open sensor instance by device.

Application clients use it to open a sensor instance and get its handle. Support multiple Application clients for open same sensor instance, in this case, the returned handle will different for different clients. meanwhile, also register sensing callback list.

Parameters

- **dev** – pointer device get from device tree.
- **cb_list** – callback list to be registered to sensing, must have a static lifetime.
- **handle** – The opened instance handle, if failed will be set to NULL.

Returns
0 on success or negative error value on failure.

int **sensing_close_sensor**(*sensing_sensor_handle_t* *handle)

Close sensor instance.

Parameters

- **handle** – The sensor instance handle need to close.

Returns
0 on success or negative error value on failure.

int **sensing_set_config**(*sensing_sensor_handle_t* handle, struct *sensing_sensor_config* *configs, int count)

Set current config items to Sensing subsystem.

Parameters

- **handle** – The sensor instance handle.
- **configs** – The configs to be set according to config attribute.
- **count** – count of configs.

Returns
0 on success or negative error value on failure, not support etc.

int **sensing_get_config**(*sensing_sensor_handle_t* handle, struct *sensing_sensor_config* *configs, int count)

Get current config items from Sensing subsystem.

Parameters

- `handle` – The sensor instance handle.
- `configs` – The configs to be get according to config attribute.
- `count` – count of configs.

Returns
0 on success or negative error value on failure, not support etc.

const struct *sensing_sensor_info* ***sensing_get_sensor_info**(*sensing_sensor_handle_t* handle)

Get sensor information from sensor instance handle.

Parameters

- `handle` – The sensor instance handle.

Returns
a const pointer to *sensing_sensor_info* on success or NULL on failure.

struct **sensing_sensor_version**

#include <*sensing.h*> Sensor Version.

Public Members

uint32_t **value**

The version represented as a 32-bit value.

uint8_t **major**

The major version number.

uint8_t **minor**

The minor version number.

uint8_t **hotfix**

The hotfix version number.

uint8_t **build**

The build version number.

struct **sensing_sensor_info**

#include <*sensing.h*> Sensor basic constant information.

Public Members

const char ***name**

Name of the sensor instance.

const char ***friendly_name**

Friendly name of the sensor instance.

const char *vendor

Vendor name of the sensor instance.

const char *model

Model name of the sensor instance.

const int32_t type

Sensor type.

const uint32_t minimal_interval

Minimal report interval in micro seconds.

struct sensing_callback_list

#include <*sensing.h*> Sensing subsystem event callback list.

Public Members

sensing_data_event_t on_data_event

Callback function for a sensor data event.

void *context

Associated context with on_data_event.

struct sensing_sensor_config

#include <*sensing.h*> Sensing subsystem sensor configure, including interval, sensitivity, latency.

Public Members

enum *sensing_sensor_attribute* attri

Attribute of the sensor configuration.

int8_t data_field

SENSING_SENSITIVITY_INDEX_ALL

Data field of the sensor configuration.

uint32_t interval

Interval between two sensor samples in microseconds (us).

uint32_t sensitivity

Sensitivity threshold for reporting new data.

A new sensor sample is reported only if the difference between it and the previous sample exceeds this sensitivity value.

uint64_t **latency**

Maximum duration for batching sensor samples before reporting in microseconds (us).

This defines how long sensor samples can be accumulated before they must be reported.

group **sensing_sensor**

Sensing Sensor API.

Defines

SENSING_SENSORS_DT_DEFINE(node, reg_ptr, cb_list_ptr, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)

Like *SENSOR_DEVICE_DT_DEFINE()* with sensing specifics.

Defines a sensor which implements the sensor API. May define an element in the sensing sensor iterable section used to enumerate all sensing sensors.

Parameters

- **node** – The devicetree node identifier.
- **reg_ptr** – Pointer to the device's *sensing_sensor_register_info*.
- **cb_list_ptr** – Pointer to sensing callback list.
- **init_fn** – Name of the init function of the driver.
- **pm_device** – PM device resources reference (NULL if device does not use PM).
- **data_ptr** – Pointer to the device's private data.
- **cfg_ptr** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

SENSING_SENSORS_DT_INST_DEFINE(inst, ...)

Like *SENSING_SENSORS_DT_DEFINE()* for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – instance number. This is replaced by `DT_DRV_COMPAT(inst)` in the call to *SENSING_SENSORS_DT_DEFINE()*.
- **...** – other parameters as expected by *SENSING_SENSORS_DT_DEFINE()*.

Functions

int **sensing_sensor_get_reporters**(const struct *device* *dev, int type, *sensing_sensor_handle_t* *reporter_handles, int max_handles)

Get reporter handles of a given sensor instance by sensor type.

Parameters

- `dev` – The sensor instance device structure.
- `type` – The given type, *SENSING_SENSOR_TYPE_ALL* to get reporters with all types.
- `max_handles` – The max count of the `reporter_handles` array input. Can get real count number via *sensing_sensor_get_reporters_count*
- `reporter_handles` – Input handles array for receiving found reporter sensor instances

Returns
number of reporters found, 0 returned if not found.

int `sensing_sensor_get_reporters_count`(const struct *device* *dev, int type)

Get reporters count of a given sensor instance by sensor type.

Parameters

- `dev` – The sensor instance device structure.
- `type` – The sensor type for checking, *SENSING_SENSOR_TYPE_ALL*

Returns
Count of reporters by `type`, 0 returned if no reporters by `type`.

int `sensing_sensor_get_state`(const struct *device* *dev, enum *sensing_sensor_state* *state)

Get this sensor's state.

Parameters

- `dev` – The sensor instance device structure.
- `state` – Returned sensor state value

Returns
0 on success or negative error value on failure.

struct `sensing_sensor_register_info`

#include <*sensing_sensor.h*> Sensor registration information.

Public Members

uint16_t `flags`

Sensor flags.

uint16_t `sample_size`

Sample size in bytes for a single sample of the registered sensor.

sensing runtime need this information for internal buffer allocation.

uint8_t `sensitivity_count`

The number of sensor sensitivities.

struct *sensing_sensor_version* `version`

Sensor version.

Version can be used to identify different versions of sensor implementation.

4.28 Task Watchdog

4.28.1 Overview

Many microcontrollers feature a hardware watchdog timer peripheral. Its purpose is to trigger an action (usually a system reset) in case of severe software malfunctions. Once initialized, the watchdog timer has to be restarted ("fed") in regular intervals to prevent it from timing out. If the software got stuck and does not manage to feed the watchdog anymore, the corrective action is triggered to bring the system back to normal operation.

In real-time operating systems with multiple tasks running in parallel, a single watchdog instance may not be sufficient anymore, as it can be used for only one task. This software watchdog based on kernel timers provides a method to supervise multiple threads or tasks (called watchdog channels).

An existing hardware watchdog can be used as an optional fallback if the task watchdog itself or the scheduler has a malfunction.

The task watchdog uses a kernel timer as its backend. If configured properly, the timer ISR is never actually called during normal operation, as the timer is continuously updated in the feed calls.

It's currently not possible to have multiple instances of task watchdogs. Instead, the task watchdog API can be accessed globally to add or delete new channels without passing around a context or device pointer in the firmware.

The maximum number of channels is predefined via Kconfig and should be adjusted to match exactly the number of channels required by the application.

4.28.2 Configuration Options

Related configuration options can be found under subsys/task_wdt/Kconfig.

- `CONFIG_TASK_WDT`
- `CONFIG_TASK_WDT_CHANNELS`
- `CONFIG_TASK_WDT_HW_FALLBACK`
- `CONFIG_TASK_WDT_MIN_TIMEOUT`
- `CONFIG_TASK_WDT_HW_FALLBACK_DELAY`

4.28.3 API Reference

Related code samples

Task watchdog
Monitor a thread using a task watchdog.

group `task_wdt_api`

Task Watchdog APIs.

Since
2.5

Version
0.8.0

Typedefs

typedef void (*`task_wdt_callback_t`)(int channel_id, void *user_data)

Task watchdog callback.

Functions

int `task_wdt_init`(const struct *device* *hw_wdt)

Initialize task watchdog.

This function sets up necessary kernel timers and the hardware watchdog (if desired as fallback). It has to be called before *task_wdt_add()* and *task_wdt_feed()*.

Parameters

- `hw_wdt` – Pointer to the hardware watchdog device used as fallback. Pass NULL if no hardware watchdog fallback is desired.

Return values

- `0` – If successful.
- `-ENOTSUP` – If assigning a hardware watchdog is not supported.
- `-Errno` – Negative errno if the fallback hw_wdt is used and the install timeout API fails. See *wdt_install_timeout()* API for possible return values.

int `task_wdt_add`(uint32_t reload_period, *task_wdt_callback_t* callback, void *user_data)

Install new timeout.

Adds a new timeout to the list of task watchdog channels.

Parameters

- `reload_period` – Period in milliseconds used to reset the timeout
- `callback` – Function to be called when watchdog timer expired. Pass NULL to use system reset handler.
- `user_data` – User data to associate with the watchdog channel.

Return values

- `channel_id` – If successful, a non-negative value indicating the index of the channel to which the timeout was assigned. This ID is supposed to be used as the parameter in calls to *task_wdt_feed()*.
- `-EINVAL` – If the reload_period is invalid.
- `-ENOMEM` – If no more timeouts can be installed.

int `task_wdt_delete`(int channel_id)

Delete task watchdog channel.

Deletes the specified channel from the list of task watchdog channels. The channel is now available again for other tasks via *task_wdt_add()* function.

Parameters

- `channel_id` – Index of the channel as returned by *task_wdt_add()*.

Return values

- `0` – If successful.
- `-EINVAL` – If there is no installed timeout for supplied channel.

int `task_wdt_feed`(int channel_id)

Feed specified watchdog channel.

This function loops through all installed task watchdogs and updates the internal kernel timer used as for the software watchdog with the next due timeout.

Parameters

- `channel_id` – Index of the fed channel as returned by *task_wdt_add()*.

Return values

- `0` – If successful.
- `-EINVAL` – If there is no installed timeout for supplied channel.

4.29 Trusted Firmware-M

4.29.1 Trusted Firmware-M Overview

Trusted Firmware-M (TF-M) is a reference implementation of the Platform Security Architecture (PSA) IoT Security Framework. It defines and implements an architecture and a set of software components that aim to address some of the main security concerns in IoT products.

Zephyr RTOS has been PSA Certified since Zephyr 2.0.0 with TF-M 1.0, and is currently integrated with TF-M 2.1.0.

What Does TF-M Offer?

Through a set of secure services and by design, TF-M provides:

- Isolation of secure and non-secure resources
- Embedded-appropriate crypto
- Management of device secrets (keys, etc.)
- Firmware verification (and encryption)
- Protected off-chip data storage and retrieval
- Proof of device identity (device attestation)
- Audit logging

Build System Integration

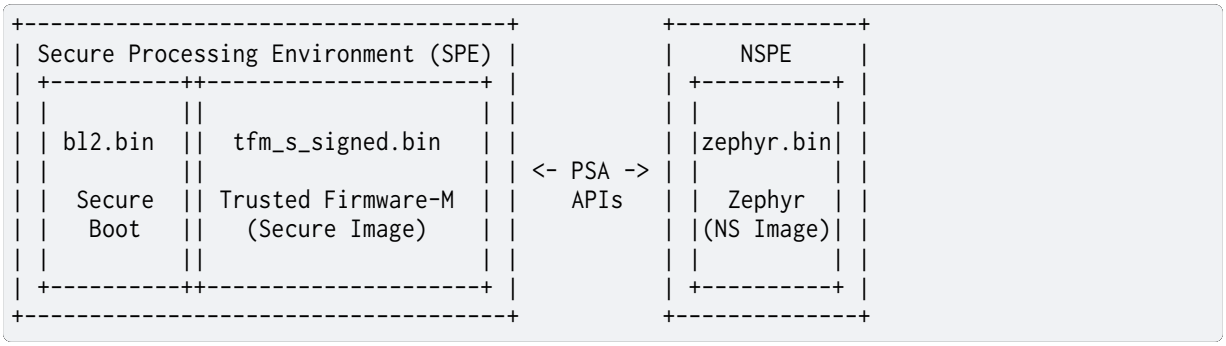
When using TF-M with a supported platform, TF-M will be automatically built and link in the background as part of the standard Zephyr build process. This build process makes a number of assumptions about how TF-M is being used, and has certain implications about what the Zephyr application image can and can not do:

- The secure processing environment (secure boot and TF-M) starts first
- Resource allocation for Zephyr relies on choices made in the secure image.

Architecture Overview

A TF-M application will, generally, have the following three parts, from most to least trusted, left-to-right, with code execution happening in the same order (secure boot > secure image > ns image).

While the secure bootloader is optional, it is enabled by default, and secure boot is an important part of providing a secure solution:



Communication between the (Zephyr) Non-Secure Processing Environment (NSPE) and the (TF-M) Secure Processing Environment image happens based on a set of PSA APIs, and normally makes use of an IPC mechanism that is included as part of the TF-M build, and implemented in Zephyr (see modules/trusted-firmware-m/interface).

Root of Trust (RoT) Architecture TF-M is based upon a **Root of Trust (RoT)** architecture. This allows for hierarchies of trust from most, to less, to least trusted, providing a sound foundation upon which to build or access trusted services and resources.

The benefit of this approach is that less trusted components are prevented from accessing or compromising more critical parts of the system, and error conditions in less trusted environments won't corrupt more trusted, isolated resources.

The following RoT hierarchy is defined for TF-M, from most to least trusted:

- PSA Root of Trust (**PRoT**), which consists of:
  - PSA Immutable Root of Trust: secure boot
  - PSA Updateable Root of Trust: most trusted secure services
- Application Root of Trust (**ARoT**): isolated secure services

The **PSA Immutable Root of Trust** is the most trusted piece of code in the system, to which subsequent Roots of Trust are anchored. In TF-M, this is the secure boot image, which verifies that the secure and non-secure images are valid, have not been tampered with, and come from a reliable source. The secure bootloader also verifies new images during the firmware update process, thanks to the public signing key(s) built into it. As the name implies, this image is **immutable**.

The **PSA Updateable Root of Trust** implements the most trusted secure services and components in TF-M, such as the Secure Partition Manager (SPM), and shared secure services like PSA Crypto, Internal Trusted Storage (ITS), etc. Services in the PSA Updateable Root of Trust have access to other resources in the same Root of Trust.

The **Application Root of Trust** is a reduced-privilege area in the secure processing environment which, depending on the isolation level chosen when building TF-M, has limited access to the PRoT, or even other ARoT services at the highest isolation levels. Some standard services exist in the ARoT, such as Protected Storage (PS), and generally custom secure services that you implement should be placed in the ARoT, unless a compelling reason is present to place them in the PRoT.

These divisions are distinct from the **untrusted code**, which runs in the non-secure environment, and has the least privilege in the system. This is the Zephyr application image in this case.

Isolation Levels At present, there are three distinct **isolation levels** defined in TF-M, with increasingly rigid boundaries between regions. The isolation level used will depend on your security requirements, and the system resources available to you.

- **Isolation Level 1** is the lowest isolation level, and the only major boundary is between the secure and non-secure processing environment, usually by means of Arm TrustZone on Armv8-M processors. There is no distinction here between the PSA Updateable Root of Trust (PRoT) and the Application Root of Trust (ARoT). They execute at the same privilege level. This isolation level will lead to the smallest combined application images.
- **Isolation Level 2** builds upon level one by introducing a distinction between the PSA Updateable Root of Trust and the Application Root of Trust, where ARoT services have limited access to PRoT services, and can only communicate with them through public APIs exposed by the PRoT services. ARoT services, however, are not strictly isolated from one another.
- **Isolation Level 3** is the highest isolation level, and builds upon level 2 by isolating ARoT services from each other, so that each ARoT is essentially silo'ed from other services. This provides the highest level of isolation, but also comes at the cost of additional overhead and code duplication between services.

The current isolation level can be checked via `CONFIG_TFM_ISOLATION_LEVEL`.

Secure Boot The default secure bootloader in TF-M is based on MCUBoot, and is referred to as `BL2` in TF-M (for the second-stage bootloader, potentially after a HW-based bootloader on the secure MCU, etc.).

All images in TF-M are hashed and signed, with the hash and signature verified by MCUBoot during the firmware update process.

Some key features of MCUBoot as used in TF-M are:

- Public signing key(s) are baked into the bootloader
- S and NS images can be signed using different keys
- Firmware images can optionally be encrypted
- Client software is responsible for writing a new image to the secondary slot
- By default, uses static flash layout of two identically-sized memory regions
- Optional security counter for rollback protection

When dealing with (optionally) encrypted images:

- Only the payload is encrypted (header, TLVs are plain text)
- Hashing and signing are applied over the un-encrypted data
- Uses `AES-CTR-128` or `AES-CTR-256` for encryption
- Encryption key randomized every encryption cycle (via `imgtool`)
- The `AES-CTR` key is included in the image and can be encrypted using:
  - `RSA-OAEP`
  - `AES-KW` (128 or 256 bits depending on the `AES-CTR` key length)
  - `ECIES-P256`
  - `ECIES-X25519`

Key config properties to control secure boot in Zephyr are:

- `CONFIG_TFM_BL2` toggles the bootloader (default = `y`).
- `CONFIG_TFM_KEY_FILE_S` overrides the secure signing key.
- `CONFIG_TFM_KEY_FILE_NS` overrides the non-secure signing key.

Secure Processing Environment Once the secure bootloader has finished executing, a TF-M based secure image will begin execution in the **secure processing environment**. This is where our device will be initially configured, and any secure services will be initialised.

Note that the starting state of our device is controlled by the secure firmware, meaning that when the non-secure Zephyr application starts, peripherals may not be in the HW-default reset state. In case of doubts, be sure to consult the board support packages in TF-M, available in the `platform/ext/target/` folder of the TF-M module (which is in `modules/tee/tf-m/trusted-firmware-m/` within a default Zephyr west workspace.)

Secure Services As of TF-M 1.8.0, the following secure services are generally available (although vendor support may vary):

- Crypto
- Firmware Update (FWU)
- Initial Attestation
- Platform
- Secure Storage, which has two parts:
  - Internal Trusted Storage (ITS)
  - Protected Storage (PS)

A template also exists for creating your own custom services.

For full details on these services, and their exposed APIs, please consult the TF-M Documentation.

Key Management and Derivation Key and secret management is a critical part of any secure device. You need to ensure that key material is available to regions that require it, but not to anything else, and that it is stored securely in a way that makes it difficult to tamper with or maliciously access.

The **Internal Trusted Storage** service in TF-M is used by the **PSA Crypto** service (which itself makes use of mbedtls) to store keys, and ensure that private keys are only ever accessible to the secure processing environment. Crypto operations that make use of key material, such as when signing payloads or when decrypting sensitive data, all take place via key handles. At no point should the key material ever be exposed to the NS environment.

One exception is that private keys can be provisioned into the secure processing environment as a one-way operation, such as during a factory provisioning process, but even this should be avoided where possible, and a request should be made to the SPE (via the PSA Crypto service) to generate a new private key itself, and the public key for that can be requested during provisioning and logged in the factory. This ensures the private key material is never exposed, or even known during the provisioning phase.

TF-M also makes extensive use of the **Hardware Unique Key (HUK)**, which every TF-M device must provide. This device-unique key is used by the **Protected Storage** service, for example, to encrypt information stored in external memory. For example, this ensures that the contents of flash memory can't be decrypted if they are removed and placed on a new device, since each device has its own unique HUK used while encrypting the memory contents the first time.

HUKs provide an additional advantage for developers, in that they can be used to derive new keys, and the **derived keys** don't need to be stored since they can be regenerated from the HUK at startup, using an additional salt/seed value (depending on the key derivation algorithm used). This removes the storage issue and a frequent attack vector. The HUK itself it usually highly protected in secure devices, and inaccessible directly by users.

`TFM_CRYPTO_ALG_HUK_DERIVATION` identifies the default key derivation algorithm used if a software implementation is used. The current default algorithm is `HKDF` (RFC 5869) with a SHA-256 hash. Other hardware implementations may be available on some platforms.

Non-Secure Processing Environment Zephyr is used for the NSPE, using a board that is supported by TF-M where the `CONFIG_BUILD_WITH_TFM` flag has been enabled.

Generally, you simply need to select the `*_ns` variant of a valid target (for example `mps2_an521_ns`), which will configure your Zephyr application to run in the NSPE, correctly build and link it with the TF-M secure images, sign the secure and non-secure images, and merge the three binaries into a single `tfm_merged.hex` file. The *west flash* command will flash `tfm_merged.hex` by default in this configuration.

At present, Zephyr can not be configured to be used as the secure processing environment.

4.29.2 TF-M Requirements

The following are some of the boards that can be used with TF-M:

Board	NSPE board name
mps2_an521_board	mps2_an521_ns (qemu supported)
mps3_an547_board	mps3_an547_ns (qemu supported)
bl5340_dvk	bl5340_dvk/nrf5340/cpuapp/ns
lpcxpresso55s69	lpcxpresso55s69_ns
nrf9160dk_nrf9160	nrf9160dk/nrf9160/ns
nrf5340dk_nrf5340	nrf5340dk/nrf5340/cpuapp/ns
b_u585i_iot02a_board	b_u585i_iot02a/stm32u585xx/ns
nucleo_l552ze_q_board	nucleo_l552ze_q/stm32l552xx/ns
stm32l562e_dk_board	stm32l562e_dk/stm32l562xx/ns
v2m_musca_b1_board	v2m_musca_b1_ns
v2m_musca_s1_board	v2m_musca_s1_ns

You can run `west boards -n _ns$` to search for non-secure variants of different board targets. To make sure TF-M is supported for a board in its output, check that `CONFIG_TRUSTED_EXECUTION_NONSECURE` is set to y in that board's default configuration.

Software Requirements

The following Python modules are required when building TF-M binaries:

- cryptography
- pyasn1
- pyyaml
- cbor>=1.0.0
- imgtool>=1.9.0
- jinja2
- click

You can install them via:

```
$ pip3 install --user cryptography pyasn1 pyyaml cbor>=1.0.0 imgtool>=1.9.0␣
↪jinja2 click
```

They are used by TF-M's signing utility to prepare firmware images for validation by the bootloader.

Part of the process of generating binaries for QEMU and merging signed secure and non-secure binaries on certain platforms also requires the use of the `srec_cat` utility.

This can be installed on Linux via:

```
$ sudo apt-get install srecord
```

And on OS X via:

```
$ brew install srecord
```

For Windows-based systems, please make sure you have a copy of the utility available on your system path. See, for example: SRecord for Windows

4.29.3 TF-M Build System

When building a valid _ns board target, TF-M will be built in the background, and linked with the Zephyr non-secure application. No knowledge of TF-M's build system is required in most cases, and the following will build a TF-M and Zephyr image pair, and run it in qemu with no additional steps required:

```
$ west build -p auto -b mps2_an521_ns samples/tfm_integration/psa_protected_
↪storage/ -t run
```

The outputs and certain key steps in this build process are described here, however, since you will need to understand and interact with the outputs, and deal with signing the secure and non-secure images before deploying them.

Images Created by the TF-M Build

The TF-M build system creates the following executable files:

- tfm_s - TF-M secure firmware
- tfm_ns - TF-M non-secure app (only used by regression tests).
- bl2 - TF-M MCUboot, if enabled

For each of these, it creates .bin, .hex, .elf, and .axf files.

The TF-M build system also creates signed variants of tfm_s and tfm_ns, and a file which combines them:

- tfm_s_signed
- tfm_ns_signed
- tfm_s_ns_signed

For each of these, only .bin files are created.

The TF-M non-secure app is discarded in favor of Zephyr non-secure app except when running the TF-M regression test suite.

The Zephyr build system usually signs both tfm_s and the Zephyr non-secure app itself. See below for details.

The 'tfm' target contains properties for all these paths. For example, the following will resolve to <path>/tfm_s.hex:

```
$<TARGET_PROPERTY:tfm,TFM_S_HEX_FILE>
```

See the top level CMakeLists.txt file in the tfm module for an overview of all the properties.

Signing Images

When CONFIG_TFM_BL2 is set to y, TF-M uses a secure bootloader (BL2) and firmware images must be signed with a private key. The firmware image is validated by the bootloader during updates using the corresponding public key, which is stored inside the secure bootloader firmware image.

By default, <tfm-dir>/bl2/ext/mcuboot/root-rsa-3072.pem is used to sign secure images, and <tfm-dir>/bl2/ext/mcuboot/root-rsa-3072_1.pem is used to sign non-secure images. These default .pem keys can (and **should**) be overridden using the CONFIG_TFM_KEY_FILE_S and CONFIG_TFM_KEY_FILE_NS config flags.

To satisfy PSA Certified Level 1 requirements, **You MUST replace the default .pem file with a new key pair!**

To generate a new public/private key pair, run the following commands:

```
$ imgtool keygen -k root-rsa-3072_s.pem -t rsa-3072
$ imgtool keygen -k root-rsa-3072_ns.pem -t rsa-3072
```

You can then place the new .pem files in an alternate location, such as your Zephyr application folder, and reference them in the prj.conf file via the CONFIG_TFM_KEY_FILE_S and CONFIG_TFM_KEY_FILE_NS config flags.

Warning

Be sure to keep your private key file in a safe, reliable location! If you lose this key file, you will be unable to sign any future firmware images, and it will no longer be possible to update your devices in the field!

After the built-in signing script has run, it creates a tfm_merged.hex file that contains all three binaries: bl2, tfm_s, and the zephyr app. This hex file can then be flashed to your development board or run in QEMU.

Custom CMake arguments When building a Zephyr application with TF-M it might be necessary to control the CMake arguments passed to the TF-M build.

Zephyr TF-M build offers several Kconfig options for controlling the build, but doesn't cover every CMake argument supported by the TF-M build system.

The TFM_CMAKE_OPTIONS property on the zephyr_property_target can be used to pass custom CMake arguments to the TF-M build system.

To pass the CMake argument -DFOO=bar to the TF-M build system, place the following CMake snippet in your CMakeLists.txt file.

```
set_property(TARGET zephyr_property_target
             APPEND PROPERTY TFM_CMAKE_OPTIONS
             -DFOO=bar
)
```

Note

The TFM_CMAKE_OPTIONS is a list so it is possible to append multiple options. Also CMake generator expressions are supported, such as $<1:-DFOO=bar>

Since TFM_CMAKE_OPTIONS is a list argument it will be expanded before it is passed to the TF-M build system. Options that have list arguments must therefore be properly escaped to avoid being expanded as a list.

```
set_property(TARGET zephyr_property_target
             APPEND PROPERTY TFM_CMAKE_OPTIONS
             -DFOO="bar\\\;baz"
)
```

Footprint and Memory Usage

The build system offers targets to view and analyse RAM and ROM usage in generated images. The tools run on the final images and give information about size of symbols and code being used in both RAM and ROM. For more information on these tools look here: *Footprint and Memory Usage*

Use the `tfm_ram_report` to get the RAM report for TF-M secure firmware (tfm_s).

Using west:

```
west build -b mps2_an521_ns samples/hello_world
west build -t tfm_ram_report
```

Using CMake and ninja:

```
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world

# Now run the build tool on the generated build system:
ninja -Cbuild tfm_ram_report
```

Use the `tfm_rom_report` to get the ROM report for TF-M secure firmware (tfm_s).

Using west:

```
west build -b mps2_an521_ns samples/hello_world
west build -t tfm_rom_report
```

Using CMake and ninja:

```
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world

# Now run the build tool on the generated build system:
ninja -Cbuild tfm_rom_report
```

Use the `bl2_ram_report` to get the RAM report for TF-M MCUboot, if enabled.

Using west:

```
west build -b mps2_an521_ns samples/hello_world
west build -t bl2_ram_report
```

Using CMake and ninja:

```
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world

# Now run the build tool on the generated build system:
ninja -Cbuild bl2_ram_report
```

Use the `bl2_rom_report` to get the ROM report for TF-M MCUboot, if enabled.

Using west:

```
west build -b mps2_an521_ns samples/hello_world
west build -t bl2_rom_report
```

Using CMake and ninja:

```
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=mps2_an521_ns samples/hello_world

# Now run the build tool on the generated build system:
ninja -Cbuild bl2_rom_report
```

4.29.4 Trusted Firmware-M Integration

The Trusted Firmware-M (TF-M) section contains information about the integration between TF-M and Zephyr RTOS. Use this information to help understand how to integrate TF-M with Zephyr for Cortex-M platforms and make use of its secure run-time services in Zephyr applications.

Board Definitions

TF-M will be built for the secure processing environment along with Zephyr if the `CONFIG_BUILD_WITH_TFM` flag is set to `y`.

Generally, this value should never be set at the application level, however, and all config flags required for TF-M should be set in a board variant with the `_ns` suffix.

This board variant must define an appropriate flash, SRAM and peripheral configuration that takes into account the initialisation process in the secure processing environment. `CONFIG_TFM_BOARD` must also be set via modules/trusted-firmware-m/Kconfig.tfm to the board name that TF-M expects for this target, so that it knows which target to build for the secure processing environment.

Example: `mps2_an521_ns` The `mps2_an521` target is a dual-core Arm Cortex-M33 evaluation board that, when using the default board variant, would generate a secure Zephyr binary.

The optional `mps2_an521_ns` target, however, sets these additional kconfig flags that indicate that Zephyr should be built as a non-secure image, linked with TF-M as an external project, and optionally the secure bootloader:

- `CONFIG_TRUSTED_EXECUTION_NONSECURE y`
- `CONFIG_ARM_TRUSTZONE_M y`

Comparing the `mps2_an521.dts` and `mps2_an521_ns.dts` files, we can see that the `_ns` version defines offsets in flash and SRAM memory, which leave the required space for TF-M and the secure bootloader:

```
reserved-memory {
            #address-cells = <1>;
            #size-cells = <1>;
            ranges;

            /* The memory regions defined below must match what the TF-M
             * project has defined for that board - a single image boot is
             * assumed. Please see the memory layout in:
             * https://git.trustedfirmware.org/TF-M/trusted-firmware-m.git/tree/platform/
↪ext/target/mps2/an521/partition/flash_layout.h
             */
```

(continues on next page)

(continued from previous page)

```
            code: memory@100000 {
                    reg = <0x00100000 DT_SIZE_K(512)>;
            };

            ram: memory@28100000 {
                    reg = <0x28100000 DT_SIZE_M(1)>;
            };
    };
```

This reserves 1 MB of code memory and 1 MB of RAM for secure boot and TF-M, such that our non-secure Zephyr application code will start at 0x10000, with RAM at 0x28100000. 512 KB code memory is available for the NS zephyr image, along with 1 MB of RAM.

This matches the flash memory layout we see in `flash_layout.h` in TF-M:

```
* 0x0000_0000 BL2 - MCUBoot (0.5 MB)
* 0x0008_0000 Secure image     primary slot (0.5 MB)
* 0x0010_0000 Non-secure image primary slot (0.5 MB)
* 0x0018_0000 Secure image     secondary slot (0.5 MB)
* 0x0020_0000 Non-secure image secondary slot (0.5 MB)
* 0x0028_0000 Scratch area (0.5 MB)
* 0x0030_0000 Protected Storage Area (20 KB)
* 0x0030_5000 Internal Trusted Storage Area (16 KB)
* 0x0030_9000 NV counters area (4 KB)
* 0x0030_A000 Unused (984 KB)
```

`mps2/an521` will be passed in to Tf-M as the board target, specified via `CONFIG_TFM_BOARD`.

4.29.5 Test Suites

TF-M includes two sets of test suites:

- tf-m-tests - Standard TF-M specific regression tests
- psa-arch-tests - Test suites for specific PSA APIs (secure storage, etc.)

These test suites can be run from Zephyr via an appropriate sample application in the samples/tfm_integration folder.

TF-M Regression Tests

The regression test suite can be run via the tfm_regression_test sample.

This sample tests various services and communication mechanisms across the NS/S boundary via the PSA APIs. They provide a useful sanity check for proper integration between the NS RTOS (Zephyr in this case) and the secure application (TF-M).

PSA Arch Tests

The PSA Arch Test suite, available via tfm_psa_test, contains a number of test suites that can be used to validate that PSA API specifications are being followed by the secure application, TF-M being an implementation of the Platform Security Architecture (PSA).

Only one of these suites can be run at a time, with the available test suites described via `CONFIG_TFM_PSA_TEST_*` KConfig flags:

Purpose

The output of these test suites is required to obtain PSA Certification for your specific board, RTOS (Zephyr here), and PSA implementation (TF-M in this case).

They also provide a useful test case to validate any PRs that make meaningful changes to TF-M, such as enabling a new TF-M board target, or making changes to the core TF-M module(s). They should generally be run as a coherence check before publishing a new PR for new board support, etc.

4.30 Virtualization

4.30.1 Inter-VM Shared Memory

- *Overview*
- *Support*
- *ivshmem-v2*
- *API Reference*

Overview

As Zephyr is enabled to run as a guest OS on Qemu and ACRN it might be necessary to make VMs aware of each other, or aware of the host. This is made possible by exposing a shared memory among parties via a feature called ivshmem, which stands for inter-VM Shared Memory.

The two types are supported: a plain shared memory (ivshmem-plain) or a shared memory with the ability for a VM to generate an interruption on another, and thus to be interrupted as well itself (ivshmem-doorbell).

Please refer to the official Qemu ivshmem documentation for more information.

Support

Zephyr supports both versions: plain and doorbell. Ivshmem driver can be built by enabling `CONFIG_IVSHMEM`. By default, this will expose the plain version. `CONFIG_IVSHMEM_DOORBELL` needs to be enabled to get the doorbell version.

Because the doorbell version uses MSI-X vectors to support notification vectors, the `CONFIG_IVSHMEM_MSI_X_VECTORS` has to be tweaked to the number of vectors that will be needed.

Note that a tiny shell module can be exposed to test the ivshmem feature by enabling `CONFIG_IVSHMEM_SHELL`.

ivshmem-v2

Zephyr also supports ivshmem-v2:

https://github.com/siemens/jailhouse/blob/master/Documentation/ivshmem-v2-specification.md

This is primarily used for IPC in the Jailhouse hypervisor (e.g. eth-ivshmem). It is also possible to use ivshmem-v2 without Jailhouse by building the Siemens fork of QEMU, and modifying the QEMU launch flags:

https://github.com/siemens/qemu/tree/wip/ivshmem2

Inter-VM Shared Memory (ivshmem) reference API.

Defines

`IVSHMEM_V2_PROTO_UNDEFINED`

`IVSHMEM_V2_PROTO_NET`

Typedefs

typedef size_t (***ivshmem_get_mem_f**)(const struct *device* *dev, uintptr_t *memmap)

typedef uint32_t (***ivshmem_get_id_f**)(const struct *device* *dev)

typedef uint16_t (***ivshmem_get_vectors_f**)(const struct *device* *dev)

typedef int (***ivshmem_int_peer_f**)(const struct *device* *dev, uint32_t peer_id, uint16_t vector)

typedef int (***ivshmem_register_handler_f**)(const struct *device* *dev, struct *k_poll_signal* *signal, uint16_t vector)

Functions

size_t **ivshmem_get_mem**(const struct *device* *dev, uintptr_t *memmap)

Get the inter-VM shared memory.

Note: This API is not supported for ivshmem-v2, as the R/W and R/O areas may not be mapped contiguously. For ivshmem-v2, use the ivshmem_get_rw_mem_section, ivshmem_get_output_mem_section and ivshmem_get_state APIs to access the shared memory.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `memmap` – A pointer to fill in with the memory address

Returns
the size of the memory mapped, or 0

uint32_t `ivshmem_get_id`(const struct *device* *dev)

Get our VM ID.

Parameters

- `dev` – Pointer to the device structure for the driver instance

Returns
our VM ID or 0 if we are not running on doorbell version

uint16_t `ivshmem_get_vectors`(const struct *device* *dev)

Get the number of interrupt vectors we can use.

Parameters

- `dev` – Pointer to the device structure for the driver instance

Returns
the number of available interrupt vectors

int `ivshmem_int_peer`(const struct *device* *dev, uint32_t peer_id, uint16_t vector)

Interrupt another VM.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `peer_id` – The VM ID to interrupt
- `vector` – The interrupt vector to use

Returns
0 on success, a negative errno otherwise

int `ivshmem_register_handler`(const struct *device* *dev, struct *k_poll_signal* *signal, uint16_t vector)

Register a vector notification (interrupt) handler.

Note: The returned status, if positive, to a raised signal is the vector that generated the signal. This lets the possibility to the user to have one signal for all vectors, or one per-vector.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `signal` – A pointer to a valid and ready to be signaled struct *k_poll_signal*. Or NULL to unregister any handler registered for the given vector.
- `vector` – The interrupt vector to get notification from

Returns
0 on success, a negative errno otherwise

struct `ivshmem_driver_api`

#include <ivshmem.h>

4.31 Retention System

The retention system provides an API which allows applications to read and write data from and to memory areas or devices that retain the data while the device is powered. This allows for sharing information between different applications or within a single application without losing state information when a device reboots. The stored data should not persist in the event of a power failure (or during some low-power modes on some devices) nor should it be stored to a non-volatile storage like *Flash*, *EEPROM API*, or battery-backed RAM.

The retention system builds on top of the retained data driver, and adds additional software-level features to it for ensuring the validity of data. Optionally, a magic header can be used to check if the front of the retained data memory section contains this specific value, and an optional checksum (1, 2, or 4-bytes in size) of the stored data can be appended to the end of the data. Additionally, the retention system API allows partitioning of the retained data sections into multiple distinct areas. For example, a 64-byte retained data area could be split up into 4 bytes for a boot mode, 16 bytes for a timestamp, 44 bytes for a last log message. All of these sections can be accessed or updated independently. The prefix and checksum can be set per-instance using devicetree.

4.31.1 Devicetree setup

To use the retention system, a retained data driver must be setup for the board you are using, there is a zephyr driver which can be used which will use some RAM as non-init for this purpose. The retention system is then initialised as a child node of this device 1 or more times - note that the memory region will need to be decremented to account for this reserved portion of RAM. See the following example (examples in this guide are based on the nrf52840dk_nrf52840 board and memory layout):

```
/ {
        sram@2003FC00 {
                compatible = "zephyr,memory-region", "mmio-sram";
                reg = <0x2003FC00 DT_SIZE_K(1)>;
                zephyr,memory-region = "RetainedMem";
                status = "okay";

                retainedmem {
                        compatible = "zephyr,retained-ram";
                        status = "okay";
                        #address-cells = <1>;
                        #size-cells = <1>;

                        /* This creates a 256-byte partition */
                        retention0: retention@0 {
                                compatible = "zephyr,retention";
                                status = "okay";

                                /* The total size of this area is 256
                                 * bytes which includes the prefix and
                                 * checksum, this means that the usable
                                 * data storage area is 256 - 3 = 253
                                 * bytes
                                 */
                                reg = <0x0 0x100>;

                                /* This is the prefix which must appear
                                 * at the front of the data
                                 */
                                prefix = [08 04];
```

(continues on next page)

(continued from previous page)

```
                        /* This uses a 1-byte checksum */
                        checksum = <1>;
                };

                /* This creates a 768-byte partition */
                retention1: retention@100 {
                        compatible = "zephyr,retention";
                        status = "okay";

                        /* Start position must be after the end
                         * of the previous partition. The total
                         * size of this area is 768 bytes which
                         * includes the prefix and checksum,
                         * this means that the usable data
                         * storage area is 768 - 6 = 762 bytes
                         */
                        reg = <0x100 0x300>;

                        /* This is the prefix which must appear
                         * at the front of the data
                         */
                        prefix = [00 11 55 88 fa bc];

                        /* If omitted, there will be no
                         * checksum
                         */
                };
        };
    };
};

/* Reduce SRAM0 usage by 1KB to account for non-init area */
&sram0 {
        reg = <0x20000000 DT_SIZE_K(255)>;
};
```

The retention areas can then be accessed using the data retention API (once enabled with `CONFIG_RETENTION`, which requires that `CONFIG_RETAINED_MEM` be enabled) by getting the device by using:

```
#include <zephyr/device.h>
#include <zephyr/retention/retention.h>

const struct device *retention1 = DEVICE_DT_GET(DT_NODELABEL(retention1));
const struct device *retention2 = DEVICE_DT_GET(DT_NODELABEL(retention2));
```

When the write function is called, the magic header and checksum (if enabled) will be set on the area, and it will be marked as valid from that point onwards.

4.31.2 Mutex protection

Mutex protection of retention areas is enabled by default when applications are compiled with multithreading support. This means that different threads can safely call the retention functions without clashing with other concurrent thread function usage, but means that retention functions cannot be used from ISRs. It is possible to disable mutex protection globally on all retention areas by enabling `CONFIG_RETENTION_MUTEX_FORCE_DISABLE` - users are then responsible for ensuring that the function calls do not conflict with each other. Note that to use this, retention driver mutex support must also be disabled by enabling `CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE`.

4.31.3 Boot mode

An addition to the retention subsystem is a boot mode interface, this can be used to dynamically change the state of an application or run a different application with a minimal set of functions when a device is rebooted (an example is to have a buttonless way of entering mcuboot's serial recovery feature from the main application).

To use the boot mode feature, a data retention entry must exist in the device tree, which is dedicated for use as the boot mode selection (the user area data size only needs to be a single byte), and this area be assigned to the chosen node of `zephyr,boot-mode`. See the following example:

```
/ {
        sram@2003FFFF {
                compatible = "zephyr,memory-region", "mmio-sram";
                reg = <0x2003FFFF 0x1>;
                zephyr,memory-region = "RetainedMem";
                status = "okay";

                retainedmem {
                        compatible = "zephyr,retained-ram";
                        status = "okay";
                        #address-cells = <1>;
                        #size-cells = <1>;

                        retention0: retention@0 {
                                compatible = "zephyr,retention";
                                status = "okay";
                                reg = <0x0 0x1>;
                        };
                };
        };

        chosen {
                zephyr,boot-mode = &retention0;
        };
};

/* Reduce SRAM0 usage by 1 byte to account for non-init area */
&sram0 {
        reg = <0x20000000 0x3FFFF>;
};
```

The boot mode interface can be enabled with `CONFIG_RETENTION_BOOT_MODE` and then accessed by using the boot mode functions. If using mcuboot with serial recovery, it can be built with `CONFIG_MCUBOOT_SERIAL` and `CONFIG_BOOT_SERIAL_BOOT_MODE` enabled which will allow rebooting directly into the serial recovery mode by using:

```
#include <zephyr/retention/bootmode.h>
#include <zephyr/sys/reboot.h>

bootmode_set(BOOT_MODE_TYPE_BOOTLOADER);
sys_reboot(0);
```

4.31.4 Retention system modules

Modules can expand the functionality of the retention system by using it as a transport (e.g. between a bootloader and application).

Bootloader Information

The bootloader information (abbreviated to blinfo) subsystem is an extension of the *Retention System* which allows for reading shared data from a bootloader and allowing applications to query it. It has an optional feature of organising the information retrieved from the bootloader and storing it in the *Settings* with the `blinfo/` prefix.

Devicetree setup To use the bootloader information subsystem, a retention area needs to be created which has a retained data section as its parent, generally non-init RAM is used for this purpose. See the following example (examples in this guide are based on the nrf52840dk_nrf52840 board and memory layout):

```
/ {
        sram@2003F000 {
                compatible = "zephyr,memory-region", "mmio-sram";
                reg = <0x2003F000 DT_SIZE_K(1)>;
                zephyr,memory-region = "RetainedMem";
                status = "okay";

                retainedmem {
                        compatible = "zephyr,retained-ram";
                        status = "okay";
                        #address-cells = <1>;
                        #size-cells = <1>;

                        boot_info0: boot_info@0 {
                                compatible = "zephyr,retention";
                                status = "okay";
                                reg = <0x0 0x100>;
                        };
                };
        };

        chosen {
                zephyr,bootloader-info = &boot_info0;
        };
};

/* Reduce SRAM0 usage by 1KB to account for non-init area */
&sram0 {
        reg = <0x20000000 DT_SIZE_K(255)>;
};
```

Note that this configuration needs to be applied on both the bootloader (MCUboot) and application to be usable. It can be combined with other retention system APIs such as the *Boot mode*

MCUboot setup Once the above devicetree configuration is applied, MCUboot needs to be configured to store the shared data in this area, the following Kconfigs need to be set for this:

- `CONFIG_RETAINED_MEM` - Enables retained memory driver
- `CONFIG_RETENTION` - Enables retention system
- `CONFIG_BOOT_SHARE_DATA` - Enables shared data
- `CONFIG_BOOT_SHARE_DATA_BOOTINFO` - Enables boot information shared data type
- `CONFIG_BOOT_SHARE_BACKEND_RETENTION` - Stores shared data using retention/blinfo subsystem

Application setup The application must enable the following base Kconfig options for the bootloader information subsystem to function:

- CONFIG_RETAINED_MEM
- CONFIG_RETENTION
- CONFIG_RETENTION_BOOTLOADER_INFO
- CONFIG_RETENTION_BOOTLOADER_INFO_TYPE_MCUBOOT

The following include is needed to use the bootloader information subsystem:

```
#include <zephyr/retention/blinfo.h>
```

By default, only the lookup function is provided: *blinfo_lookup()*, the application can call this to query the information from the bootloader. This function is enabled by default with CONFIG_RETENTION_BOOTLOADER_INFO_OUTPUT_FUNCTION, however, applications can optionally choose to use the settings storage feature instead. In this mode, the bootloader information can be queries by using settings keys, the following Kconfig options need to be enabled for this mode:

- CONFIG_SETTINGS
- CONFIG_SETTINGS_RUNTIME
- CONFIG_RETENTION_BOOTLOADER_INFO_OUTPUT_SETTINGS

This allows the information to be queried via the *settings_runtime_get()* function with the following keys:

- blinfo/mode The mode that MCUboot is configured for (enum mcuboot_mode value)
- blinfo/signature_type The signature type MCUboot is configured for (enum mcuboot_signature_type value)
- blinfo/recovery The recovery type enabled in MCUboot (enum mcuboot_recovery_mode value)
- blinfo/running_slot The running slot, useful for direct-XIP mode to know which slot to use for an update
- blinfo/bootloader_version Version of the bootloader (struct image_version object)
- blinfo/max_application_size Maximum size of an application (in bytes) that can be loaded

In addition to the previous include, the following includes are required for this mode:

```
#include <bootutil/boot_status.h>
#include <bootutil/image.h>
#include <zephyr/mcuboot_version.h>
#include <zephyr/settings/settings.h>
```

API Reference

Bootloader information API

group **bootloader_info_interface**

Bootloader info interface.

Since
3.5

Version
0.1.0

Functions

int `blinfo_lookup`(uint16_t key, char *val, int val_len_max)
Returns bootinfo information.

Parameters

- `key` – The information to return (for MCUboot: minor TLV).
- `val` – Where the return information will be placed.
- `val_len_max` – The maximum size of the provided buffer.

Return values

- `>=` – 0 If successful (contains length of read value)
- `-EOVERFLOW` – If the data is too large to fit the supplied buffer.
- `-EIO` – If the requested key was not found.
- `-errno` – Error code.

4.31.5 API Reference

Retention system API

group `retention_api`
Retention API.

Since
3.4

Version
0.1.0

Typedefs

typedef ssize_t (*`retention_size_api`)(const struct *device* *dev)

typedef int (*`retention_is_valid_api`)(const struct *device* *dev)

typedef int (*`retention_read_api`)(const struct *device* *dev, off_t offset, uint8_t *buffer, size_t size)

typedef int (*`retention_write_api`)(const struct *device* *dev, off_t offset, const uint8_t *buffer, size_t size)

typedef int (*`retention_clear_api`)(const struct *device* *dev)

Functions

ssize_t `retention_size`(const struct *device* *dev)

Returns the size of the retention area.

Parameters

- `dev` – Retention device to use.

Return values

`Positive` – value indicating size in bytes on success, else negative errno code.

int `retention_is_valid`(const struct *device* *dev)

Checks if the underlying data in the retention area is valid or not.

Parameters

- `dev` – Retention device to use.

Return values

- `1` – If successful and data is valid.
- `0` – If data is not valid.
- `-ENOTSUP` – If there is no header/checksum configured for the retention area.
- `-errno` – Error code code.

int `retention_read`(const struct *device* *dev, off_t offset, uint8_t *buffer, size_t size)

Reads data from the retention area.

Parameters

- `dev` – Retention device to use.
- `offset` – Offset to read data from.
- `buffer` – Buffer to store read data in.
- `size` – Size of data to read.

Return values

- `0` – If successful.
- `-errno` – Error code code.

int `retention_write`(const struct *device* *dev, off_t offset, const uint8_t *buffer, size_t size)

Writes data to the retention area (underlying data does not need to be cleared prior to writing), once function returns with a success code, the data will be classed as valid if queried using *retention_is_valid()*.

Parameters

- `dev` – Retention device to use.
- `offset` – Offset to write data to.
- `buffer` – Data to write.
- `size` – Size of data to be written.

Return values

`0` – on success else negative errno code.

int `retention_clear`(const struct *device* *dev)

Clears all data in the retention area (sets it to 0)

Parameters

- `dev` – Retention device to use.

Return values

`0` – on success else negative errno code.

struct `retention_api`

#include <retention.h>

Boot mode interface

group `boot_mode_interface`

Boot mode interface.

Enums

enum `BOOT_MODE_TYPES`

Values:

enumerator `BOOT_MODE_TYPE_NORMAL` = 0x00

Default (normal) boot, to user application.

enumerator `BOOT_MODE_TYPE_BOOTLOADER`

Bootloader boot mode (e.g.

serial recovery for MCUboot)

Functions

int `bootmode_check`(uint8_t boot_mode)

Checks if the boot mode of the device is set to a specific value.

Parameters

- `boot_mode` – Expected boot mode to check.

Return values

- `1` – If successful and boot mode matches.
- `0` – If boot mode does not match.
- `-errno` – Error code code.

int `bootmode_set`(uint8_t boot_mode)

Sets boot mode of device.

Parameters

- `boot_mode` – Boot mode value to set.

Return values

- `0` – If successful.

- `-errno` – Error code code.

int `bootmode_clear`(void)

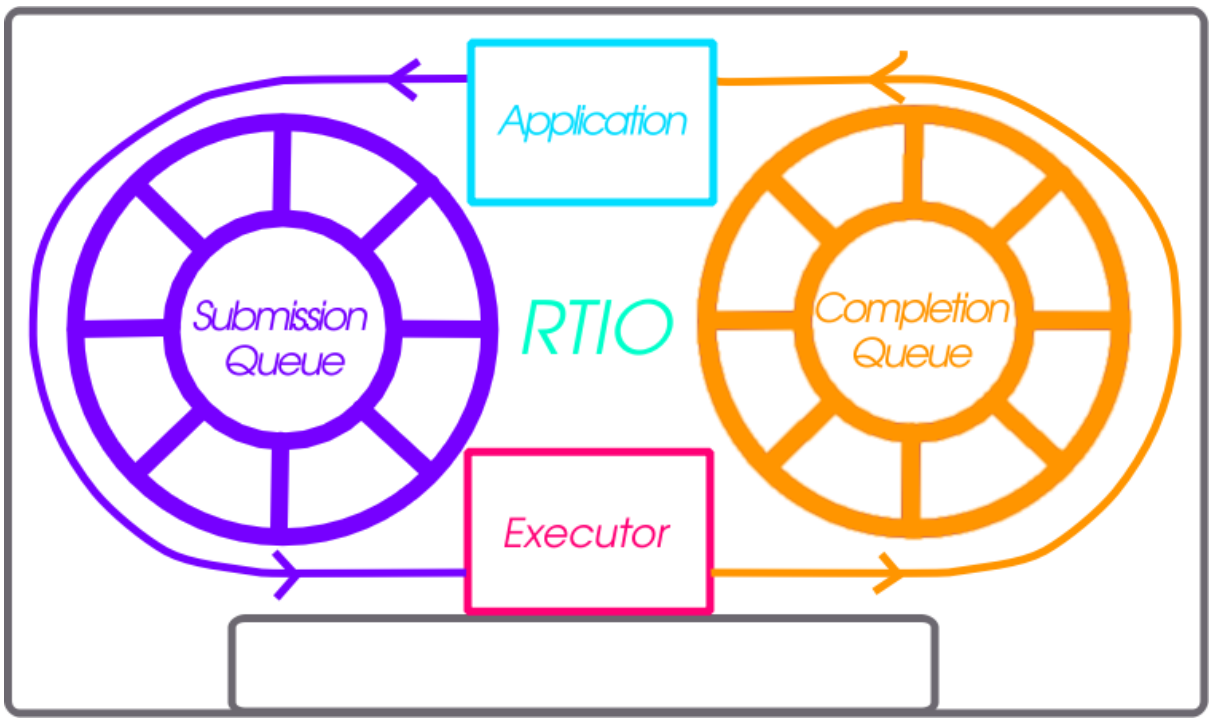
Clear boot mode value (sets to 0) - which corresponds to *BOOT_MODE_TYPE_NORMAL*.

Return values

- `0` – If successful.
- `-errno` – Error code code.

4.32 Real Time I/O (RTIO)

- *Problem*
- *Inspiration, introducing io_uring*
- *Submission Queue*
- *Completion Queue*
- *Executor*
- *IO Device*
- *Cancellation*
- *Memory pools*
- *When to Use*
- *API Reference*



RTIO provides a framework for doing asynchronous operation chains with event driven I/O. This section covers the RTIO API, queues, executor, iodev, and common usage patterns with peripheral devices.

RTIO takes a lot of inspiration from Linux's io_uring in its operations and API as that API matches up well with hardware transfer queues and descriptions such as DMA transfer lists.

4.32.1 Problem

An application wishing to do complex DMA or interrupt driven operations today in Zephyr requires direct knowledge of the hardware and how it works. There is no understanding in the DMA API of other Zephyr devices and how they relate.

This means doing complex audio, video, or sensor streaming requires direct hardware knowledge or leaky abstractions over DMA controllers. Neither is ideal.

To enable asynchronous operations, especially with DMA, a description of what to do rather than direct operations through C and callbacks is needed. Enabling DMA features such as channels with priority, and sequences of transfers requires more than a simple list of descriptions.

Using DMA and/or interrupt driven I/O shouldn't dictate whether or not the call is blocking or not.

4.32.2 Inspiration, introducing io_uring

It's better not to reinvent the wheel (or ring in this case) and io_uring as an API from the Linux kernel provides a winning model. In io_uring there are two lock-free ring buffers acting as queues shared between the kernel and a userland application. One queue for submission entries which may be chained and flushed to create concurrent sequential requests. A second queue for completion queue events. Only a single syscall is actually required to execute many operations, the io_uring_submit call. This call may block the caller when a number of operations to wait on is given.

This model maps well to DMA and interrupt driven transfers. A request to do a sequence of operations in an asynchronous way directly relates to the way hardware typically works with interrupt driven state machines potentially involving multiple peripheral IPs like bus and DMA controllers.

4.32.3 Submission Queue

The submission queue (sq), is the description of the operations to perform in concurrent chains.

For example imagine a typical SPI transfer where you wish to write a register address to then read from. So the sequence of operations might be...

1. Chip Select
2. Clock Enable
3. Write register address into SPI transmit register
4. Read from the SPI receive register into a buffer
5. Disable clock
6. Disable Chip Select

If anything in this chain of operations fails give up. Some of those operations can be embodied in a device abstraction that understands a read or write implicitly means setup the clock and chip select. The transactional nature of the request also needs to be embodied in some manner. Of the operations above perhaps the read could be done using DMA as its large enough make sense. That requires an understanding of how to setup the device's particular DMA to do so.

The above sequence of operations is embodied in RTIO as chain of submission queue entries (sqe). Chaining is done by setting a bitflag in an sqe to signify the next sqe must wait on the current one.

Because the chip select and clocking is common to a particular SPI controller and device on the bus it is embodied in what RTIO calls an iodev.

Multiple operations against the same iodev are done in the order provided as soon as possible. If two operation chains have varying points using the same device its possible one chain will have to wait for another to complete.

4.32.4 Completion Queue

In order to know when a sqe has completed there is a completion queue (cq) with completion queue events (cqe). A sqe once completed results in a cqe being pushed into the cq. The ordering of cqe may not be the same order of sqe. A chain of sqe will however ensure ordering and failure cascading.

Other potential schemes are possible but a completion queue is a well trod idea with io_uring and other similar operating system APIs.

4.32.5 Executor

The RTIO executor is a low overhead concurrent I/O task scheduler. It ensures certain request flags provide the expected behavior. It takes a list of submissions working through them in order. Various flags allow for changing the behavior of how submissions are worked through. Flags to form in order chains of submissions, transactional sets of submissions, or create multi-shot (continuously producing) requests are all possible!

4.32.6 IO Device

Turning submission queue entries (sqe) into completion queue events (cqe) is the job of objects implementing the iodev (IO device) API. This API accepts requests in the form of the iodev submit API call. It is the io devices job to work through its internal queue of submissions and convert them into completions. In effect every io device can be viewed as an independent, event driven actor like object, that accepts a never ending queue of I/O like requests. How the iodev does this work is up to the author of the iodev, perhaps the entire queue of operations can be converted to a set of DMA transfer descriptors, meaning the hardware does almost all of the real work.

4.32.7 Cancellation

Canceling an already queued operation is possible but not guaranteed. If the SQE has not yet started, it's likely that a call to *rtio_sqe_cancel()* will remove the SQE and never run it. If, however, the SQE already started running, the cancel request will be ignored.

4.32.8 Memory pools

In some cases requests to read may not know how much data will be produced. Alternatively, a reader might be handling data from multiple io devices where the frequency of the data is unpredictable. In these cases it may be wasteful to bind memory to in flight read requests. Instead with memory pools the memory to read into is left to the iodev to allocate from a memory pool associated with the RTIO context that the read was associated with. To create such an RTIO context the *RTIO_DEFINE_WITH_MEMPOOL* can be used. It allows creating an RTIO context with a

dedicated pool of "memory blocks" which can be consumed by the iodev. Below is a snippet setting up the RTIO context with a memory pool. The memory pool has 128 blocks, each block has the size of 16 bytes, and the data is 4 byte aligned.

```
#include <zephyr/rtio/rtio.h>

#define SQ_SIZE       4
#define CQ_SIZE       4
#define MEM_BLK_COUNT 128
#define MEM_BLK_SIZE  16
#define MEM_BLK_ALIGN 4

RTIO_DEFINE_WITH_MEMPOOL(rtio_context,
    SQ_SIZE, CQ_SIZE, MEM_BLK_COUNT, MEM_BLK_SIZE, MEM_BLK_ALIGN);
```

When a read is needed, the caller simply needs to replace the call *rtio_sqe_prep_read()* (which takes a pointer to a buffer and a length) with a call to *rtio_sqe_prep_read_with_pool()*. The iodev requires only a small change which works with both pre-allocated data buffers as well as the mempool. When the read is ready, instead of getting the buffers directly from the *rtio_iodev_sqe*, the iodev should get the buffer and count by calling *rtio_sqe_rx_buf()* like so:

```
uint8_t *buf;
uint32_t buf_len;
int rc = rtio_sqe_rx_buff(iodev_sqe, MIN_BUF_LEN, DESIRED_BUF_LEN, &buf, &buf_len);

if (rc != 0) {
  LOG_ERR("Failed to get buffer of at least %u bytes", MIN_BUF_LEN);
  return;
}
```

Finally, the consumer will be able to access the allocated buffer via *rtio_cqe_get_mempool_buffer()*.

```
uint8_t *buf;
uint32_t buf_len;
int rc = rtio_cqe_get_mempool_buffer(&rtio_context, &cqe, &buf, &buf_len);

if (rc != 0) {
  LOG_ERR("Failed to get mempool buffer");
  return rc;
}

/* Release the cqe events (note that the buffer is not released yet */
rtio_cqe_release_all(&rtio_context);

/* Do something with the memory */

/* Release the mempool buffer */
rtio_release_buffer(&rtio_context, buf);
```

4.32.9 When to Use

RTIO is useful in cases where concurrent or batch like I/O flows are useful.

From the driver/hardware perspective the API enables batching of I/O requests, potentially in an optimal way. Many requests to the same SPI peripheral for example might be translated to hardware command queues or DMA transfer descriptors entirely. Meaning the hardware can potentially do more than ever.

There is a small cost to each RTIO context and iodev. This cost could be weighed against using a thread for each concurrent I/O operation or custom queues and threads per peripheral. RTIO is much lower cost than that.

4.32.10 API Reference

group `rtio`

RTIO.

Since
3.2

Version
0.1.0

Defines

`RTIO_IODEV_I2C_STOP`

Equivalent to the I2C_MSG_STOP flag.

`RTIO_IODEV_I2C_RESTART`

Equivalent to the I2C_MSG_RESTART flag.

`RTIO_IODEV_I2C_10_BITS`

Equivalent to the I2C_MSG_ADDR_10_BITS.

`RTIO_OP_NOP`

An operation that does nothing and will complete immediately.

`RTIO_OP_RX`

An operation that receives (reads)

`RTIO_OP_TX`

An operation that transmits (writes)

`RTIO_OP_TINY_TX`

An operation that transmits tiny writes by copying the data to write.

`RTIO_OP_CALLBACK`

An operation that calls a given function (callback)

`RTIO_OP_TXRX`

An operation that transceives (reads and writes simultaneously)

`RTIO_OP_I2C_RECOVER`

An operation to recover I2C buses.

RTIO_OP_I2C_CONFIGURE

An operation to configure I2C buses.

RTIO_IODEV_DEFINE(name, iodev_api, iodev_data)

Statically define and initialize an RTIO IODev.

Parameters

- **name** – Name of the iodev
- **iodev_api** – Pointer to struct *rtio_iodev_api*
- **iodev_data** – Data pointer

RTIO_BMEM

Allocate to bss if available.

If CONFIG_USERSPACE is selected, allocate to the rtio_partition bss. Maps to: K_APP_BMEM(rtio_partition) static

If CONFIG_USERSPACE is disabled, allocate as plain static: static

RTIO_DMEM

Allocate as initialized memory if available.

If CONFIG_USERSPACE is selected, allocate to the rtio_partition init. Maps to: K_APP_DMEM(rtio_partition) static

If CONFIG_USERSPACE is disabled, allocate as plain static: static

RTIO_DEFINE(name, sq_sz, cq_sz)

Statically define and initialize an RTIO context.

Parameters

- **name** – Name of the RTIO
- **sq_sz** – Size of the submission queue entry pool
- **cq_sz** – Size of the completion queue entry pool

RTIO_DEFINE_WITH_MEMPOOL(name, sq_sz, cq_sz, num_blks, blk_size, balign)

Statically define and initialize an RTIO context.

Parameters

- **name** – Name of the RTIO
- **sq_sz** – Size of the submission queue, must be power of 2
- **cq_sz** – Size of the completion queue, must be power of 2
- **num_blks** – Number of blocks in the memory pool
- **blk_size** – The number of bytes in each block
- **balign** – The block alignment

Typedefs

typedef void (*rtio_callback_t)(struct *rtio* *r, const struct *rtio_sqe* *sqe, void *arg0)

Callback signature for RTIO_OP_CALLBACK.

Param r
RTIO context being used with the callback

Param sqe
Submission for the callback op

Param arg0
Argument option as part of the sqe

Functions

static inline size_t **rtio_mempool_block_size**(const struct *rtio* *r)

Get the mempool block size of the RTIO context.

Parameters

- **r** – **[in]** The RTIO context

Returns
The size of each block in the context's mempool

Returns
0 if the context doesn't have a mempool

static inline void **rtio_sqe_prep_nop**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, void *userdata)

Prepare a nop (no op) submission.

static inline void **rtio_sqe_prep_read**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, int8_t prio, uint8_t *buf, uint32_t len, void *userdata)

Prepare a read op submission.

static inline void **rtio_sqe_prep_read_with_pool**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, int8_t prio, void *userdata)

Prepare a read op submission with context's mempool.

See also

rtio_sqe_prep_read()

static inline void **rtio_sqe_prep_read_multishot**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, int8_t prio, void *userdata)

static inline void **rtio_sqe_prep_write**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, int8_t prio, uint8_t *buf, uint32_t len, void *userdata)

Prepare a write op submission.

static inline void **rtio_sqe_prep_tiny_write**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, int8_t prio, const uint8_t *tiny_write_data, uint8_t tiny_write_len, void *userdata)

Prepare a tiny write op submission.

Unlike the normal write operation where the source buffer must outlive the call the tiny write data in this case is copied to the sqe. It must be tiny to fit within the specified size of a *rtio_sqe*.

This is useful in many scenarios with RTL logic where a write of the register to subsequently read must be done.

static inline void **rtio_sqe_prep_callback**(struct *rtio_sqe* *sqe, *rtio_callback_t* callback, void *arg0, void *userdata)

Prepare a callback op submission.

A somewhat special operation in that it may only be done in kernel mode.

Used where general purpose logic is required in a queue of io operations to do transforms or logic.

static inline void **rtio_sqe_prep_transceive**(struct *rtio_sqe* *sqe, const struct *rtio_iodev* *iodev, int8_t prio, uint8_t *tx_buf, uint8_t *rx_buf, uint32_t buf_len, void *userdata)

Prepare a transceive op submission.

static inline struct *rtio_iodev_sqe* ***rtio_sqe_pool_alloc**(struct *rtio_sqe_pool* *pool)

static inline void **rtio_sqe_pool_free**(struct *rtio_sqe_pool* *pool, struct *rtio_iodev_sqe* *iodev_sqe)

static inline struct *rtio_cqe* ***rtio_cqe_pool_alloc**(struct *rtio_cqe_pool* *pool)

static inline void **rtio_cqe_pool_free**(struct *rtio_cqe_pool* *pool, struct *rtio_cqe* *cqe)

static inline int **rtio_block_pool_alloc**(struct *rtio* *r, size_t min_sz, size_t max_sz, uint8_t **buf, uint32_t *buf_len)

static inline void **rtio_block_pool_free**(struct *rtio* *r, void *buf, uint32_t buf_len)

static inline uint32_t **rtio_sqe_acquirable**(struct *rtio* *r)

Count of acquirable submission queue events.

Parameters

- **r** – RTIO context

Returns

Count of acquirable submission queue events

static inline struct *rtio_iodev_sqe* ***rtio_txn_next**(const struct *rtio_iodev_sqe* *iodev_sqe)

Get the next sqe in the transaction.

Parameters

- **iodev_sqe** – Submission queue entry

Return values

- **NULL** – if current sqe is last in transaction
- **struct** – *rtio_sqe* * if available

static inline struct *rtio_iodev_sqe* ***rtio_chain_next**(const struct *rtio_iodev_sqe* *iodev_sqe)

Get the next sqe in the chain.

Parameters

- **iodev_sqe** – Submission queue entry

Return values

- **NULL** – if current sqe is last in chain
- **struct** – *rtio_sqe* * if available

static inline struct *rtio_iodev_sqe* ***rtio_iodev_sqe_next**(const struct *rtio_iodev_sqe* *iodev_sqe)

Get the next sqe in the chain or transaction.

Parameters

- **iodev_sqe** – Submission queue entry

Return values

- **NULL** – if current sqe is last in chain
- **struct** – *rtio_iodev_sqe* * if available

static inline struct *rtio_sqe* ***rtio_sqe_acquire**(struct *rtio* *r)

Acquire a single submission queue event if available.

Parameters

- **r** – RTIO context

Return values

- **sqe** – A valid submission queue event acquired from the submission queue
- **NULL** – No subsmission queue event available

static inline void **rtio_sqe_drop_all**(struct *rtio* *r)

Drop all previously acquired sqe.

Parameters

- **r** – RTIO context

static inline struct *rtio_cqe* ***rtio_cqe_acquire**(struct *rtio* *r)

Acquire a complete queue event if available.

static inline void **rtio_cqe_produce**(struct *rtio* *r, struct *rtio_cqe* *cqe)

Produce a complete queue event if available.

static inline struct *rtio_cqe* ***rtio_cqe_consume**(struct *rtio* *r)

Consume a single completion queue event if available.

If a completion queue event is returned rtio_cq_release(r) must be called at some point to release the cqe spot for the cqe producer.

Parameters

- **r** – RTIO context

Return values

- **cqe** – A valid completion queue event consumed from the completion queue
- **NULL** – No completion queue event available

static inline struct *rtio_cqe* ***rtio_cqe_consume_block**(struct *rtio* *r)

Wait for and consume a single completion queue event.

If a completion queue event is returned rtio_cq_release(r) must be called at some point to release the cqe spot for the cqe producer.

Parameters

- **r** – RTIO context

Return values

cqe – A valid completion queue event consumed from the completion queue

static inline void **rtio_cqe_release**(struct *rtio* *r, struct *rtio_cqe* *cqe)

Release consumed completion queue event.

Parameters

- **r** – RTIO context
- **cqe** – Completion queue entry

static inline uint32_t **rtio_cqe_compute_flags**(struct *rtio_iodev_sqe* *iodev_sqe)

Compute the CQE flags from the *rtio_iodev_sqe* entry.

Parameters

- **iodev_sqe** – The SQE entry in question.

Returns

The value that should be set for the CQE's flags field.

int **rtio_cqe_get_mempool_buffer**(const struct *rtio* *r, struct *rtio_cqe* *cqe, uint8_t **buff, uint32_t *buff_len)

Retrieve the mempool buffer that was allocated for the CQE.

If the RTIO context contains a memory pool, and the SQE was created by calling rtio_sqe_read_with_pool(), this function can be used to retrieve the memory associated with the read. Once processing is done, it should be released by calling *rtio_release_buffer()*.

Parameters

- **r** – **[in]** RTIO context
- **cqe** – **[in]** The CQE handling the event.
- **buff** – **[out]** Pointer to the mempool buffer
- **buff_len** – **[out]** Length of the allocated buffer

Returns

0 on success

Returns

-EINVAL if the buffer wasn't allocated for this cqe

Returns

-ENOTSUP if memory blocks are disabled

void **rtio_executor_submit**(struct *rtio* *r)

void **rtio_executor_ok**(struct *rtio_iodev_sqe* *iodev_sqe, int result)

void **rtio_executor_err**(struct *rtio_iodev_sqe* *iodev_sqe, int result)

static inline void **rtio_iodev_sqe_ok**(struct *rtio_iodev_sqe* *iodev_sqe, int result)

Inform the executor of a submission completion with success.

This may start the next asynchronous request if one is available.

Parameters

- **iodev_sqe** – IODev Submission that has succeeded
- **result** – Result of the request

static inline void **rtio_iodev_sqe_err**(struct *rtio_iodev_sqe* *iodev_sqe, int result)

Inform the executor of a submissions completion with error.

This SHALL fail the remaining submissions in the chain.

Parameters

- **iodev_sqe** – Submission that has failed
- **result** – Result of the request

static inline void **rtio_cqe_submit**(struct *rtio* *r, int result, void *userdata, uint32_t flags)

Submit a completion queue event with a given result and userdata.

Called by the executor to produce a completion queue event, no inherent locking is performed and this is not safe to do from multiple callers.

Parameters

- **r** – RTIO context
- **result** – Integer result code (could be -errno)
- **userdata** – Userdata to pass along to completion
- **flags** – Flags to use for the CEQ see RTIO_CQE_FLAG_*

static inline int **rtio_sqe_rx_buf**(const struct *rtio_iodev_sqe* *iodev_sqe, uint32_t min_buf_len, uint32_t max_buf_len, uint8_t **buf, uint32_t *buf_len)

Get the buffer associate with the RX submission.

Parameters

- **iodev_sqe** – **[in]** The submission to probe
- **min_buf_len** – **[in]** The minimum number of bytes needed for the operation
- **max_buf_len** – **[in]** The maximum number of bytes needed for the operation
- **buf** – **[out]** Where to store the pointer to the buffer
- **buf_len** – **[out]** Where to store the size of the buffer

Returns

0 if `buf` and `buf_len` were successfully filled

Returns

-ENOMEM Not enough memory for `min_buf_len`

void **rtio_release_buffer**(struct *rtio* *r, void *buff, uint32_t buff_len)

Release memory that was allocated by the RTIO's memory pool.

If the RTIO context was created by a call to *RTIO_DEFINE_WITH_MEMPOOL()*, then the cqe data might contain a buffer that's owned by the RTIO context. In those cases (if the read request was configured via rtio_sqe_read_with_pool()) the buffer must be returned back to the pool.

Call this function when processing is complete. This function will validate that the memory actually belongs to the RTIO context and will ignore invalid arguments.

Parameters

- **r** – RTIO context
- **buff** – Pointer to the buffer to be released.
- **buff_len** – Number of bytes to free (will be rounded up to nearest memory block).

static inline void **rtio_access_grant**(struct *rtio* *r, struct *k_thread* *t)

Grant access to an RTIO context to a user thread.

int `rtio_sqe_cancel`(struct *rtio_sqe* *sqe)

Attempt to cancel an SQE.

If possible (not currently executing), cancel an SQE and generate a failure with -ECANCELED result.

Parameters

- `sqe` – **[in]** The SQE to cancel

Returns
0 if the SQE was flagged for cancellation

Returns
<0 on error

int `rtio_sqe_copy_in_get_handles`(struct *rtio* *r, const struct *rtio_sqe* *sqes, struct *rtio_sqe* **handle, size_t sqe_count)

Copy an array of SQEs into the queue and get resulting handles back.

Copies one or more SQEs into the RTIO context and optionally returns their generated SQE handles. Handles can be used to cancel events via the *rtio_sqe_cancel()* call.

Parameters

- `r` – **[in]** RTIO context
- `sqes` – **[in]** Pointer to an array of SQEs
- `handle` – **[out]** Optional pointer to *rtio_sqe* pointer to store the handle of the first generated SQE. Use NULL to ignore.
- `sqe_count` – **[in]** Count of sqes in array

Return values

- `0` – success
- `-ENOMEM` – not enough room in the queue

static inline int `rtio_sqe_copy_in`(struct *rtio* *r, const struct *rtio_sqe* *sqes, size_t sqe_count)

Copy an array of SQEs into the queue.

Useful if a batch of submissions is stored in ROM or RTIO is used from user mode where a copy must be made.

Partial copying is not done as chained SQEs need to be submitted as a whole set.

Parameters

- `r` – RTIO context
- `sqes` – Pointer to an array of SQEs
- `sqe_count` – Count of sqes in array

Return values

- `0` – success
- `-ENOMEM` – not enough room in the queue

int `rtio_cqe_copy_out`(struct *rtio* *r, struct *rtio_cqe* *cqes, size_t cqe_count, *k_timeout_t* timeout)

Copy an array of CQEs from the queue.

Copies from the RTIO context and its queue completion queue events, waiting for the given time period to gather the number of completions requested.

Parameters

- **r** – RTIO context
- **cqes** – Pointer to an array of SQEs
- **cqe_count** – Count of sqes in array
- **timeout** – Timeout to wait for each completion event. Total wait time is potentially timeout*cqe_count at maximum.

Return values

copy_count – Count of copied CQEs (0 to cqe_count)

int **rtio_submit**(struct *rtio* *r, uint32_t wait_count)

Submit I/O requests to the underlying executor.

Submits the queue of submission queue events to the executor. The executor will do the work of managing tasks representing each submission chain, freeing submission queue events when done, and producing completion queue events as submissions are completed.

Parameters

- **r** – RTIO context
- **wait_count** – Number of submissions to wait for completion of.

Return values

0 – On success

Variables

struct *k_mem_partition* **rtio_partition**

The memory partition associated with all RTIO context information.

struct **rtio_sqe**

#include <rtio.h> A submission queue event.

Public Members

uint8_t **op**

Op code.

uint8_t **prio**

Op priority.

uint16_t **flags**

Op Flags.

uint16_t **iodev_flags**

Op iodev flags.

const struct *rtio_iodev* ***iodev**

Device to operation on.

void *userdata

User provided data which is returned upon operation completion.

Could be a pointer or integer.

If unique identification of completions is desired this should be unique as well.

uint32_t buf_len

Length of buffer.

uint8_t *buf

Buffer to use.

uint8_t tiny_buf_len

Length of tiny buffer.

uint8_t tiny_buf[7]

Tiny buffer.

void *arg0

Last argument given to callback.

uint32_t i2c_config

OP_I2C_CONFIGURE.

struct rtio_cqe

#include <rtio.h> A completion queue event.

Public Members

int32_t result

Result from operation.

void *userdata

Associated userdata with operation.

uint32_t flags

Flags associated with the operation.

struct rtio_sqe_pool

#include <rtio.h>

struct rtio_cqe_pool

#include <rtio.h>

struct rtio

#include <rtio.h> An RTIO context containing what can be viewed as a pair of queues.

A queue for submissions (available and in queue to be produced) as well as a queue of completions (available and ready to be consumed).

The rtio executor along with any objects implementing the *rtio_iodev* interface are the consumers of submissions and producers of completions.

No work is started until *rtio_submit()* is called.

struct **rtio_iodev_sqe**

#include <*rtio.h*> Compute the mempool block index for a given pointer.

IO device submission queue entry

May be cast safely to and from a *rtio_sqe* as they occupy the same memory provided by the pool

Param r
[in] RTIO context

Param ptr
[in] Memory pointer in the mempool

Return
Index of the mempool block associated with the pointer. Or UINT16_MAX if invalid.

struct **rtio_iodev_api**

#include <*rtio.h*> API that an RTIO IO device should implement.

Public Members

void (***submit**)(struct *rtio_iodev_sqe* *iodev_sqe)

Submit to the iodev an entry to work on.

This call should be short in duration and most likely either enqueue or kick off an entry with the hardware.

Param iodev_sqe
Submission queue entry

struct **rtio_iodev**

#include <*rtio.h*> An IO device with a function table for submitting requests.

4.33 Zephyr bus (zbus)

The *Zephyr bus - zbus* is a lightweight and flexible software bus enabling a simple way for threads to talk to one another in a many-to-many way.

- *Concepts*
  - *Virtual Distributed Event Dispatcher*
  - *Limitations*
- *Usage*
  - *Publishing to a channel*
  - *Reading from a channel*

  - *Notifying a channel*
  - *Declaring channels and observers*
  - *Iterating over channels and observers*
  - *Advanced channel control*
- *Samples*
- *Suggested Uses*
- *Configuration Options*
- *API Reference*

4.33.1 Concepts

Threads can send messages to one or more observers using zbus. It makes the many-to-many communication possible. The bus implements message-passing and publish/subscribe communication paradigms that enable threads to communicate synchronously or asynchronously through shared memory.

The communication through zbus is channel-based. Threads (or callbacks) use channels to exchange messages. Additionally, besides other actions, threads can publish and observe channels. When a thread publishes a message on a channel, the bus will make the message available to all the published channel's observers. Based on the observer's type, it can access the message directly, receive a copy of it, or even receive only a reference of the published channel.

The figure below shows an example of a typical application using zbus in which the application logic (hardware independent) talks to other threads via software bus. Note that the threads are decoupled from each other because they only use zbus channels and do not need to know each other to talk.

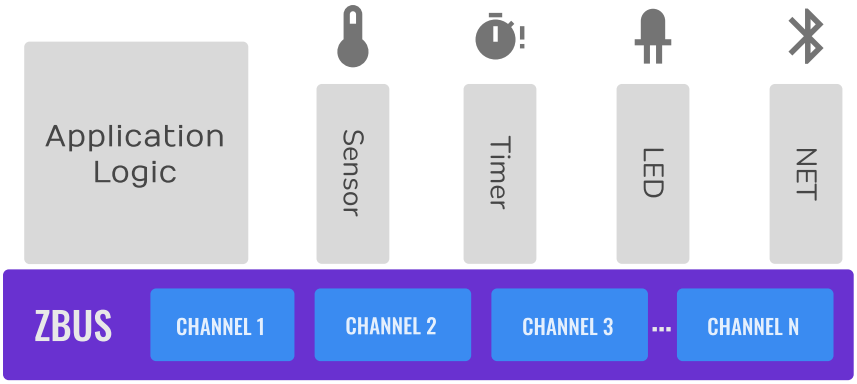


Fig. 25: A typical zbus application architecture.

The bus comprises:

- Set of channels that consists of the control metadata information, and the message itself;
- *Virtual Distributed Event Dispatcher* (VDED), the bus logic responsible for sending notifications/messages to the observers. The VDED logic runs inside the publishing action in the same thread context, giving the bus an idea of a distributed execution. When a thread publishes to a channel, it also propagates the notifications to the observers;
- Threads (subscribers and message subscribers) and callbacks (listeners) publishing, reading, and receiving notifications from the bus.

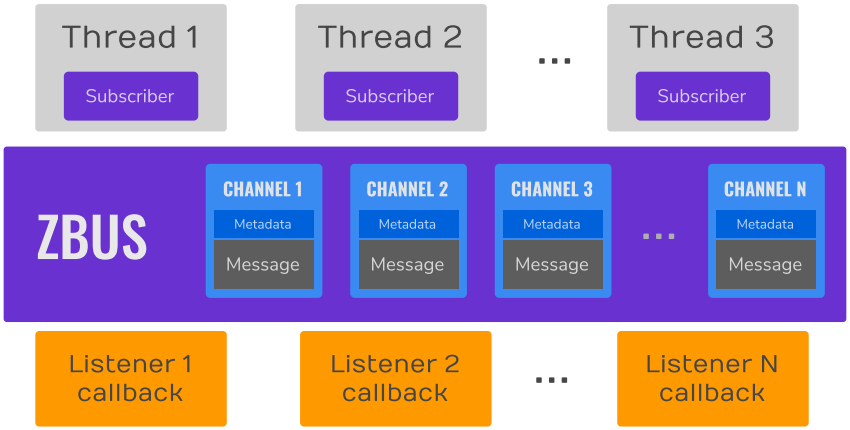

Fig. 26: ZBus anatomy.

The bus makes the publish, read, claim, finish, notify, and subscribe actions available over channels. Publishing, reading, claiming, and finishing are available in all RTOS thread contexts, including ISRs. The publish and read operations are simple and fast; the procedure is channel locking followed by a memory copy to and from a shared memory region and then a channel unlocking. Another essential aspect of zbus is the observers. There are three types of observers:

Fig. 27: ZBus observers.

- Listeners, a callback that the event dispatcher executes every time an observed channel is published or notified;
- Subscriber, a thread-based observer that relies internally on a message queue where the event dispatcher puts a changed channel's reference every time an observed channel is published or notified. Note this kind of observer does not receive the message itself. It should read the message from the channel after receiving the notification;
- Message subscribers, a thread-based observer that relies internally on a FIFO where the event dispatcher puts a copy of the message every time an observed channel is published or notified.

Channel observation structures define the relationship between a channel and its observers. For every observation, a pair channel/observer. Developers can statically allocate observation using the *ZBUS_CHAN_DEFINE* or *ZBUS_CHAN_ADD_OBS*. There are also runtime observers, enabling developers to create runtime observations. It is possible to disable an observer entirely or observations individually. The event dispatcher will ignore disabled observers and observations.

The above figure illustrates some states, from (a) to (d), for channels from `C1` to `C5`, `Subscriber 1`, and the observations. The last two are in orange to indicate they are dynamically allocated (runtime observation). (a) shows that the observer and all observations are enabled. (b) shows the observer is disabled, so the event dispatcher will ignore it. (c) shows the observer enabled. However, there is one static observervation disabled. The event dispatcher will only stop sending notifications from channel `C3`. In (d), the event dispatcher will stop sending notifications from channels `C3` and `C5` to `Subscriber 1`.

Suppose a usual sensor-based solution is in the figure below for illustration purposes. When triggered, the timer publishes to the `Trigger` channel. As the sensor thread subscribed to the `Trigger` channel, it receives the sensor data. Notice the VDED executes the `Blink` because it also listens to the `Trigger` channel. When the sensor data is ready, the sensor thread publishes it to the `Sensor data` channel. The core thread receives the message as a `Sensor data` channel message subscriber, processes the sensor data, and stores it in an internal sample buffer. It repeats until the sample buffer is full; when it happens, the core thread aggregates the sample buffer

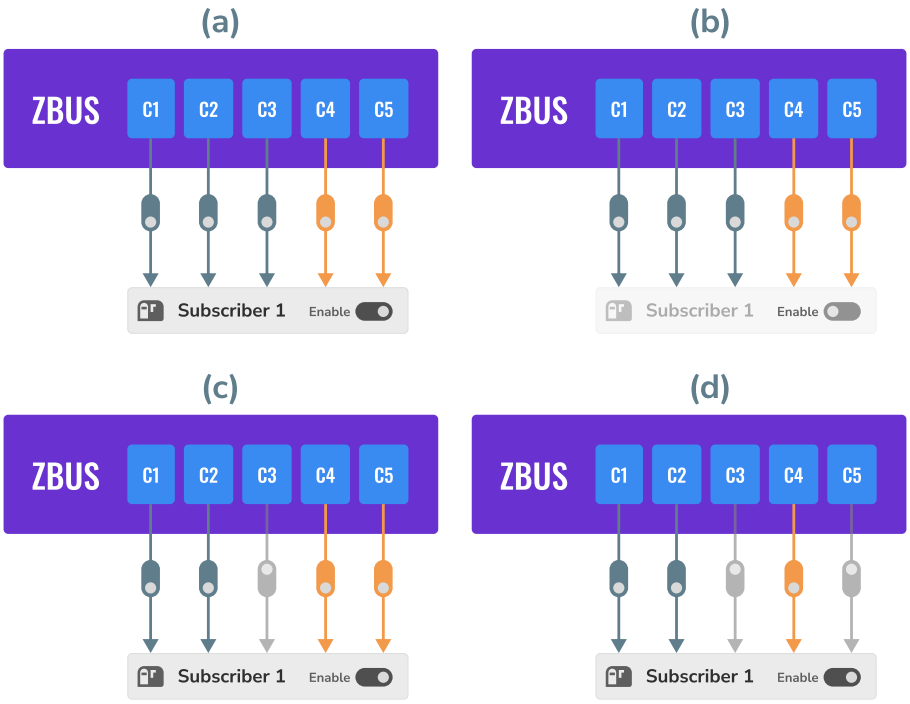

Fig. 28: ZBus observation mask.

information, prepares a package, and publishes that to the `Payload` channel. The Lora thread receives that because it is a `Payload` channel message subscriber and sends the payload to the cloud. When it completes the transmission, the Lora thread publishes to the `Transmission done` channel. The VDED executes the `Blink` again since it listens to the `Transmission done` channel.

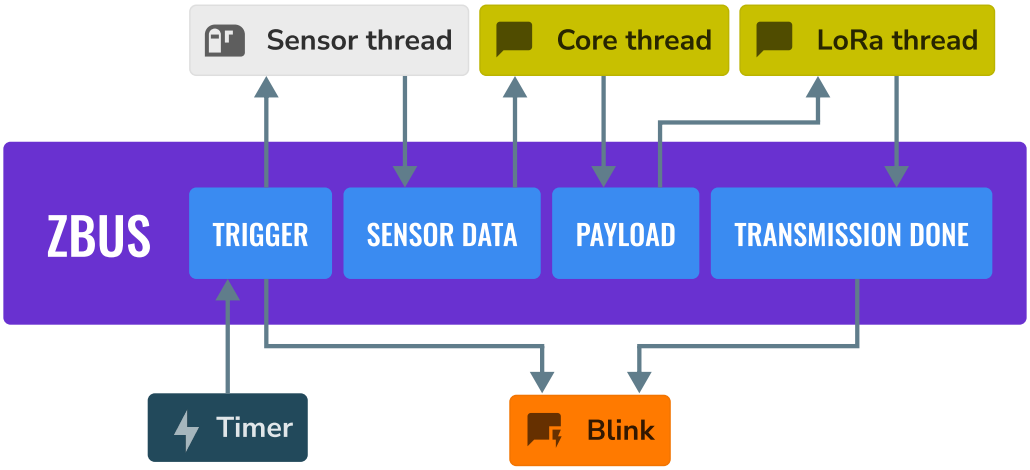

Fig. 29: ZBus sensor-based application.

This way of implementing the solution makes the application more flexible, enabling us to change things independently. For example, we want to change the trigger from a timer to a button press. We can do that, and the change does not affect other parts of the system. Likewise, we would like to change the communication interface from LoRa to Bluetooth; we only need to change the LoRa thread. No other change is required in order to make that work. Thus, the developer would do that for every block of the image. Based on that, there is a sign zbus promotes decoupling in the system architecture.

Another important aspect of using zbus is the reuse of system modules. If a code portion with well-defined behaviors (we call that module) only uses zbus channels and not hardware interfaces, it can easily be reused in other solutions. The new solution must implement the interfaces

(set of channels) the module needs to work. That indicates zbus could improve the module reuse.

The last important note is the zbus solution reach. We can count on many ways of using zbus to enable the developer to be as free as possible to create what they need. For example, messages can be dynamic or static allocated; notifications can be synchronous or asynchronous; the developer can control the channel in so many different ways claiming the channel, developers can add their metadata information to a channel by using the user-data field, the discretionary use of a validator enables the systems to be accurate over message format, and so on. Those characteristics increase the solutions that can be done with zbus and make it a good fit as an open-source community tool.

Virtual Distributed Event Dispatcher

The VDED execution always happens in the publisher's context. It can be a thread or an ISR. Be careful with publications inside ISR because the scheduler won't preempt the VDED. Use that wisely. The basic description of the execution is as follows:

- The channel lock is acquired;
- The channel receives the new message via direct copy (by a raw `memcpy()`);
- The event dispatcher logic executes the listeners, sends a copy of the message to the message subscribers, and pushes the channel's reference to the subscribers' notification message queue in the same sequence they appear on the channel observers' list. The listeners can perform non-copy quick access to the constant message reference directly (via the *zbus_chan_const_msg()* function) since the channel is still locked;
- At last, the publishing function unlocks the channel.

To illustrate the VDED execution, consider the example illustrated below. We have four threads in ascending priority `S1`, `MS2`, `MS1`, and `T1` (the highest priority); two listeners, `L1` and `L2`; and channel A. Supposing `L1`, `L2`, `MS1`, `MS2`, and `S1` observer channel A.

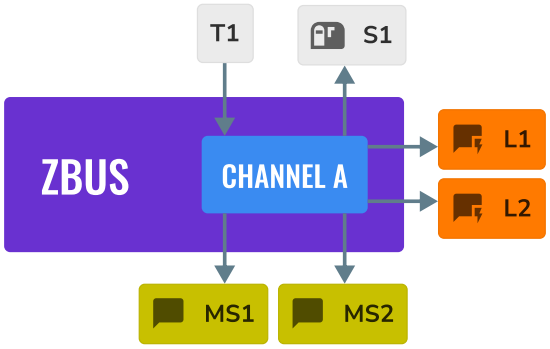

Fig. 30: ZBus VDED execution example scenario.

The following code implements channel A. Note the `struct a_msg` is illustrative only.

```
ZBUS_CHAN_DEFINE(a_chan,                        /* Name */
         struct a_msg,                          /* Message type */

         NULL,                                  /* Validator */
         NULL,                                  /* User Data */
         ZBUS_OBSERVERS(L1, L2, MS1, MS2, S1), /* observers */
         ZBUS_MSG_INIT(0)                       /* Initial value {0} */
);
```

In the figure below, the letters indicate some action related to the VDED execution. The X-axis represents the time, and the Y-axis represents the priority of threads. Channel A's message, represented by a voice balloon, is only one memory portion (shared memory). It appears several times only as an illustration of the message at that point in time.

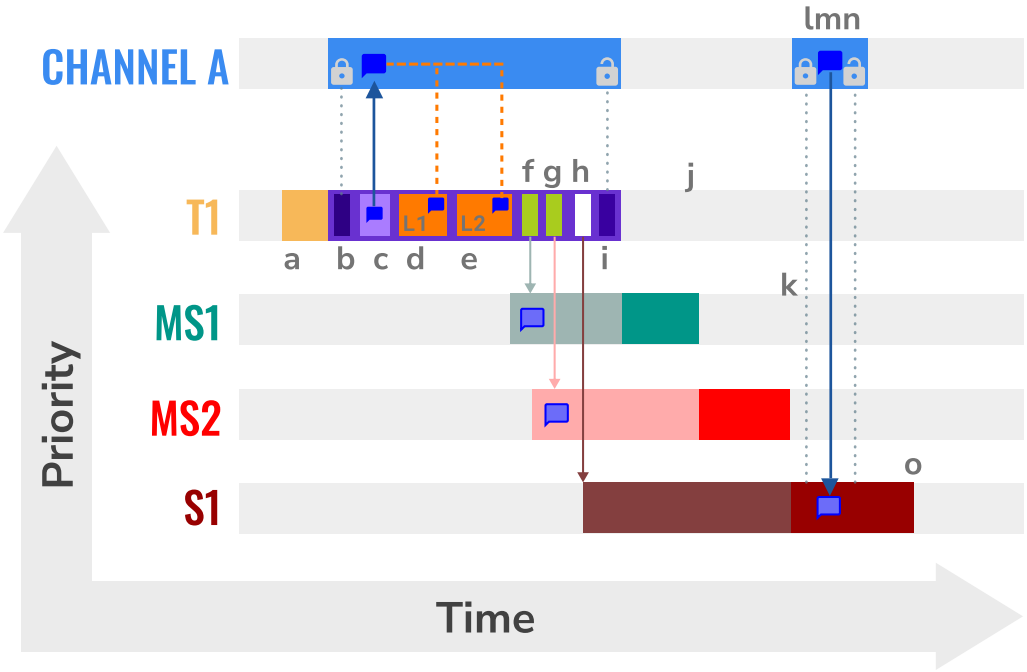

Fig. 31: ZBus VDED execution detail for priority T1 > MS1 > MS2 > S1.

The figure above illustrates the actions performed during the VDED execution when T1 publishes to channel A. Thus, the table below describes the activities (represented by a letter) of the VDED execution. The scenario considers the following priorities: T1 > MS1 > MS2 > S1. T1 has the highest priority.

Table 65: VDED execution steps in detail for priority T1 > MS1 > MS2 > S1.

Actions	Description
a	T1 starts and, at some point, publishes to channel A.
b	The publishing (VDED) process starts. The VDED locks the channel A.
c	The VDED copies the T1 message to the channel A message.
d, e	The VDED executes L1 and L2 in the respective sequence. Inside the listeners, usually, there is a call to the `zbus_chan_const_msg()` function, which provides a direct constant reference to channel A's message. It is quick, and no copy is needed here.
f, g	The VDED copies the message and sends that to MS1 and MS2 sequentially. Notice the threads get ready to execute right after receiving the notification. However, they go to a pending state because they have less priority than T1.
h	The VDED pushes the notification message to the queue of S1. Notice the thread gets ready to execute right after receiving the notification. However, it goes to a pending state because it cannot access the channel since it is still locked.
i	VDED finishes the publishing by unlocking channel A. The MS1 leaves the pending state and starts executing.
j	MS1 finishes execution. The MS2 leaves the pending state and starts executing.
k	MS2 finishes execution. The S1 leaves the pending state and starts executing.
l, m, n	The S1 leaves the pending state since channel A is not locked. It gets in the CPU again and starts executing. As it did receive a notification from channel A, it performed a channel read (as simple as lock, memory copy, unlock), continues its execution and goes out of the CPU.
o	S1 finishes its workload.

The figure below illustrates the actions performed during the VDED execution when T1 publishes

to channel A. The scenario considers the following priorities: T1 < MS1 < MS2 < S1.

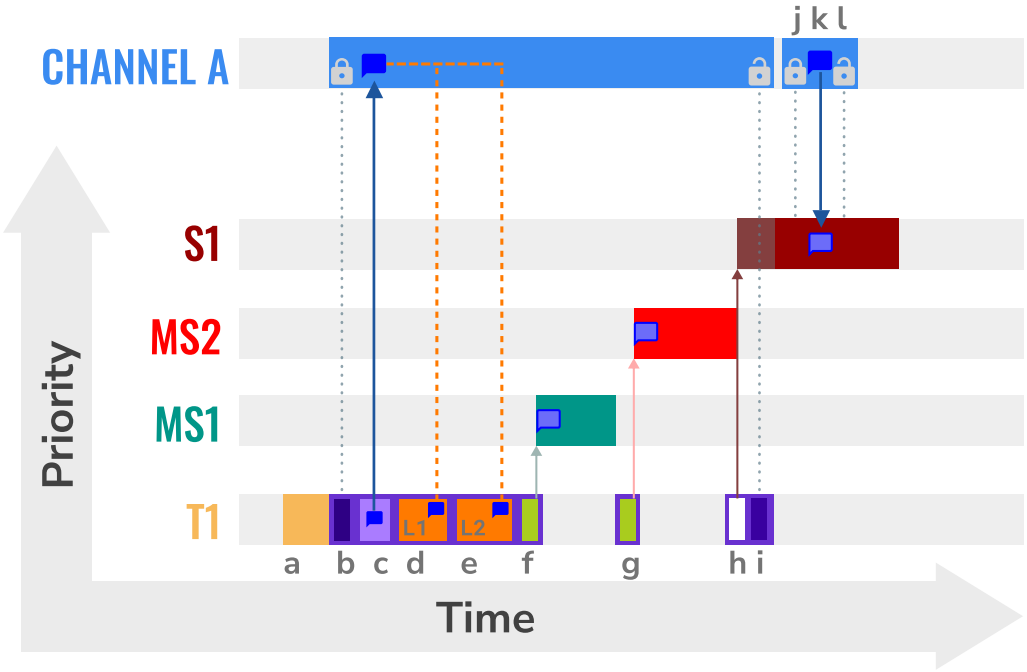

Fig. 32: ZBus VDED execution detail for priority T1 < MS1 < MS2 < S1.

Thus, the table below describes the activities (represented by a letter) of the VDED execution.

Table 66: VDED execution steps in detail for priority T1 < MS1 < MS2 < S1.

Actions	Description
a	T1 starts and, at some point, publishes to channel A.
b	The publishing (VDED) process starts. The VDED locks the channel A.
c	The VDED copies the T1 message to the channel A message.
d, e	The VDED executes L1 and L2 in the respective sequence. Inside the listeners, usually, there is a call to the `zbus_chan_const_msg()` function, which provides a direct constant reference to channel A's message. It is quick, and no copy is needed here.
f	The VDED copies the message and sends that to MS1. MS1 preempts T1 and starts working. After that, the T1 regain MCU.
g	The VDED copies the message and sends that to MS2. MS2 preempts T1 and starts working. After that, the T1 regain MCU.
h	The VDED pushes the notification message to the queue of S1.
i	VDED finishes the publishing by unlocking channel A.
j, k, l	The S1 leaves the pending state since channel A is not locked. It gets in the CPU again and starts executing. As it did receive a notification from channel A, it performs a channel read (as simple as lock, memory copy, unlock), continues its execution, and goes out the CPU.

HLP priority boost ZBus implements the Highest Locker Protocol that relies on the observers' thread priority to determine a temporary publisher priority. The protocol considers the channel's Highest Observer Priority (HOP); even if the observer is not waiting for a message on the channel, it is considered in the calculation. The VDED will elevate the publisher's priority based on the HOP to ensure small latency and as few preemptions as possible.

Note

The priority boost is enabled by default. To deactivate it, you must set the CONFIG_ZBUS_PRIORITY_BOOST configuration.

Warning

ZBus priority boost does not consider runtime observers on the HOP calculations.

The figure below illustrates the actions performed during the VDED execution when T1 publishes to channel A. The scenario considers the priority boost feature and the following priorities: T1 < MS1 < MS2 < S1.

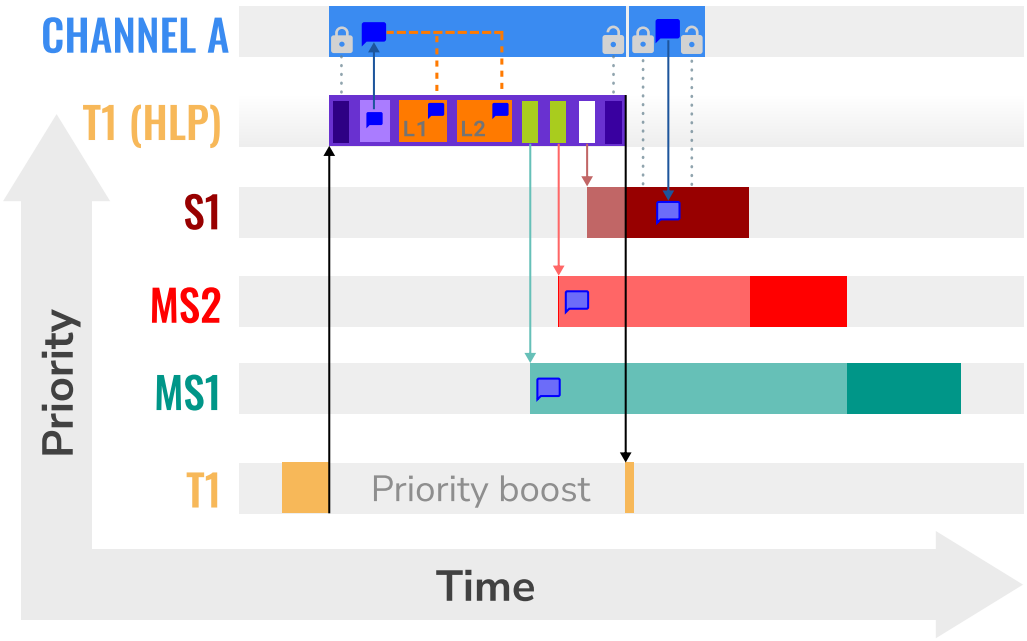

Fig. 33: ZBus VDED execution detail with priority boost enabled and for priority T1 < MS1 < MS2 < S1.

To properly use the priority boost, attaching the observer to a thread is necessary. When the subscriber is attached to a thread, it assumes its priority, and the priority boost algorithm will consider the observer's priority. The following code illustrates the thread-attaching function.

```
ZBUS_SUBSCRIBER_DEFINE(s1, 4);
void s1_thread(void *ptr1, void *ptr2, void *ptr3)
{
        ARG_UNUSED(ptr1);
        ARG_UNUSED(ptr2);
        ARG_UNUSED(ptr3);

        const struct zbus_channel *chan;

        zbus_obs_attach_to_thread(&s1);

        while (1) {
                zbus_sub_wait(&s1, &chan, K_FOREVER);
```

(continues on next page)

(continued from previous page)

```
                /* Subscriber implementation */

        }
}
K_THREAD_DEFINE(s1_id, CONFIG_MAIN_STACK_SIZE, s1_thread, NULL, NULL, NULL, 2, 0, 0);
```

On the above code, the *zbus_obs_attach_to_thread()* will set the s1 observer with priority two as the thread has that priority. It is possible to reverse that by detaching the observer using the *zbus_obs_detach_from_thread()*. Only enabled observers and observations will be considered on the channel HOP calculation. Masking a specific observation of a channel will affect the channel HOP.

In summary, the benefits of the feature are:

- The HLP is more effective for zbus than the mutexes priority inheritance;
- No bounded priority inversion will happen among the publisher and the observers;
- No other threads (that are not involved in the communication) with priority between T1 and S1 can preempt T1, avoiding unbounded priority inversion;
- Message subscribers will wait for the VDED to finish the message delivery process. So the VDED execution will be faster and more consistent;
- The HLP priority is dynamic and can change in execution;
- ZBus operations can be used inside ISRs;
- The priority boosting feature can be turned off, and plain semaphores can be used as the channel lock mechanism;
- The Highest Locker Protocol's major disadvantage, the Inheritance-related Priority Inversion, is acceptable in the zbus scenario since it will ensure a small bus latency.

Limitations

Based on the fact that developers can use zbus to solve many different problems, some challenges arise. ZBus will not solve every problem, so it is necessary to analyze the situation to be sure zbus is applicable. For instance, based on the zbus benchmark, it would not be well suited to a high-speed stream of bytes between threads. The *Pipe* kernel object solves this kind of need.

Delivery guarantees ZBus always delivers the messages to the listeners and message subscribers. However, there are no message delivery guarantees for subscribers because zbus only sends the notification, but the message reading depends on the subscriber's implementation. It is possible to increase the delivery rate by following design tips:

- Keep the listeners quick-as-possible (deal with them as ISRs). If some processing is needed, consider submitting a work item to a work-queue;
- Try to give producers a high priority to avoid losses;
- Leave spare CPU for observers to consume data produced;
- Consider using message queues or pipes for intensive byte transfers.

Warning

ZBus uses include/zephyr/net/buf.h (network buffers) to exchange data with message subscribers. Thus, choose carefully the configurations CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_POOL_SIZE and CONFIG_HEAP_MEM_POOL_SIZE. They

are crucial to a proper VDED execution (delivery guarantee) considering message subscribers. If you want to keep an isolated pool for a specific set of channels, you can use CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_POOL_ISOLATION with a dedicated pool. Look at the zbus-msg-subscriber to see the isolation in action.

Warning

Subscribers will receive only the reference of the changing channel. A data loss may be perceived if the channel is published twice before the subscriber reads it. The second publication overwrites the value from the first. Thus, the subscriber will receive two notifications, but only the last data is there.

Message delivery sequence The message delivery will follow the precedence:

1. Observers defined in a channel using the *ZBUS_CHAN_DEFINE* (following the definition sequence);
2. Observers defined using the *ZBUS_CHAN_ADD_OBS* based on the sequence priority (parameter of the macro);
3. The latest is the runtime observers in the addition sequence using the *zbus_chan_add_obs()*.

Note

The VDED will ignore all disabled observers or observations.

4.33.2 Usage

ZBus operation depends on channels and observers. Therefore, it is necessary to determine its message and observers list during the channel definition. A message is a regular C struct; the observer can be a subscriber (asynchronous), a message subscriber (asynchronous), or a listener (synchronous).

The following code defines and initializes a regular channel and its dependencies. This channel exchanges accelerometer data, for example.

```
struct acc_msg {
        int x;
        int y;
        int z;
};

ZBUS_CHAN_DEFINE(acc_chan,                              /* Name */
         struct acc_msg,                                /* Message type */

         NULL,                                          /* Validator */
         NULL,                                          /* User Data */
         ZBUS_OBSERVERS(my_listener, my_subscriber,
                        my_msg_subscriber),             /* observers */
         ZBUS_MSG_INIT(.x = 0, .y = 0, .z = 0)          /* Initial value */
);

void listener_callback_example(const struct zbus_channel *chan)
{
```

(continues on next page)

(continued from previous page)

```
        const struct acc_msg *acc;
        if (&acc_chan == chan) {
                acc = zbus_chan_const_msg(chan); // Direct message access
                LOG_DBG("From listener -> Acc x=%d, y=%d, z=%d", acc->x, acc->y, acc->z);
        }
}

ZBUS_LISTENER_DEFINE(my_listener, listener_callback_example);

ZBUS_LISTENER_DEFINE(my_listener2, listener_callback_example);

ZBUS_CHAN_ADD_OBS(acc_chan, my_listener2, 3);

ZBUS_SUBSCRIBER_DEFINE(my_subscriber, 4);
void subscriber_task(void)
{
        const struct zbus_channel *chan;

        while (!zbus_sub_wait(&my_subscriber, &chan, K_FOREVER)) {
                struct acc_msg acc = {0};

                if (&acc_chan == chan) {
                        // Indirect message access
                        zbus_chan_read(&acc_chan, &acc, K_NO_WAIT);
                        LOG_DBG("From subscriber -> Acc x=%d, y=%d, z=%d", acc.x, acc.y,␣
↪acc.z);
                }
        }
}
K_THREAD_DEFINE(subscriber_task_id, 512, subscriber_task, NULL, NULL, NULL, 3, 0, 0);

ZBUS_MSG_SUBSCRIBER_DEFINE(my_msg_subscriber);
static void msg_subscriber_task(void *ptr1, void *ptr2, void *ptr3)
{
        ARG_UNUSED(ptr1);
        ARG_UNUSED(ptr2);
        ARG_UNUSED(ptr3);
        const struct zbus_channel *chan;

        struct acc_msg acc = {0};

        while (!zbus_sub_wait_msg(&my_msg_subscriber, &chan, &acc, K_FOREVER)) {
                if (&acc_chan == chan) {
                        LOG_INF("From msg subscriber -> Acc x=%d, y=%d, z=%d", acc.x, acc.y,
↪ acc.z);
                }
        }
}
K_THREAD_DEFINE(msg_subscriber_task_id, 1024, msg_subscriber_task, NULL, NULL, NULL, 3, 0,␣
↪0);
```

It is possible to add static observers to a channel using the *ZBUS_CHAN_ADD_OBS*. We call that a post-definition static observer. The command enables us to indicate an initialization priority that affects the observers' initialization order. The sequence priority param only affects the post-definition static observers. There is no possibility to overwrite the message delivery sequence of the static observers.

Note

It is unnecessary to claim/lock a channel before accessing the message inside the listener since

the event dispatcher calls listeners with the notifying channel already locked. Subscribers, however, must claim/lock that or use regular read operations to access the message after being notified.

Channels can have a *validator function* that enables a channel to accept only valid messages. Publish attempts invalidated by hard channels will return immediately with an error code. This allows original creators of a channel to exert some authority over other developers/publishers who may want to piggy-back on their channels. The following code defines and initializes a *hard channel* and its dependencies. Only valid messages can be published to a *hard channel*. It is possible because a *validator function* was passed to the channel's definition. In this example, only messages with `move` equal to 0, -1, and 1 are valid. Publish function will discard all other values to `move`.

```
struct control_msg {
        int move;
};

bool control_validator(const void* msg, size_t msg_size) {
        const struct control_msg* cm = msg;
        bool is_valid = (cm->move == -1) || (cm->move == 0) || (cm->move == 1);
        return is_valid;
}

static int message_count = 0;

ZBUS_CHAN_DEFINE(control_chan,    /* Name */
         struct control_msg,      /* Message type */

         control_validator,       /* Validator */
         &message_count,          /* User data */
         ZBUS_OBSERVERS_EMPTY,    /* observers */
         ZBUS_MSG_INIT(.move = 0) /* Initial value */
);
```

The following sections describe in detail how to use zbus features.

Publishing to a channel

Messages are published to a channel in zbus by calling *zbus_chan_pub()*. For example, the following code builds on the examples above and publishes to channel `acc_chan`. The code is trying to publish the message `acc1` to channel `acc_chan`, and it will wait up to one second for the message to be published. Otherwise, the operation fails. As can be inferred from the code sample, it's OK to use stack allocated messages since VDED copies the data internally.

```
struct acc_msg acc1 = {.x = 1, .y = 1, .z = 1};
zbus_chan_pub(&acc_chan, &acc1, K_SECONDS(1));
```

Warning

Only use this function inside an ISR with a *K_NO_WAIT* timeout.

Reading from a channel

Messages are read from a channel in zbus by calling *zbus_chan_read()*. So, for example, the following code tries to read the channel `acc_chan`, which will wait up to 500 milliseconds to read the message. Otherwise, the operation fails.

```
struct acc_msg acc = {0};
zbus_chan_read(&acc_chan, &acc, K_MSEC(500));
```

Warning

Only use this function inside an ISR with a *K_NO_WAIT* timeout.

Warning

Choose the timeout of *zbus_chan_read()* after receiving a notification from *zbus_sub_wait()* carefully because the channel will always be unavailable during the VDED execution. Using K_NO_WAIT for reading is highly likely to return a timeout error if there are more than one subscriber. For example, consider the VDED illustration again and notice how S1 read attempts would definitely fail with K_NO_WAIT. For more details, check the *Virtual Distributed Event Dispatcher* section.

Notifying a channel

It is possible to force zbus to notify a channel's observers by calling *zbus_chan_notify()*. For example, the following code builds on the examples above and forces a notification for the channel acc_chan. Note this can send events with no message, which does not require any data exchange. See the code example under *Claim and finish a channel* where this may become useful.

```
zbus_chan_notify(&acc_chan, K_NO_WAIT);
```

Warning

Only use this function inside an ISR with a *K_NO_WAIT* timeout.

Declaring channels and observers

For accessing channels or observers from files other than its defining files, it is necessary to declare them by calling *ZBUS_CHAN_DECLARE* and *ZBUS_OBS_DECLARE*. In other words, zbus channel definitions and declarations with the same channel names in different files would point to the same (global) channel. Thus, developers should be careful about existing channels, and naming new channels or linking will fail. It is possible to declare more than one channel or observer on the same call. The following code builds on the examples above and displays the defined channels and observers.

```
ZBUS_OBS_DECLARE(my_listener, my_subscriber);
ZBUS_CHAN_DECLARE(acc_chan, version_chan);
```

Iterating over channels and observers

ZBus subsystem also implements *Iterable Sections* for channels and observers, for which there are supporting APIs like *zbus_iterate_over_channels()*, *zbus_iterate_over_channels_with_user_data()*, *zbus_iterate_over_observers()* and *zbus_iterate_over_observers_with_user_data()*. This feature enables developers to call a procedure over all declared channels, where the procedure parameter is a *zbus_channel*.

The execution sequence is in the alphabetical name order of the channels (see *Iterable Sections* documentation for details). ZBus also implements this feature for *zbus_observer*.

```
static bool print_channel_data_iterator(const struct zbus_channel *chan, void *user_data)
{
	int *count = user_data;

	LOG_INF("%d - Channel %s:", *count, zbus_chan_name(chan));
	LOG_INF("	Message size: %d", zbus_chan_msg_size(chan));
	LOG_INF("	Observers:");

	++(*count);

	struct zbus_channel_observation *observation;

	for (int16_t i = *chan->observers_start_idx, limit = *chan->observers_end_idx; i <␣
↪limit;
		++i) {
		STRUCT_SECTION_GET(zbus_channel_observation, i, &observation);

		LOG_INF("	- %s", observation->obs->name);
	}

	struct zbus_observer_node *obs_nd, *tmp;

	SYS_SLIST_FOR_EACH_CONTAINER_SAFE(chan->observers, obs_nd, tmp, node) {
		LOG_INF("	- %s", obs_nd->obs->name);
	}

	return true;
}

static bool print_observer_data_iterator(const struct zbus_observer *obs, void *user_data)
{
	int *count = user_data;

	LOG_INF("%d - %s %s", *count, obs->queue ? "Subscriber" : "Listener", zbus_obs_
↪name(obs));

	++(*count);

	return true;
}

int main(void)
{
	int count = 0;

	LOG_INF("Channel list:");

	zbus_iterate_over_channels_with_user_data(print_channel_data_iterator, &count);

	count = 0;

	LOG_INF("Observers list:");

	zbus_iterate_over_observers_with_user_data(print_observer_data_iterator, &count);

	return 0;
}
```

The code will log the following output:

```
D: Channel list:
D: 0 - Channel acc_chan:
D:       Message size: 12
D:       Observers:
D:       - my_listener
D:       - my_subscriber
D: 1 - Channel version_chan:
D:       Message size: 4
D:       Observers:
D: Observers list:
D: 0 - Listener my_listener
D: 1 - Subscriber my_subscriber
```

Advanced channel control

ZBus was designed to be as flexible and extensible as possible. Thus, there are some features designed to provide some control and extensibility to the bus.

Listeners message access For performance purposes, listeners can access the receiving channel message directly since they already have the channel locked for it. To access the channel's message, the listener should use the *zbus_chan_const_msg()* because the channel passed as an argument to the listener function is a constant pointer to the channel. The const pointer return type tells developers not to modify the message.

```
void listener_callback_example(const struct zbus_channel *chan)
{
        const struct acc_msg *acc;
        if (&acc_chan == chan) {
                acc = zbus_chan_const_msg(chan); // Use this
                // instead of zbus_chan_read(chan, &acc, K_MSEC(200))
                // or zbus_chan_msg(chan)

                LOG_DBG("From listener -> Acc x=%d, y=%d, z=%d", acc->x, acc->y, acc->z);
        }
}
```

User Data It is possible to pass custom data into the channel's `user_data` for various purposes, such as writing channel metadata. That can be achieved by passing a pointer to the channel definition macro's `user_data` field, which will then be accessible by others. Note that `user_data` is individual for each channel. Also, note that `user_data` access is not thread-safe. For thread-safe access to `user_data`, see the next section.

Claim and finish a channel To take more control over channels, two functions were added *zbus_chan_claim()* and *zbus_chan_finish()*. With these functions, it is possible to access the channel's metadata safely. When a channel is claimed, no actions are available to that channel. After finishing the channel, all the actions are available again.

Warning

Never change the fields of the channel struct directly. It may cause zbus behavior inconsistencies and scheduling issues.

Warning

Only use this function inside an ISR with a *K_NO_WAIT* timeout.

The following code builds on the examples above and claims the acc_chan to set the user_data to the channel. Suppose we would like to count how many times the channels exchange messages. We defined the user_data to have the 32 bits integer. This code could be added to the listener code described above.

```
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
        int *message_counting = (int *) zbus_chan_user_data(&acc_chan);
        *message_counting += 1;
        zbus_chan_finish(&acc_chan);
}
```

The following code has the exact behavior of the code in *Publishing to a channel*.

```
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
        struct acc_msg *acc1 = (struct acc_msg *) zbus_chan_msg(&acc_chan);
        acc1.x = 1;
        acc1.y = 1;
        acc1.z = 1;
        zbus_chan_finish(&acc_chan);
        zbus_chan_notify(&acc_chan, K_SECONDS(1));
}
```

The following code has the exact behavior of the code in *Reading from a channel*.

```
if (!zbus_chan_claim(&acc_chan, K_MSEC(200))) {
        const struct acc_msg *acc1 = (const struct acc_msg *) zbus_chan_const_msg(&acc_
↪chan);
        // access the acc_msg fields directly.
        zbus_chan_finish(&acc_chan);
}
```

Runtime observer registration It is possible to add observers to channels in runtime. This feature uses the heap to allocate the nodes dynamically. The heap size limits the number of dynamic observers zbus can create. Therefore, set the CONFIG_ZBUS_RUNTIME_OBSERVERS to enable the feature. It is possible to adjust the heap size by changing the configuration CONFIG_HEAP_MEM_POOL_SIZE. The following example illustrates the runtime registration usage.

```
ZBUS_LISTENER_DEFINE(my_listener, callback);
// ...
void thread_entry(void) {
        // ...
        /* Adding the observer to channel chan1 */
        zbus_chan_add_obs(&chan1, &my_listener, K_NO_WAIT);
        /* Removing the observer from channel chan1 */
        zbus_chan_rm_obs(&chan1, &my_listener, K_NO_WAIT);
```

4.33.3 Samples

For a complete overview of zbus usage, take a look at the samples. There are the following samples available:

- zbus-hello-world illustrates the code used above in action;

- zbus-work-queue shows how to define and use different kinds of observers. Note there is an example of using a work queue instead of executing the listener as an execution option;
- zbus-msg-subscriber illustrates how to use message subscribers;
- zbus-dyn-channel demonstrates how to use dynamically allocated exchanging data in zbus;
- zbus-uart-bridge shows an example of sending the operation of the channel to a host via serial;
- zbus-remote-mock illustrates how to implement an external mock (on the host) to send and receive messages to and from the bus;
- zbus-priority-boost illustrates zbus priority boost feature with a priority inversion scenario;
- zbus-runtime-obs-registration illustrates a way of using the runtime observer registration feature;
- zbus-confirmed-channel implements a way of implement confirmed channel only with subscribers;
- zbus-benchmark implements a benchmark with different combinations of inputs.

4.33.4 Suggested Uses

Use zbus to transfer data (messages) between threads in one-to-one, one-to-many, and many-to-many synchronously or asynchronously. Choosing the proper observer type is crucial. Use subscribers for scenarios that can tolerate message losses and duplications; when they cannot, use message subscribers (if you need a thread) or listeners (if you need to be lean and fast). In addition to the listener, another asynchronous message processing mechanism (like *message queues*) may be necessary to retain the pending message until it gets processed.

Note

ZBus can be used to transfer streams from the producer to the consumer. However, this can increase zbus' communication latency. So maybe consider a Pipe a good alternative for this communication topology.

4.33.5 Configuration Options

For enabling zbus, it is necessary to enable the `CONFIG_ZBUS` option.

Related configuration options:

- `CONFIG_ZBUS_PRIORITY_BOOST` zbus Highest Locker Protocol implementation;
- `CONFIG_ZBUS_CHANNELS_SYS_INIT_PRIORITY` determine the `SYS_INIT` priority used by zbus to organize the channels observations by channel;
- `CONFIG_ZBUS_CHANNEL_NAME` enables the name of channels to be available inside the channels metadata. The log uses this information to show the channels' names;
- `CONFIG_ZBUS_OBSERVER_NAME` enables the name of observers to be available inside the channels metadata;
- `CONFIG_ZBUS_MSG_SUBSCRIBER` enables the message subscriber observer type;
- `CONFIG_ZBUS_MSG_SUBSCRIBER_BUF_ALLOC_DYNAMIC` uses the heap to allocate message buffers;
- `CONFIG_ZBUS_MSG_SUBSCRIBER_BUF_ALLOC_STATIC` uses the stack to allocate message buffers;

- CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_POOL_SIZE the available number of message buffers to be used simultaneously;
- CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_POOL_ISOLATION enables the developer to isolate a pool for the message subscriber for a set of channels;
- CONFIG_ZBUS_MSG_SUBSCRIBER_NET_BUF_STATIC_DATA_SIZE the biggest message of zbus channels to be transported into a message buffer;
- CONFIG_ZBUS_RUNTIME_OBSERVERS enables the runtime observer registration.

4.33.6 API Reference

Related code samples

Benchmarking
Measure the time for sending 256KB from a producer to N consumers.

Confirmed channel
Use confirmed zbus channels to ensure all subscribers consume a message.

Dynamic channel
Use zbus channels with dynamically allocated messages.

Message subscriber
Use zbus message subscribers to listen to messages published to channels.

Remote mock sample
Publish to a zbus instance using UART as a bridge.

Runtime observer registration
Use zbus' runtime observer registration to filter data generated by a producer.

UART bridge
Redirect channel events to the host over UART.

Work queue
Use a work queue to process zbus messages in various ways.

zbus Hello World
Make three threads talk to each other using zbus.

zbus Priority Boost
Illustrates zbus priority boost feature with a priority inversion scenario.

group zbus_apis

Zbus API.

Defines

ZBUS_CHAN_ADD_OBS_WITH_MASK(_chan, _obs, _masked, _prio)

Add a static channel observervation.

This macro initializes a channel observation by receiving the channel and the observer.

Parameters

- **_chan** – Channel instance.
- **_obs** – Observer instance.
- **_masked** – Observation state.

- **_prio** – Observer notification sequence priority.

ZBUS_CHAN_ADD_OBS(_chan, _obs, _prio)

Add a static channel observervation.

This macro initializes a channel observation by receiving the channel and the observer.

Parameters

- **_chan** – Channel instance.
- **_obs** – Observer instance.
- **_prio** – Observer notification sequence priority.

ZBUS_OBS_DECLARE(...)

This macro list the observers to be used in a file.

Internally, it declares the observers with the extern statement. Note it is only necessary when the observers are declared outside the file.

ZBUS_CHAN_DECLARE(...)

This macro list the channels to be used in a file.

Internally, it declares the channels with the extern statement. Note it is only necessary when the channels are declared outside the file.

ZBUS_OBSERVERS_EMPTY

This macro indicates the channel has no observers.

ZBUS_OBSERVERS(...)

This macro indicates the channel has listed observers.

Note the sequence of observer notification will follow the same as listed.

ZBUS_CHAN_DEFINE(_name, _type, _validator, _user_data, _observers, _init_val)

Zbus channel definition.

This macro defines a channel.

See also

struct *zbus_channel*

Parameters

- **_name** – The channel's name.
- **_type** – The Message type. It must be a struct or union.
- **_validator** – The validator function.
- **_user_data** – A pointer to the user data.
- **_observers** – The observers list. The sequence indicates the priority of the observer. The first the highest priority.
- **_init_val** – The message initialization.

ZBUS_MSG_INIT(_val, ...)

Initialize a message.

This macro initializes a message by passing the values to initialize the message struct or union.

Parameters

- **_val** – **[in]** Variadic with the initial values. ZBUS_INIT(0) means {0}, as ZBUS_INIT(.a=10, .b=30) means {.a=10, .b=30}.

ZBUS_SUBSCRIBER_DEFINE_WITH_ENABLE(_name, _queue_size, _enable)

Define and initialize a subscriber.

This macro defines an observer of subscriber type. It defines a message queue where the subscriber will receive the notification asynchronously, and initialize the struct *zbus_observer* defining the subscriber.

Parameters

- **_name** – **[in]** The subscriber's name.
- **_queue_size** – **[in]** The notification queue's size.
- **_enable** – **[in]** The subscriber initial enable state.

ZBUS_SUBSCRIBER_DEFINE(_name, _queue_size)

Define and initialize a subscriber.

This macro defines an observer of subscriber type. It defines a message queue where the subscriber will receive the notification asynchronously, and initialize the struct *zbus_observer* defining the subscriber. The subscribers are defined in the enabled state with this macro.

Parameters

- **_name** – **[in]** The subscriber's name.
- **_queue_size** – **[in]** The notification queue's size.

ZBUS_LISTENER_DEFINE_WITH_ENABLE(_name, _cb, _enable)

Define and initialize a listener.

This macro defines an observer of listener type. This macro establishes the callback where the listener will be notified synchronously, and initialize the struct *zbus_observer* defining the listener.

Parameters

- **_name** – **[in]** The listener's name.
- **_cb** – **[in]** The callback function.
- **_enable** – **[in]** The listener initial enable state.

ZBUS_LISTENER_DEFINE(_name, _cb)

Define and initialize a listener.

This macro defines an observer of listener type. This macro establishes the callback where the listener will be notified synchronously and initialize the struct *zbus_observer* defining the listener. The listeners are defined in the enabled state with this macro.

Parameters

- **_name** – **[in]** The listener's name.
- **_cb** – **[in]** The callback function.

ZBUS_MSG_SUBSCRIBER_DEFINE_WITH_ENABLE(_name, _enable)

Define and initialize a message subscriber.

This macro defines an observer of *ZBUS_OBSERVER_SUBSCRIBER_TYPE* type. It defines a FIFO where the subscriber will receive the message asynchronously and initialize the *zbus_observer* defining the subscriber.

Parameters

- **_name** – **[in]** The subscriber's name.
- **_enable** – **[in]** The subscriber's initial state.

ZBUS_MSG_SUBSCRIBER_DEFINE(_name)

Define and initialize an enabled message subscriber.

This macro defines an observer of message subscriber type. It defines a FIFO where the subscriber will receive the message asynchronously and initialize the *zbus_observer* defining the subscriber. The message subscribers are defined in the enabled state with this macro.

Parameters

- **_name** – **[in]** The subscriber's name.

Enums

enum **zbus_observer_type**

Type used to represent an observer type.

A observer can be a listener or a subscriber.

Values:

enumerator **ZBUS_OBSERVER_LISTENER_TYPE**

enumerator **ZBUS_OBSERVER_SUBSCRIBER_TYPE**

enumerator **ZBUS_OBSERVER_MSG_SUBSCRIBER_TYPE**

Functions

int **zbus_chan_pub**(const struct *zbus_channel* *chan, const void *msg, *k_timeout_t* timeout)

Publish to a channel.

This routine publishes a message to a channel.

Parameters

- **chan** – The channel's reference.
- **msg** – Reference to the message where the publish function copies the channel's message data from.
- **timeout** – Waiting period to publish the channel, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- **0** – Channel published.
- **-ENOMSG** – The message is invalid based on the validator function or some of the observers could not receive the notification.
- **-EBUSY** – The channel is busy.
- **-EAGAIN** – Waiting period timed out.

- `-EFAULT` – A parameter is incorrect, the notification could not be sent to one or more observer, or the function context is invalid (inside an ISR). The function only returns this value when the `CONFIG_ZBUS_ASSERT_MOCK` is enabled.

int **zbus_chan_read**(const struct *zbus_channel* *chan, void *msg, *k_timeout_t* timeout)

Read a channel.

This routine reads a message from a channel.

Parameters

- `chan` – **[in]** The channel's reference.
- `msg` – **[out]** Reference to the message where the read function copies the channel's message data to.
- `timeout` – **[in]** Waiting period to read the channel, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- `0` – Channel read.
- `-EBUSY` – The channel is busy.
- `-EAGAIN` – Waiting period timed out.
- `-EFAULT` – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the `CONFIG_ZBUS_ASSERT_MOCK` is enabled.

int **zbus_chan_claim**(const struct *zbus_channel* *chan, *k_timeout_t* timeout)

Claim a channel.

This routine claims a channel. During the claiming period the channel is blocked for publishing, reading, notifying or claiming again. Finishing is the only available action.

Warning

After calling this routine, the channel cannot be used by other thread until the zbus_chan_finish routine is performed.

Warning

This routine should only be called once before a zbus_chan_finish.

Parameters

- `chan` – **[in]** The channel's reference.
- `timeout` – **[in]** Waiting period to claim the channel, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- `0` – Channel claimed.
- `-EBUSY` – The channel is busy.
- `-EAGAIN` – Waiting period timed out.
- `-EFAULT` – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the `CONFIG_ZBUS_ASSERT_MOCK` is enabled.

int **zbus_chan_finish**(const struct *zbus_channel* *chan)

Finish a channel claim.

This routine finishes a channel claim. After calling this routine with success, the channel will be able to be used by other thread.

> **Warning**
>
> This routine must only be used after a zbus_chan_claim.

Parameters

- **chan** – The channel's reference.

Return values

- **0** – Channel finished.
- **-EFAULT** – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int **zbus_chan_notify**(const struct *zbus_channel* *chan, *k_timeout_t* timeout)

Force a channel notification.

This routine forces the event dispatcher to notify the channel's observers even if the message has no changes. Note this function could be useful after claiming/finishing actions.

Parameters

- **chan** – The channel's reference.
- **timeout** – Waiting period to notify the channel, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- **0** – Channel notified.
- **-EBUSY** – The channel's semaphore returned without waiting.
- **-EAGAIN** – Timeout to take the channel's semaphore.
- **-ENOMEM** – There is not more buffer on the messgage buffers pool.
- **-EFAULT** – A parameter is incorrect, the notification could not be sent to one or more observer, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

static inline const char *__zbus_chan_name__(const struct *zbus_channel* *chan)

Get the channel's name.

This routine returns the channel's name reference.

Parameters

- **chan** – The channel's reference.

Returns

Channel's name reference.

static inline void *zbus_chan_msg(const struct *zbus_channel* *chan)

Get the reference for a channel message directly.

This routine returns the reference of a channel message.

> **Warning**
>
> This function must only be used directly for already locked channels. This can be done inside a listener for the receiving channel or after claim a channel.

Parameters

- chan – The channel's reference.

Returns

Channel's message reference.

static inline const void *zbus_chan_const_msg(const struct *zbus_channel* *chan)

Get a constant reference for a channel message directly.

This routine returns a constant reference of a channel message. This should be used inside listeners to access the message directly. In this way zbus prevents the listener of changing the notifying channel's message during the notification process.

> **Warning**
>
> This function must only be used directly for already locked channels. This can be done inside a listener for the receiving channel or after claim a channel.

Parameters

- chan – The channel's constant reference.

Returns

A constant channel's message reference.

static inline uint16_t zbus_chan_msg_size(const struct *zbus_channel* *chan)

Get the channel's message size.

This routine returns the channel's message size.

Parameters

- chan – The channel's reference.

Returns

Channel's message size.

static inline void *zbus_chan_user_data(const struct *zbus_channel* *chan)

Get the channel's user data.

This routine returns the channel's user data.

Parameters

- chan – The channel's reference.

Returns

Channel's user data.

static inline void **zbus_chan_set_msg_sub_pool**(const struct *zbus_channel* *chan, struct *net_buf_pool* *pool)

Set the channel's msg subscriber *net_buf* pool.

Parameters

- **chan** – The channel's reference.
- **pool** – The reference to the *net_buf* memory pool.

int **zbus_chan_add_obs**(const struct *zbus_channel* *chan, const struct *zbus_observer* *obs, *k_timeout_t* timeout)

Add an observer to a channel.

This routine adds an observer to the channel.

Parameters

- **chan** – The channel's reference.
- **obs** – The observer's reference to be added.
- **timeout** – Waiting period to add an observer, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- **0** – Observer added to the channel.
- **-EALREADY** – The observer is already present in the channel's runtime observers list.
- **-ENOMEM** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.
- **-EINVAL** – Some parameter is invalid.

int **zbus_chan_rm_obs**(const struct *zbus_channel* *chan, const struct *zbus_observer* *obs, *k_timeout_t* timeout)

Remove an observer from a channel.

This routine removes an observer to the channel.

Parameters

- **chan** – The channel's reference.
- **obs** – The observer's reference to be removed.
- **timeout** – Waiting period to remove an observer, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- **0** – Observer removed to the channel.
- **-EINVAL** – Invalid data supplied.
- **-EBUSY** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.
- **-ENODATA** – no observer found in channel's runtime observer list.
- **-ENOMEM** – Returned without waiting.

int **zbus_obs_set_enable**(struct *zbus_observer* *obs, bool enabled)

Change the observer state.

This routine changes the observer state. A channel when disabled will not receive notifications from the event dispatcher.

Parameters

- `obs` – **[in]** The observer's reference.
- `enabled` – **[in]** State to be. When false the observer stops to receive notifications.

Return values

- `0` – Observer set enable.
- `-EFAULT` – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the `CONFIG_ZBUS_ASSERT_MOCK` is enabled.

static inline int **zbus_obs_is_enabled**(struct *zbus_observer* *obs, bool *enable)

Get the observer state.

This routine retrieves the observer state.

Parameters

- `obs` – **[in]** The observer's reference.
- `enable` – **[out]** The boolean output's reference.

Returns

Observer state.

int **zbus_obs_set_chan_notification_mask**(const struct *zbus_observer* *obs, const struct *zbus_channel* *chan, bool masked)

Mask notifications from a channel to an observer.

The observer can mask notifications from a specific observing channel by calling this function.

Parameters

- `obs` – The observer's reference to be added.
- `chan` – The channel's reference.
- `masked` – The mask state. When the mask is true, the observer will not receive notifications from the channel.

Return values

- `0` – Channel notifications masked to the observer.
- `-ESRCH` – No observation found for the related pair chan/obs.
- `-EINVAL` – Some parameter is invalid.

int **zbus_obs_is_chan_notification_masked**(const struct *zbus_observer* *obs, const struct *zbus_channel* *chan, bool *masked)

Get the notifications masking state from a channel to an observer.

Parameters

- `obs` – The observer's reference to be added.
- `chan` – The channel's reference.
- `masked` – **[out]** The mask state. When the mask is true, the observer will not receive notifications from the channel.

Return values

- `0` – Retrieved the masked state.
- `-ESRCH` – No observation found for the related pair chan/obs.

- **-EINVAL** – Some parameter is invalid.

static inline const char ***zbus_obs_name**(const struct *zbus_observer* *obs)

Get the observer's name.

This routine returns the observer's name reference.

Parameters

- **obs** – The observer's reference.

Returns

The observer's name reference.

int **zbus_obs_attach_to_thread**(const struct *zbus_observer* *obs)

Set the observer thread priority by attaching it to a thread.

Parameters

- **obs** – **[in]** The observer's reference.

Return values

- **0** – Observer detached from the thread.
- **-EFAULT** – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int **zbus_obs_detach_from_thread**(const struct *zbus_observer* *obs)

Clear the observer thread priority by detaching it from a thread.

Parameters

- **obs** – **[in]** The observer's reference.

Return values

- **0** – Observer detached from the thread.
- **-EFAULT** – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the CONFIG_ZBUS_ASSERT_MOCK is enabled.

int **zbus_sub_wait**(const struct *zbus_observer* *sub, const struct *zbus_channel* **chan, *k_timeout_t* timeout)

Wait for a channel notification.

This routine makes the subscriber to wait a notification. The notification comes as a channel reference.

Parameters

- **sub** – **[in]** The subscriber's reference.
- **chan** – **[out]** The notification channel's reference.
- **timeout** – **[in]** Waiting period for a notification arrival, or one of the special values K_NO_WAIT and K_FOREVER.

Return values

- **0** – Notification received.
- **-ENOMSG** – Returned without waiting.
- **-EAGAIN** – Waiting period timed out.
- **-EINVAL** – The observer is not a subscriber.

- `-EFAULT` – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the `CONFIG_ZBUS_ASSERT_MOCK` is enabled.

int **zbus_sub_wait_msg**(const struct *zbus_observer* *sub, const struct *zbus_channel* **chan, void *msg, *k_timeout_t* timeout)

Wait for a channel message.

This routine makes the subscriber wait for the new message in case of channel publication.

Parameters

- `sub` – **[in]** The subscriber's reference.
- `chan` – **[out]** The notification channel's reference.
- `msg` – **[out]** A reference to a copy of the published message.
- `timeout` – **[in]** Waiting period for a notification arrival, or one of the special values, K_NO_WAIT and K_FOREVER.

Return values

- `0` – Message received.
- `-EINVAL` – The observer is not a subscriber.
- `-ENOMSG` – Could not retrieve the *net_buf* from the subscriber FIFO.
- `-EILSEQ` – Received an invalid channel reference.
- `-EFAULT` – A parameter is incorrect, or the function context is invalid (inside an ISR). The function only returns this value when the `CONFIG_ZBUS_ASSERT_MOCK` is enabled.

bool **zbus_iterate_over_channels**(bool (*iterator_func)(const struct *zbus_channel* *chan))

Iterate over channels.

Enables the developer to iterate over the channels giving to this function an iterator_func which is called for each channel. If the iterator_func returns false all the iteration stops.

Parameters

- `iterator_func` – **[in]** The function that will be execute on each iteration.

Return values

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

bool **zbus_iterate_over_channels_with_user_data**(bool (*iterator_func)(const struct *zbus_channel* *chan, void *user_data), void *user_data)

Iterate over channels with user data.

Enables the developer to iterate over the channels giving to this function an iterator_func which is called for each channel. If the iterator_func returns false all the iteration stops.

Parameters

- `iterator_func` – **[in]** The function that will be execute on each iteration.
- `user_data` – **[in]** The user data that can be passed in the function.

Return values

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

bool **zbus_iterate_over_observers**(bool (*iterator_func)(const struct *zbus_observer* *obs))

Iterate over observers.

Enables the developer to iterate over the observers giving to this function an iterator_func which is called for each observer. If the iterator_func returns false all the iteration stops.

Parameters

- `iterator_func` – **[in]** The function that will be execute on each iteration.

Return values

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

bool **zbus_iterate_over_observers_with_user_data**(bool (*iterator_func)(const struct *zbus_observer* *obs, void *user_data), void *user_data)

Iterate over observers with user data.

Enables the developer to iterate over the observers giving to this function an iterator_func which is called for each observer. If the iterator_func returns false all the iteration stops.

Parameters

- `iterator_func` – **[in]** The function that will be execute on each iteration.
- `user_data` – **[in]** The user data that can be passed in the function.

Return values

- `true` – Iterator executed for all channels.
- `false` – Iterator could not be executed. Some iterate returned false.

struct **zbus_channel_data**

#include <zbus.h> Type used to represent a channel mutable data.

Every channel has a *zbus_channel_data* structure associated.

Public Members

int16_t **observers_start_idx**

Static channel observer list start index.

Considering the ITERABLE SECTIONS allocation order.

int16_t **observers_end_idx**

Static channel observer list end index.

Considering the ITERABLE SECTIONS allocation order.

struct k_sem **sem**

Access control semaphore.

Points to the semaphore used to avoid race conditions for accessing the channel.

sys_slist_t **observers**

Channel observer list.

Represents the channel's observers list, it can be empty or have listeners and subscribers mixed in any sequence. It can be changed in runtime.

struct *net_buf_pool* ***msg_subscriber_pool**

Net buf pool for message subscribers.

It can be either the global or a separated one.

struct **zbus_channel**

#include <zbus.h> Type used to represent a channel.

Every channel has a *zbus_channel* structure associated used to control the channel access and usage.

Public Members

const char *const **name**

Channel name.

void *const **message**

Message reference.

Represents the message's reference that points to the actual shared memory region.

const size_t **message_size**

Message size.

Represents the channel's message size.

void *const **user_data**

User data available to extend zbus features.

The channel must be claimed before using this field.

bool (*const **validator**)(const void *msg, size_t msg_size)

Message validator.

Stores the reference to the function to check the message validity before actually performing the publishing. No invalid messages can be published. Every message is valid when this field is empty.

struct *zbus_channel_data* *const **data**

Mutable channel data struct.

struct **zbus_observer_data**

#include <zbus.h>

Public Members

bool **enabled**

Enabled flag.

Indicates if observer is receiving notification.

struct **zbus_observer**

#include <zbus.h> Type used to represent an observer.

Every observer has an representation structure containing the relevant information. An observer is a code portion interested in some channel. The observer can be notified synchronously or asynchronously and it is called listener and subscriber respectively. The observer can be enabled or disabled during runtime by change the enabled boolean field of the structure. The listeners have a callback function that is executed by the bus with the index of the changed channel as argument when the notification is sent. The subscribers have a message queue where the bus enqueues the index of the changed channel when a notification is sent.

See also

zbus_obs_set_enable function to properly change the observer's enabled field.

Public Members

const char *const **name**

Observer name.

enum *zbus_observer_type* **type**

Type indication.

struct *zbus_observer_data* *const **data**

Mutable observer data struct.

struct *k_msgq* *const **queue**

Observer message queue.

It turns the observer into a subscriber.

void (*const **callback**)(const struct *zbus_channel* *chan)

Observer callback function.

It turns the observer into a listener.

struct k_fifo *const **message_fifo**

Observer message FIFO.

It turns the observer into a message subscriber. It only exists if the `CONFIG_ZBUS_MSG_SUBSCRIBER` is enabled.

4.34 Miscellaneous

4.34.1 Checksum APIs

CRC

group `crc`

Enums

enum `crc_type`

CRC algorithm enumeration.

These values should be used with the *CRC* dispatch function.

Values:

enumerator `CRC4`

Use *crc4*.

enumerator `CRC4_TI`

Use *crc4_ti*.

enumerator `CRC7_BE`

Use *crc7_be*.

enumerator `CRC8`

Use *crc8*.

enumerator `CRC8_CCITT`

Use *crc8_ccitt*.

enumerator `CRC16`

Use *crc16*.

enumerator `CRC16_ANSI`

Use *crc16_ansi*.

enumerator `CRC16_CCITT`

Use *crc16_ccitt*.

enumerator `CRC16_ITU_T`

Use *crc16_itu_t*.

enumerator `CRC24_PGP`

Use *crc24_pgp*.

enumerator `CRC32_C`

Use *crc32_c*.

enumerator CRC32_IEEE

Use *crc32_ieee*.

Functions

uint16_t **crc16**(uint16_t poly, uint16_t seed, const uint8_t *src, size_t len)

Generic function for computing a CRC-16 without input or output reflection.

Compute CRC-16 by passing in the address of the input, the input length and polynomial used in addition to the initial value. This is O(n*8) where n is the length of the buffer provided. No reflection is performed.

Note

If you are planning to use a CRC based on poly 0x1012 the functions *crc16_itu_t()* is faster and thus recommended over this one.

Parameters

- **poly** – The polynomial to use omitting the leading x^16 coefficient
- **seed** – Initial value for the CRC computation
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes

Returns

The computed CRC16 value (without any XOR applied to it)

uint16_t **crc16_reflect**(uint16_t poly, uint16_t seed, const uint8_t *src, size_t len)

Generic function for computing a CRC-16 with input and output reflection.

Compute CRC-16 by passing in the address of the input, the input length and polynomial used in addition to the initial value. This is O(n*8) where n is the length of the buffer provided. Both input and output are reflected.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

- CRC-16/ANSI, CRC-16/MODBUS, CRC-16/USB, CRC-16/IBM https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-modbus poly: 0x8005 (0xA001) initial seed: 0xffff, xor output: 0x0000

Note

If you are planning to use a CRC based on poly 0x1012 the function *crc16_ccitt()* is faster and thus recommended over this one.

Parameters

- **poly** – The polynomial to use omitting the leading x^16 coefficient. Important: please reflect the poly. For example, use 0xA001 instead of 0x8005 for CRC-16-MODBUS.

- **seed** – Initial value for the CRC computation
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes

Returns
The computed CRC16 value (without any XOR applied to it)

uint8_t **crc8**(const uint8_t *src, size_t len, uint8_t polynomial, uint8_t initial_value, bool reversed)

Generic function for computing CRC 8.

Compute CRC 8 by passing in the address of the input, the input length and polynomial used in addition to the initial value.

Parameters

- **src** – Input bytes for the computation
- **len** – Length of the input in bytes
- **polynomial** – The polynomial to use omitting the leading x^8 coefficient
- **initial_value** – Initial value for the CRC computation
- **reversed** – Should we use reflected/reversed values or not

Returns
The computed CRC8 value

uint16_t **crc16_ccitt**(uint16_t seed, const uint8_t *src, size_t len)

Compute the checksum of a buffer with polynomial 0x1021, reflecting input and output.

This function is able to calculate any CRC that uses 0x1021 as it polynomial and requires reflecting both the input and the output. It is a fast variant that runs in O(n) time, where n is the length of the input buffer.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

- CRC-16/CCITT, CRC-16/CCITT-TRUE, CRC-16/KERMIT https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-kermit initial seed: 0x0000, xor output: 0x0000
- CRC-16/X-25, CRC-16/IBM-SDLC, CRC-16/ISO-HDLC https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-ibm-sdlc initial seed: 0xffff, xor output: 0xffff

See ITU-T Recommendation V.41 (November 1988).

Note

To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

Parameters

- **seed** – Value to seed the CRC with
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes

Returns
The computed CRC16 value (without any XOR applied to it)

uint16_t `crc16_itu_t`(uint16_t seed, const uint8_t *src, size_t len)

Compute the checksum of a buffer with polynomial 0x1021, no reflection of input or output.

This function is able to calculate any CRC that uses 0x1021 as it polynomial and requires no reflection on both the input and the output. It is a fast variant that runs in O(n) time, where n is the length of the input buffer.

The following checksums can, among others, be calculated by this function, depending on the value provided for the initial seed and the value the final calculated CRC is XORed with:

- CRC-16/XMODEM, CRC-16/ACORN, CRC-16/LTE https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-xmodem initial seed: 0x0000, xor output: 0x0000
- CRC16/CCITT-FALSE, CRC-16/IBM-3740, CRC-16/AUTOSAR https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-ibm-3740 initial seed: 0xffff, xor output: 0x0000
- CRC-16/GSM https://reveng.sourceforge.io/crc-catalogue/16.htm#crc.cat.crc-16-gsm initial seed: 0x0000, xor output: 0xffff

See ITU-T Recommendation V.41 (November 1988) (MSB first).

Note

To calculate the CRC across non-contiguous blocks use the return value from block N-1 as the seed for block N.

Parameters

- `seed` – Value to seed the CRC with
- `src` – Input bytes for the computation
- `len` – Length of the input in bytes

Returns
The computed CRC16 value (without any XOR applied to it)

static inline uint16_t `crc16_ansi`(const uint8_t *src, size_t len)

Compute the ANSI (or Modbus) variant of CRC-16.

The ANSI variant of CRC-16 uses 0x8005 (0xA001 reflected) as its polynomial with the initial * value set to 0xffff.

Parameters

- `src` – Input bytes for the computation
- `len` – Length of the input in bytes

Returns
The computed CRC16 value

uint32_t `crc32_ieee`(const uint8_t *data, size_t len)

Generate IEEE conform CRC32 checksum.

Parameters

- `data` – Pointer to data on which the CRC should be calculated.
- `len` – Data length.

Returns
CRC32 value.

uint32_t `crc32_ieee_update`(uint32_t crc, const uint8_t *data, size_t len)

Update an IEEE conforming CRC32 checksum.

Parameters

- `crc` – CRC32 checksum that needs to be updated.
- `data` – Pointer to data on which the CRC should be calculated.
- `len` – Data length.

Returns
CRC32 value.

uint32_t `crc32_c`(uint32_t crc, const uint8_t *data, size_t len, bool first_pkt, bool last_pkt)

Calculate CRC32C (Castagnoli) checksum.

Parameters

- `crc` – CRC32C checksum that needs to be updated.
- `data` – Pointer to data on which the CRC should be calculated.
- `len` – Data length.
- `first_pkt` – Whether this is the first packet in the stream.
- `last_pkt` – Whether this is the last packet in the stream.

Returns
CRC32 value.

uint8_t `crc8_ccitt`(uint8_t initial_value, const void *buf, size_t len)

Compute CCITT variant of CRC 8.

Normal CCITT variant of CRC 8 is using 0x07.

Parameters

- `initial_value` – Initial value for the CRC computation
- `buf` – Input bytes for the computation
- `len` – Length of the input in bytes

Returns
The computed CRC8 value

uint8_t `crc7_be`(uint8_t seed, const uint8_t *src, size_t len)

Compute the CRC-7 checksum of a buffer.

See JESD84-A441. Used by the MMC protocol. Uses 0x09 as the polynomial with no reflection. The CRC is left justified, so bit 7 of the result is bit 6 of the CRC.

Parameters

- `seed` – Value to seed the CRC with
- `src` – Input bytes for the computation

- **len** – Length of the input in bytes

Returns
The computed CRC7 value

uint8_t **crc4_ti**(uint8_t seed, const uint8_t *src, size_t len)

Compute the CRC-4 checksum of a buffer.

Used by the TMAG5170 sensor. Uses 0x03 as the polynomial with no reflection. 4 most significant bits of the CRC result will be set to zero.

Parameters

- **seed** – Value to seed the CRC with
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes

Returns
The computed CRC4 value

uint8_t **crc4**(const uint8_t *src, size_t len, uint8_t polynomial, uint8_t initial_value, bool reversed)

Generic function for computing CRC 4.

Compute CRC 4 by passing in the address of the input, the input length and polynomial used in addition to the initial value. The input buffer must be aligned to a whole byte. It is guaranteed that 4 most significant bits of the result will be set to zero.

Parameters

- **src** – Input bytes for the computation
- **len** – Length of the input in bytes
- **polynomial** – The polynomial to use omitting the leading x^4 coefficient
- **initial_value** – Initial value for the CRC computation
- **reversed** – Should we use reflected/reversed values or not

Returns
The computed CRC4 value

uint32_t **crc24_pgp**(const uint8_t *data, size_t len)

Generate an OpenPGP CRC-24 checksum as defined in RFC 4880 section 6.1.

Parameters

- **data** – A pointer to the data on which the CRC will be calculated.
- **len** – Data length in bytes.

Returns
The CRC-24 value.

uint32_t **crc24_pgp_update**(uint32_t crc, const uint8_t *data, size_t len)

Update an OpenPGP CRC-24 checksum.

Parameters

- **crc** – The CRC-24 checksum that needs to be updated. The full 32-bit value of the CRC needs to be used between calls, do not mask the value to keep only the last 24 bits.
- **data** – A pointer to the data on which the CRC will be calculated.
- **len** – Data length in bytes.

Returns
The CRC-24 value. When the last buffer of data has been processed, mask the value with CRC24_FINAL_VALUE_MASK to keep only the meaningful 24 bits of the CRC result.

static inline uint32_t **crc_by_type**(enum *crc_type* type, const uint8_t *src, size_t len, uint32_t seed, uint32_t poly, bool reflect, bool first, bool last)

Compute a CRC checksum, in a generic way.

This is a dispatch function that calls the individual CRC routine determined by `type`.

For 7, 8, 16 and 24-bit CRCs, the relevant `seed` and `poly` values should be passed in via the least-significant byte(s).

Similarly, for 7, 8, 16 and 24-bit CRCs, the relevant result is stored in the least-significant byte(s) of the returned value.

Parameters

- **type** – CRC algorithm to use.
- **src** – Input bytes for the computation
- **len** – Length of the input in bytes
- **seed** – Value to seed the CRC with
- **poly** – The polynomial to use omitting the leading coefficient
- **reflect** – Should we use reflected/reversed values or not
- **first** – Whether this is the first packet in the stream.
- **last** – Whether this is the last packet in the stream.

Returns
uint32_t the computed CRC value

4.34.2 Structured Data APIs

JSON

AWS IoT Core MQTT
Connect to AWS IoT Core and publish messages using MQTT.

group `json`

Defines

`JSON_OBJ_DESCR_PRIM`(struct_, field_name_, type_)
Helper macro to declare a descriptor for supported primitive values.

Here's an example of use:

```
struct foo {
    int32_t some_int;
};

struct json_obj_descr foo[] = {
    JSON_OBJ_DESCR_PRIM(struct foo, some_int, JSON_TOK_NUMBER),
};
```

Parameters

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct
- **type_** – Token type for JSON value corresponding to a primitive type. Must be one of: JSON_TOK_STRING for strings, JSON_TOK_NUMBER for numbers, JSON_TOK_TRUE (or JSON_TOK_FALSE) for booleans.

JSON_OBJ_DESCR_OBJECT(struct_, field_name_, sub_descr_)

Helper macro to declare a descriptor for an object value.

Here's an example of use:

```
struct nested {
    int32_t foo;
    struct {
       int32_t baz;
    } bar;
};

struct json_obj_descr nested_bar[] = {
    { ... declare bar.baz descriptor ... },
};
struct json_obj_descr nested[] = {
    { ... declare foo descriptor ... },
    JSON_OBJ_DESCR_OBJECT(struct nested, bar, nested_bar),
};
```

Parameters

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct
- **sub_descr_** – Array of *json_obj_descr* describing the subobject

JSON_OBJ_DESCR_ARRAY(struct_, field_name_, max_len_, len_field_, elem_type_)

Helper macro to declare a descriptor for an array of primitives.

Here's an example of use:

```
struct example {
    int32_t foo[10];
    size_t foo_len;
};

struct json_obj_descr array[] = {
     JSON_OBJ_DESCR_ARRAY(struct example, foo, 10, foo_len,
                          JSON_TOK_NUMBER)
};
```

Parameters

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct
- **max_len_** – Maximum number of elements in array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_type_** – Element type, must be a primitive type

JSON_OBJ_DESCR_OBJ_ARRAY(struct_, field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)

Helper macro to declare a descriptor for an array of objects.

Here's an example of use:

```
struct person_height {
    const char *name;
    int32_t height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
     JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
     JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
     JSON_OBJ_DESCR_OBJ_ARRAY(struct people_heights, heights, 10,
                              heights_len, person_height_descr,
                              ARRAY_SIZE(person_height_descr)),
};
```

Parameters

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct containing the array
- **max_len_** – Maximum number of elements in the array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_descr_** – Element descriptor, pointer to a descriptor array
- **elem_descr_len_** – Number of elements in elem_descr_

JSON_OBJ_DESCR_ARRAY_ARRAY(struct_, field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)

Helper macro to declare a descriptor for an array of array.

Here's an example of use:

```
struct person_height {
    const char *name;
    int32_t height;
};

struct person_heights_array {
    struct person_height heights;
}

struct people_heights {
    struct person_height_array heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
    JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
    JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr person_height_array_descr[] = {
    JSON_OBJ_DESCR_OBJECT(struct person_heights_array,
                          heights, person_height_descr),
};

struct json_obj_descr array_array[] = {
     JSON_OBJ_DESCR_ARRAY_ARRAY(struct people_heights, heights, 10,
                                heights_len, person_height_array_descr,
                                ARRAY_SIZE(person_height_array_descr)),
};
```

Parameters

- **struct_** – Struct packing the values
- **field_name_** – Field name in the struct containing the array
- **max_len_** – Maximum number of elements in the array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_descr_** – Element descriptor, pointer to a descriptor array
- **elem_descr_len_** – Number of elements in elem_descr_

`JSON_OBJ_DESCR_ARRAY_ARRAY_NAMED`(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)

Variant of JSON_OBJ_DESCR_ARRAY_ARRAY that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also

JSON_OBJ_DESCR_ARRAY_ARRAY

Parameters

- **struct_** – Struct packing the values
- **json_field_name_** – String, field name in JSON strings

- **struct_field_name_** – Field name in the struct containing the array
- **max_len_** – Maximum number of elements in the array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_descr_** – Element descriptor, pointer to a descriptor array
- **elem_descr_len_** – Number of elements in elem_descr_

JSON_OBJ_DESCR_PRIM_NAMED(struct_, json_field_name_, struct_field_name_, type_)

Variant of JSON_OBJ_DESCR_PRIM that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also

JSON_OBJ_DESCR_PRIM

Parameters

- **struct_** – Struct packing the values.
- **json_field_name_** – String, field name in JSON strings
- **struct_field_name_** – Field name in the struct
- **type_** – Token type for JSON value corresponding to a primitive type.

JSON_OBJ_DESCR_OBJECT_NAMED(struct_, json_field_name_, struct_field_name_, sub_descr_)

Variant of JSON_OBJ_DESCR_OBJECT that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also

JSON_OBJ_DESCR_OBJECT

Parameters

- **struct_** – Struct packing the values
- **json_field_name_** – String, field name in JSON strings
- **struct_field_name_** – Field name in the struct
- **sub_descr_** – Array of *json_obj_descr* describing the subobject

JSON_OBJ_DESCR_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_type_)

Variant of JSON_OBJ_DESCR_ARRAY that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

See also

JSON_OBJ_DESCR_ARRAY

Parameters

- **struct_** – Struct packing the values
- **json_field_name_** – String, field name in JSON strings
- **struct_field_name_** – Field name in the struct
- **max_len_** – Maximum number of elements in array
- **len_field_** – Field name in the struct for the number of elements in the array
- **elem_type_** – Element type, must be a primitive type

JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct_, json_field_name_, struct_field_name_, max_len_, len_field_, elem_descr_, elem_descr_len_)

Variant of JSON_OBJ_DESCR_OBJ_ARRAY that can be used when the structure and JSON field names differ.

This is useful when the JSON field is not a valid C identifier.

Here's an example of use:

```
struct person_height {
    const char *name;
    int32_t height;
};

struct people_heights {
    struct person_height heights[10];
    size_t heights_len;
};

struct json_obj_descr person_height_descr[] = {
     JSON_OBJ_DESCR_PRIM(struct person_height, name, JSON_TOK_STRING),
     JSON_OBJ_DESCR_PRIM(struct person_height, height, JSON_TOK_NUMBER),
};

struct json_obj_descr array[] = {
     JSON_OBJ_DESCR_OBJ_ARRAY_NAMED(struct people_heights,
                                    "people-heights", heights,
                                    10, heights_len,
                                    person_height_descr,
                                    ARRAY_SIZE(person_height_descr)),
};
```

Parameters

- **struct_** – Struct packing the values
- **json_field_name_** – String, field name of the array in JSON strings
- **struct_field_name_** – Field name in the struct containing the array
- **max_len_** – Maximum number of elements in the array
- **len_field_** – Field name in the struct for the number of elements in the array

- **elem_descr_** – Element descriptor, pointer to a descriptor array
- **elem_descr_len_** – Number of elements in elem_descr_

Typedefs

typedef int (*json_append_bytes_t)(const char *bytes, size_t len, void *data)

Function pointer type to append bytes to a buffer while encoding JSON data.

Param bytes
Contents to write to the output

Param len
Number of bytes to append to output

Param data
User-provided pointer

Return
This callback function should return a negative number on error (which will be propagated to the return value of *json_obj_encode()*), or 0 on success.

Enums

enum json_tokens

Values:

enumerator JSON_TOK_NONE = '_'

enumerator JSON_TOK_OBJECT_START = '{'

enumerator JSON_TOK_OBJECT_END = '}'

enumerator JSON_TOK_ARRAY_START = '['

enumerator JSON_TOK_ARRAY_END = ']'

enumerator JSON_TOK_STRING = '"'

enumerator JSON_TOK_COLON = ':'

enumerator JSON_TOK_COMMA = ','

enumerator JSON_TOK_NUMBER = '0'

enumerator JSON_TOK_FLOAT = '1'

enumerator JSON_TOK_OPAQUE = '2'

enumerator JSON_TOK_OBJ_ARRAY = '3'

enumerator JSON_TOK_ENCODED_OBJ = '4'

enumerator JSON_TOK_TRUE = 't'

enumerator JSON_TOK_FALSE = 'f'

enumerator JSON_TOK_NULL = 'n'

enumerator JSON_TOK_ERROR = '!'

enumerator JSON_TOK_EOF = '\0'

Functions

int64_t **json_obj_parse**(char *json, size_t len, const struct *json_obj_descr* *descr, size_t descr_len, void *val)

Parses the JSON-encoded object pointed to by *json*, with size *len*, according to the descriptor pointed to by *descr*.

Values are stored in a struct pointed to by *val*. Set up the descriptor like this:

struct s { int32_t foo; char *bar; } struct *json_obj_descr* descr[] = { *JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER)*, *JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING)*, };

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no strtod() in the minimal libc).

Parameters

- **json** – Pointer to JSON-encoded value to be parsed
- **len** – Length of JSON-encoded value
- **descr** – Pointer to the descriptor array
- **descr_len** – Number of elements in the descriptor array. Must be less than 63 due to implementation detail reasons (if more fields are necessary, use two descriptors)
- **val** – Pointer to the struct to hold the decoded values

Returns

< 0 if error, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

int **json_arr_parse**(char *json, size_t len, const struct *json_obj_descr* *descr, void *val)

Parses the JSON-encoded array pointed to by *json*, with size *len*, according to the descriptor pointed to by *descr*.

Values are stored in a struct pointed to by *val*. Set up the descriptor like this:

struct s { int32_t foo; char *bar; } struct *json_obj_descr* descr[] = { *JSON_OBJ_DESCR_PRIM(struct s, foo, JSON_TOK_NUMBER)*, *JSON_OBJ_DESCR_PRIM(struct s, bar, JSON_TOK_STRING)*, }; struct a { struct s baz[10]; size_t count; } struct *json_obj_descr* array[] = { *JSON_OBJ_DESCR_OBJ_ARRAY(struct a, baz, 10, count,descr, ARRAY_SIZE(descr))*, };

Since this parser is designed for machine-to-machine communications, some liberties were taken to simplify the design: (1) strings are not unescaped (but only valid escape sequences are accepted); (2) no UTF-8 validation is performed; and (3) only integer numbers are supported (no strtod() in the minimal libc).

Parameters

- `json` – Pointer to JSON-encoded array to be parsed
- `len` – Length of JSON-encoded array
- `descr` – Pointer to the descriptor array
- `val` – Pointer to the struct to hold the decoded values

Returns

0 if array has been successfully parsed. A negative value indicates an error (as defined on errno.h).

int **json_arr_separate_object_parse_init**(struct *json_obj* *json, char *payload, size_t len)

Initialize single-object array parsing.

JSON-encoded array data is going to be parsed one object at a time. Data is provided by *payload* with the size of *len* bytes.

Function validate that Json Array start is detected and initialize *json* object for Json object parsing separately.

Parameters

- `json` – Provide storage for parser states. To be used when parsing the array.
- `payload` – Pointer to JSON-encoded array to be parsed
- `len` – Length of JSON-encoded array

Returns

0 if array start is detected and initialization is successful or negative error code in case of failure.

int **json_arr_separate_parse_object**(struct *json_obj* *json, const struct *json_obj_descr* *descr, size_t descr_len, void *val)

Parse a single object from array.

Parses the JSON-encoded object pointed to by *json* object array, with size *len*, according to the descriptor pointed to by *descr*.

Parameters

- `json` – Pointer to JSON-object message state
- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array. Must be less than 31.
- `val` – Pointer to the struct to hold the decoded values

Returns

< 0 if error, 0 for end of message, bitmap of decoded fields on success (bit 0 is set if first field in the descriptor has been properly decoded, etc).

ssize_t **json_escape**(char *str, size_t *len, size_t buf_size)

Escapes the string so it can be used to encode JSON objects.

Parameters

- **str** – The string to escape; the escape string is stored the buffer pointed to by this parameter
- **len** – Points to a size_t containing the size before and after the escaping process
- **buf_size** – The size of buffer str points to

Returns
0 if string has been escaped properly, or -ENOMEM if there was not enough space to escape the buffer

size_t **json_calc_escaped_len**(const char *str, size_t len)

Calculates the JSON-escaped string length.

Parameters

- **str** – The string to analyze
- **len** – String size

Returns
The length str would have if it were escaped

ssize_t **json_calc_encoded_len**(const struct *json_obj_descr* *descr, size_t descr_len, const void *val)

Calculates the string length to fully encode an object.

Parameters

- **descr** – Pointer to the descriptor array
- **descr_len** – Number of elements in the descriptor array
- **val** – Struct holding the values

Returns
Number of bytes necessary to encode the values if >0, an error code is returned.

ssize_t **json_calc_encoded_arr_len**(const struct *json_obj_descr* *descr, const void *val)

Calculates the string length to fully encode an array.

Parameters

- **descr** – Pointer to the descriptor array
- **val** – Struct holding the values

Returns
Number of bytes necessary to encode the values if >0, an error code is returned.

int **json_obj_encode_buf**(const struct *json_obj_descr* *descr, size_t descr_len, const void *val, char *buffer, size_t buf_size)

Encodes an object in a contiguous memory location.

Parameters

- **descr** – Pointer to the descriptor array
- **descr_len** – Number of elements in the descriptor array
- **val** – Struct holding the values
- **buffer** – Buffer to store the JSON data
- **buf_size** – Size of buffer, in bytes, with space for the terminating NUL character

Returns
0 if object has been successfully encoded. A negative value indicates an error (as defined on errno.h).

int `json_arr_encode_buf`(const struct *json_obj_descr* *descr, const void *val, char *buffer, size_t buf_size)

Encodes an array in a contiguous memory location.

Parameters

- `descr` – Pointer to the descriptor array
- `val` – Struct holding the values
- `buffer` – Buffer to store the JSON data
- `buf_size` – Size of buffer, in bytes, with space for the terminating NUL character

Returns
0 if object has been successfully encoded. A negative value indicates an error (as defined on errno.h).

int `json_obj_encode`(const struct *json_obj_descr* *descr, size_t descr_len, const void *val, *json_append_bytes_t* append_bytes, void *data)

Encodes an object using an arbitrary writer function.

Parameters

- `descr` – Pointer to the descriptor array
- `descr_len` – Number of elements in the descriptor array
- `val` – Struct holding the values
- `append_bytes` – Function to append bytes to the output
- `data` – Data pointer to be passed to the append_bytes callback function.

Returns
0 if object has been successfully encoded. A negative value indicates an error.

int `json_arr_encode`(const struct *json_obj_descr* *descr, const void *val, *json_append_bytes_t* append_bytes, void *data)

Encodes an array using an arbitrary writer function.

Parameters

- `descr` – Pointer to the descriptor array
- `val` – Struct holding the values
- `append_bytes` – Function to append bytes to the output
- `data` – Data pointer to be passed to the append_bytes callback function.

Returns
0 if object has been successfully encoded. A negative value indicates an error.

struct `json_token`

#include <json.h>

struct `json_lexer`

#include <json.h>

struct **json_obj**

#include <json.h>

struct **json_obj_token**

#include <json.h>

struct **json_obj_descr**

#include <json.h>

JWT

JSON Web Tokens (JWT) are an open, industry standard [RFC 7519](https://tools.ietf.org/html/rfc7519) method for representing claims securely between two parties. Although JWT is fairly flexible, this API is limited to creating the simplistic tokens needed to authenticate with the Google Core IoT infrastructure.

group **jwt**

JSON Web Token (JWT)

Functions

int **jwt_init_builder**(struct *jwt_builder* *builder, char *buffer, size_t buffer_size)

Initialize the JWT builder.

Initialize the given JWT builder for the creation of a fresh token. The buffer size should at least be as long as JWT_BUILDER_MAX_SIZE returns.

Parameters

- **builder** – The builder to initialize.
- **buffer** – The buffer to write the token to.
- **buffer_size** – The size of this buffer. The token will be NULL terminated, which needs to be allowed for in this size.

Return values

- **0** – Success
- **-ENOSPC** – Buffer is insufficient to initialize

int **jwt_add_payload**(struct *jwt_builder* *builder, int32_t exp, int32_t iat, const char *aud)

add JWT primary payload.

int **jwt_sign**(struct *jwt_builder* *builder, const char *der_key, size_t der_key_len)

Sign the JWT token.

static inline size_t **jwt_payload_len**(struct *jwt_builder* *builder)

struct **jwt_builder**

#include <jwt.h> JWT data tracking.

JSON Web Tokens contain several sections, each encoded in base-64. This structure tracks the token as it is being built, including limits on the amount of available space. It should be initialized with jwt_init().

Public Members

char *base
: The base of the buffer we are writing to.

char *buf
: The place in this buffer where we are currently writing.

size_t len
: The length remaining to write.

bool overflowed
: Flag that is set if we try to write past the end of the buffer.

  If set, the token is not valid.

Chapter 5

Build and Configuration Systems

5.1 Build System (CMake)

CMake is used to build your application together with the Zephyr kernel. A CMake build is done in two stages. The first stage is called **configuration**. During configuration, the CMakeLists.txt build scripts are executed. After configuration is finished, CMake has an internal model of the Zephyr build, and can generate build scripts that are native to the host platform.

CMake supports generating scripts for several build systems, but only Ninja and Make are tested and supported by Zephyr. After configuration, you begin the **build** stage by executing the generated build scripts. These build scripts can recompile the application without involving CMake following most code changes. However, after certain changes, the configuration step must be executed again before building. The build scripts can detect some of these situations and reconfigure automatically, but there are cases when this must be done manually.

Zephyr uses CMake's concept of a 'target' to organize the build. A target can be an executable, a library, or a generated file. For application developers, the library target is the most important to understand. All source code that goes into a Zephyr build does so by being included in a library target, even application code.

Library targets have source code, that is added through CMakeLists.txt build scripts like this:

```
target_sources(app PRIVATE src/main.c)
```

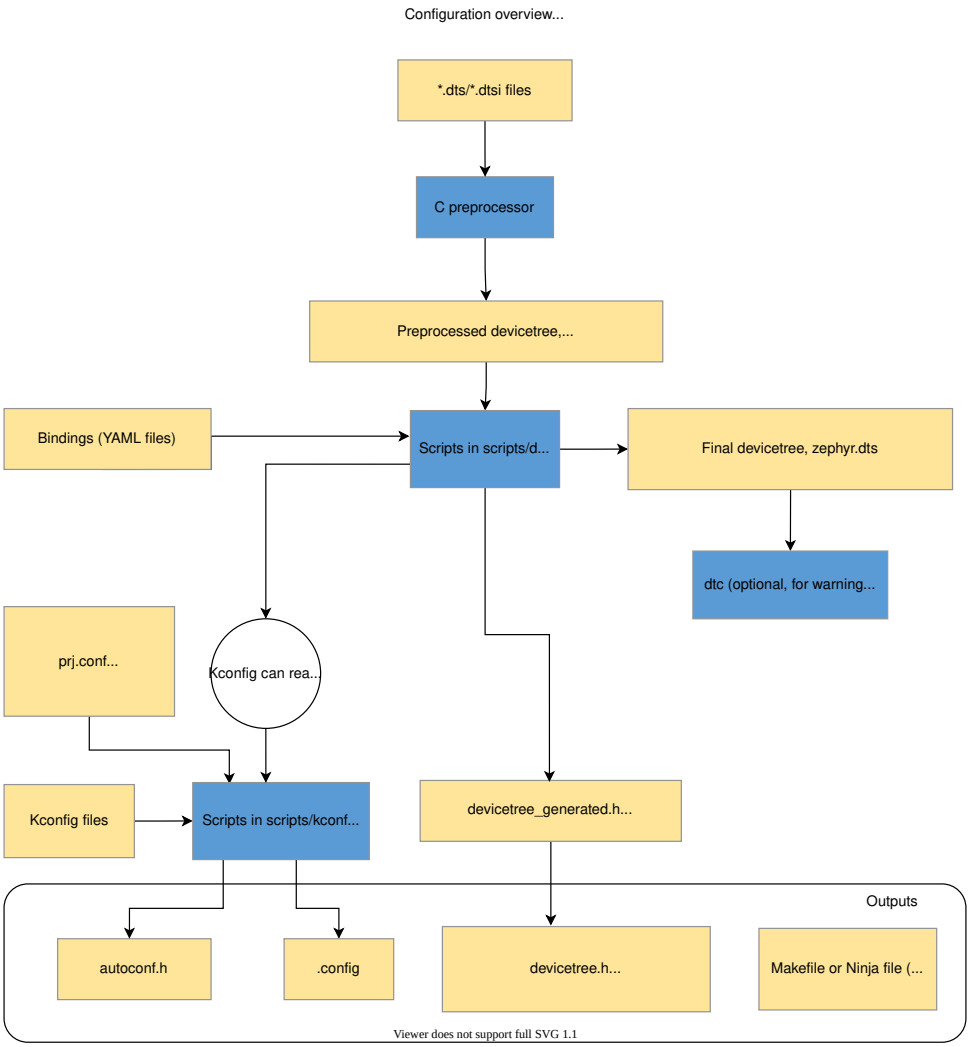
In the above `CMakeLists.txt`, an existing library target named `app` is configured to include the source file `src/main.c`. The `PRIVATE` keyword indicates that we are modifying the internals of how the library is being built. Using the keyword `PUBLIC` would modify how other libraries that link with app are built. In this case, using `PUBLIC` would cause libraries that link with `app` to also include the source file `src/main.c`, behavior that we surely do not want. The `PUBLIC` keyword could however be useful when modifying the include paths of a target library.

5.1.1 Build and Configuration Phases

The Zephyr build process can be divided into two main phases: a configuration phase (driven by CMake) and a build phase (driven by Make or Ninja).

Configuration Phase

The configuration phase begins when the user invokes *CMake* to generate a build system, specifying a source application directory and a board target.



Configuration overview...
.dts/.dtsi files
C preprocessor
Preprocessed devicetree,...
Bindings (YAML files)
Scripts in scripts/d...
Final devicetree, zephyr.dts
dtc (optional, for warning...
prj.conf...
Kconfig can rea...
Kconfig files
Scripts in scripts/kconf...
devicetree_generated.h...
Outputs
autoconf.h
.config
devicetree.h...
Makefile or Ninja file (...
Viewer does not support full SVG 1.1

CMake begins by processing the `CMakeLists.txt` file in the application directory, which refers to the `CMakeLists.txt` file in the Zephyr top-level directory, which in turn refers to `CMakeLists.txt` files throughout the build tree (directly and indirectly). Its primary output is a set of Makefiles or Ninja files to drive the build process, but the CMake scripts also do some processing of their own, which is explained here.

Note that paths beginning with `build/` below refer to the build directory you create when running CMake.

Devicetree

`*.dts` (*devicetree source*) and `*.dtsi` (*devicetree source include*) files are collected from the target's architecture, SoC, board, and application directories.

`*.dtsi` files are included by `*.dts` files via the C preprocessor (often abbreviated *cpp*, which should not be confused with C++). The C preprocessor is also used to merge in any devicetree `*.overlay` files, and to expand macros in `*.dts`, `*.dtsi`, and `*.overlay` files. The preprocessor output is placed in `build/zephyr/zephyr.dts.pre`.

The preprocessed devicetree sources are parsed by gen_defines.py to generate a `build/zephyr/include/generated/zephyr/devicetree_generated.h` header with preprocessor macros.

Source code should access preprocessor macros generated from devicetree by including the devicetree.h header, which includes `devicetree_generated.h`.

`gen_defines.py` also writes the final devicetree to `build/zephyr/zephyr.dts` in the build directory. This file's contents may be useful for debugging.

If the devicetree compiler `dtc` is installed, it is run on `build/zephyr/zephyr.dts` to catch any extra warnings and errors generated by this tool. The output from `dtc` is unused otherwise, and this step is skipped if `dtc` is not installed.

The above is just a brief overview. For more information on devicetree, see *Devicetree Guide*.

Kconfig

`Kconfig` files define available configuration options for the target architecture, SoC, board, and application, as well as dependencies between options.

Kconfig configurations are stored in *configuration files*. The initial configuration is generated by merging configuration fragments from the board and application (e.g. `prj.conf`).

The output from Kconfig is an `autoconf.h` header with preprocessor assignments, and a `.config` file that acts both as a saved configuration and as configuration output (used by CMake). The definitions in `autoconf.h` are automatically exposed at compile time, so there is no need to include this header.

Information from devicetree is available to Kconfig, through the functions defined in kconfigfunctions.py.

See *the Kconfig section of the manual* for more information.

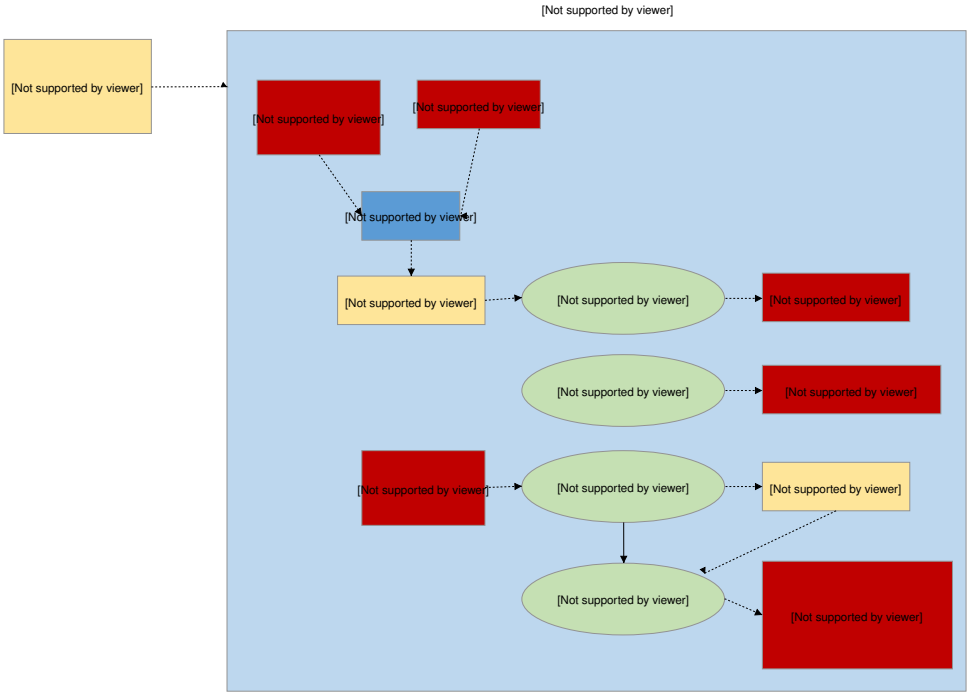
Build Phase

The build phase begins when the user invokes `make` or `ninja`. Its ultimate output is a complete Zephyr application in a format suitable for loading/flashing on the desired target board (`zephyr.elf`, `zephyr.hex`, etc.) The build phase can be broken down, conceptually, into four stages: the pre-build, first-pass binary, final binary, and post-processing.

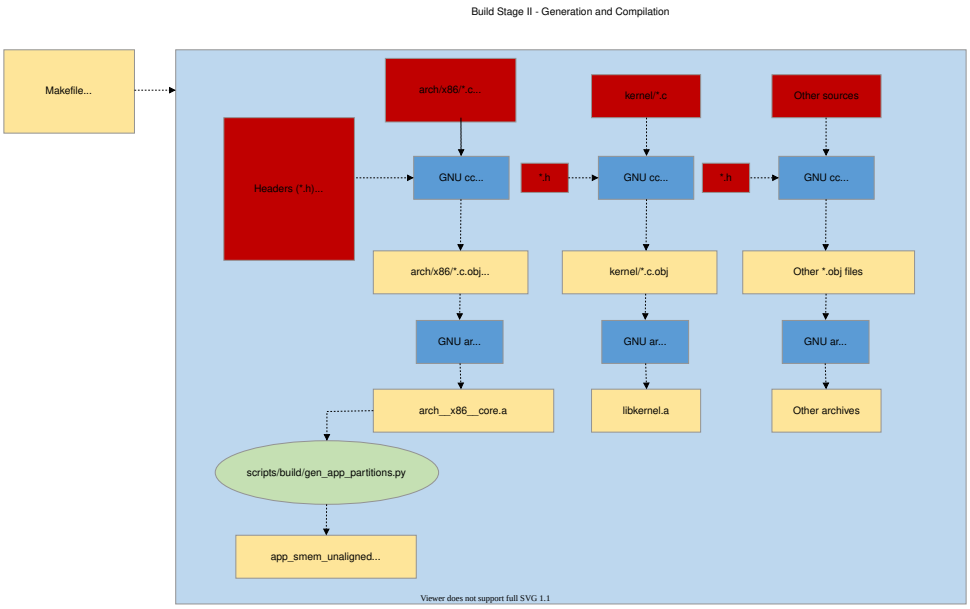
Pre-build Pre-build occurs before any source files are compiled, because during this phase header files used by the source files are generated.

Offset generation
: Access to high-level data structures and members is sometimes required when the definitions of those structures is not immediately accessible (e.g., assembly language). The generation of *offsets.h* (by *gen_offset_header.py*) facilitates this.

System call boilerplate
: The *gen_syscall.py* and *parse_syscalls.py* scripts work together to bind potential system call functions with their implementations.



Intermediate binaries Compilation proper begins with the first intermediate binary. Source files (C and assembly) are collected from various subsystems (which ones is decided during the configuration phase), and compiled into archives (with reference to header files in the tree, as well as those generated during the configuration phase and the pre-build stage(s)).



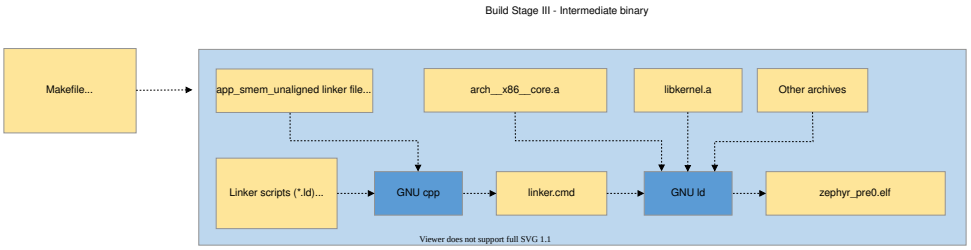
The exact number of intermediate binaries is decided during the configuration phase.

If memory protection is enabled, then:

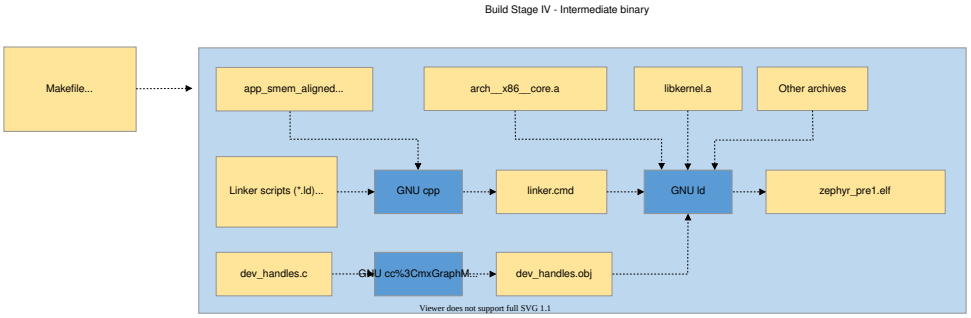
Partition grouping
: The *gen_app_partitions.py* script scans all the generated archives and outputs linker scripts to ensure that application partitions are properly grouped and aligned for the target's memory protection hardware.

Then *cpp* is used to combine linker script fragments from the target's architecture/SoC, the kernel tree, optionally the partition output if memory protection is enabled, and any other fragments selected during the configuration process, into a *linker.cmd* file. The compiled archives are then linked with *ld* as specified in the *linker.cmd*.

Unfixed size binary
: The unfixed size intermediate binary is produced when *User Mode* is enabled or *Devicetree* is in use. It produces a binary where sizes are not fixed and thus it may be used by post-process steps that will impact the size of the final binary.



Fixed size binary
: The fixed size intermediate binary is produced when *User Mode* is enabled or when generated IRQ tables are used, `CONFIG_GEN_ISR_TABLES` It produces a binary where sizes are fixed and thus the size must not change between the intermediate binary and the final binary.

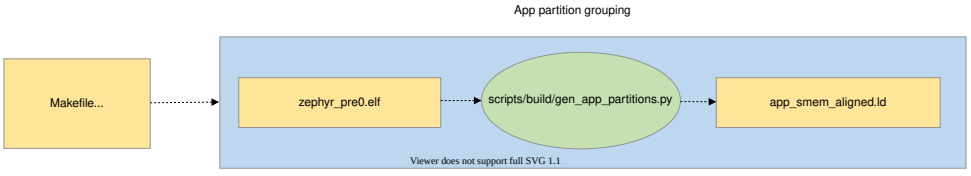


Intermediate binaries post-processing The binaries from the previous stage are incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

To complete the build procedure the following scripts are executed on the intermediate binaries to produce the missing pieces needed for the final binary.

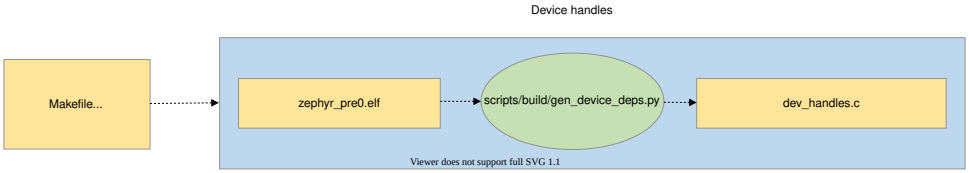
When *User Mode* is enabled:

Partition alignment
: The *gen_app_partitions.py* script scans the unfixed size binary and generates an app shared memory aligned linker script snippet where the partitions are sorted in descending order.

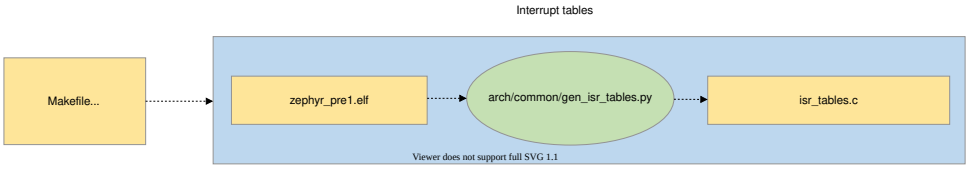


When *Devicetree* is used:

Device dependencies
The *gen_device_deps.py* script scans the unfixed size binary to determine relationships between devices that were recorded from devicetree data, and replaces the encoded relationships with values that are optimized to locate the devices actually present in the application.

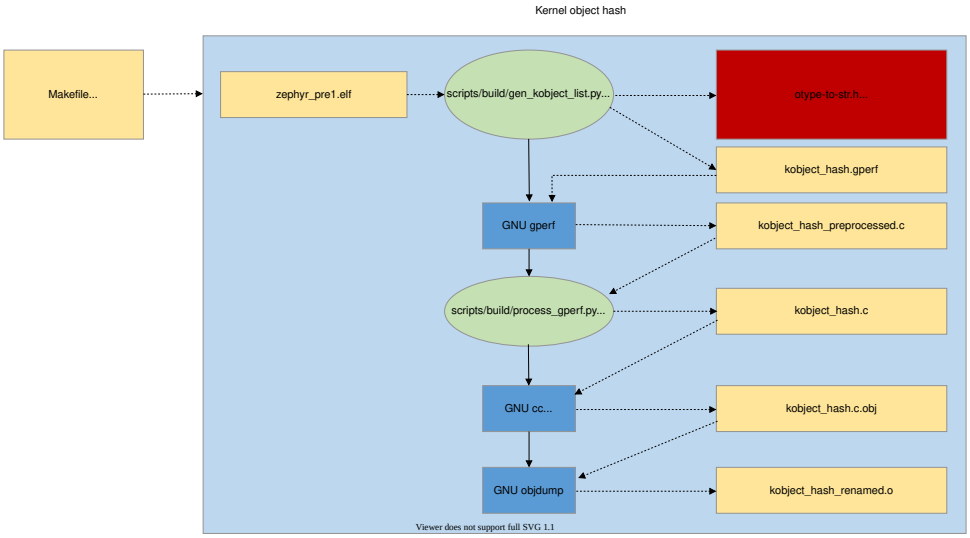


When `CONFIG_GEN_ISR_TABLES` is enabled:
The *gen_isr_tables.py* script scans the fixed size binary and creates an isr_tables.c source file with a hardware vector table and/or software IRQ table.



When *User Mode* is enabled:

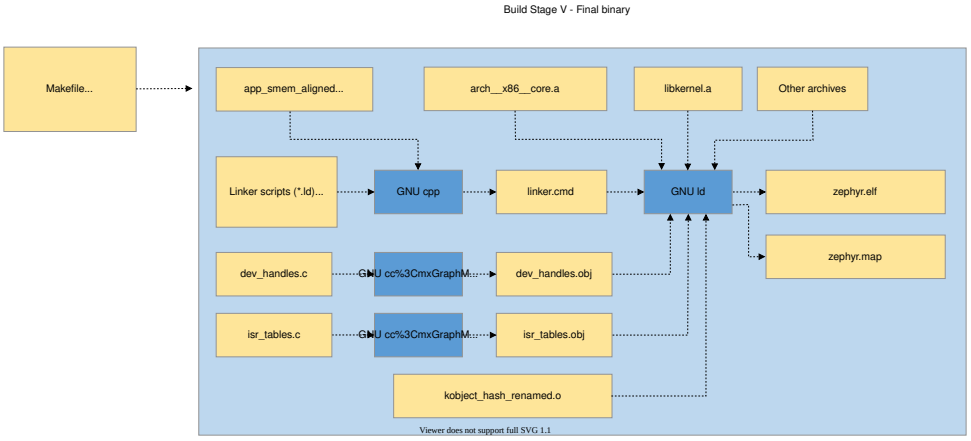
Kernel object hashing
The *gen_kobject_list.py* scans the *ELF DWARF* debug data to find the address of the all kernel objects. This list is passed to *gperf*, which generates a perfect hash function and table of those addresses, then that output is optimized by *process_gperf.py*, using known properties of our special case.



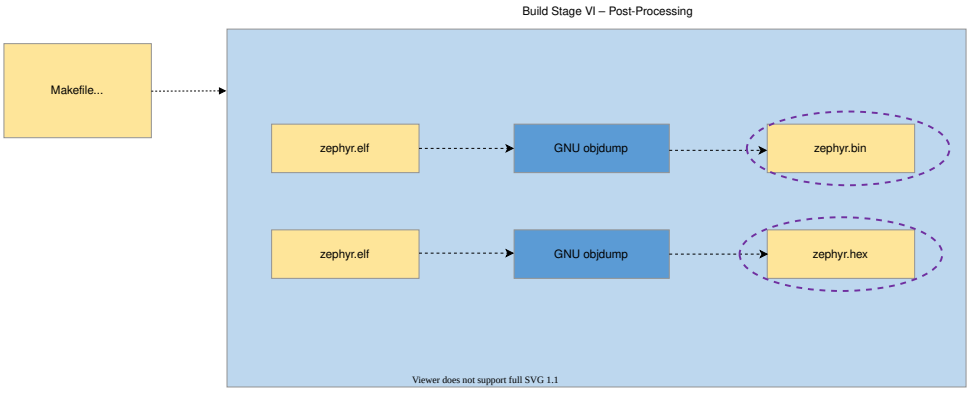
When no intermediate binary post-processing is required then the first intermediate binary will be directly used as the final binary.

Final binary The binary from the previous stage is incomplete, with empty and/or placeholder sections that must be filled in by, essentially, reflection.

The link from the previous stage is repeated, this time with the missing pieces populated.



Post processing Finally, if necessary, the completed kernel is converted from *ELF* to the format expected by the loader and/or flash tool required by the target. This is accomplished in a straightforward manner with *objdump*.



5.1.2 Supporting Scripts and Tools

The following is a detailed description of the scripts used during the build process.

scripts/build/gen_syscalls.py

Script to generate system call invocation macros

This script parses the system call metadata JSON file emitted by parse_syscalls.py to create several files:

- A file containing weak aliases of any potentially unimplemented system calls, as well as the system call dispatch table, which maps system call type IDs to their handler functions.
- A header file defining the system call type IDs, as well as function prototypes for all system call handler functions.
- A directory containing header files. Each header corresponds to a header that was identified as containing system call declarations. These generated headers contain the inline invocation functions for each system call in that header.

scripts/build/gen_device_deps.py

Translate generic handles into ones optimized for the application.

Immutable device data includes information about dependencies, e.g. that a particular sensor is controlled through a specific I2C bus and that it signals event on a pin on a specific GPIO controller. This information is encoded in the first-pass binary using identifiers derived from the devicetree. This script extracts those identifiers and replaces them with ones optimized for use with the devices actually present.

For example the sensor might have a first-pass handle defined by its devicetree ordinal 52, with the I2C driver having ordinal 24 and the GPIO controller ordinal 14. The runtime ordinal is the index of the corresponding device in the static devicetree array, which might be 6, 5, and 3, respectively.

The output is a C source file that provides alternative definitions for the array contents referenced from the immutable device objects. In the final link these definitions supersede the ones in the driver-specific object file.

scripts/build/gen_kobject_list.py

Script to generate gperf tables of kernel object metadata

User mode threads making system calls reference kernel objects by memory address, as the kernel/driver APIs in Zephyr are the same for both user and supervisor contexts. It is necessary for the kernel to be able to validate accesses to kernel objects to make the following assertions:

- That the memory address points to a kernel object
- The kernel object is of the expected type for the API being invoked
- The kernel object is of the expected initialization state
- The calling thread has sufficient permissions on the object

For more details see the *Kernel Objects* section in the documentation.

The zephyr build generates an intermediate ELF binary, zephyr_prebuilt.elf, which this script scans looking for kernel objects by examining the DWARF debug information to look for instances of data structures that are considered kernel objects. For device drivers, the API struct pointer populated at build time is also examined to disambiguate between various device driver instances since they are all 'struct device'.

This script can generate five different output files:

- A gperf script to generate the hash table mapping kernel object memory addresses to kernel object metadata, used to track permissions, object type, initialization state, and any object-specific data.
- A header file containing generated macros for validating driver instances inside the system call handlers for the driver subsystem APIs.
- A code fragment included by kernel.h with one enum constant for each kernel object type and each driver instance.
- The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping the kernel object types and driver instances to their human-readable representation in the otype_to_str() function.
- The inner cases of a switch/case C statement, included by kernel/userspace.c, mapping kernel object types to their sizes. This is used for allocating instances of them at runtime (CONFIG_DYNAMIC_OBJECTS) in the obj_size_get() function.

scripts/build/gen_offset_header.py

This script scans a specified object file and generates a header file that defined macros for the offsets of various found structure members (particularly symbols ending with `_OFFSET` or `_SIZEOF`),

primarily intended for use in assembly code.

scripts/build/parse_syscalls.py

Script to scan Zephyr include directories and emit system call and subsystem metadata

System calls require a great deal of boilerplate code in order to implement completely. This script is the first step in the build system's process of auto-generating this code by doing a text scan of directories containing C or header files, and building up a database of system calls and their function call prototypes. This information is emitted to a generated JSON file for further processing.

This script also scans for struct definitions such as __subsystem and __net_socket, emitting a JSON dictionary mapping tags to all the struct declarations found that were tagged with them.

If the output JSON file already exists, its contents are checked against what information this script would have outputted; if the result is that the file would be unchanged, it is not modified to prevent unnecessary incremental builds.

arch/x86/gen_idt.py

Generate Interrupt Descriptor Table for x86 CPUs.

This script generates the interrupt descriptor table (IDT) for x86. Please consult the IA Architecture SW Developer Manual, volume 3, for more details on this data structure.

This script accepts as input the zephyr_prebuilt.elf binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the IDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols. From the kernel binary we read a special section "intList" which contains the desired interrupt routing configuration for the kernel, populated by instances of the IRQ_CONNECT() macro.

This script outputs three binary tables:

1. The interrupt descriptor table itself.
2. A bitfield indicating which vectors in the IDT are free for installation of dynamic interrupts at runtime.
3. An array which maps configured IRQ lines to their associated vector entries in the IDT, used to program the APIC at runtime.

arch/x86/gen_gdt.py

Generate a Global Descriptor Table (GDT) for x86 CPUs.

For additional detail on GDT and x86 memory management, please consult the IA Architecture SW Developer Manual, vol. 3.

This script accepts as input the zephyr_prebuilt.elf binary, which is a link of the Zephyr kernel without various build-time generated data structures (such as the GDT) inserted into it. This kernel image has been properly padded such that inserting these data structures will not disturb the memory addresses of other symbols.

The input kernel ELF binary is used to obtain the following information:

- Memory addresses of the Main and Double Fault TSS structures so GDT descriptors can be created for them
- Memory addresses of where the GDT lives in memory, so that this address can be populated in the GDT pseudo descriptor

- whether userspace or HW stack protection are enabled in Kconfig

The output is a GDT whose contents depend on the kernel configuration. With no memory protection features enabled, we generate flat 32-bit code and data segments. If hardware- based stack overflow protection or userspace is enabled, we additionally create descriptors for the main and double- fault IA tasks, needed for userspace privilege elevation and double-fault handling. If userspace is enabled, we also create flat code/data segments for ring 3 execution.

scripts/build/gen_relocate_app.py

This script will relocate .text, .rodata, .data and .bss sections from required files and places it in the required memory region. This memory region and file are given to this python script in the form of a string.

Example of such a string would be:

```
SRAM2:COPY:/home/xyz/zephyr/samples/hello_world/src/main.c,\
SRAM1:COPY:/home/xyz/zephyr/samples/hello_world/src/main2.c, \
FLASH2:NOCOPY:/home/xyz/zephyr/samples/hello_world/src/main3.c
```

One can also specify the program header for a given memory region:

SRAM2\ :phdr0:COPY:/home/xyz/zephyr/samples/hello_world/src/main.c

To invoke this script:

```
python3 gen_relocate_app.py -i input_string -o generated_linker -c generated_code
```

Configuration that needs to be sent to the python script.

- If the memory is like SRAM1/SRAM2/CCD/AON then place full object in the sections
- If the memory type is appended with _DATA / _TEXT/ _RODATA/ _BSS only the selected memory is placed in the required memory region. Others are ignored.
- COPY/NOCOPY defines whether the script should generate the relocation code in code_relocation.c or not
- NOKEEP will suppress the default behavior of marking every relocated symbol with KEEP() in the generated linker script.

Multiple regions can be appended together like SRAM2_DATA_BSS this will place data and bss inside SRAM2.

scripts/build/process_gperf.py

gperf C file post-processor

We use gperf to build up a perfect hashtable of pointer values. The way gperf does this is to create a table 'wordlist' indexed by a string representation of a pointer address, and then doing memcmp() on a string passed in for comparison

We are exclusively working with 4-byte pointer values. This script adjusts the generated code so that we work with pointers directly and not strings. This saves a considerable amount of space.

scripts/build/gen_app_partitions.py

Script to generate a linker script organizing application memory partitions

Applications may declare build-time memory domain partitions with K_APPMEM_PARTITION_DEFINE, and assign globals to them using K_APP_DMEM or K_APP_BMEM macros. For each of these partitions, we need to route all their data into

appropriately-sized memory areas which meet the size/alignment constraints of the memory protection hardware.

This linker script is created very early in the build process, before the build attempts to link the kernel binary, as the linker script this tool generates is a necessary pre-condition for kernel linking. We extract the set of memory partitions to generate by looking for variables which have been assigned to input sections that follow a defined naming convention. We also allow entire libraries to be pulled in to assign their globals to a particular memory partition via command line directives.

This script takes as inputs:

- The base directory to look for compiled objects
- key/value pairs mapping static library files to what partitions their globals should end up in.

The output is a linker script fragment containing the definition of the app shared memory section, which is further divided, for each partition found, into data and BSS for each partition.

scripts/build/check_init_priorities.py

Checks the initialization priorities

This script parses a Zephyr executable file, creates a list of known devices and their effective initialization priorities and compares that with the device dependencies inferred from the devicetree hierarchy.

This can be used to detect devices that are initialized in the incorrect order, but also devices that are initialized at the same priority but depends on each other, which can potentially break if the linking order is changed.

Optionally, it can also produce a human readable list of the initialization calls for the various init levels.

5.2 Devicetree

A *devicetree* is a hierarchical data structure primarily used to describe hardware. Zephyr uses devicetree in two main ways:

- to describe hardware to the *Device Driver Model*
- to provide that hardware's initial configuration

This page links to a high level guide on devicetree as well as reference material.

5.2.1 Devicetree Guide

The pages in this section are a high-level guide to using devicetree for Zephyr development.

Introduction to devicetree

> **Tip**
>
> This is a conceptual overview of devicetree and how Zephyr uses it. For step-by-step guides and examples, see *Devicetree HOWTOs*.

The following pages introduce general devicetree concepts and how they apply to Zephyr.

Scope and purpose A *devicetree* is primarily a hierarchical data structure that describes hardware. The Devicetree specification defines its source and binary representations.

Zephyr uses devicetree to describe:

- the hardware available on its boards
- that hardware's initial configuration

As such, devicetree is both a hardware description language and a configuration language for Zephyr. See *Devicetree versus Kconfig* for some comparisons between devicetree and Zephyr's other main configuration language, Kconfig.

There are two types of devicetree input files: *devicetree sources* and *devicetree bindings*. The sources contain the devicetree itself. The bindings describe its contents, including data types. The *build system* uses devicetree sources and bindings to produce a generated C header. The generated header's contents are abstracted by the `devicetree.h` API, which you can use to get information from your devicetree.

Here is a simplified view of the process:

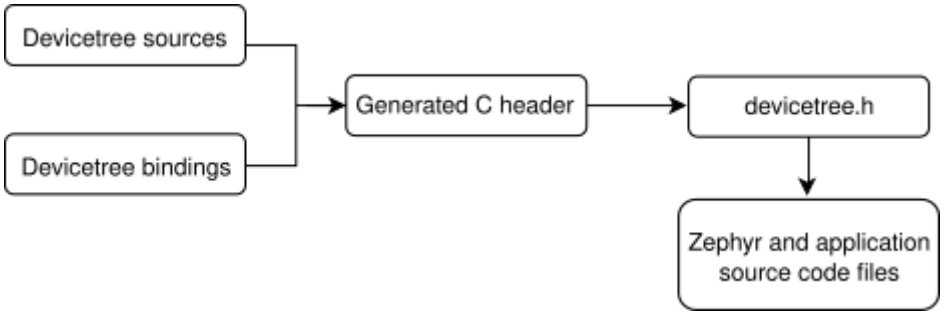


Fig. 1: Devicetree build flow

All Zephyr and application source code files can include and use `devicetree.h`. This includes *device drivers*, *applications*, *tests*, the kernel, etc.

The API itself is based on C macros. The macro names all start with `DT_`. In general, if you see a macro that starts with `DT_` in a Zephyr source file, it's probably a `devicetree.h` macro. The generated C header contains macros that start with `DT_` as well; you might see those in compiler error messages. You always can tell a generated- from a non-generated macro: generated macros have some lowercased letters, while the `devicetree.h` macro names have all capital letters.

Syntax and structure As the name indicates, a devicetree is a tree. The human-readable text format for this tree is called DTS (for devicetree source), and is defined in the Devicetree specification.

This page's purpose is to introduce devicetree in a more gradual way than the specification. However, you may still need to refer to the specification to understand some detailed cases.

Contents

- *Example*
- *Nodes*
- *Properties*

- *Devicetrees reflect hardware*
- *Properties in practice*
- *Unit addresses*
- *Important properties*
- *Writing property values*
- *Aliases and chosen nodes*

Example Here is an example DTS file:

```
/dts-v1/;

/ {
        a-node {
                subnode_nodelabel: a-sub-node {
                        foo = <3>;
                };
        };
};
```

The `/dts-v1/;` line means the file's contents are in version 1 of the DTS syntax, which has replaced a now-obsolete "version 0".

Nodes Like any tree data structure, a devicetree has a hierarchy of *nodes*. The above tree has three nodes:

1. A root node: `/`
2. A node named `a-node`, which is a child of the root node
3. A node named `a-sub-node`, which is a child of `a-node`

Nodes can be assigned *node labels*, which are unique shorthands that refer to the labeled node. Above, `a-sub-node` has the node label `subnode_nodelabel`. A node can have zero, one, or multiple node labels. You can use node labels to refer to the node elsewhere in the devicetree.

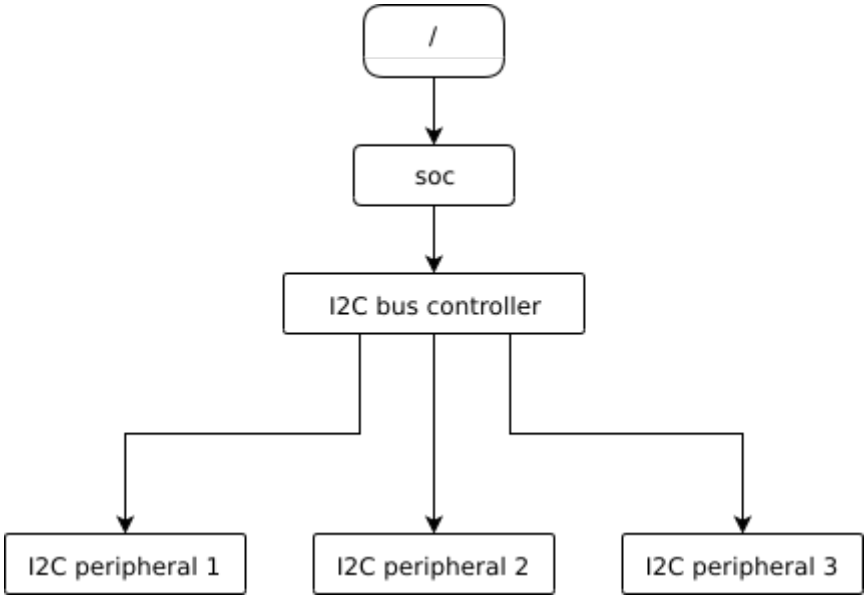
Devicetree nodes have *paths* identifying their locations in the tree. Like Unix file system paths, devicetree paths are strings separated by slashes (`/`), and the root node's path is a single slash: `/`. Otherwise, each node's path is formed by concatenating the node's ancestors' names with the node's own name, separated by slashes. For example, the full path to `a-sub-node` is `/a-node/a-sub-node`.

Properties Devicetree nodes can also have *properties*. Properties are name/value pairs. Property values can be any sequence of bytes. In some cases, the values are an array of what are called *cells*. A cell is just a 32-bit unsigned integer.

Node `a-sub-node` has a property named `foo`, whose value is a cell with value 3. The size and type of `foo`'s value are implied by the enclosing angle brackets (< and >) in the DTS.

See *Writing property values* below for more example property values.

Devicetrees reflect hardware In practice, devicetree nodes usually correspond to some hardware, and the node hierarchy reflects the hardware's physical layout. For example, let's consider a board with three I2C peripherals connected to an I2C bus controller on an SoC, like this:



Nodes corresponding to the I2C bus controller and each I2C peripheral would be present in the devicetree. Reflecting the hardware layout, the I2C peripheral nodes would be children of the bus controller node. Similar conventions exist for representing other types of hardware.

The DTS would look something like this:

```
/dts-v1/;

/ {
        soc {
                i2c-bus-controller {
                        i2c-peripheral-1 {
                        };
                        i2c-peripheral-2 {
                        };
                        i2c-peripheral-3 {
                        };
                };
        };
};
```

Properties in practice In practice, properties usually describe or configure the hardware the node represents. For example, an I2C peripheral's node has a property whose value is the peripheral's address on the bus.

Here's a tree representing the same example, but with real-world node names and properties you might see when working with I2C devices.

This is the corresponding DTS:

```
/dts-v1/;

/ {
        soc {
                i2c@40003000 {
                        compatible = "nordic,nrf-twim";
                        reg = <0x40003000 0x1000>;

                        apds9960@39 {
                                compatible = "avago,apds9960";
```

(continues on next page)

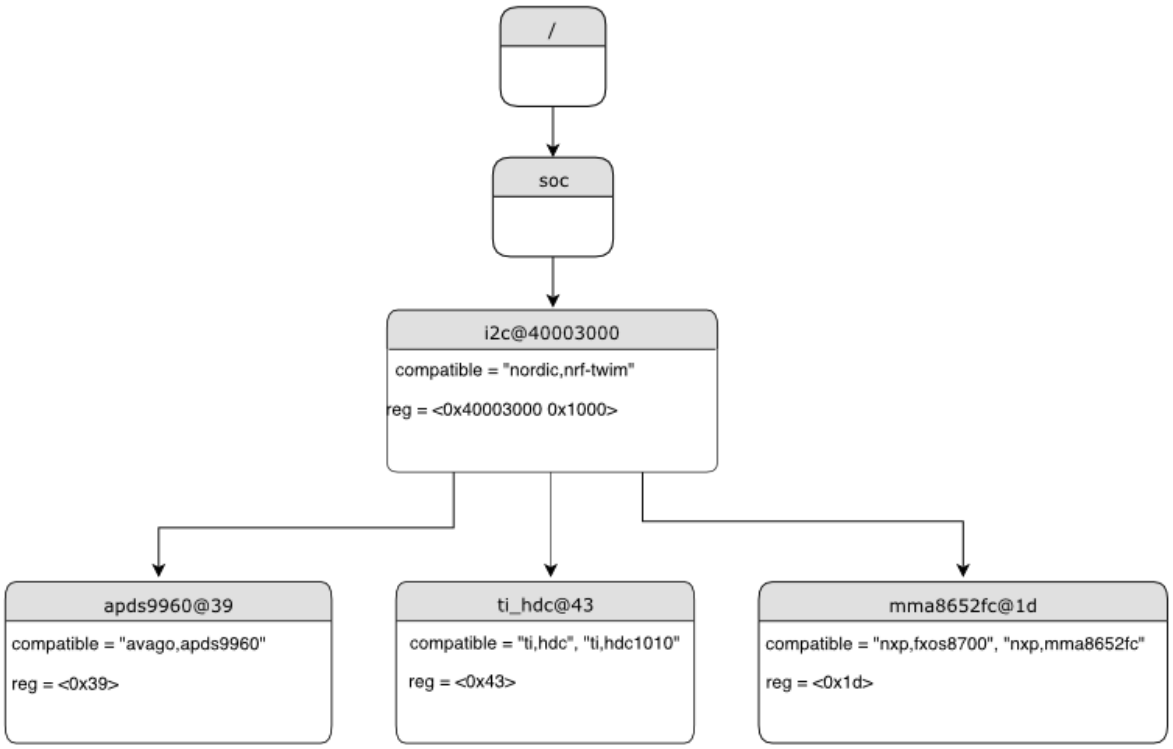


Fig. 2: I2C devicetree example with real-world names and properties. Node names are at the top of each node with a gray background. Properties are shown as "name=value" lines.

(continued from previous page)

```
                        reg = <0x39>;
                };
                ti_hdc@43 {
                        compatible = "ti,hdc", "ti,hdc1010";
                        reg = <0x43>;
                };
                mma8652fc@1d {
                        compatible = "nxp,fxos8700", "nxp,mma8652fc";
                        reg = <0x1d>;
                };
        };
};
};
```

Unit addresses In addition to showing more real-world names and properties, the above example introduces a new devicetree concept: unit addresses. Unit addresses are the parts of node names after an "at" sign (`@`), like `40003000` in `i2c@40003000`, or `39` in `apds9960@39`. Unit addresses are optional: the `soc` node does not have one.

In devicetree, unit addresses give a node's address in the address space of its parent node. Here are some example unit addresses for different types of hardware.

Memory-mapped peripherals
: The peripheral's register map base address. For example, the node named `i2c@40003000` represents an I2C controller whose register map base address is 0x40003000.

I2C peripherals
: The peripheral's address on the I2C bus. For example, the child node `apds9960@39` of the I2C controller in the previous section has I2C address 0x39.

SPI peripherals
An index representing the peripheral's chip select line number. (If there is no chip select line, 0 is used.)

Memory
The physical start address. For example, a node named `memory@2000000` represents RAM starting at physical address 0x2000000.

Memory-mapped flash
Like RAM, the physical start address. For example, a node named `flash@8000000` represents a flash device whose physical start address is 0x8000000.

Fixed flash partitions
This applies when the devicetree is used to store a flash partition table. The unit address is the partition's start offset within the flash memory. For example, take this flash device and its partitions:

```
flash@8000000 {
    /* ... */
    partitions {
            partition@0 { /* ... */ };
            partition@20000 {  /* ... */ };
            /* ... */
    };
};
```

The node named `partition@0` has offset 0 from the start of its flash device, so its base address is 0x8000000. Similarly, the base address of the node named `partition@20000` is 0x8020000.

Important properties The devicetree specification defines several standard properties. Some of the most important ones are:

compatible
The name of the hardware device the node represents.

The recommended format is `"vendor,device"`, like `"avago,apds9960"`, or a sequence of these, like `"ti,hdc", "ti,hdc1010"`. The `vendor` part is an abbreviated name of the vendor. The file dts/bindings/vendor-prefixes.txt contains a list of commonly accepted `vendor` names. The `device` part is usually taken from the datasheet.

It is also sometimes a value like `gpio-keys`, `mmio-sram`, or `fixed-clock` when the hardware's behavior is generic.

The build system uses the compatible property to find the right *bindings* for the node. Device drivers use `devicetree.h` to find nodes with relevant compatibles, in order to determine the available hardware to manage.

The `compatible` property can have multiple values. Additional values are useful when the device is a specific instance of a more general family, to allow the system to match from most- to least-specific device drivers.

Within Zephyr's bindings syntax, this property has type `string-array`.

reg
Information used to address the device. The value is specific to the device (i.e. is different depending on the compatible property).

The `reg` property is a sequence of `(address, length)` pairs. Each pair is called a "register block". Values are conventionally written in hex.

Here are some common patterns:

- Devices accessed via memory-mapped I/O registers (like `i2c@40003000`): `address` is usually the base address of the I/O register space, and `length` is the number of bytes occupied by the registers.
- I2C devices (like `apds9960@39` and its siblings): `address` is a slave address on the I2C bus. There is no `length` value.
- SPI devices: `address` is a chip select line number; there is no `length`.

You may notice some similarities between the `reg` property and common unit addresses described above. This is not a coincidence. The `reg` property can be seen as a more detailed view of the addressable resources within a device than its unit address.

status
A string which describes whether the node is enabled.

The devicetree specification allows this property to have values `"okay"`, `"disabled"`, `"reserved"`, `"fail"`, and `"fail-sss"`. Only the values `"okay"` and `"disabled"` are currently relevant to Zephyr; use of other values currently results in undefined behavior.

A node is considered enabled if its status property is either `"okay"` or not defined (i.e. does not exist in the devicetree source). Nodes with status `"disabled"` are explicitly disabled. (For backwards compatibility, the value `"ok"` is treated the same as `"okay"`, but this usage is deprecated.) Devicetree nodes which correspond to physical devices must be enabled for the corresponding `struct device` in the Zephyr driver model to be allocated and initialized.

interrupts
Information about interrupts generated by the device, encoded as an array of one or more *interrupt specifiers*. Each interrupt specifier has some number of cells. See section 2.4, *Interrupts and Interrupt Mapping*, in the Devicetree Specification release v0.3 for more details.

Zephyr's devicetree bindings language lets you give a name to each cell in an interrupt specifier.

Note

Earlier versions of Zephyr made frequent use of the `label` property, which is distinct from the standard *node label*. Use of the label *property* in new devicetree bindings, as well as use of the `DT_LABEL` macro in new code, are actively discouraged. Label properties continue to persist for historical reasons in some existing bindings and overlays, but should not be used in new bindings or device implementations.

Writing property values This section describes how to write property values in DTS format. The property types in the table below are described in detail in *Devicetree bindings*.

Some specifics are skipped in the interest of keeping things simple; if you're curious about details, see the devicetree specification.

Property type	How to write	Example
string	Double quoted	`a-string = "hello, world!";`
int	between angle brackets (< and >)	`an-int = <1>;`
boolean	for `true`, with no value (for `false`, use `/delete-property/`)	`my-true-boolean;`
array	between angle brackets (< and >), separated by spaces	`foo = <0xdeadbeef 1234 0>;`
uint8-array	in hexadecimal *without* leading `0x`, between square brackets (`[` and `]`).	`a-byte-array = [00 01 ab];`
string-array	separated by commas	`a-string-array = "string one", "string two", "string three";`
phandle	between angle brackets (< and >)	`a-phandle = <&mynode>;`
phandles	between angle brackets (< and >), separated by spaces	`some-phandles = <&mynode0 &mynode1 &mynode2>;`
phandle-array	between angle brackets (< and >), separated by spaces	`a-phandle-array = <&mynode0 1 2>, <&mynode1 3 4>;`

Additional notes on the above:

- The values in the `phandle`, `phandles`, and `phandle-array` types are described further in *Phandles*
- Boolean properties are true if present. They should not have a value. A boolean property is only false if it is completely missing in the DTS.
- The `foo` property value above has three *cells* with values 0xdeadbeef, 1234, and 0, in that order. Note that hexadecimal and decimal numbers are allowed and can be intermixed. Since Zephyr transforms DTS to C sources, it is not necessary to specify the endianness of an individual cell here.
- 64-bit integers are written as two 32-bit cells in big-endian order. The value 0xaaaa0000bbbb1111 would be written `<0xaaaa0000 0xbbbb1111>`.
- The `a-byte-array` property value is the three bytes 0x00, 0x01, and 0xab, in that order.
- Parentheses, arithmetic operators, and bitwise operators are allowed. The `bar` property contains a single cell with value 64:

  ```
  bar = <(2 * (1 << 5))>;
  ```

  Note that the entire expression must be parenthesized.
- Property values refer to other nodes in the devicetree by their *phandles*. You can write a phandle using `&foo`, where `foo` is a *node label*. Here is an example devicetree fragment:

  ```
  foo: device@0 { };
  device@1 {
          sibling = <&foo 1 2>;
  };
  ```

  The `sibling` property of node `device@1` contains three cells, in this order:

  1. The `device@0` node's phandle, which is written here as `&foo` since the `device@0` node has a node label `foo`
  2. The value 1
  3. The value 2

In the devicetree, a phandle value is a cell – which again is just a 32-bit unsigned int. However, the Zephyr devicetree API generally exposes these values as *node identifiers*. Node identifiers are covered in more detail in *Devicetree access from C/C++*.

- Array and similar type property values can be split into several <> blocks, like this:

```
foo = <1 2>, <3 4>;                          // Okay for 'type: array'
foo = <&label1 &label2>, <&label3 &label4>; // Okay for 'type: phandles'
foo = <&label1 1 2>, <&label2 3 4>;          // Okay for 'type: phandle-array'
```

This is recommended for readability when possible if the value can be logically grouped into blocks of sub-values.

Aliases and chosen nodes There are two additional ways beyond *node labels* to refer to a particular node without specifying its entire path: by alias, or by chosen node.

Here is an example devicetree which uses both:

```
/dts-v1/;

/ {
    chosen {
            zephyr,console = &uart0;
    };

    aliases {
            my-uart = &uart0;
    };

    soc {
            uart0: serial@12340000 {
                    ...
            };
    };
};
```

The `/aliases` and `/chosen` nodes do not refer to an actual hardware device. Their purpose is to specify other nodes in the devicetree.

Above, `my-uart` is an alias for the node with path `/soc/serial@12340000`. Using its node label `uart0`, the same node is set as the value of the chosen `zephyr,console` node.

Zephyr sample applications sometimes use aliases to allow overriding the particular hardware device used by the application in a generic way. For example, blinky uses this to abstract the LED to blink via the `led0` alias.

The `/chosen` node's properties are used to configure system- or subsystem-wide values. See *Chosen nodes* for more information.

Input and output files This section describes the input and output files shown in the figure in *Scope and purpose* in more detail.

Input files There are four types of devicetree input files:

- sources (`.dts`)
- includes (`.dtsi`)
- overlays (`.overlay`)
- bindings (`.yaml`)

The devicetree files inside the `zephyr` directory look like this:

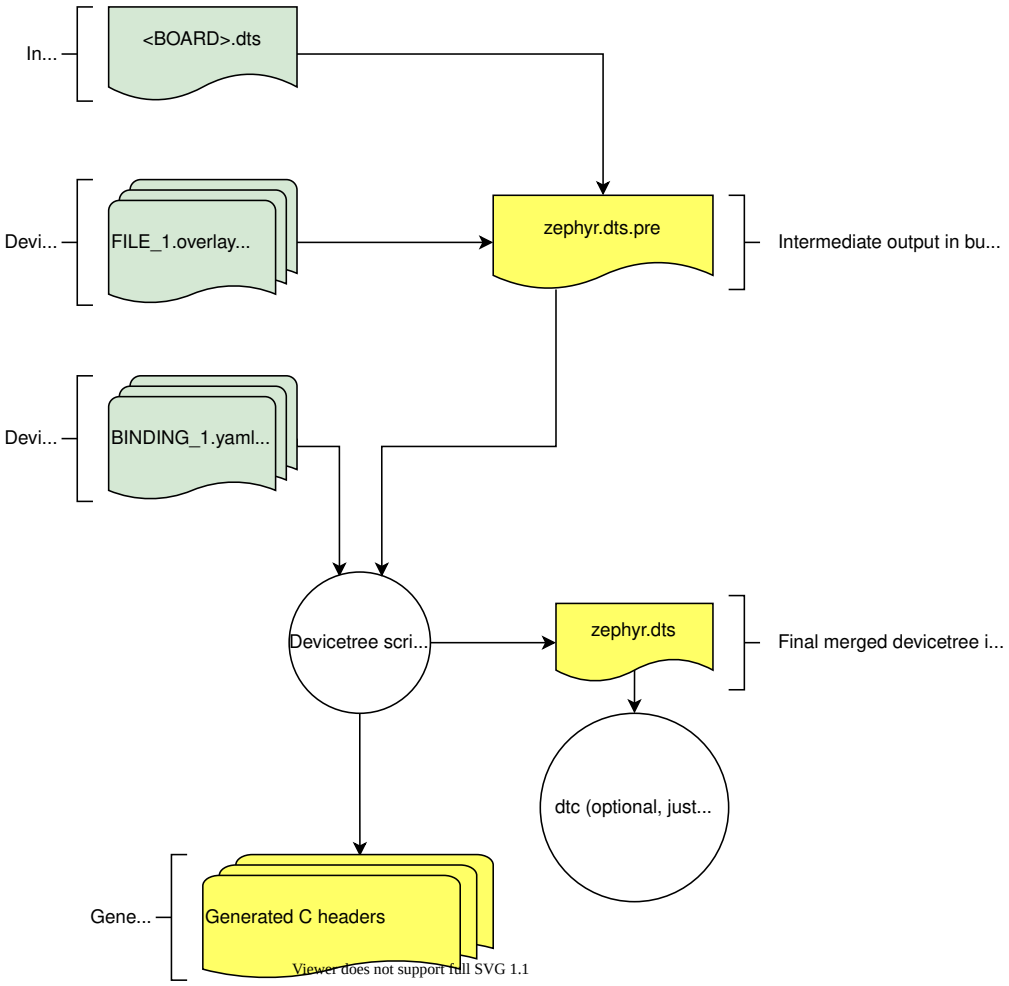

Fig. 3: Devicetree input (green) and output (yellow) files

```
boards/<ARCH>/<BOARD>/<BOARD>.dts
dts/common/skeleton.dtsi
dts/<ARCH>/.../<SOC>.dtsi
dts/bindings/.../binding.yaml
```

Generally speaking, every supported board has a `BOARD.dts` file describing its hardware. For example, the `reel_board` has boards/phytec/reel_board/reel_board.dts.

`BOARD.dts` includes one or more `.dtsi` files. These `.dtsi` files describe the CPU or system-on-chip Zephyr runs on, perhaps by including other `.dtsi` files. They can also describe other common hardware features shared by multiple boards. In addition to these includes, `BOARD.dts` also describes the board's specific hardware.

The `dts/common` directory contains `skeleton.dtsi`, a minimal include file for defining a complete devicetree. Architecture-specific subdirectories (`dts/<ARCH>`) contain `.dtsi` files for CPUs or SoCs which extend `skeleton.dtsi`.

The C preprocessor is run on all devicetree files to expand macro references, and includes are generally done with `#include <filename>` directives, even though DTS has a `/include/ "<filename>"` syntax.

`BOARD.dts` can be extended or modified using *overlays*. Overlays are also DTS files; the `.overlay` extension is just a convention which makes their purpose clear. Overlays adapt the base devicetree for different purposes:

- Zephyr applications can use overlays to enable a peripheral that is disabled by default, select a sensor on the board for an application specific purpose, etc. Along with *Configuration System (Kconfig)*, this makes it possible to reconfigure the kernel and device drivers without modifying source code.
- Overlays are also used when defining *Shields*.

The build system automatically picks up `.overlay` files stored in certain locations. It is also possible to explicitly list the overlays to include, via the `DTC_OVERLAY_FILE` CMake variable. See *Set devicetree overlays* for details.

The build system combines `BOARD.dts` and any `.overlay` files by concatenating them, with the overlays put last. This relies on DTS syntax which allows merging overlapping definitions of nodes in the devicetree. See *Example: FRDM-K64F and Hexiwear K64* for an example of how this works (in the context of `.dtsi` files, but the principle is the same for overlays). Putting the contents of the `.overlay` files last allows them to override `BOARD.dts`.

Devicetree bindings (which are YAML files) are essentially glue. They describe the contents of devicetree sources, includes, and overlays in a way that allows the build system to generate C macros usable by device drivers and applications. The `dts/bindings` directory contains bindings.

Scripts and tools The following libraries and scripts, located in scripts/dts/, create output files from input files. Their sources have extensive documentation.

dtlib.py
: A low-level DTS parsing library.

edtlib.py
: A library layered on top of dtlib that uses bindings to interpret properties and give a higher-level view of the devicetree. Uses dtlib to do the DTS parsing.

gen_defines.py
: A script that uses edtlib to generate C preprocessor macros from the devicetree and bindings.

In addition to these, the standard `dtc` (devicetree compiler) tool is run on the final devicetree if it is installed on your system. This is just to catch errors or warnings. The output is unused.

Boards may need to pass `dtc` additional flags, e.g. for warning suppression. Board directories can contain a file named `pre_dt_board.cmake` which configures these extra flags, like this:

```
list(APPEND EXTRA_DTC_FLAGS "-Wno-simple_bus_reg")
```

Output files These are created in your application's build directory.

Warning

Don't include the header files directly. *Devicetree access from C/C++* explains what to do instead.

`<build>/zephyr/zephyr.dts.pre`
: The preprocessed DTS source. This is an intermediate output file, which is input to `gen_defines.py` and used to create `zephyr.dts` and `devicetree_generated.h`.

`<build>/zephyr/include/generated/zephyr/devicetree_generated.h`
: The generated macros and additional comments describing the devicetree. Included by `devicetree.h`.

`<build>/zephyr/zephyr.dts`
: The final merged devicetree. This file is output by `gen_defines.py`. It is useful for debugging any issues. If the devicetree compiler `dtc` is installed, it is also run on this file, to catch any additional warnings or errors.

Design goals

Zephyr's use of devicetree has evolved significantly over time, and further changes are expected. The following are the general design goals, along with specific examples about how they impact Zephyr's source code, and areas where more work remains to be done.

Single source for hardware information Zephyr's built-in device drivers and sample applications shall obtain configurable hardware descriptions from devicetree.

Examples

- New device drivers shall use devicetree APIs to determine which *devices to create*.
- In-tree sample applications shall use *aliases* to determine which of multiple possible generic devices of a given type will be used in the current build. For example, the blinky sample uses this to determine the LED to blink.
- Boot-time pin muxing and pin control for new SoCs shall be accomplished via a devicetree-based pinctrl driver

Example remaining work

- Zephyr's *Test Runner (Twister)* currently use `board.yaml` files to determine the hardware supported by a board. This should be obtained from devicetree instead.
- Legacy device drivers currently use Kconfig to determine which instances of a particular compatible are enabled. This can and should be done with devicetree overlays instead.
- Board-level documentation still contains tables of hardware support which are generated and maintained by hand. This can and should be obtained from the board level devicetree instead.

- Runtime determination of `struct device` relationships should be done using information obtained from devicetree, e.g. for device power management.

Source compatibility with other operating systems Zephyr's devicetree tooling is based on a generic layer which is interoperable with other devicetree users, such as the Linux kernel.

Zephyr's binding language *semantics* can support Zephyr-specific attributes, but shall not express Zephyr-specific relationships.

Examples

- Zephyr's devicetree source parser, *dtlib.py*, is source-compatible with other tools like dtc in both directions: `dtlib.py` can parse `dtc` output, and `dtc` can parse `dtlib.py` output.
- Zephyr's "extended dtlib" library, `edtlib.py`, shall not include Zephyr-specific features. Its purpose is to provide a higher-level view of the devicetree for common elements like interrupts and buses.

  Only the high-level `gen_defines.py` script, which is built on top of `edtlib.py`, contains Zephyr-specific knowledge and features.

Example remaining work

- Zephyr has a custom *Devicetree bindings* language *syntax*. While Linux's dtschema does not yet meet Zephyr's needs, we should try to follow what it is capable of representing in Zephyr's own bindings.
- Due to inflexibility in the bindings language, Zephyr cannot support the full set of bindings supported by Linux.
- Devicetree source sharing between Zephyr and Linux is not done.

Devicetree bindings

A devicetree on its own is only half the story for describing hardware, as it is a relatively unstructured format. *Devicetree bindings* provide the other half.

A devicetree binding declares requirements on the contents of nodes, and provides semantic information about the contents of valid nodes. Zephyr devicetree bindings are YAML files in a custom format (Zephyr does not use the dt-schema tools used by the Linux kernel).

These pages introduce bindings, describe what they do, note where they are found, and explain their data format.

Note

See the *Bindings index* for reference information on bindings built in to Zephyr.

Note

For a detailed syntax reference, see *Devicetree bindings syntax*.

Introduction to Devicetree Bindings Devicetree nodes are matched to bindings using their *compatible properties*.

During the *Configuration Phase*, the build system tries to match each node in the devicetree to a binding file. When this succeeds, the build system uses the information in the binding file both when validating the node's contents and when generating macros for the node.

A simple example Here is an example devicetree node:

```
/* Node in a DTS file */
bar-device {
     compatible = "foo-company,bar-device";
     num-foos = <3>;
};
```

Here is a minimal binding file which matches the node:

```
# A YAML binding matching the node

compatible: "foo-company,bar-device"

properties:
  num-foos:
    type: int
    required: true
```

The build system matches the `bar-device` node to its YAML binding because the node's `compatible` property matches the binding's `compatible:` line.

What the build system does with bindings The build system uses bindings both to validate devicetree nodes and to convert the devicetree's contents into the generated *devicetree_generated.h* header file.

For example, the build system would use the above binding to check that the required `num-foos` property is present in the `bar-device` node, and that its value, `<3>`, has the correct type.

The build system will then generate a macro for the `bar-device` node's `num-foos` property, which will expand to the integer literal `3`. This macro lets you get the value of the property in C code using the API which is discussed later in this guide in *Devicetree access from C/C++*.

For another example, the following node would cause a build error, because it has no `num-foos` property, and this property is marked required in the binding:

```
bad-node {
     compatible = "foo-company,bar-device";
};
```

Other ways nodes are matched to bindings If a node has more than one string in its `compatible` property, the build system looks for compatible bindings in the listed order and uses the first match.

Take this node as an example:

```
baz-device {
     compatible = "foo-company,baz-device", "generic-baz-device";
};
```

The `baz-device` node would get matched to a binding with a `compatible: "generic-baz-device"` line if the build system can't find a binding with a `compatible: "foo-company,baz-device"` line.

Nodes without compatible properties can be matched to bindings associated with their parent nodes. These are called "child bindings". If a node describes hardware on a bus, like I2C or SPI,

then the bus type is also taken into account when matching nodes to bindings. (See *On-bus* for details).

See *The /zephyr,user node* for information about a special node that doesn't require any binding.

Where bindings are located Binding file names usually match their `compatible:` lines. For example, the above example binding would be named `foo-company,bar-device.yaml` by convention.

The build system looks for bindings in `dts/bindings` subdirectories of the following places:

- the zephyr repository
- your *application source directory*
- your *board directory*
- any *shield directories*
- any directories manually included in the *DTS_ROOT* CMake variable
- any *module* that defines a `dts_root` in its *Build settings*

The build system will consider any YAML file in any of these, including in any subdirectories, when matching nodes to bindings. A file is considered YAML if its name ends with `.yaml` or `.yml`.

Warning

The binding files must be located somewhere inside the `dts/bindings` subdirectory of the above places.

For example, if `my-app` is your application directory, then you must place application-specific bindings inside `my-app/dts/bindings`. So `my-app/dts/bindings/serial/my-company,my-serial-port.yaml` would be found, but `my-app/my-company,my-serial-port.yaml` would be ignored.

Devicetree bindings syntax This page documents the syntax of Zephyr's bindings format. Zephyr bindings files are YAML files. A *simple example* was given in the introduction page.

Contents

- *Top level keys*
- *Description*
- *Compatible*
- *Properties*
  - *Property entry syntax*
  - *Example property definitions*
  - *required*
  - *type*
  - *deprecated*
  - *default*
  - *enum*

    - *const*
    - *specifier-space*
  - *Child-binding*
  - *Bus*
  - *On-bus*
  - *Specifier cell names (*-cells)*
  - *Include*
  - *Nexus nodes and maps*

Top level keys The top level of a bindings file maps keys to values. The top-level keys look like this:

```
# A high level description of the device the binding applies to:
description: |
   This is the Vendomatic company's foo-device.

   Descriptions which span multiple lines (like this) are OK,
   and are encouraged for complex bindings.

   See https://yaml-multiline.info/ for formatting help.

# You can include definitions from other bindings using this syntax:
include: other.yaml

# Used to match nodes to this binding:
compatible: "manufacturer,foo-device"

properties:
  # Requirements for and descriptions of the properties that this
  # binding's nodes need to satisfy go here.

child-binding:
  # You can constrain the children of the nodes matching this binding
  # using this key.

# If the node describes bus hardware, like an SPI bus controller
# on an SoC, use 'bus:' to say which one, like this:
bus: spi

# If the node instead appears as a device on a bus, like an external
# SPI memory chip, use 'on-bus:' to say what type of bus, like this.
# Like 'compatible', this key also influences the way nodes match
# bindings.
on-bus: spi

foo-cells:
  # "Specifier" cell names for the 'foo' domain go here; example 'foo'
  # values are 'gpio', 'pwm', and 'dma'. See below for more information.
```

These keys are explained in the following sections.

Description A free-form description of node hardware goes here. You can put links to datasheets or example nodes or properties as well.

Compatible This key is used to match nodes to this binding as described in *Introduction to Devicetree Bindings*. It should look like this in a binding file:

```
# Note the comma-separated vendor prefix and device name
compatible: "manufacturer,device"
```

This devicetree node would match the above binding:

```
device {
     compatible = "manufacturer,device";
};
```

Assuming no binding has `compatible: "manufacturer,device-v2"`, it would also match this node:

```
device-2 {
    compatible = "manufacturer,device-v2", "manufacturer,device";
};
```

Each node's `compatible` property is tried in order. The first matching binding is used. The *on-bus:* key can be used to refine the search.

If more than one binding for a compatible is found, an error is raised.

The `manufacturer` prefix identifies the device vendor. See dts/bindings/vendor-prefixes.txt for a list of accepted vendor prefixes. The `device` part is usually from the datasheet.

Some bindings apply to a generic class of devices which do not have a specific vendor. In these cases, there is no vendor prefix. One example is the `gpio-leds` compatible which is commonly used to describe board LEDs connected to GPIOs.

Properties The `properties:` key describes properties that nodes which match the binding contain. For example, a binding for a UART peripheral might look something like this:

```
compatible: "manufacturer,serial"

properties:
  reg:
    type: array
    description: UART peripheral MMIO register space
    required: true
  current-speed:
    type: int
    description: current baud rate
    required: true
```

In this example, a node with compatible `"manufacturer,serial"` must contain a node named `current-speed`. The property's value must be a single integer. Similarly, the node must contain a `reg` property.

The build system uses bindings to generate C macros for devicetree properties that appear in DTS files. You can read more about how to get property values in source code from these macros in *Devicetree access from C/C++*. Generally speaking, the build system only generates macros for properties listed in the `properties:` key for the matching binding. Properties not mentioned in the binding are generally ignored by the build system.

The one exception is that the build system will always generate macros for standard properties, like *reg*, whose meaning is defined by the devicetree specification. This happens regardless of whether the node has a matching binding or not.

Property entry syntax Property entries in `properties:` are written in this syntax:

```
<property name>:
  required: <true | false>
  type: <string | int | boolean | array | uint8-array | string-array |
         phandle | phandles | phandle-array | path | compound>
  deprecated: <true | false>
  default: <default>
  description: <description of the property>
  enum:
    - <item1>
    - <item2>
    ...
    - <itemN>
  const: <string | int | array | uint8-array | string-array>
  specifier-space: <space-name>
```

Example property definitions Here are some more examples.

```
properties:
    # Describes a property like 'current-speed = <115200>;'. We pretend that
    # it's obligatory for the example node and set 'required: true'.
    current-speed:
        type: int
        required: true
        description: Initial baud rate for bar-device

    # Describes an optional property like 'keys = "foo", "bar";'
    keys:
        type: string-array
        description: Keys for bar-device

    # Describes an optional property like 'maximum-speed = "full-speed";'
    # the enum specifies known values that the string property may take
    maximum-speed:
        type: string
        description: Configures USB controllers to work up to a specific speed.
        enum:
           - "low-speed"
           - "full-speed"
           - "high-speed"
           - "super-speed"

    # Describes an optional property like 'resolution = <16>;'
    # the enum specifies known values that the int property may take
    resolution:
      type: int
      enum:
       - 8
       - 16
       - 24
       - 32

    # Describes a required property '#address-cells = <1>';  the const
    # specifies that the value for the property is expected to be the value 1
    "#address-cells":
        type: int
        required: true
        const: 1

    int-with-default:
        type: int
```

(continues on next page)

(continued from previous page)

```
    default: 123
    description: Value for int register, default is power-up configuration.

  array-with-default:
    type: array
    default: [1, 2, 3] # Same as 'array-with-default = <1 2 3>'

  string-with-default:
    type: string
    default: "foo"

  string-array-with-default:
    type: string-array
    default: ["foo", "bar"] # Same as 'string-array-with-default = "foo", "bar"'

  uint8-array-with-default:
    type: uint8-array
    default: [0x12, 0x34] # Same as 'uint8-array-with-default = [12 34]'
```

required Adding `required: true` to a property definition will fail the build if a node matches the binding, but does not contain the property.

The default setting is `required: false`; that is, properties are optional by default. Using `required: false` is therefore redundant and strongly discouraged.

type The type of a property constrains its values. The following types are available. See *Writing property values* for more details about writing values of each type in a DTS file. See *Phandles* for more information about the `phandle*` type properties.

Type	Description	Example in DTS
`string`	exactly one string	`status = "disabled";`
`int`	exactly one 32-bit value (cell)	`current-speed = <115200>;`
`boolean`	flags that don't take a value when true, and are absent if false	`hw-flow-control;`
`array`	zero or more 32-bit values (cells)	`offsets = <0x100 0x200 0x300>;`
`uint8-array`	zero or more bytes, in hex ('bytestring' in the Devicetree specification)	`local-mac-address = [de ad be ef 12 34];`
`string-array`	zero or more strings	`dma-names = "tx", "rx";`
`phandle`	exactly one phandle	`interrupt-parent = <&gic>;`
`phandles`	zero or more phandles	`pinctrl-0 = <&usart2_tx_pd5 &usart2_rx_pd6>;`
`phandle-array`	a list of phandles and 32-bit cells (usually specifiers)	`dmas = <&dma0 2>, <&dma0 3>;`
`path`	a path to a node as a phandle path reference or path string	`zephyr,bt-c2h-uart = &uart0;` or `foo = "/path/to/some/node";`
`compound`	a catch-all for more complex types (no macros will be generated)	`foo = <&label>, [01 02];`

deprecated A property with `deprecated: true` indicates to both the user and the tooling that the property is meant to be phased out.

The tooling will report a warning if the devicetree includes the property that is flagged as deprecated. (This warning is upgraded to an error in the *Test Runner (Twister)* for upstream pull requests.)

The default setting is `deprecated: false`. Using `deprecated: false` is therefore redundant and strongly discouraged.

default The optional `default:` setting gives a value that will be used if the property is missing from the devicetree node.

For example, with this binding fragment:

```
properties:
  foo:
    type: int
    default: 3
```

If property `foo` is missing in a matching node, then the output will be as if `foo = <3>;` had appeared in the DTS (except YAML data types are used for the default value).

Note that combining `default:` with `required: true` will raise an error.

For rules related to `default` in upstream Zephyr bindings, see *Rules for default values*.

See *Example property definitions* for examples. Putting `default:` on any property type besides those used in *Example property definitions* will raise an error.

enum The `enum:` line is followed by a list of values the property may contain. If a property value in DTS is not in the `enum:` list in the binding, an error is raised. See *Example property definitions* for examples.

const This specifies a constant value the property must take. It is mainly useful for constraining the values of common properties for a particular piece of hardware.

Warning

It is an abuse of this feature to use it to name properties in unconventional ways.

For example, this feature is not meant for cases like naming a property `my-pin`, then assigning it to the "gpio" specifier space using this feature. Properties which refer to GPIOs should use conventional names, i.e. end in `-gpios` or `-gpio`.

specifier-space This property, if present, manually sets the specifier space associated with a property with type `phandle-array`.

Normally, the specifier space is encoded implicitly in the property name. A property named `foos` with type `phandle-array` implicitly has specifier space `foo`. As a special case, `*-gpios` properties have specifier space "gpio", so that `foo-gpios` will have specifier space "gpio" rather than "foo-gpio".

You can use `specifier-space` to manually provide a space if using this convention would result in an awkward or unconventional name.

For example:

```
compatible: ...
properties:
  bar:
    type: phandle-array
    specifier-space: my-custom-space
```

Above, the bar property's specifier space is set to "my-custom-space".

You could then use the property in a devicetree like this:

```
controller1: custom-controller@1000 {
        #my-custom-space-cells = <2>;
};

controller2: custom-controller@2000 {
        #my-custom-space-cells = <1>;
};

my-node {
        bar = <&controller1 10 20>, <&controller2 30>;
};
```

Generally speaking, you should reserve this feature for cases where the implicit specifier space naming convention doesn't work. One appropriate example is an mboxes property with specifier space "mbox", not "mboxe". You can write this property as follows:

```
properties:
  mboxes:
    type: phandle-array
    specifier-space: mbox
```

Child-binding child-binding can be used when a node has children that all share the same properties. Each child gets the contents of child-binding as its binding, though an explicit compatible = ... on the child node takes precedence, if a binding is found for it.

Consider a binding for a PWM LED node like this one, where the child nodes are required to have a pwms property:

```
pwmleds {
        compatible = "pwm-leds";

        red_pwm_led {
                pwms = <&pwm3 4 15625000>;
        };
        green_pwm_led {
                pwms = <&pwm3 0 15625000>;
        };
        /* ... */
};
```

The binding would look like this:

```
compatible: "pwm-leds"

child-binding:
  description: LED that uses PWM

  properties:
    pwms:
      type: phandle-array
      required: true
```

child-binding also works recursively. For example, this binding:

```
compatible: foo

child-binding:
  child-binding:
    properties:
      my-property:
        type: int
        required: true
```

will apply to the grandchild node in this DTS:

```
parent {
        compatible = "foo";
        child {
                grandchild {
                        my-property = <123>;
                };
        };
};
```

Bus If the node is a bus controller, use bus: in the binding to say what type of bus. For example, a binding for a SPI peripheral on an SoC would look like this:

```
compatible: "manufacturer,spi-peripheral"
bus: spi
# ...
```

The presence of this key in the binding informs the build system that the children of any node matching this binding appear on this type of bus.

This in turn influences the way on-bus: is used to match bindings for the child nodes.

For a single bus supporting multiple protocols, e.g. I3C and I2C, the bus: in the binding can have a list as value:

```
compatible: "manufacturer,i3c-controller"
bus: [i3c, i2c]
# ...
```

On-bus If the node appears as a device on a bus, use on-bus: in the binding to say what type of bus.

For example, a binding for an external SPI memory chip should include this line:

```
on-bus: spi
```

And a binding for an I2C based temperature sensor should include this line:

```
on-bus: i2c
```

When looking for a binding for a node, the build system checks if the binding for the parent node contains bus: <bus type>. If it does, then only bindings with a matching on-bus: <bus type> and bindings without an explicit on-bus are considered. Bindings with an explicit on-bus: <bus type> are searched for first, before bindings without an explicit on-bus. The search repeats for each item in the node's compatible property, in order.

This feature allows the same device to have different bindings depending on what bus it appears on. For example, consider a sensor device with compatible manufacturer,sensor which can be used via either I2C or SPI.

The sensor node may therefore appear in the devicetree as a child node of either an SPI or an I2C controller, like this:

```
spi-bus@0 {
   /* ... some compatible with 'bus: spi', etc. ... */

   sensor@0 {
       compatible = "manufacturer,sensor";
       reg = <0>;
       /* ... */
   };
};

i2c-bus@0 {
   /* ... some compatible with 'bus: i2c', etc. ... */

   sensor@79 {
       compatible = "manufacturer,sensor";
       reg = <79>;
       /* ... */
   };
};
```

You can write two separate binding files which match these individual sensor nodes, even though they have the same compatible:

```
# manufacturer,sensor-spi.yaml, which matches sensor@0 on the SPI bus:
compatible: "manufacturer,sensor"
on-bus: spi

# manufacturer,sensor-i2c.yaml, which matches sensor@79 on the I2C bus:
compatible: "manufacturer,sensor"
properties:
  uses-clock-stretching:
    type: boolean
on-bus: i2c
```

Only `sensor@79` can have a `use-clock-stretching` property. The bus-sensitive logic ignores `manufacturer,sensor-i2c.yaml` when searching for a binding for `sensor@0`.

Specifier cell names (*-cells) This section documents how to name the cells in a specifier within a binding. These concepts are discussed in detail later in this guide in *phandle-array properties*.

Consider a binding for a node whose phandle may appear in a `phandle-array` property, like the PWM controllers `pwm1` and `pwm2` in this example:

```
pwm1: pwm@deadbeef {
    compatible = "foo,pwm";
    #pwm-cells = <2>;
};

pwm2: pwm@deadbeef {
    compatible = "bar,pwm";
    #pwm-cells = <1>;
};

my-node {
    pwms = <&pwm1 1 2000>, <&pwm2 3000>;
};
```

The bindings for compatible "foo,pwm" and "bar,pwm" must give a name to the cells that appear in a PWM specifier using pwm-cells:, like this:

```
# foo,pwm.yaml
compatible: "foo,pwm"
...
pwm-cells:
  - channel
  - period

# bar,pwm.yaml
compatible: "bar,pwm"
...
pwm-cells:
  - period
```

A *-names (e.g. pwm-names) property can appear on the node as well, giving a name to each entry.

This allows the cells in the specifiers to be accessed by name, e.g. using APIs like *DT_PWMS_CHANNEL_BY_NAME*.

If the specifier is empty (e.g. #clock-cells = <0>), then *-cells can either be omitted (recommended) or set to an empty array. Note that an empty array is specified as e.g. clock-cells: [] in YAML.

Include Bindings can include other files, which can be used to share common property definitions between bindings. Use the include: key for this. Its value is either a string or a list.

In the simplest case, you can include another file by giving its name as a string, like this:

```
include: foo.yaml
```

If any file named foo.yaml is found (see *Where bindings are located* for the search process), it will be included into this binding.

Included files are merged into bindings with a simple recursive dictionary merge. The build system will check that the resulting merged binding is well-formed. It is allowed to include at any level, including child-binding, like this:

```
# foo.yaml will be merged with content at this level
include: foo.yaml

child-binding:
  # bar.yaml will be merged with content at this level
  include: bar.yaml
```

It is an error if a key appears with a different value in a binding and in a file it includes, with one exception: a binding can have required: true for a *property definition* for which the included file has required: false. The required: true takes precedence, allowing bindings to strengthen requirements from included files.

Note that weakening requirements by having required: false where the included file has required: true is an error. This is meant to keep the organization clean.

The file base.yaml contains definitions for many common properties. When writing a new binding, it is a good idea to check if base.yaml already defines some of the needed properties, and include it if it does.

Note that you can make a property defined in base.yaml obligatory like this, taking *reg* as an example:

```
reg:
  required: true
```

This relies on the dictionary merge to fill in the other keys for `reg`, like `type`.

To include multiple files, you can use a list of strings:

```
include:
  - foo.yaml
  - bar.yaml
```

This includes the files `foo.yaml` and `bar.yaml`. (You can write this list in a single line of YAML as `include: [foo.yaml, bar.yaml]`.)

When including multiple files, any overlapping `required` keys on properties in the included files are ORed together. This makes sure that a `required: true` is always respected.

In some cases, you may want to include some property definitions from a file, but not all of them. In this case, `include:` should be a list, and you can filter out just the definitions you want by putting a mapping in the list, like this:

```
include:
  - name: foo.yaml
    property-allowlist:
      - i-want-this-one
      - and-this-one
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Each map element must have a `name` key which is the filename to include, and may have `property-allowlist` and `property-blocklist` keys that filter which properties are included.

You cannot have a single map element with both `property-allowlist` and `property-blocklist` keys. A map element with neither `property-allowlist` nor `property-blocklist` is valid; no additional filtering is done.

You can freely intermix strings and mappings in a single `include:` list:

```
include:
  - foo.yaml
  - name: bar.yaml
    property-blocklist:
      - do-not-include-this-one
      - or-this-one
```

Finally, you can filter from a child binding like this:

```
include:
  - name: bar.yaml
    child-binding:
      property-allowlist:
        - child-prop-to-allow
```

Nexus nodes and maps All `phandle-array` type properties support mapping through `*-map` properties, e.g. `gpio-map`, as defined by the Devicetree specification.

This is used, for example, to define connector nodes for common breakout headers, such as the `arduino_header` nodes that are conventionally defined in the devicetrees for boards with Arduino compatible expansion headers.

Rules for upstream bindings This section includes general rules for writing bindings that you want to submit to the upstream Zephyr Project. (You don't need to follow these rules for bindings you don't intend to contribute to the Zephyr Project, but it's a good idea.)

Decisions made by the Zephyr devicetree maintainer override the contents of this section. If that happens, though, please let them know so they can update this page, or you can send a patch yourself.

Contents

- *Always check for existing bindings*
- *General rules*
  - *File names*
  - *Recommendations are requirements*
  - *Descriptions*
  - *Naming conventions*
- *Rules for vendor prefixes*
- *Rules for default values*
- *The `zephyr,` prefix*

Always check for existing bindings Zephyr aims for devicetree *Source compatibility with other operating systems*. Therefore, if there is an existing binding for your device in an authoritative location, you should try to replicate its properties when writing a Zephyr binding, and you must justify any Zephyr-specific divergences.

In particular, this rule applies if:

- There is an existing binding in the mainline Linux kernel. See `Documentation/devicetree/bindings` in Linus's tree for existing bindings and the Linux devicetree documentation for more information.
- Your hardware vendor provides an official binding outside of the Linux kernel.

General rules

File names Bindings which match a compatible must have file names based on the compatible.

- For example, a binding for compatible `vnd,foo` must be named `vnd,foo.yaml`.
- If the binding is bus-specific, you can append the bus to the file name; for example, if the binding YAML has `on-bus: bar`, you may name the file `vnd,foo-bar.yaml`.

Recommendations are requirements All recommendations in *default* are requirements when submitting the binding.

In particular, if you use the `default:` feature, you must justify the value in the property's description.

Descriptions There are only two acceptable ways to write property `description:` strings.

If your description is short, it's fine to use this style:

```
description: my short string
```

If your description is long or spans multiple lines, you must use this style:

```
description: |
  My very long string
  goes here.
  Look at all these lines!
```

This | style prevents YAML parsers from removing the newlines in multi-line descriptions. This in turn makes these long strings display properly in the *Bindings index*.

Naming conventions Do not use uppercase letters (`A` through `Z`) or underscores (`_`) in property names. Use lowercase letters (`a` through `z`) instead of uppercase. Use dashes (`-`) instead of underscores. (The one exception to this rule is if you are replicating a well-established binding from somewhere like Linux.)

Rules for vendor prefixes The following general rules apply to vendor prefixes in *compatible* properties.

- If your device is manufactured by a specific vendor, then its compatible should have a vendor prefix.

  If your binding describes hardware with a well known vendor from the list in dts/bindings/vendor-prefixes.txt, you must use that vendor prefix.

- If your device is not manufactured by a specific hardware vendor, do **not** invent a vendor prefix. Vendor prefixes are not mandatory parts of compatible properties, and compatibles should not include them unless they refer to an actual vendor. There are some exceptions to this rule, but the practice is strongly discouraged.

- Do not submit additions to Zephyr's `dts/bindings/vendor-prefixes.txt` file unless you also include users of the new prefix. This means at least a binding and a devicetree using the vendor prefix, and should ideally include a device driver handling that compatible.

  For custom bindings, you can add a custom `dts/bindings/vendor-prefixes.txt` file to any directory in your *DTS_ROOT*. The devicetree tooling will respect these prefixes, and will not generate warnings or errors if you use them in your own bindings or devicetrees.

- We sometimes synchronize Zephyr's vendor-prefixes.txt file with the Linux kernel's equivalent file; this process is exempt from the previous rule.

- If your binding is describing an abstract class of hardware with Zephyr specific drivers handling the nodes, it's usually best to use `zephyr` as the vendor prefix. See *Zephyr-specific binding (zephyr)* for examples.

Rules for default values In any case where `default:` is used in a devicetree binding, the `description:` for that property **must** explain *why* the value was selected and any conditions that would make it necessary to provide a different value. Additionally, if changing one property would require changing another to create a consistent configuration, then those properties should be made required.

There is no need to document the default value itself; this is already present in the *Bindings index* output.

There is a risk in using `default:` when the value in the binding may be incorrect for a particular board or hardware configuration. For example, defaulting the capacity of the connected power cell in a charging IC binding is likely to be incorrect. For such properties it's better to make the property `required: true`, forcing the user to make an explicit choice.

Driver developers should use their best judgment as to whether a value can be safely defaulted. Candidates for default values include:

- delays that would be different only under unusual conditions (such as intervening hardware)

- configuration for devices that have a standard initial configuration (such as a USB audio headset)
- defaults which match the vendor-specified power-on reset value (as long as they are independent from other properties)

Examples of how to write descriptions according to these rules:

```
properties:
  cs-interval:
    type: int
    default: 0
    description: |
      Minimum interval between chip select deassertion and assertion.
      The default corresponds to the reset value of the register field.
  hold-time-ms:
    type: int
    default: 20
    description: |
      Amount of time to hold the power enable GPIO asserted before
      initiating communication. The default was recommended in the
      manufacturer datasheet, and would only change under very
      cold temperatures.
```

Some examples of what **not** to do, and why:

```
properties:
  # Description doesn't mention anything about the default
  foo:
    type: int
    default: 1
    description: number of foos

  # Description mentions the default value instead of why it
  # was chosen
  bar:
    type: int
    default: 2
    description: bar size; default is 2

  # Explanation of the default value is in a comment instead
  # of the description. This won't be shown in the bindings index.
  baz:
    type: int
    # This is the recommended value chosen by the manufacturer.
    default: 2
    description: baz time in milliseconds
```

The `zephyr,` prefix You must add this prefix to property names in the following cases:

- Zephyr-specific extensions to bindings we share with upstream Linux. One example is the `zephyr,vref-mv` ADC channel property which is common to ADC controllers defined in dts/bindings/adc/adc-controller.yaml. This channel binding is partially shared with an analogous Linux binding, and Zephyr-specific extensions are marked as such with the prefix.
- Configuration values that are specific to a Zephyr device driver. One example is the `zephyr,lazy-load` property in the `ti,bq274xx` binding. Though devicetree in general is a hardware description and configuration language, it is Zephyr's only mechanism for configuring driver behavior for an individual `struct device`. Therefore, as a compromise, we do allow some software configuration in Zephyr's devicetree bindings, as long as they use this prefix to show that they are Zephyr specific.

You may use the `zephyr,` prefix when naming a devicetree compatible that is specific to Zephyr. One example is `zephyr,ipc-openamp-static-vrings`. In this case, it's permitted but not required to add the `zephyr,` prefix to properties defined in the binding.

Devicetree access from C/C++

This guide describes Zephyr's `<zephyr/devicetree.h>` API for reading the devicetree from C source files. It assumes you're familiar with the concepts in *Introduction to devicetree* and *Devicetree bindings*. See *Devicetree Reference* for reference material.

A note for Linux developers Linux developers familiar with devicetree should be warned that the API described here differs significantly from how devicetree is used on Linux.

Instead of generating a C header with all the devicetree data which is then abstracted behind a macro API, the Linux kernel would instead read the devicetree data structure in its binary form. The binary representation is parsed at runtime, for example to load and initialize device drivers.

Zephyr does not work this way because the size of the devicetree binary and associated handling code would be too large to fit comfortably on the relatively constrained devices Zephyr supports.

Node identifiers To get information about a particular devicetree node, you need a *node identifier* for it. This is a just a C macro that refers to the node.

These are the main ways to get a node identifier:

By path
: Use *DT_PATH()* along with the node's full path in the devicetree, starting from the root node. This is mostly useful if you happen to know the exact node you're looking for.

By node label
: Use *DT_NODELABEL()* to get a node identifier from a *node label*. Node labels are often provided by SoC `.dtsi` files to give nodes names that match the SoC datasheet, like `i2c1`, `spi2`, etc.

By alias
: Use *DT_ALIAS()* to get a node identifier for a property of the special `/aliases` node. This is sometimes done by applications (like blinky, which uses the `led0` alias) that need to refer to *some* device of a particular type ("the board's user LED") but don't care which one is used.

By instance number
: This is done primarily by device drivers, as instance numbers are a way to refer to individual nodes based on a matching compatible. Get these with *DT_INST()*, but be careful doing so. See below.

By chosen node
: Use *DT_CHOSEN()* to get a node identifier for `/chosen` node properties.

By parent/child
: Use *DT_PARENT()* and *DT_CHILD()* to get a node identifier for a parent or child node, starting from a node identifier you already have.

Two node identifiers which refer to the same node are identical and can be used interchangeably.

Here's a DTS fragment for some imaginary hardware we'll return to throughout this file for examples:

```
/dts-v1/;

/ {
```

(continues on next page)

(continued from previous page)

```
        aliases {
                sensor-controller = &i2c1;
        };

        soc {
                i2c1: i2c@40002000 {
                        compatible = "vnd,soc-i2c";
                        label = "I2C_1";
                        reg = <0x40002000 0x1000>;
                        status = "okay";
                        clock-frequency = < 100000 >;
                };
        };
};
```

Here are a few ways to get node identifiers for the `i2c@40002000` node:

- `DT_PATH(soc, i2c_40002000)`
- `DT_NODELABEL(i2c1)`
- `DT_ALIAS(sensor_controller)`
- `DT_INST(x, vnd_soc_i2c)` for some unknown number `x`. See the *DT_INST()* documentation for details.

Important

Non-alphanumeric characters like dash (`-`) and the at sign (`@`) in devicetree names are converted to underscores (`_`). The names in a DTS are also converted to lowercase.

Node identifiers are not values There is no way to store one in a variable. You cannot write:

```
/* These will give you compiler errors: */

void *i2c_0 = DT_INST(0, vnd_soc_i2c);
unsigned int i2c_1 = DT_INST(1, vnd_soc_i2c);
long my_i2c = DT_NODELABEL(i2c1);
```

If you want something short to save typing, use C macros:

```
/* Use something like this instead: */

#define MY_I2C DT_NODELABEL(i2c1)

#define INST(i) DT_INST(i, vnd_soc_i2c)
#define I2C_0 INST(0)
#define I2C_1 INST(1)
```

Property access The right API to use to read property values depends on the node and property.

- *Checking properties and values*
- *Simple properties*
- *reg properties*
- *interrupts properties*
- *phandle properties*

Checking properties and values You can use *DT_NODE_HAS_PROP()* to check if a node has a property. For the *example devicetree* above:

```
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), clock_frequency)  /* expands to 1 */
DT_NODE_HAS_PROP(DT_NODELABEL(i2c1), not_a_property)   /* expands to 0 */
```

Simple properties Use `DT_PROP(node_id, property)` to read basic integer, boolean, string, numeric array, and string array properties.

For example, to read the `clock-frequency` property's value in the *above example*:

```
DT_PROP(DT_PATH(soc, i2c_40002000), clock_frequency)  /* This is 100000, */
DT_PROP(DT_NODELABEL(i2c1), clock_frequency)          /* and so is this, */
DT_PROP(DT_ALIAS(sensor_controller), clock_frequency) /* and this. */
```

Important

The DTS property `clock-frequency` is spelled `clock_frequency` in C. That is, properties also need special characters converted to underscores. Their names are also forced to lowercase.

Properties with `string` and `boolean` types work the exact same way. The `DT_PROP()` macro expands to a string literal in the case of strings, and the number 0 or 1 in the case of booleans. For example:

```
#define I2C1 DT_NODELABEL(i2c1)

DT_PROP(I2C1, status)  /* expands to the string literal "okay" */
```

Note

Don't use DT_NODE_HAS_PROP() for boolean properties. Use DT_PROP() instead as shown above. It will expand to either 0 or 1 depending on if the property is present or absent.

Properties with type `array`, `uint8-array`, and `string-array` work similarly, except `DT_PROP()` expands to an array initializer in these cases. Here is an example devicetree fragment:

```
foo: foo@1234 {
        a = <1000 2000 3000>; /* array */
        b = [aa bb cc dd];    /* uint8-array */
        c = "bar", "baz";     /* string-array */
};
```

Its properties can be accessed like this:

```
#define FOO DT_NODELABEL(foo)

int a[] = DT_PROP(FOO, a);           /* {1000, 2000, 3000} */
unsigned char b[] = DT_PROP(FOO, b); /* {0xaa, 0xbb, 0xcc, 0xdd} */
char* c[] = DT_PROP(FOO, c);         /* {"foo", "bar"} */
```

You can use *DT_PROP_LEN()* to get logical array lengths in number of elements.

```
size_t a_len = DT_PROP_LEN(FOO, a); /* 3 */
size_t b_len = DT_PROP_LEN(FOO, b); /* 4 */
size_t c_len = DT_PROP_LEN(FOO, c); /* 2 */
```

`DT_PROP_LEN()` cannot be used with the special `reg` or `interrupts` properties. These have alternative macros which are described next.

reg properties See *Important properties* for an introduction to `reg`.

Given a node identifier `node_id`, `DT_NUM_REGS(node_id)` is the total number of register blocks in the node's `reg` property.

You **cannot** read register block addresses and lengths with `DT_PROP(node, reg)`. Instead, if a node only has one register block, use *DT_REG_ADDR()* or *DT_REG_SIZE()*:

- `DT_REG_ADDR(node_id)`: the given node's register block address
- `DT_REG_SIZE(node_id)`: its size

Use *DT_REG_ADDR_BY_IDX()* or *DT_REG_SIZE_BY_IDX()* instead if the node has multiple register blocks:

- `DT_REG_ADDR_BY_IDX(node_id, idx)`: address of register block at index `idx`
- `DT_REG_SIZE_BY_IDX(node_id, idx)`: size of block at index `idx`

The `idx` argument to these must be an integer literal or a macro that expands to one without requiring any arithmetic. In particular, `idx` cannot be a variable. This won't work:

```
/* This will cause a compiler error. */

for (size_t i = 0; i < DT_NUM_REGS(node_id); i++) {
        size_t addr = DT_REG_ADDR_BY_IDX(node_id, i);
}
```

interrupts properties See *Important properties* for a brief introduction to `interrupts`.

Given a node identifier `node_id`, `DT_NUM_IRQS(node_id)` is the total number of interrupt specifiers in the node's `interrupts` property.

The most general purpose API macro for accessing these is *DT_IRQ_BY_IDX()*:

```
DT_IRQ_BY_IDX(node_id, idx, val)
```

Here, `idx` is the logical index into the `interrupts` array, i.e. it is the index of an individual interrupt specifier in the property. The `val` argument is the name of a cell within the interrupt specifier. To use this macro, check the bindings file for the node you are interested in to find the `val` names.

Most Zephyr devicetree bindings have a cell named `irq`, which is the interrupt number. You can use *DT_IRQN()* as a convenient way to get a processed view of this value.

Warning

Here, "processed" reflects Zephyr's devicetree *Scripts and tools*, which change the `irq` number in *zephyr.dts* to handle hardware constraints on some SoCs and in accordance with Zephyr's multilevel interrupt numbering.

This is currently not very well documented, and you'll need to read the scripts' source code and existing drivers for more details if you are writing a device driver.

Note

See *Phandles* for a detailed guide to phandles.

phandle properties Property values can refer to other nodes using the `&another-node` phandle syntax introduced in *Writing property values*. Properties which contain phandles have type

`phandle`, `phandles`, or `phandle-array` in their bindings. We'll call these "phandle properties" for short.

You can convert a phandle to a node identifier using *DT_PHANDLE()*, *DT_PHANDLE_BY_IDX()*, or *DT_PHANDLE_BY_NAME()*, depending on the type of property you are working with.

One common use case for phandle properties is referring to other hardware in the tree. In this case, you usually want to convert the devicetree-level phandle to a Zephyr driver-level *struct device*. See *Get a struct device from a devicetree node* for ways to do that.

Another common use case is accessing specifier values in a phandle array. The general purpose APIs for this are *DT_PHA_BY_IDX()* and *DT_PHA()*. There are also hardware-specific shorthands like *DT_GPIO_CTLR_BY_IDX()*, *DT_GPIO_CTLR()*, *DT_GPIO_PIN_BY_IDX()*, *DT_GPIO_PIN()*, *DT_GPIO_FLAGS_BY_IDX()*, and *DT_GPIO_FLAGS()*.

See *DT_PHA_HAS_CELL_AT_IDX()* and *DT_PROP_HAS_IDX()* for ways to check if a specifier value is present in a phandle property.

Other APIs Here are pointers to some other available APIs.

- *DT_CHOSEN()*, *DT_HAS_CHOSEN()*: for properties of the special `/chosen` node
- *DT_HAS_COMPAT_STATUS_OKAY()*, *DT_NODE_HAS_COMPAT()*: global- and node-specific tests related to the `compatible` property
- *DT_BUS()*: get a node's bus controller, if there is one
- *DT_ENUM_IDX()*: for properties whose values are among a fixed list of choices
- *Fixed flash partitions*: APIs for managing fixed flash partitions. Also see *Flash map*, which wraps this in a more user-friendly API.

Device driver conveniences Special purpose macros are available for writing device drivers, which usually rely on *instance identifiers*.

To use these, you must define `DT_DRV_COMPAT` to the `compat` value your driver implements support for. This `compat` value is what you would pass to *DT_INST()*.

If you do that, you can access the properties of individual instances of your compatible with less typing, like this:

```
#include <zephyr/devicetree.h>

#define DT_DRV_COMPAT my_driver_compat

/* This is same thing as DT_INST(0, my_driver_compat): */
DT_DRV_INST(0)

/*
 * This is the same thing as
 * DT_PROP(DT_INST(0, my_driver_compat), clock_frequency)
 */
DT_INST_PROP(0, clock_frequency)
```

See *Instance-based APIs* for a generic API reference.

Hardware specific APIs Convenience macros built on top of the above APIs are also defined to help readability for hardware specific code. See *Hardware specific APIs* for details.

Generated macros While the `zephyr/devicetree.h` API is not generated, it does rely on a generated C header which is put into every application build directory: *devicetree_generated.h*. This file contains macros with devicetree data.

These macros have tricky naming conventions which the *Devicetree API* API abstracts away. They should be considered an implementation detail, but it's useful to understand them since they will frequently be seen in compiler error messages.

This section contains an Augmented Backus-Naur Form grammar for these generated macros, with examples and more details in comments. See RFC 7405 (which extends RFC 5234) for a syntax specification.

```
; An RFC 7405 ABNF grammar for devicetree macros.
;
; This does *not* cover macros pulled out of DT via Kconfig,
; like CONFIG_SRAM_BASE_ADDRESS, etc. It only describes the
; ones that start with DT_ and are directly generated.

```
; property-macro: a macro related to a node property
;
; These combine a node identifier with a "lowercase-and-underscores form"
; property name. The value expands to something related to the property's
; value.
;
; The optional prop-suf suffix is when there's some specialized
; subvalue that deserves its own macro, like the macros for an array
; property's individual elements
;
; The "plain vanilla" macro for a property's value, with no prop-suf,
; looks like this:
;
;   DT_N_<node path>_P_<property name>
;
; Components:
;
; - path-id: node's devicetree path converted to a C token
; - prop-id: node's property name converted to a C token
; - prop-suf: an optional property-specific suffix
property-macro =  %s"DT_N" path-id %s"_P_" prop-id [prop-suf]

; ------------------------------------------------------------------------
; path-id: a node's path-based macro identifier
;
; This in "lowercase-and-underscores" form. I.e. it is
; the node's devicetree path converted to a C token by changing:
;
; - each slash (/) to _S_
; - all letters to lowercase
; - non-alphanumerics characters to underscores
;
; For example, the leaf node "bar-BAZ" in this devicetree:
;
;   / {
;           foo@123 {
;                   bar-BAZ {};
;           };
;   };
;
; has path-id "_S_foo_123_S_bar_baz".
path-id = 1*( %s"_S_" dt-name )

; ------------------------------------------------------------------------
; prop-id: a property identifier
;
; A property name converted to a C token by changing:
;
; - all letters to lowercase
; - non-alphanumeric characters to underscores
;
; Example node:
;
;   chosen {
;       zephyr,console = &uart1;
;       WHY,AM_I_SHOUTING = "unclear";
;   };
;
; The 'zephyr,console' property has prop-id 'zephyr_console'.
; 'WHY,AM_I_SHOUTING' has prop-id 'why_am_i_shouting'.
prop-id = dt-name
```

```
; ---------------------------------------------------------------------
; prop-suf: a property-specific macro suffix
;
; Extra macros are generated for properties:
;
; - that are special to the specification ("reg", "interrupts", etc.)
; - with array types (uint8-array, phandle-array, etc.)
; - with "enum:" in their bindings
; - that have zephyr device API specific macros for phandle-arrays
; - related to phandle specifier names ("foo-names")
;
; Here are some examples:
;
; - _EXISTS: property, index or name existence flag
; - _SIZE: logical property length
; - _IDX_<i>: values of individual array elements
; - _IDX_<DIGIT>_VAL_<dt-name>: values of individual specifier
;   cells within a phandle array
; - _ADDR_<i>: for reg properties, the i-th register block address
; - _LEN_<i>: for reg properties, the i-th register block length
;
; The different cases are not exhaustively documented here to avoid
; this file going stale. Please see devicetree.h if you need to know
; the details.
prop-suf = 1*( "_" gen-name ["_" dt-name] )

; ---------------------------------------------------------------------
; other-macro: grab bag for everything that isn't a node-macro.

; See examples below.
other-macro =  %s"DT_N_" alternate-id
; Total count of enabled instances of a compatible.
other-macro =/ %s"DT_N_INST_" dt-name %s"_NUM_OKAY"
; These are used internally by DT_FOREACH_NODE and
; DT_FOREACH_STATUS_OKAY_NODE respectively.
other-macro =/ %s"DT_FOREACH_HELPER"
other-macro =/ %s"DT_FOREACH_OKAY_HELPER"
; These are used internally by DT_FOREACH_STATUS_OKAY,
; which iterates over each enabled node of a compatible.
other-macro =/ %s"DT_FOREACH_OKAY_" dt-name
other-macro =/ %s"DT_FOREACH_OKAY_VARGS_" dt-name
; These are used internally by DT_INST_FOREACH_STATUS_OKAY,
; which iterates over each enabled instance of a compatible.
other-macro =/ %s"DT_FOREACH_OKAY_INST_" dt-name
other-macro =/ %s"DT_FOREACH_OKAY_INST_VARGS_" dt-name
; E.g.: #define DT_CHOSEN_zephyr_flash
other-macro =/ %s"DT_CHOSEN_" dt-name
; Declares that a compatible has at least one node on a bus.
; Example:
;
;   #define DT_COMPAT_vnd_dev_BUS_spi 1
other-macro =/ %s"DT_COMPAT_" dt-name %s"_BUS_" dt-name
; Declares that a compatible has at least one status "okay" node.
; Example:
;
;   #define DT_COMPAT_HAS_OKAY_vnd_dev 1
other-macro =/ %s"DT_COMPAT_HAS_OKAY_" dt-name
; Currently used to allow mapping a lowercase-and-underscores "label"
; property to a fixed-partitions node. See the flash map API docs
; for an example.
```

(continues on next page)

(continued from previous page)

```
other-macro =/ %s"DT_COMPAT_" dt-name %s"_LABEL_" dt-name

; ------------------------------------------------------------------
; alternate-id: another way to specify a node besides a path-id
;
; Example devicetree:
;
;   / {
;           aliases {
;                   dev = &dev_1;
;           };
;
;           soc {
;               dev_1: device@123 {
;                   compatible = "vnd,device";
;               };
;           };
;   };
;
; Node device@123 has these alternate-id values:
;
; - ALIAS_dev
; - NODELABEL_dev_1
; - INST_0_vnd_device
;
; The full alternate-id macros are:
;
;   #define DT_N_INST_0_vnd_device     DT_N_S_soc_S_device_123
;   #define DT_N_ALIAS_dev             DT_N_S_soc_S_device_123
;   #define DT_N_NODELABEL_dev_1       DT_N_S_soc_S_device_123
;
; These mainly exist to allow pasting an alternate-id macro onto a
; "_P_<prop-id>" to access node properties given a node's alias, etc.
;
; Notice that "inst"-type IDs have a leading instance identifier,
; which is generated by the devicetree scripts. The other types of
; alternate-id begin immediately with names taken from the devicetree.
alternate-id =  ( %s"ALIAS" / %s"NODELABEL" ) dt-name
alternate-id =/ %s"INST_" 1*DIGIT "_" dt-name

; ------------------------------------------------------------------
; miscellaneous helper definitions

; A dt-name is one or more:
; - lowercase ASCII letters (a-z)
; - numbers (0-9)
; - underscores ("_")
;
; They are the result of converting names or combinations of names
; from devicetree to a valid component of a C identifier by
; lowercasing letters (in practice, this is a no-op) and converting
; non-alphanumeric characters to underscores.
;
; You'll see these referred to as "lowercase-and-underscores" forms of
; various devicetree identifiers throughout the documentation.
dt-name = 1*( lower / DIGIT / "_" )

; gen-name is used as a stand-in for a component of a generated macro
; name which does not come from devicetree (dt-name covers that case).
;
; - uppercase ASCII letters (a-z)
```

(continues on next page)

(continued from previous page)

```
; - numbers (0-9)
; - underscores ("_")
gen-name = upper 1*( upper / DIGIT / "_" )

; "lowercase ASCII letter" turns out to be pretty annoying to specify
; in RFC-7405 syntax.
;
; This is just ASCII letters a (0x61) through z (0x7a).
lower = %x61-7A

; "uppercase ASCII letter" in RFC-7405 syntax
upper = %x41-5A
```

Phandles

The devicetree concept of a *phandle* is very similar to pointers in C. You can use phandles to refer to nodes in devicetree similarly to the way you can use pointers to refer to structures in C.

Getting phandles The usual way to get a phandle for a devicetree node is from one of its node labels. For example, with this devicetree:

```
/ {
        lbl_a: node-1 {};
        lbl_b: lbl_c: node-2 {};
};
```

You can write the phandle for:

- /node-1 as &lbl_a
- /node-2 as either &lbl_b or &lbl_c

Notice how the &nodelabel devicetree syntax is similar to the "address of" C syntax.

Note

"Type" in this section refers to one of the type names documented in *Properties* in the devicetree bindings documentation.

Using phandles Here are the main ways you will use phandles.

One node: phandle type You can use phandles to refer to node-b from node-a, where node-b is related to node-a in some way.

One common example is when node-a represents some hardware that generates an interrupt, and node-b represents the interrupt controller that receives the asserted interrupt. In this case, you could write:

```
node_b: node-b {
        interrupt-controller;
};

node-a {
        interrupt-parent = <&node_b>;
};
```

This uses the standard interrupt-parent property defined in the devicetree specification to capture the relationship between the two nodes.

These properties have type phandle.

Zero or more nodes: phandles type You can use phandles to make an array of references to other nodes.

One common example occurs in *pin control*. Pin control properties like pinctrl-0, pinctrl-1 etc. may contain multiple phandles, each of which "points" to a node containing information related to pin configuration for that hardware peripheral. Here's an example of six phandles in a single property:

```
pinctrl-0 = <&quadspi_clk_pe10 &quadspi_ncs_pe11
             &quadspi_bk1_io0_pe12 &quadspi_bk1_io1_pe13
             &quadspi_bk1_io2_pe14 &quadspi_bk1_io3_pe15>;
```

These properties have type phandles.

Zero or more nodes with metadata: phandle-array type You can use phandles to refer to and configure one or more resources that are "owned" by some other node.

This is the most complex case. There are examples and more details in the next section.

These properties have type phandle-array.

phandle-array properties These properties are commonly used to specify a resource that is owned by another node along with additional metadata about the resource.

High level description Usually, properties with this type are written like `phandle-array-prop` in this example:

```
node {
        phandle-array-prop = <&foo 1 2>, <&bar 3>, <&baz 4 5>;
};
```

That is, the property's value is written as a comma-separated sequence of "groups", where each "group" is written inside of angle brackets (`< ... >`). Each "group" starts with a phandle (`&foo`, `&bar`, `&baz`). The values that follow the phandle in each "group" are called *specifiers*. There are three specifiers in the above example:

1. `1 2`
2. `3`
3. `4 5`

The phandle in each "group" is used to "point" to the hardware that controls the resource you are interested in. The specifier describes the resource itself, along with any additional necessary metadata.

The rest of this section describes a common example. Subsequent sections document more rules about how to use phandle-array properties in practice.

Example phandle-arrays: GPIOs Perhaps the most common use case for phandle-array properties is specifying one or more GPIOs on your SoC that another chip on your board connects to. For that reason, we'll focus on that use case here. However, there are **many other use cases** that are handled in devicetree with phandle-array properties.

For example, consider an external chip with an interrupt pin that is connected to a GPIO on your SoC. You will typically need to provide that GPIO's information (GPIO controller and pin number) to the *device driver* for that chip. You usually also need to provide other metadata about the GPIO, like whether it is active low or high, what kind of internal pull resistor within the SoC should be enabled in order to communicate with the device, etc., to the driver.

In the devicetree, there will be a node that represents the GPIO controller that controls a group of pins. This reflects the way GPIO IP blocks are usually developed in hardware. Therefore, there is no single node in the devicetree that represents a GPIO pin, and you can't use a single phandle to represent it.

Instead, you would use a phandle-array property, like this:

```
my-external-ic {
        irq-gpios = <&gpioX pin flags>;
};
```

In this example, `irq-gpios` is a phandle-array property with just one "group" in its value. `&gpioX` is the phandle for the GPIO controller node that controls the pin. `pin` is the pin number (0, 1, 2, ...). `flags` is a bit mask describing pin metadata (for example `(GPIO_ACTIVE_LOW | GPIO_PULL_UP)`); see include/zephyr/dt-bindings/gpio/gpio.h for more details.

The device driver handling the `my-external-ic` node can then use the `irq-gpios` property's value to set up interrupt handling for the chip as it is used on your board. This lets you configure the device driver in devicetree, without changing the driver's source code.

Such properties can contain multiple values as well:

```
my-other-external-ic {
        handshake-gpios = <&gpioX pinX flagsX>, <&gpioY pinY flagsY>;
};
```

The above example specifies two pins:

- `pinX` on the GPIO controller with phandle `&gpioX`, flags `flagsX`
- `pinY` on `&gpioY`, flags `flagsY`

You may be wondering how the "pin and flags" convention is established and enforced. To answer this question, we'll need to introduce a concept called specifier spaces before moving on to some information about devicetree bindings.

Specifier spaces *Specifier spaces* are a way to allow nodes to describe how you should use them in phandle-array properties.

We'll start with an abstract, high level description of how specifier spaces work in DTS files, before moving on to a concrete example and providing references to further reading for how this all works in practice using DTS files and bindings files.

High level description As described above, a phandle-array property is a sequence of "groups" of phandles followed by some number of cells:

```
node {
        phandle-array-prop = <&foo 1 2>, <&bar 3>;
};
```

The cells that follow each phandle are called a *specifier*. In this example, there are two specifiers:

1. `1 2`: two cells
2. `3`: one cell

Every phandle-array property has an associated *specifier space*. This sounds complex, but it's really just a way to assign a meaning to the cells that follow each phandle in a hardware specific way. Every specifier space has a unique name. There are a few "standard" names for commonly used hardware, but you can create your own as well.

Devicetree nodes encode the number of cells that must appear in a specifier, by name, using the `#SPACE_NAME-cells` property. For example, let's assume that `phandle-array-prop`'s specifier space is named `baz`. Then we would need the `foo` and `bar` nodes to have the following `#baz-cells` properties:

```
foo: node@1000 {
        #baz-cells = <2>;
};

bar: node@2000 {
        #baz-cells = <1>;
};
```

Without the `#baz-cells` property, the devicetree tooling would not be able to validate the number of cells in each specifier in `phandle-array-prop`.

This flexibility allows you to write down an array of hardware resources in a single devicetree property, even though the amount of metadata you need to describe each resource might be different for different nodes.

A single node can also have different numbers of cells in different specifier spaces. For example, we might have:

```
foo: node@1000 {
        #baz-cells = <2>;
        #bob-cells = <1>;
};
```

With that, if `phandle-array-prop-2` has specifier space `bob`, we could write:

```
node {
        phandle-array-prop = <&foo 1 2>, <&bar 3>;
        phandle-array-prop-2 = <&foo 4>;
};
```

This flexibility allows you to have a node that manages multiple different kinds of resources at the same time. The node describes the amount of metadata needed to describe each kind of resource (how many cells are needed in each case) using different `#SPACE_NAME-cells` properties.

Example specifier space: gpio From the above example, you're already familiar with how one specifier space works: in the "gpio" space, specifiers almost always have two cells:

1. a pin number
2. a bit mask of flags related to the pin

Therefore, almost all GPIO controller nodes you will see in practice will look like this:

```
gpioX: gpio-controller@deadbeef {
        gpio-controller;
        #gpio-cells = <2>;
};
```

Associating properties with specifier spaces Above, we have described that:

- each phandle-array property has an associated specifier space
- specifier spaces are identified by name
- devicetree nodes use `#SPECIFIER_NAME-cells` properties to configure the number of cells which must appear in a specifier

In this section, we explain how phandle-array properties get their specifier spaces.

High level description In general, a `phandle-array` property named `foos` implicitly has specifier space `foo`. For example:

```
properties:
  dmas:
    type: phandle-array
  pwms:
    type: phandle-array
```

The `dmas` property's specifier space is "dma". The `pwm` property's specifier space is `pwm`.

Special case: GPIO `*-gpios` properties are special-cased so that e.g. `foo-gpios` resolves to `#gpio-cells` rather than `#foo-gpio-cells`.

Manually specifying a space You can manually specify the specifier space for any `phandle-array` property. See *specifier-space*.

Naming the cells in a specifier You should name the cells in each specifier space your hardware supports when writing bindings. For details on how to do this, see *Specifier cell names (*-cells)*.

This allows C code to query information about and retrieve the values of cells in a specifier by name using devicetree APIs like these:

- *DT_PHA_BY_IDX*
- *DT_PHA_BY_NAME*

This feature and these macros are used internally by numerous hardware-specific APIs. Here are a few examples:

- *DT_GPIO_PIN_BY_IDX*
- *DT_PWMS_CHANNEL_BY_IDX*
- *DT_DMAS_CELL_BY_NAME*
- *DT_IO_CHANNELS_INPUT_BY_IDX*
- *DT_CLOCKS_CELL_BY_NAME*

See also

- *Writing property values*: how to write phandles in devicetree properties
- *Properties*: how to write bindings for properties with phandle types (`phandle`, `phandles`, `phandle-array`)
- *specifier-space*: how to manually specify a phandle-array property's specifier space

The `/zephyr,user` node

Zephyr's devicetree scripts handle the `/zephyr,user` node as a special case: you can put essentially arbitrary properties inside it and retrieve their values without having to write a binding. It is meant as a convenient container when only a few simple properties are needed.

> **Note**
>
> This node is meant for sample code and user applications. It should not be used in the upstream Zephyr source code for device drivers, subsystems, etc.

Simple values You can store numeric or array values in `/zephyr,user` if you want them to be configurable at build time via devicetree.

For example, with this devicetree overlay:

```
/ {
    zephyr,user {
            boolean;
            bytes = [81 82 83];
            number = <23>;
            numbers = <1>, <2>, <3>;
            string = "text";
            strings = "a", "b", "c";
    };
};
```

You can get the above property values in C/C++ code like this:

```
#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

DT_PROP(ZEPHYR_USER_NODE, boolean) // 1
DT_PROP(ZEPHYR_USER_NODE, bytes)   // {0x81, 0x82, 0x83}
DT_PROP(ZEPHYR_USER_NODE, number)  // 23
```

(continues on next page)

(continued from previous page)

```
DT_PROP(ZEPHYR_USER_NODE, numbers) // {1, 2, 3}
DT_PROP(ZEPHYR_USER_NODE, string)  // "text"
DT_PROP(ZEPHYR_USER_NODE, strings) // {"a", "b", "c"}
```

Devices You can store *phandles* in `/zephyr,user` if you want to be able to reconfigure which devices your application uses in simple cases using devicetree overlays.

For example, with this devicetree overlay:

```
/ {
    zephyr,user {
            handle = <&gpio0>;
            handles = <&gpio0>, <&gpio1>;
    };
};
```

You can convert the phandles in the `handle` and `handles` properties to device pointers like this:

```
/*
 * Same thing as:
 *
 * ... my_dev = DEVICE_DT_GET(DT_NODELABEL(gpio0));
 */
const struct device *my_device =
    DEVICE_DT_GET(DT_PROP(ZEPHYR_USER_NODE, handle));

#define PHANDLE_TO_DEVICE(node_id, prop, idx) \
    DEVICE_DT_GET(DT_PHANDLE_BY_IDX(node_id, prop, idx)),

/*
 * Same thing as:
 *
 * ... *my_devices[] = {
 *         DEVICE_DT_GET(DT_NODELABEL(gpio0)),
 *         DEVICE_DT_GET(DT_NODELABEL(gpio1)),
 * };
 */
const struct device *my_devices[] = {
    DT_FOREACH_PROP_ELEM(ZEPHYR_USER_NODE, handles, PHANDLE_TO_DEVICE)
};
```

GPIOs The `/zephyr,user` node is a convenient place to store application-specific GPIOs that you want to be able to reconfigure with a devicetree overlay.

For example, with this devicetree overlay:

```
#include <zephyr/dt-bindings/gpio/gpio.h>

/ {
    zephyr,user {
            signal-gpios = <&gpio0 1 GPIO_ACTIVE_HIGH>;
    };
};
```

You can convert the pin defined in `signal-gpios` to a `struct gpio_dt_spec` in your source code, then use it like this:

```
#include <zephyr/drivers/gpio.h>

#define ZEPHYR_USER_NODE DT_PATH(zephyr_user)

const struct gpio_dt_spec signal =
        GPIO_DT_SPEC_GET(ZEPHYR_USER_NODE, signal_gpios);

/* Configure the pin */
gpio_pin_configure_dt(&signal, GPIO_OUTPUT_INACTIVE);

/* Set the pin to its active level */
gpio_pin_set_dt(&signal, 1);
```

(See *gpio_dt_spec*, *GPIO_DT_SPEC_GET*, and *gpio_pin_configure_dt()* for details on these APIs.)

Devicetree HOWTOs

This page has step-by-step advice for getting things done with devicetree.

> **Tip**
>
> See *Troubleshooting devicetree* for troubleshooting advice.

Get your devicetree and generated header A board's devicetree (*BOARD.dts*) pulls in common node definitions via `#include` preprocessor directives. This at least includes the SoC's `.dtsi`. One way to figure out the devicetree's contents is by opening these files, e.g. by looking in `dts/<ARCH>/<vendor>/<soc>.dtsi`, but this can be time consuming.

If you just want to see the "final" devicetree for your board, build an application and open the `zephyr.dts` file in the build directory.

> **Tip**
>
> You can build hello_world to see the "base" devicetree for your board without any additional changes from *overlay files*.

For example, using the qemu_cortex_m3 board to build hello_world:

```
# --cmake-only here just forces CMake to run, skipping the
# build process to save time.
west build -b qemu_cortex_m3 samples/hello_world --cmake-only
```

You can change `qemu_cortex_m3` to match your board.

CMake prints the input and output file locations like this:

```
-- Found BOARD.dts: .../zephyr/boards/arm/qemu_cortex_m3/qemu_cortex_m3.dts
-- Generated zephyr.dts: .../zephyr/build/zephyr/zephyr.dts
-- Generated devicetree_generated.h: .../zephyr/build/zephyr/include/generated/zephyr/
↪devicetree_generated.h
```

The `zephyr.dts` file is the final devicetree in DTS format.

The `devicetree_generated.h` file is the corresponding generated header.

See *Input and output files* for details about these files.

Get a struct device from a devicetree node When writing Zephyr applications, you'll often want to get a driver-level *struct device* corresponding to a devicetree node.

For example, with this devicetree fragment, you might want the struct device for serial@40002000:

```
/ {
        soc {
                serial0: serial@40002000 {
                        status = "okay";
                        current-speed = <115200>;
                        /* ... */
                };
        };

        aliases {
                my-serial = &serial0;
        };

        chosen {
                zephyr,console = &serial0;
        };
};
```

Start by making a *node identifier* for the device you are interested in. There are different ways to do this; pick whichever one works best for your requirements. Here are some examples:

```
/* Option 1: by node label */
#define MY_SERIAL DT_NODELABEL(serial0)

/* Option 2: by alias */
#define MY_SERIAL DT_ALIAS(my_serial)

/* Option 3: by chosen node */
#define MY_SERIAL DT_CHOSEN(zephyr_console)

/* Option 4: by path */
#define MY_SERIAL DT_PATH(soc, serial_40002000)
```

Once you have a node identifier there are two ways to proceed. One way to get a device is to use *DEVICE_DT_GET()*:

```
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);

if (!device_is_ready(uart_dev)) {
        /* Not ready, do not use */
        return -ENODEV;
}
```

There are variants of *DEVICE_DT_GET()* such as *DEVICE_DT_GET_OR_NULL()*, *DEVICE_DT_GET_ONE()* or *DEVICE_DT_GET_ANY()*. This idiom fetches the device pointer at build-time, which means there is no runtime penalty. This method is useful if you want to store the device pointer as configuration data. But because the device may not be initialized, or may have failed to initialize, you must verify that the device is ready to be used before passing it to any API functions. (This check is done for you by *device_get_binding()*.)

In some situations the device cannot be known at build-time, e.g., if it depends on user input like in a shell application. In this case you can get the `struct device` by combining *device_get_binding()* with the device name:

```
const char *dev_name = /* TODO: insert device name from user */;
const struct device *uart_dev = device_get_binding(dev_name);
```

You can then use `uart_dev` with *Universal Asynchronous Receiver-Transmitter (UART)* API functions like *uart_configure()*. Similar code will work for other device types; just make sure you use the correct API for the device.

If you're having trouble, see *Troubleshooting devicetree*. The first thing to check is that the node has `status = "okay"`, like this:

```
#define MY_SERIAL DT_NODELABEL(my_serial)

#if DT_NODE_HAS_STATUS(MY_SERIAL, okay)
const struct device *const uart_dev = DEVICE_DT_GET(MY_SERIAL);
#else
#error "Node is disabled"
#endif
```

If you see the `#error` output, make sure to enable the node in your devicetree. In some situations your code will compile but it will fail to link with a message similar to:

```
...undefined reference to `__device_dts_ord_N'
collect2: error: ld returned 1 exit status
```

This likely means there's a Kconfig issue preventing the device driver from being built, resulting in a reference that does not exist. If your code compiles successfully, the last thing to check is if the device is ready, like this:

```
if (!device_is_ready(uart_dev)) {
     printk("Device not ready\n");
}
```

If you find that the device is not ready, it likely means that the device's initialization function failed. Enabling logging or debugging driver code may help in such situations. Note that you can also use *device_get_binding()* to obtain a reference at runtime. If it returns `NULL` it can either mean that device's driver failed to initialize or that it does not exist.

Find a devicetree binding *Devicetree bindings* are YAML files which declare what you can do with the nodes they describe, so it's critical to be able to find them for the nodes you are using.

If you don't have them already, *Get your devicetree and generated header*. To find a node's binding, open the generated header file, which starts with a list of nodes in a block comment:

```
/*
 * [...]
 * Nodes in dependency order (ordinal and path):
 *   0   /
 *   1   /aliases
 *   2   /chosen
 *   3   /flash@0
 *   4   /memory@20000000
 *          (etc.)
 * [...]
 */
```

Make note of the path to the node you want to find, like `/flash@0`. Search for the node's output in the file, which starts with something like this if the node has a matching binding:

```
/*
 * Devicetree node:
 *   /flash@0
 *
 * Binding (compatible = soc-nv-flash):
 *   $ZEPHYR_BASE/dts/bindings/mtd/soc-nv-flash.yaml
```

(continues on next page)

(continued from previous page)

```
 * [...]
 */
```

See *Check for missing bindings* for troubleshooting.

Set devicetree overlays Devicetree overlays are explained in *Introduction to devicetree*. The CMake variable **DTC_OVERLAY_FILE** contains a space- or semicolon-separated list of overlay files to use. If **DTC_OVERLAY_FILE** specifies multiple files, they are included in that order by the C preprocessor. A file in a Zephyr module can be referred to by escaping the Zephyr module dir variable like `\${ZEPHYR_<module>_MODULE_DIR}/<path-to>/dts.overlay` when setting the DTC_OVERLAY_FILE variable.

You can set **DTC_OVERLAY_FILE** to contain exactly the files you want to use. Here is an *example* using `west build`.

If you don't set **DTC_OVERLAY_FILE**, the build system will follow these steps, looking for files in your application configuration directory to use as devicetree overlays:

1. If the file `socs/<SOC>_<BOARD_QUALIFIERS>.overlay` exists, it will be used.
2. If the file `boards/<BOARD>.overlay` exists, it will be used in addition to the above.
3. If the current board has *multiple revisions* and `boards/<BOARD>_<revision>.overlay` exists, it will be used in addition to the above.
4. If one or more files have been found in the previous steps, the build system stops looking and just uses those files.
5. Otherwise, if `<BOARD>.overlay` exists, it will be used, and the build system will stop looking for more files.
6. Otherwise, if `app.overlay` exists, it will be used.

Extra devicetree overlays may be provided using `EXTRA_DTC_OVERLAY_FILE` which will still allow the build system to automatically use devicetree overlays described in the above steps.

The build system appends overlays specified in `EXTRA_DTC_OVERLAY_FILE` to the overlays in `DTC_OVERLAY_FILE` when processing devicetree overlays. This means that changes made via `EXTRA_DTC_OVERLAY_FILE` have higher precedence than those made via `DTC_OVERLAY_FILE`.

All configuration files will be taken from the application's configuration directory except for files with an absolute path that are given with the `DTC_OVERLAY_FILE` or `EXTRA_DTC_OVERLAY_FILE` argument.

See *Application Configuration Directory* on how the application configuration directory is defined.

Using *Shields* will also add devicetree overlay files.

The **DTC_OVERLAY_FILE** value is stored in the CMake cache and used in successive builds.

The *build system* prints all the devicetree overlays it finds in the configuration phase, like this:

```
-- Found devicetree overlay: .../some/file.overlay
```

Use devicetree overlays See *Set devicetree overlays* for how to add an overlay to the build.

Overlays can override node property values in multiple ways. For example, if your BOARD.dts contains this node:

```
/ {
        soc {
                serial0: serial@40002000 {
                        status = "okay";
                        current-speed = <115200>;
                        /* ... */
                };
        };
};
```

These are equivalent ways to override the `current-speed` value in an overlay:

```
/* Option 1 */
&serial0 {
     current-speed = <9600>;
};

/* Option 2 */
&{/soc/serial@40002000} {
     current-speed = <9600>;
};
```

We'll use the `&serial0` style for the rest of these examples.

You can add aliases to your devicetree using overlays: an alias is just a property of the `/aliases` node. For example:

```
/ {
     aliases {
             my-serial = &serial0;
     };
};
```

Chosen nodes work the same way. For example:

```
/ {
     chosen {
             zephyr,console = &serial0;
     };
};
```

To delete a property (in addition to deleting properties in general, this is how to set a boolean property to false if it's true in BOARD.dts):

```
&serial0 {
     /delete-property/ some-unwanted-property;
};
```

You can add subnodes using overlays. For example, to configure a SPI or I2C child device on an existing bus node, do something like this:

```
/* SPI device example */
&spi1 {
     my_spi_device: temp-sensor@0 {
             compatible = "...";
             label = "TEMP_SENSOR_0";
             /* reg is the chip select number, if needed;
              * If present, it must match the node's unit address. */
             reg = <0>;

             /* Configure other SPI device properties as needed.
              * Find your device's DT binding for details. */
```

(continues on next page)

(continued from previous page)

```
            spi-max-frequency = <4000000>;
    };
};

/* I2C device example */
&i2c2 {
    my_i2c_device: touchscreen@76 {
            compatible = "...";
            label = "TOUCHSCREEN";
            /* reg is the I2C device address.
             * It must match the node's unit address. */
            reg = <76>;

            /* Configure other I2C device properties as needed.
             * Find your device's DT binding for details. */
    };
};
```

Other bus devices can be configured similarly:

- create the device as a subnode of the parent bus
- set its properties according to its binding

Assuming you have a suitable device driver associated with the `my_spi_device` and `my_i2c_device` compatibles, you should now be able to enable the driver via Kconfig and *get the struct device* for your newly added bus node, then use it with that driver API.

Write device drivers using devicetree APIs "Devicetree-aware" *device drivers* should create a `struct device` for each `status = "okay"` devicetree node with a particular *compatible* (or related set of compatibles) supported by the driver.

Writing a devicetree-aware driver begins by defining a *devicetree binding* for the devices supported by the driver. Use existing bindings from similar drivers as a starting point. A skeletal binding to get started needs nothing more than this:

```
description: <Human-readable description of your binding>
compatible: "foo-company,bar-device"
include: base.yaml
```

See *Find a devicetree binding* for more advice on locating existing bindings.

After writing your binding, your driver C file can then use the devicetree API to find `status = "okay"` nodes with the desired compatible, and instantiate a `struct device` for each one. There are two options for instantiating each `struct device`: using instance numbers, and using node labels.

In either case:

- Each `struct device`'s name should be set to its devicetree node's `label` property. This allows the driver's users to *Get a struct device from a devicetree node* in the usual way.
- Each device's initial configuration should use values from devicetree properties whenever practical. This allows users to configure the driver using *devicetree overlays*.

Examples for how to do this follow. They assume you've already implemented the device-specific configuration and data structures and API functions, like this:

```
/* my_driver.c */
#include <zephyr/drivers/some_api.h>

/* Define data (RAM) and configuration (ROM) structures: */
```

(continues on next page)

(continued from previous page)

```
struct my_dev_data {
     /* per-device values to store in RAM */
};
struct my_dev_cfg {
     uint32_t freq; /* Just an example: initial clock frequency in Hz */
     /* other configuration to store in ROM */
};

/* Implement driver API functions (drivers/some_api.h callbacks): */
static int my_driver_api_func1(const struct device *dev, uint32_t *foo) { /* ... */ }
static int my_driver_api_func2(const struct device *dev, uint64_t bar) { /* ... */ }
static struct some_api my_api_funcs = {
     .func1 = my_driver_api_func1,
     .func2 = my_driver_api_func2,
};
```

Option 1: create devices using instance numbers Use this option, which uses *Instance-based APIs*, if possible. However, they only work when devicetree nodes for your driver's `compatible` are all equivalent, and you do not need to be able to distinguish between them.

To use instance-based APIs, begin by defining `DT_DRV_COMPAT` to the lowercase-and-underscores version of the compatible that the device driver supports. For example, if your driver's compatible is `"vnd,my-device"` in devicetree, you would define `DT_DRV_COMPAT` to `vnd_my_device` in your driver C file:

```
/*
 * Put this near the top of the file. After the includes is a good place.
 * (Note that you can therefore run "git grep DT_DRV_COMPAT drivers" in
 * the zephyr Git repository to look for example drivers using this style).
 */
#define DT_DRV_COMPAT vnd_my_device
```

Important

As shown, the DT_DRV_COMPAT macro should have neither quotes nor special characters. Remove quotes and convert special characters to underscores when creating `DT_DRV_COMPAT` from the compatible property.

Finally, define an instantiation macro, which creates each `struct device` using instance numbers. Do this after defining `my_api_funcs`.

```
/*
 * This instantiation macro is named "CREATE_MY_DEVICE".
 * Its "inst" argument is an arbitrary instance number.
 *
 * Put this near the end of the file, e.g. after defining "my_api_funcs".
 */
#define CREATE_MY_DEVICE(inst)                                          \
     static struct my_dev_data my_data_##inst = {                       \
             /* initialize RAM values as needed, e.g.: */               \
             .freq = DT_INST_PROP(inst, clock_frequency),               \
     };                                                                 \
     static const struct my_dev_cfg my_cfg_##inst = {                   \
             /* initialize ROM values as needed. */                     \
     };                                                                 \
     DEVICE_DT_INST_DEFINE(inst,                                        \
                           my_dev_init_function,                        \
```

(continues on next page)

(continued from previous page)

```
                        NULL,                                   \
                        &my_data_##inst,                        \
                        &my_cfg_##inst,                         \
                        MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY,  \
                        &my_api_funcs);
```

Notice the use of APIs like *DT_INST_PROP()* and *DEVICE_DT_INST_DEFINE()* to access devicetree node data. These APIs retrieve data from the devicetree for instance number `inst` of the node with compatible determined by `DT_DRV_COMPAT`.

Finally, pass the instantiation macro to *DT_INST_FOREACH_STATUS_OKAY()*:

```
/* Call the device creation macro for each instance: */
DT_INST_FOREACH_STATUS_OKAY(CREATE_MY_DEVICE)
```

`DT_INST_FOREACH_STATUS_OKAY` expands to code which calls `CREATE_MY_DEVICE` once for each enabled node with the compatible determined by `DT_DRV_COMPAT`. It does not append a semicolon to the end of the expansion of `CREATE_MY_DEVICE`, so the macro's expansion must end in a semicolon or function definition to support multiple devices.

Option 2: create devices using node labels Some device drivers cannot use instance numbers. One example is an SoC peripheral driver which relies on vendor HAL APIs specialized for individual IP blocks to implement Zephyr driver callbacks. Cases like this should use *DT_NODELABEL()* to refer to individual nodes in the devicetree representing the supported peripherals on the SoC. The devicetree.h *Generic APIs* can then be used to access node data.

For this to work, your *SoC's dtsi file* must define node labels like `mydevice0`, `mydevice1`, etc. appropriately for the IP blocks your driver supports. The resulting devicetree usually looks something like this:

```
/ {
        soc {
                mydevice0: dev@0 {
                        compatible = "vnd,my-device";
                };
                mydevice1: dev@1 {
                        compatible = "vnd,my-device";
                };
        };
};
```

The driver can use the `mydevice0` and `mydevice1` node labels in the devicetree to operate on specific device nodes:

```
/*
 * This is a convenience macro for creating a node identifier for
 * the relevant devices. An example use is MYDEV(0) to refer to
 * the node with label "mydevice0".
 */
#define MYDEV(idx) DT_NODELABEL(mydevice ## idx)

/*
 * Define your instantiation macro; "idx" is a number like 0 for mydevice0
 * or 1 for mydevice1. It uses MYDEV() to create the node label from the
 * index.
 */
#define CREATE_MY_DEVICE(idx)                                   \
     static struct my_dev_data my_data_##idx = {                \
             /* initialize RAM values as needed, e.g.: */       \
             .freq = DT_PROP(MYDEV(idx), clock_frequency),      \
```

(continues on next page)

(continued from previous page)

```
    };                                                              \
    static const struct my_dev_cfg my_cfg_##idx = { /* ... */ };    \
    DEVICE_DT_DEFINE(MYDEV(idx),                                    \
                     my_dev_init_function,                          \
                     NULL,                                          \
                     &my_data_##idx,                                \
                     &my_cfg_##idx,                                 \
                     MY_DEV_INIT_LEVEL, MY_DEV_INIT_PRIORITY,       \
                     &my_api_funcs)
```

Notice the use of APIs like *DT_PROP()* and *DEVICE_DT_DEFINE()* to access devicetree node data.

Finally, manually detect each enabled devicetree node and use `CREATE_MY_DEVICE` to instantiate each `struct device`:

```
#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice0), okay)
CREATE_MY_DEVICE(0)
#endif

#if DT_NODE_HAS_STATUS(DT_NODELABEL(mydevice1), okay)
CREATE_MY_DEVICE(1)
#endif
```

Since this style does not use `DT_INST_FOREACH_STATUS_OKAY()`, the driver author is responsible for calling `CREATE_MY_DEVICE()` for every possible node, e.g. using knowledge about the peripherals available on supported SoCs.

Device drivers that depend on other devices At times, one `struct device` depends on another `struct device` and requires a pointer to it. For example, a sensor device might need a pointer to its SPI bus controller device. Some advice:

- Write your devicetree binding in a way that permits use of *Hardware specific APIs* from devicetree.h if possible.
- In particular, for bus devices, your driver's binding should include a file like dts/bindings/spi/spi-device.yaml which provides common definitions for devices addressable via a specific bus. This enables use of APIs like *DT_BUS()* to obtain a node identifier for the bus node. You can then *Get a struct device from a devicetree node* for the bus in the usual way.

Search existing bindings and device drivers for examples.

Applications that depend on board-specific devices One way to allow application code to run unmodified on multiple boards is by supporting a devicetree alias to specify the hardware specific portions, as is done in the blinky sample. The application can then be configured in *BOARD.dts* files or via *devicetree overlays*.

Troubleshooting devicetree

Here are some tips for fixing misbehaving devicetree related code.

See *Devicetree HOWTOs* for other "HOWTO" style information.

Important

Try this first, before doing anything else.

Try again with a pristine build directory See *Pristine Builds* for examples, or just delete the build directory completely and retry.

This is general advice which is especially applicable to debugging devicetree issues, because the outputs are created during the CMake configuration phase, and are not always regenerated when one of their inputs changes.

Make sure <devicetree.h> is included Unlike Kconfig symbols, the `devicetree.h` header must be included explicitly.

Many Zephyr header files rely on information from devicetree, so including some other API may transitively include `devicetree.h`, but that's not guaranteed.

undefined reference to __device_dts_ord_<N> This usually happens on a line like this:

```
const struct device *dev = DEVICE_DT_GET(NODE_ID);
```

where `NODE_ID` is a valid *node identifier*, but no device driver has allocated a `struct device` for this devicetree node. You thus get a linker error, because you're asking for a pointer to a device that isn't defined.

To fix it, you need to make sure that:

1. The node is enabled: the node must have `status = "okay";`.

   (Recall that a missing `status` property means the same thing as `status = "okay";`; see *Important properties* for more information about `status`).

2. A device driver responsible for allocating the `struct device` is enabled. That is, the Kconfig option which makes the build system compile the driver sources into your application needs to be set to `y`.

   (See *Setting Kconfig configuration values* for more information on setting Kconfig options.)

Below, `<build>` means your build directory.

Making sure the node is enabled:

To find the devicetree node you need to check, use the number `<N>` from the linker error. Look for this number in the list of nodes at the top of `<build>/zephyr/include/generated/zephyr/devicetree_generated.h`. For example, if `<N>` is 15, and your `devicetree_generated.h` file looks like this, the node you are interested in is `/soc/i2c@deadbeef`:

```
/*
 * Generated by gen_defines.py
 *
 * DTS input file:
 *   <build>/zephyr/zephyr.dts.pre
 *
 * Directories with bindings:
 *   $ZEPHYR_BASE/dts/bindings
 *
 * Node dependency ordering (ordinal and path):
 *   0   /
 *   1   /aliases
[...]
 *   15  /soc/i2c@deadbeef
[...]
```

Now look for this node in `<build>/zephyr/zephyr.dts`, which is the final devicetree for your application build. (See *Get your devicetree and generated header* for information and examples.)

If the node has `status = "disabled";` in `zephyr.dts`, then you need to enable it by setting `status = "okay";`, probably by using a devicetree *overlay*. For example, if `zephyr.dts` looks like this:

```
i2c0: i2c@deadbeef {
        status = "disabled";
};
```

Then you should put this into your devicetree overlay and *Try again with a pristine build directory*:

```
&i2c0 {
        status = "okay";
};
```

Make sure that you see `status = "okay";` in `zephyr.dts` after you rebuild.

Making sure the device driver is enabled:

The first step is to figure out which device driver is responsible for handling your devicetree node and allocating devices for it. To do this, you need to start with the `compatible` property in your devicetree node, and find the driver that allocates `struct device` instances for that compatible.

If you're not familiar with how devices are allocated from devicetree nodes based on compatible properties, the ZDS 2021 talk A deep dive into the Zephyr 2.5 device model may be a useful place to start, along with the *Device Driver Model* pages. See *Important properties* and the Devicetree specification for more information about `compatible`.

There is currently no documentation for what device drivers exist and which devicetree compatibles they are associated with. You will have to figure this out by reading the source code:

- Look in drivers for the appropriate subdirectory that corresponds to the API your device implements
- Look inside that directory for relevant files until you figure out what the driver is, or realize there is no such driver.

Often, but not always, you can find the driver by looking for a file that sets the `DT_DRV_COMPAT` macro to match your node's `compatible` property, except lowercased and with special characters converted to underscores. For example, if your node's compatible is `vnd,foo-device`, look for a file with this line:

```
#define DT_DRV_COMPAT vnd_foo_device
```

Important

This **does not always work** since not all drivers use `DT_DRV_COMPAT`.

If you find a driver, you next need to make sure the Kconfig option that compiles it is enabled. (If you don't find a driver, and you are sure the compatible property is correct, then you need to write a driver. Writing drivers is outside the scope of this documentation page.)

Continuing the above example, if your devicetree node looks like this now:

```
i2c0: i2c@deadbeef {
        compatible = "nordic,nrf-twim";
        status = "okay";
};
```

Then you would look inside of drivers/i2c for the driver file that handles the compatible `nordic,nrf-twim`. In this case, that is drivers/i2c/i2c_nrfx_twim.c. Notice how even in cases where `DT_DRV_COMPAT` is not set, you can use information like driver file names as clues.

Once you know the driver you want to enable, you need to make sure its Kconfig option is set to `y`. You can figure out which Kconfig option is needed by looking for a line similar to

this one in the `CMakeLists.txt` file in the drivers subdirectory. Continuing the above example, drivers/i2c/CMakeLists.txt has a line that looks like this:

```
zephyr_library_sources_ifdef(CONFIG_NRFX_TWIM       i2c_nrfx_twim.c)
```

This means that `CONFIG_NRFX_TWIM` must be set to `y` in `<build>/zephyr/.config` file.

If your driver's Kconfig is not set to `y`, you need to figure out what you need to do to make that happen. Often, this will happen automatically as soon as you enable the devicetree node. Otherwise, it is sometimes as simple as adding a line like this to your application's `prj.conf` file and then making sure to *Try again with a pristine build directory*:

```
CONFIG_FOO=y
```

where `CONFIG_FOO` is the option that `CMakeLists.txt` uses to decide whether or not to compile the driver.

However, there may be other problems in your way, such as unmet Kconfig dependencies that you also have to enable before you can enable your driver.

Consult the Kconfig file that defines `CONFIG_FOO` (for your value of `FOO`) for more information.

Make sure you're using the right names Remember that:

- In C/C++, devicetree names must be lowercased and special characters must be converted to underscores. Zephyr's generated devicetree header has DTS names converted in this way into the C tokens used by the preprocessor-based `<devicetree.h>` API.
- In overlays, use devicetree node and property names the same way they would appear in any DTS file. Zephyr overlays are just DTS fragments.

For example, if you're trying to **get** the `clock-frequency` property of a node with path `/soc/i2c@12340000` in a C/C++ file:

```
/*
 * foo.c: lowercase-and-underscores names
 */

/* Don't do this: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c@1234000), clock-frequency)
/*                                          ^             ^
 *                                      @ should be _     - should be _  */

/* Do this instead: */
#define MY_CLOCK_FREQ DT_PROP(DT_PATH(soc, i2c_1234000), clock_frequency)
/*                                          ^               ^           */
```

And if you're trying to **set** that property in a devicetree overlay:

```
/*
 * foo.overlay: DTS names with special characters, etc.
 */

/* Don't do this; you'll get devicetree errors. */
&{/soc/i2c_12340000/} {
     clock_frequency = <115200>;
};

/* Do this instead. Overlays are just DTS fragments. */
&{/soc/i2c@12340000/} {
     clock-frequency = <115200>;
};
```

Look at the preprocessor output To save preprocessor output files, enable the CONFIG_COMPILER_SAVE_TEMPS option. For example, to build hello_world with west with this option set, use:

```
west build -b BOARD samples/hello_world -- -DCONFIG_COMPILER_SAVE_TEMPS=y
```

This will create a preprocessor output file named `foo.c.i` in the build directory for each source file `foo.c`.

You can then search for the file in the build directory to see what your devicetree macros expanded to. For example, on macOS and Linux, using `find` to find `main.c.i`:

```
$ find build -name main.c.i
build/CMakeFiles/app.dir/src/main.c.i
```

It's usually easiest to run a style formatter on the results before opening them. For example, to use `clang-format` to reformat the file in place:

```
clang-format -i build/CMakeFiles/app.dir/src/main.c.i
```

You can then open the file in your favorite editor to view the final C results after preprocessing.

Do not track macro expansion Compiler messages for devicetree errors can sometimes be very long. This typically happens when the compiler prints a message for every step of a complex macro expansion that has several intermediate expansion steps.

To prevent the compiler from doing this, you can disable the CONFIG_COMPILER_TRACK_MACRO_EXPANSION option. This typically reduces the output to one message per error.

For example, to build hello_world with west and this option disabled, use:

```
west build -b BOARD samples/hello_world -- -DCONFIG_COMPILER_TRACK_MACRO_EXPANSION=n
```

Validate properties If you're getting a compile error reading a node property, check your node identifier and property. For example, if you get a build error on a line that looks like this:

```
int baud_rate = DT_PROP(DT_NODELABEL(my_serial), current_speed);
```

Try checking the node by adding this to the file and recompiling:

```
#if !DT_NODE_EXISTS(DT_NODELABEL(my_serial))
#error "whoops"
#endif
```

If you see the "whoops" error message when you rebuild, the node identifier isn't referring to a valid node. *Get your devicetree and generated header* and debug from there.

Some hints for what to check next if you don't see the "whoops" error message:

- did you *Make sure you're using the right names*?
- does the *property exist*?
- does the node have a *matching binding*?
- does the binding define the property?

Check for missing bindings See *Devicetree bindings* for information about bindings, and *Bindings index* for information on bindings built into Zephyr.

If the build fails to *Find a devicetree binding* for a node, then either the node's `compatible` property is not defined, or its value has no matching binding. If the property is set, check for typos in its name. In a devicetree source file, `compatible` should look like `"vnd,some-device"` – *Make sure you're using the right names*.

If your binding file is not under `zephyr/dts`, you may need to set *DTS_ROOT*; see *Where bindings are located*.

Errors with DT_INST_() APIs If you're using an API like *DT_INST_PROP()*, you must define `DT_DRV_COMPAT` to the lowercase-and-underscores version of the compatible you are interested in. See *Option 1: create devices using instance numbers*.

Devicetree versus Kconfig

Along with devicetree, Zephyr also uses the Kconfig language to configure the source code. Whether to use devicetree or Kconfig for a particular purpose can sometimes be confusing. This section should help you decide which one to use.

In short:

- Use devicetree to describe **hardware** and its **boot-time configuration**. Examples include peripherals on a board, boot-time clock frequencies, interrupt lines, etc.
- Use Kconfig to configure **software support** to build into the final image. Examples include whether to add networking support, which drivers are needed by the application, etc.

In other words, devicetree mainly deals with hardware, and Kconfig with software.

For example, consider a board containing a SoC with 2 UART, or serial port, instances.

- The fact that the board has this UART **hardware** is described with two UART nodes in the devicetree. These provide the UART type (via the `compatible` property) and certain settings such as the address range of the hardware peripheral registers in memory (via the `reg` property).
- Additionally, the UART **boot-time configuration** is also described with devicetree. This could include configuration such as the RX IRQ line's priority and the UART baud rate. These may be modifiable at runtime, but their boot-time configuration is described in devicetree.
- Whether or not to include **software support** for UART in the build is controlled via Kconfig. Applications which do not need to use the UARTs can remove the driver source code from the build using Kconfig, even though the board's devicetree still includes UART nodes.

As another example, consider a device with a 2.4GHz, multi-protocol radio supporting both the Bluetooth Low Energy and 802.15.4 wireless technologies.

- Devicetree should be used to describe the presence of the radio **hardware**, what driver or drivers it's compatible with, etc.
- **Boot-time configuration** for the radio, such as TX power in dBm, should also be specified using devicetree.
- Kconfig should determine which **software features** should be built for the radio, such as selecting a BLE or 802.15.4 protocol stack.

As another example, Kconfig options that formerly enabled a particular instance of a driver (that is itself enabled by Kconfig) have been removed. The devices are selected individually using devicetree's *status* keyword on the corresponding hardware instance.

There are **exceptions** to these rules:

- Because Kconfig is unable to flexibly control some instance-specific driver configuration parameters, such as the size of an internal buffer, these options may be defined in devicetree. However, to make clear that they are specific to Zephyr drivers and not hardware description or configuration these properties should be prefixed with `zephyr,`, e.g. `zephyr,random-mac-address` in the common Ethernet devicetree properties.
- Devicetree's `chosen` keyword, which allows the user to select a specific instance of a hardware device to be used for a particular purpose. An example of this is selecting a particular UART for use as the system's console.

5.2.2 Devicetree Reference

These pages contain reference material for Zephyr's devicetree APIs and built-in bindings.

For the platform-independent details, see the Devicetree specification.

Devicetree API

This is a reference page for the `<zephyr/devicetree.h>` API. The API is macro based. Use of these macros has no impact on scheduling. They can be used from any calling context and at file scope.

Some of these – the ones beginning with `DT_INST_` – require a special macro named `DT_DRV_COMPAT` to be defined before they can be used; these are discussed individually below. These macros are generally meant for use within *device drivers*, though they can be used outside of drivers with appropriate care.

Contents

- *Generic APIs*
  - *Node identifiers and helpers*
  - *Property access*
  - *`ranges` property*
  - *`reg` property*
  - *`interrupts` property*
  - *For-each macros*
  - *Existence checks*
  - *Inter-node dependencies*
  - *Bus helpers*
- *Instance-based APIs*
- *Hardware specific APIs*
  - *CAN*
  - *Clocks*
  - *DMA*
  - *Fixed flash partitions*
  - *GPIO*
  - *IO channels*

  - *MBOX*
  - *Pinctrl (pin control)*
  - *PWM*
  - *Reset Controller*
  - *SPI*
- *Chosen nodes*
- *Zephyr-specific chosen nodes*

Generic APIs The APIs in this section can be used anywhere and do not require `DT_DRV_COMPAT` to be defined.

Node identifiers and helpers A *node identifier* is a way to refer to a devicetree node at C preprocessor time. While node identifiers are not C values, you can use them to access devicetree data in C rvalue form using, for example, the *Property access* API.

The root node `/` has node identifier `DT_ROOT`. You can create node identifiers for other devicetree nodes using *`DT_PATH()`*, *`DT_NODELABEL()`*, *`DT_ALIAS()`*, and *`DT_INST()`*.

There are also *`DT_PARENT()`* and *`DT_CHILD()`* macros which can be used to create node identifiers for a given node's parent node or a particular child node, respectively.

The following macros create or operate on node identifiers.

Related code samples

GPIO with custom Devicetree binding
Use custom Devicetree binding to control a GPIO.

group `devicetree-generic-id`

Defines

`DT_INVALID_NODE`

Name for an invalid node identifier.

This supports cases where factored macros can be invoked from paths where devicetree data may or may not be available. It is a preprocessor identifier that does not match any valid devicetree node identifier.

`DT_ROOT`

Node identifier for the root node in the devicetree.

`DT_PATH(...)`

Get a node identifier for a devicetree path.

The arguments to this macro are the names of non-root nodes in the tree required to reach the desired node, starting from the root. Non-alphanumeric characters in each

name must be converted to underscores to form valid C tokens, and letters must be lowercased.

Example devicetree fragment:

```
/ {
        soc {
                serial1: serial@40001000 {
                        status = "okay";
                        current-speed = <115200>;
                        ...
                };
        };
};
```

You can use *DT_PATH(soc, serial_40001000)* to get a node identifier for the `serial@40001000` node. Node labels like `serial1` cannot be used as *DT_PATH()* arguments; use *DT_NODELABEL()* for those instead.

Example usage with *DT_PROP()* to get the `current-speed` property:

```
DT_PROP(DT_PATH(soc, serial_40001000), current_speed) // 115200
```

(The `current-speed` property is also in `lowercase-and-underscores` form when used with this API.)

When determining arguments to *DT_PATH()*:

- the first argument corresponds to a child node of the root (`soc` above)
- a second argument corresponds to a child of the first argument (`serial_40001000` above, from the node name `serial@40001000` after lowercasing and changing `@` to `_`)
- and so on for deeper nodes in the desired node's path

Note

This macro returns a node identifier from path components. To get a path string from a node identifier, use *DT_NODE_PATH()* instead.

Parameters

- `...` – lowercase-and-underscores node names along the node's path, with each name given as a separate argument

Returns

node identifier for the node with that path

`DT_NODELABEL`(label)

Get a node identifier for a node label.

Convert non-alphanumeric characters in the node label to underscores to form valid C tokens, and lowercase all letters. Note that node labels are not the same thing as label properties.

Example devicetree fragment:

```
serial1: serial@40001000 {
        label = "UART_0";
        status = "okay";
```

(continues on next page)

(continued from previous page)

```
        current-speed = <115200>;
        ...
};
```

The only node label in this example is `serial1`.

The string `UART_0` is *not* a node label; it's the value of a property named label.

You can use *DT_NODELABEL(serial1)* to get a node identifier for the `serial@40001000` node. Example usage with *DT_PROP()* to get the current-speed property:

```
DT_PROP(DT_NODELABEL(serial1), current_speed) // 115200
```

Another example devicetree fragment:

```
cpu@0 {
       L2_0: l2-cache {
               cache-level = <2>;
               ...
       };
};
```

Example usage to get the cache-level property:

```
DT_PROP(DT_NODELABEL(l2_0), cache_level) // 2
```

Notice how `L2_0` in the devicetree is lowercased to `l2_0` in the *DT_NODELABEL()* argument.

Parameters

- **label** – lowercase-and-underscores node label name

Returns
node identifier for the node with that label

`DT_ALIAS`(alias)

Get a node identifier from /aliases.

This macro's argument is a property of the `/aliases` node. It returns a node identifier for the node which is aliased. Convert non-alphanumeric characters in the alias property to underscores to form valid C tokens, and lowercase all letters.

Example devicetree fragment:

```
/ {
        aliases {
                my-serial = &serial1;
        };

        soc {
                serial1: serial@40001000 {
                        status = "okay";
                        current-speed = <115200>;
                        ...
                };
        };
};
```

You can use *DT_ALIAS(my_serial)* to get a node identifier for the `serial@40001000` node. Notice how `my-serial` in the devicetree becomes `my_serial` in the *DT_ALIAS()* argument. Example usage with *DT_PROP()* to get the current-speed property:

```
DT_PROP(DT_ALIAS(my_serial), current_speed) // 115200
```

Parameters

- **alias** – lowercase-and-underscores alias name.

Returns
node identifier for the node with that alias

DT_INST(inst, compat)

Get a node identifier for an instance of a compatible.

All nodes with a particular compatible property value are assigned instance numbers, which are zero-based indexes specific to that compatible. You can get a node identifier for these nodes by passing *DT_INST()* an instance number, `inst`, along with the lowercase-and-underscores version of the compatible, `compat`.

Instance numbers have the following properties:

- for each compatible, instance numbers start at 0 and are contiguous
- exactly one instance number is assigned for each node with a compatible, **including disabled nodes**
- enabled nodes (status property is `okay` or missing) are assigned the instance numbers starting from 0, and disabled nodes have instance numbers which are greater than those of any enabled node

No other guarantees are made. In particular:

- instance numbers **in no way reflect** any numbering scheme that might exist in SoC documentation, node labels or unit addresses, or properties of the /aliases node (use *DT_NODELABEL()* or *DT_ALIAS()* for those)
- there **is no general guarantee** that the same node will have the same instance number between builds, even if you are building the same application again in the same build directory

Example devicetree fragment:

```
serial1: serial@40001000 {
        compatible = "vnd,soc-serial";
        status = "disabled";
        current-speed = <9600>;
        ...
};

serial2: serial@40002000 {
        compatible = "vnd,soc-serial";
        status = "okay";
        current-speed = <57600>;
        ...
};

serial3: serial@40003000 {
        compatible = "vnd,soc-serial";
        current-speed = <115200>;
        ...
};
```

Assuming no other nodes in the devicetree have compatible "vnd,soc-serial", that compatible has nodes with instance numbers 0, 1, and 2.

The nodes serial@40002000 and serial@40003000 are both enabled, so their instance numbers are 0 and 1, but no guarantees are made regarding which node has which instance number.

Since serial@40001000 is the only disabled node, it has instance number 2, since disabled nodes are assigned the largest instance numbers. Therefore:

```
// Could be 57600 or 115200. There is no way to be sure:
// either serial@40002000 or serial@40003000 could
// have instance number 0, so this could be the current-speed
// property of either of those nodes.
DT_PROP(DT_INST(0, vnd_soc_serial), current_speed)

// Could be 57600 or 115200, for the same reason.
// If the above expression expands to 57600, then
// this expands to 115200, and vice-versa.
DT_PROP(DT_INST(1, vnd_soc_serial), current_speed)

// 9600, because there is only one disabled node, and
// disabled nodes are "at the end" of the instance
// number "list".
DT_PROP(DT_INST(2, vnd_soc_serial), current_speed)
```

Notice how "vnd,soc-serial" in the devicetree becomes vnd_soc_serial (without quotes) in the *DT_INST()* arguments. (As usual, current-speed in the devicetree becomes current_speed as well.)

Nodes whose compatible property has multiple values are assigned independent instance numbers for each compatible.

Parameters

- **inst** – instance number for compatible compat
- **compat** – lowercase-and-underscores compatible, without quotes

Returns

node identifier for the node with that instance number and compatible

DT_PARENT(node_id)

Get a node identifier for a parent node.

Example devicetree fragment:

```
parent: parent-node {
        child: child-node {
                ...
        };
};
```

The following are equivalent ways to get the same node identifier:

```
DT_NODELABEL(parent)
DT_PARENT(DT_NODELABEL(child))
```

Parameters

- **node_id** – node identifier

Returns

a node identifier for the node's parent

DT_GPARENT(node_id)

Get a node identifier for a grandparent node.

Example devicetree fragment:

```
gparent: grandparent-node {
        parent: parent-node {
                child: child-node { ... }
        };
};
```

The following are equivalent ways to get the same node identifier:

```
DT_GPARENT(DT_NODELABEL(child))
DT_PARENT(DT_PARENT(DT_NODELABEL(child))
```

Parameters

- **node_id** – node identifier

Returns

a node identifier for the node's parent's parent

DT_CHILD(node_id, child)

Get a node identifier for a child node.

Example devicetree fragment:

```
/ {
        soc-label: soc {
                serial1: serial@40001000 {
                        status = "okay";
                        current-speed = <115200>;
                        ...
                };
        };
};
```

Example usage with *DT_PROP()* to get the status of the `serial@40001000` node:

```
#define SOC_NODE DT_NODELABEL(soc_label)
DT_PROP(DT_CHILD(SOC_NODE, serial_40001000), status) // "okay"
```

Node labels like `serial1` cannot be used as the `child` argument to this macro. Use *DT_NODELABEL()* for that instead.

You can also use *DT_FOREACH_CHILD()* to iterate over node identifiers for all of a node's children.

Parameters

- **node_id** – node identifier
- **child** – lowercase-and-underscores child node name

Returns

node identifier for the node with the name referred to by 'child'

DT_COMPAT_GET_ANY_STATUS_OKAY(compat)

Get a node identifier for a status okay node with a compatible.

Use this if you want to get an arbitrary enabled node with a given compatible, and you do not care which one you get. If any enabled nodes with the given compatible exist, a node identifier for one of them is returned. Otherwise, *DT_INVALID_NODE* is returned.

Example devicetree fragment:

```
node-a {
   compatible = "vnd,device";
   status = "okay";
};

node-b {
   compatible = "vnd,device";
   status = "okay";
};

node-c {
   compatible = "vnd,device";
   status = "disabled";
};
```

Example usage:

```
DT_COMPAT_GET_ANY_STATUS_OKAY(vnd_device)
```

This expands to a node identifier for either `node-a` or `node-b`. It will not expand to a node identifier for `node-c`, because that node does not have status `okay`.

Parameters

- **compat** – lowercase-and-underscores compatible, without quotes

Returns
node identifier for a node with that compatible, or *DT_INVALID_NODE*

`DT_NODE_PATH`(node_id)

Get a devicetree node's full path as a string literal.

This returns the path to a node from a node identifier. To get a node identifier from path components instead, use *DT_PATH()*.

Example devicetree fragment:

```
/ {
        soc {
                node: my-node@12345678 { ... };
        };
};
```

Example usage:

```
DT_NODE_PATH(DT_NODELABEL(node)) // "/soc/my-node@12345678"
DT_NODE_PATH(DT_PATH(soc))       // "/soc"
DT_NODE_PATH(DT_ROOT)            // "/"
```

Parameters

- **node_id** – node identifier

Returns
the node's full path in the devicetree

`DT_NODE_FULL_NAME`(node_id)

Get a devicetree node's name with unit-address as a string literal.

This returns the node name and unit-address from a node identifier.

Example devicetree fragment:

```
/ {
        soc {
                node: my-node@12345678 { ... };
        };
};
```

Example usage:

```
DT_NODE_FULL_NAME(DT_NODELABEL(node)) // "my-node@12345678"
```

Parameters

- **node_id** – node identifier

Returns
the node's name with unit-address as a string in the devicetree

DT_NODE_CHILD_IDX(node_id)

Get a devicetree node's index into its parent's list of children.

Indexes are zero-based.

It is an error to use this macro with the root node.

Example devicetree fragment:

```
parent {
        c1: child-1 {};
        c2: child-2 {};
};
```

Example usage:

```
DT_NODE_CHILD_IDX(DT_NODELABEL(c1)) // 0
DT_NODE_CHILD_IDX(DT_NODELABEL(c2)) // 1
```

Parameters

- **node_id** – node identifier

Returns
the node's index in its parent node's list of children

DT_CHILD_NUM(node_id)

Get the number of child nodes of a given node.

Parameters

- **node_id** – a node identifier

Returns
Number of child nodes

DT_CHILD_NUM_STATUS_OKAY(node_id)

Get the number of child nodes of a given node which child nodes' status are okay.

Parameters

- **node_id** – a node identifier

Returns
Number of child nodes which status are okay

DT_SAME_NODE(node_id1, node_id2)

Do node_id1 and node_id2 refer to the same node?

Both node_id1 and node_id2 must be node identifiers for nodes that exist in the devicetree (if unsure, you can check with *DT_NODE_EXISTS()*).

The expansion evaluates to 0 or 1, but may not be a literal integer 0 or 1.

Parameters

- **node_id1** – first node identifier
- **node_id2** – second node identifier

Returns

an expression that evaluates to 1 if the node identifiers refer to the same node, and evaluates to 0 otherwise

DT_NODELABEL_STRING_ARRAY(node_id)

Get a devicetree node's node labels as an array of strings.

Example devicetree fragment:

```
foo: bar: node@deadbeef {};
```

Example usage:

```
DT_NODELABEL_STRING_ARRAY(DT_NODELABEL(foo))
```

This expands to:

```
{ "foo", "bar", }
```

Parameters

- **node_id** – node identifier

Returns

an array initializer for an array of the node's node labels as strings

Property access The following general-purpose macros can be used to access node properties. There are special-purpose APIs for accessing the *ranges property*, *reg property* and *interrupts property*.

Property values can be read using these macros even if the node is disabled, as long as it has a matching binding.

group devicetree-generic-prop

Defines

DT_PROP(node_id, prop)

Get a devicetree property value.

For properties whose bindings have the following types, this macro expands to:

- string: a string literal
- boolean: 0 if the property is false, or 1 if it is true
- int: the property's value as an integer literal

- array, uint8-array, string-array: an initializer expression in braces, whose elements are integer or string literals (like `{0, 1, 2}`, `{"hello", "world"}`, etc.)
- phandle: a node identifier for the node with that phandle

A property's type is usually defined by its binding. In some special cases, it has an assumed type defined by the devicetree specification even when no binding is available: `compatible` has type string-array, `status` has type string, and `interrupt-controller` has type boolean.

For other properties or properties with unknown type due to a missing binding, behavior is undefined.

For usage examples, see *DT_PATH()*, *DT_ALIAS()*, *DT_NODELABEL()*, and *DT_INST()* above.

Parameters

- `node_id` – node identifier
- `prop` – lowercase-and-underscores property name

Returns
a representation of the property's value

`DT_PROP_LEN`(node_id, prop)

Get a property's logical length.

Here, "length" is a number of elements, which may differ from the property's size in bytes.

The return value depends on the property's type:

- for types array, string-array, and uint8-array, this expands to the number of elements in the array
- for type phandles, this expands to the number of phandles
- for type phandle-array, this expands to the number of phandle and specifier blocks in the property
- for type phandle, this expands to 1 (so that a phandle can be treated as a degenerate case of phandles with length 1)
- for type string, this expands to 1 (so that a string can be treated as a degenerate case of string-array with length 1)

These properties are handled as special cases:

- reg property: use *DT_NUM_REGS(node_id)* instead
- interrupts property: use *DT_NUM_IRQS(node_id)* instead

It is an error to use this macro with the `ranges`, `dma-ranges`, `reg` or `interrupts` properties.

For other properties, behavior is undefined.

Parameters

- `node_id` – node identifier
- `prop` – a lowercase-and-underscores property with a logical length

Returns
the property's length

DT_PROP_LEN_OR(node_id, prop, default_value)

Like *DT_PROP_LEN()*, but with a fallback to `default_value`.

If the property is defined (as determined by *DT_NODE_HAS_PROP()*), this expands to *DT_PROP_LEN(node_id, prop)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **prop** – a lowercase-and-underscores property with a logical length
- **default_value** – a fallback value to expand to

Returns
the property's length or the given default value

DT_PROP_HAS_IDX(node_id, prop, idx)

Is index `idx` valid for an array type property?

If this returns 1, then *DT_PROP_BY_IDX(node_id, prop, idx)* or *DT_PHA_BY_IDX(node_id, prop, idx, ...)* are valid at index `idx`. If it returns 0, it is an error to use those macros with that index.

These properties are handled as special cases:

- `reg` property: use *DT_REG_HAS_IDX(node_id, idx)* instead
- `interrupts` property: use *DT_IRQ_HAS_IDX(node_id, idx)* instead

It is an error to use this macro with the `reg` or `interrupts` properties.

Parameters

- **node_id** – node identifier
- **prop** – a lowercase-and-underscores property with a logical length
- **idx** – index to check

Returns
An expression which evaluates to 1 if `idx` is a valid index into the given property, and 0 otherwise.

DT_PROP_HAS_NAME(node_id, prop, name)

Is name `name` available in a `foo-names` property?

This property is handled as special case:

- `interrupts` property: use *DT_IRQ_HAS_NAME(node_id, idx)* instead

It is an error to use this macro with the `interrupts` property.

Example devicetree fragment:

```
nx: node-x {
   foos = <&bar xx yy>, <&baz xx zz>;
   foo-names = "event", "error";
   status = "okay";
};
```

Example usage:

```
DT_PROP_HAS_NAME(DT_NODELABEL(nx), foos, event)    // 1
DT_PROP_HAS_NAME(DT_NODELABEL(nx), foos, failure)  // 0
```

Parameters

- **node_id** – node identifier
- **prop** – a lowercase-and-underscores `prop-names` type property
- **name** – a lowercase-and-underscores name to check

Returns
An expression which evaluates to 1 if "name" is an available name into the given property, and 0 otherwise.

`DT_PROP_BY_IDX`(node_id, prop, idx)

Get the value at index `idx` in an array type property.

It might help to read the argument order as being similar to `node->property[index]`.

The return value depends on the property's type:

- for types array, string-array, uint8-array, and phandles, this expands to the idx-th array element as an integer, string literal, integer, and node identifier respectively
- for type phandle, idx must be 0 and the expansion is a node identifier (this treats phandle like a phandles of length 1)
- for type string, idx must be 0 and the expansion is the entire string (this treats string like string-array of length 1)

These properties are handled as special cases:

- `reg`: use *DT_REG_ADDR_BY_IDX()* or *DT_REG_SIZE_BY_IDX()* instead
- `interrupts`: use *DT_IRQ_BY_IDX()*
- `ranges`: use *DT_NUM_RANGES()*
- `dma-ranges`: it is an error to use this property with *DT_PROP_BY_IDX()*

For properties of other types, behavior is undefined.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns
a representation of the idx-th element of the property

`DT_PROP_OR`(node_id, prop, default_value)

Like *DT_PROP()*, but with a fallback to `default_value`.

If the value exists, this expands to *DT_PROP(node_id, prop)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

- **default_value** – a fallback value to expand to

Returns
the property's value or default_value

DT_ENUM_IDX(node_id, prop)

Get a property value's index into its enumeration values.

The return values start at zero.

Example devicetree fragment:

```
usb1: usb@12340000 {
        maximum-speed = "full-speed";
};
usb2: usb@12341000 {
        maximum-speed = "super-speed";
};
```

Example bindings fragment:

```
properties:
  maximum-speed:
    type: string
    enum:
       - "low-speed"
       - "full-speed"
       - "high-speed"
       - "super-speed"
```

Example usage:

```
DT_ENUM_IDX(DT_NODELABEL(usb1), maximum_speed) // 1
DT_ENUM_IDX(DT_NODELABEL(usb2), maximum_speed) // 3
```

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

Returns
zero-based index of the property's value in its enum: list

DT_ENUM_IDX_OR(node_id, prop, default_idx_value)

Like *DT_ENUM_IDX()*, but with a fallback to a default enum index.

If the value exists, this expands to its zero based index value thanks to *DT_ENUM_IDX(node_id, prop)*.

Otherwise, this expands to provided default index enum value.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **default_idx_value** – a fallback index value to expand to

Returns
zero-based index of the property's value in its enum if present, default_idx_value otherwise

DT_ENUM_HAS_VALUE(node_id, prop, value)

Does a node enumeration property have a given value?

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **value** – lowercase-and-underscores enumeration value

Returns

1 if the node property has the value *value*, 0 otherwise.

DT_STRING_TOKEN(node_id, prop)

Get a string property's value as a token.

This removes "the quotes" from a string property's value, converting any non-alphanumeric characters to underscores. This can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_TOKEN() can only be used for properties with string type.

It is an error to use *DT_STRING_TOKEN()* in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
        prop = "foo";
};
n2: node-2 {
        prop = "FOO";
}
n3: node-3 {
        prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_TOKEN(DT_NODELABEL(n1), prop) // foo
DT_STRING_TOKEN(DT_NODELABEL(n2), prop) // FOO
DT_STRING_TOKEN(DT_NODELABEL(n3), prop) // 123_foo
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The uppercased "FOO" in the DTS remains FOO as a token. It is *not* converted to foo.
- The whitespace in the DTS "123 foo" string is converted to 123_foo as a token.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

Returns
the value of prop as a token, i.e. without any quotes and with special characters converted to underscores

DT_STRING_TOKEN_OR(node_id, prop, default_value)

Like *DT_STRING_TOKEN()*, but with a fallback to default_value.

If the value exists, this expands to *DT_STRING_TOKEN(node_id, prop)*. The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **default_value** – a fallback value to expand to

Returns
the property's value as a token, or default_value

DT_STRING_UPPER_TOKEN(node_id, prop)

Like *DT_STRING_TOKEN()*, but uppercased.

This removes "the quotes" from a string property's value, converting any non-alphanumeric characters to underscores, and capitalizing the result. This can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_UPPER_TOKEN() can only be used for properties with string type.

It is an error to use *DT_STRING_UPPER_TOKEN()* in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
        prop = "foo";
};
n2: node-2 {
        prop = "123 foo";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n1), prop) // FOO
DT_STRING_UPPER_TOKEN(DT_NODELABEL(n2), prop) // 123_FOO
```

Notice how:

- Unlike C identifiers, the property values may begin with a number. It's the user's responsibility not to use such values as the name of a C identifier.
- The lowercased "foo" in the DTS becomes FOO as a token, i.e. it is uppercased.
- The whitespace in the DTS "123 foo" string is converted to 123_FOO as a token, i.e. it is uppercased and whitespace becomes an underscore.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

Returns
the value of prop as an uppercased token, i.e. without any quotes and with special characters converted to underscores

DT_STRING_UPPER_TOKEN_OR(node_id, prop, default_value)

Like *DT_STRING_UPPER_TOKEN()*, but with a fallback to `default_value`.

If the value exists, this expands to *DT_STRING_UPPER_TOKEN(node_id, prop)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **default_value** – a fallback value to expand to

Returns
the property's value as an uppercased token, or `default_value`

DT_STRING_UNQUOTED(node_id, prop)

Get a string property's value as an unquoted sequence of tokens.

This removes "the quotes" from string-valued properties. That can be useful, for example, when defining floating point values as a string in devicetree that you would like to use to initialize a float or double variable in C.

DT_STRING_UNQUOTED() can only be used for properties with string type.

It is an error to use *DT_STRING_UNQUOTED()* in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
        prop = "12.7";
};
n2: node-2 {
        prop = "0.5";
}
n3: node-3 {
        prop = "A B C";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string
```

Example usage:

```
DT_STRING_UNQUOTED(DT_NODELABEL(n1), prop) // 12.7
DT_STRING_UNQUOTED(DT_NODELABEL(n2), prop) // 0.5
DT_STRING_UNQUOTED(DT_NODELABEL(n3), prop) // A B C
```

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

Returns
the property's value as a sequence of tokens, with no quotes

`DT_STRING_UNQUOTED_OR`(node_id, prop, default_value)

Like *DT_STRING_UNQUOTED()*, but with a fallback to `default_value`.

If the value exists, this expands to *DT_STRING_UNQUOTED(node_id, prop)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **default_value** – a fallback value to expand to

Returns
the property's value as a sequence of tokens, with no quotes, or `default_value`

`DT_STRING_TOKEN_BY_IDX`(node_id, prop, idx)

Get an element out of a string-array property as a token.

This removes "the quotes" from an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_TOKEN_BY_IDX() can only be used for properties with string-array type.

It is an error to use *DT_STRING_TOKEN_BY_IDX()* in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
        prop = "f1", "F2";
};
n2: node-2 {
        prop = "123 foo", "456 FOO";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string-array
```

Example usage:

```
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 0) // f1
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 1) // F2
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 0) // 123_foo
DT_STRING_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 1) // 456_FOO
```

For more information, see *DT_STRING_TOKEN*.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns
the element in `prop` at index `idx` as a token

DT_STRING_UPPER_TOKEN_BY_IDX(node_id, prop, idx)

Like *DT_STRING_TOKEN_BY_IDX()*, but uppercased.

This removes "the quotes" and capitalizes an element in the array, and converts non-alphanumeric characters to underscores. That can be useful, for example, when programmatically using the value to form a C variable or code.

DT_STRING_UPPER_TOKEN_BY_IDX() can only be used for properties with string-array type.

It is an error to use *DT_STRING_UPPER_TOKEN_BY_IDX()* in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
        prop = "f1", "F2";
};
n2: node-2 {
        prop = "123 foo", "456 FOO";
};
```

Example bindings fragment:

```
properties:
  prop:
    type: string-array
```

Example usage:

```
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 0) // F1
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n1), prop, 1) // F2
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 0) // 123_FOO
DT_STRING_UPPER_TOKEN_BY_IDX(DT_NODELABEL(n2), prop, 1) // 456_FOO
```

For more information, see *DT_STRING_UPPER_TOKEN*.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns

the element in `prop` at index `idx` as an uppercased token

DT_STRING_UNQUOTED_BY_IDX(node_id, prop, idx)

Get a string array item value as an unquoted sequence of tokens.

This removes "the quotes" from string-valued item. That can be useful, for example, when defining floating point values as a string in devicetree that you would like to use to initialize a float or double variable in C.

DT_STRING_UNQUOTED_BY_IDX() can only be used for properties with string-array type.

It is an error to use *DT_STRING_UNQUOTED_BY_IDX()* in other circumstances.

Example devicetree fragment:

```
n1: node-1 {
        prop = "12.7", "34.1";
};
n2: node-2 {
        prop = "A B", "C D";
}
```

Example bindings fragment:

```
properties:
  prop:
    type: string-array
```

Example usage:

```
DT_STRING_UNQUOTED_BY_IDX(DT_NODELABEL(n1), prop, 0) // 12.7
DT_STRING_UNQUOTED_BY_IDX(DT_NODELABEL(n1), prop, 1) // 34.1
DT_STRING_UNQUOTED_BY_IDX(DT_NODELABEL(n2), prop, 0) // A B
DT_STRING_UNQUOTED_BY_IDX(DT_NODELABEL(n2), prop, 1) // C D
```

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns
the property's value as a sequence of tokens, with no quotes

DT_PROP_BY_PHANDLE_IDX(node_id, phs, idx, prop)

Get a property value from a phandle in a property.

This is a shorthand for:

```
DT_PROP(DT_PHANDLE_BY_IDX(node_id, phs, idx), prop)
```

That is, `prop` is a property of the phandle's node, not a property of `node_id`.

Example devicetree fragment:

```
n1: node-1 {
        foo = <&n2 &n3>;
};

n2: node-2 {
        bar = <42>;
};

n3: node-3 {
        baz = <43>;
};
```

Example usage:

```
#define N1 DT_NODELABEL(n1)

DT_PROP_BY_PHANDLE_IDX(N1, foo, 0, bar) // 42
DT_PROP_BY_PHANDLE_IDX(N1, foo, 1, baz) // 43
```

Parameters

- **node_id** – node identifier
- **phs** – lowercase-and-underscores property with type `phandle`, `phandles`, or `phandle-array`
- **idx** – logical index into `phs`, which must be zero if `phs` has type `phandle`
- **prop** – lowercase-and-underscores property of the phandle's node

Returns
the property's value

`DT_PROP_BY_PHANDLE_IDX_OR`(node_id, phs, idx, prop, default_value)

Like *DT_PROP_BY_PHANDLE_IDX()*, but with a fallback to `default_value`.

If the value exists, this expands to *DT_PROP_BY_PHANDLE_IDX(node_id, phs,idx, prop)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **phs** – lowercase-and-underscores property with type `phandle`, `phandles`, or `phandle-array`
- **idx** – logical index into `phs`, which must be zero if `phs` has type `phandle`
- **prop** – lowercase-and-underscores property of the phandle's node
- **default_value** – a fallback value to expand to

Returns
the property's value

`DT_PROP_BY_PHANDLE`(node_id, ph, prop)

Get a property value from a phandle's node.

This is equivalent to *DT_PROP_BY_PHANDLE_IDX(node_id, ph, 0, prop)*.

Parameters

- **node_id** – node identifier
- **ph** – lowercase-and-underscores property of `node_id` with type `phandle`
- **prop** – lowercase-and-underscores property of the phandle's node

Returns
the property's value

`DT_PHA_BY_IDX`(node_id, pha, idx, cell)

Get a phandle-array specifier cell value at an index.

It might help to read the argument order as being similar to `node->phandle_array[index].cell`. That is, the cell value is in the `pha` property of `node_id`, inside the specifier at index `idx`.

Example devicetree fragment:

```
gpio0: gpio@abcd1234 {
        #gpio-cells = <2>;
};

gpio1: gpio@1234abcd {
        #gpio-cells = <2>;
};

led: led_0 {
        gpios = <&gpio0 17 0x1>, <&gpio1 5 0x3>;
};
```

Bindings fragment for the `gpio0` and `gpio1` nodes:

```
gpio-cells:
  - pin
  - flags
```

Above, gpios has two elements:

- index 0 has specifier <17 0x1>, so its pin cell is 17, and its flags cell is 0x1
- index 1 has specifier <5 0x3>, so pin is 5 and flags is 0x3

Example usage:

```
#define LED DT_NODELABEL(led)

DT_PHA_BY_IDX(LED, gpios, 0, pin)   // 17
DT_PHA_BY_IDX(LED, gpios, 1, flags) // 0x3
```

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into pha
- **cell** – lowercase-and-underscores cell name within the specifier at pha index idx

Returns
the cell's value

DT_PHA_BY_IDX_OR(node_id, pha, idx, cell, default_value)

Like *DT_PHA_BY_IDX()*, but with a fallback to default_value.

If the value exists, this expands to *DT_PHA_BY_IDX(node_id, pha,idx, cell)*. The default_value parameter is not expanded in this case.

Otherwise, this expands to default_value.

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into pha
- **cell** – lowercase-and-underscores cell name within the specifier at pha index idx
- **default_value** – a fallback value to expand to

Returns
the cell's value or default_value

DT_PHA(node_id, pha, cell)

Equivalent to *DT_PHA_BY_IDX(node_id, pha, 0, cell)*

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – lowercase-and-underscores cell name

Returns
the cell's value

DT_PHA_OR(node_id, pha, cell, default_value)

Like *DT_PHA()*, but with a fallback to `default_value`.

If the value exists, this expands to *DT_PHA(node_id, pha, cell)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type `phandle-array`
- **cell** – lowercase-and-underscores cell name
- **default_value** – a fallback value to expand to

Returns
the cell's value or `default_value`

DT_PHA_BY_NAME(node_id, pha, name, cell)

Get a value within a phandle-array specifier by name.

This is like *DT_PHA_BY_IDX()*, except it treats `pha` as a structure where each array element has a name.

It might help to read the argument order as being similar to `node->phandle_struct.name.cell`. That is, the cell value is in the `pha` property of `node_id`, treated as a data structure where each array element has a name.

Example devicetree fragment:

```
n: node {
        io-channels = <&adc1 10>, <&adc2 20>;
        io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the "adc1" and "adc2" nodes:

```
io-channel-cells:
  - input
```

Example usage:

```
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, sensor, input)  // 10
DT_PHA_BY_NAME(DT_NODELABEL(n), io_channels, bandgap, input) // 20
```

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type `phandle-array`
- **name** – lowercase-and-underscores name of a specifier in `pha`
- **cell** – lowercase-and-underscores cell name in the named specifier

Returns
the cell's value

DT_PHA_BY_NAME_OR(node_id, pha, name, cell, default_value)

Like *DT_PHA_BY_NAME()*, but with a fallback to `default_value`.

If the value exists, this expands to *DT_PHA_BY_NAME(node_id, pha,name, cell)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type `phandle-array`
- **name** – lowercase-and-underscores name of a specifier in `pha`
- **cell** – lowercase-and-underscores cell name in the named specifier
- **default_value** – a fallback value to expand to

Returns

the cell's value or `default_value`

DT_PHANDLE_BY_NAME(node_id, pha, name)

Get a phandle's node identifier from a phandle array by `name`.

It might help to read the argument order as being similar to `node->phandle_struct.name.phandle`. That is, the phandle array is treated as a structure with named elements. The return value is the node identifier for a phandle inside the structure.

Example devicetree fragment:

```
adc1: adc@abcd1234 {
        foobar = "ADC_1";
};

adc2: adc@1234abcd {
        foobar = "ADC_2";
};

n: node {
        io-channels = <&adc1 10>, <&adc2 20>;
        io-channel-names = "SENSOR", "BANDGAP";
};
```

Above, "io-channels" has two elements:

- the element named `"SENSOR"` has phandle `&adc1`
- the element named `"BANDGAP"` has phandle `&adc2`

Example usage:

```
#define NODE DT_NODELABEL(n)

DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, sensor), foobar)  // "ADC_1"
DT_PROP(DT_PHANDLE_BY_NAME(NODE, io_channels, bandgap), foobar) // "ADC_2"
```

Notice how devicetree properties and names are lowercased, and non-alphanumeric characters are converted to underscores.

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type `phandle-array`
- **name** – lowercase-and-underscores name of an element in `pha`

Returns
a node identifier for the node with that phandle

DT_PHANDLE_BY_IDX(node_id, prop, idx)

Get a node identifier for a phandle in a property.

When a node's value at a logical index contains a phandle, this macro returns a node identifier for the node with that phandle.

Therefore, if prop has type phandle, idx must be zero. (A phandle type is treated as a phandles with a fixed length of 1).

Example devicetree fragment:

```
n1: node-1 {
        foo = <&n2 &n3>;
};

n2: node-2 { ... };
n3: node-3 { ... };
```

Above, foo has type phandles and has two elements:

- index 0 has phandle &n2, which is node-2's phandle
- index 1 has phandle &n3, which is node-3's phandle

Example usage:

```
#define N1 DT_NODELABEL(n1)

DT_PHANDLE_BY_IDX(N1, foo, 0) // node identifier for node-2
DT_PHANDLE_BY_IDX(N1, foo, 1) // node identifier for node-3
```

Behavior is analogous for phandle-arrays.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name in node_id with type phandle, phandles or phandle-array
- **idx** – index into prop

Returns
node identifier for the node with the phandle at that index

DT_PHANDLE(node_id, prop)

Get a node identifier for a phandle property's value.

This is equivalent to *DT_PHANDLE_BY_IDX(node_id, prop, 0)*. Its primary benefit is readability when prop has type phandle.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property of node_id with type phandle

Returns
a node identifier for the node pointed to by "ph"

ranges property Use these APIs instead of *Property access* to access the ranges property. Because this property's semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings. However, they take on special semantics when the node's binding indicates it is a PCIe bus node, as defined in the PCI Bus Binding to: IEEE Std 1275-1994 Standard for Boot (Initialization Configuration) Firmware

group devicetree-ranges-prop

Defines

DT_NUM_RANGES(node_id)

Get the number of range blocks in the ranges property.

Use this instead of *DT_PROP_LEN(node_id, ranges)*.

Example devicetree fragment:

```
pcie0: pcie@0 {
        compatible = "pcie-controller";
        reg = <0 1>;
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                 <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                 <0x3000000 0x80 0 0x80 0 0x80 0>;
};

other: other@1 {
        reg = <1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
DT_NUM_RANGES(DT_NODELABEL(pcie0)) // 3
DT_NUM_RANGES(DT_NODELABEL(other)) // 2
```

Parameters

- **node_id** – node identifier

DT_RANGES_HAS_IDX(node_id, idx)

Is idx a valid range block index?

If this returns 1, then *DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx)*, *DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)* or *DT_RANGES_LENGTH_BY_IDX(node_id, idx)* are valid. For *DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)* the return value of *DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(node_id, idx)* will indicate validity. If it returns 0, it is an error to use those macros with index idx, including *DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)*.

Example devicetree fragment:

```
pcie0: pcie@0 {
        compatible = "pcie-controller";
        reg = <0 1>;
```

(continues on next page)

(continued from previous page)

```
        #address-cells = <3>;
        #size-cells = <2>;

        ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                 <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                 <0x3000000 0x80 0 0x80 0 0x80 0>;
};

other: other@1 {
        reg = <1 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 0) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 1) // 1
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_IDX(DT_NODELABEL(other), 3) // 0
```

Parameters

- **node_id** – node identifier
- **idx** – index to check

Returns

1 if `idx` is a valid register block index, 0 otherwise.

`DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX`(node_id, idx)

Does a ranges property have child bus flags at index?

If this returns 1, then *DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)* is valid. If it returns 0, it is an error to use this macro with index `idx`. This macro only returns 1 for PCIe buses (i.e. nodes whose bindings specify they are “pcie” bus nodes.)

Example devicetree fragment:

```
parent {
        #address-cells = <2>;

        pcie0: pcie@0 {
                compatible = "pcie-controller";
                reg = <0 0 1>;
                #address-cells = <3>;
                #size-cells = <2>;

                ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                         <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                         <0x3000000 0x80 0 0x80 0 0x80 0>;
        };

        other: other@1 {
                reg = <0 1 1>;

                ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
```

(continues on next page)

(continued from previous page)

```
                        <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
        };
};
```

Example usage:

```
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 0) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 1) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 2) // 1
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(pcie0), 3) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 1) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 2) // 0
DT_RANGES_HAS_CHILD_BUS_FLAGS_AT_IDX(DT_NODELABEL(other), 3) // 0
```

Parameters

- **node_id** – node identifier
- **idx** – logical index into the ranges array

Returns

1 if idx is a valid child bus flags index, 0 otherwise.

DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(node_id, idx)

Get the ranges property child bus flags at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is extracted from the Child Bus Address as Child Bus Flags field.

Example devicetree fragments:

```
parent {
        #address-cells = <2>;

        pcie0: pcie@0 {
                compatible = "pcie-controller";
                reg = <0 0 1>;
                #address-cells = <3>;
                #size-cells = <2>;

                ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                         <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                         <0x3000000 0x80 0 0x80 0 0x80 0>;
        };
};
```

Example usage:

```
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x1000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2000000
DT_RANGES_CHILD_BUS_FLAGS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x3000000
```

Parameters

- **node_id** – node identifier
- **idx** – logical index into the ranges array

Returns

range child bus flags field at idx

DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(node_id, idx)

Get the ranges property child bus address at index.

When the node is a PCIe bus, the Child Bus Address has an extra cell used to store some flags, thus this cell is removed from the Child Bus Address.

Example devicetree fragments:

```
parent {
        #address-cells = <2>;

        pcie0: pcie@0 {
                compatible = "pcie-controller";
                reg = <0 0 1>;
                #address-cells = <3>;
                #size-cells = <2>;

                ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                         <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                         <0x3000000 0x80 0 0x80 0 0x80 0>;
        };

        other: other@1 {
                reg = <0 1 1>;

                ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                         <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
        };
};
```

Example usage:

```
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0
DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

Parameters

- **node_id** – node identifier
- **idx** – logical index into the ranges array

Returns

range child bus address field at idx

DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(node_id, idx)

Get the ranges property parent bus address at index.

Similarly to *DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX()*, this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
        #address-cells = <2>;

        pcie0: pcie@0 {
                compatible = "pcie-controller";
                reg = <0 0 1>;
                #address-cells = <3>;
                #size-cells = <2>;
```

(continues on next page)

(continued from previous page)

```
                ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                         <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                         <0x3000000 0x80 0 0x80 0 0x80 0>;
        };

        other: other@1 {
                reg = <0 1 1>;

                ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                         <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
        };
};
```

Example usage:

```
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x10000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 0) // 0x3eff0000
DT_RANGES_PARENT_BUS_ADDRESS_BY_IDX(DT_NODELABEL(other), 1) // 0x10000000
```

Parameters

- `node_id` – node identifier
- `idx` – logical index into the ranges array

Returns
range parent bus address field at idx

`DT_RANGES_LENGTH_BY_IDX`(node_id, idx)

Get the ranges property length at index.

Similarly to *DT_RANGES_CHILD_BUS_ADDRESS_BY_IDX()*, this properly accounts for child bus flags cells when the node is a PCIe bus.

Example devicetree fragment:

```
parent {
        #address-cells = <2>;

        pcie0: pcie@0 {
                compatible = "pcie-controller";
                reg = <0 0 1>;
                #address-cells = <3>;
                #size-cells = <2>;

                ranges = <0x1000000 0 0 0 0x3eff0000 0 0x10000>,
                         <0x2000000 0 0x10000000 0 0x10000000 0 0x2eff0000>,
                         <0x3000000 0x80 0 0x80 0 0x80 0>;
        };

        other: other@1 {
                reg = <0 1 1>;

                ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                         <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
        };
};
```

Example usage:

```
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 1) // 0x2eff0000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(pcie0), 2) // 0x8000000000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 0) // 0x10000
DT_RANGES_LENGTH_BY_IDX(DT_NODELABEL(other), 1) // 0x2eff0000
```

Parameters

- **node_id** – node identifier
- **idx** – logical index into the ranges array

Returns
range length field at idx

DT_FOREACH_RANGE(node_id, fn)

Invokes `fn` for each entry of `node_id` ranges property.

The macro `fn` must take two parameters, `node_id` which will be the node identifier of the node with the ranges property and `idx` the index of the ranges block.

Example devicetree fragment:

```
n: node@0 {
        reg = <0 0 1>;

        ranges = <0x0 0x0 0x0 0x3eff0000 0x10000>,
                 <0x0 0x10000000 0x0 0x10000000 0x2eff0000>;
};
```

Example usage:

```
#define RANGE_LENGTH(node_id, idx) DT_RANGES_LENGTH_BY_IDX(node_id, idx),

const uint64_t *ranges_length[] = {
        DT_FOREACH_RANGE(DT_NODELABEL(n), RANGE_LENGTH)
};
```

This expands to:

```
const char *ranges_length[] = {
    0x10000, 0x2eff0000,
};
```

Parameters

- **node_id** – node identifier
- **fn** – macro to invoke

reg property Use these APIs instead of *Property access* to access the `reg` property. Because this property's semantics are defined by the devicetree specification, these macros can be used even for nodes without matching bindings.

group devicetree-reg-prop

Defines

DT_NUM_REGS(node_id)

Get the number of register blocks in the reg property.

Use this instead of *DT_PROP_LEN(node_id, reg)*.

Parameters

- **node_id** – node identifier

Returns
Number of register blocks in the node's "reg" property.

DT_REG_HAS_IDX(node_id, idx)

Is idx a valid register block index?

If this returns 1, then *DT_REG_ADDR_BY_IDX(node_id, idx)* or *DT_REG_SIZE_BY_IDX(node_id, idx)* are valid. If it returns 0, it is an error to use those macros with index idx.

Parameters

- **node_id** – node identifier
- **idx** – index to check

Returns
1 if idx is a valid register block index, 0 otherwise.

DT_REG_HAS_NAME(node_id, name)

Is name a valid register block name?

If this returns 1, then *DT_REG_ADDR_BY_NAME(node_id, name)* or *DT_REG_SIZE_BY_NAME(node_id, name)* are valid. If it returns 0, it is an error to use those macros with name name.

Parameters

- **node_id** – node identifier
- **name** – name to check

Returns
1 if name is a valid register block name, 0 otherwise.

DT_REG_ADDR_BY_IDX(node_id, idx)

Get the base address of the register block at index idx.

Parameters

- **node_id** – node identifier
- **idx** – index of the register whose address to return

Returns
address of the idx-th register block

DT_REG_SIZE_BY_IDX(node_id, idx)

Get the size of the register block at index idx.

This is the size of an individual register block, not the total number of register blocks in the property; use *DT_NUM_REGS()* for that.

Parameters

- **node_id** – node identifier
- **idx** – index of the register whose size to return

Returns
size of the idx-th register block

DT_REG_ADDR(node_id)

Get a node's (only) register block address.

Equivalent to *DT_REG_ADDR_BY_IDX(node_id, 0)*.

Parameters

- **node_id** – node identifier

Returns
node's register block address

DT_REG_ADDR_U64(node_id)

64-bit version of *DT_REG_ADDR()*

This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to *DT_REG_ADDR()* in linker/ASM context.

Parameters

- **node_id** – node identifier

Returns
node's register block address

DT_REG_SIZE(node_id)

Get a node's (only) register block size.

Equivalent to *DT_REG_SIZE_BY_IDX(node_id, 0)*.

Parameters

- **node_id** – node identifier

Returns
node's only register block's size

DT_REG_ADDR_BY_NAME(node_id, name)

Get a register block's base address by name.

Parameters

- **node_id** – node identifier
- **name** – lowercase-and-underscores register specifier name

Returns
address of the register block specified by name

DT_REG_ADDR_BY_NAME_OR(node_id, name, default_value)

Like *DT_REG_ADDR_BY_NAME()*, but with a fallback to `default_value`.

Parameters

- **node_id** – node identifier
- **name** – lowercase-and-underscores register specifier name
- **default_value** – a fallback value to expand to

Returns
address of the register block specified by name if present, `default_value` otherwise

DT_REG_ADDR_BY_NAME_U64(node_id, name)

64-bit version of *DT_REG_ADDR_BY_NAME()*

This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to *DT_REG_ADDR_BY_NAME()* in linker/ASM context.

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

Returns
address of the register block specified by name

`DT_REG_SIZE_BY_NAME`(node_id, name)

Get a register block's size by name.

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name

Returns
size of the register block specified by name

`DT_REG_SIZE_BY_NAME_OR`(node_id, name, default_value)

Like *DT_REG_SIZE_BY_NAME()*, but with a fallback to `default_value`.

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores register specifier name
- `default_value` – a fallback value to expand to

Returns
size of the register block specified by name if present, `default_value` otherwise

`interrupts` property Use these APIs instead of *Property access* to access the `interrupts` property.

Because this property's semantics are defined by the devicetree specification, some of these macros can be used even for nodes without matching bindings. This does not apply to macros which take cell names as arguments.

group `devicetree-interrupts-prop`

Defines

`DT_NUM_IRQS`(node_id)

Get the number of interrupt sources for the node.

Use this instead of *DT_PROP_LEN(node_id, interrupts)*.

Parameters

- `node_id` – node identifier

Returns
Number of interrupt specifiers in the node's "interrupts" property.

`DT_NUM_NODELABELS`(node_id)

Get the number of node labels that a node has.

Example devicetree fragment:

```
/ {
    foo {};
    bar: bar@1000 {};
    baz: baz2: baz@2000 {};
};
```

Example usage:

```
DT_NUM_NODELABELS(DT_PATH(foo))       // 0
DT_NUM_NODELABELS(DT_NODELABEL(bar)) // 1
DT_NUM_NODELABELS(DT_NODELABEL(baz)) // 2
```

Parameters

- **node_id** – node identifier

Returns
number of node labels that the node has

`DT_IRQ_LEVEL`(node_id)

Get the interrupt level for the node.

Parameters

- **node_id** – node identifier

Returns
interrupt level

`DT_IRQ_HAS_IDX`(node_id, idx)

Is `idx` a valid interrupt index?

If this returns 1, then *DT_IRQ_BY_IDX(node_id, idx)* is valid. If it returns 0, it is an error to use that macro with this index.

Parameters

- **node_id** – node identifier
- **idx** – index to check

Returns
1 if the idx is valid for the interrupt property 0 otherwise.

`DT_IRQ_HAS_CELL_AT_IDX`(node_id, idx, cell)

Does an interrupts property have a named cell specifier at an index? If this returns 1, then *DT_IRQ_BY_IDX(node_id, idx, cell)* is valid.

If it returns 0, it is an error to use that macro.

Parameters

- **node_id** – node identifier
- **idx** – index to check
- **cell** – named cell value whose existence to check

Returns
1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

`DT_IRQ_HAS_CELL`(node_id, cell)

Equivalent to *DT_IRQ_HAS_CELL_AT_IDX(node_id, 0, cell)*

Parameters

- **node_id** – node identifier

- **cell** – named cell value whose existence to check

Returns
1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

DT_IRQ_HAS_NAME(node_id, name)

Does an interrupts property have a named specifier value at an index? If this returns 1, then *DT_IRQ_BY_NAME(node_id, name, cell)* is valid.

If it returns 0, it is an error to use that macro.

Parameters

- **node_id** – node identifier
- **name** – lowercase-and-underscores interrupt specifier name

Returns
1 if "name" is a valid named specifier 0 otherwise.

DT_IRQ_BY_IDX(node_id, idx, cell)

Get a value within an interrupt specifier at an index.

It might help to read the argument order as being similar to "node->interrupts[index].cell".

This can be used to get information about an individual interrupt when a device generates more than one.

Example devicetree fragment:

```
my-serial: serial@abcd1234 {
        interrupts = < 33 0 >, < 34 1 >;
};
```

Assuming the node's interrupt domain has "#interrupt-cells = <2>;" and the individual cells in each interrupt specifier are named "irq" and "priority" by the node's binding, here are some examples:

```
#define SERIAL DT_NODELABEL(my_serial)

Example usage                        Value
-------------                        -----
DT_IRQ_BY_IDX(SERIAL, 0, irq)           33
DT_IRQ_BY_IDX(SERIAL, 0, priority)       0
DT_IRQ_BY_IDX(SERIAL, 1, irq,           34
DT_IRQ_BY_IDX(SERIAL, 1, priority)       1
```

Parameters

- **node_id** – node identifier
- **idx** – logical index into the interrupt specifier array
- **cell** – cell name specifier

Returns
the named value at the specifier given by the index

DT_IRQ_BY_NAME(node_id, name, cell)

Get a value within an interrupt specifier by name.

It might help to read the argument order as being similar to `node->interrupts.name.cell`.

This can be used to get information about an individual interrupt when a device generates more than one, if the bindings give each interrupt specifier a name.

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores interrupt specifier name
- `cell` – cell name specifier

Returns
the named value at the specifier given by the index

`DT_IRQ`(node_id, cell)

Get an interrupt specifier's value Equivalent to *DT_IRQ_BY_IDX(node_id, 0, cell)*.

Parameters

- `node_id` – node identifier
- `cell` – cell name specifier

Returns
the named value at that index

`DT_IRQ_INTC_BY_IDX`(node_id, idx)

Get an interrupt specifier's interrupt controller by index.

```
gpio0: gpio0 {
        interrupt-controller;
        #interrupt-cells = <2>;
};

foo: foo {
        interrupt-parent = <&gpio0>;
        interrupts = <1 1>, <2 2>;
};

bar: bar {
        interrupts-extended = <&gpio0 3 3>, <&pic0 4>;
};

pic0: pic0 {
        interrupt-controller;
        #interrupt-cells = <1>;

        qux: qux {
                interrupts = <5>, <6>;
                interrupt-names = "int1", "int2";
        };
};
```

Example usage:

```
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(foo), 0) // &gpio0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(foo), 1) // &gpio0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(bar), 0) // &gpio0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(bar), 1) // &pic0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(qux), 0) // &pic0
DT_IRQ_INTC_BY_IDX(DT_NODELABEL(qux), 1) // &pic0
```

Parameters

- `node_id` – node identifier
- `idx` – interrupt specifier's index

Returns
node_id of interrupt specifier's interrupt controller

DT_IRQ_INTC_BY_NAME(node_id, name)

Get an interrupt specifier's interrupt controller by name.

```
gpio0: gpio0 {
        interrupt-controller;
        #interrupt-cells = <2>;
};

foo: foo {
        interrupt-parent = <&gpio0>;
        interrupts = <1 1>, <2 2>;
        interrupt-names = "int1", "int2";
};

bar: bar {
        interrupts-extended = <&gpio0 3 3>, <&pic0 4>;
        interrupt-names = "int1", "int2";
};

pic0: pic0 {
        interrupt-controller;
        #interrupt-cells = <1>;

        qux: qux {
                interrupts = <5>, <6>;
                interrupt-names = "int1", "int2";
        };
};
```

Example usage:

```
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(foo), int1) // &gpio0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(foo), int2) // &gpio0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(bar), int1) // &gpio0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(bar), int2) // &pic0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(qux), int1) // &pic0
DT_IRQ_INTC_BY_NAME(DT_NODELABEL(qux), int2) // &pic0
```

Parameters

- **node_id** – node identifier
- **name** – interrupt specifier's name

Returns

node_id of interrupt specifier's interrupt controller

DT_IRQ_INTC(node_id)

Get an interrupt specifier's interrupt controller.

```
gpio0: gpio0 {
        interrupt-controller;
        #interrupt-cells = <2>;
};

foo: foo {
        interrupt-parent = <&gpio0>;
        interrupts = <1 1>;
};

bar: bar {
```

(continues on next page)

(continued from previous page)

```
        interrupts-extended = <&gpio0 3 3>;
};

pic0: pic0 {
        interrupt-controller;
        #interrupt-cells = <1>;

        qux: qux {
                interrupts = <5>;
        };
};
```

Example usage:

```
DT_IRQ_INTC(DT_NODELABEL(foo)) // &gpio0
DT_IRQ_INTC(DT_NODELABEL(bar)) // &gpio0
DT_IRQ_INTC(DT_NODELABEL(qux)) // &pic0
```

See also

DT_IRQ_INTC_BY_IDX()

Note

Equivalent to *DT_IRQ_INTC_BY_IDX(node_id, 0)*

Parameters

- `node_id` – node identifier

Returns
node_id of interrupt specifier's interrupt controller

`DT_IRQN_BY_IDX`(node_id, idx)

Get the node's Zephyr interrupt number at index If `CONFIG_MULTI_LEVEL_INTERRUPTS` is enabled, the interrupt number at index will be multi-level encoded.

Parameters

- `node_id` – node identifier
- `idx` – logical index into the interrupt specifier array

Returns
the Zephyr interrupt number

`DT_IRQN`(node_id)

Get a node's (only) irq number.

Equivalent to *DT_IRQ(node_id, irq)*. This is provided as a convenience for the common case where a node generates exactly one interrupt, and the IRQ number is in a cell named `irq`.

Parameters

- `node_id` – node identifier

Returns
the interrupt number for the node's only interrupt

For-each macros There is currently only one "generic" for-each macro, *DT_FOREACH_CHILD()*, which allows iterating over the children of a devicetree node.

There are special-purpose for-each macros, like *DT_INST_FOREACH_STATUS_OKAY()*, but these require DT_DRV_COMPAT to be defined before use.

group devicetree-generic-foreach

Defines

DT_FOREACH_NODE(fn)

Invokes fn for every node in the tree.

The macro fn must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

Parameters

- fn – macro to invoke

DT_FOREACH_NODE_VARGS(fn, ...)

Invokes fn for every node in the tree with multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the node. The remaining are passed-in by the caller.

The macro is expanded once for each node in the tree. The order that nodes are visited in is not specified.

Parameters

- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_FOREACH_STATUS_OKAY_NODE(fn)

Invokes fn for every status okay node in the tree.

The macro fn must take one parameter, which will be a node identifier. The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

Parameters

- fn – macro to invoke

DT_FOREACH_STATUS_OKAY_NODE_VARGS(fn, ...)

Invokes fn for every status okay node in the tree with multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the node. The remaining are passed-in by the caller.

The macro is expanded once for each node in the tree with status okay (as usual, a missing status property is treated as status okay). The order that nodes are visited in is not specified.

Parameters

- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD(node_id, fn)

Invokes fn for each child of node_id.

The macro fn must take one parameter, which will be the node identifier of a child node of node_id.

The children will be iterated over in the same order as they appear in the final devicetree.

Example devicetree fragment:

```
n: node {
        child-1 {
                foobar = "foo";
        };
        child-2 {
                foobar = "bar";
        };
};
```

Example usage:

```
#define FOOBAR_AND_COMMA(node_id) DT_PROP(node_id, foobar),

const char *child_foobars[] = {
    DT_FOREACH_CHILD(DT_NODELABEL(n), FOOBAR_AND_COMMA)
};
```

This expands to:

```
const char *child_foobars[] = {
    "foo", "bar",
};
```

Parameters

- **node_id** – node identifier
- **fn** – macro to invoke

DT_FOREACH_CHILD_SEP(node_id, fn, sep)

Invokes fn for each child of node_id with a separator.

The macro fn must take one parameter, which will be the node identifier of a child node of node_id.

Example devicetree fragment:

```
n: node {
        child-1 {
                ...
        };
        child-2 {
                ...
        };
};
```

Example usage:

```
const char *child_names[] = {
    DT_FOREACH_CHILD_SEP(DT_NODELABEL(n), DT_NODE_FULL_NAME, (,))
};
```

This expands to:

```
const char *child_names[] = {
    "child-1", "child-2"
};
```

Parameters

- `node_id` – node identifier
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

`DT_FOREACH_CHILD_VARGS`(node_id, fn, ...)

Invokes `fn` for each child of `node_id` with multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also

DT_FOREACH_CHILD

Parameters

- `node_id` – node identifier
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

`DT_FOREACH_CHILD_SEP_VARGS`(node_id, fn, sep, ...)

Invokes `fn` for each child of `node_id` with separator and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also

DT_FOREACH_CHILD_VARGS

Parameters

- `node_id` – node identifier
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- `...` – variable number of arguments to pass to `fn`

DT_FOREACH_CHILD_STATUS_OKAY(node_id, fn)

Call fn on the child nodes with status okay

The macro fn should take one argument, which is the node identifier for the child node.

As usual, both a missing status and an ok status are treated as okay.

The children will be iterated over in the same order as they appear in the final devicetree.

Parameters

- node_id – node identifier
- fn – macro to invoke

DT_FOREACH_CHILD_STATUS_OKAY_SEP(node_id, fn, sep)

Call fn on the child nodes with status okay with separator.

The macro fn should take one argument, which is the node identifier for the child node.

As usual, both a missing status and an ok status are treated as okay.

See also

DT_FOREACH_CHILD_STATUS_OKAY

Parameters

- node_id – node identifier
- fn – macro to invoke
- sep – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_FOREACH_CHILD_STATUS_OKAY_VARGS(node_id, fn, ...)

Call fn on the child nodes with status okay with multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

As usual, both a missing status and an ok status are treated as okay.

The children will be iterated over in the same order as they appear in the final devicetree.

See also

DT_FOREACH_CHILD_STATUS_OKAY

Parameters

- node_id – node identifier
- fn – macro to invoke
- ... – variable number of arguments to pass to fn

DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(node_id, fn, sep, ...)

Call fn on the child nodes with status okay with separator and multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

As usual, both a missing status and an ok status are treated as okay.

See also

DT_FOREACH_CHILD_SEP_STATUS_OKAY

Parameters

- **node_id** – node identifier
- **fn** – macro to invoke
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- **...** – variable number of arguments to pass to fn

DT_FOREACH_PROP_ELEM(node_id, prop, fn)

Invokes fn for each element in the value of property prop.

The macro fn must take three parameters: fn(node_id, prop, idx). node_id and prop are the same as what is passed to *DT_FOREACH_PROP_ELEM()*, and idx is the current index into the array. The idx values are integer literals starting from 0.

The prop argument must refer to a property that can be passed to *DT_PROP_LEN()*.

Example devicetree fragment:

```
n: node {
        my-ints = <1 2 3>;
};
```

Example usage:

```
#define TIMES_TWO(node_id, prop, idx) \
        (2 * DT_PROP_BY_IDX(node_id, prop, idx)),

int array[] = {
        DT_FOREACH_PROP_ELEM(DT_NODELABEL(n), my_ints, TIMES_TWO)
};
```

This expands to:

```
int array[] = {
        (2 * 1), (2 * 2), (2 * 3),
};
```

In general, this macro expands to:

```
fn(node_id, prop, 0) fn(node_id, prop, 1) [...] fn(node_id, prop, n-1)
```

where n is the number of elements in prop, as it would be returned by *DT_PROP_LEN(node_id, prop)*.

See also

DT_PROP_LEN

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke

DT_FOREACH_PROP_ELEM_SEP(node_id, prop, fn, sep)

Invokes `fn` for each element in the value of property `prop` with separator.

Example devicetree fragment:

```
n: node {
        my-gpios = <&gpioa 0 GPIO_ACTICE_HIGH>,
                   <&gpiob 1 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```
struct gpio_dt_spec specs[] = {
        DT_FOREACH_PROP_ELEM_SEP(DT_NODELABEL(n), my_gpios,
                                 GPIO_DT_SPEC_GET_BY_IDX, (,))
};
```

This expands as a first step to:

```
struct gpio_dt_spec specs[] = {
        GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), my_gpios, 0),
        GPIO_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), my_gpios, 1)
};
```

The `prop` parameter has the same restrictions as the same parameter given to *DT_FOREACH_PROP_ELEM()*.

See also

DT_FOREACH_PROP_ELEM

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_FOREACH_PROP_ELEM_VARGS(node_id, prop, fn, ...)

Invokes `fn` for each element in the value of property `prop` with multiple arguments.

The macro `fn` must take multiple parameters: `fn(node_id, prop, idx, ...)`. `node_id` and `prop` are the same as what is passed to *DT_FOREACH_PROP_ELEM()*, and `idx` is the

current index into the array. The `idx` values are integer literals starting from 0. The remaining arguments are passed-in by the caller.

The `prop` parameter has the same restrictions as the same parameter given to *DT_FOREACH_PROP_ELEM()*.

See also

DT_FOREACH_PROP_ELEM

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke
- **...** – variable number of arguments to pass to `fn`

`DT_FOREACH_PROP_ELEM_SEP_VARGS`(node_id, prop, fn, sep, ...)

Invokes `fn` for each element in the value of property `prop` with multiple arguments and a separator.

The `prop` parameter has the same restrictions as the same parameter given to *DT_FOREACH_PROP_ELEM()*.

See also

DT_FOREACH_PROP_ELEM_VARGS

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- **...** – variable number of arguments to pass to fn

`DT_FOREACH_STATUS_OKAY`(compat, fn)

Invokes `fn` for each status `okay` node of a compatible.

This macro expands to:

```
fn(node_id_1) fn(node_id_2) ... fn(node_id_n)
```

where each `node_id_<i>` is a node identifier for some node with compatible `compat` and status `okay`. Whitespace is added between expansions as shown above.

Example devicetree fragment:

```
/ {
        a {
                compatible = "foo";
                status = "okay";
        };
        b {
                compatible = "foo";
                status = "disabled";
        };
        c {
                compatible = "foo";
        };
};
```

Example usage:

```
DT_FOREACH_STATUS_OKAY(foo, DT_NODE_PATH)
```

This expands to one of the following:

```
"/a" "/c"
"/c" "/a"
```

“One of the following” is because no guarantees are made about the order that node identifiers are passed to `fn` in the expansion.

(The `/c` string literal is present because a missing status property is always treated as if the status were set to `okay`.)

Note also that `fn` is responsible for adding commas, semicolons, or other terminators as needed.

Parameters

- **compat** – lowercase-and-underscores devicetree compatible
- **fn** – Macro to call for each enabled node. Must accept a node_id as its only parameter.

DT_FOREACH_STATUS_OKAY_VARGS(compat, fn, ...)

Invokes `fn` for each status `okay` node of a compatible with multiple arguments.

This is like *DT_FOREACH_STATUS_OKAY()* except you can also pass additional arguments to `fn`.

Example devicetree fragment:

```
/ {
        a {
                compatible = "foo";
                val = <3>;
        };
        b {
                compatible = "foo";
                val = <4>;
        };
};
```

Example usage:

```
#define MY_FN(node_id, operator) DT_PROP(node_id, val) operator
x = DT_FOREACH_STATUS_OKAY_VARGS(foo, MY_FN, +) 0;
```

This expands to one of the following:

```
x = 3 + 4 + 0;
x = 4 + 3 + 0;
```

i.e. it sets x to 7. As with *DT_FOREACH_STATUS_OKAY()*, there are no guarantees about the order nodes appear in the expansion.

Parameters

- **compat** – lowercase-and-underscores devicetree compatible
- **fn** – Macro to call for each enabled node. Must accept a node_id as its only parameter.
- **...** – Additional arguments to pass to fn

DT_FOREACH_NODELABEL(node_id, fn)

Invokes fn for each node label of a given node.

The order of the node labels in this macro's expansion matches the order in the final devicetree, with duplicates removed.

Node labels are passed to fn as tokens. Note that devicetree node labels are always valid C tokens (see "6.2 Labels" in Devicetree Specification v0.4 for details). The node labels are passed as tokens to fn as-is, without any lowercasing or conversion of special characters to underscores.

Example devicetree fragment:

```
foo: bar: FOO: node@deadbeef {};
```

Example usage:

```
int foo = 1;
int bar = 2;
int FOO = 3;

#define FN(nodelabel) + nodelabel
int sum = 0 DT_FOREACH_NODELABEL(DT_NODELABEL(foo), FN)
```

This expands to:

```
int sum = 0 + 1 + 2 + 3;
```

Parameters

- **node_id** – node identifier whose node labels to use
- **fn** – macro which will be passed each node label in order

DT_FOREACH_NODELABEL_VARGS(node_id, fn, ...)

Invokes fn for each node label of a given node with multiple arguments.

This is like *DT_FOREACH_NODELABEL()* except you can also pass additional arguments to fn.

Example devicetree fragment:

```
foo: bar: node@deadbeef {};
```

Example usage:

```
int foo = 0;
int bar = 1;
```

(continues on next page)

(continued from previous page)

```
#define VAR_PLUS(nodelabel, to_add) int nodelabel ## _added = nodelabel + to_add;

DT_FOREACH_NODELABEL_VARGS(DT_NODELABEL(foo), VAR_PLUS, 1)
```

This expands to:

```
int foo = 0;
int bar = 1;
int foo_added = foo + 1;
int bar_added = bar + 1;
```

Parameters

- `node_id` – node identifier whose node labels to use
- `fn` – macro which will be passed each node label in order
- `...` – additional arguments to pass to `fn`

Existence checks This section documents miscellaneous macros that can be used to test if a node exists, how many nodes of a certain type exist, whether a node has certain properties, etc. Some macros used for special purposes (such as *DT_IRQ_HAS_IDX()* and all macros which require `DT_DRV_COMPAT`) are documented elsewhere on this page.

GPIO with custom Devicetree binding
Use custom Devicetree binding to control a GPIO.

group `devicetree-generic-exist`

Defines

`DT_NODE_EXISTS`(node_id)

Does a node identifier refer to a node?

Tests whether a node identifier refers to a node which exists, i.e. is defined in the devicetree.

It doesn't matter whether or not the node has a matching binding, or what the node's status value is. This is purely a check of whether the node exists at all.

Parameters

- `node_id` – a node identifier

Returns
1 if the node identifier refers to a node, 0 otherwise.

`DT_NODE_HAS_STATUS`(node_id, status)

Does a node identifier refer to a node with a status?

Example uses:

```
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), okay)
DT_NODE_HAS_STATUS(DT_PATH(soc, i2c_12340000), disabled)
```

Tests whether a node identifier refers to a node which:

- exists in the devicetree, and
- has a status property matching the second argument (except that either a missing status or an ok status in the devicetree is treated as if it were okay instead)

Parameters

- **node_id** – a node identifier
- **status** – a status as one of the tokens okay or disabled, not a string

Returns
1 if the node has the given status, 0 otherwise.

DT_HAS_COMPAT_STATUS_OKAY(compat)

Does the devicetree have a status okay node with a compatible?

Test for whether the devicetree has any nodes with status okay and the given compatible. That is, this returns 1 if and only if there is at least one node_id for which both of these expressions return 1:

```
DT_NODE_HAS_STATUS(node_id, okay)
DT_NODE_HAS_COMPAT(node_id, compat)
```

As usual, both a missing status and an ok status are treated as okay.

Parameters

- **compat** – lowercase-and-underscores compatible, without quotes

Returns
1 if both of the above conditions are met, 0 otherwise

DT_NUM_INST_STATUS_OKAY(compat)

Get the number of instances of a given compatible with status okay

Parameters

- **compat** – lowercase-and-underscores compatible, without quotes

Returns
Number of instances with status okay

DT_NODE_HAS_COMPAT(node_id, compat)

Does a devicetree node match a compatible?

Example devicetree fragment:

```
n: node {
        compatible = "vnd,specific-device", "generic-device";
}
```

Example usages which evaluate to 1:

```
DT_NODE_HAS_COMPAT(DT_NODELABEL(n), vnd_specific_device)
DT_NODE_HAS_COMPAT(DT_NODELABEL(n), generic_device)
```

This macro only uses the value of the compatible property. Whether or not a particular compatible has a matching binding has no effect on its value, nor does the node's status.

Parameters

- **node_id** – node identifier

- **compat** – lowercase-and-underscores compatible, without quotes

Returns
1 if the node's compatible property contains `compat`, 0 otherwise.

`DT_NODE_HAS_COMPAT_STATUS`(node_id, compat, status)

Does a devicetree node have a compatible and status?

This is equivalent to:

```
(DT_NODE_HAS_COMPAT(node_id, compat) &&
 DT_NODE_HAS_STATUS(node_id, status))
```

Parameters

- **node_id** – node identifier
- **compat** – lowercase-and-underscores compatible, without quotes
- **status** – okay or disabled as a token, not a string

`DT_NODE_HAS_PROP`(node_id, prop)

Does a devicetree node have a property?

Tests whether a devicetree node has a property defined.

This tests whether the property is defined at all, not whether a boolean property is true or false. To get a boolean property's truth value, use *DT_PROP(node_id, prop)* instead.

Parameters

- **node_id** – node identifier
- **prop** – lowercase-and-underscores property name

Returns
1 if the node has the property, 0 otherwise.

`DT_PHA_HAS_CELL_AT_IDX`(node_id, pha, idx, cell)

Does a phandle array have a named cell specifier at an index?

If this returns 1, then the phandle-array property `pha` has a cell named `cell` at index `idx`, and therefore *DT_PHA_BY_IDX(node_id,pha, idx, cell)* is valid. If it returns 0, it's an error to use *DT_PHA_BY_IDX()* with the same arguments.

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type `phandle-array`
- **idx** – index to check within `pha`
- **cell** – lowercase-and-underscores cell name whose existence to check at index `idx`

Returns
1 if the named cell exists in the specifier at index idx, 0 otherwise.

`DT_PHA_HAS_CELL`(node_id, pha, cell)

Equivalent to *DT_PHA_HAS_CELL_AT_IDX(node_id, pha, 0, cell)*

Parameters

- **node_id** – node identifier
- **pha** – lowercase-and-underscores property with type `phandle-array`
- **cell** – lowercase-and-underscores cell name whose existence to check at index `idx`

Returns
1 if the named cell exists in the specifier at index 0, 0 otherwise.

Inter-node dependencies The `devicetree.h` API has some support for tracking dependencies between nodes. Dependency tracking relies on a binary "depends on" relation between devicetree nodes, which is defined as the transitive closure of the following "directly depends on" relation:

- every non-root node directly depends on its parent node
- a node directly depends on any nodes its properties refer to by phandle
- a node directly depends on its `interrupt-parent` if it has an `interrupts` property
- a parent node inherits all dependencies from its child nodes

A *dependency ordering* of a devicetree is a list of its nodes, where each node `n` appears earlier in the list than any nodes that depend on `n`. A node's *dependency ordinal* is then its zero-based index in that list. Thus, for two distinct devicetree nodes `n1` and `n2` with dependency ordinals `d1` and `d2`, we have:

- `d1 != d2`
- if `n1` depends on `n2`, then `d1 > d2`
- `d1 > d2` does **not** necessarily imply that `n1` depends on `n2`

The Zephyr build system chooses a dependency ordering of the final devicetree and assigns a dependency ordinal to each node. Dependency related information can be accessed using the following macros. The exact dependency ordering chosen is an implementation detail, but cyclic dependencies are detected and cause errors, so it's safe to assume there are none when using these macros.

There are instance number-based conveniences as well; see *DT_INST_DEP_ORD()* and subsequent documentation.

group `devicetree-dep-ord`

Defines

`DT_DEP_ORD`(node_id)
Get a node's dependency ordinal.

Parameters
- **node_id** – Node identifier

Returns
the node's dependency ordinal as an integer literal

`DT_DEP_ORD_STR_SORTABLE`(node_id)
Get a node's dependency ordinal in string sortable form.

Parameters
- **node_id** – Node identifier

Returns
the node's dependency ordinal as a zero-padded integer literal

`DT_REQUIRES_DEP_ORDS`(node_id)
Get a list of dependency ordinals of a node's direct dependencies.

There is a comma after each ordinal in the expansion, **including** the last one:

```
DT_REQUIRES_DEP_ORDS(my_node) // required_ord_1, ..., required_ord_n,
```

The one case *DT_REQUIRES_DEP_ORDS()* expands to nothing is when given the root node identifier `DT_ROOT` as argument. The root has no direct dependencies; every other node at least depends on its parent.

Parameters

- **node_id** – Node identifier

Returns
a list of dependency ordinals, with each ordinal followed by a comma (`,`), or an empty expansion

`DT_SUPPORTS_DEP_ORDS`(node_id)

Get a list of dependency ordinals of what depends directly on a node.

There is a comma after each ordinal in the expansion, **including** the last one:

```
DT_SUPPORTS_DEP_ORDS(my_node) // supported_ord_1, ..., supported_ord_n,
```

DT_SUPPORTS_DEP_ORDS() may expand to nothing. This happens when `node_id` refers to a leaf node that nothing else depends on.

Parameters

- **node_id** – Node identifier

Returns
a list of dependency ordinals, with each ordinal followed by a comma (`,`), or an empty expansion

`DT_INST_DEP_ORD`(inst)

Get a DT_DRV_COMPAT instance's dependency ordinal.

Equivalent to *DT_DEP_ORD(DT_DRV_INST(inst))*.

Parameters

- **inst** – instance number

Returns
The instance's dependency ordinal

`DT_INST_REQUIRES_DEP_ORDS`(inst)

Get a list of dependency ordinals of a DT_DRV_COMPAT instance's direct dependencies.

Equivalent to *DT_REQUIRES_DEP_ORDS(DT_DRV_INST(inst))*.

Parameters

- **inst** – instance number

Returns
a list of dependency ordinals for the nodes the instance depends on directly

`DT_INST_SUPPORTS_DEP_ORDS`(inst)

Get a list of dependency ordinals of what depends directly on a DT_DRV_COMPAT instance.

Equivalent to *DT_SUPPORTS_DEP_ORDS(DT_DRV_INST(inst))*.

Parameters

- **inst** – instance number

Returns
a list of node identifiers for the nodes that depend directly on the instance

Bus helpers Zephyr's devicetree bindings language supports a `bus:` key which allows bindings to declare that nodes with a given compatible describe system buses. In this case, child nodes are considered to be on a bus of the given type, and the following APIs may be used.

group `devicetree-generic-bus`

Defines

`DT_BUS`(node_id)

Node's bus controller.

Get the node identifier of the node's bus controller. This can be used with *DT_PROP()* to get properties of the bus controller.

It is an error to use this with nodes which do not have bus controllers.

Example devicetree fragment:

```
i2c@deadbeef {
        status = "okay";
        clock-frequency = < 100000 >;

        i2c_device: accelerometer@12 {
                ...
        };
};
```

Example usage:

```
DT_PROP(DT_BUS(DT_NODELABEL(i2c_device)), clock_frequency) // 100000
```

Parameters

- **node_id** – node identifier

Returns

a node identifier for the node's bus controller

`DT_ON_BUS`(node_id, bus)

Is a node on a bus of a given type?

Example devicetree overlay:

```
&i2c0 {
       temp: temperature-sensor@76 {
                compatible = "vnd,some-sensor";
                reg = <0x76>;
       };
};
```

Example usage, assuming `i2c0` is an I2C bus controller node, and therefore `temp` is on an I2C bus:

```
DT_ON_BUS(DT_NODELABEL(temp), i2c) // 1
DT_ON_BUS(DT_NODELABEL(temp), spi) // 0
```

Parameters

- **node_id** – node identifier
- **bus** – lowercase-and-underscores bus type as a C token (i.e. without quotes)

Returns
1 if the node is on a bus of the given type, 0 otherwise

Instance-based APIs These are recommended for use within device drivers. To use them, define DT_DRV_COMPAT to the lowercase-and-underscores compatible the device driver implements support for. Here is an example devicetree fragment:

```
serial@40001000 {
        compatible = "vnd,serial";
        status = "okay";
        current-speed = <115200>;
};
```

Example usage, assuming serial@40001000 is the only enabled node with compatible vnd,serial:

```
#define DT_DRV_COMPAT vnd_serial
DT_DRV_INST(0)                  // node identifier for serial@40001000
DT_INST_PROP(0, current_speed)  // 115200
```

Warning

Be careful making assumptions about instance numbers. See *DT_INST()* for the API guarantees.

As shown above, the DT_INST_* APIs are conveniences for addressing nodes by instance number. They are almost all defined in terms of one of the *Generic APIs*. The equivalent generic API can be found by removing INST_ from the macro name. For example, DT_INST_PROP(inst, prop) is equivalent to DT_PROP(DT_DRV_INST(inst), prop). Similarly, DT_INST_REG_ADDR(inst) is equivalent to DT_REG_ADDR(DT_DRV_INST(inst)), and so on. There are some exceptions: *DT_ANY_INST_ON_BUS_STATUS_OKAY()* and *DT_INST_FOREACH_STATUS_OKAY()* are special-purpose helpers without straightforward generic equivalents.

Since DT_DRV_INST() requires DT_DRV_COMPAT to be defined, it's an error to use any of these without that macro defined.

Note that there are also helpers available for specific hardware; these are documented in *Hardware specific APIs*.

group **devicetree-inst**

Defines

DT_DRV_INST(inst)
Node identifier for an instance of a DT_DRV_COMPAT compatible.

Parameters
- **inst** – instance number

Returns
a node identifier for the node with DT_DRV_COMPAT compatible and instance number inst

DT_INST_PARENT(inst)
Get a DT_DRV_COMPAT parent's node identifier.

See also

DT_PARENT

Parameters

- **inst** – instance number

Returns
a node identifier for the instance's parent

DT_INST_GPARENT(inst)
Get a DT_DRV_COMPAT grandparent's node identifier.

See also

DT_GPARENT

Parameters

- **inst** – instance number

Returns
a node identifier for the instance's grandparent

DT_INST_CHILD(inst, child)
Get a node identifier for a child node of *DT_DRV_INST(inst)*

See also

DT_CHILD

Parameters

- **inst** – instance number
- **child** – lowercase-and-underscores child node name

Returns
node identifier for the node with the name referred to by 'child'

DT_INST_CHILD_NUM(inst)
Get the number of child nodes of a given node.

This is equivalent to

See also

DT_CHILD_NUM(DT_DRV_INST(inst)).

Parameters

- **inst** – Devicetree instance number

Returns
Number of child nodes

`DT_INST_CHILD_NUM_STATUS_OKAY`(inst)

Get the number of child nodes of a given node.

This is equivalent to

See also

DT_CHILD_NUM_STATUS_OKAY(DT_DRV_INST(inst)).

Parameters

- `inst` – Devicetree instance number

Returns
Number of child nodes which status are okay

`DT_INST_NODELABEL_STRING_ARRAY`(inst)

Get a string array of *DT_DRV_INST(inst)*'s node labels.

Equivalent to *DT_NODELABEL_STRING_ARRAY(DT_DRV_INST(inst))*.

Parameters

- `inst` – instance number

Returns
an array initializer for an array of the instance's node labels as strings

`DT_INST_NUM_NODELABELS`(inst)

Get the number of node labels by instance number.

Equivalent to *DT_NUM_NODELABELS(DT_DRV_INST(inst))*.

Parameters

- `inst` – instance number

Returns
the number of node labels that the node with that instance number has

`DT_INST_FOREACH_CHILD`(inst, fn)

Call `fn` on all child nodes of *DT_DRV_INST(inst)*.

The macro `fn` should take one argument, which is the node identifier for the child node.

The children will be iterated over in the same order as they appear in the final devicetree.

See also

DT_FOREACH_CHILD

Parameters

- `inst` – instance number
- `fn` – macro to invoke on each child node identifier

DT_INST_FOREACH_CHILD_SEP(inst, fn, sep)

Call fn on all child nodes of *DT_DRV_INST(inst)* with a separator.

The macro fn should take one argument, which is the node identifier for the child node.

See also

DT_FOREACH_CHILD_SEP

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_VARGS(inst, fn, ...)

Call fn on all child nodes of *DT_DRV_INST(inst)*.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

The children will be iterated over in the same order as they appear in the final devicetree.

See also

DT_FOREACH_CHILD

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier
- **...** – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_SEP_VARGS(inst, fn, sep, ...)

Call fn on all child nodes of *DT_DRV_INST(inst)* with separator.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also

DT_FOREACH_CHILD_SEP_VARGS

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier

- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- **...** – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_STATUS_OKAY(inst, fn)

Call fn on all child nodes of *DT_DRV_INST(inst)* with status okay.

The macro fn should take one argument, which is the node identifier for the child node.

See also

DT_FOREACH_CHILD_STATUS_OKAY

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier

DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP(inst, fn, sep)

Call fn on all child nodes of *DT_DRV_INST(inst)* with status okay and with separator.

The macro fn should take one argument, which is the node identifier for the child node.

See also

DT_FOREACH_CHILD_STATUS_OKAY_SEP

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_CHILD_STATUS_OKAY_VARGS(inst, fn, ...)

Call fn on all child nodes of *DT_DRV_INST(inst)* with status okay and multiple arguments.

The macro fn takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also

DT_FOREACH_CHILD_STATUS_OKAY_VARGS

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier
- **...** – variable number of arguments to pass to fn

DT_INST_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS(inst, fn, sep, ...)

Call `fn` on all child nodes of *DT_DRV_INST(inst)* with status `okay` and with separator and multiple arguments.

The macro `fn` takes multiple arguments. The first should be the node identifier for the child node. The remaining are passed-in by the caller.

See also

DT_FOREACH_CHILD_STATUS_OKAY_SEP_VARGS

Parameters

- **inst** – instance number
- **fn** – macro to invoke on each child node identifier
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- **...** – variable number of arguments to pass to `fn`

DT_INST_ENUM_IDX(inst, prop)

Get a `DT_DRV_COMPAT` value's index into its enumeration values.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

Returns

zero-based index of the property's value in its enum: list

DT_INST_ENUM_IDX_OR(inst, prop, default_idx_value)

Like *DT_INST_ENUM_IDX()*, but with a fallback to a default enum index.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **default_idx_value** – a fallback index value to expand to

Returns

zero-based index of the property's value in its enum if present, default_idx_value otherwise

DT_INST_ENUM_HAS_VALUE(inst, prop, value)

Does a `DT_DRV_COMPAT` enumeration property have a given value?

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **value** – lowercase-and-underscores enumeration value

Returns

1 if the node property has the value *value*, 0 otherwise.

DT_INST_PROP(inst, prop)

Get a DT_DRV_COMPAT instance property.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

Returns

a representation of the property's value

DT_INST_PROP_LEN(inst, prop)

Get a DT_DRV_COMPAT property length.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

Returns

logical length of the property

DT_INST_PROP_HAS_IDX(inst, prop, idx)

Is index idx valid for an array type property on a DT_DRV_COMPAT instance?

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **idx** – index to check

Returns

1 if idx is a valid index into the given property, 0 otherwise.

DT_INST_PROP_HAS_NAME(inst, prop, name)

Is name name available in a foo-names property?

Parameters

- **inst** – instance number
- **prop** – a lowercase-and-underscores prop-names type property
- **name** – a lowercase-and-underscores name to check

Returns

An expression which evaluates to 1 if name is an available name into the given property, and 0 otherwise.

DT_INST_PROP_BY_IDX(inst, prop, idx)

Get a DT_DRV_COMPAT element value in an array property.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns

a representation of the idx-th element of the property

DT_INST_PROP_OR(inst, prop, default_value)

Like *DT_INST_PROP()*, but with a fallback to default_value.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **default_value** – a fallback value to expand to

Returns
DT_INST_PROP(inst, prop) or `default_value`

`DT_INST_PROP_LEN_OR`(inst, prop, default_value)

Like *DT_INST_PROP_LEN()*, but with a fallback to `default_value`.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **default_value** – a fallback value to expand to

Returns
DT_INST_PROP_LEN(inst, prop) or `default_value`

`DT_INST_STRING_TOKEN`(inst, prop)

Get a `DT_DRV_COMPAT` instance's string property's value as a token.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

Returns
the value of `prop` as a token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_UPPER_TOKEN`(inst, prop)

Like *DT_INST_STRING_TOKEN()*, but uppercased.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

Returns
the value of `prop` as an uppercased token, i.e. without any quotes and with special characters converted to underscores

`DT_INST_STRING_UNQUOTED`(inst, prop)

Get a `DT_DRV_COMPAT` instance's string property's value as an unquoted sequence of tokens.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

Returns
the value of `prop` as a sequence of tokens, with no quotes

`DT_INST_STRING_TOKEN_BY_IDX`(inst, prop, idx)

Get an element out of string-array property as a token.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name

- **idx** – the index to get

Returns
the element in prop at index idx as a token

DT_INST_STRING_UPPER_TOKEN_BY_IDX(inst, prop, idx)

Like *DT_INST_STRING_TOKEN_BY_IDX()*, but uppercased.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns
the element in prop at index idx as an uppercased token

DT_INST_STRING_UNQUOTED_BY_IDX(inst, prop, idx)

Get an element out of string-array property as an unquoted sequence of tokens.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **idx** – the index to get

Returns
the value of prop at index idx as a sequence of tokens, with no quotes

DT_INST_PROP_BY_PHANDLE(inst, ph, prop)

Get a DT_DRV_COMPAT instance's property value from a phandle's node.

Parameters

- **inst** – instance number
- **ph** – lowercase-and-underscores property of inst with type phandle
- **prop** – lowercase-and-underscores property of the phandle's node

Returns
the value of prop as described in the *DT_PROP()* documentation

DT_INST_PROP_BY_PHANDLE_IDX(inst, phs, idx, prop)

Get a DT_DRV_COMPAT instance's property value from a phandle in a property.

Parameters

- **inst** – instance number
- **phs** – lowercase-and-underscores property with type phandle, phandles, or phandle-array
- **idx** – logical index into "phs", which must be zero if "phs" has type phandle
- **prop** – lowercase-and-underscores property of the phandle's node

Returns
the value of prop as described in the *DT_PROP()* documentation

DT_INST_PHA_BY_IDX(inst, pha, idx, cell)

Get a DT_DRV_COMPAT instance's phandle-array specifier value at an index.

Parameters

- **inst** – instance number

- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into the property pha
- **cell** – binding's cell name within the specifier at index idx

Returns
the value of the cell inside the specifier at index idx

DT_INST_PHA_BY_IDX_OR(inst, pha, idx, cell, default_value)

Like *DT_INST_PHA_BY_IDX()*, but with a fallback to default_value.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – logical index into the property pha
- **cell** – binding's cell name within the specifier at index idx
- **default_value** – a fallback value to expand to

Returns
DT_INST_PHA_BY_IDX(inst, pha, idx, cell) or default_value

DT_INST_PHA(inst, pha, cell)

Get a DT_DRV_COMPAT instance's phandle-array specifier value Equivalent to *DT_INST_PHA_BY_IDX(inst, pha, 0, cell)*

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – binding's cell name for the specifier at pha index 0

Returns
the cell value

DT_INST_PHA_OR(inst, pha, cell, default_value)

Like *DT_INST_PHA()*, but with a fallback to default_value.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – binding's cell name for the specifier at pha index 0
- **default_value** – a fallback value to expand to

Returns
DT_INST_PHA(inst, pha, cell) or default_value

DT_INST_PHA_BY_NAME(inst, pha, name, cell)

Get a DT_DRV_COMPAT instance's value within a phandle-array specifier by name.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **name** – lowercase-and-underscores name of a specifier in pha
- **cell** – binding's cell name for the named specifier

Returns
the cell value

DT_INST_PHA_BY_NAME_OR(inst, pha, name, cell, default_value)

Like *DT_INST_PHA_BY_NAME()*, but with a fallback to default_value.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **name** – lowercase-and-underscores name of a specifier in pha
- **cell** – binding's cell name for the named specifier
- **default_value** – a fallback value to expand to

Returns

DT_INST_PHA_BY_NAME(inst, pha, name, cell) or default_value

DT_INST_PHANDLE_BY_NAME(inst, pha, name)

Get a DT_DRV_COMPAT instance's phandle node identifier from a phandle array by name.

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **name** – lowercase-and-underscores name of an element in pha

Returns

node identifier for the phandle at the element named "name"

DT_INST_PHANDLE_BY_IDX(inst, prop, idx)

Get a DT_DRV_COMPAT instance's node identifier for a phandle in a property.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name in inst with type phandle, phandles or phandle-array
- **idx** – index into prop

Returns

a node identifier for the phandle at index idx in prop

DT_INST_PHANDLE(inst, prop)

Get a DT_DRV_COMPAT instance's node identifier for a phandle property's value.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property of inst with type phandle

Returns

a node identifier for the node pointed to by "ph"

DT_INST_REG_HAS_IDX(inst, idx)

is idx a valid register block index on a DT_DRV_COMPAT instance?

Parameters

- **inst** – instance number
- **idx** – index to check

Returns

1 if idx is a valid register block index, 0 otherwise.

DT_INST_REG_HAS_NAME(inst, name)

is name a valid register block name on a DT_DRV_COMPAT instance?

Parameters

- **inst** – instance number
- **name** – name to check

Returns

1 if name is a valid register block name, 0 otherwise.

DT_INST_REG_ADDR_BY_IDX(inst, idx)

Get a DT_DRV_COMPAT instance's idx-th register block's address.

Parameters

- **inst** – instance number
- **idx** – index of the register whose address to return

Returns

address of the instance's idx-th register block

DT_INST_REG_SIZE_BY_IDX(inst, idx)

Get a DT_DRV_COMPAT instance's idx-th register block's size.

Parameters

- **inst** – instance number
- **idx** – index of the register whose size to return

Returns

size of the instance's idx-th register block

DT_INST_REG_ADDR_BY_NAME(inst, name)

Get a DT_DRV_COMPAT's register block address by name.

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores register specifier name

Returns

address of the register block with the given name

DT_INST_REG_ADDR_BY_NAME_OR(inst, name, default_value)

Like *DT_INST_REG_ADDR_BY_NAME()*, but with a fallback to default_value.

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores register specifier name
- **default_value** – a fallback value to expand to

Returns

address of the register block specified by name if present, default_value otherwise

DT_INST_REG_ADDR_BY_NAME_U64(inst, name)

64-bit version of *DT_INST_REG_ADDR_BY_NAME()*

This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to *DT_INST_REG_ADDR_BY_NAME()* in linker/ASM context.

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores register specifier name

Returns
address of the register block with the given `name`

`DT_INST_REG_SIZE_BY_NAME`(inst, name)

Get a `DT_DRV_COMPAT`'s register block size by name.

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores register specifier name

Returns
size of the register block with the given `name`

`DT_INST_REG_SIZE_BY_NAME_OR`(inst, name, default_value)

Like *DT_INST_REG_SIZE_BY_NAME()*, but with a fallback to `default_value`.

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores register specifier name
- **default_value** – a fallback value to expand to

Returns
size of the register block specified by name if present, `default_value` otherwise

`DT_INST_REG_ADDR`(inst)

Get a `DT_DRV_COMPAT`'s (only) register block address.

Parameters

- **inst** – instance number

Returns
instance's register block address

`DT_INST_REG_ADDR_U64`(inst)

64-bit version of *DT_INST_REG_ADDR()*

This macro version adds the appropriate suffix for 64-bit unsigned integer literals. Note that this macro is equivalent to *DT_INST_REG_ADDR()* in linker/ASM context.

Parameters

- **inst** – instance number

Returns
instance's register block address

`DT_INST_REG_SIZE`(inst)

Get a `DT_DRV_COMPAT`'s (only) register block size.

Parameters

- **inst** – instance number

Returns
instance's register block size

DT_INST_IRQ_LEVEL(inst)

Get a DT_DRV_COMPAT interrupt level.

Parameters

- **inst** – instance number

Returns
interrupt level

DT_INST_IRQ_BY_IDX(inst, idx, cell)

Get a DT_DRV_COMPAT interrupt specifier value at an index.

Parameters

- **inst** – instance number
- **idx** – logical index into the interrupt specifier array
- **cell** – cell name specifier

Returns
the named value at the specifier given by the index

DT_INST_IRQ_INTC_BY_IDX(inst, idx)

Get a DT_DRV_COMPAT interrupt specifier's interrupt controller by index.

Parameters

- **inst** – instance number
- **idx** – interrupt specifier's index

Returns
node_id of interrupt specifier's interrupt controller

DT_INST_IRQ_INTC_BY_NAME(inst, name)

Get a DT_DRV_COMPAT interrupt specifier's interrupt controller by name.

Parameters

- **inst** – instance number
- **name** – interrupt specifier's name

Returns
node_id of interrupt specifier's interrupt controller

DT_INST_IRQ_INTC(inst)

Get a DT_DRV_COMPAT interrupt specifier's interrupt controller.

See also

DT_INST_IRQ_INTC_BY_IDX()

Note

Equivalent to *DT_INST_IRQ_INTC_BY_IDX(node_id, 0)*

Parameters

- **inst** – instance number

Returns
node_id of interrupt specifier's interrupt controller

`DT_INST_IRQ_BY_NAME`(inst, name, cell)
Get a `DT_DRV_COMPAT` interrupt specifier value by name.

Parameters
- **inst** – instance number
- **name** – lowercase-and-underscores interrupt specifier name
- **cell** – cell name specifier

Returns
the named value at the specifier given by the index

`DT_INST_IRQ`(inst, cell)
Get a `DT_DRV_COMPAT` interrupt specifier's value.

Parameters
- **inst** – instance number
- **cell** – cell name specifier

Returns
the named value at that index

`DT_INST_IRQN`(inst)
Get a `DT_DRV_COMPAT`'s (only) irq number.

Parameters
- **inst** – instance number

Returns
the interrupt number for the node's only interrupt

`DT_INST_IRQN_BY_IDX`(inst, idx)
Get a `DT_DRV_COMPAT`'s irq number at index.

Parameters
- **inst** – instance number
- **idx** – logical index into the interrupt specifier array

Returns
the interrupt number for the node's idx-th interrupt

`DT_INST_BUS`(inst)
Get a `DT_DRV_COMPAT`'s bus node identifier.

Parameters
- **inst** – instance number

Returns
node identifier for the instance's bus node

`DT_INST_ON_BUS`(inst, bus)
Test if a `DT_DRV_COMPAT`'s bus type is a given type.

Parameters
- **inst** – instance number
- **bus** – a binding's bus type as a C token, lowercased and without quotes

Returns
1 if the given instance is on a bus of the given type, 0 otherwise

`DT_INST_STRING_TOKEN_OR`(inst, name, default_value)

Like *DT_INST_STRING_TOKEN()*, but with a fallback to `default_value`.

Parameters

- **`inst`** – instance number
- **`name`** – lowercase-and-underscores property name
- **`default_value`** – a fallback value to expand to

Returns
if `prop` exists, its value as a token, i.e. without any quotes and with special characters converted to underscores. Otherwise `default_value`

`DT_INST_STRING_UPPER_TOKEN_OR`(inst, name, default_value)

Like *DT_INST_STRING_UPPER_TOKEN()*, but with a fallback to `default_value`.

Parameters

- **`inst`** – instance number
- **`name`** – lowercase-and-underscores property name
- **`default_value`** – a fallback value to expand to

Returns
the property's value as an uppercased token, or `default_value`

`DT_INST_STRING_UNQUOTED_OR`(inst, name, default_value)

Like *DT_INST_STRING_UNQUOTED()*, but with a fallback to `default_value`.

Parameters

- **`inst`** – instance number
- **`name`** – lowercase-and-underscores property name
- **`default_value`** – a fallback value to expand to

Returns
the property's value as a sequence of tokens, with no quotes, or `default_value`

`DT_HAS_COMPAT_ON_BUS_STATUS_OKAY`(compat, bus)

`DT_ANY_INST_ON_BUS_STATUS_OKAY`(bus)

Test if any `DT_DRV_COMPAT` node is on a bus of a given type and has status okay.

This is a special-purpose macro which can be useful when writing drivers for devices which can appear on multiple buses. One example is a sensor device which may be wired on an I2C or SPI bus.

Example devicetree overlay:

```
&i2c0 {
        temp: temperature-sensor@76 {
                compatible = "vnd,some-sensor";
                reg = <0x76>;
        };
};
```

Example usage, assuming `i2c0` is an I2C bus controller node, and therefore `temp` is on an I2C bus:

```
#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_ON_BUS_STATUS_OKAY(i2c) // 1
```

Parameters

- **bus** – a binding's bus type as a C token, lowercased and without quotes

Returns

1 if any enabled node with that compatible is on that bus type, 0 otherwise

DT_ANY_INST_HAS_PROP_STATUS_OKAY(prop)

Check if any DT_DRV_COMPAT node with status okay has a given property.

Example devicetree overlay:

```
&i2c0 {
    sensor0: sensor@0 {
        compatible = "vnd,some-sensor";
        status = "okay";
        reg = <0>;
        foo = <1>;
        bar = <2>;
    };

    sensor1: sensor@1 {
        compatible = "vnd,some-sensor";
        status = "okay";
        reg = <1>;
        foo = <2>;
    };

    sensor2: sensor@2 {
        compatible = "vnd,some-sensor";
        status = "disabled";
        reg = <2>;
        baz = <1>;
    };
};
```

Example usage:

```
#define DT_DRV_COMPAT vnd_some_sensor

DT_ANY_INST_HAS_PROP_STATUS_OKAY(foo) // 1
DT_ANY_INST_HAS_PROP_STATUS_OKAY(bar) // 1
DT_ANY_INST_HAS_PROP_STATUS_OKAY(baz) // 0
```

Parameters

- **prop** – lowercase-and-underscores property name

DT_INST_FOREACH_STATUS_OKAY(fn)

Call fn on all nodes with compatible DT_DRV_COMPAT and status okay

This macro calls fn(inst) on each inst number that refers to a node with status okay. Whitespace is added between invocations.

Example devicetree fragment:

```
a {
        compatible = "vnd,device";
        status = "okay";
        foobar = "DEV_A";
};

b {
        compatible = "vnd,device";
        status = "okay";
        foobar = "DEV_B";
};

c {
        compatible = "vnd,device";
        status = "disabled";
        foobar = "DEV_C";
};
```

Example usage:

```
#define DT_DRV_COMPAT vnd_device
#define MY_FN(inst) DT_INST_PROP(inst, foobar),

DT_INST_FOREACH_STATUS_OKAY(MY_FN)
```

This expands to:

```
MY_FN(0) MY_FN(1)
```

and from there, to either this:

```
"DEV_A", "DEV_B",
```

or this:

```
"DEV_B", "DEV_A",
```

No guarantees are made about the order that a and b appear in the expansion.

Note that `fn` is responsible for adding commas, semicolons, or other separators or terminators.

Device drivers should use this macro whenever possible to instantiate a struct device for each enabled node in the devicetree of the driver's compatible `DT_DRV_COMPAT`.

Parameters

- **fn** – Macro to call for each enabled node. Must accept an instance number as its only parameter.

`DT_INST_FOREACH_STATUS_OKAY_VARGS`(fn, ...)

Call `fn` on all nodes with compatible `DT_DRV_COMPAT` and status `okay` with multiple arguments.

See also

DT_INST_FOREACH_STATUS_OKAY

Parameters

- **fn** – Macro to call for each enabled node. Must accept an instance number as its only parameter.
- **...** – variable number of arguments to pass to fn

DT_INST_FOREACH_NODELABEL(inst, fn)

Call fn on all node labels for a given DT_DRV_COMPAT instance.

Equivalent to *DT_FOREACH_NODELABEL(DT_DRV_INST(inst), fn)*.

Parameters

- **inst** – instance number
- **fn** – macro which will be passed each node label for the node with that instance number

DT_INST_FOREACH_NODELABEL_VARGS(inst, fn, ...)

Call fn on all node labels for a given DT_DRV_COMPAT instance with multiple arguments.

Equivalent to *DT_FOREACH_NODELABEL_VARGS(DT_DRV_INST(inst), fn, ...)*.

Parameters

- **inst** – instance number
- **fn** – macro which will be passed each node label for the node with that instance number
- **...** – additional arguments to pass to fn

DT_INST_FOREACH_PROP_ELEM(inst, prop, fn)

Invokes fn for each element of property prop for a DT_DRV_COMPAT instance.

Equivalent to *DT_FOREACH_PROP_ELEM(DT_DRV_INST(inst), prop, fn)*.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke

DT_INST_FOREACH_PROP_ELEM_SEP(inst, prop, fn, sep)

Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with a separator.

Equivalent to *DT_FOREACH_PROP_ELEM_SEP(DT_DRV_INST(inst), prop, fn, sep)*.

Parameters

- **inst** – instance number
- **prop** – lowercase-and-underscores property name
- **fn** – macro to invoke
- **sep** – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.

DT_INST_FOREACH_PROP_ELEM_VARGS(inst, prop, fn, ...)

Invokes fn for each element of property prop for a DT_DRV_COMPAT instance with multiple arguments.

Equivalent to DT_FOREACH_PROP_ELEM_VARGS(*DT_DRV_INST(inst)*, prop, fn, **VA_ARGS**)

See also

DT_INST_FOREACH_PROP_ELEM

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `...` – variable number of arguments to pass to `fn`

`DT_INST_FOREACH_PROP_ELEM_SEP_VARGS`(inst, prop, fn, sep, ...)

Invokes `fn` for each element of property `prop` for a `DT_DRV_COMPAT` instance with multiple arguments and a separator.

Equivalent to DT_FOREACH_PROP_ELEM_SEP_VARGS(*DT_DRV_INST(inst)*, prop, fn, sep, **VA_ARGS**)

See also

DT_INST_FOREACH_PROP_ELEM

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name
- `fn` – macro to invoke
- `sep` – Separator (e.g. comma or semicolon). Must be in parentheses; this is required to enable providing a comma as separator.
- `...` – variable number of arguments to pass to fn

`DT_INST_NODE_HAS_PROP`(inst, prop)

Does a DT_DRV_COMPAT instance have a property?

Parameters

- `inst` – instance number
- `prop` – lowercase-and-underscores property name

Returns

1 if the instance has the property, 0 otherwise.

`DT_INST_NODE_HAS_COMPAT`(inst, compat)

Does a DT_DRV_COMPAT instance have the compatible?

Parameters

- `inst` – instance number
- `compat` – lowercase-and-underscores compatible, without quotes

Returns

1 if the instance matches the compatible, 0 otherwise.

DT_INST_PHA_HAS_CELL_AT_IDX(inst, pha, idx, cell)

Does a phandle array have a named cell specifier at an index for a DT_DRV_COMPAT instance?

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **idx** – index to check
- **cell** – named cell value whose existence to check

Returns

1 if the named cell exists in the specifier at index idx, 0 otherwise.

DT_INST_PHA_HAS_CELL(inst, pha, cell)

Does a phandle array have a named cell specifier at index 0 for a DT_DRV_COMPAT instance?

Parameters

- **inst** – instance number
- **pha** – lowercase-and-underscores property with type phandle-array
- **cell** – named cell value whose existence to check

Returns

1 if the named cell exists in the specifier at index 0, 0 otherwise.

DT_INST_IRQ_HAS_IDX(inst, idx)

is index valid for interrupt property on a DT_DRV_COMPAT instance?

Parameters

- **inst** – instance number
- **idx** – logical index into the interrupt specifier array

Returns

1 if the idx is valid for the interrupt property 0 otherwise.

DT_INST_IRQ_HAS_CELL_AT_IDX(inst, idx, cell)

Does a DT_DRV_COMPAT instance have an interrupt named cell specifier?

Parameters

- **inst** – instance number
- **idx** – index to check
- **cell** – named cell value whose existence to check

Returns

1 if the named cell exists in the interrupt specifier at index idx 0 otherwise.

DT_INST_IRQ_HAS_CELL(inst, cell)

Does a DT_DRV_COMPAT instance have an interrupt value?

Parameters

- **inst** – instance number
- **cell** – named cell value whose existence to check

Returns

1 if the named cell exists in the interrupt specifier at index 0 0 otherwise.

DT_INST_IRQ_HAS_NAME(inst, name)

Does a DT_DRV_COMPAT instance have an interrupt value?

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores interrupt specifier name

Returns

1 if name is a valid named specifier

Hardware specific APIs The following APIs can also be used by including <devicetree.h>; no additional include is needed.

CAN These conveniences may be used for nodes which describe CAN controllers/transceivers, and properties related to them.

group devicetree-can

Defines

DT_CAN_TRANSCEIVER_MIN_BITRATE(node_id, min)

Get the minimum transceiver bitrate for a CAN controller.

The bitrate will be limited to the minimum bitrate supported by the CAN controller. If no CAN transceiver is present in the devicetree, the minimum bitrate will be that of the CAN controller.

Example devicetree fragment:

```
transceiver0: can-phy0 {
        compatible = "vnd,can-transceiver";
        min-bitrate = <15000>;
        max-bitrate = <1000000>;
        #phy-cells = <0>;
};

can0: can@... {
        compatible = "vnd,can-controller";
        phys = <&transceiver0>;
};

can1: can@... {
        compatible = "vnd,can-controller";

        can-transceiver {
                min-bitrate = <25000>;
                max-bitrate = <2000000>;
        };
};

can2: can@... {
        compatible = "vnd,can-controller";

        can-transceiver {
                max-bitrate = <2000000>;
        };
};
```

Example usage:

```
DT_CAN_TRANSCEIVER_MIN_BITRATE(DT_NODELABEL(can0), 10000) // 15000
DT_CAN_TRANSCEIVER_MIN_BITRATE(DT_NODELABEL(can1), 0)     // 250000
DT_CAN_TRANSCEIVER_MIN_BITRATE(DT_NODELABEL(can1), 50000) // 500000
DT_CAN_TRANSCEIVER_MIN_BITRATE(DT_NODELABEL(can2), 0)     // 0
```

Parameters

- `node_id` – node identifier
- `min` – minimum bitrate supported by the CAN controller

Returns
the minimum bitrate supported by the CAN controller/transceiver combination

`DT_CAN_TRANSCEIVER_MAX_BITRATE`(node_id, max)

Get the maximum transceiver bitrate for a CAN controller.

The bitrate will be limited to the maximum bitrate supported by the CAN controller. If no CAN transceiver is present in the devicetree, the maximum bitrate will be that of the CAN controller.

Example devicetree fragment:

```
transceiver0: can-phy0 {
        compatible = "vnd,can-transceiver";
        max-bitrate = <1000000>;
        #phy-cells = <0>;
};

can0: can@... {
        compatible = "vnd,can-controller";
        phys = <&transceiver0>;
};

can1: can@... {
        compatible = "vnd,can-controller";

        can-transceiver {
                max-bitrate = <2000000>;
        };
};
```

Example usage:

```
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can0), 5000000) // 1000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 5000000) // 2000000
DT_CAN_TRANSCEIVER_MAX_BITRATE(DT_NODELABEL(can1), 1000000) // 1000000
```

Parameters

- `node_id` – node identifier
- `max` – maximum bitrate supported by the CAN controller

Returns
the maximum bitrate supported by the CAN controller/transceiver combination

DT_INST_CAN_TRANSCEIVER_MIN_BITRATE(inst, min)

Get the minimum transceiver bitrate for a DT_DRV_COMPAT CAN controller.

See also

DT_CAN_TRANSCEIVER_MIN_BITRATE()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **min** – minimum bitrate supported by the CAN controller

Returns

the minimum bitrate supported by the CAN controller/transceiver combination

DT_INST_CAN_TRANSCEIVER_MAX_BITRATE(inst, max)

Get the maximum transceiver bitrate for a DT_DRV_COMPAT CAN controller.

See also

DT_CAN_TRANSCEIVER_MAX_BITRATE()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **max** – maximum bitrate supported by the CAN controller

Returns

the maximum bitrate supported by the CAN controller/transceiver combination

Clocks These conveniences may be used for nodes which describe clock sources, and properties related to them.

group devicetree-clocks

Defines

DT_CLOCKS_HAS_IDX(node_id, idx)

Test if a node has a clocks phandle-array property at a given index.

This expands to 1 if the given index is valid clocks property phandle-array index. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
        clocks = <...>, <...>;
};
```

(continues on next page)

(continued from previous page)

```
n2: node-2 {
        clocks = <...>;
};
```

Example usage:

```
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_CLOCKS_HAS_IDX(DT_NODELABEL(n2), 1) // 0
```

Parameters

- `node_id` – node identifier; may or may not have any clocks property
- `idx` – index of a clocks property phandle-array whose existence to check

Returns
1 if the index exists, 0 otherwise

`DT_CLOCKS_HAS_NAME`(node_id, name)

Test if a node has a clock-names array property holds a given name.

This expands to 1 if the name is available as clocks-name array property cell. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
        clocks = <...>, <...>;
        clock-names = "alpha", "beta";
};

n2: node-2 {
        clocks = <...>;
        clock-names = "alpha";
};
```

Example usage:

```
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), alpha) // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n1), beta)  // 1
DT_CLOCKS_HAS_NAME(DT_NODELABEL(n2), beta)  // 0
```

Parameters

- `node_id` – node identifier; may or may not have any clock-names property.
- `name` – lowercase-and-underscores clock-names cell value name to check

Returns
1 if the clock name exists, 0 otherwise

`DT_NUM_CLOCKS`(node_id)

Get the number of elements in a clocks property.

Example devicetree fragment:

```
n1: node-1 {
        clocks = <&foo>, <&bar>;
};
```

(continues on next page)

(continued from previous page)

```
n2: node-2 {
        clocks = <&foo>;
};
```

Example usage:

```
DT_NUM_CLOCKS(DT_NODELABEL(n1)) // 2
DT_NUM_CLOCKS(DT_NODELABEL(n2)) // 1
```

Parameters

- **node_id** – node identifier with a clocks property

Returns
number of elements in the property

`DT_CLOCKS_CTLR_BY_IDX`(node_id, idx)

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

Example devicetree fragment:

```
clk1: clock-controller@... { ... };

clk2: clock-controller@... { ... };

n: node {
        clocks = <&clk1 10 20>, <&clk2 30 40>;
};
```

Example usage:

```
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(clk1)
DT_CLOCKS_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(clk2)
```

See also

DT_PHANDLE_BY_IDX()

Parameters

- **node_id** – node identifier
- **idx** – logical index into “clocks”

Returns
the node identifier for the clock controller referenced at index “idx”

`DT_CLOCKS_CTLR`(node_id)

Equivalent to *DT_CLOCKS_CTLR_BY_IDX(node_id, 0)*

See also

DT_CLOCKS_CTLR_BY_IDX()

Parameters

- **node_id** – node identifier

Returns
a node identifier for the clocks controller at index 0 in “clocks”

DT_CLOCKS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the controller phandle from a clocks phandle-array property by name.

Example devicetree fragment:

```
clk1: clock-controller@... { ... };

clk2: clock-controller@... { ... };

n: node {
        clocks = <&clk1 10 20>, <&clk2 30 40>;
        clock-names = "alpha", "beta";
};
```

Example usage:

```
DT_CLOCKS_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(clk2)
```

See also

DT_PHANDLE_BY_NAME()

Parameters

- **node_id** – node identifier
- **name** – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

Returns
the node identifier for the clock controller referenced by name

DT_CLOCKS_CELL_BY_IDX(node_id, idx, cell)

Get a clock specifier’s cell value at an index.

Example devicetree fragment:

```
clk1: clock-controller@... {
        compatible = "vnd,clock";
        #clock-cells = < 2 >;
};

n: node {
        clocks = < &clk1 10 20 >, < &clk1 30 40 >;
};
```

Bindings fragment for the vnd,clock compatible:

```
clock-cells:
  - bus
  - bits
```

Example usage:

```
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 0, bus) // 10
DT_CLOCKS_CELL_BY_IDX(DT_NODELABEL(n), 1, bits) // 40
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier for a node with a clocks property
- **idx** – logical index into clocks property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_CLOCKS_CELL_BY_NAME(node_id, name, cell)

Get a clock specifier’s cell value by name.

Example devicetree fragment:

```
clk1: clock-controller@... {
        compatible = "vnd,clock";
        #clock-cells = < 2 >;
};

n: node {
        clocks = < &clk1 10 20 >, < &clk1 30 40 >;
        clock-names = "alpha", "beta";
};
```

Bindings fragment for the vnd,clock compatible:

```
clock-cells:
  - bus
  - bits
```

Example usage:

```
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), alpha, bus) // 10
DT_CLOCKS_CELL_BY_NAME(DT_NODELABEL(n), beta, bits) // 40
```

See also

DT_PHA_BY_NAME()

Parameters

- **node_id** – node identifier for a node with a clocks property
- **name** – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_CLOCKS_CELL(node_id, cell)

Equivalent to *DT_CLOCKS_CELL_BY_IDX(node_id, 0, cell)*

See also

DT_CLOCKS_CELL_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a clocks property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index 0

`DT_INST_CLOCKS_HAS_IDX`(inst, idx)

Equivalent to *DT_CLOCKS_HAS_IDX(DT_DRV_INST(inst), idx)*

Parameters

- `inst` – DT_DRV_COMPAT instance number; may or may not have any clocks property
- `idx` – index of a clocks property phandle-array whose existence to check

Returns
1 if the index exists, 0 otherwise

`DT_INST_CLOCKS_HAS_NAME`(inst, name)

Equivalent to DT_CLOCK_HAS_NAME(DT_DRV_INST(inst), name)

Parameters

- `inst` – DT_DRV_COMPAT instance number; may or may not have any clock-names property.
- `name` – lowercase-and-underscores clock-names cell value name to check

Returns
1 if the clock name exists, 0 otherwise

`DT_INST_NUM_CLOCKS`(inst)

Equivalent to *DT_NUM_CLOCKS(DT_DRV_INST(inst))*

Parameters

- `inst` – instance number

Returns
number of elements in the clocks property

`DT_INST_CLOCKS_CTLR_BY_IDX`(inst, idx)

Get the node identifier for the controller phandle from a “clocks” phandle-array property at an index.

See also

DT_CLOCKS_CTLR_BY_IDX()

Parameters

- `inst` – instance number
- `idx` – logical index into “clocks”

Returns
the node identifier for the clock controller referenced at index “idx”

`DT_INST_CLOCKS_CTLR`(inst)
Equivalent to *DT_INST_CLOCKS_CTLR_BY_IDX(inst, 0)*

See also
DT_CLOCKS_CTLR()

Parameters
- `inst` – instance number

Returns
a node identifier for the clocks controller at index 0 in “clocks”

`DT_INST_CLOCKS_CTLR_BY_NAME`(inst, name)
Get the node identifier for the controller phandle from a clocks phandle-array property by name.

See also
DT_CLOCKS_CTLR_BY_NAME()

Parameters
- `inst` – instance number
- `name` – lowercase-and-underscores name of a clocks element as defined by the node’s clock-names property

Returns
the node identifier for the clock controller referenced by the named element

`DT_INST_CLOCKS_CELL_BY_IDX`(inst, idx, cell)
Get a DT_DRV_COMPAT instance’s clock specifier’s cell value at an index.

See also
DT_CLOCKS_CELL_BY_IDX()

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into clocks property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_INST_CLOCKS_CELL_BY_NAME(inst, name, cell)

Get a DT_DRV_COMPAT instance's clock specifier's cell value by name.

> **See also**
>
> *DT_CLOCKS_CELL_BY_NAME()*

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **name** – lowercase-and-underscores name of a clocks element as defined by the node's clock-names property
- **cell** – lowercase-and-underscores cell name

Returns

the cell value in the specifier at the named element

DT_INST_CLOCKS_CELL(inst, cell)

Equivalent to *DT_INST_CLOCKS_CELL_BY_IDX(inst, 0, cell)*

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **cell** – lowercase-and-underscores cell name

Returns

the value of the cell inside the specifier at index 0

DMA These conveniences may be used for nodes which describe direct memory access controllers or channels, and properties related to them.

group devicetree-dmas

Defines

DT_DMAS_CTLR_BY_IDX(node_id, idx)

Get the node identifier for the DMA controller from a dmas property at an index.

Example devicetree fragment:

```
dma1: dma@... { ... };

dma2: dma@... { ... };

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
           <&dma2 6 3 0x404 0x5>;
};
```

Example usage:

```
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(dma2)
```

See also

DT_PROP_BY_PHANDLE_IDX()

Parameters

- **node_id** – node identifier for a node with a dmas property
- **idx** – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index “idx”

DT_DMAS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the DMA controller from a dmas property by name.

Example devicetree fragment:

```
dma1: dma@... { ... };

dma2: dma@... { ... };

n: node {
    dmas = <&dma1 1 2 0x400 0x3>,
           <&dma2 6 3 0x404 0x5>;
    dma-names = "tx", "rx";
};
```

Example usage:

```
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(dma1)
DT_DMAS_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(dma2)
```

See also

DT_PHANDLE_BY_NAME()

Parameters

- **node_id** – node identifier for a node with a dmas property
- **name** – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property

Returns
the node identifier for the DMA controller in the named element

DT_DMAS_CTLR(node_id)

Equivalent to *DT_DMAS_CTLR_BY_IDX(node_id, 0)*

See also

DT_DMAS_CTLR_BY_IDX()

Parameters

- **node_id** – node identifier for a node with a dmas property

Returns
the node identifier for the DMA controller at index 0 in the node's "dmas" property

`DT_INST_DMAS_CTLR_BY_IDX`(inst, idx)
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance's dmas property at an index.

See also
DT_DMAS_CTLR_BY_IDX()

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into dmas property

Returns
the node identifier for the DMA controller referenced at index "idx"

`DT_INST_DMAS_CTLR_BY_NAME`(inst, name)
Get the node identifier for the DMA controller from a DT_DRV_COMPAT instance's dmas property by name.

See also
DT_DMAS_CTLR_BY_NAME()

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
the node identifier for the DMA controller in the named element

`DT_INST_DMAS_CTLR`(inst)
Equivalent to *DT_INST_DMAS_CTLR_BY_IDX(inst, 0)*

See also
DT_DMAS_CTLR_BY_IDX()

Parameters
- `inst` – DT_DRV_COMPAT instance number

Returns
the node identifier for the DMA controller at index 0 in the instance's "dmas" property

DT_DMAS_CELL_BY_IDX(node_id, idx, cell)

Get a DMA specifier's cell value at an index.

Example devicetree fragment:

```
dma1: dma@... {
        compatible = "vnd,dma";
        #dma-cells = <2>;
};

dma2: dma@... {
        compatible = "vnd,dma";
        #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
           <&dma2 6 0x404>;
};
```

Bindings fragment for the vnd,dma compatible:

```
dma-cells:
  - channel
  - config
```

Example usage:

```
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 6
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 0, config) // 0x400
DT_DMAS_CELL_BY_IDX(DT_NODELABEL(n), 1, config) // 0x404
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier for a node with a dmas property
- **idx** – logical index into dmas property
- **cell** – lowercase-and-underscores cell name

Returns

the cell value at index "idx"

DT_INST_DMAS_CELL_BY_IDX(inst, idx, cell)

Get a DT_DRV_COMPAT instance's DMA specifier's cell value at an index.

See also

DT_DMAS_CELL_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – logical index into dmas property

- **cell** – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

DT_DMAS_CELL_BY_NAME(node_id, name, cell)

Get a DMA specifier’s cell value by name.

Example devicetree fragment:

```
dma1: dma@... {
        compatible = "vnd,dma";
        #dma-cells = <2>;
};

dma2: dma@... {
        compatible = "vnd,dma";
        #dma-cells = <2>;
};

n: node {
    dmas = <&dma1 1 0x400>,
           <&dma2 6 0x404>;
    dma-names = "tx", "rx";
};
```

Bindings fragment for the vnd,dma compatible:

```
dma-cells:
  - channel
  - config
```

Example usage:

```
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, channel) // 1
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, channel) // 6
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), tx, config) // 0x400
DT_DMAS_CELL_BY_NAME(DT_NODELABEL(n), rx, config) // 0x404
```

See also

DT_PHA_BY_NAME()

Parameters

- **node_id** – node identifier for a node with a dmas property
- **name** – lowercase-and-underscores name of a dmas element as defined by the node’s dma-names property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_DMAS_CELL_BY_NAME(inst, name, cell)

Get a DT_DRV_COMPAT instance’s DMA specifier’s cell value by name.

See also

DT_DMAS_CELL_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

`DT_DMAS_HAS_IDX`(node_id, idx)

Is index "idx" valid for a dmas property?

Parameters

- `node_id` – node identifier for a node with a dmas property
- `idx` – logical index into dmas property

Returns
1 if the "dmas" property has index "idx", 0 otherwise

`DT_INST_DMAS_HAS_IDX`(inst, idx)

Is index "idx" valid for a DT_DRV_COMPAT instance's dmas property?

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into dmas property

Returns
1 if the "dmas" property has a specifier at index "idx", 0 otherwise

`DT_DMAS_HAS_NAME`(node_id, name)

Does a dmas property have a named element?

Parameters

- `node_id` – node identifier for a node with a dmas property
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

`DT_INST_DMAS_HAS_NAME`(inst, name)

Does a DT_DRV_COMPAT instance's dmas property have a named element?

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a dmas element as defined by the node's dma-names property

Returns
1 if the dmas property has the named element, 0 otherwise

Fixed flash partitions These conveniences may be used for the special-purpose `fixed-partitions` compatible used to encode information about flash memory partitions in the device tree. See See `fixed-partition` for more details.

group `devicetree-fixed-partition`

Defines

`DT_NODE_BY_FIXED_PARTITION_LABEL`(label)

Get a node identifier for a fixed partition with a given label property.

Example devicetree fragment:

```
flash@... {
         partitions {
                 compatible = "fixed-partitions";
                 boot_partition: partition@0 {
                         label = "mcuboot";
                 };
                 slot0_partition: partition@c000 {
                         label = "image-0";
                 };
                 ...
         };
};
```

Example usage:

```
DT_NODE_BY_FIXED_PARTITION_LABEL(mcuboot) // node identifier for boot_partition
DT_NODE_BY_FIXED_PARTITION_LABEL(image_0) // node identifier for slot0_partition
```

Parameters

- `label` – lowercase-and-underscores label property value

Returns
a node identifier for the partition with that label property

`DT_HAS_FIXED_PARTITION_LABEL`(label)

Test if a fixed partition with a given label property exists.

Parameters

- `label` – lowercase-and-underscores label property value

Returns
1 if any “fixed-partitions” child node has the given label, 0 otherwise.

`DT_FIXED_PARTITION_EXISTS`(node_id)

Test if fixed-partition compatible node exists.

Parameters

- `node_id` – DTS node to test

Returns
1 if node exists and is fixed-partition compatible, 0 otherwise.

`DT_FIXED_PARTITION_ID`(node_id)

Get a numeric identifier for a fixed partition.

Parameters

- **node_id** – node identifier for a fixed-partitions child node

Returns
the partition's ID, a unique zero-based index number

DT_MEM_FROM_FIXED_PARTITION(node_id)

Get the node identifier of the flash memory for a partition.

Parameters

- **node_id** – node identifier for a fixed-partitions child node

Returns
the node identifier of the internal memory that contains the fixed-partitions node, or *DT_INVALID_NODE* if it doesn't exist.

DT_MTD_FROM_FIXED_PARTITION(node_id)

Get the node identifier of the flash controller for a partition.

Parameters

- **node_id** – node identifier for a fixed-partitions child node

Returns
the node identifier of the memory technology device that contains the fixed-partitions node.

DT_FIXED_PARTITION_ADDR(node_id)

Get the absolute address of a fixed partition.

Example devicetree fragment:

```
&flash_controller {
        flash@1000000 {
                compatible = "soc-nv-flash";
                partitions {
                        compatible = "fixed-partitions";
                        storage_partition: partition@3a000 {
                                label = "storage";
                        };
                };
        };
};
```

Here, the "storage" partition is seen to belong to flash memory starting at address 0x1000000. The partition's unit address of 0x3a000 represents an offset inside that flash memory.

Example usage:

```
DT_FIXED_PARTITION_ADDR(DT_NODELABEL(storage_partition)) // 0x103a000
```

This macro can only be used with partitions of internal memory addressable by the CPU. Otherwise, it may produce a compile-time error, such as: __REG_IDX_0_VAL_ADDRESS' undeclared'.

Parameters

- **node_id** – node identifier for a fixed-partitions child node

Returns
the partition's offset plus the base address of the flash node containing it.

GPIO These conveniences may be used for nodes which describe GPIO controllers/pins, and properties related to them.

group devicetree-gpio

Defines

DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, idx)

Get the node identifier for the controller phandle from a gpio phandle-array property at an index.

Example devicetree fragment:

```
gpio1: gpio@... { };

gpio2: gpio@... { };

n: node {
        gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Example usage:

```
DT_GPIO_CTLR_BY_IDX(DT_NODELABEL(n), gpios, 1) // DT_NODELABEL(gpio2)
```

See also

DT_PHANDLE_BY_IDX()

Parameters

- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type "phandle-array"
- idx – logical index into "gpio_pha"

Returns

the node identifier for the gpio controller referenced at index "idx"

DT_GPIO_CTLR(node_id, gpio_pha)

Equivalent to *DT_GPIO_CTLR_BY_IDX(node_id, gpio_pha, 0)*

See also

DT_GPIO_CTLR_BY_IDX()

Parameters

- node_id – node identifier
- gpio_pha – lowercase-and-underscores GPIO property with type "phandle-array"

Returns

a node identifier for the gpio controller at index 0 in "gpio_pha"

DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, idx)

Get a GPIO specifier's pin cell at an index.

This macro only works for GPIO specifiers with cells named "pin". Refer to the node's binding to check if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
        compatible = "vnd,gpio";
        #gpio-cells = <2>;
};

gpio2: gpio@... {
        compatible = "vnd,gpio";
        #gpio-cells = <2>;
};

n: node {
        gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
  - pin
  - flags
```

Example usage:

```
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 0) // 10
DT_GPIO_PIN_BY_IDX(DT_NODELABEL(n), gpios, 1) // 30
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier
- **gpio_pha** – lowercase-and-underscores GPIO property with type "phandle-array"
- **idx** – logical index into "gpio_pha"

Returns

the pin cell value at index "idx"

DT_GPIO_PIN(node_id, gpio_pha)

Equivalent to *DT_GPIO_PIN_BY_IDX(node_id, gpio_pha, 0)*

See also

DT_GPIO_PIN_BY_IDX()

Parameters

- **node_id** – node identifier
- **gpio_pha** – lowercase-and-underscores GPIO property with type "phandle-array"

Returns
the pin cell value at index 0

DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, idx)

Get a GPIO specifier's flags cell at an index.

This macro expects GPIO specifiers with cells named "flags". If there is no "flags" cell in the GPIO specifier, zero is returned. Refer to the node's binding to check specifier cell names if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
        compatible = "vnd,gpio";
        #gpio-cells = <2>;
};

gpio2: gpio@... {
        compatible = "vnd,gpio";
        #gpio-cells = <2>;
};

n: node {
        gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                <&gpio2 30 GPIO_ACTIVE_HIGH>;
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
  - pin
  - flags
```

Example usage:

```
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 0) // GPIO_ACTIVE_LOW
DT_GPIO_FLAGS_BY_IDX(DT_NODELABEL(n), gpios, 1) // GPIO_ACTIVE_HIGH
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier
- **gpio_pha** – lowercase-and-underscores GPIO property with type "phandle-array"
- **idx** – logical index into "gpio_pha"

Returns
the flags cell value at index "idx", or zero if there is none

DT_GPIO_FLAGS(node_id, gpio_pha)

Equivalent to *DT_GPIO_FLAGS_BY_IDX(node_id, gpio_pha, 0)*

See also

DT_GPIO_FLAGS_BY_IDX()

Parameters

- **node_id** – node identifier
- **gpio_pha** – lowercase-and-underscores GPIO property with type "phandle-array"

Returns
the flags cell value at index 0, or zero if there is none

DT_NUM_GPIO_HOGS(node_id)

Get the number of GPIO hogs in a node.

This expands to the number of hogged GPIOs, or zero if there are none.

Example devicetree fragment:

```
gpio1: gpio@... {
  compatible = "vnd,gpio";
  #gpio-cells = <2>;

  n1: node-1 {
          gpio-hog;
          gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
          output-high;
  };

  n2: node-2 {
          gpio-hog;
          gpios = <3 GPIO_ACTIVE_HIGH>;
          output-low;
  };
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
  - pin
  - flags
```

Example usage:

```
DT_NUM_GPIO_HOGS(DT_NODELABEL(n1)) // 2
DT_NUM_GPIO_HOGS(DT_NODELABEL(n2)) // 1
```

Parameters

- **node_id** – node identifier; may or may not be a GPIO hog node.

Returns
number of hogged GPIOs in the node

DT_GPIO_HOG_PIN_BY_IDX(node_id, idx)

Get a GPIO hog specifier's pin cell at an index.

This macro only works for GPIO specifiers with cells named "pin". Refer to the node's binding to check if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
  compatible = "vnd,gpio";
  #gpio-cells = <2>;

  n1: node-1 {
          gpio-hog;
          gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
          output-high;
  };

  n2: node-2 {
          gpio-hog;
          gpios = <3 GPIO_ACTIVE_HIGH>;
          output-low;
  };
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
  - pin
  - flags
```

Example usage:

```
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n1), 0) // 0
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n1), 1) // 1
DT_GPIO_HOG_PIN_BY_IDX(DT_NODELABEL(n2), 0) // 3
```

Parameters

- `node_id` – node identifier
- `idx` – logical index into “gpios”

Returns
the pin cell value at index “idx”

`DT_GPIO_HOG_FLAGS_BY_IDX`(node_id, idx)

Get a GPIO hog specifier’s flags cell at an index.

This macro expects GPIO specifiers with cells named “flags”. If there is no “flags” cell in the GPIO specifier, zero is returned. Refer to the node’s binding to check specifier cell names if necessary.

Example devicetree fragment:

```
gpio1: gpio@... {
  compatible = "vnd,gpio";
  #gpio-cells = <2>;

  n1: node-1 {
          gpio-hog;
          gpios = <0 GPIO_ACTIVE_HIGH>, <1 GPIO_ACTIVE_LOW>;
          output-high;
  };

  n2: node-2 {
          gpio-hog;
          gpios = <3 GPIO_ACTIVE_HIGH>;
          output-low;
  };
};
```

Bindings fragment for the vnd,gpio compatible:

```
gpio-cells:
  - pin
  - flags
```

Example usage:

```
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n1), 0) // GPIO_ACTIVE_HIGH
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n1), 1) // GPIO_ACTIVE_LOW
DT_GPIO_HOG_FLAGS_BY_IDX(DT_NODELABEL(n2), 0) // GPIO_ACTIVE_HIGH
```

Parameters

- `node_id` – node identifier
- `idx` – logical index into “gpios”

Returns
the flags cell value at index “idx”, or zero if there is none

`DT_INST_GPIO_PIN_BY_IDX`(inst, gpio_pha, idx)

Get a DT_DRV_COMPAT instance’s GPIO specifier’s pin cell value at an index.

See also

DT_GPIO_PIN_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”
- `idx` – logical index into “gpio_pha”

Returns
the pin cell value at index “idx”

`DT_INST_GPIO_PIN`(inst, gpio_pha)

Equivalent to *DT_INST_GPIO_PIN_BY_IDX(inst, gpio_pha, 0)*

See also

DT_INST_GPIO_PIN_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type “phandle-array”

Returns
the pin cell value at index 0

`DT_INST_GPIO_FLAGS_BY_IDX`(inst, gpio_pha, idx)

Get a DT_DRV_COMPAT instance's GPIO specifier's flags cell at an index.

See also

DT_GPIO_FLAGS_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type "phandle-array"
- `idx` – logical index into "gpio_pha"

Returns

the flags cell value at index "idx", or zero if there is none

`DT_INST_GPIO_FLAGS`(inst, gpio_pha)

Equivalent to *DT_INST_GPIO_FLAGS_BY_IDX(inst, gpio_pha, 0)*

See also

DT_INST_GPIO_FLAGS_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `gpio_pha` – lowercase-and-underscores GPIO property with type "phandle-array"

Returns

the flags cell value at index 0, or zero if there is none

IO channels These are commonly used by device drivers which need to use IO channels (e.g. ADC or DAC channels) for conversion.

group `devicetree-io-channels`

Defines

`DT_IO_CHANNELS_CTLR_BY_IDX`(node_id, idx)

Get the node identifier for the node referenced by an io-channels property at an index.

Example devicetree fragment:

```
adc1: adc@... { ... };

adc2: adc@... { ... };

n: node {
```

(continues on next page)

(continued from previous page)

```
        io-channels = <&adc1 10>, <&adc2 20>;
};
```

Example usage:

```
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(adc1)
DT_IO_CHANNELS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(adc2)
```

See also

DT_PROP_BY_PHANDLE_IDX()

Parameters

- **node_id** – node identifier for a node with an io-channels property
- **idx** – logical index into io-channels property

Returns
the node identifier for the node referenced at index “idx”

`DT_IO_CHANNELS_CTLR_BY_NAME`(node_id, name)

Get the node identifier for the node referenced by an io-channels property by name.

Example devicetree fragment:

```
adc1: adc@... { ... };

adc2: adc@... { ... };

n: node {
        io-channels = <&adc1 10>, <&adc2 20>;
        io-channel-names = "SENSOR", "BANDGAP";
};
```

Example usage:

DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), sensor) // *DT_NODELABEL(adc1)* *DT_IO_CHANNELS_CTLR_BY_NAME(DT_NODELABEL(n), bandgap)* // *DT_NODELABEL(adc2)*

See also

DT_PHANDLE_BY_NAME()

Parameters

- **node_id** – node identifier for a node with an io-channels property
- **name** – lowercase-and-underscores name of an io-channels element as defined by the node’s io-channel-names property

Returns
the node identifier for the node referenced at the named element

DT_IO_CHANNELS_CTLR(node_id)

Equivalent to *DT_IO_CHANNELS_CTLR_BY_IDX(node_id, 0)*

See also

DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

- **node_id** – node identifier for a node with an io-channels property

Returns

the node identifier for the node referenced at index 0 in the node's "io-channels" property

DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, idx)

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property at an index.

See also

DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – logical index into io-channels property

Returns

the node identifier for the node referenced at index "idx"

DT_INST_IO_CHANNELS_CTLR_BY_NAME(inst, name)

Get the node identifier from a DT_DRV_COMPAT instance's io-channels property by name.

See also

DT_IO_CHANNELS_CTLR_BY_NAME()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **name** – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

Returns

the node identifier for the node referenced at the named element

DT_INST_IO_CHANNELS_CTLR(inst)

Equivalent to *DT_INST_IO_CHANNELS_CTLR_BY_IDX(inst, 0)*

See also

DT_IO_CHANNELS_CTLR_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns

the node identifier for the node referenced at index 0 in the node's "io-channels" property

DT_IO_CHANNELS_INPUT_BY_IDX(node_id, idx)

Get an io-channels specifier input cell at an index.

This macro only works for io-channels specifiers with cells named "input". Refer to the node's binding to check if necessary.

Example devicetree fragment:

```
adc1: adc@... {
        compatible = "vnd,adc";
        #io-channel-cells = <1>;
};

adc2: adc@... {
        compatible = "vnd,adc";
        #io-channel-cells = <1>;
};

n: node {
        io-channels = <&adc1 10>, <&adc2 20>;
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:

- input

Example usage:

```
DT_IO_CHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 0) // 10
DT_IO_CHANNELS_INPUT_BY_IDX(DT_NODELABEL(n), 1) // 20
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier for a node with an io-channels property
- **idx** – logical index into io-channels property

Returns

the input cell in the specifier at index "idx"

DT_IO_CHANNELS_INPUT_BY_NAME(node_id, name)

Get an io-channels specifier input cell by name.

This macro only works for io-channels specifiers with cells named "input". Refer to the node's binding to check if necessary.

Example devicetree fragment:

```
adc1: adc@... {
        compatible = "vnd,adc";
        #io-channel-cells = <1>;
};

adc2: adc@... {
        compatible = "vnd,adc";
        #io-channel-cells = <1>;
};

n: node {
        io-channels = <&adc1 10>, <&adc2 20>;
        io-channel-names = "SENSOR", "BANDGAP";
};
```

Bindings fragment for the vnd,adc compatible:

io-channel-cells:

- input

Example usage:

```
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), sensor) // 10
DT_IO_CHANNELS_INPUT_BY_NAME(DT_NODELABEL(n), bandgap) // 20
```

See also

DT_PHA_BY_NAME()

Parameters

- **node_id** – node identifier for a node with an io-channels property
- **name** – lowercase-and-underscores name of an io-channels element as defined by the node's io-channel-names property

Returns

the input cell in the specifier at the named element

DT_IO_CHANNELS_INPUT(node_id)

Equivalent to *DT_IO_CHANNELS_INPUT_BY_IDX(node_id, 0)*

See also

DT_IO_CHANNELS_INPUT_BY_IDX()

Parameters

- **node_id** – node identifier for a node with an io-channels property

Returns
the input cell in the specifier at index 0

`DT_INST_IO_CHANNELS_INPUT_BY_IDX`(inst, idx)
Get an input cell from the “DT_DRV_INST(inst)” io-channels property at an index.

See also
DT_IO_CHANNELS_INPUT_BY_IDX()

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into io-channels property

Returns
the input cell in the specifier at index “idx”

`DT_INST_IO_CHANNELS_INPUT_BY_NAME`(inst, name)
Get an input cell from the “DT_DRV_INST(inst)” io-channels property by name.

See also
DT_IO_CHANNELS_INPUT_BY_NAME()

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of an io-channels element as defined by the instance’s io-channel-names property

Returns
the input cell in the specifier at the named element

`DT_INST_IO_CHANNELS_INPUT`(inst)
Equivalent to *DT_INST_IO_CHANNELS_INPUT_BY_IDX(inst, 0)*

Parameters
- `inst` – DT_DRV_COMPAT instance number

Returns
the input cell in the specifier at index 0

MBOX These conveniences may be used for nodes which describe MBOX controllers/users, and properties related to them.

group `devicetree-mbox`

Defines

DT_MBOX_CTLR_BY_NAME(node_id, name)

Get the node identifier for the MBOX controller from a mboxes property by name.

Example devicetree fragment:

```
mbox1: mbox-controller@... { ... };

n: node {
        mboxes = <&mbox1 8>,
                 <&mbox1 9>;
        mbox-names = "tx", "rx";
};
```

Example usage:

```
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), tx) // DT_NODELABEL(mbox1)
DT_MBOX_CTLR_BY_NAME(DT_NODELABEL(n), rx) // DT_NODELABEL(mbox1)
```

See also

DT_PHANDLE_BY_NAME()

Parameters

- **node_id** – node identifier for a node with a mboxes property
- **name** – lowercase-and-underscores name of a mboxes element as defined by the node's mbox-names property

Returns

the node identifier for the MBOX controller in the named element

DT_MBOX_CHANNEL_BY_NAME(node_id, name)

Get a MBOX channel value by name.

Example devicetree fragment:

```
mbox1: mbox@... {
        #mbox-cells = <1>;
};

n: node {
    mboxes = <&mbox1 1>,
             <&mbox1 6>;
    mbox-names = "tx", "rx";
};
```

Bindings fragment for the mbox compatible:

```
mbox-cells:
  - channel
```

Example usage:

```
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), tx) // 1
DT_MBOX_CHANNEL_BY_NAME(DT_NODELABEL(n), rx) // 6
```

See also

DT_PHA_BY_NAME_OR()

Parameters

- **node_id** – node identifier for a node with a mboxes property
- **name** – lowercase-and-underscores name of a mboxes element as defined by the node's mbox-names property

Returns

the channel value in the specifier at the named element or 0 if no channels are supported

Pinctrl (pin control) These are used to access pin control properties by name or index.

Devicetree nodes may have properties which specify pin control (sometimes known as pin mux) settings. These are expressed using `pinctrl-<index>` properties within the node, where the `<index>` values are contiguous integers starting from 0. These may also be named using the `pinctrl-names` property.

Here is an example:

```
node {
    ...
    pinctrl-0 = <&foo &bar ...>;
    pinctrl-1 = <&baz ...>;
    pinctrl-names = "default", "sleep";
};
```

Above, `pinctrl-0` has name `"default"`, and `pinctrl-1` has name `"sleep"`. The `pinctrl-<index>` property values contain phandles. The `&foo`, `&bar`, etc. phandles within the properties point to nodes whose contents vary by platform, and which describe a pin configuration for the node.

group **devicetree-pinctrl**

Defines

`DT_PINCTRL_BY_IDX`(node_id, pc_idx, idx)

Get a node identifier for a phandle in a pinctrl property by index.

Example devicetree fragment:

```
n: node {
        pinctrl-0 = <&foo &bar>;
        pinctrl-1 = <&baz &blub>;
}
```

Example usage:

```
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 0, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_IDX(DT_NODELABEL(n), 1, 0) // DT_NODELABEL(baz)
```

Parameters

- **node_id** – node with a pinctrl-'pc_idx' property
- **pc_idx** – index of the pinctrl property itself

- **idx** – index into the value of the pinctrl property

Returns
node identifier for the phandle at index 'idx' in 'pinctrl-'pc_idx''

DT_PINCTRL_0(node_id, idx)

Get a node identifier from a pinctrl-0 property.

This is equivalent to:

```
DT_PINCTRL_BY_IDX(node_id, 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

Parameters

- **node_id** – node with a pinctrl-0 property
- **idx** – index into the pinctrl-0 property

Returns
node identifier for the phandle at index idx in the pinctrl-0 property of that node

DT_PINCTRL_BY_NAME(node_id, name, idx)

Get a node identifier for a phandle inside a pinctrl node by name.

Example devicetree fragment:

```
n: node {
        pinctrl-0 = <&foo &bar>;
        pinctrl-1 = <&baz &blub>;
        pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), default, 1) // DT_NODELABEL(bar)
DT_PINCTRL_BY_NAME(DT_NODELABEL(n), sleep, 0) // DT_NODELABEL(baz)
```

Parameters

- **node_id** – node with a named pinctrl property
- **name** – lowercase-and-underscores pinctrl property name
- **idx** – index into the value of the named pinctrl property

Returns
node identifier for the phandle at that index in the pinctrl property

DT_PINCTRL_NAME_TO_IDX(node_id, name)

Convert a pinctrl name to its corresponding index.

Example devicetree fragment:

```
n: node {
        pinctrl-0 = <&foo &bar>;
        pinctrl-1 = <&baz &blub>;
        pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), default) // 0
DT_PINCTRL_NAME_TO_IDX(DT_NODELABEL(n), sleep)   // 1
```

Parameters

- `node_id` – node identifier with a named pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name

`DT_PINCTRL_IDX_TO_NAME_TOKEN`(node_id, pc_idx)

Convert a pinctrl property index to its name as a token.

This allows you to get a pinctrl property's name, and "remove the

quotes" from it.

DT_PINCTRL_IDX_TO_NAME_TOKEN() can only be used if the node has a pinctrl-'pc_idx' property and a pinctrl-names property element for that index. It is an error to use it in other circumstances.

Example devicetree fragment:

```
n: node {
        pinctrl-0 = <...>;
        pinctrl-1 = <...>;
        pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // default
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // f_o_o2
```

The same caveats and restrictions that apply to *DT_STRING_TOKEN()*'s return value also apply here.

Parameters

- `node_id` – node identifier
- `pc_idx` – index of a pinctrl property in that node

Returns
name of the pinctrl property, as a token, without any quotes and with non-alphanumeric characters converted to underscores

`DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN`(node_id, pc_idx)

Like *DT_PINCTRL_IDX_TO_NAME_TOKEN()*, but with an uppercased result.

This does the a similar conversion as *DT_PINCTRL_IDX_TO_NAME_TOKEN(node_id, pc_idx)*. The only difference is that alphabetical characters in the result are uppercased.

Example devicetree fragment:

```
n: node {
        pinctrl-0 = <...>;
        pinctrl-1 = <...>;
        pinctrl-names = "default", "f.o.o2";
};
```

Example usage:

```
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 0) // DEFAULT
DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_NODELABEL(n), 1) // F_0_02
```

The same caveats and restrictions that apply to *DT_STRING_UPPER_TOKEN()*'s return value also apply here.

`DT_NUM_PINCTRLS_BY_IDX`(node_id, pc_idx)

Get the number of phandles in a pinctrl property.

Example devicetree fragment:

```
n1: node-1 {
        pinctrl-0 = <&foo &bar>;
};

n2: node-2 {
        pinctrl-0 = <&baz>;
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n1), 0) // 2
DT_NUM_PINCTRLS_BY_IDX(DT_NODELABEL(n2), 0) // 1
```

Parameters

- `node_id` – node identifier with a pinctrl property
- `pc_idx` – index of the pinctrl property itself

Returns
number of phandles in the property with that index

`DT_NUM_PINCTRLS_BY_NAME`(node_id, name)

Like *DT_NUM_PINCTRLS_BY_IDX()*, but by name instead.

Example devicetree fragment:

```
n: node {
        pinctrl-0 = <&foo &bar>;
        pinctrl-1 = <&baz>
        pinctrl-names = "default", "sleep";
};
```

Example usage:

```
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), default) // 2
DT_NUM_PINCTRLS_BY_NAME(DT_NODELABEL(n), sleep)   // 1
```

Parameters

- `node_id` – node identifier with a pinctrl property
- `name` – lowercase-and-underscores name name of the pinctrl property

Returns
number of phandles in the property with that name

`DT_NUM_PINCTRL_STATES`(node_id)

Get the number of pinctrl properties in a node.

This expands to 0 if there are no pinctrl-i properties. Otherwise, it expands to the number of such properties.

Example devicetree fragment:

```
n1: node-1 {
        pinctrl-0 = <...>;
        pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n1)) // 2
DT_NUM_PINCTRL_STATES(DT_NODELABEL(n2)) // 0
```

Parameters

- **node_id** – node identifier; may or may not have any pinctrl properties

Returns
number of pinctrl properties in the node

DT_PINCTRL_HAS_IDX(node_id, pc_idx)

Test if a node has a pinctrl property with an index.

This expands to 1 if the pinctrl-'idx' property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
        pinctrl-0 = <...>;
        pinctrl-1 = <...>;
};

n2: node-2 {
};
```

Example usage:

```
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 0) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 1) // 1
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n1), 2) // 0
DT_PINCTRL_HAS_IDX(DT_NODELABEL(n2), 0) // 0
```

Parameters

- **node_id** – node identifier; may or may not have any pinctrl properties
- **pc_idx** – index of a pinctrl property whose existence to check

Returns
1 if the property exists, 0 otherwise

DT_PINCTRL_HAS_NAME(node_id, name)

Test if a node has a pinctrl property with a name.

This expands to 1 if the named pinctrl property exists. Otherwise, it expands to 0.

Example devicetree fragment:

```
n1: node-1 {
        pinctrl-0 = <...>;
        pinctrl-names = "default";
};
```

(continues on next page)

(continued from previous page)

```
n2: node-2 {
};
```

Example usage:

```
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), default) // 1
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n1), sleep)   // 0
DT_PINCTRL_HAS_NAME(DT_NODELABEL(n2), default) // 0
```

Parameters

- **node_id** – node identifier; may or may not have any pinctrl properties
- **name** – lowercase-and-underscores pinctrl property name to check

Returns
1 if the property exists, 0 otherwise

`DT_INST_PINCTRL_BY_IDX`(inst, pc_idx, idx)

Get a node identifier for a phandle in a pinctrl property by index for a DT_DRV_COMPAT instance.

This is equivalent to *DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), pc_idx, idx)*.

Parameters

- **inst** – instance number
- **pc_idx** – index of the pinctrl property itself
- **idx** – index into the value of the pinctrl property

Returns
node identifier for the phandle at index ‘idx’ in ‘pinctrl-‘pc_idx”

`DT_INST_PINCTRL_0`(inst, idx)

Get a node identifier from a pinctrl-0 property for a DT_DRV_COMPAT instance.

This is equivalent to:

```
DT_PINCTRL_BY_IDX(DT_DRV_INST(inst), 0, idx)
```

It is provided for convenience since pinctrl-0 is commonly used.

Parameters

- **inst** – instance number
- **idx** – index into the pinctrl-0 property

Returns
node identifier for the phandle at index idx in the pinctrl-0 property of that instance

`DT_INST_PINCTRL_BY_NAME`(inst, name, idx)

Get a node identifier for a phandle inside a pinctrl node for a DT_DRV_COMPAT instance.

This is equivalent to *DT_PINCTRL_BY_NAME(DT_DRV_INST(inst), name, idx)*.

Parameters

- **inst** – instance number
- **name** – lowercase-and-underscores pinctrl property name

- `idx` – index into the value of the named pinctrl property

Returns
node identifier for the phandle at that index in the pinctrl property

`DT_INST_PINCTRL_NAME_TO_IDX`(inst, name)

Convert a pinctrl name to its corresponding index for a DT_DRV_COMPAT instance.

This is equivalent to *DT_PINCTRL_NAME_TO_IDX(DT_DRV_INST(inst),name)*.

Parameters

- `inst` – instance number
- `name` – lowercase-and-underscores name of the pinctrl whose index to get

Returns
integer literal for the index of the pinctrl property with that name

`DT_INST_PINCTRL_IDX_TO_NAME_TOKEN`(inst, pc_idx)

Convert a pinctrl index to its name as an uppercased token.

This is equivalent to *DT_PINCTRL_IDX_TO_NAME_TOKEN(DT_DRV_INST(inst), pc_idx)*.

Parameters

- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

Returns
name of the pin control property as a token

`DT_INST_PINCTRL_IDX_TO_NAME_UPPER_TOKEN`(inst, pc_idx)

Convert a pinctrl index to its name as an uppercased token.

This is equivalent to *DT_PINCTRL_IDX_TO_NAME_UPPER_TOKEN(DT_DRV_INST(inst), idx)*.

Parameters

- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

Returns
name of the pin control property as an uppercase token

`DT_INST_NUM_PINCTRLS_BY_IDX`(inst, pc_idx)

Get the number of phandles in a pinctrl property for a DT_DRV_COMPAT instance.

This is equivalent to *DT_NUM_PINCTRLS_BY_IDX(DT_DRV_INST(inst),pc_idx)*.

Parameters

- `inst` – instance number
- `pc_idx` – index of the pinctrl property itself

Returns
number of phandles in the property with that index

`DT_INST_NUM_PINCTRLS_BY_NAME`(inst, name)

Like *DT_INST_NUM_PINCTRLS_BY_IDX()*, but by name instead.

This is equivalent to *DT_NUM_PINCTRLS_BY_NAME(DT_DRV_INST(inst),name)*.

Parameters

- `inst` – instance number
- `name` – lowercase-and-underscores name of the pinctrl property

Returns
number of phandles in the property with that name

`DT_INST_NUM_PINCTRL_STATES`(inst)
Get the number of pinctrl properties in a DT_DRV_COMPAT instance.

This is equivalent to *DT_NUM_PINCTRL_STATES(DT_DRV_INST(inst))*.

Parameters
- `inst` – instance number

Returns
number of pinctrl properties in the instance

`DT_INST_PINCTRL_HAS_IDX`(inst, pc_idx)
Test if a DT_DRV_COMPAT instance has a pinctrl property with an index.

This is equivalent to *DT_PINCTRL_HAS_IDX(DT_DRV_INST(inst), pc_idx)*.

Parameters
- `inst` – instance number
- `pc_idx` – index of a pinctrl property whose existence to check

Returns
1 if the property exists, 0 otherwise

`DT_INST_PINCTRL_HAS_NAME`(inst, name)
Test if a DT_DRV_COMPAT instance has a pinctrl property with a name.

This is equivalent to *DT_PINCTRL_HAS_NAME(DT_DRV_INST(inst), name)*.

Parameters
- `inst` – instance number
- `name` – lowercase-and-underscores pinctrl property name to check

Returns
1 if the property exists, 0 otherwise

PWM These conveniences may be used for nodes which describe PWM controllers and properties related to them.

group `devicetree-pwms`

Defines

`DT_PWMS_CTLR_BY_IDX`(node_id, idx)
Get the node identifier for the PWM controller from a pwms property at an index.

Example devicetree fragment:

```
pwm1: pwm-controller@... { ... };

pwm2: pwm-controller@... { ... };

n: node {
        pwms = <&pwm1 1 PWM_POLARITY_NORMAL>,
               <&pwm2 3 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 0) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_IDX(DT_NODELABEL(n), 1) // DT_NODELABEL(pwm2)
```

See also

DT_PROP_BY_PHANDLE_IDX()

Parameters

- **node_id** – node identifier for a node with a pwms property
- **idx** – logical index into pwms property

Returns
the node identifier for the PWM controller referenced at index “idx”

DT_PWMS_CTLR_BY_NAME(node_id, name)

Get the node identifier for the PWM controller from a pwms property by name.

Example devicetree fragment:

```
pwm1: pwm-controller@... { ... };
```

pwm2: pwm-controller... { ... };

n: node { pwms = <&pwm1 1 PWM_POLARITY_NORMAL>, <&pwm2 3 PWM_POLARITY_INVERTED>; pwm-names = “alpha”, “beta”; };

Example usage:

```
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(pwm1)
DT_PWMS_CTLR_BY_NAME(DT_NODELABEL(n), beta)  // DT_NODELABEL(pwm2)
```

See also

DT_PHANDLE_BY_NAME()

Parameters

- **node_id** – node identifier for a node with a pwms property
- **name** – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns
the node identifier for the PWM controller in the named element

DT_PWMS_CTLR(node_id)

Equivalent to *DT_PWMS_CTLR_BY_IDX(node_id, 0)*

See also

DT_PWMS_CTLR_BY_IDX()

Parameters

- **node_id** – node identifier for a node with a pwms property

Returns
the node identifier for the PWM controller at index 0 in the node's "pwms" property

`DT_PWMS_CELL_BY_IDX`(node_id, idx, cell)

Get PWM specifier's cell value at an index.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
        compatible = "vnd,pwm";
        #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
        compatible = "vnd,pwm";
        #pwm-cells = <2>;
};

n: node {
        pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
               <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
};
```

Bindings fragment for the "vnd,pwm" compatible:

```
pwm-cells:
  - channel
  - period
  - flags
```

Example usage:

```
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, channel) // 1
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, channel) // 3
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, period)  // 200000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, period)  // 100000
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 0, flags)   // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_IDX(DT_NODELABEL(n), 1, flags)   // PWM_POLARITY_INVERTED
```

See also

DT_PHA_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index "idx"

`DT_PWMS_CELL_BY_NAME`(node_id, name, cell)

Get a PWM specifier's cell value by name.

Example devicetree fragment:

```
pwm1: pwm-controller@... {
        compatible = "vnd,pwm";
        #pwm-cells = <2>;
};

pwm2: pwm-controller@... {
        compatible = "vnd,pwm";
        #pwm-cells = <2>;
};

n: node {
        pwms = <&pwm1 1 200000 PWM_POLARITY_NORMAL>,
               <&pwm2 3 100000 PWM_POLARITY_INVERTED>;
        pwm-names = "alpha", "beta";
};
```

Bindings fragment for the “vnd,pwm” compatible:

```
pwm-cells:
  - channel
  - period
  - flags
```

Example usage:

```
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, channel) // 1
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, channel)  // 3
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, period)  // 200000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, period)   // 100000
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), alpha, flags)   // PWM_POLARITY_NORMAL
DT_PWMS_CELL_BY_NAME(DT_NODELABEL(n), beta, flags)    // PWM_POLARITY_INVERTED
```

See also

DT_PHA_BY_NAME()

Parameters

- **node_id** – node identifier for a node with a pwms property
- **name** – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_PWMS_CELL(node_id, cell)

Equivalent to *DT_PWMS_CELL_BY_IDX(node_id, 0, cell)*

See also

DT_PWMS_CELL_BY_IDX()

Parameters

- **node_id** – node identifier for a node with a pwms property

- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index 0

`DT_PWMS_CHANNEL_BY_IDX`(node_id, idx)

Get a PWM specifier's channel cell value at an index.

This macro only works for PWM specifiers with cells named "channel". Refer to the node's binding to check if necessary.

This is equivalent to *DT_PWMS_CELL_BY_IDX(node_id, idx, channel)*.

See also

DT_PWMS_CELL_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

Returns
the channel cell value at index "idx"

`DT_PWMS_CHANNEL_BY_NAME`(node_id, name)

Get a PWM specifier's channel cell value by name.

This macro only works for PWM specifiers with cells named "channel". Refer to the node's binding to check if necessary.

This is equivalent to *DT_PWMS_CELL_BY_NAME(node_id, name, channel)*.

See also

DT_PWMS_CELL_BY_NAME()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the channel cell value in the specifier at the named element

`DT_PWMS_CHANNEL`(node_id)

Equivalent to *DT_PWMS_CHANNEL_BY_IDX(node_id, 0)*

See also

DT_PWMS_CHANNEL_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property

Returns
the channel cell value at index 0

`DT_PWMS_PERIOD_BY_IDX`(node_id, idx)

Get PWM specifier's period cell value at an index.

This macro only works for PWM specifiers with cells named "period". Refer to the node's binding to check if necessary.

This is equivalent to *DT_PWMS_CELL_BY_IDX(node_id, idx, period)*.

See also

DT_PWMS_CELL_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

Returns
the period cell value at index "idx"

`DT_PWMS_PERIOD_BY_NAME`(node_id, name)

Get a PWM specifier's period cell value by name.

This macro only works for PWM specifiers with cells named "period". Refer to the node's binding to check if necessary.

This is equivalent to *DT_PWMS_CELL_BY_NAME(node_id, name, period)*.

See also

DT_PWMS_CELL_BY_NAME()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the period cell value in the specifier at the named element

`DT_PWMS_PERIOD`(node_id)

Equivalent to *DT_PWMS_PERIOD_BY_IDX(node_id, 0)*

See also

DT_PWMS_PERIOD_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property

Returns
the period cell value at index 0

`DT_PWMS_FLAGS_BY_IDX`(node_id, idx)

Get a PWM specifier's flags cell value at an index.

This macro expects PWM specifiers with cells named "flags". If there is no "flags" cell in the PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if necessary.

This is equivalent to *DT_PWMS_CELL_BY_IDX(node_id, idx, flags)*.

See also

DT_PWMS_CELL_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `idx` – logical index into pwms property

Returns
the flags cell value at index "idx", or zero if there is none

`DT_PWMS_FLAGS_BY_NAME`(node_id, name)

Get a PWM specifier's flags cell value by name.

This macro expects PWM specifiers with cells named "flags". If there is no "flags" cell in the PWM specifier, zero is returned. Refer to the node's binding to check specifier cell names if necessary.

This is equivalent to *DT_PWMS_CELL_BY_NAME(node_id, name, flags)* if there is a flags cell, but expands to zero if there is none.

See also

DT_PWMS_CELL_BY_NAME()

Parameters

- `node_id` – node identifier for a node with a pwms property
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

`DT_PWMS_FLAGS`(node_id)

Equivalent to *DT_PWMS_FLAGS_BY_IDX(node_id, 0)*

See also

DT_PWMS_FLAGS_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a pwms property

Returns
the flags cell value at index 0, or zero if there is none

`DT_INST_PWMS_CTLR_BY_IDX`(inst, idx)

Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance's pwms property at an index.

See also

DT_PWMS_CTLR_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into pwms property

Returns
the node identifier for the PWM controller referenced at index "idx"

`DT_INST_PWMS_CTLR_BY_NAME`(inst, name)

Get the node identifier for the PWM controller from a DT_DRV_COMPAT instance's pwms property by name.

See also

DT_PWMS_CTLR_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the node identifier for the PWM controller in the named element

`DT_INST_PWMS_CTLR`(inst)

Equivalent to *DT_INST_PWMS_CTLR_BY_IDX(inst, 0)*

See also

DT_PWMS_CTLR_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns
the node identifier for the PWM controller at index 0 in the instance's "pwms" property

`DT_INST_PWMS_CELL_BY_IDX`(inst, idx, cell)

Get a DT_DRV_COMPAT instance's PWM specifier's cell value at an index.

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into pwms property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index "idx"

`DT_INST_PWMS_CELL_BY_NAME`(inst, name, cell)

Get a DT_DRV_COMPAT instance's PWM specifier's cell value by name.

See also

DT_PWMS_CELL_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

`DT_INST_PWMS_CELL`(inst, cell)

Equivalent to *DT_INST_PWMS_CELL_BY_IDX(inst, 0, cell)*

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index 0

`DT_INST_PWMS_CHANNEL_BY_IDX`(inst, idx)

Equivalent to *DT_INST_PWMS_CELL_BY_IDX(inst, idx, channel)*

See also

DT_INST_PWMS_CELL_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into pwms property

Returns
the channel cell value at index “idx”

`DT_INST_PWMS_CHANNEL_BY_NAME`(inst, name)
Equivalent to *DT_INST_PWMS_CELL_BY_NAME(inst, name, channel)*

See also

DT_INST_PWMS_CELL_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node’s pwm-names property

Returns
the channel cell value in the specifier at the named element

`DT_INST_PWMS_CHANNEL`(inst)
Equivalent to *DT_INST_PWMS_CHANNEL_BY_IDX(inst, 0)*

See also

DT_INST_PWMS_CHANNEL_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns
the channel cell value at index 0

`DT_INST_PWMS_PERIOD_BY_IDX`(inst, idx)
Equivalent to *DT_INST_PWMS_CELL_BY_IDX(inst, idx, period)*

See also

DT_INST_PWMS_CELL_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into pwms property

Returns
the period cell value at index “idx”

DT_INST_PWMS_PERIOD_BY_NAME(inst, name)

Equivalent to *DT_INST_PWMS_CELL_BY_NAME(inst, name, period)*

See also

DT_INST_PWMS_CELL_BY_NAME()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **name** – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns

the period cell value in the specifier at the named element

DT_INST_PWMS_PERIOD(inst)

Equivalent to *DT_INST_PWMS_PERIOD_BY_IDX(inst, 0)*

See also

DT_INST_PWMS_PERIOD_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns

the period cell value at index 0

DT_INST_PWMS_FLAGS_BY_IDX(inst, idx)

Equivalent to *DT_INST_PWMS_CELL_BY_IDX(inst, idx, flags)*

See also

DT_INST_PWMS_CELL_BY_IDX()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – logical index into pwms property

Returns

the flags cell value at index "idx", or zero if there is none

DT_INST_PWMS_FLAGS_BY_NAME(inst, name)

Equivalent to *DT_INST_PWMS_CELL_BY_NAME(inst, name, flags)*

See also

DT_INST_PWMS_CELL_BY_NAME()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property

Returns
the flags cell value in the specifier at the named element, or zero if there is none

`DT_INST_PWMS_FLAGS`(inst)
Equivalent to *DT_INST_PWMS_FLAGS_BY_IDX(inst, 0)*

See also

DT_INST_PWMS_FLAGS_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns
the flags cell value at index 0, or zero if there is none

Reset Controller These conveniences may be used for nodes which describe reset controllers and properties related to them.

group `devicetree-reset-controller`

Defines

`DT_RESET_CTLR_BY_IDX`(node_id, idx)
Get the node identifier for the controller phandle from a "resets" phandle-array property at an index.

Example devicetree fragment:

```
reset1: reset-controller@... { ... };

reset2: reset-controller@... { ... };

n: node {
        resets = <&reset1 10>, <&reset2 20>;
};
```

Example usage:

```
DT_RESET_CTLR_BY_IDX(DT_NODELABEL(n), 0)) // DT_NODELABEL(reset1)
DT_RESET_CTLR_BY_IDX(DT_NODELABEL(n), 1)) // DT_NODELABEL(reset2)
```

See also

DT_PHANDLE_BY_IDX()

Parameters

- `node_id` – node identifier
- `idx` – logical index into “resets”

Returns
the node identifier for the reset controller referenced at index “idx”

`DT_RESET_CTLR`(node_id)

Equivalent to *DT_RESET_CTLR_BY_IDX(node_id, 0)*

See also

DT_RESET_CTLR_BY_IDX()

Parameters

- `node_id` – node identifier

Returns
a node identifier for the reset controller at index 0 in “resets”

`DT_RESET_CTLR_BY_NAME`(node_id, name)

Get the node identifier for the controller phandle from a resets phandle-array property by name.

Example devicetree fragment:

```
reset1: reset-controller@... { ... };

reset2: reset-controller@... { ... };

n: node {
        resets = <&reset1 10>, <&reset2 20>;
        reset-names = "alpha", "beta";
};
```

Example usage:

```
DT_RESET_CTLR_BY_NAME(DT_NODELABEL(n), alpha) // DT_NODELABEL(reset1)
DT_RESET_CTLR_BY_NAME(DT_NODELABEL(n), beta) // DT_NODELABEL(reset2)
```

See also

DT_PHANDLE_BY_NAME()

Parameters

- `node_id` – node identifier
- `name` – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property

Returns
the node identifier for the reset controller referenced by name

`DT_RESET_CELL_BY_IDX`(node_id, idx, cell)

Get a reset specifier's cell value at an index.

Example devicetree fragment:

```
reset: reset-controller@... {
        compatible = "vnd,reset";
        #reset-cells = <1>;
};

n: node {
        resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```
reset-cells:
  - id
```

Example usage:

```
DT_RESET_CELL_BY_IDX(DT_NODELABEL(n), 0, id) // 10
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier for a node with a resets property
- **idx** – logical index into resets property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value at index "idx"

`DT_RESET_CELL_BY_NAME`(node_id, name, cell)

Get a reset specifier's cell value by name.

Example devicetree fragment:

```
reset: reset-controller@... {
        compatible = "vnd,reset";
        #reset-cells = <1>;
};

n: node {
        resets = <&reset 10>;
        reset-names = "alpha";
};
```

Bindings fragment for the vnd,reset compatible:

```
reset-cells:
  - id
```

Example usage:

```
DT_RESET_CELL_BY_NAME(DT_NODELABEL(n), alpha, id) // 10
```

See also

DT_PHA_BY_NAME()

Parameters

- `node_id` – node identifier for a node with a resets property
- `name` – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

`DT_RESET_CELL`(node_id, cell)

Equivalent to *DT_RESET_CELL_BY_IDX(node_id, 0, cell)*

See also

DT_RESET_CELL_BY_IDX()

Parameters

- `node_id` – node identifier for a node with a resets property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index 0

`DT_INST_RESET_CTLR_BY_IDX`(inst, idx)

Get the node identifier for the controller phandle from a "resets" phandle-array property at an index.

See also

DT_RESET_CTLR_BY_IDX()

Parameters

- `inst` – instance number
- `idx` – logical index into "resets"

Returns
the node identifier for the reset controller referenced at index "idx"

`DT_INST_RESET_CTLR`(inst)

Equivalent to *DT_INST_RESET_CTLR_BY_IDX(inst, 0)*

See also

DT_RESET_CTLR()

Parameters

- `inst` – instance number

Returns
a node identifier for the reset controller at index 0 in “resets”

`DT_INST_RESET_CTLR_BY_NAME`(inst, name)

Get the node identifier for the controller phandle from a resets phandle-array property by name.

See also

DT_RESET_CTLR_BY_NAME()

Parameters

- `inst` – instance number
- `name` – lowercase-and-underscores name of a resets element as defined by the node’s reset-names property

Returns
the node identifier for the reset controller referenced by the named element

`DT_INST_RESET_CELL_BY_IDX`(inst, idx, cell)

Get a DT_DRV_COMPAT instance’s reset specifier’s cell value at an index.

See also

DT_RESET_CELL_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into resets property
- `cell` – lowercase-and-underscores cell name

Returns
the cell value at index “idx”

`DT_INST_RESET_CELL_BY_NAME`(inst, name, cell)

Get a DT_DRV_COMPAT instance’s reset specifier’s cell value by name.

See also

DT_RESET_CELL_BY_NAME()

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **name** – lowercase-and-underscores name of a resets element as defined by the node's reset-names property
- **cell** – lowercase-and-underscores cell name

Returns
the cell value in the specifier at the named element

DT_INST_RESET_CELL(inst, cell)

Equivalent to *DT_INST_RESET_CELL_BY_IDX(inst, 0, cell)*

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **cell** – lowercase-and-underscores cell name

Returns
the value of the cell inside the specifier at index 0

DT_RESET_ID_BY_IDX(node_id, idx)

Get a Reset Controller specifier's id cell at an index.

This macro only works for Reset Controller specifiers with cells named "id". Refer to the node's binding to check if necessary.

Example devicetree fragment:

```
reset: reset-controller@... {
        compatible = "vnd,reset";
        #reset-cells = <1>;
};

n: node {
        resets = <&reset 10>;
};
```

Bindings fragment for the vnd,reset compatible:

```
reset-cells:
  - id
```

Example usage:

```
DT_RESET_ID_BY_IDX(DT_NODELABEL(n), 0) // 10
```

See also

DT_PHA_BY_IDX()

Parameters

- **node_id** – node identifier
- **idx** – logical index into "resets"

Returns
the id cell value at index “idx”

`DT_RESET_ID`(node_id)
Equivalent to *DT_RESET_ID_BY_IDX(node_id, 0)*

See also

DT_RESET_ID_BY_IDX()

Parameters

- `node_id` – node identifier

Returns
the id cell value at index 0

`DT_INST_RESET_ID_BY_IDX`(inst, idx)
Get a DT_DRV_COMPAT instance’s Reset Controller specifier’s id cell value at an index.

See also

DT_RESET_ID_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `idx` – logical index into “resets”

Returns
the id cell value at index “idx”

`DT_INST_RESET_ID`(inst)
Equivalent to *DT_INST_RESET_ID_BY_IDX(inst, 0)*

See also

DT_INST_RESET_ID_BY_IDX()

Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns
the id cell value at index 0

SPI These conveniences may be used for nodes which describe either SPI controllers or devices, depending on the case.

group `devicetree-spi`

Defines

DT_SPI_HAS_CS_GPIOS(spi)

Does a SPI controller node have chip select GPIOs configured?

SPI bus controllers use the “cs-gpios” property for configuring chip select GPIOs. Its value is a phandle-array which specifies the chip select lines.

Example devicetree fragment:

```
spi1: spi@... {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                   <&gpio2 20 GPIO_ACTIVE_LOW>;
};

spi2: spi@... {
        compatible = "vnd,spi";
};
```

Example usage:

```
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi1)) // 1
DT_SPI_HAS_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters

- **spi** – a SPI bus controller node identifier

Returns

1 if “spi” has a cs-gpios property, 0 otherwise

DT_SPI_NUM_CS_GPIOS(spi)

Number of chip select GPIOs in a SPI controller’s cs-gpios property.

Example devicetree fragment:

```
spi1: spi@... {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                   <&gpio2 20 GPIO_ACTIVE_LOW>;
};

spi2: spi@... {
        compatible = "vnd,spi";
};
```

Example usage:

```
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi1)) // 2
DT_SPI_NUM_CS_GPIOS(DT_NODELABEL(spi2)) // 0
```

Parameters

- **spi** – a SPI bus controller node identifier

Returns

Logical length of spi’s cs-gpios property, or 0 if “spi” doesn’t have a cs-gpios property

DT_SPI_DEV_HAS_CS_GPIOS(spi_dev)

Does a SPI device have a chip select line configured? Example devicetree fragment:

```
spi1: spi@... {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                   <&gpio2 20 GPIO_ACTIVE_LOW>;

        a: spi-dev-a@0 {
                reg = <0>;
        };

        b: spi-dev-b@1 {
                reg = <1>;
        };
};

spi2: spi@... {
        compatible = "vnd,spi";
        c: spi-dev-c@0 {
                reg = <0>;
        };
};
```

Example usage:

```
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(a)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(b)) // 1
DT_SPI_DEV_HAS_CS_GPIOS(DT_NODELABEL(c)) // 0
```

Parameters

- **spi_dev** – a SPI device node identifier

Returns

1 if spi_dev's bus node *DT_BUS(spi_dev)* has a chip select pin at index *DT_REG_ADDR(spi_dev)*, 0 otherwise

DT_SPI_DEV_CS_GPIOS_CTLR(spi_dev)

Get a SPI device's chip select GPIO controller's node identifier.

Example devicetree fragment:

```
gpio1: gpio@... { ... };

gpio2: gpio@... { ... };

spi@... {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                   <&gpio2 20 GPIO_ACTIVE_LOW>;

        a: spi-dev-a@0 {
                reg = <0>;
        };

        b: spi-dev-b@1 {
                reg = <1>;
        };
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(a)) // DT_NODELABEL(gpio1)
DT_SPI_DEV_CS_GPIOS_CTLR(DT_NODELABEL(b)) // DT_NODELABEL(gpio2)
```

Parameters

- **spi_dev** – a SPI device node identifier

Returns
node identifier for spi_dev's chip select GPIO controller

DT_SPI_DEV_CS_GPIOS_PIN(spi_dev)

Get a SPI device's chip select GPIO pin number.

It's an error if the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no pin cell.

Example devicetree fragment:

```
spi1: spi@... {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                   <&gpio2 20 GPIO_ACTIVE_LOW>;

        a: spi-dev-a@0 {
                reg = <0>;
        };

        b: spi-dev-b@1 {
                reg = <1>;
        };
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(a)) // 10
DT_SPI_DEV_CS_GPIOS_PIN(DT_NODELABEL(b)) // 20
```

Parameters

- **spi_dev** – a SPI device node identifier

Returns
pin number of spi_dev's chip select GPIO

DT_SPI_DEV_CS_GPIOS_FLAGS(spi_dev)

Get a SPI device's chip select GPIO flags.

Example devicetree fragment:

```
spi1: spi@... {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>;

        a: spi-dev-a@0 {
                reg = <0>;
        };
};
```

Example usage:

```
DT_SPI_DEV_CS_GPIOS_FLAGS(DT_NODELABEL(a)) // GPIO_ACTIVE_LOW
```

If the GPIO specifier for spi_dev's entry in its bus node's cs-gpios property has no flags cell, this expands to zero.

Parameters

- **spi_dev** – a SPI device node identifier

Returns
flags value of spi_dev's chip select GPIO specifier, or zero if there is none

`DT_INST_SPI_DEV_HAS_CS_GPIOS`(inst)

Equivalent to *DT_SPI_DEV_HAS_CS_GPIOS(DT_DRV_INST(inst))*.

See also

DT_SPI_DEV_HAS_CS_GPIOS()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns
1 if the instance's bus has a CS pin at index *DT_INST_REG_ADDR(inst)*, 0 otherwise

`DT_INST_SPI_DEV_CS_GPIOS_CTLR`(inst)

Get GPIO controller node identifier for a SPI device instance This is equivalent to *DT_SPI_DEV_CS_GPIOS_CTLR(DT_DRV_INST(inst))*.

See also

DT_SPI_DEV_CS_GPIOS_CTLR()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns
node identifier for instance's chip select GPIO controller

`DT_INST_SPI_DEV_CS_GPIOS_PIN`(inst)

Equivalent to *DT_SPI_DEV_CS_GPIOS_PIN(DT_DRV_INST(inst))*.

See also

DT_SPI_DEV_CS_GPIOS_PIN()

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns
pin number of the instance's chip select GPIO

`DT_INST_SPI_DEV_CS_GPIOS_FLAGS`(inst)
DT_SPI_DEV_CS_GPIOS_FLAGS(DT_DRV_INST(inst)).

> **See also**
> *DT_SPI_DEV_CS_GPIOS_FLAGS()*

Parameters
- `inst` – DT_DRV_COMPAT instance number

Returns
flags value of the instance's chip select GPIO specifier, or zero if there is none

Chosen nodes The special `/chosen` node contains properties whose values describe system-wide settings. The *DT_CHOSEN()* macro can be used to get a node identifier for a chosen node.

group `devicetree-generic-chosen`

Defines

`DT_CHOSEN`(prop)
Get a node identifier for a `/chosen` node property.

This is only valid to call if *DT_HAS_CHOSEN(prop)* is 1.

Parameters
- `prop` – lowercase-and-underscores property name for the /chosen node

Returns
a node identifier for the chosen node property

`DT_HAS_CHOSEN`(prop)
Test if the devicetree has a `/chosen` node.

Parameters
- `prop` – lowercase-and-underscores devicetree property

Returns
1 if the chosen property exists and refers to a node, 0 otherwise

Zephyr-specific chosen nodes The following table documents some commonly used Zephyr-specific chosen nodes.

Sometimes, a chosen node's label property will be used to set the default value of a Kconfig option which in turn configures a hardware-specific device. This is usually for backwards compatibility in cases when the Kconfig option predates devicetree support in Zephyr. In other cases, there is no Kconfig option, and the devicetree node is used directly in the source code to select a device.

Table 1: Zephyr-specific chosen properties

Property	Purpose
zephyr,bt-c2h-uart	Selects the UART used for host communication in the bluetooth-hci-uart-sample
zephyr,bt-mon-uart	Sets UART device used for the Bluetooth monitor logging
zephyr,bt-hci	Selects the HCI device used by the Bluetooth host stack
zephyr,canbus	Sets the default CAN controller
zephyr,ccm	Core-Coupled Memory node on some STM32 SoCs
zephyr,code-partition	Flash partition that the Zephyr image's text section should be linked into
zephyr,console	Sets UART device used by console driver
zephyr,display	Sets the default display controller
zephyr,keyboard-scan	Sets the default keyboard scan controller
zephyr,dtcm	Data Tightly Coupled Memory node on some Arm SoCs
zephyr,entropy	A device which can be used as a system-wide entropy source
zephyr,flash	A node whose `reg` is sometimes used to set the defaults for `CONFIG_FLASH_BASE_ADDRESS` and `CONFIG_FLASH_SIZE`
zephyr,flash-controller	The node corresponding to the flash controller device for the `zephyr,flash` node
zephyr,gdbstub-uart	Sets UART device used by the *GDB stub* subsystem
zephyr,ieee802154	Used by the networking subsystem to set the IEEE 802.15.4 device
zephyr,ipc	Used by the OpenAMP subsystem to specify the inter-process communication (IPC) device
zephyr,ipc_shm	A node whose `reg` is used by the OpenAMP subsystem to determine the base address and size of the shared memory (SHM) usable for interprocess-communication (IPC)
zephyr,itcm	Instruction Tightly Coupled Memory node on some Arm SoCs
zephyr,log-uart	Sets the UART device(s) used by the logging subsystem's UART backend. If defined, the UART log backend would output to the devices listed in this node.
zephyr,ocm	On-chip memory node on Xilinx Zynq-7000 and ZynqMP SoCs
zephyr,osdp-uart	Sets UART device used by OSDP subsystem
zephyr,ot-uart	Used by the OpenThread to specify UART device for Spinel protocol
zephyr,pcie-controller	The node corresponding to the PCIe Controller
zephyr,ppp-uart	Sets UART device used by PPP
zephyr,settings-partition	Fixed partition node. If defined this selects the partition used by the NVS and FCB settings backends.
zephyr,shell-uart	Sets UART device used by serial shell backend
zephyr,sram	A node whose `reg` sets the base address and size of SRAM memory available to the Zephyr image, used during linking
zephyr,tracing-uart	Sets UART device used by tracing subsystem
zephyr,uart-mcumgr	UART used for *Device Management*
zephyr,uart-pipe	Sets UART device used by serial pipe driver
zephyr,usb-device	USB device node. If defined and has a `vbus-gpios` property, these will be used by the USB subsystem to enable/disable VBUS

Bindings index

This page documents the available devicetree bindings. See *Devicetree bindings* for an introduction to the Zephyr bindings file format.

Vendor index This section contains an index of hardware vendors. Click on a vendor's name to go to the list of bindings for that vendor.

- *Generic or vendor-independent*
- *Advanced Micro Devices (AMD), Inc. (amd)*
- *Altera Corp. (altr)*

- *Zhengzhou Winsen Electronics Technology Co., Ltd. (winsen)*

- *Unknown vendor*

Bindings by vendor This section contains available bindings, grouped by vendor. Within each group, bindings are listed by the "compatible" property they apply to, like this:

Vendor name (vendor prefix)

- <compatible-A>
- <compatible-B> (on <bus-name> bus)
- <compatible-C>
- ...

The text "(on <bus-name> bus)" appears when bindings may behave differently depending on the bus the node appears on. For example, this applies to some sensor device nodes, which may appear as children of either I2C or SPI bus nodes.

5.3 Configuration System (Kconfig)

The Zephyr kernel and subsystems can be configured at build time to adapt them for specific application and platform needs. Configuration is handled through Kconfig, which is the same configuration system used by the Linux kernel. The goal is to support configuration without having to change any source code.

Configuration options (often called *symbols*) are defined in `Kconfig` files, which also specify dependencies between symbols that determine what configurations are valid. Symbols can be grouped into menus and sub-menus to keep the interactive configuration interfaces organized.

The output from Kconfig is a header file `autoconf.h` with macros that can be tested at build time. Code for unused features can be compiled out to save space.

The following sections explain how to set Kconfig configuration options, go into detail on how Kconfig is used within the Zephyr project, and have some tips and best practices for writing `Kconfig` files.

5.3.1 Interactive Kconfig interfaces

There are two interactive configuration interfaces available for exploring the available Kconfig options and making temporary changes: `menuconfig` and `guiconfig`. `menuconfig` is a curses-based interface that runs in the terminal, while `guiconfig` is a graphical configuration interface.

Note

The configuration can also be changed by editing `zephyr/.config` in the application build directory by hand. Using one of the configuration interfaces is often handier, as they correctly handle dependencies between configuration symbols.

If you try to enable a symbol with unsatisfied dependencies in `zephyr/.config`, the assignment will be ignored and overwritten when re-configuring.

To make a setting permanent, you should set it in a `*.conf` file, as described in *Setting Kconfig configuration values*.

Tip

Saving a minimal configuration file (with e.g. `D` in menuconfig) and inspecting it can be handy when making settings permanent. The minimal configuration file only lists symbols that differ from their default value.

To run one of the configuration interfaces, do this:

1. Build your application as usual using either `west` or `cmake`:

   Using west:

   ```
   west build -b <board>
   ```

   Using CMake and ninja:

   ```
   mkdir build && cd build
   cmake -GNinja -DBOARD=<board> ..
   ninja
   ```

2. To run the terminal-based `menuconfig` interface, use either of these commands:

   ```
   west build -t menuconfig
   ```

   ```
   ninja menuconfig
   ```

   To run the graphical `guiconfig`, use either of these commands:

   ```
   west build -t guiconfig
   ```

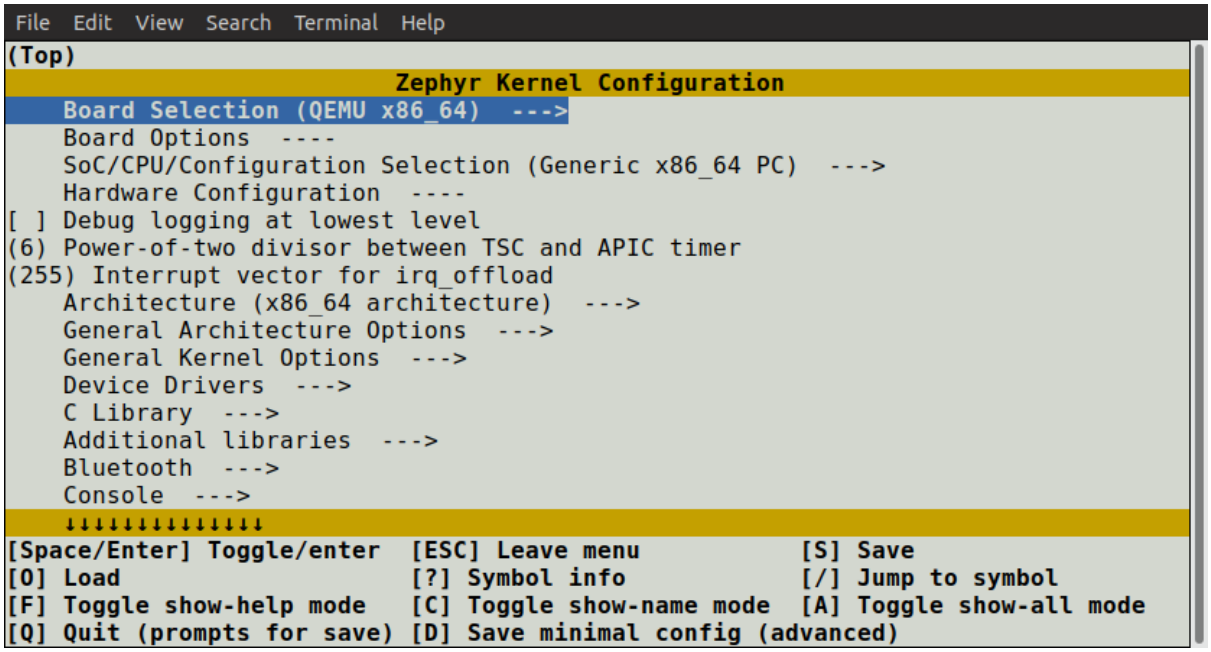
   ```
   ninja guiconfig
   ```

   Note

   If you get an import error for `tkinter` when trying to run `guiconfig`, you are missing required packages. See *Install Linux Host Dependencies*. The package you need is usually called something like `python3-tk`/`python3-tkinter`.

   `tkinter` is not included by default in many Python installations, despite being part of the standard library.

The two interfaces are shown below:



`guiconfig` always shows the help text and other information related to the currently selected item in the bottom window pane. In the terminal interface, press ? to view the same information.

> **Note**
>
> If you prefer to work in the `guiconfig` interface, then it's a good idea to check any changes to Kconfig files you make in *single-menu mode*, which is toggled via a checkbox at the top. Unlike full-tree mode, single-menu mode will distinguish between symbols defined with `config` and symbols defined with `menuconfig`, showing you what things would look like in the `menuconfig` interface.

3. Change configuration values in the `menuconfig` interface as follows:

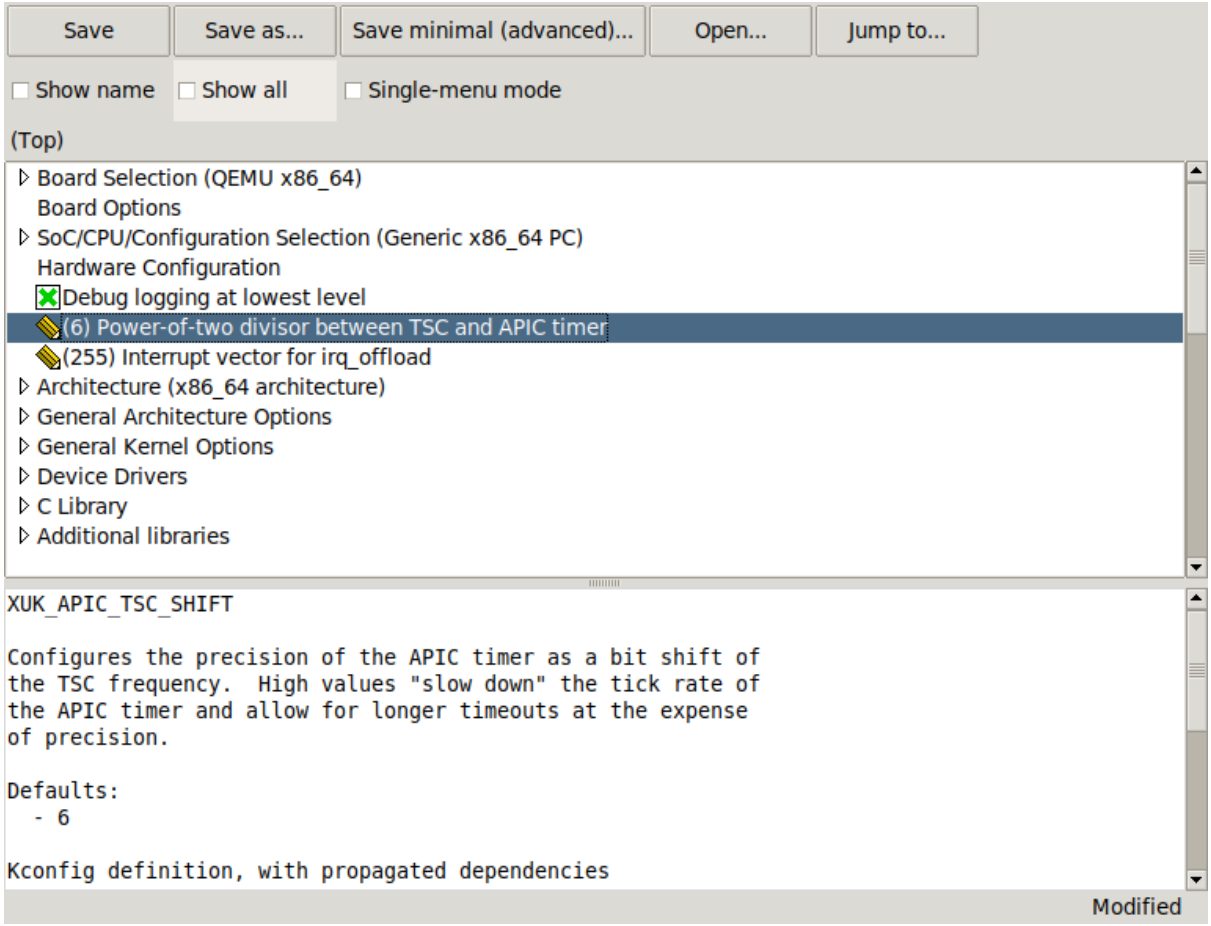
   - Navigate the menu with the arrow keys. Common Vim key bindings are supported as well.
   - Use `Space` and `Enter` to enter menus and toggle values. Menus appear with `--->` next to them. Press `ESC` to return to the parent menu.

     Boolean configuration options are shown with *[ ]* brackets, while numeric and string-valued configuration symbols are shown with *( )* brackets. Symbol values that can't be changed are shown as `-` or `-*-`.

     > **Note**
     >
     > You can also press `Y` or `N` to set a boolean configuration symbol to the corresponding value.

   - Press ? to display information about the currently selected symbol, including its help text. Press `ESC` or `Q` to return from the information display to the menu.

   In the `guiconfig` interface, either click on the image next to the symbol to change its value, or double-click on the row with the symbol (this only works if the symbol has no children, as double-clicking a symbol with children open/closes its menu instead).



`guiconfig` also supports keyboard controls, which are similar to `menuconfig`.

4. Pressing `Q` in the `menuconfig` interface will bring up the save-and-quit dialog (if there are changes to save):

   Press `Y` to save the kernel configuration options to the default filename (`zephyr/.config`). You will typically save to the default filename unless you are experimenting with different configurations.

   The `guiconfig` interface will also prompt for saving the configuration on exit if it has been modified.

> **Note**
>
> The configuration file used during the build is always `zephyr/.config`. If you have another saved configuration that you want to build with, copy it to `zephyr/.config`. Make sure to back up your original configuration file.
>
> Also note that filenames starting with `.` are not listed by `ls` by default on Linux and macOS. Use the `-a` flag to see them.

Finding a symbol in the menu tree and navigating to it can be tedious. To jump directly to a symbol, press the `/` key (this also works in `guiconfig`). This brings up the following dialog, where you can search for symbols by name and jump to them. In `guiconfig`, you can also change symbol values directly within the dialog.

If you jump to a symbol that isn't currently visible (e.g., due to having unsatisfied dependencies), then *show-all mode* will be enabled. In show-all mode, all symbols are displayed, including currently invisible symbols. To turn off show-all mode, press `A` in `menuconfig` or `Ctrl-A` in

```

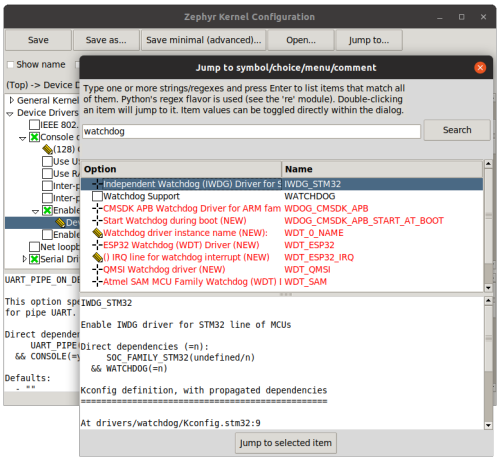
Type text to narrow the search. Regexes are supported (via Python's 're'
module). The up/down cursor keys step in the list. [Enter] jumps to the
selected symbol. [ESC] aborts the search. Type multiple space-separated
strings/regexes to find entries that match all of them. Type Ctrl-F to
view the help of the selected item without leaving the dialog.
```



guiconfig.

> **Note**
>
> Show-all mode can't be turned off if there are no visible items in the current menu.

To figure out why a symbol you jumped to isn't visible, inspect its dependencies, either by pressing ? in menuconfig or in the information pane at the bottom in guiconfig. If you discover that the symbol depends on another symbol that isn't enabled, you can jump to that symbol in turn to see if it can be enabled.

> **Note**
>
> In menuconfig, you can press Ctrl-F to view the help of the currently selected item in the jump-to dialog without leaving the dialog.

For more information on menuconfig and guiconfig, see the Python docstrings at the top of menuconfig.py and guiconfig.py.

5.3.2 Setting Kconfig configuration values

The *menuconfig and guiconfig interfaces* can be used to test out configurations during application development. This page explains how to make settings permanent.

All Kconfig options can be searched in the Kconfig search page.

> **Note**
>
> Before making changes to Kconfig files, it's a good idea to also go through the *Kconfig - Tips and Best Practices* page.

Visible and invisible Kconfig symbols

When making Kconfig changes, it's important to understand the difference between *visible* and *invisible* symbols.

- A visible symbol is a symbol defined with a prompt. Visible symbols show up in the interactive configuration interfaces (hence *visible*), and can be set in configuration files.

  Here's an example of a visible symbol:

  ```
  config FPU
     bool "Support floating point operations"
     depends on HAS_FPU
  ```

  The symbol is shown like this in menuconfig, where it can be toggled:

  ```
  [ ] Support floating point operations
  ```

- An *invisible* symbol is a symbol without a prompt. Invisible symbols are not shown in the interactive configuration interfaces, and users have no direct control over their value. They instead get their value from defaults or from other symbols.

  Here's an example of an invisible symbol:

```
config CPU_HAS_FPU
   bool
   help
     This symbol is y if the CPU has a hardware floating point unit.
```

In this case, CPU_HAS_FPU is enabled through other symbols having `select CPU_HAS_FPU`.

Setting symbols in configuration files

Visible symbols can be configured by setting them in configuration files. The initial configuration is produced by merging a `*_defconfig` file for the board with application settings, usually from `prj.conf`. See *The Initial Configuration* below for more details.

Assignments in configuration files use this syntax:

```
CONFIG_<symbol name>=<value>
```

There should be no spaces around the equals sign.

`bool` symbols can be enabled or disabled by setting them to `y` or `n`, respectively. The `FPU` symbol from the example above could be enabled like this:

```
CONFIG_FPU=y
```

Note

A boolean symbol can also be set to `n` with a comment formatted like this:

```
# CONFIG_SOME_OTHER_BOOL is not set
```

This is the format you will see in the merged configuration in `zephyr/.config`.

This style is accepted for historical reasons: Kconfig configuration files can be parsed as makefiles (though Zephyr doesn't use this). Having `n`-valued symbols correspond to unset variables simplifies tests in Make.

Other symbol types are assigned like this:

```
CONFIG_SOME_STRING="cool value"
CONFIG_SOME_INT=123
```

Comments use a #:

```
# This is a comment
```

Assignments in configuration files are only respected if the dependencies for the symbol are satisfied. A warning is printed otherwise. To figure out what the dependencies of a symbol are, use one of the *interactive configuration interfaces* (you can jump directly to a symbol with /), or look up the symbol in the Kconfig search page.

The Initial Configuration

The initial configuration for an application comes from merging configuration settings from three sources:

1. A `BOARD`-specific configuration file stored in `boards/<VENDOR>/<BOARD>/<BOARD>_defconfig`
2. Any CMake cache entries prefix with `CONFIG_`

3. The application configuration

The application configuration can come from the sources below (each file is known as a Kconfig fragment, which are then merged to get the final configuration used for a particular build). By default, `prj.conf` is used.

1. If `CONF_FILE` is set, the configuration file(s) specified in it are merged and used as the application configuration. `CONF_FILE` can be set in various ways:
   1. In `CMakeLists.txt`, before calling `find_package(Zephyr)`
   2. By passing `-DCONF_FILE=<conf file(s)>`, either directly or via `west`
   3. From the CMake variable cache

   Furthermore if `CONF_FILE` is set as single configuration file of the form `prj_<build>.conf` and if file `boards/<BOARD>_<build>.conf` exists in same folder as file `prj_<build>.conf`, the result of merging `prj_<build>.conf` and `boards/<BOARD>_<build>.conf` is used - note that this feature is deprecated, *File Suffixes* should be used instead.
2. Otherwise, if `boards/<BOARD>.conf` exists in the application configuration directory, the result of merging it with `prj.conf` is used.
3. Otherwise, if board revisions are used and `boards/<BOARD>_<revision>.conf` exists in the application configuration directory, the result of merging it with `prj.conf` and `boards/<BOARD>.conf` is used.
4. Otherwise, `prj.conf` is used from the application configuration directory. If it does not exist then a fatal error will be emitted.

Furthermore, applications can have SoC overlay configuration that is applied to it, the file `socs/<SOC>_<BOARD_QUALIFIERS>.conf` will be applied if it exists, after the main project configuration has been applied and before any board overlay configuration files have been applied.

All configuration files will be taken from the application's configuration directory except for files with an absolute path that are given with the `CONF_FILE`, `EXTRA_CONF_FILE`, `DTC_OVERLAY_FILE`, and `EXTRA_DTC_OVERLAY_FILE` arguments. For these, a file in a Zephyr module can be referred by escaping the Zephyr module dir variable like this `\${ZEPHYR_<module>_MODULE_DIR}/<path-to>/<file>` when setting any of said variables in the application's `CMakeLists.txt`.

See *Application Configuration Directory* on how the application configuration directory is defined.

If a symbol is assigned both in `<BOARD>_defconfig` and in the application configuration, the value set in the application configuration takes precedence.

The merged configuration is saved to `zephyr/.config` in the build directory.

As long as `zephyr/.config` exists and is up-to-date (is newer than any `BOARD` and application configuration files), it will be used in preference to producing a new merged configuration. `zephyr/.config` is also the configuration that gets modified when making changes in the *interactive configuration interfaces*.

Tracking Kconfig symbols

It is possible to create Kconfig symbols which takes the default value of another Kconfig symbol.

This is valuable when you want a symbol specific to an application or subsystem but do not want to rely directly on the common symbol. For example, you might want to decouple the settings so they can be independently configured, or to ensure you always have a locally named setting, even if the external setting name changes. is later changed.

For example, consider the common `FOO_STRING` setting where a subsystem wants to have a `SUB_FOO_STRING` but still allow for customization.

This can be done like this:

```
config FOO_STRING
        string "Foo"
        default "foo"

config SUB_FOO_STRING
        string "Sub-foo"
        default FOO_STRING
```

This ensures that the default value of SUB_FOO_STRING is identical to FOO_STRING while still allows users to configure both settings independently.

It is also possible to make SUB_FOO_STRING invisible and thereby keep the two symbols in sync, unless the value of the tracking symbol is changed in a defconfig file.

```
config FOO_STRING
        string "Foo"
        default "foo"

config SUB_FOO_STRING
        string
        default FOO_STRING
        help
          Hidden symbol which follows FOO_STRING
          Can be changed through *.defconfig files.
```

Configuring invisible Kconfig symbols

When making changes to the default configuration for a board, you might have to configure invisible symbols. This is done in boards/<VENDOR>/<BOARD>/Kconfig.defconfig, which is a regular Kconfig file.

Note

Assignments in .config files have no effect on invisible symbols, so this scheme is not just an organizational issue.

Assigning values in Kconfig.defconfig relies on defining a Kconfig symbol in multiple locations. As an example, say we want to set FOO_WIDTH below to 32:

```
config FOO_WIDTH
    int
```

To do this, we extend the definition of FOO_WIDTH as follows, in Kconfig.defconfig:

```
if BOARD_MY_BOARD

config FOO_WIDTH
    default 32

endif
```

Note

Since the type of the symbol (int) has already been given at the first definition location, it does not need to be repeated here. Only giving the type once at the "base" definition of the symbol is a good idea for reasons explained in *Common Kconfig shorthands*.

`default` values in `Kconfig.defconfig` files have priority over `default` values given on the "base" definition of a symbol. Internally, this is implemented by including the `Kconfig.defconfig` files first. Kconfig uses the first `default` with a satisfied condition, where an empty condition corresponds to `if y` (is always satisfied).

Note that conditions from surrounding top-level `if`s are propagated to symbol properties, so the above `default` is equivalent to `default 32 if BOARD_MY_BOARD`.

Multiple symbol definitions When a symbol is defined in multiple locations, each definition acts as an independent symbol that happens to share the same name. This means that properties are not appended to previous definitions. If the conditions for **ANY** definition result in the symbol resolving to `y`, the symbol will be `y`. It is therefore not possible to make the dependencies of a symbol more restrictive by defining it in multiple locations.

For example, the dependencies of the symbol `FOO` below are satisfied if either `DEP1` **OR** `DEP2` are true, it does not require both:

```
config FOO
   ...
   depends on DEP1

config FOO
   ...
   depends on DEP2
```

Warning

Symbols without explicit dependencies still follow the above rule. A symbol without any dependencies will result in the symbol always being assignable. The definition below will result in `FOO` always being enabled by default, regardless of the value of `DEP1`.

```
config FOO
   bool "FOO"
   depends on DEP1

config FOO
   default y
```

This dependency weakening can be avoided with the *configdefault* extension if the desire is only to add a new default without modifying any other behaviour of the symbol.

Note

When making changes to `Kconfig.defconfig` files, always check the symbol's direct dependencies in one of the *interactive configuration interfaces* afterwards. It is often necessary to repeat dependencies from the base definition of the symbol to avoid weakening a symbol's dependencies.

Motivation for Kconfig.defconfig files One motivation for this configuration scheme is to avoid making fixed `BOARD`-specific settings configurable in the interactive configuration interfaces. If all board configuration were done via `<BOARD>_defconfig`, all symbols would have to be visible, as values given in `<BOARD>_defconfig` have no effect on invisible symbols.

Having fixed settings be user-configurable would clutter up the configuration interfaces and make them harder to understand, and would make it easier to accidentally create broken configurations.

When dealing with fixed board-specific settings, also consider whether they should be handled via *devicetree* instead.

Configuring choices There are two ways to configure a Kconfig `choice`:

1. By setting one of the choice symbols to `y` in a configuration file.

   Setting one choice symbol to `y` automatically gives all other choice symbols the value `n`.

   If multiple choice symbols are set to `y`, only the last one set to `y` will be honored (the rest will get the value `n`). This allows a choice selection from a board `defconfig` file to be overridden from an application `prj.conf` file.

2. By changing the `default` of the choice in `Kconfig.defconfig`.

   As with symbols, changing the default for a choice is done by defining the choice in multiple locations. For this to work, the choice must have a name.

   As an example, assume that a choice has the following base definition (here, the name of the choice is `FOO`):

   ```
   choice FOO
       bool "Foo choice"
       default B

   config A
       bool "A"

   config B
       bool "B"

   endchoice
   ```

   To change the default symbol of `FOO` to `A`, you would add the following definition to `Kconfig.defconfig`:

   ```
   choice FOO
       default A
   endchoice
   ```

The `Kconfig.defconfig` method should be used when the dependencies of the choice might not be satisfied. In that case, you're setting the default selection whenever the user makes the choice visible.

More Kconfig resources The *Kconfig - Tips and Best Practices* page has some tips for writing Kconfig files.

The kconfiglib.py docstring (at the top of the file) goes over how symbol values are calculated in detail.

5.3.3 Kconfig - Tips and Best Practices

This page covers some Kconfig best practices and explains some Kconfig behaviors and features that might be cryptic or that are easily overlooked.

What to turn into Kconfig options

When deciding whether something belongs in Kconfig, it helps to distinguish between symbols that have prompts and symbols that don't.

If a symbol has a prompt (e.g. `bool "Enable foo"`), then the user can change the symbol's value in the `menuconfig` or `guiconfig` interface (see *Interactive Kconfig interfaces*), or by manually editing configuration files. Conversely, a symbol without a prompt can never be changed directly by the user, not even by manually editing configuration files.

Only put a prompt on a symbol if it makes sense for the user to change its value.

Symbols without prompts are called *hidden* or *invisible* symbols, because they don't show up in `menuconfig` and `guiconfig`. Symbols that have prompts can also be invisible, when their dependencies are not satisfied.

Symbols without prompts can't be configured directly by the user (they derive their value from other symbols), so less restrictions apply to them. If some derived setting is easier to calculate in Kconfig than e.g. during the build, then do it in Kconfig, but keep the distinction between symbols with and without prompts in mind.

See the *optional prompts* section for a way to deal with settings that are fixed on some machines and configurable on other machines.

What not to turn into Kconfig options

In Zephyr, Kconfig configuration is done after selecting a target board. In general, it does not make sense to use Kconfig for a value that corresponds to a fixed machine-specific setting. Usually, such settings should be handled via *devicetree* instead.

In particular, avoid adding new Kconfig options of the following types:

Options that specify a device in the system by name For example, if you are writing an I2C device driver, avoid creating an option named `MY_DEVICE_I2C_BUS_NAME` for specifying the bus node your device is controlled by. See *Device drivers that depend on other devices* for alternatives.

Similarly, if your application depends on a hardware-specific PWM device to control an RGB LED, avoid creating an option like `MY_PWM_DEVICE_NAME`. See *Applications that depend on board-specific devices* for alternatives.

Options that specify fixed hardware configuration For example, avoid Kconfig options specifying a GPIO pin.

An alternative applicable to device drivers is to define a GPIO specifier with type phandle-array in the device binding, and using the *GPIO* devicetree API from C. Similar advice applies to other cases where devicetree.h provides *Hardware specific APIs* for referring to other nodes in the system. Search the source code for drivers using these APIs for examples.

An application-specific devicetree *binding* to identify board specific properties may be appropriate. See tests/drivers/gpio/gpio_basic_api for an example.

For applications, see blinky for a devicetree-based alternative.

`select` statements

The `select` statement is used to force one symbol to `y` whenever another symbol is `y`. For example, the following code forces `CONSOLE` to `y` whenever `USB_CONSOLE` is `y`:

```
config CONSOLE
     bool "Console support"

...

config USB_CONSOLE
     bool "USB console support"
     select CONSOLE
```

This section covers some pitfalls and good uses for `select`.

`select` pitfalls `select` might seem like a generally useful feature at first, but can cause configuration issues if overused.

For example, say that a new dependency is added to the `CONSOLE` symbol above, by a developer who is unaware of the `USB_CONSOLE` symbol (or simply forgot about it):

```
config CONSOLE
     bool "Console support"
     depends on STRING_ROUTINES
```

Enabling `USB_CONSOLE` now forces `CONSOLE` to `y`, even if `STRING_ROUTINES` is `n`.

To fix the problem, the `STRING_ROUTINES` dependency needs to be added to `USB_CONSOLE` as well:

```
config USB_CONSOLE
     bool "USB console support"
     select CONSOLE
     depends on STRING_ROUTINES

...

config STRING_ROUTINES
     bool "Include string routines"
```

More insidious cases with dependencies inherited from `if` and `menu` statements are common.

An alternative attempt to solve the issue might be to turn the `depends on` into another `select`:

```
config CONSOLE
     bool "Console support"
     select STRING_ROUTINES

...

config USB_CONSOLE
     bool "USB console support"
     select CONSOLE
```

In practice, this often amplifies the problem, because any dependencies added to `STRING_ROUTINES` now need to be copied to both `CONSOLE` and `USB_CONSOLE`.

In general, whenever the dependencies of a symbol are updated, the dependencies of all symbols that (directly or indirectly) select it have to be updated as well. This is very often overlooked in practice, even for the simplest case above.

Chains of symbols selecting each other should be avoided in particular, except for simple helper symbols, as covered below in *Using select for helper symbols*.

Liberal use of `select` also tends to make Kconfig files harder to read, both due to the extra dependencies and due to the non-local nature of `select`, which hides ways in which a symbol might get enabled.

Alternatives to `select` For the example in the previous section, a better solution is usually to turn the `select` into a `depends on`:

```
config CONSOLE
     bool "Console support"

...

config USB_CONSOLE
     bool "USB console support"
     depends on CONSOLE
```

This makes it impossible to generate an invalid configuration, and means that dependencies only ever have to be updated in a single spot.

An objection to using `depends on` here might be that configuration files that enable `USB_CONSOLE` now also need to enable `CONSOLE`:

```
CONFIG_CONSOLE=y
CONFIG_USB_CONSOLE=y
```

This comes down to a trade-off, but if enabling `CONSOLE` is the norm, then a mitigation is to make `CONSOLE` default to `y`:

```
config CONSOLE
     bool "Console support"
     default y
```

This gives just a single assignment in configuration files:

```
CONFIG_USB_CONSOLE=y
```

Note that configuration files that do not want `CONSOLE` enabled now have to explicitly disable it:

```
CONFIG_CONSOLE=n
```

Using `select` for helper symbols A good and safe use of `select` is for setting "helper" symbols that capture some condition. Such helper symbols should preferably have no prompt or dependencies.

For example, a helper symbol for indicating that a particular CPU/SoC has an FPU could be defined as follows:

```
config CPU_HAS_FPU
     bool
     help
       If y, the CPU has an FPU

...

config SOC_FOO
     bool "FOO SoC"
     select CPU_HAS_FPU

...

config SOC_BAR
     bool "BAR SoC"
     select CPU_HAS_FPU
```

This makes it possible for other symbols to check for FPU support in a generic way, without having to look for particular architectures:

```
config FPU
     bool "Support floating point operations"
     depends on CPU_HAS_FPU
```

The alternative would be to have dependencies like the following, possibly duplicated in several spots:

```
config FPU
     bool "Support floating point operations"
     depends on SOC_FOO || SOC_BAR || ...
```

Invisible helper symbols can also be useful without `select`. For example, the following code defines a helper symbol that has the value `y` if the machine has some arbitrarily-defined "large" amount of memory:

```
config LARGE_MEM
     def_bool MEM_SIZE >= 64
```

Note

This is short for the following:

```
config LARGE_MEM
  bool
  default MEM_SIZE >= 64
```

`select` recommendations In summary, here are some recommended practices for `select`:

- Avoid selecting symbols with prompts or dependencies. Prefer `depends on`. If `depends on` causes annoying bloat in configuration files, consider adding a Kconfig default for the most common value.

  Rare exceptions might include cases where you're sure that the dependencies of the selecting and selected symbol will never drift out of sync, e.g. when dealing with two simple symbols defined close to one another within the same `if`.

  Common sense applies, but be aware that `select` often causes issues in practice. `depends on` is usually a cleaner and safer solution.

- Select simple helper symbols without prompts and dependencies however much you like. They're a great tool for simplifying Kconfig files.

- An exemption are buses like I2C and SPI, and following the same thought process things like MFD as well. Drivers on these buses should use `select` to allow the automatic activation of the necessary bus drivers when devices on the bus are enabled in the devicetree.

```
config ADC_FOO
   bool "external SPI ADC foo driver"
   select SPI
```

(Lack of) conditional includes

`if` blocks add dependencies to each item within the `if`, as if `depends on` was used.

A common misunderstanding related to `if` is to think that the following code conditionally includes the file `Kconfig.other`:

```
if DEP
source "Kconfig.other"
endif
```

In reality, there are no conditional includes in Kconfig. `if` has no special meaning around a `source`.

Note

Conditional includes would be impossible to implement, because `if` conditions may contain (either directly or indirectly) forward references to symbols that haven't been defined yet.

Say that `Kconfig.other` above contains this definition:

```
config FOO
     bool "Support foo"
```

In this case, `FOO` will end up with this definition:

```
config FOO
     bool "Support foo"
     depends on DEP
```

Note that it is redundant to add `depends on DEP` to the definition of `FOO` in `Kconfig.other`, because the `DEP` dependency has already been added by `if DEP`.

In general, try to avoid adding redundant dependencies. They can make the structure of the Kconfig files harder to understand, and also make changes more error-prone, since it can be hard to spot that the same dependency is added twice.

"Stuck" symbols in menuconfig and guiconfig

There is a common subtle gotcha related to interdependent configuration symbols with prompts. Consider these symbols:

```
config FOO
     bool "Foo"

config STACK_SIZE
     hex "Stack size"
     default 0x200 if FOO
     default 0x100
```

Assume that the intention here is to use a larger stack whenever `FOO` is enabled, and that the configuration initially has `FOO` disabled. Also, remember that Zephyr creates an initial configuration in `zephyr/.config` in the build directory by merging configuration files (including e.g. `prj.conf`). This configuration file exists before `menuconfig` or `guiconfig` is run.

When first entering the configuration interface, the value of `STACK_SIZE` is 0x100, as expected. After enabling `FOO`, you might reasonably expect the value of `STACK_SIZE` to change to 0x200, but it stays as 0x100.

To understand what's going on, remember that `STACK_SIZE` has a prompt, meaning it is user-configurable, and consider that all Kconfig has to go on from the initial configuration is this:

```
CONFIG_STACK_SIZE=0x100
```

Since Kconfig can't know if the 0x100 value came from a `default` or was typed in by the user, it has to assume that it came from the user. Since `STACK_SIZE` is user-configurable, the value from the configuration file is respected, and any symbol defaults are ignored. This is why the value of `STACK_SIZE` appears to be "frozen" at 0x100 when toggling `FOO`.

The right fix depends on what the intention is. Here's some different scenarios with suggestions:

- If `STACK_SIZE` can always be derived automatically and does not need to be user-configurable, then just remove the prompt:

  ```
  config STACK_SIZE
     hex
     default 0x200 if FOO
     default 0x100
  ```

  Symbols without prompts ignore any value from the saved configuration.

- If STACK_SIZE should usually be user-configurable, but needs to be set to 0x200 when FOO is enabled, then disable its prompt when FOO is enabled, as described in *optional prompts*:

```
config STACK_SIZE
   hex "Stack size" if !FOO
   default 0x200 if FOO
   default 0x100
```

- If STACK_SIZE should usually be derived automatically, but needs to be set to a custom value in rare circumstances, then add another option for making STACK_SIZE user-configurable:

```
config CUSTOM_STACK_SIZE
   bool "Use a custom stack size"
   help
     Enable this if you need to use a custom stack size. When disabled, a
     suitable stack size is calculated automatically.

config STACK_SIZE
   hex "Stack size" if CUSTOM_STACK_SIZE
   default 0x200 if FOO
   default 0x100
```

  As long as CUSTOM_STACK_SIZE is disabled, STACK_SIZE will ignore the value from the saved configuration.

It is a good idea to try out changes in the menuconfig or guiconfig interface, to make sure that things behave the way you expect. This is especially true when making moderately complex changes like these.

Assignments to promptless symbols in configuration files

Assignments to hidden (promptless, also called *invisible*) symbols in configuration files are always ignored. Hidden symbols get their value indirectly from other symbols, via e.g. default and select.

A common source of confusion is opening the output configuration file (zephyr/.config), seeing a bunch of assignments to hidden symbols, and assuming that those assignments must be respected when the configuration is read back in by Kconfig. In reality, all assignments to hidden symbols in zephyr/.config are ignored by Kconfig, like for other configuration files.

To understand why zephyr/.config still includes assignments to hidden symbols, it helps to realize that zephyr/.config serves two separate purposes:

1. It holds the saved configuration, and
2. it holds configuration output. zephyr/.config is parsed by the CMake files to let them query configuration settings, for example.

The assignments to hidden symbols in zephyr/.config are just configuration output. Kconfig itself ignores assignments to hidden symbols when calculating symbol values.

Note

A *minimal configuration*, which can be generated from within the *menuconfig and guiconfig interfaces*, could be considered closer to just a saved configuration, without the full configuration output.

depends on and string/int/hex symbols

depends on works not just for bool symbols, but also for string, int, and hex symbols (and for choices).

The Kconfig definitions below will hide the FOO_DEVICE_FREQUENCY symbol and disable any configuration output for it when FOO_DEVICE is disabled.

```
config FOO_DEVICE
     bool "Foo device"

config FOO_DEVICE_FREQUENCY
     int "Foo device frequency"
     depends on FOO_DEVICE
```

In general, it's a good idea to check that only relevant symbols are ever shown in the menuconfig/guiconfig interface. Having FOO_DEVICE_FREQUENCY show up when FOO_DEVICE is disabled (and possibly hidden) makes the relationship between the symbols harder to understand, even if code never looks at FOO_DEVICE_FREQUENCY when FOO_DEVICE is disabled.

menuconfig symbols

If the definition of a symbol FOO is immediately followed by other symbols that depend on FOO, then those symbols become children of FOO. If FOO is defined with config FOO, then the children are shown indented relative to FOO. Defining FOO with menuconfig FOO instead puts the children in a separate menu rooted at FOO.

menuconfig has no effect on evaluation. It's just a display option.

menuconfig can cut down on the number of menus and make the menu structure easier to navigate. For example, say you have the following definitions:

```
menu "Foo subsystem"

config FOO_SUBSYSTEM
     bool "Foo subsystem"

if FOO_SUBSYSTEM

config FOO_FEATURE_1
     bool "Foo feature 1"

config FOO_FEATURE_2
     bool "Foo feature 2"

config FOO_FREQUENCY
     int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM

endmenu
```

In this case, it's probably better to get rid of the menu and turn FOO_SUBSYSTEM into a menuconfig symbol:

```
menuconfig FOO_SUBSYSTEM
     bool "Foo subsystem"

if FOO_SUBSYSTEM
```

(continues on next page)

(continued from previous page)

```
config FOO_FEATURE_1
     bool "Foo feature 1"

config FOO_FEATURE_2
     bool "Foo feature 2"

config FOO_FREQUENCY
     int "Foo frequency"

... lots of other FOO-related symbols

endif # FOO_SUBSYSTEM
```

In the `menuconfig` interface, this will be displayed as follows:

```
[*] Foo subsystem  --->
```

Note that making a symbol without children a `menuconfig` is meaningless. It should be avoided, because it looks identical to a symbol with all children invisible:

```
[*] I have no children  ----
[*] All my children are invisible  ----
```

Commas in macro arguments

Kconfig uses commas to separate macro arguments. This means a construct like this will fail:

```
config FOO
    bool
    default y if $(dt_chosen_enabled,"zephyr,bar")
```

To solve this problem, create a variable with the text and use this variable as argument, as follows:

```
DT_CHOSEN_ZEPHYR_BAR := zephyr,bar

config FOO
    bool
    default y if $(dt_chosen_enabled,$(DT_CHOSEN_ZEPHYR_BAR))
```

Checking changes in menuconfig/guiconfig

When adding new symbols or making other changes to Kconfig files, it is a good idea to look up the symbols in *menuconfig or guiconfig* afterwards. To get to a symbol quickly, use the jump-to feature (press /).

Here are some things to check:

- Are the symbols placed in a good spot? Check that they appear in a menu where they make sense, close to related symbols.

  If one symbol depends on another, then it's often a good idea to place it right after the symbol it depends on. It will then be shown indented relative to the symbol it depends on in the `menuconfig` interface, and in a separate menu rooted at the symbol in `guiconfig`. This also works if several symbols are placed after the symbol they depend on.

- Is it easy to guess what the symbols do from their prompts?

- If many symbols are added, do all combinations of values they can be set to make sense?

  For example, if two symbols FOO_SUPPORT and NO_FOO_SUPPORT are added, and both can be enabled at the same time, then that makes a nonsensical configuration. In this case, it's probably better to have a single FOO_SUPPORT symbol.

- Are there any duplicated dependencies?

  This can be checked by selecting a symbol and pressing ? to view the symbol information. If there are duplicated dependencies, then use the `Included via ...` path shown in the symbol information to figure out where they come from.

Checking changes with scripts/kconfig/lint.py

After you make Kconfig changes, you can use the scripts/kconfig/lint.py script to check for some potential issues, like unused symbols and symbols that are impossible to enable. Use `--help` to see available options.

Some checks are necessarily a bit heuristic, so a symbol being flagged by a check does not necessarily mean there's a problem. If a check returns a false positive e.g. due to token pasting in C (CONFIG_FOO_##index##_BAR), just ignore it.

When investigating an unknown symbol FOO_BAR, it is a good idea to run `git grep FOO_BAR` to look for references. It is also a good idea to search for some components of the symbol name with e.g. `git grep FOO` and `git grep BAR`, as it can help uncover token pasting.

Style recommendations and shorthands

This section gives some style recommendations and explains some common Kconfig shorthands.

Factoring out common dependencies If a sequence of symbols/choices share a common dependency, the dependency can be factored out with an `if`.

As an example, consider the following code:

```
config FOO
     bool "Foo"
     depends on DEP

config BAR
     bool "Bar"
     depends on DEP

choice
     prompt "Choice"
     depends on DEP

config BAZ
     bool "Baz"

config QAZ
     bool "Qaz"

endchoice
```

Here, the DEP dependency can be factored out like this:

```
if DEP

config FOO
     bool "Foo"

config BAR
     bool "Bar"

choice
     prompt "Choice"

config BAZ
     bool "Baz"

config QAZ
     bool "Qaz"

endchoice

endif # DEP
```

Note

Internally, the second version of the code is transformed into the first.

If a sequence of symbols/choices with shared dependencies are all in the same menu, the dependency can be put on the menu itself:

```
menu "Foo features"
     depends on FOO_SUPPORT

config FOO_FEATURE_1
     bool "Foo feature 1"

config FOO_FEATURE_2
     bool "Foo feature 2"

endmenu
```

If `FOO_SUPPORT` is `n`, the entire menu disappears.

Redundant defaults `bool` symbols implicitly default to `n`, and `string` symbols implicitly default to the empty string. Therefore, `default n` and `default ""` are (almost) always redundant.

The recommended style in Zephyr is to skip redundant defaults for `bool` and `string` symbols. That also generates clearer documentation: (*Implicitly defaults to n* instead of *n if <dependencies, possibly inherited>*).

Defaults *should* always be given for `int` and `hex` symbols, however, as they implicitly default to the empty string. This is partly for compatibility with the C Kconfig tools, though an implicit 0 default might be less likely to be what was intended compared to other symbol types as well.

The one case where `default n`/`default ""` is not redundant is when defining a symbol in multiple locations and wanting to override e.g. a `default y` on a later definition. Note that a `default n` does not override a previously defined `default y`.

That is, FOO will be set to `n` in the example below. If the `default n` was omitted in the first definition, FOO would have been set to `y`.

```
config FOO
   bool "foo"
   default n

config FOO
   bool "foo"
   default y
```

In the following example FOO will get the value y.

```
config FOO
   bool "foo"
   default y

config FOO
   bool "foo"
   default n
```

Common Kconfig shorthands Kconfig has two shorthands that deal with prompts and defaults.

- `<type> "prompt"` is a shorthand for giving a symbol/choice a type and a prompt at the same time. These two definitions are equal:

```
config FOO
   bool "foo"
```

```
config FOO
   bool
   prompt "foo"
```

  The first style, with the shorthand, is preferred in Zephyr.

- `def_<type> <value>` is a shorthand for giving a type and a value at the same time. These two definitions are equal:

```
config FOO
   def_bool BAR && BAZ
```

```
config FOO
   bool
   default BAR && BAZ
```

Using both the `<type> "prompt"` and the `def_<type> <value>` shorthand in the same definition is redundant, since it gives the type twice.

The `def_<type> <value>` shorthand is generally only useful for symbols without prompts, and somewhat obscure.

Note

For a symbol defined in multiple locations (e.g., in a `Kconfig.defconfig` file in Zephyr), it is best to only give the symbol type for the "base" definition of the symbol, and to use `default` (instead of `def_<type> value`) for the remaining definitions. That way, if the base definition of the symbol is removed, the symbol ends up without a type, which generates a warning that points to the other definitions. That makes the extra definitions easier to discover and remove.

Prompt strings For a Kconfig symbol that enables a driver/subsystem FOO, consider having just "Foo" as the prompt, instead of "Enable Foo support" or the like. It will usually be clear in the context of an option that can be toggled on/off, and makes things consistent.

Header comments and other nits A few formatting nits, to help keep things consistent:

- Use this format for any header comments at the top of `Kconfig` files:

```
# <Overview of symbols defined in the file, preferably in plain English>
(Blank line)
# Copyright (c) 2019 ...
# SPDX-License-Identifier: <License>
(Blank line)
(Kconfig definitions)
```

- Format comments as `# Comment` rather than `#Comment`
- Put a blank line before/after each top-level `if` and `endif`
- Use a single tab for each indentation
- Indent help text with two extra spaces

Lesser-known/used Kconfig features

This section lists some more obscure Kconfig behaviors and features that might still come in handy.

The `imply` statement The `imply` statement is similar to `select`, but respects dependencies and doesn't force a value. For example, the following code could be used to enable USB keyboard support by default on the FOO SoC, while still allowing the user to turn it off:

```
config SOC_FOO
     bool "FOO SoC"
     imply USB_KEYBOARD

...

config USB_KEYBOARD
     bool "USB keyboard support"
```

`imply` acts like a suggestion, whereas `select` forces a value.

Optional prompts A condition can be put on a symbol's prompt to make it optionally configurable by the user. For example, a value `MASK` that's hardcoded to 0xFF on some boards and configurable on others could be expressed as follows:

```
config MASK
     hex "Bitmask" if HAS_CONFIGURABLE_MASK
     default 0xFF
```

Note

This is short for the following:

```
config MASK
  hex
  prompt "Bitmask" if HAS_CONFIGURABLE_MASK
  default 0xFF
```

The HAS_CONFIGURABLE_MASK helper symbol would get selected by boards to indicate that MASK is configurable. When MASK is configurable, it will also default to 0xFF.

Optional choices Defining a choice with the optional keyword allows the whole choice to be toggled off to select none of the symbols:

```
choice
     prompt "Use legacy protocol"
     optional

config LEGACY_PROTOCOL_1
     bool "Legacy protocol 1"

config LEGACY_PROTOCOL_2
     bool "Legacy protocol 2"

endchoice
```

In the menuconfig interface, this will be displayed e.g. as [*] Use legacy protocol (Legacy protocol 1) --->, where the choice can be toggled off to enable neither of the symbols.

visible if conditions Putting a visible if condition on a menu hides the menu and all the symbols within it, while still allowing symbol default values to kick in.

As a motivating example, consider the following code:

```
menu "Foo subsystem"
     depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_1
     int "Foo setting 1"
     default 1

config FOO_SETTING_2
     int "Foo setting 2"
     default 2

endmenu
```

When HAS_CONFIGURABLE_FOO is n, no configuration output is generated for FOO_SETTING_1 and FOO_SETTING_2, as the code above is logically equivalent to the following code:

```
config FOO_SETTING_1
     int "Foo setting 1"
     default 1
     depends on HAS_CONFIGURABLE_FOO

config FOO_SETTING_2
     int "Foo setting 2"
     default 2
     depends on HAS_CONFIGURABLE_FOO
```

If we want the symbols to still get their default values even when HAS_CONFIGURABLE_FOO is n, but not be configurable by the user, then we can use visible if instead:

```
menu "Foo subsystem"
     visible if HAS_CONFIGURABLE_FOO
```

(continues on next page)

(continued from previous page)

```
config FOO_SETTING_1
     int "Foo setting 1"
     default 1

config FOO_SETTING_2
     int "Foo setting 2"
     default 2

endmenu
```

This is logically equivalent to the following:

```
config FOO_SETTING_1
     int "Foo setting 1" if HAS_CONFIGURABLE_FOO
     default 1

config FOO_SETTING_2
     int "Foo setting 2" if HAS_CONFIGURABLE_FOO
     default 2
```

Note

See the *optional prompts* section for the meaning of the conditions on the prompts.

When `HAS_CONFIGURABLE_FOO` is `n`, we now get the following configuration output for the symbols, instead of no output:

```
...
CONFIG_FOO_SETTING_1=1
CONFIG_FOO_SETTING_2=2
...
```

Other resources

The *Intro to symbol values* section in the Kconfiglib docstring goes over how symbols values are calculated in more detail.

5.3.4 Custom Kconfig Preprocessor Functions

Kconfiglib supports custom Kconfig preprocessor functions written in Python. These functions are defined in scripts/kconfig/kconfigfunctions.py.

Note

The official Kconfig preprocessor documentation can be found here.

Most of the custom preprocessor functions are used to get devicetree information into Kconfig. For example, the default value of a Kconfig symbol can be fetched from a devicetree `reg` property.

Devicetree-related Functions

The functions listed below are used to get devicetree information into Kconfig. See the Python docstrings in scripts/kconfig/kconfigfunctions.py for detailed documentation.

The `*_int` version of each function returns the value as a decimal integer, while the `*_hex` version returns a hexadecimal value starting with `0x`.

```
$(dt_alias_enabled,<node alias>)
$(dt_chosen_bool_prop, <property in /chosen>, <prop>)
$(dt_chosen_enabled,<property in /chosen>)

$(substring,<string>,<start>[,<stop>])
```

Example Usage Assume that the devicetree for some board looks like this:

```
{
     soc {
             #address-cells = <1>;
             #size-cells = <1>;

             spi0: spi@10014000 {
                     compatible = "sifive,spi0";
                     reg = <0x10014000 0x1000 0x20010000 0x3c0900>;
                     reg-names = "control", "mem";
                     ...
             };
};
```

The second entry in `reg` in `spi@1001400` (`<0x20010000 0x3c0900>`) corresponds to `mem`, and has the address `0x20010000`. This address can be inserted into Kconfig as follows:

```
config FLASH_BASE_ADDRESS
     default $(dt_node_reg_addr_hex,/soc/spi@1001400,1)
```

After preprocessor expansion, this turns into the definition below:

```
config FLASH_BASE_ADDRESS
     default 0x20010000
```

5.3.5 Kconfig extensions

Zephyr uses the Kconfiglib implementation of Kconfig, which includes some Kconfig extensions:

- Default values can be applied to existing symbols without *weakening* the symbols dependencies through the use of `configdefault`.

  ```
  config FOO
      bool "FOO"
      depends on BAR

  configdefault FOO
      default y if FIZZ
  ```

  The statement above is equivalent to:

  ```
  config FOO
      bool "Foo"
      default y if FIZZ
      depends on BAR
  ```

  `configdefault` symbols cannot contain any fields other than `default`, however they can be wrapped in `if` statements. The two statements below are equivalent:

  ```
  configdefault FOO
      default y if BAR

  if BAR
  configdefault FOO
      default y
  endif # BAR
  ```

- Environment variables in `source` statements are expanded directly, meaning no "bounce" symbols with `option env="ENV_VAR"` need to be defined.

> **Note**
>
> `option env` has been removed from the C tools as of Linux 4.18 as well.

The recommended syntax for referencing environment variables is `$(FOO)` rather than `$FOO`. This uses the new Kconfig preprocessor. The `$FOO` syntax for expanding environment variables is only supported for backwards compatibility.

- The `source` statement supports glob patterns and includes each matching file. A pattern is required to match at least one file.

  Consider the following example:

```
source "foo/bar/*/Kconfig"
```

  If the pattern `foo/bar/*/Kconfig` matches the files `foo/bar/baz/Kconfig` and `foo/bar/qaz/Kconfig`, the statement above is equivalent to the following two `source` statements:

```
source "foo/bar/baz/Kconfig"
source "foo/bar/qaz/Kconfig"
```

  If no files match the pattern, an error is generated.

  The wildcard patterns accepted are the same as for the Python glob module.

  For cases where it's okay for a pattern to match no files (or for a plain filename to not exist), a separate `osource` (*optional source*) statement is available. `osource` is a no-op if no file matches.

> **Note**
>
> `source` and `osource` are analogous to `include` and `-include` in Make.

- An `rsource` statement is available for including files specified with a relative path. The path is relative to the directory of the `Kconfig` file that contains the `rsource` statement.

  As an example, assume that `foo/Kconfig` is the top-level `Kconfig` file, and that `foo/bar/Kconfig` has the following statements:

```
source "qaz/Kconfig1"
rsource "qaz/Kconfig2"
```

  This will include the two files `foo/qaz/Kconfig1` and `foo/bar/qaz/Kconfig2`.

  `rsource` can be used to create `Kconfig` "subtrees" that can be moved around freely.

  `rsource` also supports glob patterns.

  A drawback of `rsource` is that it can make it harder to figure out where a file gets included, so only use it if you need it.

- An `orsource` statement is available that combines `osource` and `rsource`.

  For example, the following statement will include `Kconfig1` and `Kconfig2` from the current directory (if they exist):

```
orsource "Kconfig[12]"
```

- `def_int`, `def_hex`, and `def_string` keywords are available, analogous to `def_bool`. These set the type and add a `default` at the same time.

Users interested in optimizing their configuration for security should refer to the Zephyr Security Guide's section on the *Hardening Tool*.

5.4 Snippets

Snippets are a way to save build system settings in one place, and then use those settings when you build any Zephyr application. This lets you save common configuration separately when it applies to multiple different applications.

Some example use cases for snippets are:

- changing your board's console backend from a "real" UART to a USB CDC-ACM UART
- enabling frequently-used debugging options
- applying interrelated configuration settings to your "main" CPU and a co-processor core on an AMP SoC

The following pages document this feature.

5.4.1 Using Snippets

> **Tip**
>
> See *Built-in snippets* for a list of snippets that are provided by Zephyr.

Snippets have names. You use snippets by giving their names to the build system.

With west build

To use a snippet named `foo` when building an application `app`:

```
west build -S foo app
```

To use multiple snippets:

```
west build -S snippet1 -S snippet2 [...] app
```

With cmake

If you are running CMake directly instead of using `west build`, use the `SNIPPET` variable. This is a whitespace- or semicolon-separated list of snippet names you want to use. For example:

```
cmake -Sapp -Bbuild -DSNIPPET="snippet1;snippet2" [...]
cmake --build build
```

Application required snippets

If an application should always be compiled with a given snippet, it can be added to that application's `CMakeLists.txt` file. For example:

```
if(NOT snippet1 IN_LIST SNIPPET)
  set(SNIPPET snippet1 ${SNIPPET} CACHE STRING "" FORCE)
endif()

find_package(Zephyr ....)
```

5.4.2 Built-in snippets

CDC-ACM Console Snippet (cdc-acm-console)

```
west build -S cdc-acm-console [...]
```

Overview This snippet redirects serial console output to a CDC ACM UART. The USB device which should be used is configured using *Devicetree*.

Requirements Hardware support for:

- CONFIG_USB_DEVICE_STACK
- CONFIG_SERIAL
- CONFIG_CONSOLE
- CONFIG_UART_CONSOLE
- CONFIG_UART_LINE_CTRL

A devicetree node with node label zephyr_udc0 that points to an enabled USB device node with driver support. This should look roughly like this in *your devicetree*:

```
zephyr_udc0: usbd@deadbeef {
     compatible = "vnd,usb-device";
     /* ... */
};
```

Nordic FLPR snippet with execution in place (nordic-flpr-xip)

Overview This snippet allows users to build Zephyr with the capability to boot Nordic FLPR (Fast Lightweight Peripheral Processor) from application core. FLPR code is to be executed from RRAM, so the FLPR image must be built for the xip board variant, or with CONFIG_XIP enabled.

Nordic FLPR snippet with execution from SRAM (nordic-flpr)

Overview This snippet allows users to build Zephyr with the capability to boot Nordic FLPR (Fast Lightweight Peripheral Processor) from application core. FLPR code is to be executed from SRAM, so the FLPR image must be built without the xip board variant, or with CONFIG_XIP disabled.

Nordic boot PPR snippet with execution in place (nordic-ppr-xip)

Overview This snippet allows users to build Zephyr with the capability to boot Nordic PPR (Peripheral Processor) from another core. PPR code is to be executed from MRAM, so the PPR image must be built for the xip board variant, or with CONFIG_XIP enabled.

Nordic PPR snippet (nordic-ppr)

Overview This snippet allows users to build Zephyr with the capability to boot Nordic PPR (Peripheral Processor) from another core.

NUS Console Snippet (nus-console)

```
west build -S nus-console [...]
```

Overview This snippet redirects serial console output to a UART over NUS (Bluetooth LE) instance. The Bluetooth Serial device used shall be configured using *Devicetree*.

Requirements Hardware support for:

- CONFIG_BT
- CONFIG_BT_PERIPHERAL
- CONFIG_BT_ZEPHYR_NUS
- CONFIG_SERIAL
- CONFIG_CONSOLE
- CONFIG_UART_CONSOLE

RAM Console Snippet (ram-console)

```
west build -S ram-console [...]
```

Overview This snippet redirects console output to a RAM buffer. The RAM console buffer is a global array located in RAM region by default, whose address is unknown before building. The RAM console driver also supports using a dedicated section for the RAM console buffer with prefined address.

How to enable RAM console buffer section Add board dts overlay to this snippet to add property `zephyr,ram-console` in the chosen node and memory-region node with compatible string `zephyr,memory-region` as the following:

```
/ {
    chosen {
        zephyr,ram-console = &snippet_ram_console;
    };

   snippet_ram_console: memory@93d00000 {
        compatible = "zephyr,memory-region";
        reg = <0x93d00000 DT_SIZE_K(4)>;
        zephyr,memory-region = "RAM_CONSOLE";
   };
};
```

RTT Console Snippet (rtt-console)

```
west build -S rtt-console [...]
```

Overview This snippet redirects serial console output to SEGGER RTT.

Requirements Hardware support for:

- CONFIG_HAS_SEGGER_RTT
- CONFIG_CONSOLE

Xen Dom0: universal snippet for XEN control domain

Overview This snippet allows user to build Zephyr as a Xen initial domain (Dom0). The feature is implemented as configuration snippet to allow support for any compatible platform.

How to add support of a new board

- add board dts overlay to this snippet which deletes/adds memory and deletes UART nodes;
- add correct memory and hypervisor nodes, based on regions Xen picked for Domain-0 on your setup.

Programming Correct snippet designation for Xen must be entered when you invoke `west build`. For example:

```
west build -b qemu_cortex_a53 -S xen_dom0 samples/synchronization
```

QEMU example with Xen Overlay for qemu_cortex_a53 board, that is present in *board/* directory of this snippet is QEMU Xen control domain example. To run such setup, you need to:

- fetch and build Xen (e.g. RELEASE-4.17.0) for arm64 platform
- take and compile sample device tree from *example/* directory
- build your Zephyr sample/application with *xen_dom0* snippet and start it as Xen control domain

For starting you can use QEMU from Zephyr SDK by following command:

```
<path to Zephyr SDK>/sysroots/x86_64-pokysdk-linux/usr/bin/qemu-system-aarch64 -cpu cortex-
↪a53 \
-m 6G -nographic -machine virt,gic-version=3,virtualization=true -chardev stdio,id=con,
↪mux=on \
-serial chardev:con -mon chardev=con,mode=readline -pidfile qemu.pid \
-device loader,file=<path to Zephyr app build>/zephyr.bin,addr=0x40600000 \
-dtb <path to DTB>/xen.dtb -kernel <path to Xen build>/xen
```

This will start you a Xen hypervisor with your application as Xen control domain. To make it usable, you can add *zephyr-xenlib* by Xen-troops library to your project. It'll provide basic domain management functionalities - domain creation and configuration.

5.4.3 Writing Snippets

- *Basics*
- *Namespacing*
- *Where snippets are located*
- *Processing order*

- *Devicetree overlays (.overlay)*
- *.conf files*
- *DTS_EXTRA_CPPFLAGS*
- *Board-specific settings*
  - *By name*
  - *By regular expression*

Basics

Snippets are defined using YAML files named `snippet.yml`.

A `snippet.yml` file contains the name of the snippet, along with additional build system settings, like this:

```
name: snippet-name
# ... build system settings go here ...
```

Build system settings go in other keys in the file as described later on in this page.

You can combine settings whenever they appear under the same keys. For example, you can combine a snippet-specific devicetree overlay and a `.conf` file like this:

```
name: foo
append:
  EXTRA_DTC_OVERLAY_FILE: foo.overlay
  EXTRA_CONF_FILE: foo.conf
```

Namespacing

When writing devicetree overlays in a snippet, use `snippet_<name>` or `snippet-<name>` as a namespace prefix when choosing names for node labels, node names, etc. This avoids namespace conflicts.

For example, if your snippet is named `foo-bar`, write your devicetree overlays like this:

```
chosen {
        zephyr,baz = &snippet_foo_bar_dev;
};

snippet_foo_bar_dev: device@12345678 {
        /* ... */
};
```

Where snippets are located

The build system looks for snippets in these places:

1. In directories configured by the `SNIPPET_ROOT` CMake variable. This always includes the zephyr repository (so snippets/ is always a source of snippets) and the application source directory (so `<app>/snippets` is also).

   Additional directories can be added manually at CMake time.

The variable is a whitespace- or semicolon-separated list of directories which may contain snippet definitions.

For each directory in the list, the build system looks for `snippet.yml` files underneath a subdirectory named `snippets/`, if one exists.

For example, if **SNIPPET_ROOT** is set to `/foo;/bar`, the build system will look for `snippet.yml` files underneath the following subdirectories:

- `/foo/snippets/`
- `/bar/snippets/`

The `snippet.yml` files can be nested anywhere underneath these locations.

2. In any *module* whose `module.yml` file provides a `snippet_root` setting.

   For example, in a zephyr module named `baz`, you can add this to your `module.yml` file:

   ```
   settings:
     snippet_root: .
   ```

   And then any `snippet.yml` files in `baz/snippets` will automatically be discovered by the build system, just as if the path to `baz` had appeared in **SNIPPET_ROOT**.

Processing order

Snippets are processed in the order they are listed in the **SNIPPET** variable, or in the order of the `-S` arguments if using west.

To apply `bar` after `foo`:

```
cmake -Sapp -Bbuild -DSNIPPET="foo;bar" [...]
cmake --build build
```

The same can be achieved with west as follows:

```
west build -S foo -S bar [...] app
```

When multiple snippets set the same configuration, the configuration value set by the last processed snippet ends up in the final configurations.

For instance, if `foo` sets `CONFIG_FOO=1` and `bar` sets `CONFIG_FOO=2` in the above example, the resulting final configuration will be `CONFIG_FOO=2` because `bar` is processed after `foo`.

This principle applies to both Kconfig fragments (`.conf` files) and devicetree overlays (`.overlay` files).

Devicetree overlays (`.overlay`)

This `snippet.yml` adds `foo.overlay` to the build:

```
name: foo
append:
  EXTRA_DTC_OVERLAY_FILE: foo.overlay
```

The path to `foo.overlay` is relative to the directory containing `snippet.yml`.

`.conf` files

This `snippet.yml` adds `foo.conf` to the build:

```
name: foo
append:
  EXTRA_CONF_FILE: foo.conf
```

The path to `foo.conf` is relative to the directory containing `snippet.yml`.

DTS_EXTRA_CPPFLAGS

This `snippet.yml` adds `DTS_EXTRA_CPPFLAGS` CMake Cache variables to the build:

```
name: foo
append:
  DTS_EXTRA_CPPFLAGS: -DMY_DTS_CONFIGURE
```

Adding these flags enables control over the content of a devicetree file.

Board-specific settings

You can write settings that only apply to some boards.

The settings described here are applied in **addition** to snippet settings that apply to all boards. (This is similar, for example, to the way that an application with both `prj.conf` and `boards/foo.conf` files will use both `.conf` files in the build when building for board `foo`, instead of just `boards/foo.conf`)

By name

```
name: ...
boards:
  bar: # settings for board "bar" go here
    append:
      EXTRA_DTC_OVERLAY_FILE: bar.overlay
  baz: # settings for board "baz" go here
    append:
      EXTRA_DTC_OVERLAY_FILE: baz.overlay
```

The above example uses `bar.overlay` when building for board `bar`, and `baz.overlay` when building for `baz`.

By regular expression You can enclose the board name in slashes (`/`) to match the name against a regular expression in the CMake syntax. The regular expression must match the entire board name.

For example:

```
name: foo
boards:
  /my_vendor_.*/:
    append:
      EXTRA_DTC_OVERLAY_FILE: my_vendor.overlay
```

The above example uses devicetree overlay `my_vendor.overlay` when building for either board `my_vendor_board1` or `my_vendor_board2`. It would not use the overlay when building for either `another_vendor_board` or `x_my_vendor_board`.

5.4.4 Snippets Design

This page documents design goals for the snippets feature. Further information can be found in Issue #51834.

- **extensible**: for example, it is possible to add board support for an existing built-in snippet without modifying the zephyr repository
- **composable**: it is possible to use multiple snippets at once, for example using:

```
west build -S <snippet1> -S <snippet2> ...
```

- **able to combine multiple types of configuration**: snippets make it possible to store multiple different types of build system settings in one place, and apply them all together
- **specializable**: for example, it is possible to customize a snippet's behavior for a particular board, or board revision
- **future-proof and backwards-compatible**: arbitrary future changes to the snippets feature will be possible without breaking backwards compatibility for older snippets
- **applicable to purely "software" changes**: unlike the shields feature, snippets do not assume the presence of a "daughterboard", "shield", "hat", or any other type of external assembly which is connected to the main board
- **DRY** (don't repeat yourself): snippets allow you to skip unnecessary repetition; for example, you can apply the same board-specific configuration to boards `foo` and `bar` by specifying `/(foo|bar)/` as a regular expression for the settings, which will then apply to both boards

5.5 Zephyr CMake Package

The Zephyr CMake package is a convenient way to create a Zephyr-based application.

> **Note**
>
> The *Application types* section introduces the application types used in this page.

The Zephyr CMake package ensures that CMake can automatically select a Zephyr installation to use for building the application, whether it is a *Zephyr repository application*, a *Zephyr workspace application*, or a *Zephyr freestanding application*.

When developing a Zephyr-based application, then a developer simply needs to write `find_package(Zephyr)` in the beginning of the application `CMakeLists.txt` file.

To use the Zephyr CMake package it must first be exported to the CMake user package registry. This is means creating a reference to the current Zephyr installation inside the CMake user package registry.

Ubuntu

In Linux, the CMake user package registry is found in:

`~/.cmake/packages/Zephyr`

macOS

In macOS, the CMake user package registry is found in:

`~/.cmake/packages/Zephyr`

Windows

In Windows, the CMake user package registry is found in:

`HKEY_CURRENT_USER\Software\Kitware\CMake\Packages\Zephyr`

The Zephyr CMake package allows CMake to automatically find a Zephyr base. One or more Zephyr installations must be exported. Exporting multiple Zephyr installations may be useful when developing or testing Zephyr freestanding applications, Zephyr workspace application with vendor forks, etc..

5.5.1 Zephyr CMake package export (west)

When installing Zephyr using *west* then it is recommended to export Zephyr using `west zephyr-export`.

5.5.2 Zephyr CMake package export (without west)

Zephyr CMake package is exported to the CMake user package registry using the following commands:

```
cmake -P <PATH-TO-ZEPHYR>/share/zephyr-package/cmake/zephyr_export.cmake
```

This will export the current Zephyr to the CMake user package registry.

To also export the Zephyr Unittest CMake package, run the following command in addition:

```
cmake -P <PATH-TO-ZEPHYR>/share/zephyrunittest-package/cmake/zephyr_export.cmake
```

5.5.3 Zephyr Base Environment Setting

The Zephyr CMake package search functionality allows for explicitly specifying a Zephyr base using an environment variable.

To do this, use the following `find_package()` syntax:

```
find_package(Zephyr REQUIRED HINTS $ENV{ZEPHYR_BASE})
```

This syntax instructs CMake to first search for Zephyr using the Zephyr base environment setting *ZEPHYR_BASE* and then use the normal search paths.

5.5.4 Zephyr CMake Package Search Order

When Zephyr base environment setting is not used for searching, the Zephyr installation matching the following criteria will be used:

- A Zephyr repository application will use the Zephyr in which it is located. For example:

  ```
  <projects>/zephyr-workspace/zephyr
  └── samples
      └── hello_world
  ```

  in this example, `hello_world` will use `<projects>/zephyr-workspace/zephyr`.

- Zephyr workspace application will use the Zephyr that share the same workspace. For example:

```
<projects>/zephyr-workspace
├── zephyr
├── ...
└── my_applications
    └── my_first_app
```

in this example, `my_first_app` will use `<projects>/zephyr-workspace/zephyr` as this Zephyr is located in the same workspace as the Zephyr workspace application.

Note

The root of a Zephyr workspace is identical to `west topdir` if the workspace was installed using `west`

- Zephyr freestanding application will use the Zephyr registered in the CMake user package registry. For example:

```
<projects>/zephyr-workspace-1
└── zephyr                      (Not exported to CMake)

<projects>/zephyr-workspace-2
└── zephyr                      (Exported to CMake)

<home>/app
├── CMakeLists.txt
├── prj.conf
└── src
    └── main.c
```

in this example, only `<projects>/zephyr-workspace-2/zephyr` is exported to the CMake package registry and therefore this Zephyr will be used by the Zephyr freestanding application `<home>/app`.

If user wants to test the application with `<projects>/zephyr-workspace-1/zephyr`, this can be done by using the Zephyr Base environment setting, meaning set `ZEPHYR_BASE=<projects>/zephyr-workspace-1/zephyr`, before running CMake.

Note

The Zephyr package selected on the first CMake invocation will be used for all subsequent builds. To change the Zephyr package, for example to test the application using Zephyr base environment setting, then it is necessary to do a pristine build first (See *Rebuilding an Application*).

5.5.5 Zephyr CMake Package Version

When writing an application then it is possible to specify a Zephyr version number `x.y.z` that must be used in order to build the application.

Specifying a version is especially useful for a Zephyr freestanding application as it ensures the application is built with a minimal Zephyr version.

It also helps CMake to select the correct Zephyr to use for building, when there are multiple Zephyr installations in the system.

For example:

```
find_package(Zephyr 2.2.0)
project(app)
```

will require app to be built with Zephyr 2.2.0 as minimum. CMake will search all exported candidates to find a Zephyr installation which matches this version criteria.

Thus it is possible to have multiple Zephyr installations and have CMake automatically select between them based on the version number provided, see CMake package version for details.

For example:

```
<projects>/zephyr-workspace-2.a
└── zephyr                        (Exported to CMake)

<projects>/zephyr-workspace-2.b
└── zephyr                        (Exported to CMake)

<home>/app
├── CMakeLists.txt
├── prj.conf
└── src
    └── main.c
```

in this case, there are two released versions of Zephyr installed at their own workspaces. Workspace 2.a and 2.b, corresponding to the Zephyr version.

To ensure app is built with minimum version `2.a` the following `find_package` syntax may be used:

```
find_package(Zephyr 2.a)
project(app)
```

Note that both `2.a` and `2.b` fulfill this requirement.

CMake also supports the keyword `EXACT`, to ensure an exact version is used, if that is required. In this case, the application CMakeLists.txt could be written as:

```
find_package(Zephyr 2.a EXACT)
project(app)
```

In case no Zephyr is found which satisfies the version required, as example, the application specifies

```
find_package(Zephyr 2.z)
project(app)
```

then an error similar to below will be printed:

```
Could not find a configuration file for package "Zephyr" that is compatible
with requested version "2.z".

The following configuration files were considered but not accepted:

  <projects>/zephyr-workspace-2.a/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake,␣
↪version: 2.a.0
  <projects>/zephyr-workspace-2.b/zephyr/share/zephyr-package/cmake/ZephyrConfig.cmake,␣
↪version: 2.b.0
```

Note

It can also be beneficial to specify a version number for Zephyr repository applications and Zephyr workspace applications. Specifying a version in those cases ensures the application

will only build if the Zephyr repository or workspace is matching. This can be useful to avoid accidental builds when only part of a workspace has been updated.

5.5.6 Multiple Zephyr Installations (Zephyr workspace)

Testing out a new Zephyr version, while at the same time keeping the existing Zephyr in the workspace untouched is sometimes beneficial.

Or having both an upstream Zephyr, Vendor specific, and a custom Zephyr in same workspace.

For example:

```
<projects>/zephyr-workspace
├── zephyr
├── zephyr-vendor
├── zephyr-custom
├── ...
└── my_applications
    └── my_first_app
```

in this setup, `find_package(Zephyr)` has the following order of precedence for selecting which Zephyr to use:

- Project name: `zephyr`
- First project, when Zephyr projects are ordered lexicographical, in this case.
  - `zephyr-custom`
  - `zephyr-vendor`

This means that `my_first_app` will use `<projects>/zephyr-workspace/zephyr`.

It is possible to specify a Zephyr preference list in the application.

A Zephyr preference list can be specified as:

```
set(ZEPHYR_PREFER "zephyr-custom" "zephyr-vendor")
find_package(Zephyr)

project(my_first_app)
```

the `ZEPHYR_PREFER` is a list, allowing for multiple Zephyrs. If a Zephyr is specified in the list, but not found in the system, it is simply ignored and `find_package(Zephyr)` will continue to the next candidate.

This allows for temporary creation of a new Zephyr release to be tested, without touching current Zephyr. When testing is done, the `zephyr-test` folder can simply be removed. Such a CMakeLists.txt could look as:

```
set(ZEPHYR_PREFER "zephyr-test")
find_package(Zephyr)

project(my_first_app)
```

5.5.7 Zephyr Build Configuration CMake packages

There are two Zephyr Build configuration packages which provide control over the build settings in Zephyr in a more generic way. These packages are:

- **ZephyrBuildConfiguration**: Applies to all Zephyr applications in the workspace

- **ZephyrAppConfiguration**: Applies only to the application you are currently building

They are similar to the per-user `.zephyrrc` file that can be used to set *Environment Variables*, but they set CMake variables instead. They also allow you to automatically share the build configuration among all users through the project repository. They also allow more advanced use cases, such as loading of additional CMake boilerplate code.

The Zephyr Build Configuration CMake packages will be loaded in the Zephyr boilerplate code after initial properties and `ZEPHYR_BASE` has been defined, but before CMake code execution. The ZephyrBuildConfiguration is included first and ZephyrAppConfiguration afterwards. That means the application-specific package could override the workspace settings, if needed. This allows the Zephyr Build Configuration CMake packages to setup or extend properties such as: `DTS_ROOT`, `BOARD_ROOT`, `TOOLCHAIN_ROOT` / other toolchain setup, fixed overlays, and any other property that can be controlled. It also allows inclusion of additional boilerplate code.

To provide a ZephyrBuildConfiguration or ZephyrAppConfiguration, create `ZephyrBuildConfig.cmake` and/or `ZephyrAppConfig.cmake` respectively and place them in the appropriate location. The CMake `find_package` mechanism will search for these files with the steps below. Other default CMake package search paths and hints are disabled and there is no version checking implemented for these packages. This also means that these packages cannot be installed in the CMake package registry. The search steps are:

1. If `ZephyrBuildConfiguration_ROOT`, or `ZephyrAppConfiguration_ROOT` respectively, is set, search within this prefix path. If a matching file is found, execute this file. If no matching file is found, go to step 2.
2. Search within `${ZEPHYR_BASE}/../*`, or `${APPLICATION_SOURCE_DIR}` respectively. If a matching file is found, execute this file. If no matching file is found, abort the search.

It is recommended to place the files in the default paths from step 2, but with the `<PackageName>_ROOT` variables you have the flexibility to place them anywhere. This is especially necessary for freestanding applications, for which the default path to ZephyrBuildConfiguration usually does not work. In this case the `<PackageName>_ROOT` variables can be set on the CMake command line, **before** `find_package(Zephyr ...)`, as environment variable or from a CMake cache initialization file with the `-C` command line option.

Note

The `<PackageName>_ROOT` variables, as well as the default paths, are just the prefixes to the search path. These prefixes get combined with additional path suffixes, which together form the actual search path. Any combination that honors the CMake package search procedure is valid and will work.

If you want to completely disable the search for these packages, you can use the special CMake `CMAKE_DISABLE_FIND_PACKAGE_<PackageName>` variable for that. Just set `CMAKE_DISABLE_FIND_PACKAGE_ZephyrBuildConfiguration` or `CMAKE_DISABLE_FIND_PACKAGE_ZephyrAppConfiguration` to `TRUE` to disable the package.

An example folder structure could look like this:

```
<projects>/zephyr-workspace
├── zephyr
├── ...
├── manifest repo (can be named anything)
|    └── cmake/ZephyrBuildConfig.cmake
├── ...
└── zephyr application
     └── share/zephyrapp-package/cmake/ZephyrAppConfig.cmake
```

A sample `ZephyrBuildConfig.cmake` can be seen below.

```
# ZephyrBuildConfig.cmake sample code

# To ensure final path is absolute and does not contain ../.. in variable.
get_filename_component(APPLICATION_PROJECT_DIR
                       ${CMAKE_CURRENT_LIST_DIR}/../../..
                       ABSOLUTE
)

# Add this project to list of board roots
list(APPEND BOARD_ROOT ${APPLICATION_PROJECT_DIR})

# Default to GNU Arm Embedded toolchain if no toolchain is set
if(NOT ENV{ZEPHYR_TOOLCHAIN_VARIANT})
    set(ZEPHYR_TOOLCHAIN_VARIANT gnuarmemb)
    find_program(GNU_ARM_GCC arm-none-eabi-gcc)
    if(NOT ${GNU_ARM_GCC} STREQUAL GNU_ARM_GCC-NOTFOUND)
        # The toolchain root is located above the path to the compiler.
        get_filename_component(GNUARMEMB_TOOLCHAIN_PATH ${GNU_ARM_GCC}/../.. ABSOLUTE)
    endif()
endif()
```

5.5.8 Zephyr CMake package source code

The Zephyr CMake package source code in share/zephyr-package/cmake and share/zephyrunittest-package/cmake contains the CMake config package which is used by the CMake `find_package` function.

It also contains code for exporting Zephyr as a CMake config package.

The following is an overview of the files in these directories:

ZephyrConfigVersion.cmake
: The Zephyr package version file. This file is called by CMake to determine if this installation fulfils the requirements specified by user when calling `find_package(Zephyr ...)`. It is also responsible for detection of Zephyr repository or workspace only installations.

ZephyrUnittestConfigVersion.cmake
: Same responsibility as `ZephyrConfigVersion.cmake`, but for unit tests. Includes `ZephyrConfigVersion.cmake`.

ZephyrConfig.cmake
: The Zephyr package file. This file is called by CMake to for the package meeting which fulfils the requirements specified by user when calling `find_package(Zephyr ...)`. This file is responsible for sourcing of boilerplate code.

ZephyrUnittestConfig.cmake
: Same responsibility as `ZephyrConfig.cmake`, but for unit tests. Includes `ZephyrConfig.cmake`.

zephyr_package_search.cmake
: Common file used for detection of Zephyr repository and workspace candidates. Used by `ZephyrConfigVersion.cmake` and `ZephyrConfig.cmake` for common code.

zephyr_export.cmake
: See *Zephyr CMake package export (without west)*.

5.6 Sysbuild (System build)

Sysbuild is a higher-level build system that can be used to combine multiple other build systems together. It is a higher-level layer that combines one or more Zephyr build systems and optional

additional build systems into a hierarchical build system.

For example, you can use sysbuild to build a Zephyr application together with the MCUboot bootloader, flash them both onto your device, and debug the results.

Sysbuild works by configuring and building at least a Zephyr application and, optionally, as many additional projects as you want. The additional projects can be either Zephyr applications or other types of builds you want to run.

Like Zephyr's *build system*, sysbuild is written in CMake and uses *Kconfig*.

5.6.1 Definitions

The following are some key concepts used in this document:

Single-image build
When sysbuild is used to create and manage just one Zephyr application's build system.

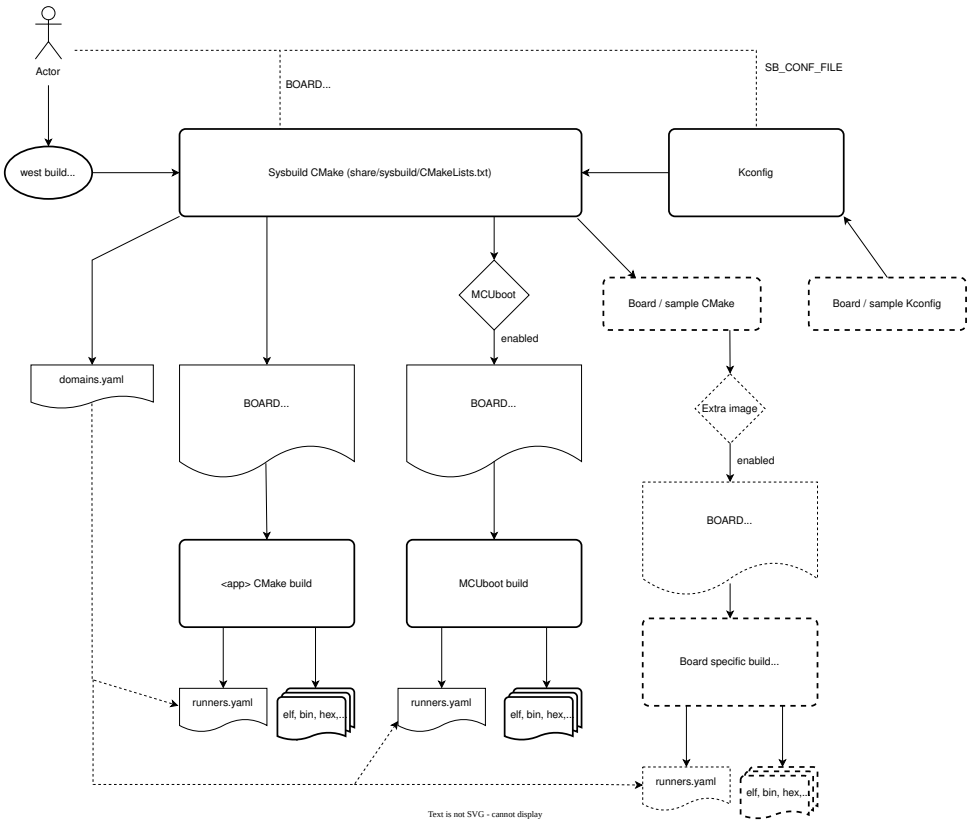
Multi-image build
When sysbuild is used to manage multiple build systems. The word "image" is used because your main goal is usually to generate the binaries of the firmware application images from each build system.

Domain
Every Zephyr CMake build system managed by sysbuild.

Multi-domain
When more than one Zephyr CMake build system (domain) is managed by sysbuild.

5.6.2 Architectural Overview

This figure is an overview of sysbuild's inputs, outputs, and user interfaces:



The following are some key sysbuild features indicated in this figure:

- You can run sysbuild either with *west build* or directly via `cmake`.
- You can use sysbuild to generate application images from each build system, shown above as ELF, BIN, and HEX files.
- You can configure sysbuild or any of the build systems it manages using various configuration variables. These variables are namespaced so that sysbuild can direct them to the right build system. In some cases, such as the `BOARD` variable, these are shared among multiple build systems.
- Sysbuild itself is also configured using Kconfig. For example, you can instruct sysbuild to build the MCUboot bootloader, as well as to build and link your main Zephyr application as an MCUboot-bootable image, using sysbuild's Kconfig files.
- Sysbuild integrates with west's *Building, Flashing and Debugging* commands. It does this by managing the *Flash and debug runners*, and specifically the `runners.yaml` files that each Zephyr build system will contain. These are packaged into a global view of how to flash and debug each build system in a `domains.yaml` file generated and managed by sysbuild.
- Build names are prefixed with the target name and an underscore, for example the sysbuild target is prefixed with `sysbuild_` and if MCUboot is enabled as part of sysbuild, it will be prefixed with `mcuboot_`. This also allows for running things like menuconfig with the prefix, for example (if using ninja) `ninja sysbuild_menuconfig` to configure sysbuild or (if using make) `make mcuboot_menuconfig`.

5.6.3 Building with sysbuild

As mentioned above, you can run sysbuild via `west build` or `cmake`.

`west build`

Here is an example. For details, see *Sysbuild (multi-domain builds)* in the `west build` documentation.

```
west build -b reel_board --sysbuild samples/hello_world
```

Tip

To configure `west build` to use `--sysbuild` by default from now on, run:

```
west config build.sysbuild True
```

Since sysbuild supports both single- and multi-image builds, this lets you use sysbuild all the time, without worrying about what type of build you are running.

To turn this off, run this before generating your build system:

```
west config build.sysbuild False
```

To turn this off for just one `west build` command, run:

```
west build --no-sysbuild ...
```

`cmake`

Here is an example using CMake and Ninja.

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world share/sysbuild
ninja -Cbuild
```

To use sysbuild directly with CMake, you must specify the sysbuild project as the source folder, and give -DAPP_DIR=<path-to-sample> as an extra CMake argument. APP_DIR is the path to the main Zephyr application managed by sysbuild.

5.6.4 Configuration namespacing

When building a single Zephyr application without sysbuild, all CMake cache settings and Kconfig build options given on the command line as -D<var>=<value> or -DCONFIG_<var>=<value> are handled by the Zephyr build system.

However, when sysbuild combines multiple Zephyr build systems, there could be Kconfig settings exclusive to sysbuild (and not used by any of the applications). To handle this, sysbuild has namespaces for configuration variables. You can use these namespaces to direct settings either to sysbuild itself or to a specific Zephyr application managed by sysbuild using the information in these sections.

The following example shows how to build hello_world with MCUboot enabled, applying to both images debug optimizations:

west build

```
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y␣
↪-DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_CONFIG_DEBUG_OPTIMIZATIONS=y
```

cmake

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_
↪BOOTLOADER_MCUBOOT=y -DCONFIG_DEBUG_OPTIMIZATIONS=y -Dmcuboot_CONFIG_DEBUG_
↪OPTIMIZATIONS=y share/sysbuild
ninja -Cbuild
```

See the following subsections for more information.

CMake variable namespacing

CMake variable settings can be passed to CMake using -D<var>=<value> on the command line. You can also set Kconfig options via CMake as -DCONFIG_<var>=<value> or -D<namespace>_CONFIG_<var>=<value>.

Since sysbuild is the entry point for the build system, and sysbuild is written in CMake, all CMake variables are first processed by sysbuild.

Sysbuild creates a namespace for each domain. The namespace prefix is the domain's application name. See *Adding Zephyr applications to sysbuild* for more information.

To set the variable <var> in the namespace <namespace>, use this syntax:

```
-D<namespace>_<var>=<value>
```

For example, to set the CMake variable FOO in the my_sample application build system to the value BAR, run the following commands:

west build

```
west build --sysbuild ... -- -Dmy_sample_FOO=BAR
```

cmake

```
cmake -Dmy_sample_FOO=BAR ...
```

Kconfig namespacing

To set the sysbuild Kconfig option <var> to the value <value>, use this syntax:

```
-DSB_CONFIG_<var>=<value>
```

In the previous example, SB_CONFIG is the namespace prefix for sysbuild's Kconfig options.

To set a Zephyr application's Kconfig option instead, use this syntax:

```
-D<namespace>_CONFIG_<var>=<value>
```

In the previous example, <namespace> is the application name discussed above in *CMake variable namespacing*.

For example, to set the Kconfig option FOO in the my_sample application build system to the value BAR, run the following commands:

west build

```
west build --sysbuild ... -- -Dmy_sample_CONFIG_FOO=BAR
```

cmake

```
cmake -Dmy_sample_CONFIG_FOO=BAR ...
```

Tip

When no <namespace> is used, the Kconfig setting is passed to the main Zephyr application my_sample.

This means that passing -DCONFIG_<var>=<value> and -Dmy_sample_CONFIG_<var>=<value> are equivalent.

This allows you to build the same application with or without sysbuild using the same syntax for setting Kconfig values at CMake time. For example, the following commands will work in the same way:

```
west build -b <board> my_sample -- -DCONFIG_FOO=BAR
```

```
west build -b <board> --sysbuild my_sample -- -DCONFIG_FOO=BAR
```

5.6.5 Sysbuild flashing using west flash

You can use *west flash* to flash applications with sysbuild.

When invoking west flash on a build consisting of multiple images, each image is flashed in sequence. Extra arguments such as --runner jlink are passed to each invocation.

For more details, see *Multi-domain flashing*.

5.6.6 Sysbuild debugging using west debug

You can use west debug to debug the main application, whether you are using sysbuild or not. Just follow the existing *west debug* guide to debug the main sample.

To debug a different domain (Zephyr application), such as mcuboot, use the --domain argument, as follows:

```
west debug --domain mcuboot
```

For more details, see *Multi-domain debugging*.

5.6.7 Building a sample with MCUboot

Sysbuild supports MCUboot natively.

To build a sample like `hello_world` with MCUboot, enable MCUboot and build and flash the sample as follows:

`west build`

```
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y
```

`cmake`

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONFIG_
↪BOOTLOADER_MCUBOOT=y share/sysbuild
ninja -Cbuild
```

This builds `hello_world` and `mcuboot` for the `reel_board`, and then flashes both the `mcuboot` and `hello_world` application images to the board.

More detailed information regarding the use of MCUboot with Zephyr can be found in the MCUboot with Zephyr documentation page on the MCUboot website.

Note

The deprecated MCUBoot Kconfig option `CONFIG_ZEPHYR_TRY_MASS_ERASE` will perform a full chip erase when flashed. If this option is enabled, then flashing only MCUBoot, for example using `west flash --domain mcuboot`, may erase the entire flash, including the main application image.

5.6.8 Sysbuild Kconfig file

You can set sysbuild's Kconfig options for a single application using configuration files. By default, sysbuild looks for a configuration file named `sysbuild.conf` in the application top-level directory.

In the following example, there is a `sysbuild.conf` file that enables building and flashing with MCUboot whenever sysbuild is used:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
└── sysbuild.conf
```

```
SB_CONFIG_BOOTLOADER_MCUBOOT=y
```

You can set a configuration file to use with the `-DSB_CONF_FILE=<sysbuild-conf-file>` CMake build setting.

For example, you can create `sysbuild-mcuboot.conf` and then specify this file when building with sysbuild, as follows:

`west build`

```
west build -b reel_board --sysbuild samples/hello_world -- -DSB_CONF_FILE=sysbuild-mcuboot.
↪conf
```

cmake

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=samples/hello_world -DSB_CONF_
↪FILE=sysbuild-mcuboot.conf share/sysbuild
ninja -Cbuild
```

5.6.9 Sysbuild targets

Sysbuild creates build targets for each image (including sysbuild itself) for the following modes:

- menuconfig
- hardenconfig
- guiconfig

For the main application (as is the same without using sysbuild) these can be ran normally without any prefix. For other images (including sysbuild), these are ran with a prefix of the image name and an underscore e.g. `sysbuild_` or `mcuboot_`, using ninja or make - for details on how to run image build targets that do not have mapped build targets in sysbuild, see the *Dedicated image build targets* section.

5.6.10 Dedicated image build targets

Not all build targets for images are given equivalent prefixed build targets when sysbuild is used, for example build targets like `ram_report`, `rom_report`, `footprint`, `puncover` and `pahole` are not exposed. When using *Trusted Firmware*, this includes build targets prefix with `tfm_` and `bl2_`, for example: `tfm_rom_report` and `bl2_ram_report`. To run these build targets, the build directory of the image can be provided to west/ninja/make along with the name of the build target to execute and it will run.

`west`

Assuming that a project has been configured and built using `west` using sysbuild with mcuboot enabled in the default `build` folder location, the `rom_report` build target for `mcuboot` can be ran with:

```
west build -d build/mcuboot -t rom_report
```

`ninja`

Assuming that a project has been configured using `cmake` and built using `ninja` using sysbuild with mcuboot enabled, the `rom_report` build target for `mcuboot` can be ran with:

```
ninja -C mcuboot rom_report
```

`make`

Assuming that a project has been configured using `cmake` and built using `make` using sysbuild with mcuboot enabled, the `rom_report` build target for `mcuboot` can be ran with:

```
make -C mcuboot rom_report
```

5.6.11 Adding Zephyr applications to sysbuild

You can use the `ExternalZephyrProject_Add()` function to add Zephyr applications as sysbuild domains. Call this CMake function from your application's `sysbuild.cmake` file, or any other CMake file you know will run as part sysbuild CMake invocation.

Targeting the same board

To include `my_sample` as another sysbuild domain, targeting the same board as the main image, use this example:

```
ExternalZephyrProject_Add(
  APPLICATION my_sample
  SOURCE_DIR <path-to>/my_sample
)
```

This could be useful, for example, if your board requires you to build and flash an SoC-specific bootloader along with your main application.

Targeting a different board

In sysbuild and Zephyr CMake build system a board may refer to:

- A physical board with a single core SoC.
- A specific core on a physical board with a multi-core SoC, such as nrf5340dk_nrf5340.
- A specific SoC on a physical board with multiple SoCs, such as nrf9160dk_nrf9160 and nrf9160dk_nrf52840.

If your main application, for example, is built for `mps2_an521`, and your helper application must target the `mps2_an521_remote` board (cpu1), add a CMake function call that is structured as follows:

```
ExternalZephyrProject_Add(
  APPLICATION my_sample
  SOURCE_DIR <path-to>/my_sample
  BOARD mps2_an521_remote
)
```

This could be useful, for example, if your main application requires another helper Zephyr application to be built and flashed alongside it, but the helper runs on another core in your SoC.

Targeting conditionally using Kconfig

You can control whether extra applications are included as sysbuild domains using Kconfig.

If the extra application image is specific to the board or an application, you can create two additional files: `sysbuild.cmake` and `Kconfig.sysbuild`.

For an application, this would look like this:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
├── Kconfig.sysbuild
└── sysbuild.cmake
```

In the previous example, `sysbuild.cmake` would be structured as follows:

```
if(SB_CONFIG_SECOND_SAMPLE)
  ExternalZephyrProject_Add(
    APPLICATION second_sample
    SOURCE_DIR <path-to>/second_sample
  )
endif()
```

`Kconfig.sysbuild` would be structured as follows:

```
source "sysbuild/Kconfig"

config SECOND_SAMPLE
        bool "Second sample"
        default y
```

This will include `second_sample` by default, while still allowing you to disable it using the Kconfig option `SECOND_SAMPLE`.

For more information on setting sysbuild Kconfig options, see *Kconfig namespacing*.

Building without flashing

You can mark `my_sample` as a build-only application in this manner:

```
ExternalZephyrProject_Add(
  APPLICATION my_sample
  SOURCE_DIR <path-to>/my_sample
  BUILD_ONLY TRUE
)
```

As a result, `my_sample` will be built as part of the sysbuild build invocation, but it will be excluded from the default image sequence used by `west flash`. Instead, you may use the outputs of this domain for other purposes - for example, to produce a secondary image for DFU, or to merge multiple images together.

You can also replace `TRUE` with another boolean constant in CMake, such as a Kconfig option, which would make `my_sample` conditionally build-only.

Note

Applications marked as build-only can still be flashed manually, using `west flash --domain my_sample`. As such, the `BUILD_ONLY` option only controls the default behavior of `west flash`.

Zephyr application configuration

When adding a Zephyr application to sysbuild, such as MCUboot, then the configuration files from the application (MCUboot) itself will be used.

When integrating multiple applications with each other, then it is often necessary to make adjustments to the configuration of extra images.

Sysbuild gives users the ability of creating Kconfig fragments or devicetree overlays that will be used together with the application's default configuration. Sysbuild also allows users to change *Application Configuration Directory* in order to give users full control of an image's configuration.

Zephyr application Kconfig fragment and devicetree overlay In the folder of the main application, create a Kconfig fragment or a devicetree overlay under a sysbuild folder, where the name of the file is `<image>.conf` or `<image>.overlay`, for example if your main application includes `my_sample` then create a `sysbuild/my_sample.conf` file or a devicetree overlay `sysbuild/my_sample.overlay`.

A Kconfig fragment could look as:

```
# sysbuild/my_sample.conf
CONFIG_FOO=n
```

Zephyr application configuration directory In the folder of the main application, create a new folder under `sysbuild/<image>/`. This folder will then be used as `APPLICATION_CONFIG_DIR` when building `<image>`. As an example, if your main application includes `my_sample` then create a `sysbuild/my_sample/` folder and place any configuration files in there as you would normally do:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
└── sysbuild
    └── my_sample
        ├── prj.conf
        ├── app.overlay
        └── boards
            ├── <board_A>.conf
            ├── <board_A>.overlay
            ├── <board_B>.conf
            └── <board_B>.overlay
```

All configuration files under the `sysbuild/my_sample/` folder will now be used when `my_sample` is included in the build, and the default configuration files for `my_sample` will be ignored.

This give you full control on how images are configured when integrating those with `application`.

Sysbuild file suffix support File suffix support through the makevar:*FILE_SUFFIX* is supported in sysbuild (see *File Suffixes* for details on this feature in applications). For sysbuild, a globally provided option will be passed down to all images. In addition, the image configuration file will have this value applied and used (instead of the build type) if the file exists.

Given the example project:

```
<home>/application
├── CMakeLists.txt
├── prj.conf
├── sysbuild.conf
├── sysbuild_test_key.conf
└── sysbuild
    ├── mcuboot.conf
    ├── mcuboot_max_log.conf
    └── my_sample.conf
```

- If `FILE_SUFFIX` is not defined and both `mcuboot` and `my_sample` images are included, `mcuboot` will use the `mcuboot.conf` Kconfig fragment file and `my_sample` will use the `my_sample.conf` Kconfig fragment file. Sysbuild itself will use the `sysbuild.conf` Kconfig fragment file.
- If `FILE_SUFFIX` is set to `max_log` and both `mcuboot` and `my_sample` images are included, `mcuboot` will use the `mcuboot_max_log.conf` Kconfig fragment file and `my_sample` will use the

my_sample.conf Kconfig fragment file (as it will fallback to the file without the suffix). Sysbuild itself will use the sysbuild.conf Kconfig fragment file (as it will fallback to the file without the suffix).

- If FILE_SUFFIX is set to test_key and both mcuboot and my_sample images are included, mcuboot will use the mcuboot.conf Kconfig fragment file and my_sample will use the my_sample.conf Kconfig fragment file (as it will fallback to the files without the suffix). Sysbuild itself will use the sysbuild_test_key.conf Kconfig fragment file. This can be used to apply a different sysbuild configuration, for example to use a different signing key in MCUboot and when signing the main application.

The FILE_SUFFIX can also be applied only to single images by prefixing the variable with the image name:

west build

```
west build -b reel_board --sysbuild file_suffix_example -- -DSB_CONFIG_BOOTLOADER_MCUBOOT=y␣
↪-Dmcuboot_FILE_SUFFIX="max_log"
```

cmake

```
cmake -Bbuild -GNinja -DBOARD=reel_board -DAPP_DIR=<app_dir> -DSB_CONFIG_BOOTLOADER_
↪MCUBOOT=y -Dmcuboot_FILE_SUFFIX="max_log" share/sysbuild
ninja -Cbuild
```

Adding dependencies among Zephyr applications

Sometimes, in a multi-image build, you may want certain Zephyr applications to be configured or flashed in a specific order. For example, if you need some information from one application's build system to be available to another's, then the first thing to do is to add a configuration dependency between them. Separately, you can also add flashing dependencies to control the sequence of images used by west flash; this could be used if a specific flashing order is required by an SoC, a _runner_, or something else.

By default, sysbuild will configure and flash applications in the order that they are added, as ExternalZephyrProject_Add() calls are processed by CMake. You can use the sysbuild_add_dependencies() function to make adjustments to this order, according to your needs. Its usage is similar to the standard add_dependencies() function in CMake.

Here is an example of adding configuration dependencies for my_sample:

```
sysbuild_add_dependencies(IMAGE CONFIGURE my_sample sample_a sample_b)
```

This will ensure that sysbuild will run CMake for sample_a and sample_b (in some order) before doing the same for my_sample, when building these domains in a single invocation.

If you want to add flashing dependencies instead, then do it like this:

```
sysbuild_add_dependencies(IMAGE FLASH my_sample sample_a sample_b)
```

As a result, my_sample will be flashed after sample_a and sample_b (in some order), when flashing these domains in a single invocation.

Note

Adding flashing dependencies is not allowed for build-only applications. If my_sample had been created with BUILD_ONLY TRUE, then the above call to sysbuild_add_dependencies() would have produced an error.

5.6.12 Adding non-Zephyr applications to sysbuild

You can include non-Zephyr applications in a multi-image build using the standard CMake module ExternalProject. Please refer to the CMake documentation for usage details.

When using `ExternalProject`, the non-Zephyr application will be built as part of the sysbuild build invocation, but `west flash` or `west debug` will not be aware of the application. Instead, you must manually flash and debug the application.

5.6.13 Extending sysbuild

Sysbuild can be extended by other modules to give it additional functionality or include other configuration or images, an example could be to add support for another bootloader or external signing method.

Modules can be extended by adding custom CMake or Kconfig files as normal *modules* do, this will cause the files to be included in each image that is part of a project. Alternatively, there are *sysbuild-specific module extension* files which can be used to include CMake and Kconfig files for the overall sysbuild image itself, this is where e.g. a custom image for a particular board or SoC can be added.

5.7 Application version management

Zephyr supports an application version management system for applications which is built around the system that Zephyr uses for its own version system management. This allows applications to define a version file and have application (or module) code include the auto-generated file and be able to access it, just as they can with the kernel version. This version information is available from multiple scopes, including:

- Code (C/C++)
- Kconfig
- CMake

which makes it a very versatile system for lifecycle management of applications. In addition, it can be used when building applications which target supported bootloaders (e.g. MCUboot) allowing images to be signed with correct version of the application automatically - no manual signing steps are required.

5.7.1 VERSION file

Application version information is set on a per-application basis in a file named `VERSION`, which must be placed at the base directory of the application, where the CMakeLists.txt file is located. This is a simple text file which contains the various version information fields, each on a newline. The basic `VERSION` file has the following structure:

```
VERSION_MAJOR =
VERSION_MINOR =
PATCHLEVEL =
VERSION_TWEAK =
EXTRAVERSION =
```

Each field and the values it supports is described below. Zephyr limits the value of each numeric field to a single byte (note that there may be further restrictions depending upon what the version is used for, e.g. bootloaders might only support some of these fields or might place limits on the maximum values of fields):

Field	Data type
VERSION_MAJOR	Numerical (0-255)
VERSION_MINOR	Numerical (0-255)
PATCHLEVEL	Numerical (0-255)
VERSION_TWEAK	Numerical (0-255)
EXTRAVERSION	Alphanumerical (Lowercase a-z and 0-9)

When an application is configured using CMake, the version file will be automatically processed, and will be checked automatically each time the version is changed, so CMake does not need to be manually re-ran for changes to this file.

For the sections below, examples are provided for the following `VERSION` file:

```
VERSION_MAJOR = 1
VERSION_MINOR = 2
PATCHLEVEL = 3
VERSION_TWEAK = 4
EXTRAVERSION = unstable
```

5.7.2 Use in code

To use the version information in application code, the version file must be included, then the fields can be freely used. The include file name is `app_version.h` (no path is needed), the following defines are available:

Define	Type	Field(s)	Example
APPVERSION	Numerical	`VERSION_MAJOR` (left shifted by 24 bits), `VERSION_MINOR` (left shifted by 16 bits), `PATCHLEVEL` (left shifted by 8 bits), `VERSION_TWEAK`	0x1020304
APP_VERSION_N	Numerical	`VERSION_MAJOR` (left shifted by 16 bits), `VERSION_MINOR` (left shifted by 8 bits), `PATCHLEVEL`	0x10203
APP_VERSION_N	Numerical	`VERSION_MAJOR`	1
APP_VERSION_N	Numerical	`VERSION_MINOR`	2
APP_PATCHLEV	Numerical	`PATCHLEVEL`	3
APP_TWEAK	Numerical	`VERSION_TWEAK`	4
APP_VERSION_S	String (quoted)	`VERSION_MAJOR`, `VERSION_MINOR`, `PATCHLEVEL`, `EXTRAVERSION`	“1.2.3-unstable”
APP_VERSION_E	String (quoted)	`VERSION_MAJOR`, `VERSION_MINOR`, `PATCHLEVEL`, `EXTRAVERSION VERSION_TWEAK`	“1.2.3-unstable+4”
APP_VERSION_T	String (quoted)	`VERSION_MAJOR`, `VERSION_MINOR`, `PATCHLEVEL`, `VERSION_TWEAK`	“1.2.3+4”
APP_BUILD_VEI	String (unquoted)	None (value of `git describe --abbrev=12 --always` from application repository)	v3.3.0-18-g2c85d9224fca

5.7.3 Use in Kconfig

The following variables are available for usage in Kconfig files:

Variable	Type	Field(s)	Example
$(VERSION_MAJOR)	Numerical	VERSION_MAJOR	1
$(VERSION_MINOR)	Numerical	VERSION_MINOR	2
$(PATCHLEVEL)	Numerical	PATCHLEVEL	3
$(VERSION_TWEAK)	Numerical	VERSION_TWEAK	4
$(APPVERSION)	String	VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION	1.2.3-unstable
$(APP_VERSION_EXTEN	String	VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION, VERSION_TWEAK	1.2.3-unstable+4
$(APP_VERSION_TWEAK	String	VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, VERSION_TWEAK	1.2.3+4

5.7.4 Use in CMake

The following variable are available for usage in CMake files:

Variable	Type	Field(s)	Example
APPVERSION	Numerical (hex)	VERSION_MAJOR (left shifted by 24 bits), VERSION_MINOR (left shifted by 16 bits), PATCHLEVEL (left shifted by 8 bits), VERSION_TWEAK	0x1020304
APP_VERSION_N	Numerical (hex)	VERSION_MAJOR (left shifted by 16 bits), VERSION_MINOR (left shifted by 8 bits), PATCHLEVEL	0x10203
APP_VERSION_M	Numerical	VERSION_MAJOR	1
APP_VERSION_M	Numerical	VERSION_MINOR	2
APP_PATCHLEVE	Numerical	PATCHLEVEL	3
APP_VERSION_T	Numerical	VERSION_TWEAK	4
APP_VERSION_S	String	VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION	1.2.3-unstable
APP_VERSION_E	String	VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, EXTRAVERSION, VERSION_TWEAK	1.2.3-unstable+4
APP_VERSION_T	String	VERSION_MAJOR, VERSION_MINOR, PATCHLEVEL, VERSION_TWEAK	1.2.3+4

5.7.5 Use in MCUboot-supported applications

No additional configuration needs to be done to the target application so long as it is configured to support MCUboot and a signed image is generated, the version information will be automatically included in the image data.

5.8 Flashing

5.8.1 Flashing configuration

Zephyr supports setting up configuration for flash runners (invoked from *west flash*) which allows for customising how commands are used when programming boards. This configuration is used for *Sysbuild (System build)* projects and allows for configuring when commands are ran for groups of board targets. As an example: a multi-core SoC might want to only allow the `--erase` argument to be used once for all of the cores in the SoC which would prevent multiple erase tasks running in a single `west flash` invocation, which could wrongly clear the memory which is used by the other images being programmed.

Priority

Flashing configuration is singular, it will only be read from a single location, this configuration can reside in the following files starting with the highest priority:

- `soc.yml` (in soc folder)
- `board.yml` (in board folder)

Configuration

Configuration is applied in the yml file by using a `runners` map with a single `run_once` child, this then contains a map of commands as they would be provided to the flash runner e.g. `--reset` followed by a list which specifies the settings for each of these commands (these are grouped by flash runner, and by qualifiers/boards). Commands have associated runners that they apply to using a `runners` list value, this can contain `all` if it applies to all runners, otherwise must contain each runner that it applies to using the runner-specific name. Groups of board targets can be specified using the `groups` key which has a list of board target sets. Board targets are regular expression matches, for `soc.yml` files each set of board targets must be in a `qualifiers` key (only regular expression matches for board qualifiers are allowed, board names must be omitted from these entries). For `board.yml` files each set of board targets must be in a `boards` key, these are lists containing the matches which form a singular group. A final parameter `run` can be set to `first` which means that the command will be ran once with the first image flashing process per set of board targets, or to `last` which will be ran once for the final image flash per set of board targets.

An example flashing configuration for a `soc.yml` is shown below in which the `--recover` command will only be used once for any board targets which used the nRF5340 SoC application or network CPU cores, and will only reset the network or application core after all images for the respective core have been flashed.

```
runners:
  run_once:
    '--recover':
      - run: first
        runners:
          - nrfjprog
        groups:
          - qualifiers:
              - nrf5340/cpunet
              - nrf5340/cpuapp
              - nrf5340/cpuapp/ns
    '--reset':
      - run: last
        runners:
          - nrfjprog
          - jlink
        groups:
          - qualifiers:
              - nrf5340/cpunet
          - qualifiers:
              - nrf5340/cpuapp
              - nrf5340/cpuapp/ns
      # Made up non-real world example to show how to specify different options for␣
↪different
      # flash runners
      - run: first
        runners:
          - some_other_runner
        groups:
          - qualifiers:
              - nrf5340/cpunet
          - qualifiers:
              - nrf5340/cpuapp
              - nrf5340/cpuapp/ns
```

Usage

Commands that are supported by flash runners can be used as normal when flashing non-sysbuild applications, the run once configuration will not be used. When flashing a sysbuild project with multiple images, the flash runner run once configuration will be applied.

For example, building the smp-svr sample for the nrf5340dk which will include MCUboot as a secondary image:

```
cmake -GNinja -Sshare/sysbuild/ -Bbuild -DBOARD=nrf5340dk/nrf5340/cpuapp -DAPP_DIR=samples/
↪subsys/mgmt/mcumgr/smp_svr
cmake --build build
```

Once built with an nrf5340dk connected, the following command can be used to flash the board with both applications and will only perform a single device recovery operation when programming the first image:

```
west flash --recover
```

If the above was ran without the flashing configuration, the recovery process would be ran twice and the device would be unbootable.

Chapter 6

Connectivity

6.1 Bluetooth

This section contains information regarding the Bluetooth stack of the Zephyr OS. You can use this information to understand the principles behind the operation of the layers and how they were implemented.

Zephyr includes a complete Bluetooth Low Energy stack from application to radio hardware, as well as portions of a Classical Bluetooth (BR/EDR) Host layer.

6.1.1 Supported features

Since its inception, Zephyr has had a strong focus on Bluetooth and, in particular, on Bluetooth Low Energy (BLE). Through the contributions of several companies and individuals involved in existing open source implementations of the Bluetooth specification (Linux's BlueZ) as well as the design and development of BLE radio hardware, the protocol stack in Zephyr has grown to be mature and feature-rich, as can be seen in the section below.

- Bluetooth v5.3 compliant
  - Highly configurable
    - Features, buffer sizes/counts, stack sizes, etc.
  - Portable to all architectures supported by Zephyr (including big and little endian, alignment flavors and more)
  - Support for *all combinations* of Host and Controller builds:
    - Controller-only (HCI) over UART, SPI, USB and IPC physical transports
    - Host-only over UART, SPI, and IPC (shared memory)
    - Combined (Host + Controller)
- *Bluetooth-SIG qualifiable*
  - Conformance tests run regularly on all layers (Controller and Host, except BT Classic) on Nordic Semiconductor hardware.
- *Bluetooth Low Energy Controller* (LE Link Layer)
  - Unlimited role and connection count, all roles supported
  - All v5.3 specification features supported (except a few minor items)
  - Concurrent multi-protocol support ready
  - Intelligent scheduling of roles to minimize overlap

  - Portable design to any open BLE radio, currently supports Nordic Semiconductor nRF52x and nRF53x SoC Series, as well as proprietary radios
  - Supports little and big endian architectures, and abstracts the hard real-time specifics so that they can be encapsulated in a hardware-specific module
  - Support for Controller (HCI) builds over different physical transports
  - Isochronous channels
- *Bluetooth Host*
  - Generic Access Profile (GAP) with all possible LE roles
    - Peripheral & Central
    - Observer & Broadcaster
    - Multiple PHY support (2Mbit/s, Coded)
    - Extended Advertising
    - Periodic Advertising (including Sync Transfer)
  - GATT (Generic Attribute Profile)
    - Server (to be a sensor)
    - Client (to connect to sensors)
    - Enhanced ATT (EATT)
    - GATT Database Hash
    - GATT Multiple Notifications
  - Pairing support, including the Secure Connections feature from Bluetooth 4.2
  - Non-volatile storage support for permanent storage of Bluetooth-specific settings and data
  - Bluetooth Mesh support
    - Relay, Friend Node, Low-Power Node (LPN) and GATT Proxy features
    - Both Provisioning roles and bearers supported (PB-ADV & PB-GATT)
    - Foundation Models included
    - Highly configurable, fits as small as 16k RAM devices
  - Basic Bluetooth BR/EDR (Classic) support
    - Generic Access Profile (GAP)
    - Logical Link Control and Adaptation Protocol (L2CAP)
    - Serial Port emulation (RFCOMM protocol)
    - Service Discovery Protocol (SDP)
  - Clean HCI driver abstraction
    - 3-Wire (H:5) & 5-Wire (H:4) UART
    - SPI
    - Local controller support as a virtual HCI driver
  - Verified with multiple popular controllers
  - Isochronous channels
  - *LE Audio*

6.1.2 Qualification

Qualification setup

The Zephyr Bluetooth host can be qualified using Bluetooth's PTS (Profile Tuning Suite) software. It is originally a manual process, but is automated by using the AutoPTS automation software.

The setup is described in more details in the pages linked below.

AutoPTS on Windows 10 with nRF52 board This tutorial shows how to setup AutoPTS client and server to run both on Windows 10. We use WSL1 with Ubuntu only to build a Zephyr project to an elf file, because Zephyr SDK is not available on Windows yet. Tutorial covers only nrf52840dk.

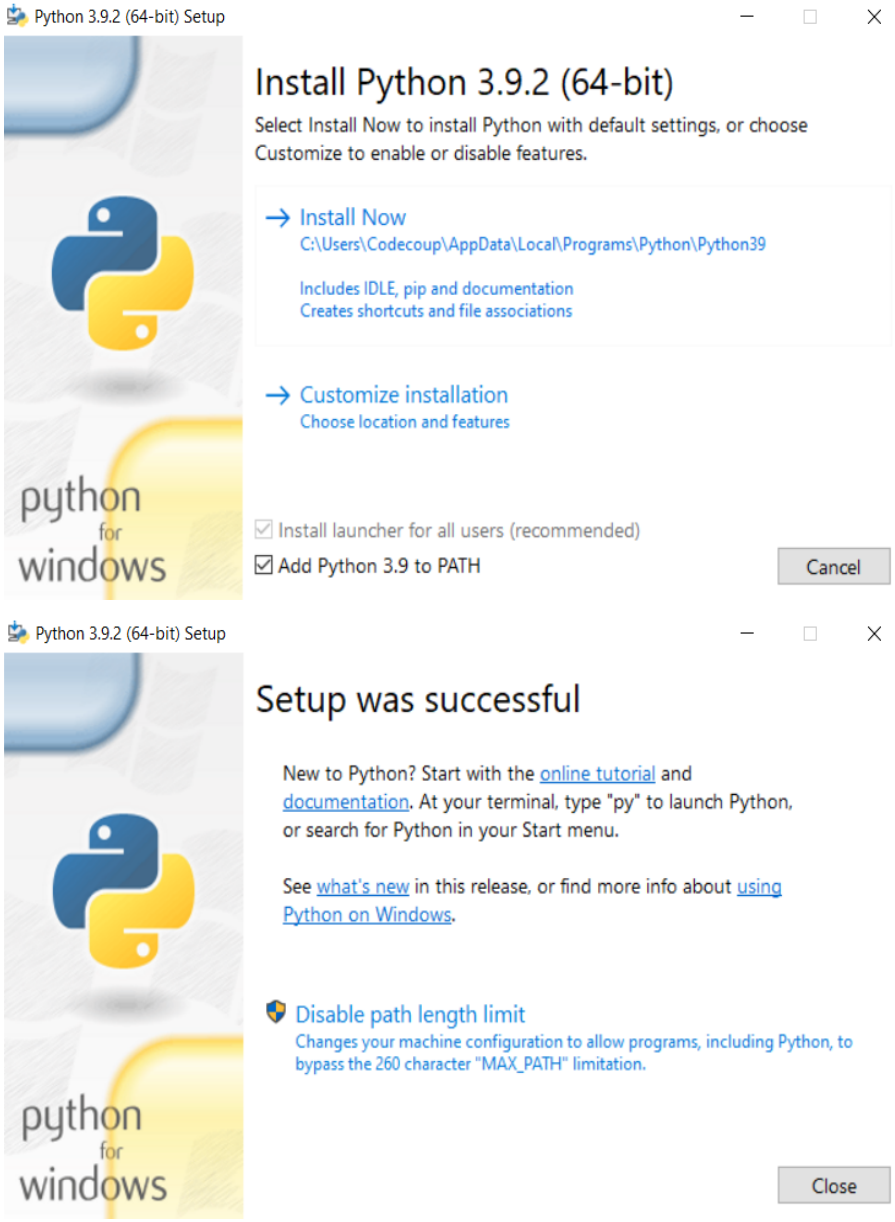
- *Update Windows and drivers*
- *Install Python 3*
- *Install Git*
- *Install PTS 8*
- *Setup Zephyr project for Windows*
- *Install nrftools*
- *Connect devices*
- *Flash board*
- *Setup auto-pts project*
- *Install socat.exe*
- *Running AutoPTS*
- *Troubleshooting*

Update Windows and drivers Update Windows in:

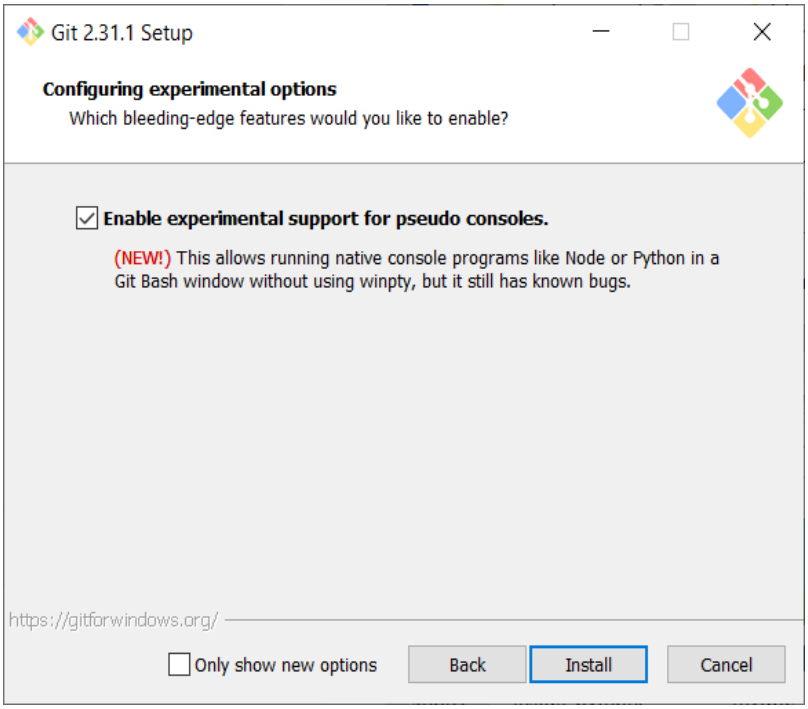
Start -> Settings -> Update & Security -> Windows Update

Update drivers, following the instructions from your hardware vendor.

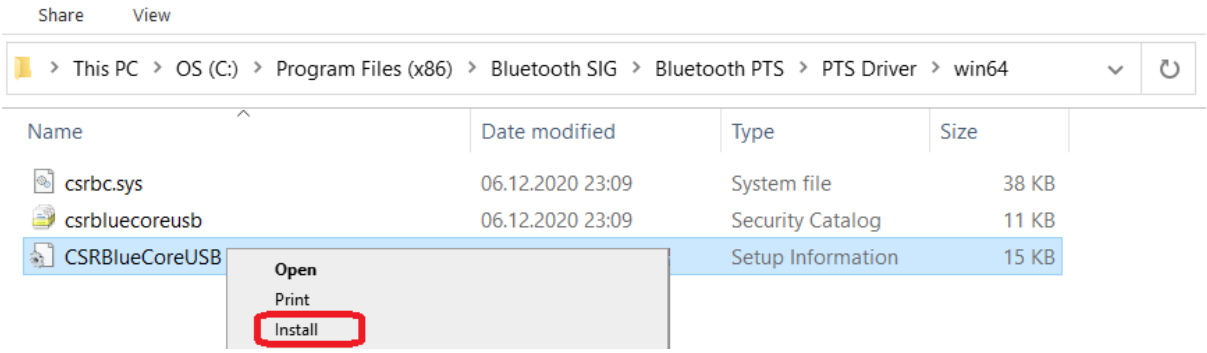
Install Python 3 Download and install Python 3. Setup was tested with versions >=3.8. Let the installer add the Python installation directory to the PATH and disable the path length limitation.



Install Git Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.



Install PTS 8 Install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory "C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf"

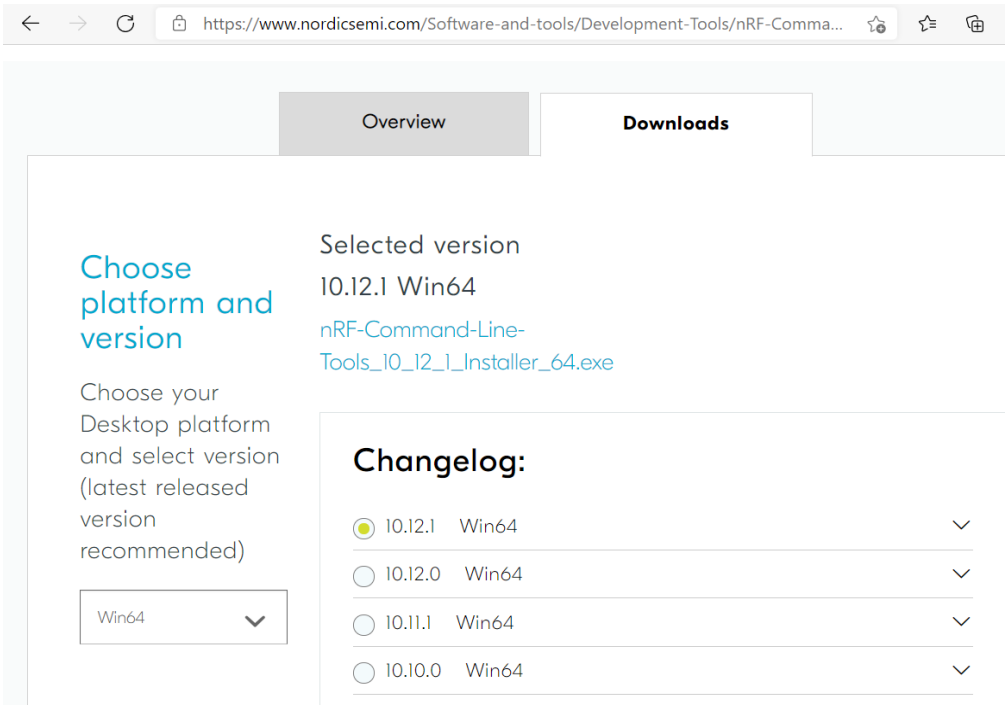


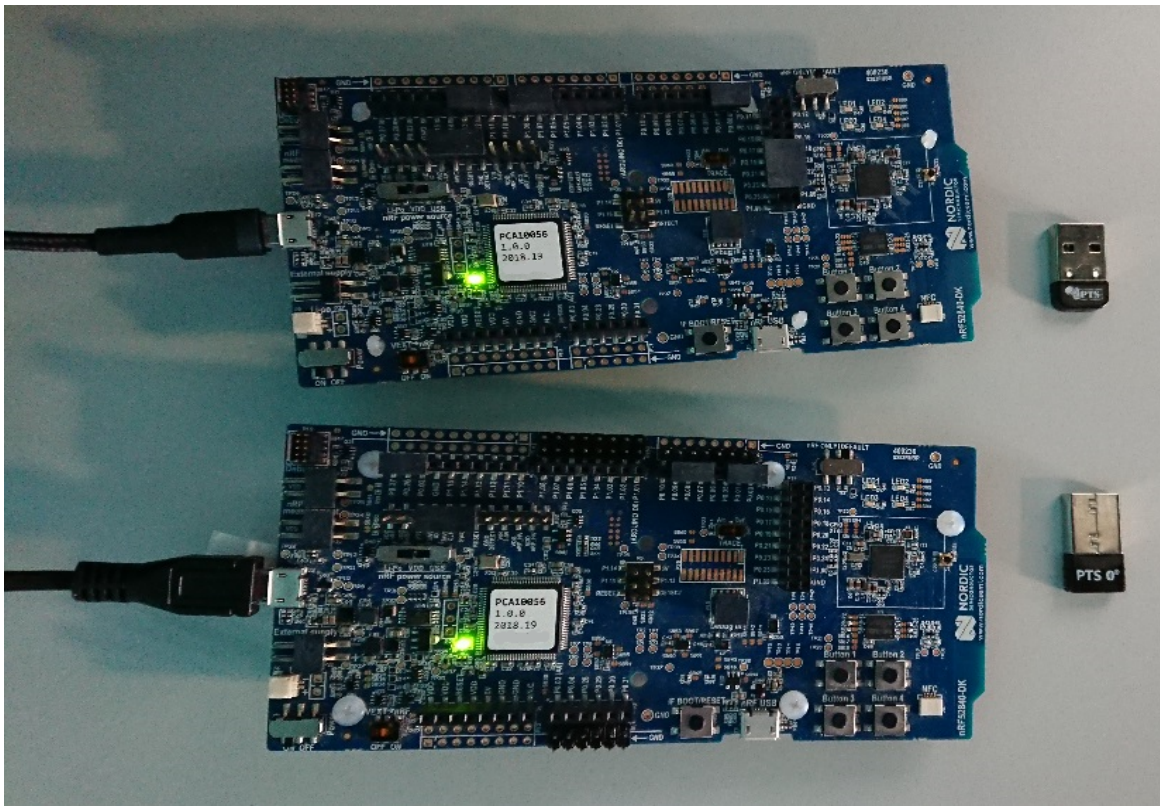
Note

Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Setup Zephyr project for Windows Perform Windows setup from Getting Started Guide.

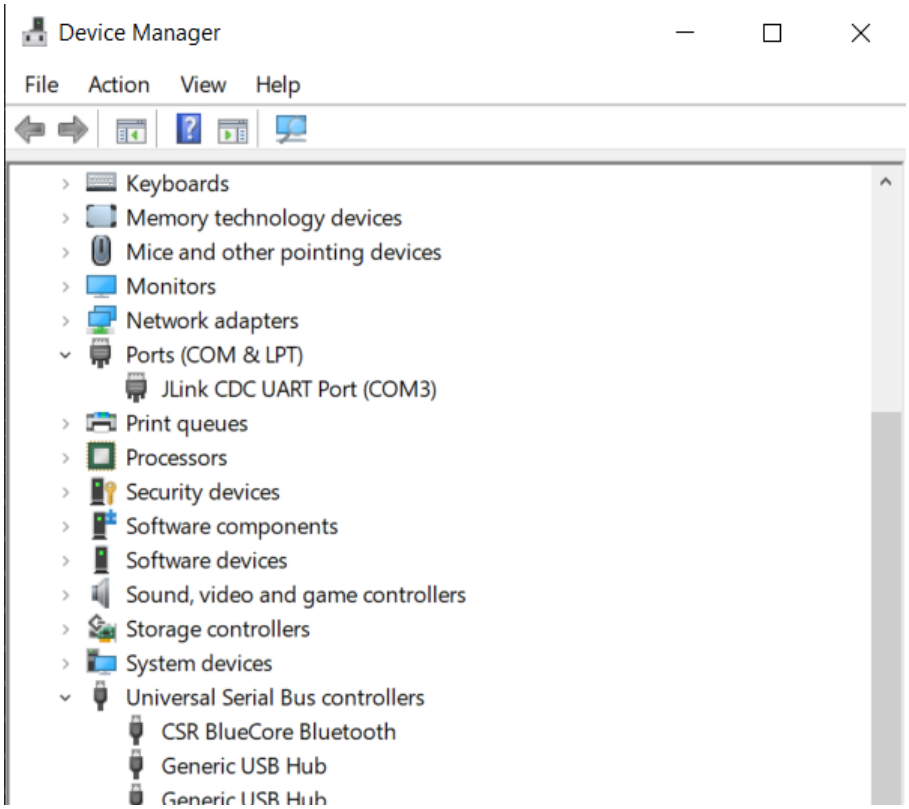
Install nrftools On Windows download latest nrftools (version >= 10.12.1) from site https://www.nordicsemi.com/Software-and-tools/Development-Tools/nRF-Command-Line-Tools/Download and run default install.





Connect devices

Flash board In Device Manager find COM port of your nrf board. In my case it is COM3.



In Git Bash, go to zephyrproject

```
cd ~/zephyrproject
```

Build the auto-pts tester app

```
west build -p auto -b nrf52840dk/nrf52840 zephyr/tests/bluetooth/tester/
```

You can display flashing options with:

```
west flash --help
```

and flash board with built earlier elf file:

```
west flash --skip-rebuild --board-dir /dev/ttyS2 --elf-file ~/zephyrproject/build/zephyr/
↪zephyr.elf
```

Note that west does not accept COMs, so use /dev/ttyS2 as the COM3 equivalent, /dev/ttyS2 as the COM3 equivalent, etc.(/dev/ttyS + decremented COM number).

Setup auto-pts project In Git Bash, clone project repo:

```
git clone https://github.com/intel/auto-pts.git
```

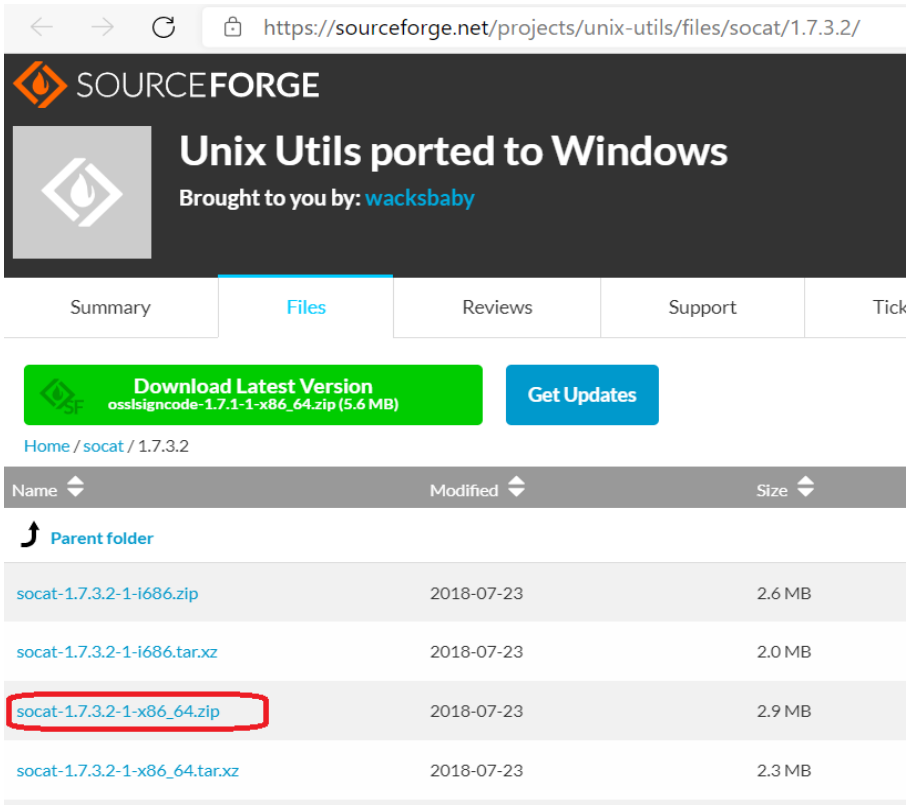
Go into the project folder:

```
cd auto-pts
```

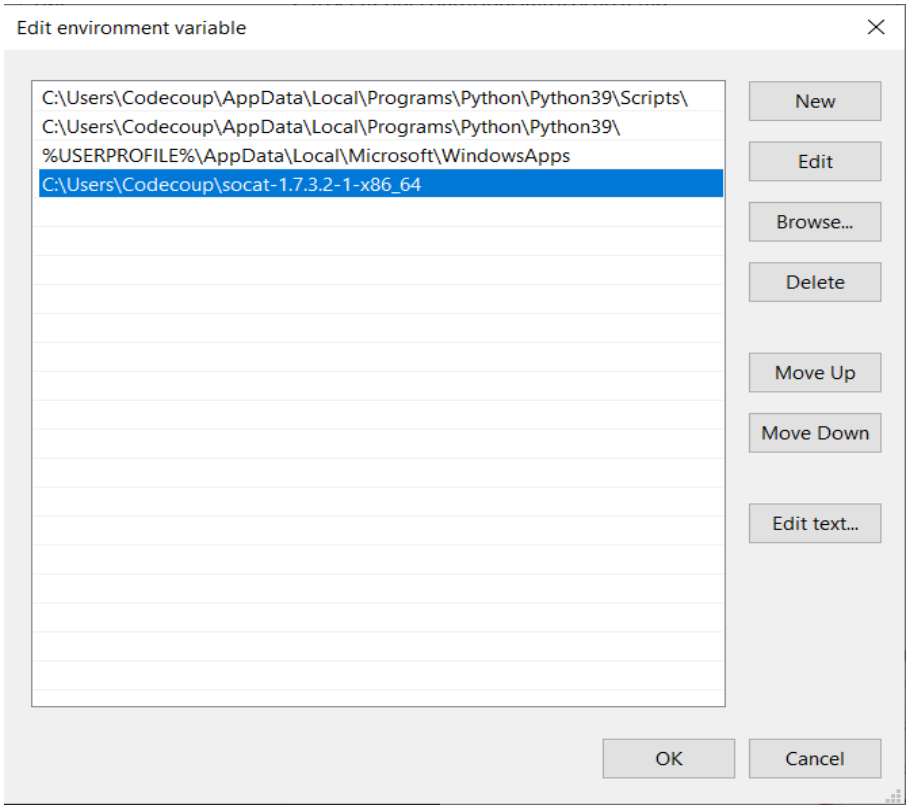
Install required python modules:

```
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
pip3 install --user -r autoptsclient_requirements.txt
```

Install socat.exe Download and extract socat.exe from https://sourceforge.net/projects/unix-utils/files/socat/1.7.3.2/ into folder ~/socat-1.7.3.2-1-x86_64/.

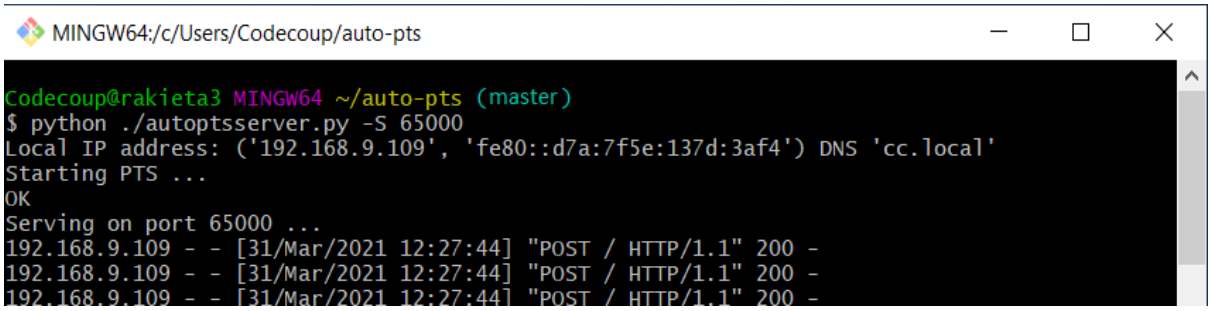


Add path to directory of socat.exe to PATH:



Running AutoPTS Server and client by default will run on localhost address. Run server:

```
python ./autoptsserver.py -S 65000
```



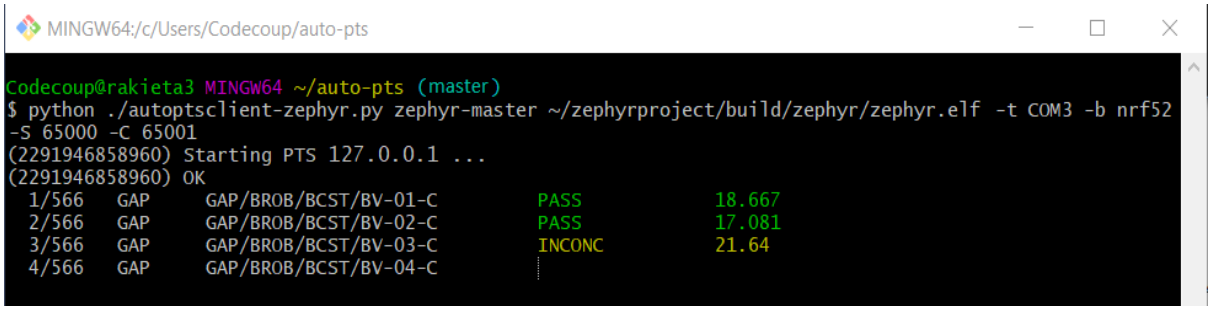
Note

If the error "ImportError: No module named pywintypes" appeared after the fresh setup, uninstall and install the pywin32 module:

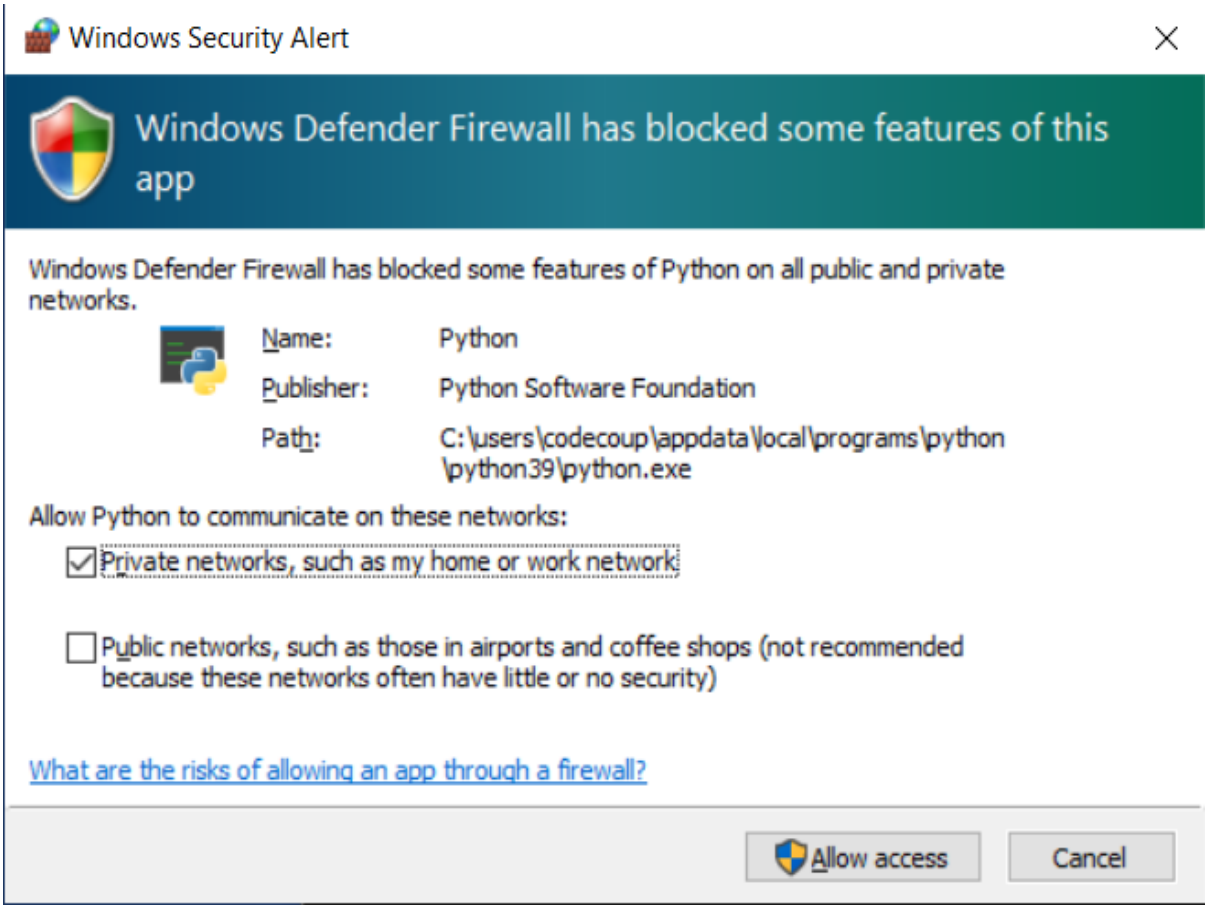
```
pip install --upgrade --force-reinstall pywin32
```

Run client:

```
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t␣
↪COM3 -b nrf52 -S 65000 -C 65001
```



At the first run, when Windows asks, enable connection through firewall:



Troubleshooting

- "When running actual hardware test mode, I have only BTP TIMEOUTs."

This is a problem with connection between auto-pts client and board. There are many possible causes. Try:

- Clean your auto-pts and zephyr repos with

Warning

This command will force the irreversible removal of all uncommitted files in the repo.

```
git clean -fdx
```

then build and flash tester elf again.

- If you have set up Windows on virtual machine, check if guest extensions are installed properly or change USB compatibility mode in VM settings to USB 2.0.
- Check, if firewall in not blocking python.exe or socat.exe.
- Check if board sends ready event after restart (hex 00 00 80 ff 00 00). Open serial connection to board with e.g. PuTTy with proper COM and baud rate. After board reset you should see some strings in console.
- Check if socat.exe creates tunnel to board. Run in console

```
socat.exe -x -v tcp-listen:65123 /dev/ttyS2,raw,b115200
```

where /dev/ttyS2 is the COM3 equivalent. Open PuTTY, set connection type to Raw, IP to 127.0.0.1, port to 65123. After board reset you should see some strings in console.

AutoPTS on Linux This tutorial shows how to setup AutoPTS client on Linux with AutoPTS server running on Windows 10 virtual machine. Tested with Ubuntu 20.4 and Linux Mint 20.4.

You must have a Zephyr development environment set up. See *Getting Started Guide* for details.

Supported methods to test zephyr bluetooth host:

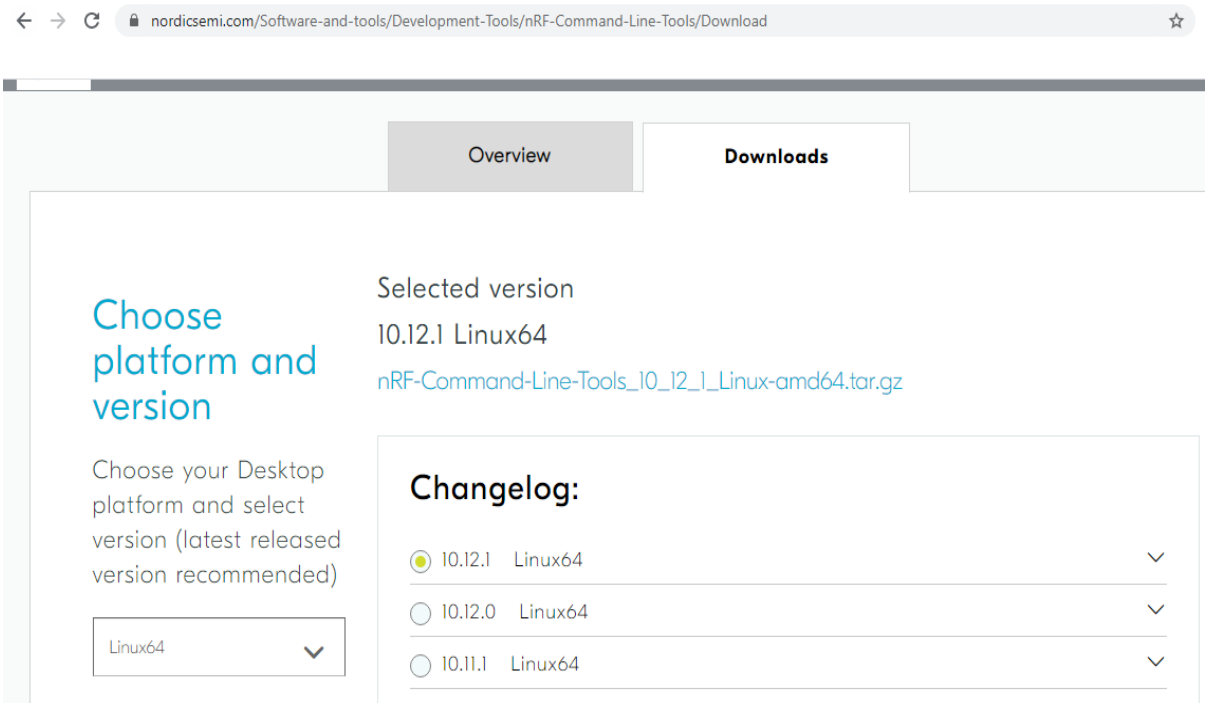
- Testing Zephyr Host Stack on QEMU
- Testing Zephyr Host Stack on native_sim
- Testing Zephyr combined (controller + host) build on Real hardware (such as nRF52)

For running with QEMU or native_sim, see *Running on QEMU or native_sim*.

- *Setup Linux*
- *Install nrftools (only required in the actual hardware test mode)*
- *Setup Windows 10 virtual machine*
  - *Update Windows*
  - *Setup static IP*
  - *Install Python 3*
  - *Install Git*
  - *Install PTS 8*
  - *Connect PTS dongle*
- *Connect devices (only required in the actual hardware test mode)*
- *Flash board (only required in the actual hardware test mode)*
- *Setup auto-pts project*
  - *AutoPTS client on Linux*
  - *Autopts server on Windows virtual machine*
- *Running AutoPTS*
- *Troubleshooting*

Setup Linux

Install nrftools (only required in the actual hardware test mode) Download latest nrftools (version >= 10.12.1) from site https://www.nordicsemi.com/Software-and-tools/Development-Tools/nRF-Command-Line-Tools/Download.



After you extract archive, you will see 2 .deb files, e.g.:

- JLink_Linux_V688a_x86_64.deb
- nRF-Command-Line-Tools_10_12_1_Linux-amd64.deb

and README.md. To install the tools, double click on each .deb file or follow instructions from README.md.

Setup Windows 10 virtual machine Choose and install your hypervisor like VMWare Workstation(preferred) or VirtualBox. On VirtualBox could be some issues, if your host has fewer than 6 CPU.

Create Windows virtual machine instance. Make sure it has at least 2 cores and installed guest extensions.

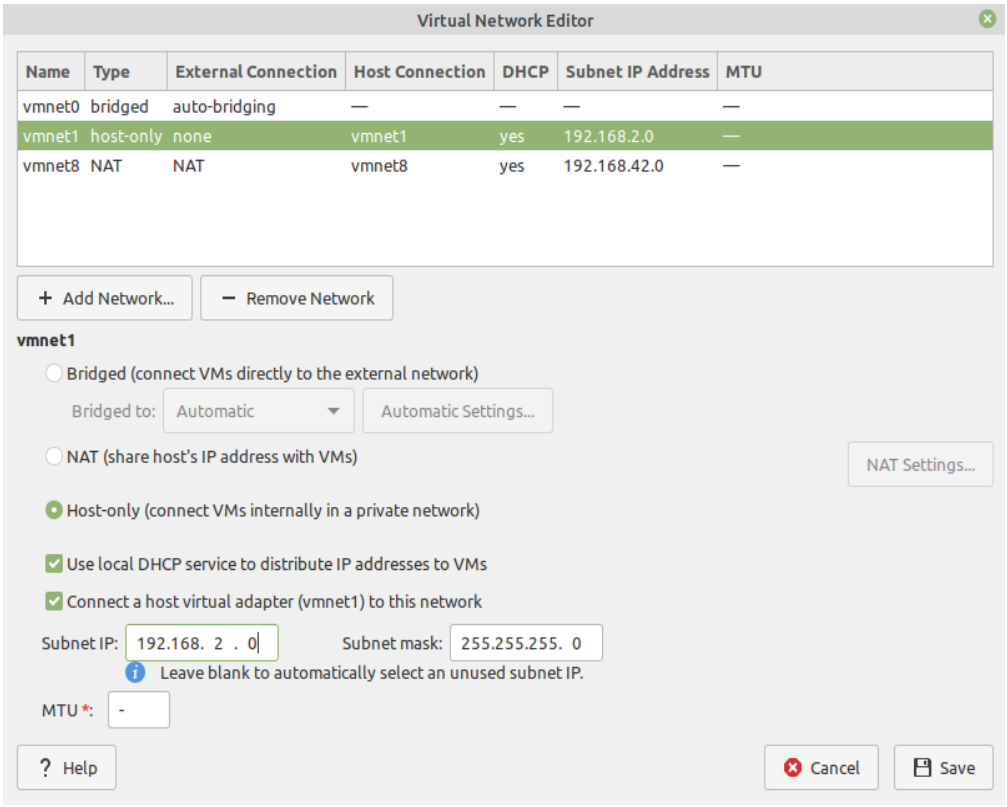
Setup tested with VirtualBox 6.1.18 and VMWare Workstation 16.1.1 Pro.

Update Windows Update Windows in:

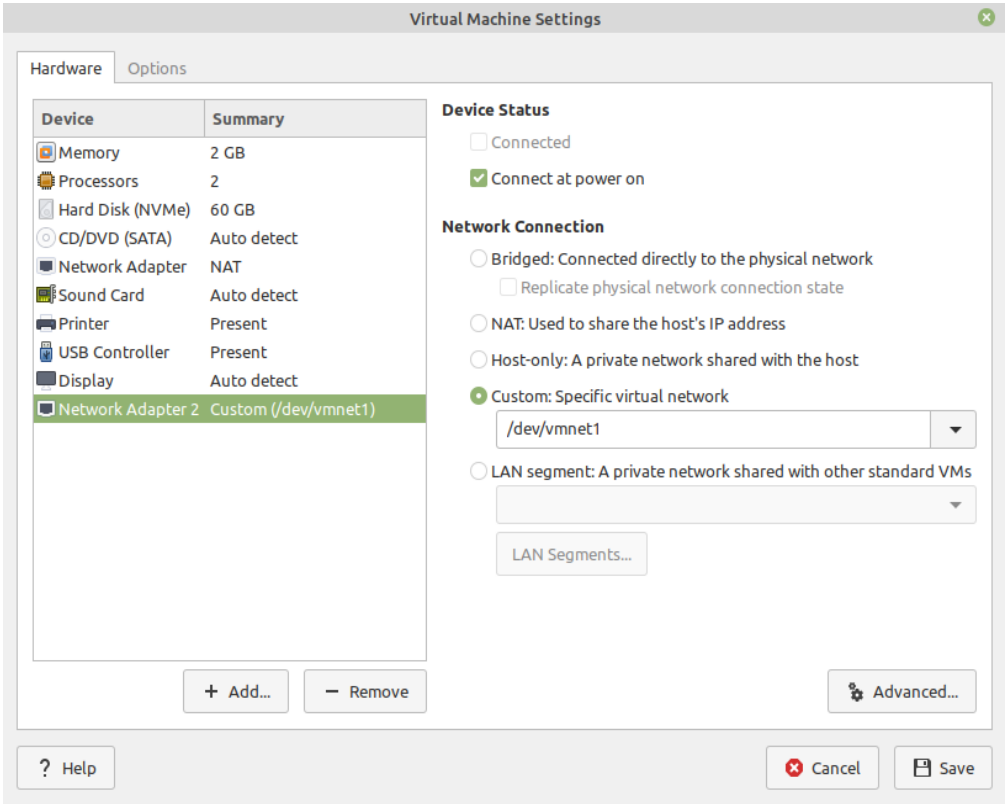
Start -> Settings -> Update & Security -> Windows Update

Setup static IP

WMWare Works On Linux, open Virtual Network Editor app and create network:



Open virtual machine network settings. Add custom adapter:



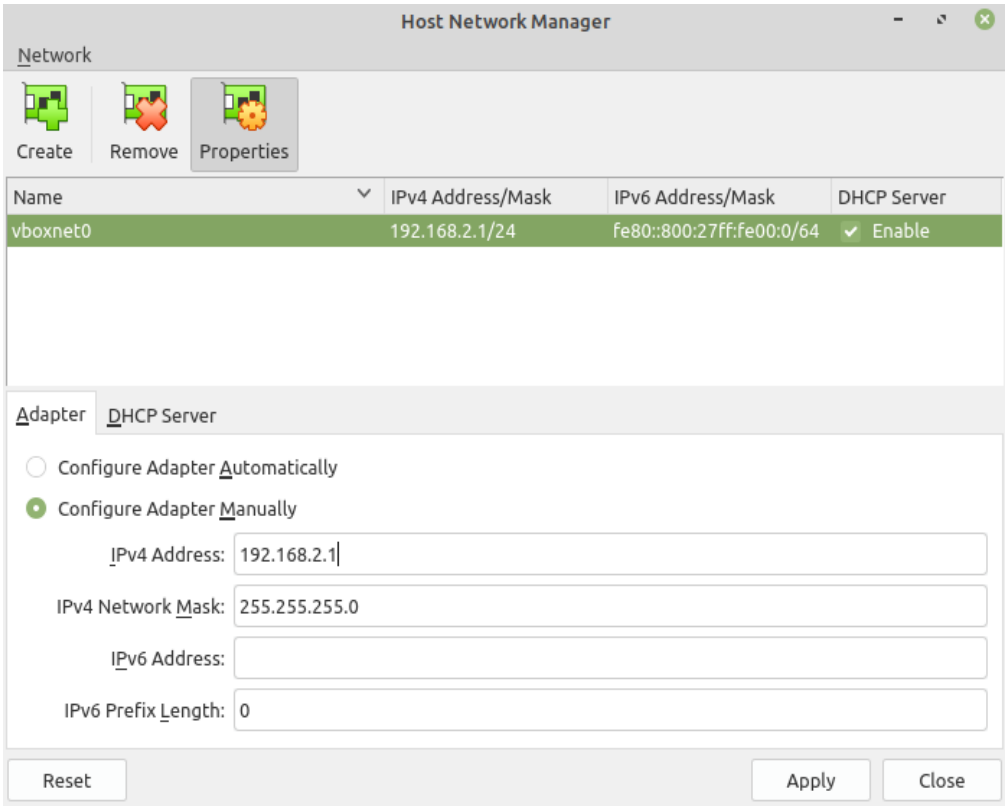
If you type 'ifconfig' in terminal, you should be able to find your host IP:

```
vmnet1: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 192.168.2.1  netmask 255.255.255.0  broadcast 192.168.2.255
        inet6 fe80::250:56ff:fec0:1  prefixlen 64  scopeid 0x20<link>
        ether 00:50:56:c0:00:01  txqueuelen 1000  (Ethernet)
        RX packets 0  bytes 0 (0.0 B)
        RX errors 0  dropped 0  overruns 0  frame 0
        TX packets 42  bytes 0 (0.0 B)
        TX errors 0  dropped 0 overruns 0  carrier 0  collisions 0
```

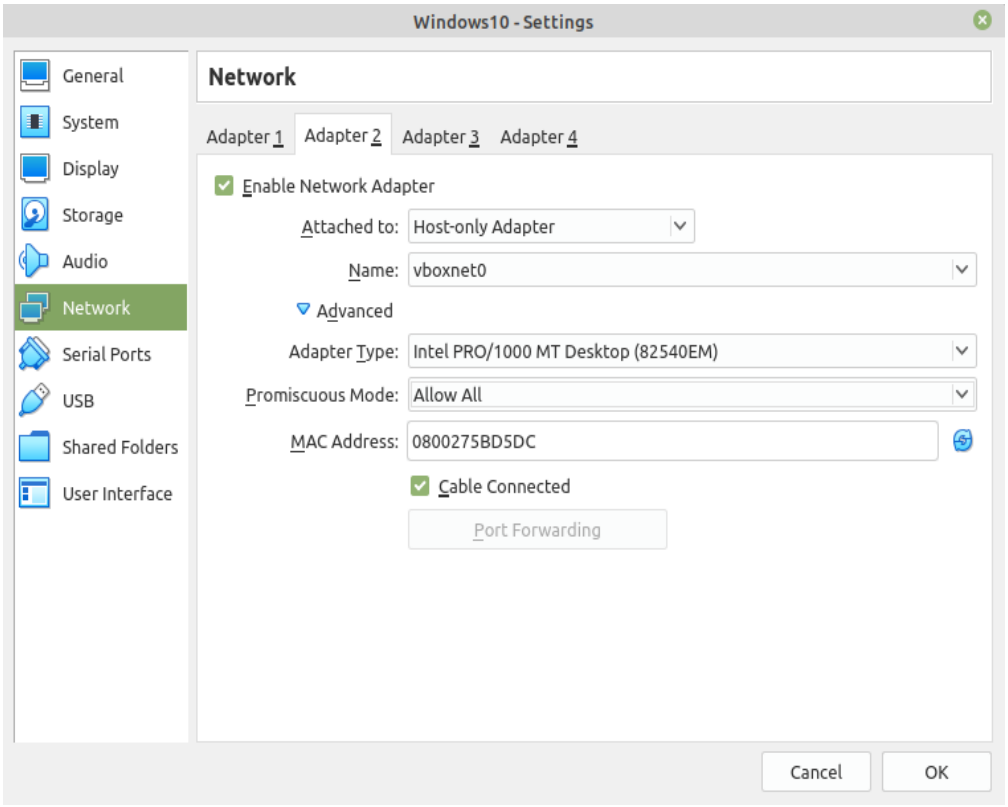
VirtualBox Go to:

File -> Host Network Manager

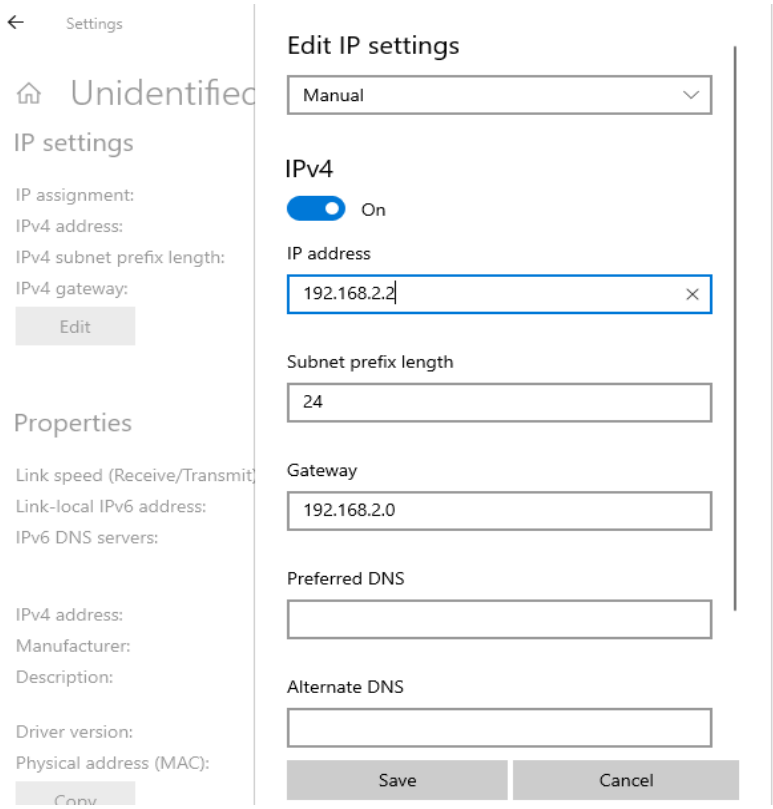
and create network:



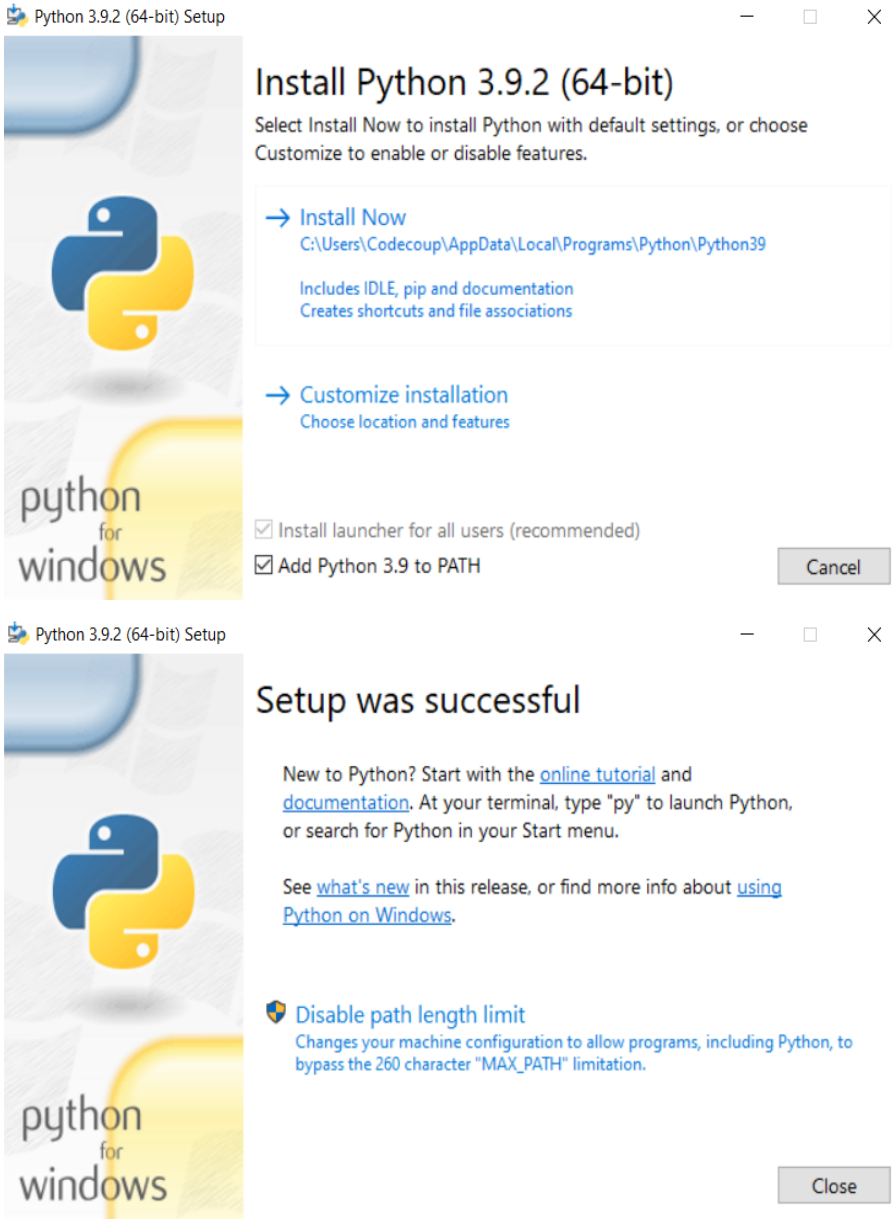
Open virtual machine network settings. On adapter 1 you will have created by default NAT. Add adapter 2:



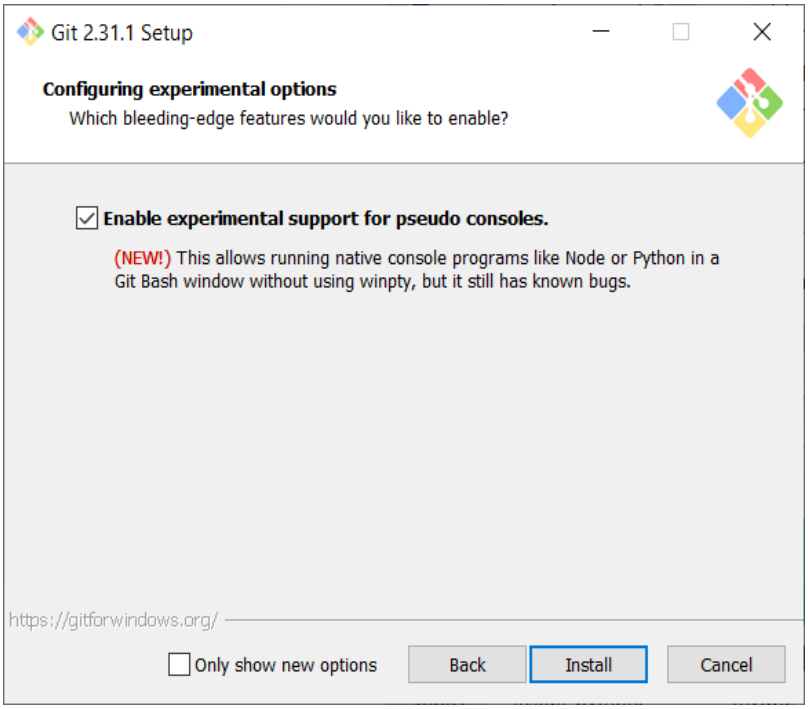
Windows Setup static IP on Windows virtual machine. Go to Settings -> Network & Internet -> Ethernet -> Unidentified network -> Edit and set:



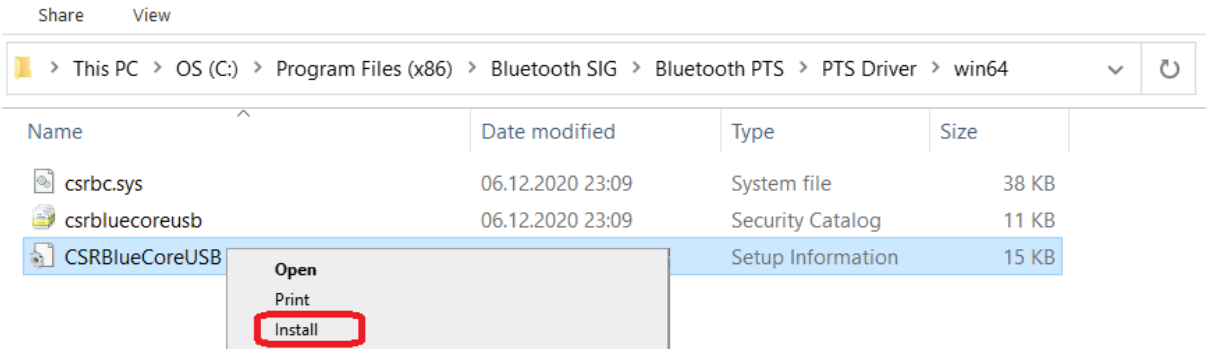
Install Python 3 Download and install latest Python 3 on Windows. Let the installer add the Python installation directory to the PATH and disable the path length limitation.



Install Git Download and install Git. During installation enable option: Enable experimental support for pseudo consoles. We will use Git Bash as Windows terminal.



Install PTS 8 On Windows virtual machine, install latest PTS from https://www.bluetooth.org. Remember to install drivers from installation directory "C:/Program Files (x86)/Bluetooth SIG/Bluetooth PTS/PTS Driver/win64/CSRBlueCoreUSB.inf"



Note

Starting with PTS 8.0.1 the Bluetooth Protocol Viewer is no longer included. So to capture Bluetooth events, you have to download it separately.

Connect PTS dongle With VirtualBox there should be no problem. Just find dongle in Devices -> USB and connect.

With VMWare you might need to use some trick, if you cannot find dongle in VM -> Removable Devices. Type in Linux terminal:

```
usb-devices
```

and find in output your PTS Bluetooth USB dongle

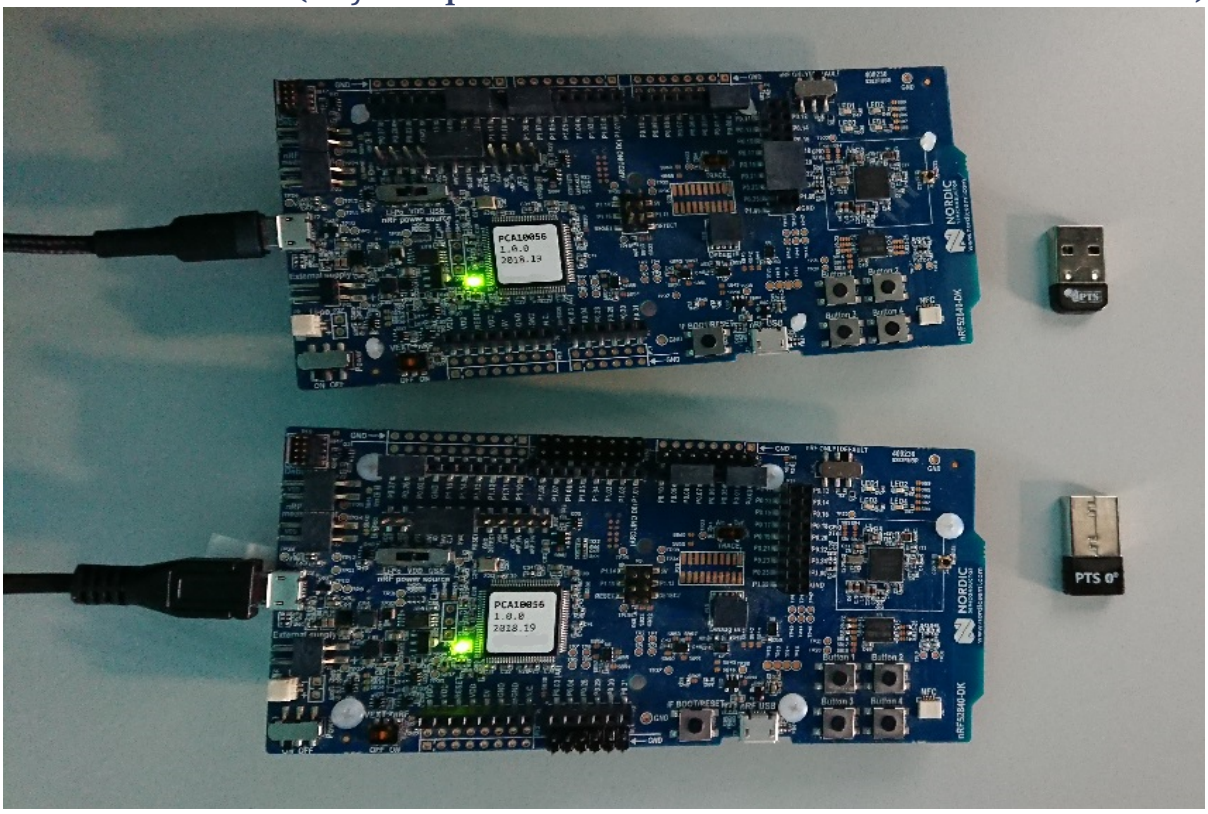
```
T:  Bus=01 Lev=01 Prnt=01 Port=01 Cnt=01 Dev#=  6 Spd=12  MxCh= 0
D:  Ver= 2.00 Cls=e0(wlcon) Sub=01 Prot=01 MxPS=64 #Cfgs=  1
P:  Vendor=0a12 ProdID=0001 Rev=25.20
S:  Product=CSR rck PTS Dongle
C:  #Ifs= 3 Cfg#= 1 Atr=c0 MxPwr=0mA
```

Note Vendor and ProdID number. Close VMWare Workstation and open .vmx of your virtual machine (path similar to /home/codecoup/vmware/Windows 10/Windows 10.vmx) in text editor. Write anywhere in the file following line:

```
usb.autoConnect.device0 = "0x0a12:0x0001"
```

just replace 0x0a12 with Vendor number and 0x0001 with ProdID number you found earlier.

Connect devices (only required in the actual hardware test mode)



Flash board (only required in the actual hardware test mode) On Linux, go to ~/zephyrproject. There should be already ~/zephyrproject/build directory. Flash board:

```
west flash
```

Setup auto-pts project

AutoPTS client on Linux Clone auto-pts project:

```
git clone https://github.com/intel/auto-pts.git
```

Install socat, that is used to transfer BTP data stream from UART's tty file:

```
sudo apt-get install python-setuptools socat
```

Install required python modules:

```
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsclient_requirements.txt
```

Autopts server on Windows virtual machine In Git Bash, clone auto-pts project repo:

```
git clone https://github.com/intel/auto-pts.git
```

Install required python modules:

```
cd auto-pts
pip3 install --user wheel
pip3 install --user -r autoptsserver_requirements.txt
```

Restart virtual machine.

Running AutoPTS Server and client by default will run on localhost address. Run server:

```
python ./autoptsserver.py
```

```
codecoup@DESKTOP-5SFTBGB MINGW64 ~/auto-pts (master)
$ python ./autoptsserver.py
Local IP address: ('10.0.2.15', 'fe80::ccb2:6ca1:6368:342a') DNS 'home'
Local IP address: ('192.168.2.2', 'fe80::fd12:15d5:2ddb:9147') DNS None
Starting PTS ...
OK
Serving on port 65000 ...
```

Testing Zephyr Host Stack on QEMU:

```
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/samples/
↪bluetooth/hci_uart/README.html#bluetooth-hci-uart

python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\PTS_
↪PROJECT\PTS_PROJECT.pqw6" \
    ~/zephyrproject/build/zephyr/zephyr.elf -i SERVER_IP -l LOCAL_IP
```

Testing Zephyr Host Stack on native_sim:

```
# A Bluetooth controller needs to be mounted.
# For running with HCI UART, please visit: https://docs.zephyrproject.org/latest/samples/
↪bluetooth/hci_uart/README.html#bluetooth-hci-uart

west build -b native_sim zephyr/tests/bluetooth/tester/ -DEXTRA_CONF_FILE=overlay-native.
↪conf

sudo python ./autoptsclient-zephyr.py "C:\Users\USER_NAME\Documents\Profile Tuning Suite\
↪PTS_PROJECT\PTS_PROJECT.pqw6" \
    ~/zephyrproject/build/zephyr/zephyr.exe -i SERVER_IP -l LOCAL_IP --hci 0
```

Testing Zephyr combined (controller + host) build on nRF52:

Note

If the error "ImportError: No module named pywintypes" appeared after the fresh setup, uninstall and install the pywin32 module:

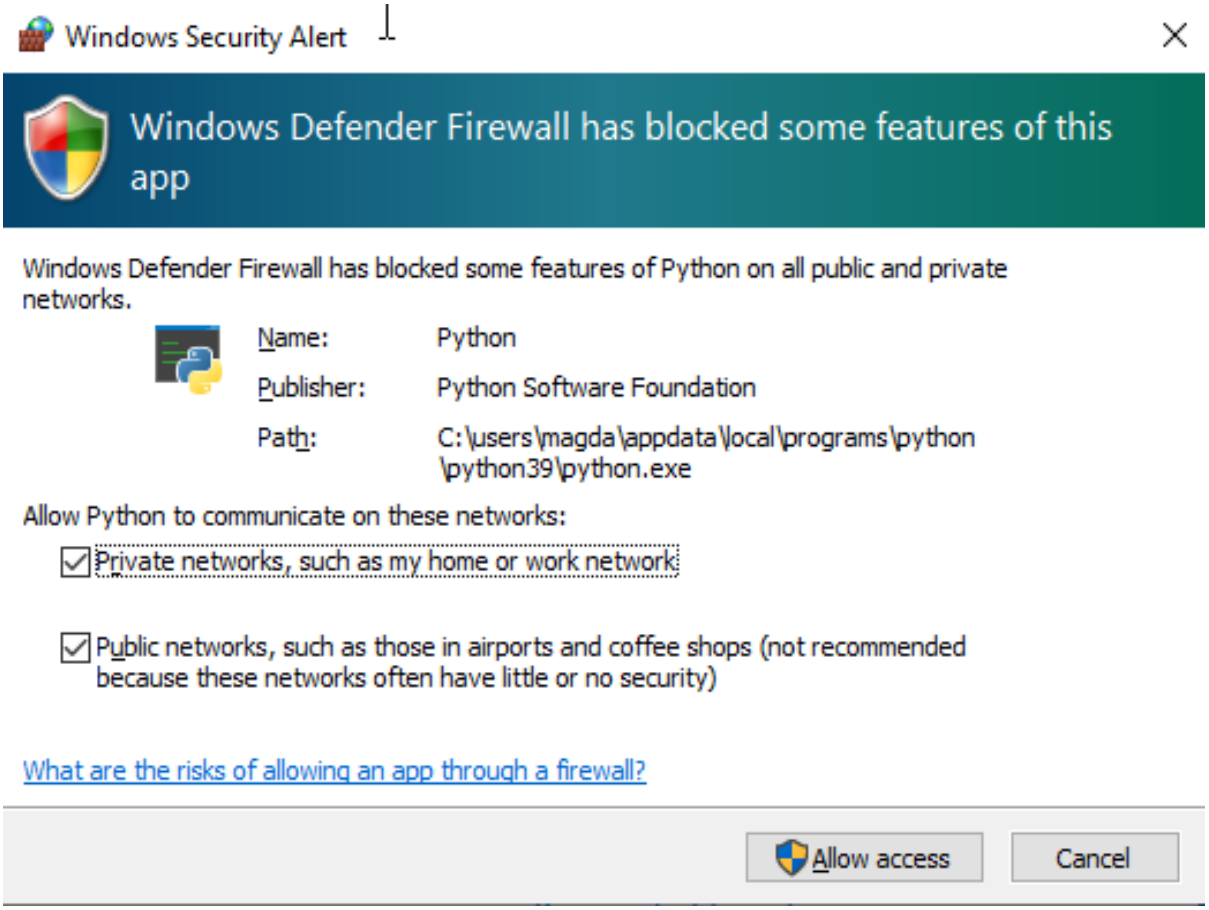
```
pip install --upgrade --force-reinstall pywin32
```

Run client:

```
python ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf -t /
↪dev/ACM0 \
    -b nrf52 -l 192.168.2.1 -i 192.168.2.2
```

```
codecoup@:~/auto-pts$ ./autoptsclient-zephyr.py zephyr-master ~/zephyrproject/build/zephyr/zephyr.elf
-t /dev/ttyACM0 -b nrf52 -l 192.168.2.1 -i 192.168.2.2
(140092026955280) Starting PTS 192.168.2.2 ...
(140092026955280) OK
  1/629   DIS     DIS/SR/SD/BV-01-C             PASS            23.477
  2/629   DIS     DIS/SR/DEC/BV-01-C            PASS            22.659
```

At the first run, when Windows asks, enable connection through firewall:



Troubleshooting

- "After running one test, I need to restart my Windows virtual machine to run another, because of fail verdict from APICOM in PTS logs."

It means your virtual machine has not enough processor cores or memory. Try to add more in settings. Note that a host with 4 CPUs could be not enough with VirtualBox as hypervisor. In this

case, choose rather VMWare Workstation.

- "I cannot start autoptsserver-zephyr.py. I always got error:"

```
codecoup@DESKTOP-5SFTBGB MINGW64 ~/auto-pts (master)
$ python ./autoptsserver.py
Local IP address: ('10.0.2.15', 'fe80::ccb2:6ca1:6368:342a') DNS 'home'
Local IP address: ('192.168.2.2', 'fe80::fd12:15d5:2ddb:9147') DNS None
Starting PTS ...

```

One or more of the following steps should help:

- Close all PTS Windows.
- Replug PTS bluetooth dongle.
- Delete temporary workspace. You will find it in auto-pts-code/workspaces/zephyr/zephyr-master/ as temp_zephyr-master. Be careful, do not remove the original one zephyr-master.pqw6.
- Restart Windows virtual machine.

ICS Features

The Zephyr ICS file for the Host features can be downloaded here: `ICS_Zephyr_Bluetooth_Host.pts`.

Use the Bluetooth Qualification website to view and edit the ICS.

6.1.3 Stack Architecture

Overview

This page describes the software architecture of Zephyr's Bluetooth protocol stack.

> **Note**
>
> Zephyr supports mainly Bluetooth Low Energy (BLE), the low-power version of the Bluetooth specification. Zephyr also has limited support for portions of the BR/EDR Host. Throughout this architecture document we use BLE interchangeably for Bluetooth except when noted.

BLE Layers There are 3 main layers that together constitute a full Bluetooth Low Energy protocol stack:

- **Host**: This layer sits right below the application, and is comprised of multiple (non real-time) network and transport protocols enabling applications to communicate with peer devices in a standard and interoperable way.
- **Controller**: The Controller implements the Link Layer (LE LL), the low-level, real-time protocol which provides, in conjunction with the Radio Hardware, standard-interoperable over-the-air communication. The LL schedules packet reception and transmission, guarantees the delivery of data, and handles all the LL control procedures.
- **Radio Hardware**: Hardware implements the required analog and digital baseband functional blocks that permit the Link Layer firmware to send and receive in the 2.4GHz band of the spectrum.

Host Controller Interface The Bluetooth Specification describes the format in which a Host must communicate with a Controller. This is called the Host Controller Interface (HCI) protocol. HCI can be implemented over a range of different physical transports like UART, SPI, or USB. This protocol defines the commands that a Host can send to a Controller and the events that it can expect in return, and also the format for user and protocol data that needs to go over the air. The HCI ensures that different Host and Controller implementations can communicate in a standard way making it possible to combine Hosts and Controllers from different vendors.

Configurations The three separate layers of the protocol and the standardized interface make it possible to implement the Host and Controller on different platforms. The two following configurations are commonly used:

- **Single-chip configuration**: In this configuration, a single microcontroller implements all three layers and the application itself. This can also be called a system-on-chip (SoC) implementation. In this case the BLE Host and the BLE Controller communicate directly through function calls and queues in RAM. The Bluetooth specification does not specify how HCI is implemented in this single-chip configuration and so how HCI commands, events, and data flows between the two can be implementation-specific. This configuration is well suited for those applications and designs that require a small footprint and the lowest possible power consumption, since everything runs on a single IC.
- **Dual-chip configuration**: This configuration uses two separate ICs, one running the Application and the Host, and a second one with the Controller and the Radio Hardware. This is sometimes also called a connectivity-chip configuration. This configuration allows for a wider variety of combinations of Hosts when using the Zephyr OS as a Controller. Since HCI ensures interoperability among Host and Controller implementations, including of course Zephyr's very own BLE Host and Controller, users of the Zephyr Controller can choose to use whatever Host running on any platform they prefer. For example, the host can be the Linux BLE Host stack (BlueZ) running on any processor capable of supporting Linux. The Host processor may of course also run Zephyr and the Zephyr OS BLE Host. Conversely, combining an IC running the Zephyr Host with an external Controller that does not run Zephyr is also supported.

Build Types The Zephyr software stack as an RTOS is highly configurable, and in particular, the BLE subsystem can be configured in multiple ways during the build process to include only the features and layers that are required to reduce RAM and ROM footprint as well as power consumption. Here's a short list of the different BLE-enabled builds that can be produced from the Zephyr project codebase:

- **Controller-only build**: When built as a BLE Controller, Zephyr includes the Link Layer and a special application. This application is different depending on the physical transport chosen for HCI:
  - hci_uart
  - hci_usb

  - hci_spi

  This application acts as a bridge between the UART, SPI or USB peripherals and the Controller subsystem, listening for HCI commands, sending application data and responding with events and received data. A build of this type sets the following Kconfig option values:

  - `CONFIG_BT=y`
  - `CONFIG_BT_HCI=y`
  - `CONFIG_BT_HCI_RAW=y`
  - `CONFIG_BT_CTLR=y`
  - `CONFIG_BT_LL_SW_SPLIT=y` (if using the open source Link Layer)

- **Host-only build**: A Zephyr OS Host build will contain the Application and the BLE Host, along with an HCI driver (UART or SPI) to interface with an external Controller chip. A build of this type sets the following Kconfig option values:

  - `CONFIG_BT=y`
  - `CONFIG_BT_HCI=y`
  - `CONFIG_BT_CTLR=n`

  All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Host-only

- **Combined build**: This includes the Application, the Host and the Controller, and it is used exclusively for single-chip (SoC) configurations. A build of this type sets the following Kconfig option values:

  - `CONFIG_BT=y`
  - `CONFIG_BT_HCI=y`
  - `CONFIG_BT_CTLR=y`
  - `CONFIG_BT_LL_SW_SPLIT=y` (if using the open source Link Layer)

  All of the samples located in `samples/bluetooth` except for the ones used for Controller-only builds can be built as Combined

The picture below shows the SoC or single-chip configuration when using a Zephyr combined build (a build that includes both a BLE Host and a Controller in the same firmware image that is programmed onto the chip):

When using connectivity or dual-chip configurations, several Host and Controller combinations are possible, some of which are depicted below:

When using a Zephyr Host (left side of image), two instances of Zephyr OS must be built with different configurations, yielding two separate images that must be programmed into each of the chips respectively. The Host build image contains the application, the BLE Host and the selected HCI driver (UART or SPI), while the Controller build runs either the hci_uart, or the hci_spi app to provide an interface to the BLE Controller.

This configuration is not limited to using a Zephyr OS Host, as the right side of the image shows. One can indeed take one of the many existing GNU/Linux distributions, most of which include Linux's own BLE Host (BlueZ), to connect it via UART or USB to one or more instances of the Zephyr OS Controller build. BlueZ as a Host supports multiple Controllers simultaneously for applications that require more than one BLE radio operating at the same time but sharing the same Host stack.

Source tree layout

The stack is split up as follows in the source tree:

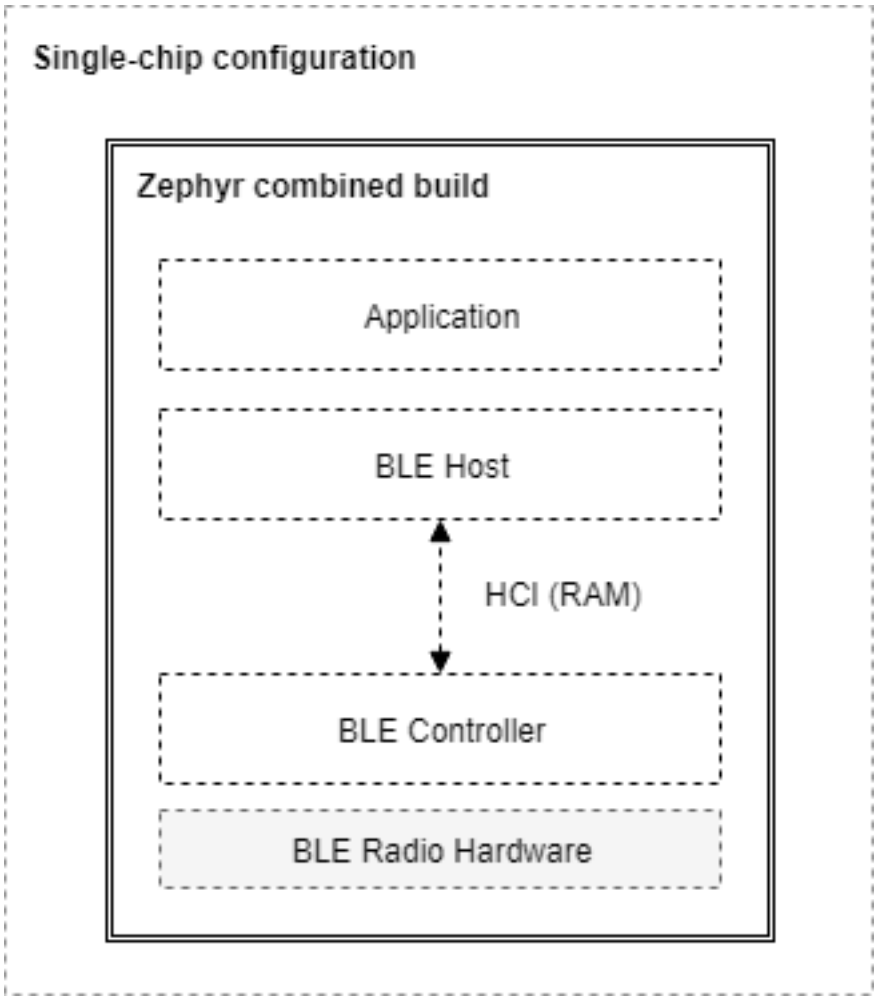

Fig. 1: A Combined build on a Single-Chip configuration

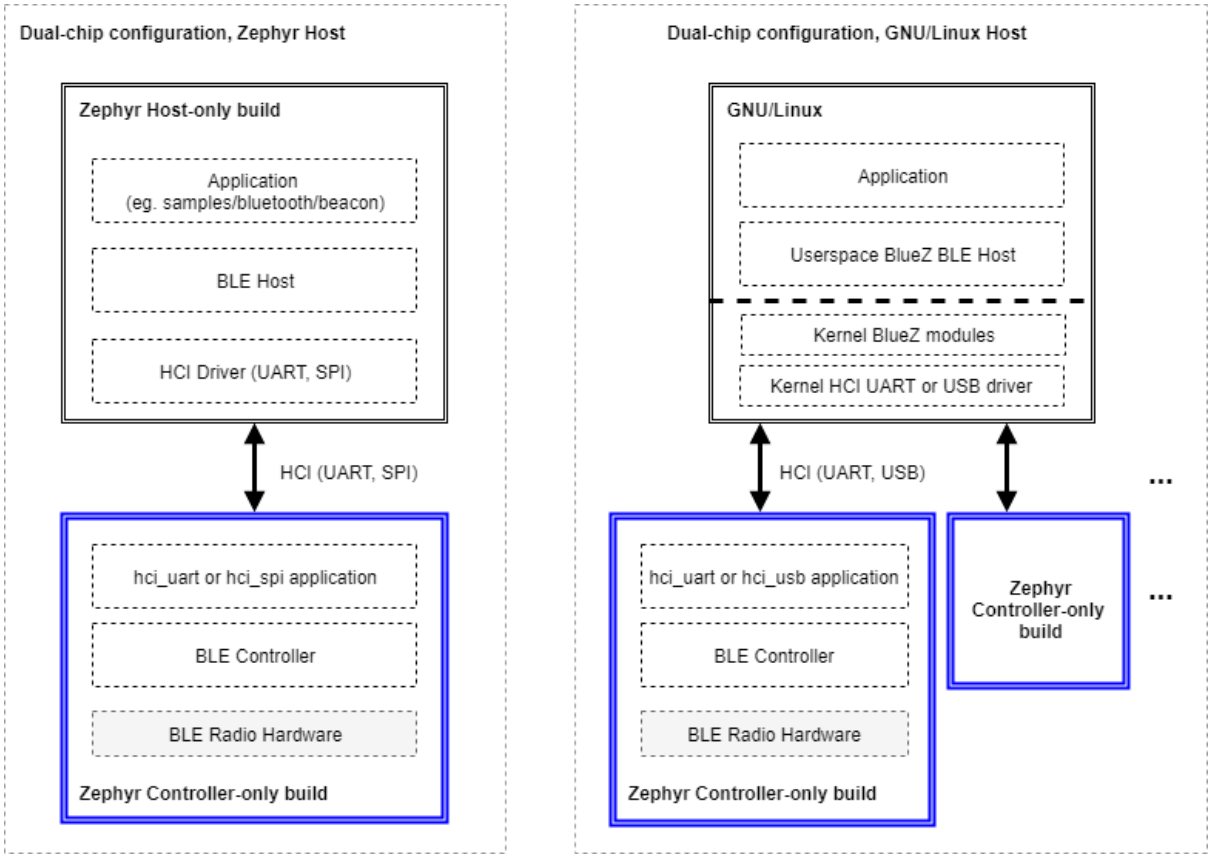

Fig. 2: Host-only and Controller-only builds on dual-chip configurations

`subsys/bluetooth/host`
: *The host stack*. This is where the HCI command and event handling as well as connection tracking happens. The implementation of the core protocols such as L2CAP, ATT, and SMP is also here.

`subsys/bluetooth/controller`
: *Bluetooth LE Controller* implementation. Implements the controller-side of HCI, the Link Layer as well as access to the radio transceiver.

`include/bluetooth/`
: *Public API* header files. These are the header files applications need to include in order to use Bluetooth functionality.

`drivers/bluetooth/`
: HCI transport drivers. Every HCI transport needs its own driver. For example, the two common types of UART transport protocols (3-Wire and 5-Wire) have their own drivers.

`samples/bluetooth/`
: Sample Bluetooth code. This is a good reference to get started with Bluetooth application development.

`tests/bluetooth/`
: Test applications. These applications are used to verify the functionality of the Bluetooth stack, but are not necessary the best source for sample code (see `samples/bluetooth` instead).

`doc/connectivity/bluetooth/`
: Extra documentation, such as PICS documents.

6.1.4 LE Host

The Bluetooth Host implements all the higher-level protocols and profiles, and most importantly, provides a high-level API for applications. The following diagram depicts the main protocol & profile layers of the host.

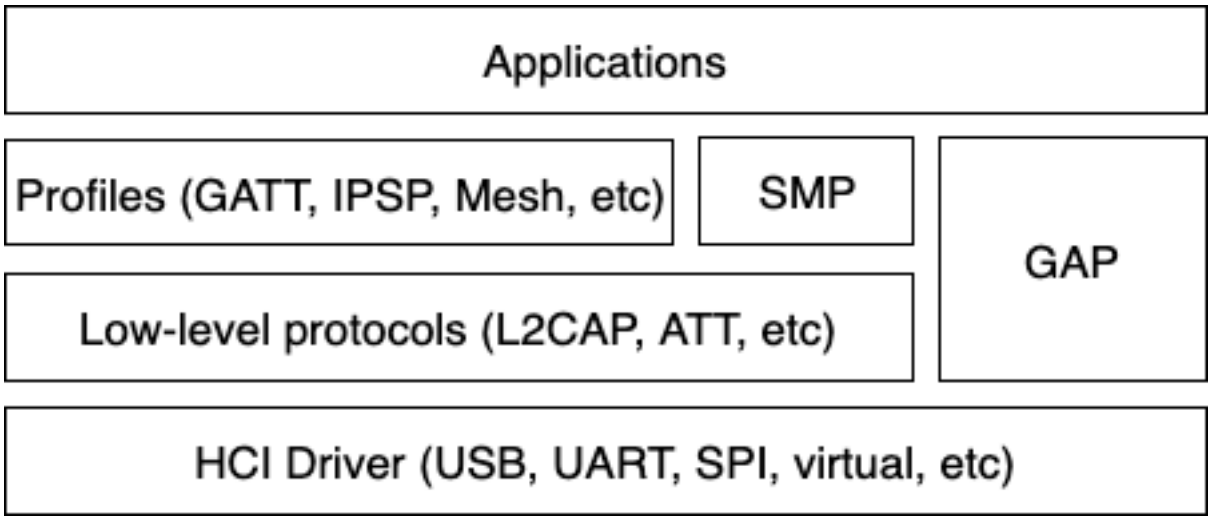

Fig. 3: Bluetooth Host protocol & profile layers.

Lowest down in the host stack sits a so-called HCI driver, which is responsible for abstracting away the details of the HCI transport. It provides a basic API for delivering data from the controller to the host, and vice-versa.

Perhaps the most important block above the HCI handling is the Generic Access Profile (GAP). GAP simplifies Bluetooth LE access by defining four distinct roles of BLE usage:

- Connection-oriented roles
  - Peripheral (e.g. a smart sensor, often with a limited user interface)
  - Central (typically a mobile phone or a PC)
- Connection-less roles
  - Broadcaster (sending out BLE advertisements, e.g. a smart beacon)
  - Observer (scanning for BLE advertisements)

Each role comes with its own build-time configuration option: `CONFIG_BT_PERIPHERAL`, `CONFIG_BT_CENTRAL`, `CONFIG_BT_BROADCASTER` & `CONFIG_BT_OBSERVER`. Of the connection-oriented roles central implicitly enables observer role, and peripheral implicitly enables broadcaster role. Usually the first step when creating an application is to decide which roles are needed and go from there. Bluetooth Mesh is a slightly special case, requiring at least the observer and broadcaster roles, and possibly also the Peripheral role. This will be described in more detail in a later section.

Peripheral role

Most Zephyr-based BLE devices will most likely be peripheral-role devices. This means that they perform connectable advertising and expose one or more GATT services. After registering services using the *bt_gatt_service_register()* API the application will typically start connectable advertising using the *bt_le_adv_start()* API.

There are several peripheral sample applications available in the tree, such as samples/bluetooth/peripheral_hr.

Central role

Central role may not be as common for Zephyr-based devices as peripheral role, but it is still a plausible one and equally well supported in Zephyr. Rather than accepting connections from other devices a central role device will scan for available peripheral device and choose one to connect to. Once connected, a central will typically act as a GATT client, first performing discovery of available services and then accessing one or more supported services.

To initially discover a device to connect to the application will likely use the *bt_le_scan_start()* API, wait for an appropriate device to be found (using the scan callback), stop scanning using *bt_le_scan_stop()* and then connect to the device using *bt_conn_le_create()*. If the central wants to keep automatically reconnecting to the peripheral it should use the *bt_le_set_auto_conn()* API.

There are some sample applications for the central role available in the tree, such as samples/bluetooth/central_hr.

Observer role

An observer role device will use the *bt_le_scan_start()* API to scan for device, but it will not connect to any of them. Instead it will simply utilize the advertising data of found devices, combining it optionally with the received signal strength (RSSI).

Broadcaster role

A broadcaster role device will use the *bt_le_adv_start()* API to advertise specific advertising data, but the type of advertising will be non-connectable, i.e. other device will not be able to connect to it.

Connections

Connection handling and the related APIs can be found in the *Connection Management* section.

Security

To achieve a secure relationship between two Bluetooth devices a process called pairing is used. This process can either be triggered implicitly through the security properties of GATT services, or explicitly using the `bt_conn_security()` API on a connection object.

To achieve a higher security level, and protect against Man-In-The-Middle (MITM) attacks, it is recommended to use some out-of-band channel during the pairing. If the devices have a sufficient user interface this "channel" is the user itself. The capabilities of the device are registered using the *bt_conn_auth_cb_register()* API. The *bt_conn_auth_cb* struct that's passed to this API has a set of optional callbacks that can be used during the pairing - if the device lacks some feature the corresponding callback may be set to NULL. For example, if the device does not have an input method but does have a display, the `passkey_entry` and `passkey_confirm` callbacks would be set to NULL, but the `passkey_display` would be set to a callback capable of displaying a passkey to the user.

Depending on the local and remote security requirements & capabilities, there are four possible security levels that can be reached:

BT_SECURITY_L1
: No encryption and no authentication.

BT_SECURITY_L2
: Encryption but no authentication (no MITM protection).

BT_SECURITY_L3
: Encryption and authentication using the legacy pairing method from Bluetooth 4.0 and 4.1.

BT_SECURITY_L4
: Encryption and authentication using the LE Secure Connections feature available since Bluetooth 4.2.

Note

Mesh has its own security solution through a process called provisioning. It follows a similar procedure as pairing, but is done using separate mesh-specific APIs.

L2CAP

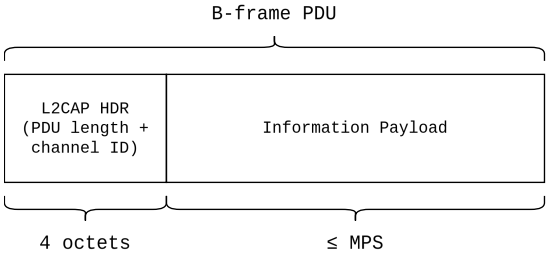
L2CAP stands for the Logical Link Control and Adaptation Protocol. It is a common layer for all communication over Bluetooth connections, however an application comes in direct contact with it only when using it in the so-called Connection-oriented Channels (CoC) mode. More information on this can be found in the *L2CAP API section*.

Terminology The definitions are from the Core Specification version 5.4, volume 3, part A 1.4.

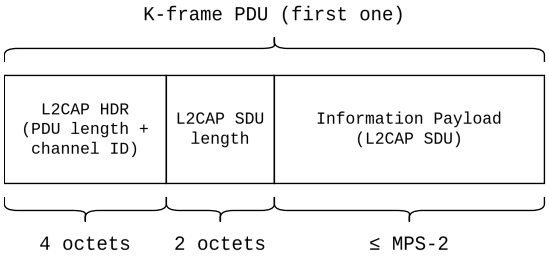
Term	Description
Upper layer	Layer above L2CAP, it exchanges data in form of SDUs. It may be an application or a higher level protocol.
Lower layer	Layer below L2CAP, it exchanges data in form of PDUs (or fragments). It is usually the HCI.
Service Data Unit (SDU)	Packet of data that L2CAP exchanges with the upper layer. This term is relevant only in Enhanced Retransmission mode, Streaming mode, Retransmission mode and Flow Control Mode, not in Basic L2CAP mode.
Protocol Data Unit (PDU)	Packet of data containing L2CAP data. PDUs always start with Basic L2CAP header. Types of PDUs for LE: *B-frames* and *K-frames*. Types of PDUs for BR/EDR: I-frames, S-frames, C-frames and G-frames.
Maximum Transmission Unit (MTU)	Maximum size of an SDU that the upper layer is capable of accepting.
Maximum Payload Size (MPS)	Maximum payload size that the L2CAP layer is capable of accepting. In Basic L2CAP mode, the MTU size is equal to MPS. In credit-based channels without segmentation, the MTU is MPS minus 2.
Basic L2CAP header	Present at the beginning of each PDU. It contains two fields, the PDU length and the Channel Identifier (CID).

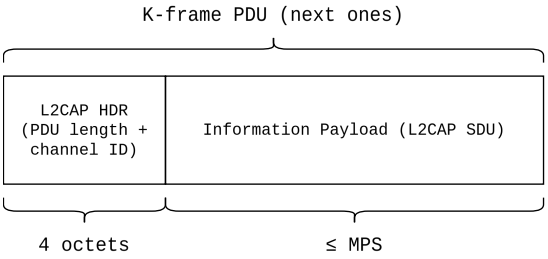
PDU Types

B-frame: Basic information frame PDU used in Basic L2CAP mode. It contains the payload received from the upper layer or delivered to the upper layer as its payload.



K-frame: Credit-based frame PDU used in LE Credit Based Flow Control mode and Enhanced Credit Based Flow Control mode. It contains a SDU segment and additional protocol information.





Relevant Kconfig

Kconfig symbol	Description
CONFIG_BT_BUF_ACL_RX_SIZE	Represents the MPS
CONFIG_BT_L2CAP_TX_MTU	Represents the L2CAP MTU
CONFIG_BT_L2CAP_DYNAMIC_CHAN	Enables LE Credit Based Flow Control and thus the stack may use *K-frame* PDUs

GATT

The Generic Attribute Profile is the most common means of communication over LE connections. A more detailed description of this layer and the API reference can be found in the *GATT API reference section*.

Mesh

Mesh is a little bit special when it comes to the needed GAP roles. By default, mesh requires both observer and broadcaster role to be enabled. If the optional GATT Proxy feature is desired, then peripheral role should also be enabled.

The API reference for mesh can be found in the *Mesh API reference section*.

LE Audio

The LE audio is a set of profiles and services that utilizes GATT and Isochronous Channel to provide audio over Bluetooth Low Energy. The architecture and API references can be found in *Bluetooth Audio Architecture*.

Persistent storage

The Bluetooth host stack uses the settings subsystem to implement persistent storage to flash. This requires the presence of a flash driver and a designated "storage" partition on flash. A typical set of configuration options needed will look something like the following:

```
CONFIG_BT_SETTINGS=y
CONFIG_FLASH=y
CONFIG_FLASH_PAGE_LAYOUT=y
CONFIG_FLASH_MAP=y
CONFIG_NVS=y
CONFIG_SETTINGS=y
```

Once enabled, it is the responsibility of the application to call settings_load() after having initialized Bluetooth (using the *bt_enable()* API).

6.1.5 LE Audio Stack

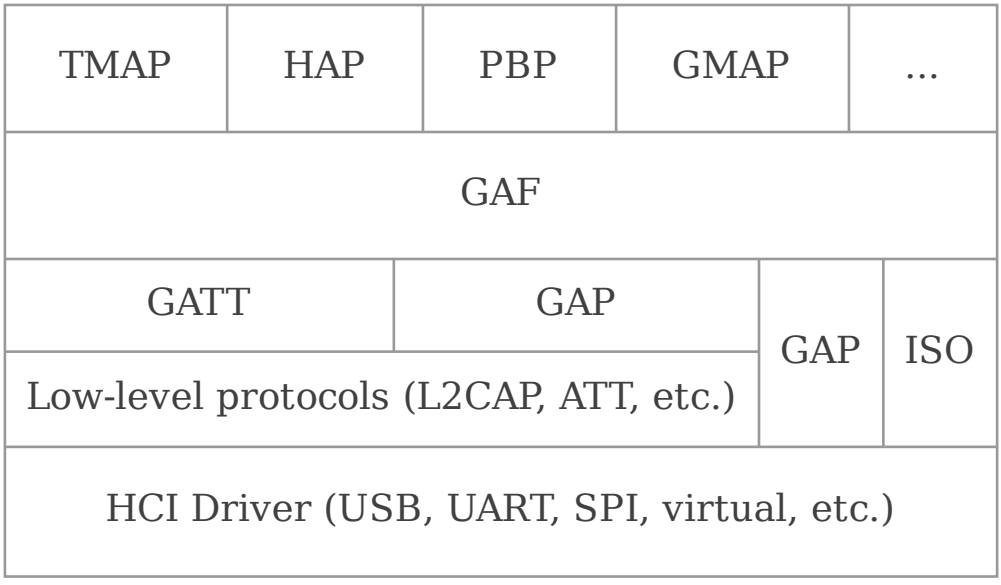


Fig. 4: Bluetooth Audio Architecture

Overall design

The overall design of the LE Audio stack is that the implementation follows the specifications as closely as possible, both in terms of structure but also naming. Most API functions are prefixed by the specification acronym (e.g. *bt_bap* for the Basic Audio Profile (BAP) and *bt_vcp* for the Volume Control Profile (VCP)). The functions are then further prefixed with the specific role from each profile where applicable (e.g. `bt_bap_unicast_client_discover()` and `bt_vcp_vol_rend_set_vol()`). There are usually a function per procedure defined by the profile or service specifications, and additional helper or meta functions that do not correspond to procedures.

The structure of the files generally also follow this, where BAP related files are prefixed with *bap* and VCP related files are prefixed with *vcp*. If the file is specific for a profile role, the role is also embedded in the file name.

Generic Audio Framework (GAF)

The Generic Audio Framework (GAF) is considered the middleware of the Bluetooth LE Audio architecture. The GAF contains the profiles and services that allows higher layer applications and profiles to set up streams, change volume, control media and telephony and more. The GAF builds on GATT, GAP and isochronous channels (ISO).

GAF uses GAP to connect, advertise and synchronize to other devices. GAF uses GATT to configure streams, associate streams with content (e.g. media or telephony), control volume and more. GAF uses ISO for the audio streams themselves, both as unicast (connected) audio streams or broadcast (unconnected) audio streams.

GAF mandates the use of the LC3 codec, but also supports other codecs.

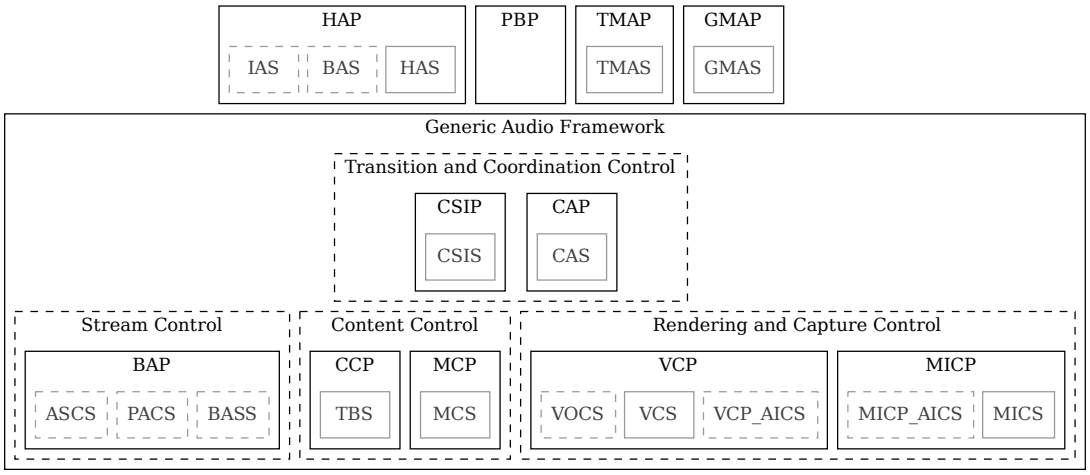

Fig. 5: Generic Audio Framework (GAF)

The top-level profiles TMAP and HAP are not part of the GAF, but rather provide top-level requirements for how to use the GAF.

GAF and the top layer profiles gave been implemented in Zephyr with the following structure.

Profile Dependencies The LE Audio profiles depend on other profiles and services, as outlined in the following tables. In these tables 'Server' refers to acting in the GATT server role, and 'Client' refers to acting in the GATT client role for the specific service. If a profile role depends on another

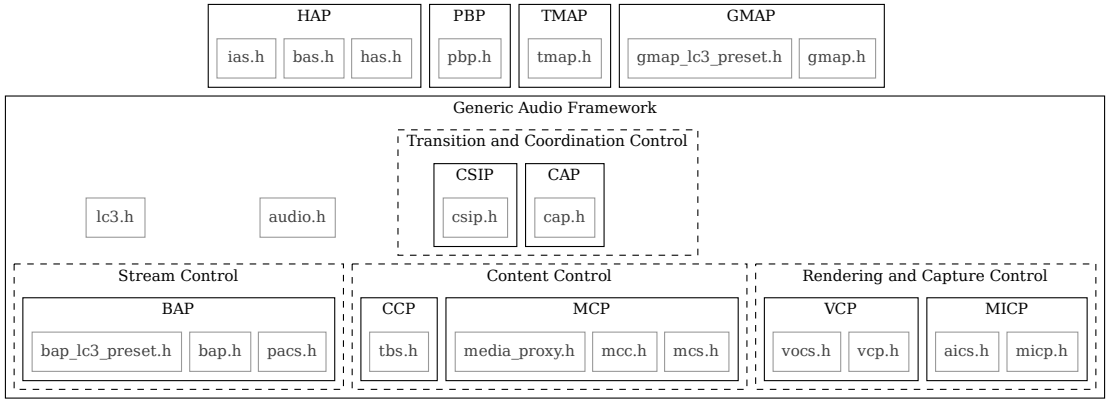

Fig. 6: Zephyr Generic Audio Framework

profile that depends on a service, then that dependency is implicitly also applied to that profile. For example, if the CAP Acceptor uses the BAP Unicast Server role, then the requirements on the ASCS Server and PACS Server also apply to the CAP Acceptor.

The dependencies for Stream Control (BAP) are in the following table.

Table 1: BAP dependencies

	Unicast Server	Unicast Client	Broadcast Source	Broadcast Sink	Scan Delegator	Broadcast Assistant
BAP Scan Delegator				M		
ASCS Client		M				
ASCS Server	M					
PACS Client		M				O
PACS Server	M			M		
BASS Client						M
BASS Server					M	

Note:

- As the table shows, the Broadcast Source role has no dependencies on other LE Audio profiles or services

The dependencies for Content Control (MCP and CCP) are in the following tables.

Table 2: MCP dependencies

	Media Control Server	Media Control Client
GMCS Server	M	
GMCS Client		M
MCS Server	O	
MCS Client		O
OTS Server	O	
OTS Client		O

Table 3: CCP dependencies

	Call Control Server	Call Control Client
GTBS Server	M	
GTBS Client		M
TBS Server	M	
TBS Client		M

The dependencies for Rendering Control (MICP and VCP) are in the following tables.

Table 4: MICP dependencies

	Microphone Controller	Microphone Device
MICS Server	M	
MICS Client		M
AICS Server	O	
AICS Client		O

Table 5: VCP dependencies

	Volume Renderer	Volume Controller
VCS Server	M	
VCS Client		M
VOCS Server	O	
VOCS Client		O
AICS Server	O	
AICS Client		O

The last element in GAF is Transition and Coordination Control (CAP and CSIP) with the dependencies from the following tables.

Table 6: CAP dependencies

	Acceptor	Initiator	Commander
CAS Server	M		C.8
CAS Client		M	M
BAP Unicast Client		C.1	
BAP Unicast Server	C.2		
BAP Broadcast Source		C.1	
BAP Broadcast Sink	C.2		
BAP Broadcast Assistant			C.4, C.6
BAP Scan Delegator	C.3		C.6
VCP Volume Controller			C.6
VCP Volume Renderer	O		
MICP Microphone Controller			C.6
MICP Microphone Device	O		
CCP Call Control Server		O	
CCP Call Control Client	O		C.6
MCP Media Control Server		O	
MCP Media Control Client	O		C.6
CSIP Set Coordinator		C.5	M
CSIP Set Member	C.7		

Notes:

- C.1: Support at least one of BAP Unicast Client or BAP Broadcast Source
- C.2: Support at least one of BAP Unicast Server or BAP Broadcast Sink
- C.3: Mandatory if BAP Broadcast Sink
- C.4: Mandatory if BAP Scan Delegator
- C.5: Mandatory if BAP Unicast Client
- C.6: Support at least one
- C.7: Mandatory if part of a coordinated set
- C.8: Mandatory if the Commander transmits CAP announcements

Table 7: CSIP dependencies

	Set Member	Set Coordinator
CSIS Server	M	
CSIS Client		M

The dependencies of the higher level profiles (GMAP, HAP, PBP and TMAP) are listed in the following tables.

Table 8: GMAP dependencies

	Unicast Game Gateway	Unicast Game Terminal	Broadcast Game Sender	Broadcast Game Receiver
GMAS Server	M	M	O	M
GMAS Client	M	O	O	O
CAP Initiator	M		M	
CAP Acceptor		M		M
CAP Commander	M		M	
BAP Broadcast Source			M	
BAP Broadcast Sink				M
BAP Unicast Client	M			
BAP Unicast Server		M		
VCP Volume Controller	M			
VCP Volume Renderer		C.1		M
MICP Microphone Controller	O			
MICP Microphone Device		C.2		

Notes:

- C.1 Mandatory if the UGT supports the UGT Sink feature
- C.2 Optional if the UGT supports the UGT Source feature

Table 9: HAP dependencies

	Hearing Aid	Hearing Aid Unicast Client	Hearing Aid Remote Controller
HAS Client			M
HAS Server	M		
CAP Initiator		M	
CAP Acceptor	M		
CAP Commander			M
BAP Unicast Client		M	
BAP Unicast Server	M		
VCP Volume Controller			M
VCP Volume Renderer	M		
VOCS Server	C.1		
AICS Server	O		
MICP Microphone Controller			O
MICP Microphone Device	C.2		
CCP Call Control Client	O		
CCP Call Control Server		O	
CSIP Set Coordinator		M	M
CSIP Set Member	C.3		
BAS Server	C.4		
IAS Server	O		

Notes:

- C.1 Mandatory if the HA supports the Volume Baslance feature and is part of a Binaural Hearing Aid Set
- C.2 Mandatory if the HA supports the BAP Audio Source Role
- C.3 Mandatory if the HA is capable of being part of a Binaural Hearing Aid set
- C.4 If equipped with batteries
- C.5 If CCP Call Control Server is supported

Table 10: PBP dependencies

	Public Broadcast Source	Public Broadcast sink	Public Broadcast Assistant
CAP Initiator	M		
CAP Acceptor		M	
CAP Commander			M
BAP Broadcast Assistant			M

Table 11: TMAP dependencies

	Call Gateway	Call Terminal	Unicast Media Sender	Unicast Media Receiver	Broadcast Media Sender	Broadcast Media Receiver
TMAS Server	M	M	M	M	O	M
TMAS Client	O	O	O	O	O	O
CAP Initiator	M		M		M	
CAP Acceptor		M		M		M
CAP Commander	M	O	M	O	O	O
BAP Broadcast Source					M	
BAP Broadcast Sink						M
BAP Unicast Client	M		M			
BAP Unicast Server		M		M		
VCP Volume Controller	M		M			
VCP Volume Renderer		C.1		M		M
MCP Media Control Server			M			
CCP Call Control Server	M					

Notes:

- C.1 Mandatory to support if the BAP Unicast Server is acting as an Audio Sink

Bluetooth Audio Stack Status The following table shows the current status and support of the profiles in the Bluetooth Audio Stack.

Table 12: Bluetooth Audio Profile status

Module	Role	Version	Added in Release	Status	Remaining
VCP	Volume Renderer	1.0	2.6	• Feature complete • Shell Module • BSIM test	• Sample Application

continues on next page

Table 12 – continued from previous page

Module	Role	Version	Added in Release	Status	Remaining
	Volume Controller	1.0	2.6	• Feature complete • Shell Module • BSIM test	• Sample Application
MICP	Microphone Device	1.0	2.7	• Feature complete • Shell Module • BSIM test	• Sample Application

Using the Bluetooth Audio Stack To use any of the profiles in the Bluetooth Audio Stack, including the top-level profiles outside of GAF, `CONFIG_BT_AUDIO` shall be enabled. This Kconfig option allows the enabling of the individual profiles inside of the Bluetooth Audio Stack. Each profile can generally be enabled on its own, but enabling higher-layer profiles (such as CAP, TMAP and HAP) will typically require enabling some of the lower layer profiles.

It is, however, possible to create a device that uses e.g. only Stream Control (with just the BAP), without using any of the content control or rendering/capture control profiles, or vice versa. Using the higher layer profiles will however typically provide a better user experience and better interoperability with other devices.

Common Audio Profile (CAP) The Common Audio Profile introduces restrictions and requirements on the lower layer profiles. The procedures in CAP works on one or more streams for one or more devices. Is it thus possible via CAP to do a single function call to setup multiple streams across multiple devices.

The figure below shows a complete structure of the procedures in CAP and how they correspond to procedures from the other profiles. The circles with I, A and C show whether the procedure

has active involvement or requirements from the CAP Initiator, CAP Accept and CAP Commander roles respectively.

The API reference for CAP can be found in *Common Audio Profile*.

Stream Control (BAP) Stream control is implemented by the Basic Audio Profile. This profile defines multiple roles:

- Unicast Client
- Unicast Server
- Broadcast Source
- Broadcast Sink
- Scan Delegator
- Broadcast Assistant

Each role can be enabled individually, and it is possible to support more than one role.

Notes about the stream control services There are 3 services primarily used by stream control using the Basic Audio Profile.

Audio Stream Control Service (ASCS) ASCS is a service used exclusively for setting up unicast streams, and is located on the BAP Unicast Server device. The service exposes one or more endpoints that can either be a sink or source endpoint, from the perspective of the Unicast Server. That means a sink endpoint is always audio from the Unicast Client to the Unicast Server, and a source endpoint is always from the Unicast Server to the Unicast Client.

Unlike most other GATT services, ASCS require that each characteristic in the service has unique data per client. This means that if a Unicast Server is connected to multiple Unicast Clients, the Unicast Clients are not able to see or control the endpoints configured by the other clients. For example if a person's smartphone is streaming audio to a headset, then the same person will not be able to see or control that stream from their smartwatch.

Broadcast Audio Scan Service (BASS) BASS is a service that is exclusively used by the Scan Delegator and Broadcast Assistant. The main purpose of the service is to offload scanning from low power peripherals to e.g. phones and PCs. Unlike ASCS where the data is required to be unique per client, the data in BASS (called receive states) are (usually) shared among all connected clients. That means it is possible for a person to tell their headphones to synchronize to a Broadcast Source using their phone, and then later tell their headphones to stop synchronizing using their smartwatch.

A Broadcast Assistant can be any device, and may only support this one role without any audio capabilities. This allows legacy devices that do not support periodic advertisements or isochronous channels to still provide an interface and scan offloading for peripherals. The Bluetooth SIG have provided a guide on how to develop such legacy Broadcast Assistants that can be found at https://www.bluetooth.com/bluetooth-resources/developing-auracast-receivers-with-an-assistant-application-for-legacy-smartphones/. An important note about this guide is that many operating systems (especially on phones), do not allow generic usage of the BASS UUID, effectively making it impossible to implement your own Broadcast Assistant, because you cannot access the BASS.

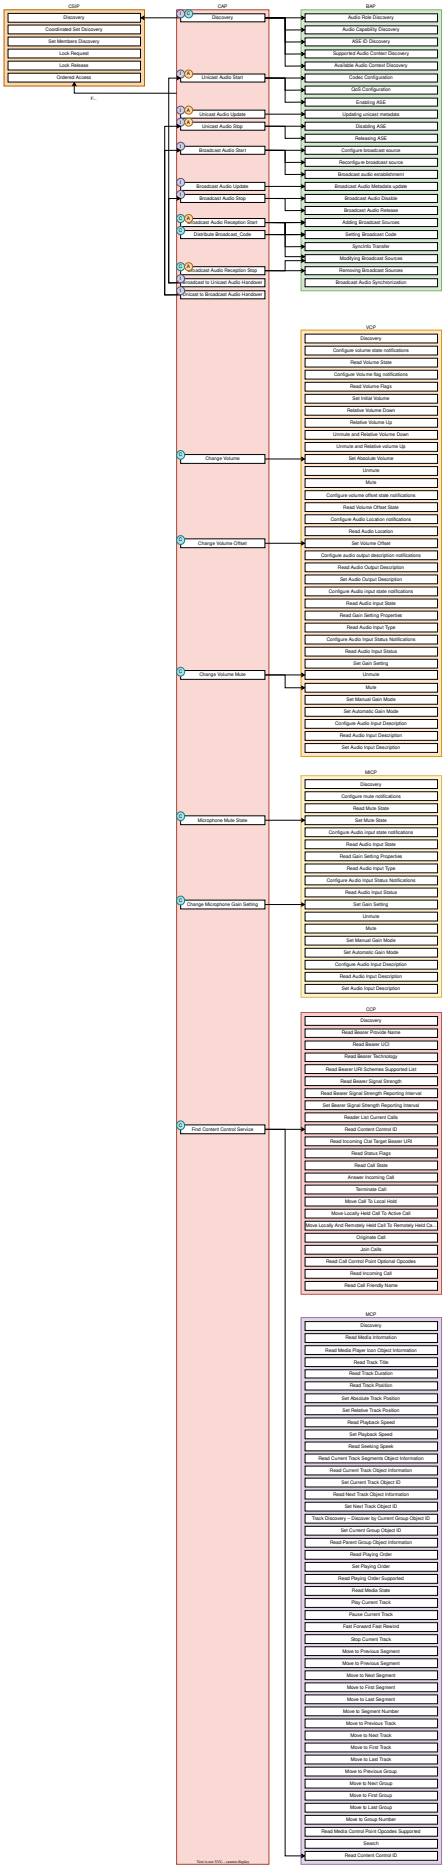

Fig. 7: Common Audio Profile Procedures

Published Audio Capabilities Service (PACS) PACS is used to expose a device's audio capabilities in Published Audio Capabilities (PAC) records. PACS is used by nearly all roles, where the Unicast Client and Broadcast Assistant will act as PACS clients, and Unicast Server and Broadcast Sink will act as PACS servers. These records contain information about the codec, and which values are supported by each codec. The values for the LC3 codec are defined by the Bluetooth Assigned numbers (https://www.bluetooth.com/specifications/assigned-numbers/), and the values for other codecs such as SBC are left undefined/implementation specific for BAP.

PACS also usually share the same data between each connected client, but by using functions such as `bt_pacs_conn_set_available_contexts_for_conn()`, it is possible to set specific values for specific clients.

The API reference for stream control can be found in *Bluetooth Audio*.

Rendering and Capture Control Rendering and capture control is implemented by the Volume Control Profile (VCP) and Microphone Control Profile (MICP).

The VCP implementation supports the following roles

- Volume Control Service (VCS) Server
- Volume Control Service (VCS) Client

The MICP implementation supports the following roles

- Microphone Control Profile (MICP) Microphone Device (server)
- Microphone Control Profile (MICP) Microphone Controller (client)

The API reference for volume control can be found in *Bluetooth Volume Control*.

The API reference for Microphone Control can be found in *Bluetooth Microphone Control*.

Content Control Content control is implemented by the Call Control Profile (CCP) and Media Control Profile (MCP).

The CCP implementation is not yet implemented in Zephyr.

The MCP implementation supports the following roles

- Media Control Service (MCS) Server via the Media Proxy module
- Media Control Client (MCC)

The API reference for media control can be found in *Bluetooth Media Control*.

Generic TBS and Generic MCS Both the Telephone Bearer Service (TBS) used by CCP and the Media Control Service (MCS) used by MCP have the concept of generic instances of the services called Generic TBS (GTBS) and Generic MCS (GMCS).

While these share a common name prefix, the behavior of these two may be significantly different.

Generic TBS The TBS spec defines GTBS as

> GTBS provides a single point of access and exposes a representation of its internal telephone bearers into a single telephone bearer. This service provides telephone status and control of the device as a single unit with a single set of characteristics. It is left up to the implementation to determine what telephone bearer a characteristic of GTBS represents at any time. There is no specified manner of representing a characteristic from each individual TBS that resides on the device to the same characteristic of the GTBS.

> For example, if there is more than one TBS on a device and each has a unique telephone bearer name (e.g., Name1 and Name2), the way the GTBS represents the telephone bearer name is left up to the implementation. GTBS is suited for clients that do not need to access or control all the information available on specific telephone bearers.

This means that a GTBS instance represents one or more telephone bearers. A telephone bearer could be any application on a device that can handle (telephone) calls, such as the default Call application on a smartphone, but also other applications such as Signal, Discord, Teams, Slack, etc.

GTBS may be standalone (i.e.the device only has a GTBS instance without any TBS instances), and the behavior of the GTBS is mostly left up to the implementation. In Zephyr the implementation of GBTS is that it contains some generic information, such as the provider name which is defined to simply be "Generic TBS", but the majority of the information in the GTBS instance in Zephyr has been implemented to be a union of the data of the other bearers. For example if you have a bearer for regular phone calls and Teams and have an active call in both bearers, then each of those bearers will report a single call, but the GTBS instance will report 2 calls, making it possible for a simple Call Control Client to control all calls from a single bearer. Similarly the supported URIs for each bearer are also made into a union in GTBS, and when placing a call using the GTBS the server will pick the most suited bearer depending on the URI. For example calls with URI *tel* would go to the regular phone application, and calls with the URI *skype* would go to the Teams application.

In conclusion the GTBS implementation in Zephyr is a union of the non-generic telephone bearers.

Generic MCS The MCS spec defines GMCS as

> The GMCS provides status and control of media playback for the device as a single unit. An MCS instance describes and controls the media playback for a specific media player within the device. A device implements MCS instances to allow clients to access the separate internal media player entities.

and where the behavior of GMCS is defined as

> ... the behavior of MCS and GMCS is identical, and all the characteristics and the characteristics' behaviors are the same. The term "MCS" is used throughout the document. Unless otherwise specifically stated in this specification, the same meaning applies to GMCS as well.

This means that a GMCS instance works the same way as an MCS instance, and it follows that GMCS

> controls the media playback for a specific media player within the device

A media player on a device could be anything that plays media, such as a Spotify or Youtube application on a smartphone. Thus if a device has multiple MCS instances, then each of these control media for that specific application, but the GMCS also controls media playback for a specific media player. GMCS can thus be considered a pointer to a specific MCS instance, and control either e.g. Spotify or Youtube, but not both.

The MCS spec does however provide an example of GMCS where a device can

> Implement a GMCS that provides status and control of media playback for the device as a whole.

Which may indicate that an implementation may use GMCS to represent all media players with GMCS and not a specific media player as stated above. In the case where a device does not have any MCS instances and only GMCS, then GMCS will point to a generic instance.

The Zephyr implementation of MCS and GMCS is incomplete, and currently only supports instantiating a single instance that can either be an MCS or GMCS. This means that the implementation is neither complete nor spec-compliant.

Difference between GTBS and GMCS The definitions and implementations of GTBS and GMCS as stated above are notably different. GTBS works as a union between the other TBS instances (if any), and GMCS works as a pointer to a specific MCS instance (if any). This effectively means that a simple Call Control Client can control all calls just using GTBS, but a Media Control Client may only be able to control a single player using GMCS.

Coordinated Sets Coordinated Sets is implemented by the Coordinated Sets Identification Profile (CSIP).

The CSIP implementation supports the following roles

- Coordinated Set Identification Service (CSIP) Set Member
- Coordinated Set Identification Service (CSIP) Set Coordinator

The API reference for media control can be found in *Bluetooth Coordinated Sets*.

Specification correctness and data location The implementations are designed to ensure specification compliance as much as possible. When a specification introduces a requirement with e.g. a **shall** then the implementation should attempt to ensure that this requirement is always followed. Depending on the context of this, the implementation ensures this by rejecting invalid parameters from the application, or from the remote devices.

Some requirements from the specifications are not or can not be handled by the stack itself for various reasons. One reason when the stack cannot handle a requirement is if the data related to the requirement is exclusively controlled by the application. An example of this is the advertising data, where multiple service have requirements for what to advertise and when, but where both the advertising state and data is exclusively controlled by the application.

Oppositely there are also requirements from the specification, where the data related to the requirement is exclusively controlled by the stack. An example of this is the Volume Control Service (VCS) state, where the specifications mandata that the VCP Volume Renderer (VCS server) modify the values without a choice, e.g. when setting the absolutely volume. In cases like this the application is only notified about the change with a callback, but cannot reject the request (the stack will reject any invalid requests).

Generally when the data is simple (like the VCS state which only take up a few bytes), the data is kept in and controlled by the stack, as this can ensure that the requirements can be handled by the stack, making it easier to use a profile role correctly. When the data is more complex (e.g. the PAC records), the data may be kept by the application and the stack only contains a reference to it. When the data is very application specific (e.g. advertising data), the data is kept in and controlled by the application.

As a rule of thumb, the return types of the callbacks for each profile implementation indicate whether the data is controlled by the stack or the application. For example all the callbacks for the VCP Volume Renderer have the return type of *void*, but the return type of the BAP Unicast Server callbacks are *int*, indicating that the application not only controls a lot of the Unicast Server data, but can also reject the requests. The choice of what the return type of the callbacks often depend on the specifications, and how much control the role has in a given context.

Things worth knowing or considering when using LE Audio This section describes a few tings to consider when contributing to or using LE Audio in Zephyr. The things described by this section are not unique to Zephyr as they are defined by the specifications.

Security requirements All LE Audio services require Security Level 2 but where the key must be 128-bit and derived via an OOB method or via LE Secure connections. There is no Core-spec defined way of reporting this in GATT, as ATT does not have a specific error code for missing OOB method or LE Secure Connections (although there is a way to report wrong key size).

In Zephyr we do not force the device to always use these, as a device that uses LE Audio may also use other profiles and services that do not require such security. We guard all access to services using a custom security check implemented in subsys/bluetooth/audio/audio.c, where all LE Audio services must use the internal *BT_AUDIO_CHRC* macro for proper security verification.

Access to the LTK for encrypted SIRKs in CSIS The Coordinated Set Identification Service (CSIS) may encrypt the SIRK (set identity resolving key). The process of encrypting the SIRK requires the LTK as the encryption key, which is typically not exposed to higher layer implementations such as CSIS. This does not have any effect on the security though.

MTU requirements The Basic Audio Profile (BAP) has a requirement that both sides shall support a minimum ATT_MTU of at least 64 on the unenhanced ATT bearer or at least one enhanced ATT bearer. The requirement comes from the preferred (or sometimes mandatory) use of GATT Write Without Response, and where support for Write Long Characteristic Value is optional in most cases.

If a ASCS device supports values larger than the minimum ATT_MTU of 64 octets, then it shall support Read long Characteristic Value by setting `CONFIG_BT_ATT_PREPARE_COUNT` to a non-zero value.

6.1.6 LE Audio resources

This section contains some links and reference to resources that are useful for either contributors to the LE Audio Stack in Zephyr, LE Audio application developers or both.

The LE audio channel on Discord

Zephyr has a specific Discord channel for LE Audio development, which is open to all. Find it here at https://discordapp.com/channels/720317445772017664/1207326649591271434 or simply search for *ble-audio* from within Discord. Since the *ble-audio* channel is open for all, we cannot discuss any specifications that are in development in that channel. For discussions that require a Bluetooth SIG membership we refer to the *bluetooth-sig* Discord channel found at https://discordapp.com/channels/720317445772017664/869172014018097162.

Zephyr weekly meetings

Anyone who is a Bluetooth SIG member and a Zephyr member can join the weekly meetings where we discuss and plan the development of LE Audio in Zephyr. You can find the time of the meetings by joining the Bluetooth-sig group at https://lists.zephyrproject.org/g/Bluetooth-sig.

Github project

LE Audio in Zephyr has its own Github project available at https://github.com/orgs/zephyrproject-rtos/projects/26. The project is mostly automated, and the LE Audio contributors almost only rely on the automated workflows to present the state of development. Anyone is able to pick any of the open issues and work on it. If you cannot assign the issue to yourself, please leave a comment in the issue itself or ping the Discord channel for help.

Bluetooth SIG errata for LE Audio

There are many specifications for LE Audio, and several of them are still being updated and developed. To get an overview of the errata for the LE Audio specifications you can visit

- Generic Audio (GA) errata https://bluetooth.atlassian.net/wiki/spaces/GA/pages/1634402349/GAWG+Errata+Lists
- Hearing Aid (HA) errata https://bluetooth.atlassian.net/wiki/spaces/HA/pages/1634140216/HA+WG+Errata+List
- Audio, Telephony and Automotive (ATA) errata https://bluetooth.atlassian.net/wiki/spaces/ATA/pages/1668481034/ATA+Errata+Lists

Access to errata requires a Bluetooth SIG membership.

Bluetooth SIG working groups for LE Audio

There are 3 working groups in the Bluetooth SIG related to LE Audio:

- Generic Audio (GA) https://www.bluetooth.org/groups/group.aspx?gId=665
- Hearing Aid (HA) https://www.bluetooth.org/groups/group.aspx?gId=605
- Audio, Telephony, and Automotive (ATA) https://www.bluetooth.org/groups/group.aspx?gId=659

By joining these groups you will also get emails from their respective mailing lists, where multiple questions and discussions are handled. The working groups also have scheduled weekly meetings, where issues and the development of the specifications are handled.

Access to the Bluetooth SIG working groups requires a Bluetooth SIG membership.

The LE Audio Book

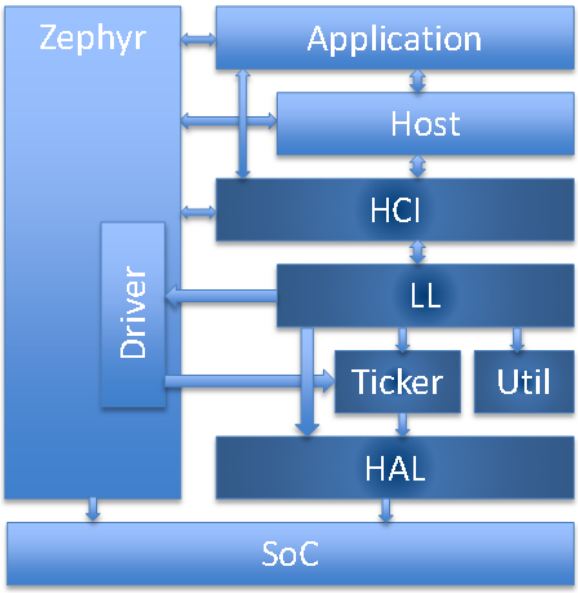
There is a free ebook on LE Audio at https://www.bluetooth.com/bluetooth-resources/le-audio-book/. The book was released in January 2022, and thus before some of the specifications were finalized, but also before some of the released updates to the specifications. Nevertheless the book still provides a good explanation for many of the concepts and ideas, but please refer to the individual specifications for technical information.

Bluetooth SIG informational papers, reports and guides

The Bluetooth SIG occasionally release new informational papers, report and guides. These can be found at https://www.bluetooth.com/bluetooth-resources/?tags=le-audio&keyword. Here you will also find the aforementioned LE Audio book, among many other good resources.

6.1.7 LE Controller

Overview



1. HCI
   - Host Controller Interface, Bluetooth standard
   - Provides Zephyr Bluetooth HCI Driver
2. HAL
   - Hardware Abstraction Layer
   - Vendor Specific, and Zephyr Driver usage
3. Ticker
   - Soft real time radio/resource scheduling
4. LL_SW
   - Software-based Link Layer implementation
   - States and roles, control procedures, packet controller
5. Util
   - Bare metal memory pool management
   - Queues of variable count, lockless usage
   - FIFO of fixed count, lockless usage
   - Mayfly concept based deferred ISR executions

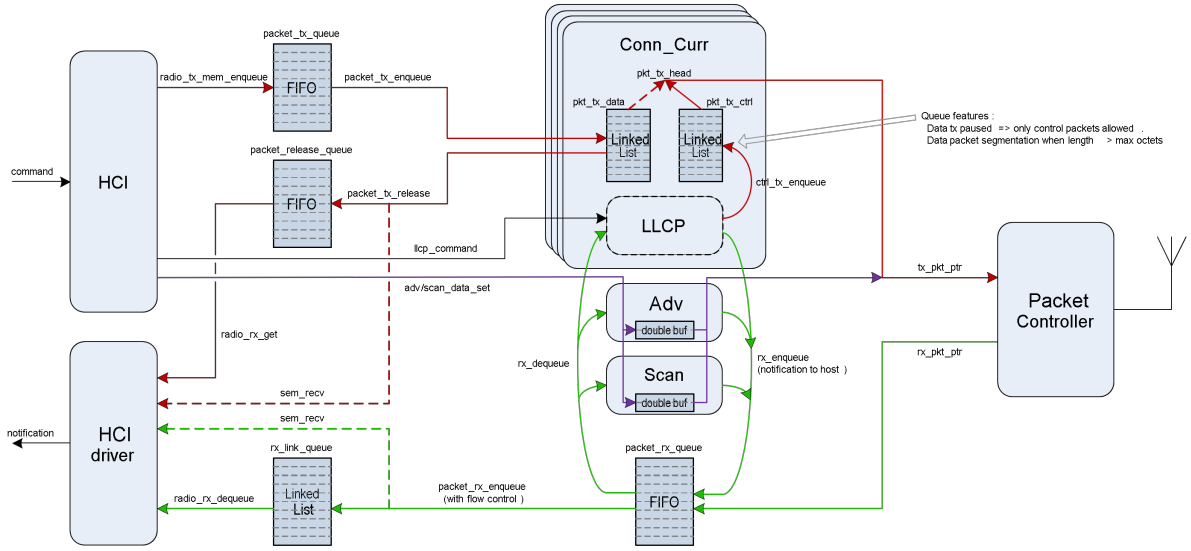
- Race-to-idle execution
- Lock-less, bare metal

Legacy Controller



Bluetooth Low Energy Controller - Vendor Specific Details

Hardware Requirements

Nordic Semiconductor The Nordic Semiconductor Bluetooth Low Energy Controller implementation requires the following hardware peripherals.

Table 13: SoC Peripheral Use

Resource	nRF Peripheral	# instances	Zephyr Driver Accessible	Description
Clock	NRF_CLOCK	1	Yes	• A Low Frequency Clock (LFCLOCK) or sleep clock, for low power consumption between Bluetooth radio events • A High Frequency Clock (HFCLOCK) or active clock, for high precision packet timing and software based transceiver state switching with inter-frame space (tIFS) timing inside Bluetooth radio events
RTC [a]	NRF_RTC0	1	**No**	• Uses 2 capture/compare registers
Timer	NRF_TIMER0 or NRF_TIMER4 and NRF_TIMER1	2 or 1 Page 1703, 1	**No**	• 2 instances, one each for packet timing and tIFS software switching, respectively • 7 capture/compare registers (3 mandatory, 1 optional for ISR profiling, 4 for single timer tIFS switching) on first instance • 4 capture/compare registers for second instance, if single tIFS timer is not used.
PPI [b]	NRF_PPI	21 channels (20[2]), and 2 channel groups[3]	Yes[4]	• Used for radio mode switching to achieve tIFS timings, for PA/LNA control
DPPI [c]	NRF_DPPI	20 channels, and 2 channel groups Page 17	Yes Page 1	• Used for radio mode switching to achieve tIFS timings, for PA/LNA control
SWI [d]	NRF_SWI4 and NRF_SWI5, or NRF_SWI2 and NRF_SWI3[5]	2	**No**	• 2 instances, for Lower Link Layer and Upper Link Layer Low priority execution context
Radio	NRF_RADIO	1	**No**	• 2.4 GHz radio transceiver with multiple radio standards such as 1 Mbps, 2 Mbps and Coded PHY S2/S8 Long Range Bluetooth Low Energy technology
RNG [e]	NRF_RNG	1	Yes	
ECB [f]	NRF_ECB	1	**No**	
CBC-CCM [g]	NRF_CCM	1	**No**	
AAR [h]	NRF_AAR	1	**No**	
GPIO [i]	NRF_GPIO	2 GPIO pins for PA and LNA, 1 each	Yes	• Additionally, 10 Debug GPIO pins (optional)
GPIOTE [j]	NRF_GPIOTE	1	Yes	

6.1.8 Application Development

Bluetooth applications are developed using the common infrastructure and approach that is described in the *Application Development* section of the documentation.

Additional information that is only relevant to Bluetooth applications can be found on this page.

- *Thread safety*
- *Hardware setup*
  - *Embedded*
  - *Host on Linux with an external Controller*
  - *Simulated nRF5x with BabbleSim*
- *Initialization*
- *Bluetooth Application Example*
- *More Examples*

Thread safety

Calling into the Bluetooth API is intended to be thread safe, unless otherwise noted in the documentation of the API function. The effort to ensure that this is the case for all API calls is an ongoing one, but the overall goal is formally stated in this paragraph. Bug reports and Pull Requests that move the subsystem in the direction of such goal are welcome.

Hardware setup

This section describes the options you have when building and debugging Bluetooth applications with Zephyr. Depending on the hardware that is available to you, the requirements you have and the type of development you prefer you may pick one or another setup to match your needs.

There are 3 possible setups:

1. *Embedded*
2. *External controller*
   - *QEMU host*
   - *native_sim host*
3. *Simulated nRF5x with BabbleSim*

Embedded This setup relies on all software running directly on the embedded platform(s) that the application is targeting. All the *Configurations* and *Build Types* are supported but you might need to build Zephyr more than once if you are using a dual-chip configuration or if you have multiple cores in your SoC each running a different build type (e.g., one running the Host, the other the Controller).

[1] `CONFIG_BT_CTLR_SW_SWITCH_SINGLE_TIMER=y`
[0] `CONFIG_BT_CTLR_TIFS_HW=n`
[2] When not using pre-defined PPI channels
[3] For software-based tIFS switching
[4] Drivers that use nRFx interfaces
[5] For nRF53x Series

To start developing using this setup follow the *Getting Started Guide*, choose one (or more if you are using a dual-chip solution) boards that support Bluetooth and then *run the application*).

There is a way to access the *HCI* traffic between the Host and Controller, even if there is no physical transport. See *Embedded HCI tracing* for instructions.

Note

This is currently only available on GNU/Linux

Host on Linux with an external Controller This setup relies on a "dual-chip" *configuration* which is comprised of the following devices:

1. A *Host-only* application running in the *QEMU* emulator or the native_sim native port of Zephyr
2. A Controller, which can be one of the following types:
   - A commercially available Controller
   - A *Controller-only* build of Zephyr
   - A *Virtual controller*

Warning

Certain external Controllers are either unable to accept the Host to Controller flow control parameters that Zephyr sets by default (Qualcomm), or do not transmit any data from the Controller to the Host (Realtek). If you see a message similar to:

```
<wrn> bt_hci_core: opcode 0x0c33 status 0x12
```

when booting your sample of choice (make sure you have enabled `CONFIG_LOG` in your `prj.conf` before running the sample), or if there is no data flowing from the Controller to the Host, then you need to disable Host to Controller flow control. To do so, set `CONFIG_BT_HCI_ACL_FLOW_CONTROL=n` in your `prj.conf`.

QEMU You can run the Zephyr Host on the *QEMU emulator* and have it interact with a physical external Bluetooth Controller.

Refer to *Running on QEMU or native_sim* for full instructions on how to build and run an application in this setup.

Note

This is currently only available on GNU/Linux

native_sim The native_sim target builds your Zephyr application with the Zephyr kernel, and some minimal HW emulation as a native Linux executable.

This executable is a normal Linux program, which can be debugged and instrumented like any other, and it communicates with a physical or virtual external Controller. Refer to:

- *Running on QEMU or native_sim* for the physical controller
- *Running on a Virtual Controller and native_sim* for the virtual controller

> **Note**
>
> This is currently only available on GNU/Linux

Simulated nRF5x with BabbleSim The nrf52_bsim and nrf5340bsim boards, are simulated target boards which emulate the necessary peripherals of a nRF52/53 SOC to be able to develop and test BLE applications. These boards, use:

- BabbleSim to simulate the nRF5x modem and the radio environment.
- The POSIX arch and native simulator to emulate the processor, and run natively on your host.
- Models of the nrf5x HW

Just like with the native_sim target, the build result is a normal Linux executable. You can find more information on how to run simulations with one or several devices in either of these boards's documentation.

With the nrf52_bsim, typically you do *Combined builds*, but it is also possible to build the controller with one of the HCI UART samples in one simulated device, and the host with the H4 driver instead of the integrated controller in another simulated device.

With the nrf5340bsim, you can build with either, both controller and host on its network core, or, with the network core running only the controller, the application core running the host and your application, and the HCI transport over IPC.

Initialization

The Bluetooth subsystem is initialized using the *bt_enable()* function. The caller should ensure that function succeeds by checking the return code for errors. If a function pointer is passed to *bt_enable()*, the initialization happens asynchronously, and the completion is notified through the given function.

Bluetooth Application Example

A simple Bluetooth beacon application is shown below. The application initializes the Bluetooth Subsystem and enables non-connectable advertising, effectively acting as a Bluetooth Low Energy broadcaster.

```

/*
 * Set Advertisement data. Based on the Eddystone specification:
 * https://github.com/google/eddystone/blob/master/protocol-specification.md
 * https://github.com/google/eddystone/tree/master/eddystone-url
 */

(continued from previous page)

```
/* Set Scan Response data */
static const struct bt_data sd[] = {
        BT_DATA(BT_DATA_NAME_COMPLETE, DEVICE_NAME, DEVICE_NAME_LEN),
};

static void bt_ready(int err)
{
        char addr_s[BT_ADDR_LE_STR_LEN];
        bt_addr_le_t addr = {0};
        size_t count = 1;

        if (err) {
                printk("Bluetooth init failed (err %d)\n", err);
                return;
        }

        printk("Bluetooth initialized\n");

        /* Start advertising */
        err = bt_le_adv_start(BT_LE_ADV_NCONN_IDENTITY, ad, ARRAY_SIZE(ad),
                              sd, ARRAY_SIZE(sd));
        if (err) {
                printk("Advertising failed to start (err %d)\n", err);
                return;
        }

        /* For connectable advertising you would use
         * bt_le_oob_get_local().  For non-connectable non-identity
         * advertising an non-resolvable private address is used;
         * there is no API to retrieve that.
         */

        bt_id_get(&addr, &count);
        bt_addr_le_to_str(&addr, addr_s, sizeof(addr_s));

        printk("Beacon started, advertising as %s\n", addr_s);
}

int main(void)
{
        int err;

        printk("Starting Beacon Demo\n");

        /* Initialize the Bluetooth Subsystem */
        err = bt_enable(bt_ready);
        if (err) {
                printk("Bluetooth init failed (err %d)\n", err);
        }
        return 0;
}
```

The key APIs employed by the beacon sample are *bt_enable()* that's used to initialize Bluetooth and then *bt_le_adv_start()* that's used to start advertising a specific combination of advertising and scan response data.

More Examples

More sample Bluetooth applications are available in `samples/bluetooth/`.

6.1.9 API

Bluetooth Classic Host and profiles

Hands Free Profile (HFP)

API Reference

group `bt_hfp`

Hands Free Profile (HFP)

Defines

`HFP_HF_CMD_OK`

`HFP_HF_CMD_ERROR`

`HFP_HF_CMD_CME_ERROR`

`HFP_HF_CMD_UNKNOWN_ERROR`

Enums

enum `bt_hfp_hf_at_cmd`

Values:

enumerator `BT_HFP_HF_ATA`

enumerator `BT_HFP_HF_AT_CHUP`

Functions

int `bt_hfp_hf_register`(struct *bt_hfp_hf_cb* *cb)

Register HFP HF profile.

Register Handsfree profile callbacks to monitor the state and get the required HFP details to display.

Parameters

- `cb` – callback structure.

Returns

0 in case of success or negative value in case of error.

int `bt_hfp_hf_send_cmd`(struct bt_conn *conn, enum *bt_hfp_hf_at_cmd* cmd)

Handsfree client Send AT.

Send specific AT commands to handsfree client profile.

Parameters

- `conn` – Connection object.
- `cmd` – AT command to be sent.

Returns
0 in case of success or negative value in case of error.

struct `bt_hfp_hf_cmd_complete`

#include <*hfp_hf.h*> HFP HF Command completion field.

struct `bt_hfp_hf_cb`

#include <*hfp_hf.h*> HFP profile application callback.

Public Members

void (*`connected`)(struct bt_conn *conn)

HF connected callback to application.

If this callback is provided it will be called whenever the connection completes.

Param conn
Connection object.

void (*`disconnected`)(struct bt_conn *conn)

HF disconnected callback to application.

If this callback is provided it will be called whenever the connection gets disconnected, including when a connection gets rejected or cancelled or any error in SLC establishment.

Param conn
Connection object.

void (*`sco_connected`)(struct bt_conn *conn, struct bt_conn *sco_conn)

HF SCO/eSCO connected Callback.

If this callback is provided it will be called whenever the SCO/eSCO connection completes.

Param conn
Connection object.
Param sco_conn
SCO/eSCO Connection object.

void (*`sco_disconnected`)(struct bt_conn *sco_conn, uint8_t reason)

HF SCO/eSCO disconnected Callback.

If this callback is provided it will be called whenever the SCO/eSCO connection gets disconnected.

Param conn
Connection object.
Param reason
BT_HCI_ERR_* reason for the disconnection.

void (*`service`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback provides service indicator value to the application

Param conn
Connection object.

Param value
service indicator value received from the AG.

void (*`call`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback provides call indicator value to the application

Param conn
Connection object.

Param value
call indicator value received from the AG.

void (*`call_setup`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback provides call setup indicator value to the application

Param conn
Connection object.

Param value
call setup indicator value received from the AG.

void (*`call_held`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback provides call held indicator value to the application

Param conn
Connection object.

Param value
call held indicator value received from the AG.

void (*`signal`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback provides signal indicator value to the application

Param conn
Connection object.

Param value
signal indicator value received from the AG.

void (*`roam`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback provides roaming indicator value to the application

Param conn
Connection object.

Param value
roaming indicator value received from the AG.

void (*`battery`)(struct bt_conn *conn, uint32_t value)

HF indicator Callback.

This callback battery service indicator value to the application

Param conn
Connection object.

Param value
battery indicator value received from the AG.

void (*`ring_indication`)(struct bt_conn *conn)

HF incoming call Ring indication callback to application.

If this callback is provided it will be called whenever there is an incoming call.

Param conn
Connection object.

void (*`cmd_complete_cb`)(struct bt_conn *conn, struct *bt_hfp_hf_cmd_complete* *cmd)

HF notify command completed callback to application.

The command sent from the application is notified about its status

Param conn
Connection object.

Param cmd
structure contains status of the command including cme.

Serial Port Emulation (RFCOMM)

API Reference

group `bt_rfcomm`

RFCOMM.

Typedefs

typedef enum *bt_rfcomm_role* `bt_rfcomm_role_t`

Role of RFCOMM session and dlc.

Used only by internal APIs

Enums

Values:

enumerator `BT_RFCOMM_CHAN_HFP_HF` = 1

enumerator `BT_RFCOMM_CHAN_HFP_AG`

enumerator `BT_RFCOMM_CHAN_HSP_AG`

enumerator `BT_RFCOMM_CHAN_HSP_HS`

enumerator `BT_RFCOMM_CHAN_SPP`

enum `bt_rfcomm_role`

Role of RFCOMM session and dlc.

Used only by internal APIs

Values:

enumerator BT_RFCOMM_ROLE_ACCEPTOR

enumerator BT_RFCOMM_ROLE_INITIATOR

Functions

int **bt_rfcomm_server_register**(struct *bt_rfcomm_server* *server)

Register RFCOMM server.

Register RFCOMM server for a channel, each new connection is authorized using the *accept()* callback which in case of success shall allocate the dlc structure to be used by the new connection.

Parameters

- **server** – Server structure.

Returns

0 in case of success or negative value in case of error.

int **bt_rfcomm_dlc_connect**(struct bt_conn *conn, struct *bt_rfcomm_dlc* *dlc, uint8_t channel)

Connect RFCOMM channel.

Connect RFCOMM dlc by channel, once the connection is completed dlc connected() callback will be called. If the connection is rejected disconnected() callback is called instead.

Parameters

- **conn** – Connection object.
- **dlc** – Dlc object.
- **channel** – Server channel to connect to.

Returns

0 in case of success or negative value in case of error.

int **bt_rfcomm_dlc_send**(struct *bt_rfcomm_dlc* *dlc, struct *net_buf* *buf)

Send data to RFCOMM.

Send data from buffer to the dlc. Length should be less than or equal to mtu.

Parameters

- **dlc** – Dlc object.
- **buf** – Data buffer.

Returns

Bytes sent in case of success or negative value in case of error.

int **bt_rfcomm_dlc_disconnect**(struct *bt_rfcomm_dlc* *dlc)

Disconnect RFCOMM dlc.

Disconnect RFCOMM dlc, if the connection is pending it will be canceled and as a result the dlc disconnected() callback is called.

Parameters

- **dlc** – Dlc object.

Returns

0 in case of success or negative value in case of error.

struct *net_buf* *bt_rfcomm_create_pdu(struct *net_buf_pool* *pool)

Allocate the buffer from pool after reserving head room for RFCOMM, L2CAP and ACL headers.

Parameters

- `pool` – Which pool to take the buffer from.

Returns

New buffer.

struct `bt_rfcomm_dlc_ops`

#include <*rfcomm.h*> RFCOMM DLC operations structure.

Public Members

void (*`connected`)(struct *bt_rfcomm_dlc* *dlc)

DLC connected callback.

If this callback is provided it will be called whenever the connection completes.

Param dlc
The dlc that has been connected

void (*`disconnected`)(struct *bt_rfcomm_dlc* *dlc)

DLC disconnected callback.

If this callback is provided it will be called whenever the dlc is disconnected, including when a connection gets rejected or cancelled (both incoming and outgoing)

Param dlc
The dlc that has been Disconnected

void (*`recv`)(struct *bt_rfcomm_dlc* *dlc, struct *net_buf* *buf)

DLC recv callback.

Param dlc
The dlc receiving data.

Param buf
Buffer containing incoming data.

void (*`sent`)(struct *bt_rfcomm_dlc* *dlc, int err)

DLC sent callback.

Param dlc
The dlc which has sent data.

Param err
Sent result.

struct `bt_rfcomm_dlc`

#include <*rfcomm.h*> RFCOMM DLC structure.

struct `bt_rfcomm_server`

#include <*rfcomm.h*>

Public Members

uint8_t **channel**

Server Channel.

int (***accept**)(struct bt_conn *conn, struct *bt_rfcomm_dlc* **dlc)

Server accept callback.

This callback is called whenever a new incoming connection requires authorization.

Param conn
The connection that is requesting authorization

Param dlc
Pointer to received the allocated dlc

Return
0 in case of success or negative value in case of error.

Service Discovery Protocol (SDP)

API Reference

group bt_sdp

Service class identifiers of standard services and service groups

BT_SDP_SDP_SERVER_SVCLASS

Service Discovery Server.

BT_SDP_BROWSE_GRP_DESC_SVCLASS

Browse Group Descriptor.

BT_SDP_PUBLIC_BROWSE_GROUP

Public Browse Group.

BT_SDP_SERIAL_PORT_SVCLASS

Serial Port.

BT_SDP_LAN_ACCESS_SVCLASS

LAN Access Using PPP.

BT_SDP_DIALUP_NET_SVCLASS

Dialup Networking.

BT_SDP_IRMC_SYNC_SVCLASS

IrMC Sync.

BT_SDP_OBEX_OBJPUSH_SVCLASS

OBEX Object Push.

Generic Attribute Profile.

`BT_SDP_APPLE_AGENT_SVCLASS`
Apple Agent.

Attribute identifier codes

Possible values for attribute-id are listed below.

See SDP Spec, section “Service Attribute Definitions” for more details.

`BT_SDP_ATTR_RECORD_HANDLE`
Service Record Handle.

`BT_SDP_ATTR_SVCLASS_ID_LIST`
Service Class ID List.

`BT_SDP_ATTR_RECORD_STATE`
Service Record State.

`BT_SDP_ATTR_SERVICE_ID`
Service ID.

`BT_SDP_ATTR_PROTO_DESC_LIST`
Protocol Descriptor List.

`BT_SDP_ATTR_BROWSE_GRP_LIST`
Browse Group List.

`BT_SDP_ATTR_LANG_BASE_ATTR_ID_LIST`
Language Base Attribute ID List.

`BT_SDP_ATTR_SVCINFO_TTL`
Service Info Time to Live.

`BT_SDP_ATTR_SERVICE_AVAILABILITY`
Service Availability.

`BT_SDP_ATTR_PROFILE_DESC_LIST`
Bluetooth Profile Descriptor List.

`BT_SDP_ATTR_DOC_URL`
: Documentation URL.

`BT_SDP_ATTR_CLNT_EXEC_URL`
: Client Executable URL.

`BT_SDP_ATTR_ICON_URL`
: Icon URL.

`BT_SDP_ATTR_ADD_PROTO_DESC_LIST`
: Additional Protocol Descriptor List.

`BT_SDP_ATTR_GROUP_ID`
: Group ID.

`BT_SDP_ATTR_IP_SUBNET`
: IP Subnet.

`BT_SDP_ATTR_VERSION_NUM_LIST`
: Version Number List.

`BT_SDP_ATTR_SUPPORTED_FEATURES_LIST`
: Supported Features List.

`BT_SDP_ATTR_GOEP_L2CAP_PSM`
: GOEP L2CAP PSM.

`BT_SDP_ATTR_SVCDB_STATE`
: Service Database State.

`BT_SDP_ATTR_MPSD_SCENARIOS`
: MPSD Scenarios.

`BT_SDP_ATTR_MPMD_SCENARIOS`
: MPMD Scenarios.

`BT_SDP_ATTR_MPS_DEPENDENCIES`
: Supported Profiles & Protocols.

`BT_SDP_ATTR_SERVICE_VERSION`
: Service Version.

`BT_SDP_ATTR_EXTERNAL_NETWORK`
: External Network.

`BT_SDP_ATTR_SUPPORTED_DATA_STORES_LIST`
: Supported Data Stores List.

BT_SDP_ATTR_DATA_EXCHANGE_SPEC
: Data Exchange Specification.

BT_SDP_ATTR_NETWORK
: Network.

BT_SDP_ATTR_FAX_CLASS1_SUPPORT
: Fax Class 1 Support.

BT_SDP_ATTR_REMOTE_AUDIO_VOLUME_CONTROL
: Remote Audio Volume Control.

BT_SDP_ATTR_MCAP_SUPPORTED_PROCEDURES
: MCAP Supported Procedures.

BT_SDP_ATTR_FAX_CLASS20_SUPPORT
: Fax Class 2.0 Support.

BT_SDP_ATTR_SUPPORTED_FORMATS_LIST
: Supported Formats List.

BT_SDP_ATTR_FAX_CLASS2_SUPPORT
: Fax Class 2 Support (vendor-specific)

BT_SDP_ATTR_AUDIO_FEEDBACK_SUPPORT
: Audio Feedback Support.

BT_SDP_ATTR_NETWORK_ADDRESS
: Network Address.

BT_SDP_ATTR_WAP_GATEWAY
: WAP Gateway.

BT_SDP_ATTR_HOMEPAGE_URL
: Homepage URL.

BT_SDP_ATTR_WAP_STACK_TYPE
: WAP Stack Type.

BT_SDP_ATTR_SECURITY_DESC
: Security Description.

BT_SDP_ATTR_NET_ACCESS_TYPE
: Net Access Type.

BT_SDP_ATTR_MAX_NET_ACCESSRATE
: Max Net Access Rate.

`BT_SDP_ATTR_IP4_SUBNET`
: IPv4 Subnet.

`BT_SDP_ATTR_IP6_SUBNET`
: IPv6 Subnet.

`BT_SDP_ATTR_SUPPORTED_CAPABILITIES`
: BIP Supported Capabilities.

`BT_SDP_ATTR_SUPPORTED_FEATURES`
: BIP Supported Features.

`BT_SDP_ATTR_SUPPORTED_FUNCTIONS`
: BIP Supported Functions.

`BT_SDP_ATTR_TOTAL_IMAGING_DATA_CAPACITY`
: BIP Total Imaging Data Capacity.

`BT_SDP_ATTR_SUPPORTED_REPOSITORIES`
: Supported Repositories.

`BT_SDP_ATTR_MAS_INSTANCE_ID`
: MAS Instance ID.

`BT_SDP_ATTR_SUPPORTED_MESSAGE_TYPES`
: Supported Message Types.

`BT_SDP_ATTR_PBAP_SUPPORTED_FEATURES`
: PBAP Supported Features.

`BT_SDP_ATTR_MAP_SUPPORTED_FEATURES`
: MAP Supported Features.

`BT_SDP_ATTR_SPECIFICATION_ID`
: Specification ID.

`BT_SDP_ATTR_VENDOR_ID`
: Vendor ID.

`BT_SDP_ATTR_PRODUCT_ID`
: Product ID.

`BT_SDP_ATTR_VERSION`
: Version.

`BT_SDP_ATTR_PRIMARY_RECORD`
: Primary Record.

`BT_SDP_ATTR_VENDOR_ID_SOURCE`
: Vendor ID Source.

`BT_SDP_ATTR_HID_DEVICE_RELEASE_NUMBER`
: HID Device Release Number.

`BT_SDP_ATTR_HID_PARSER_VERSION`
: HID Parser Version.

`BT_SDP_ATTR_HID_DEVICE_SUBCLASS`
: HID Device Subclass.

`BT_SDP_ATTR_HID_COUNTRY_CODE`
: HID Country Code.

`BT_SDP_ATTR_HID_VIRTUAL_CABLE`
: HID Virtual Cable.

`BT_SDP_ATTR_HID_RECONNECT_INITIATE`
: HID Reconnect Initiate.

`BT_SDP_ATTR_HID_DESCRIPTOR_LIST`
: HID Descriptor List.

`BT_SDP_ATTR_HID_LANG_ID_BASE_LIST`
: HID Language ID Base List.

`BT_SDP_ATTR_HID_SDP_DISABLE`
: HID SDP Disable.

`BT_SDP_ATTR_HID_BATTERY_POWER`
: HID Battery Power.

`BT_SDP_ATTR_HID_REMOTE_WAKEUP`
: HID Remote Wakeup.

`BT_SDP_ATTR_HID_PROFILE_VERSION`
: HID Profile Version.

`BT_SDP_ATTR_HID_SUPERVISION_TIMEOUT`
: HID Supervision Timeout.

`BT_SDP_ATTR_HID_NORMALLY_CONNECTABLE`
: HID Normally Connectable.

`BT_SDP_ATTR_HID_BOOT_DEVICE`
: HID Boot Device.

The Data representation in SDP PDUs (pps 339, 340 of BT SDP Spec)

These are the exact data type+size descriptor values that go into the PDU buffer.

The datatype (leading 5bits) + size descriptor (last 3 bits) is 8 bits. The size descriptor is critical to extract the right number of bytes for the data value from the PDU.

For most basic types, the datatype+size descriptor is straightforward. However for constructed types and strings, the size of the data is in the next "n" bytes following the 8 bits (datatype+size) descriptor. Exactly what the "n" is specified in the 3 bits of the data size descriptor.

TextString and URLString can be of size 2^{8, 16, 32} bytes DataSequence and DataSequenceAlternates can be of size 2^{8, 16, 32} The size are computed post-facto in the API and are not known apriori.

`BT_SDP_DATA_NIL`
: Nil, the null type.

`BT_SDP_UINT8`
: Unsigned 8-bit integer.

`BT_SDP_UINT16`
: Unsigned 16-bit integer.

`BT_SDP_UINT32`
: Unsigned 32-bit integer.

`BT_SDP_UINT64`
: Unsigned 64-bit integer.

`BT_SDP_UINT128`
: Unsigned 128-bit integer.

`BT_SDP_INT8`
: Signed 8-bit integer.

`BT_SDP_INT16`
: Signed 16-bit integer.

`BT_SDP_INT32`
: Signed 32-bit integer.

`BT_SDP_INT64`
: Signed 64-bit integer.

`BT_SDP_INT128`
: Signed 128-bit integer.

`BT_SDP_UUID_UNSPEC`
: UUID, unspecified size.

`BT_SDP_UUID16`
: UUID, 16-bit.

`BT_SDP_UUID32`
: UUID, 32-bit.

`BT_SDP_UUID128`
: UUID, 128-bit.

`BT_SDP_TEXT_STR_UNSPEC`
: Text string, unspecified size.

`BT_SDP_TEXT_STR8`
: Text string, 8-bit length.

`BT_SDP_TEXT_STR16`
: Text string, 16-bit length.

`BT_SDP_TEXT_STR32`
: Text string, 32-bit length.

`BT_SDP_BOOL`
: Boolean.

`BT_SDP_SEQ_UNSPEC`
: Data element sequence, unspecified size.

`BT_SDP_SEQ8`
: Data element sequence, 8-bit length.

`BT_SDP_SEQ16`
: Data element sequence, 16-bit length.

`BT_SDP_SEQ32`
: Data element sequence, 32-bit length.

`BT_SDP_ALT_UNSPEC`
: Data element alternative, unspecified size.

`BT_SDP_ALT8`
: Data element alternative, 8-bit length.

`BT_SDP_ALT16`
: Data element alternative, 16-bit length.

`BT_SDP_ALT32`
: Data element alternative, 32-bit length.

BT_SDP_URL_STR_UNSPEC
: URL string, unspecified size.

BT_SDP_URL_STR8
: URL string, 8-bit length.

BT_SDP_URL_STR16
: URL string, 16-bit length.

BT_SDP_URL_STR32
: URL string, 32-bit length.

: Declare an array of 8-bit elements in an attribute.

BT_SDP_ARRAY_16(...)
: Declare an array of 16-bit elements in an attribute.

BT_SDP_ARRAY_32(...)
: Declare an array of 32-bit elements in an attribute.

BT_SDP_TYPE_SIZE(_type)
: Declare a fixed-size data element header.

  Parameters

  - **_type** – Data element header containing type and size descriptors.

BT_SDP_TYPE_SIZE_VAR(_type, _size)
: Declare a variable-size data element header.

  Parameters

  - **_type** – Data element header containing type and size descriptors.
  - **_size** – The actual size of the data.

BT_SDP_DATA_ELEM_LIST(...)
Declare a list of data elements.

BT_SDP_NEW_SERVICE
SDP New Service Record Declaration Macro.

Helper macro to declare a new service record. Default attributes: Record Handle, Record State, Language Base, Root Browse Group

BT_SDP_LIST(_att_id, _type_size, _data_elem_seq)
Generic SDP List Attribute Declaration Macro.

Helper macro to declare a list attribute.

Parameters

- **_att_id** – List Attribute ID.
- **_data_elem_seq** – Data element sequence for the list.
- **_type_size** – SDP type and size descriptor.

BT_SDP_SERVICE_ID(_uuid)
SDP Service ID Attribute Declaration Macro.

Helper macro to declare a service ID attribute.

Parameters

- **_uuid** – Service ID 16bit UUID.

BT_SDP_SERVICE_NAME(_name)
SDP Name Attribute Declaration Macro.

Helper macro to declare a service name attribute.

Parameters

- **_name** – Service name as a string (up to 256 chars).

BT_SDP_SUPPORTED_FEATURES(_features)
SDP Supported Features Attribute Declaration Macro.

Helper macro to declare supported features of a profile/protocol.

Parameters

- **_features** – Feature mask as 16bit unsigned integer.

BT_SDP_RECORD(_attrs)
SDP Service Declaration Macro.

Helper macro to declare a service.

Parameters

- **_attrs** – List of attributes for the service record.

Typedefs

typedef uint8_t (*bt_sdp_discover_func_t)(struct bt_conn *conn, struct *bt_sdp_client_result* *result)
Callback type reporting to user that there is a resolved result on remote for given UUID and the result record buffer can be used by user for further inspection.

A function of this type is given by the user to the *bt_sdp_discover_params* object. It'll be called on each valid record discovery completion for given UUID. When UUID resolution gives back no records then NULL is passed to the user. Otherwise user can get valid record(s) and then the internal hint 'next record' is set to false saying the UUID resolution is complete or the hint can be set by caller to true meaning that next record is available for given UUID. The returned function value allows the user to control retrieving follow-up resolved records if any. If the user doesn't want to read more resolved records for given UUID since current record data fulfills its requirements then should return BT_SDP_DISCOVER_UUID_STOP. Otherwise returned value means more subcall iterations are allowable.

Param conn
Connection object identifying connection to queried remote.

Param result
Object pointing to logical unparsed SDP record collected on base of response driven by given UUID.

Return
BT_SDP_DISCOVER_UUID_STOP in case of no more need to read next record data and continue discovery for given UUID. By returning BT_SDP_DISCOVER_UUID_CONTINUE user allows this discovery continuation.

Enums

Helper enum to be used as return value of bt_sdp_discover_func_t.

The value informs the caller to perform further pending actions or stop them.

Values:

enumerator **BT_SDP_DISCOVER_UUID_STOP** = 0

enumerator **BT_SDP_DISCOVER_UUID_CONTINUE**

enum **bt_sdp_proto**

Protocols to be asked about specific parameters.

Values:

enumerator **BT_SDP_PROTO_RFCOMM** = 0x0003

enumerator **BT_SDP_PROTO_L2CAP** = 0x0100

Functions

int **bt_sdp_register_service**(struct *bt_sdp_record* *service)

Register a Service Record.

Register a Service Record. Applications can make use of macros such as BT_SDP_DECLARE_SERVICE, BT_SDP_LIST, BT_SDP_SERVICE_ID, BT_SDP_SERVICE_NAME, etc. A service declaration must start with BT_SDP_NEW_SERVICE.

Parameters

- **service** – Service record declared using BT_SDP_DECLARE_SERVICE.

Returns
0 in case of success or negative value in case of error.

int **bt_sdp_discover**(struct bt_conn *conn, const struct *bt_sdp_discover_params* *params)

Allows user to start SDP discovery session.

The function performs SDP service discovery on remote server driven by user delivered discovery parameters. Discovery session is made as soon as no SDP transaction is ongoing between peers and if any then this one is queued to be processed at discovery completion of previous one. On the service discovery completion the callback function will be called to get feedback to user about findings.

Parameters

- **conn** – Object identifying connection to remote.
- **params** – SDP discovery parameters.

Returns
0 in case of success or negative value in case of error.

int **bt_sdp_discover_cancel**(struct bt_conn *conn, const struct *bt_sdp_discover_params* *params)

Release waiting SDP discovery request.

It can cancel valid waiting SDP client request identified by SDP discovery parameters object.

Parameters

- **conn** – Object identifying connection to remote.
- **params** – SDP discovery parameters.

Returns
0 in case of success or negative value in case of error.

int **bt_sdp_get_proto_param**(const struct *net_buf* *buf, enum *bt_sdp_proto* proto, uint16_t *param)

Give to user parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Protocol Descriptor List attribute.

Parameters

- **buf** – Original buffered raw record data.
- **proto** – Known protocol to be checked like RFCOMM or L2CAP.
- **param** – On success populated by found parameter value.

Returns
0 on success when specific parameter associated with given protocol value is found, or negative if error occurred during processing.

int **bt_sdp_get_addl_proto_param**(const struct *net_buf* *buf, enum *bt_sdp_proto* proto, uint8_t param_index, uint16_t *param)

Get additional parameter value related to given stacked protocol UUID.

API extracts specific parameter associated with given protocol UUID available in Additional Protocol Descriptor List attribute.

Parameters

- **buf** – Original buffered raw record data.

- `proto` – Known protocol to be checked like RFCOMM or L2CAP.
- `param_index` – There may be more than one parameter related to the given protocol UUID. This function returns the result that is indexed by this parameter. It's value is from 0, 0 means the first matched result, 1 means the second matched result.
- `param` – **[out]** On success populated by found parameter value.

Returns
0 on success when a specific parameter associated with a given protocol value is found, or negative if error occurred during processing.

int `bt_sdp_get_profile_version`(const struct *net_buf* *buf, uint16_t profile, uint16_t *version)

Get profile version.

Helper API extracting remote profile version number. To get it proper generic profile parameter needs to be selected usually listed in SDP Interoperability Requirements section for given profile specification.

Parameters

- `buf` – Original buffered raw record data.
- `profile` – Profile family identifier the profile belongs.
- `version` – On success populated by found version number.

Returns
0 on success, negative value if error occurred during processing.

int `bt_sdp_get_features`(const struct *net_buf* *buf, uint16_t *features)

Get SupportedFeatures attribute value.

Allows if exposed by remote retrieve SupportedFeature attribute.

Parameters

- `buf` – Buffer holding original raw record data from remote.
- `features` – On success object to be populated with SupportedFeature mask.

Returns
0 on success if feature found and valid, negative in case any error

struct `bt_sdp_data_elem`

#include <*sdp.h*> SDP Generic Data Element Value.

Public Members

uint8_t `type`

Type of the data element.

uint32_t `data_size`

Size of the data element.

uint32_t `total_size`

Total size of the data element.

struct **bt_sdp_attribute**

#include <*sdp.h*> SDP Attribute Value.

Public Members

uint16_t **id**

Attribute ID.

struct *bt_sdp_data_elem* **val**

Attribute data.

struct **bt_sdp_record**

#include <*sdp.h*> SDP Service Record Value.

Public Members

uint32_t **handle**

Redundant, for quick ref.

struct *bt_sdp_attribute* ***attrs**

Base addr of attr array.

size_t **attr_count**

Number of attributes.

uint8_t **index**

Index of the record in LL.

struct *bt_sdp_record* ***next**

Next service record.

struct **bt_sdp_client_result**

#include <*sdp.h*> Generic SDP Client Query Result data holder.

Public Members

struct *net_buf* ***resp_buf**

buffer containing unparsed SDP record result for given UUID

bool **next_record_hint**

flag pointing that there are more result chunks for given UUID

const struct *bt_uuid* ***uuid**

Reference to UUID object on behalf one discovery was started.

struct **bt_sdp_discover_params**

#include <*sdp.h*> Main user structure used in SDP discovery of remote.

Public Members

const struct *bt_uuid* *uuid
: UUID (service) to be discovered on remote SDP entity.

bt_sdp_discover_func_t func
: Discover callback to be called on resolved SDP record.

struct *net_buf_pool* *pool
: Memory buffer enabled by user for SDP query results

Bluetooth LE Audio

Bluetooth Audio

API Reference

group bt_audio
: Bluetooth Audio.

Unicast Announcement Type

BT_AUDIO_UNICAST_ANNOUNCEMENT_GENERAL
: Unicast Server is connectable and is requesting a connection.

BT_AUDIO_UNICAST_ANNOUNCEMENT_TARGETED
: Unicast Server is connectable but is not requesting a connection.

Defines

BT_AUDIO_BROADCAST_ID_SIZE
: Size of the broadcast ID in octets.

BT_AUDIO_BROADCAST_ID_MAX
: Maximum broadcast ID value.

BT_AUDIO_PD_PREF_NONE
: Indicates that the server have no preference for the presentation delay.

BT_AUDIO_PD_MAX
: Maximum presentation delay in microseconds.

BT_AUDIO_BROADCAST_CODE_SIZE
: Maximum size of the broadcast code in octets.

BT_AUDIO_BROADCAST_NAME_LEN_MIN
: The minimum size of a Broadcast Name as defined by Bluetooth Assigned Numbers.

BT_AUDIO_BROADCAST_NAME_LEN_MAX
: The maximum size of a Broadcast Name as defined by Bluetooth Assigned Numbers.

BT_AUDIO_LANG_SIZE
: Size of the stream language value, e.g.

  “eng”

BT_AUDIO_CODEC_CAP_CHAN_COUNT_MIN
: Minimum supported channel counts.

BT_AUDIO_CODEC_CAP_CHAN_COUNT_MAX
: Maximum supported channel counts.

BT_AUDIO_CODEC_CAP_CHAN_COUNT_SUPPORT(...)
: Channel count support capability.

  Macro accepts variable number of channel counts. The allowed channel counts are defined by specification and have to be in range from *BT_AUDIO_CODEC_CAP_CHAN_COUNT_MIN* to *BT_AUDIO_CODEC_CAP_CHAN_COUNT_MAX* inclusive.

  Example to support 1 and 3 channels: *BT_AUDIO_CODEC_CAP_CHAN_COUNT_SUPPORT(1, 3)*

BT_AUDIO_CONTEXT_TYPE_ANY
: Any known context.

BT_AUDIO_METADATA_TYPE_IS_KNOWN(_type)
: Helper to check whether metadata type is known by the stack.

  Note

  _type is evaluated thrice.

BT_AUDIO_CODEC_DATA(_type, _bytes...)
: Helper to declare elements of *bt_audio_codec_cap* arrays.

  This macro is mainly for creating an array of struct *bt_audio_codec_cap* data arrays.

  Parameters

  - **_type** – Type of advertising data field
  - **_bytes** – Variable number of single-byte parameters

BT_AUDIO_CODEC_CFG(_id, _cid, _vid, _data, _meta)
: Helper to declare *Codec config parsing APIs*.

  Parameters

  - **_id** – Codec ID
  - **_cid** – Company ID
  - **_vid** – Vendor ID

- **_data** – Codec Specific Data in LVT format
- **_meta** – Codec Specific Metadata in LVT format

BT_AUDIO_CODEC_CAP(_id, _cid, _vid, _data, _meta)

Helper to declare Codec capability parsing APIs structure.

Parameters

- **_id** – Codec ID
- **_cid** – Company ID
- **_vid** – Vendor ID
- **_data** – Codec Specific Data in LVT format
- **_meta** – Codec Specific Metadata in LVT format

BT_AUDIO_LOCATION_ANY

Any known location.

BT_AUDIO_CODEC_QOS(_interval, _framing, _phy, _sdu, _rtn, _latency, _pd)

Helper to declare elements of *bt_audio_codec_qos*.

Parameters

- **_interval** – SDU interval (usec)
- **_framing** – Framing
- **_phy** – Target PHY
- **_sdu** – Maximum SDU Size
- **_rtn** – Retransmission number
- **_latency** – Maximum Transport Latency (msec)
- **_pd** – Presentation Delay (usec)

BT_AUDIO_CODEC_QOS_UNFRAMED(_interval, _sdu, _rtn, _latency, _pd)

Helper to declare Input Unframed *bt_audio_codec_qos*.

Parameters

- **_interval** – SDU interval (usec)
- **_sdu** – Maximum SDU Size
- **_rtn** – Retransmission number
- **_latency** – Maximum Transport Latency (msec)
- **_pd** – Presentation Delay (usec)

BT_AUDIO_CODEC_QOS_FRAMED(_interval, _sdu, _rtn, _latency, _pd)

Helper to declare Input Framed *bt_audio_codec_qos*.

Parameters

- **_interval** – SDU interval (usec)
- **_sdu** – Maximum SDU Size
- **_rtn** – Retransmission number
- **_latency** – Maximum Transport Latency (msec)
- **_pd** – Presentation Delay (usec)

BT_AUDIO_CODEC_QOS_PREF(_unframed_supported, _phy, _rtn, _latency, _pd_min, _pd_max, _pref_pd_min, _pref_pd_max)

Helper to declare elements of *bt_audio_codec_qos_pref*.

Parameters

- **_unframed_supported** – Unframed PDUs supported
- **_phy** – Preferred Target PHY
- **_rtn** – Preferred Retransmission number
- **_latency** – Preferred Maximum Transport Latency (msec)
- **_pd_min** – Minimum Presentation Delay (usec)
- **_pd_max** – Maximum Presentation Delay (usec)
- **_pref_pd_min** – Preferred Minimum Presentation Delay (usec)
- **_pref_pd_max** – Preferred Maximum Presentation Delay (usec)

Enums

enum **bt_audio_codec_cap_type**

Codec capability types.

Used to build and parse codec capabilities as specified in the PAC specification. Source is assigned numbers for Generic Audio, bluetooth.com.

Values:

enumerator **BT_AUDIO_CODEC_CAP_TYPE_FREQ** = 0x01

Supported sampling frequencies.

enumerator **BT_AUDIO_CODEC_CAP_TYPE_DURATION** = 0x02

Supported frame durations.

enumerator **BT_AUDIO_CODEC_CAP_TYPE_CHAN_COUNT** = 0x03

Supported audio channel counts.

enumerator **BT_AUDIO_CODEC_CAP_TYPE_FRAME_LEN** = 0x04

Supported octets per codec frame.

enumerator **BT_AUDIO_CODEC_CAP_TYPE_FRAME_COUNT** = 0x05

Supported maximum codec frames per SDU

enum **bt_audio_codec_cap_freq**

Supported frequencies bitfield.

Values:

enumerator **BT_AUDIO_CODEC_CAP_FREQ_8KHZ** = *BIT*(0)

8 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_11KHZ** = *BIT*(1)

11.025 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_16KHZ** = *BIT*(2)
16 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_22KHZ** = *BIT*(3)
22.05 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_24KHZ** = *BIT*(4)
24 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_32KHZ** = *BIT*(5)
32 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_44KHZ** = *BIT*(6)
44.1 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_48KHZ** = *BIT*(7)
48 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_88KHZ** = *BIT*(8)
88.2 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_96KHZ** = *BIT*(9)
96 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_176KHZ** = *BIT*(10)
176.4 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_192KHZ** = *BIT*(11)
192 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_384KHZ** = *BIT*(12)
384 Khz sampling frequency

enumerator **BT_AUDIO_CODEC_CAP_FREQ_ANY** = (*BT_AUDIO_CODEC_CAP_FREQ_8KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_11KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_16KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_22KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_24KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_32KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_44KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_48KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_88KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_96KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_176KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_192KHZ* | *BT_AUDIO_CODEC_CAP_FREQ_384KHZ*)
Any frequency capability.

enum **bt_audio_codec_cap_frame_dur**
Supported frame durations bitfield.

Values:

enumerator **BT_AUDIO_CODEC_CAP_DURATION_7_5** = *BIT*(0)
7.5 msec frame duration capability

enumerator BT_AUDIO_CODEC_CAP_DURATION_10 = *BIT*(1)

10 msec frame duration capability

enumerator BT_AUDIO_CODEC_CAP_DURATION_ANY = (*BT_AUDIO_CODEC_CAP_DURATION_7_5* | *BT_AUDIO_CODEC_CAP_DURATION_10*)

Any frame duration capability.

enumerator BT_AUDIO_CODEC_CAP_DURATION_PREFER_7_5 = *BIT*(4)

7.5 msec preferred frame duration capability.

This shall only be set if *BT_AUDIO_CODEC_CAP_DURATION_7_5* is also set, and if *BT_AUDIO_CODEC_CAP_DURATION_PREFER_10* is not set.

enumerator BT_AUDIO_CODEC_CAP_DURATION_PREFER_10 = *BIT*(5)

10 msec preferred frame duration capability

This shall only be set if *BT_AUDIO_CODEC_CAP_DURATION_10* is also set, and if *BT_AUDIO_CODEC_CAP_DURATION_PREFER_7_5* is not set.

enum bt_audio_codec_cap_chan_count

Supported audio capabilities channel count bitfield.

Values:

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_1 = *BIT*(0)

Supporting 1 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_2 = *BIT*(1)

Supporting 2 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_3 = *BIT*(2)

Supporting 3 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_4 = *BIT*(3)

Supporting 4 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_5 = *BIT*(4)

Supporting 5 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_6 = *BIT*(5)

Supporting 6 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_7 = *BIT*(6)

Supporting 7 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_8 = *BIT*(7)

Supporting 8 channel.

enumerator BT_AUDIO_CODEC_CAP_CHAN_COUNT_ANY = (*BT_AUDIO_CODEC_CAP_CHAN_COUNT_1* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_2* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_3* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_4* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_5* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_6* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_7* | *BT_AUDIO_CODEC_CAP_CHAN_COUNT_8*)

Supporting all channels.

enum **bt_audio_codec_cfg_type**

Codec configuration types.

Used to build and parse codec configurations as specified in the ASCS and BAP specifications. Source is assigned numbers for Generic Audio, bluetooth.com.

Values:

enumerator **BT_AUDIO_CODEC_CFG_FREQ** = 0x01

Sampling frequency.

enumerator **BT_AUDIO_CODEC_CFG_DURATION** = 0x02

Frame duration.

enumerator **BT_AUDIO_CODEC_CFG_CHAN_ALLOC** = 0x03

Audio channel allocation.

enumerator **BT_AUDIO_CODEC_CFG_FRAME_LEN** = 0x04

Octets per codec frame.

enumerator **BT_AUDIO_CODEC_CFG_FRAME_BLKS_PER_SDU** = 0x05

Codec frame blocks per SDU.

enum **bt_audio_codec_cfg_freq**

Codec configuration sampling freqency.

Values:

enumerator **BT_AUDIO_CODEC_CFG_FREQ_8KHZ** = 0x01

8 Khz codec sampling frequency

enumerator **BT_AUDIO_CODEC_CFG_FREQ_11KHZ** = 0x02

11.025 Khz codec sampling frequency

enumerator **BT_AUDIO_CODEC_CFG_FREQ_16KHZ** = 0x03

16 Khz codec sampling frequency

enumerator **BT_AUDIO_CODEC_CFG_FREQ_22KHZ** = 0x04

22.05 Khz codec sampling frequency

enumerator **BT_AUDIO_CODEC_CFG_FREQ_24KHZ** = 0x05

24 Khz codec sampling frequency

enumerator **BT_AUDIO_CODEC_CFG_FREQ_32KHZ** = 0x06

32 Khz codec sampling frequency

enumerator **BT_AUDIO_CODEC_CFG_FREQ_44KHZ** = 0x07

44.1 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_48KHZ = 0x08

48 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_88KHZ = 0x09

88.2 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_96KHZ = 0x0a

96 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_176KHZ = 0x0b

176.4 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_192KHZ = 0x0c

192 Khz codec sampling frequency

enumerator BT_AUDIO_CODEC_CFG_FREQ_384KHZ = 0x0d

384 Khz codec sampling frequency

enum bt_audio_codec_cfg_frame_dur

Codec configuration frame duration.

Values:

enumerator BT_AUDIO_CODEC_CFG_DURATION_7_5 = 0x00

7.5 msec Frame Duration configuration

enumerator BT_AUDIO_CODEC_CFG_DURATION_10 = 0x01

10 msec Frame Duration configuration

enum bt_audio_context

Audio Context Type for Generic Audio.

These values are defined by the Generic Audio Assigned Numbers, bluetooth.com

Values:

enumerator BT_AUDIO_CONTEXT_TYPE_PROHIBITED = 0

Prohibited.

enumerator BT_AUDIO_CONTEXT_TYPE_UNSPECIFIED = *BIT*(0)

Identifies audio where the use case context does not match any other defined value, or where the context is unknown or cannot be determined.

enumerator BT_AUDIO_CONTEXT_TYPE_CONVERSATIONAL = *BIT*(1)

Conversation between humans, for example, in telephony or video calls, including traditional cellular as well as VoIP and Push-to-Talk.

enumerator BT_AUDIO_CONTEXT_TYPE_MEDIA = *BIT*(2)

Media, for example, music playback, radio, podcast or movie soundtrack, or tv audio.

enumerator BT_AUDIO_CONTEXT_TYPE_GAME = *BIT*(3)

Audio associated with video gaming, for example gaming media; gaming effects; music and in-game voice chat between participants; or a mix of all the above.

enumerator BT_AUDIO_CONTEXT_TYPE_INSTRUCTIONAL = *BIT*(4)

Instructional audio, for example, in navigation, announcements, or user guidance.

enumerator BT_AUDIO_CONTEXT_TYPE_VOICE_ASSISTANTS = *BIT*(5)

Man-machine communication, for example, with voice recognition or virtual assistants.

enumerator BT_AUDIO_CONTEXT_TYPE_LIVE = *BIT*(6)

Live audio, for example, from a microphone where audio is perceived both through a direct acoustic path and through an LE Audio Stream.

enumerator BT_AUDIO_CONTEXT_TYPE_SOUND_EFFECTS = *BIT*(7)

Sound effects including keyboard and touch feedback; menu and user interface sounds; and other system sounds.

enumerator BT_AUDIO_CONTEXT_TYPE_NOTIFICATIONS = *BIT*(8)

Notification and reminder sounds; attention-seeking audio, for example, in beeps signaling the arrival of a message.

enumerator BT_AUDIO_CONTEXT_TYPE_RINGTONE = *BIT*(9)

Alerts the user to an incoming call, for example, an incoming telephony or video call, including traditional cellular as well as VoIP and Push-to-Talk.

enumerator BT_AUDIO_CONTEXT_TYPE_ALERTS = *BIT*(10)

Alarms and timers; immediate alerts, for example, in a critical battery alarm, timer expiry or alarm clock, toaster, cooker, kettle, microwave, etc.

enumerator BT_AUDIO_CONTEXT_TYPE_EMERGENCY_ALARM = *BIT*(11)

Emergency alarm Emergency sounds, for example, fire alarms or other urgent alerts.

enum bt_audio_parental_rating

Parental rating defined by the Generic Audio assigned numbers (bluetooth.com).

The numbering scheme is aligned with Annex F of EN 300 707 v1.2.1 which defined parental rating for viewing.

Values:

enumerator BT_AUDIO_PARENTAL_RATING_NO_RATING = 0x00

No rating.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_ANY = 0x01

For all ages.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_5_OR_ABOVE = 0x02

Recommended for listeners of age 5 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_6_OR_ABOVE = 0x03
Recommended for listeners of age 6 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_7_OR_ABOVE = 0x04
Recommended for listeners of age 7 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_8_OR_ABOVE = 0x05
Recommended for listeners of age 8 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_9_OR_ABOVE = 0x06
Recommended for listeners of age 9 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_10_OR_ABOVE = 0x07
Recommended for listeners of age 10 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_11_OR_ABOVE = 0x08
Recommended for listeners of age 11 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_12_OR_ABOVE = 0x09
Recommended for listeners of age 12 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_13_OR_ABOVE = 0x0A
Recommended for listeners of age 13 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_14_OR_ABOVE = 0x0B
Recommended for listeners of age 14 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_15_OR_ABOVE = 0x0C
Recommended for listeners of age 15 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_16_OR_ABOVE = 0x0D
Recommended for listeners of age 16 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_17_OR_ABOVE = 0x0E
Recommended for listeners of age 17 and above.

enumerator BT_AUDIO_PARENTAL_RATING_AGE_18_OR_ABOVE = 0x0F
Recommended for listeners of age 18 and above.

enum bt_audio_active_state
Audio Active State defined by the Generic Audio assigned numbers (bluetooth.com).
Values:

enumerator BT_AUDIO_ACTIVE_STATE_DISABLED = 0x00
No audio data is being transmitted.

enumerator BT_AUDIO_ACTIVE_STATE_ENABLED = 0x01
Audio data is being transmitted.

enum **bt_audio_metadata_type**

Codec metadata type IDs.

Metadata types defined by the Generic Audio assigned numbers (bluetooth.com).

Values:

enumerator **BT_AUDIO_METADATA_TYPE_PREF_CONTEXT** = 0x01

Preferred audio context.

Bitfield of preferred audio contexts.

If 0, the context type is not a preferred use case for this codec configuration.

See the BT_AUDIO_CONTEXT_* for valid values.

enumerator **BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT** = 0x02

Streaming audio context.

Bitfield of streaming audio contexts.

If 0, the context type is not a preferred use case for this codec configuration.

See the BT_AUDIO_CONTEXT_* for valid values.

enumerator **BT_AUDIO_METADATA_TYPE_PROGRAM_INFO** = 0x03

UTF-8 encoded title or summary of stream content.

enumerator **BT_AUDIO_METADATA_TYPE_LANG** = 0x04

Language.

3 octet lower case language code defined by ISO 639-3 Possible values can be found at https://iso639-3.sil.org/code_tables/639/data

enumerator **BT_AUDIO_METADATA_TYPE_CCID_LIST** = 0x05

Array of 8-bit CCID values.

enumerator **BT_AUDIO_METADATA_TYPE_PARENTAL_RATING** = 0x06

Parental rating.

See *bt_audio_parental_rating* for valid values.

enumerator **BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI** = 0x07

UTF-8 encoded URI for additional Program information.

enumerator **BT_AUDIO_METADATA_TYPE_AUDIO_STATE** = 0x08

Audio active state.

See *bt_audio_active_state* for valid values.

enumerator **BT_AUDIO_METADATA_TYPE_BROADCAST_IMMEDIATE** = 0x09

Broadcast Audio Immediate Rendering flag

enumerator **BT_AUDIO_METADATA_TYPE_EXTENDED** = 0xFE

Extended metadata.

enumerator BT_AUDIO_METADATA_TYPE_VENDOR = 0xFF
Vendor specific metadata.

enum bt_audio_location
Location values for BT Audio.
These values are defined by the Generic Audio Assigned Numbers, bluetooth.com
Values:

enumerator BT_AUDIO_LOCATION_MONO_AUDIO = 0
Mono Audio (no specified Audio Location)

enumerator BT_AUDIO_LOCATION_FRONT_LEFT = *BIT*(0)
Front Left.

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT = *BIT*(1)
Front Right.

enumerator BT_AUDIO_LOCATION_FRONT_CENTER = *BIT*(2)
Front Center.

enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_1 = *BIT*(3)
Low Frequency Effects 1.

enumerator BT_AUDIO_LOCATION_BACK_LEFT = *BIT*(4)
Back Left.

enumerator BT_AUDIO_LOCATION_BACK_RIGHT = *BIT*(5)
Back Right.

enumerator BT_AUDIO_LOCATION_FRONT_LEFT_OF_CENTER = *BIT*(6)
Front Left of Center.

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_OF_CENTER = *BIT*(7)
Front Right of Center.

enumerator BT_AUDIO_LOCATION_BACK_CENTER = *BIT*(8)
Back Center.

enumerator BT_AUDIO_LOCATION_LOW_FREQ_EFFECTS_2 = *BIT*(9)
Low Frequency Effects 2.

enumerator BT_AUDIO_LOCATION_SIDE_LEFT = *BIT*(10)
Side Left.

enumerator BT_AUDIO_LOCATION_SIDE_RIGHT = *BIT*(11)
Side Right.

enumerator BT_AUDIO_LOCATION_TOP_FRONT_LEFT = *BIT*(12)
Top Front Left.

enumerator BT_AUDIO_LOCATION_TOP_FRONT_RIGHT = *BIT*(13)
Top Front Right.

enumerator BT_AUDIO_LOCATION_TOP_FRONT_CENTER = *BIT*(14)
Top Front Center.

enumerator BT_AUDIO_LOCATION_TOP_CENTER = *BIT*(15)
Top Center.

enumerator BT_AUDIO_LOCATION_TOP_BACK_LEFT = *BIT*(16)
Top Back Left.

enumerator BT_AUDIO_LOCATION_TOP_BACK_RIGHT = *BIT*(17)
Top Back Right.

enumerator BT_AUDIO_LOCATION_TOP_SIDE_LEFT = *BIT*(18)
Top Side Left.

enumerator BT_AUDIO_LOCATION_TOP_SIDE_RIGHT = *BIT*(19)
Top Side Right.

enumerator BT_AUDIO_LOCATION_TOP_BACK_CENTER = *BIT*(20)
Top Back Center.

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_CENTER = *BIT*(21)
Bottom Front Center.

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_LEFT = *BIT*(22)
Bottom Front Left.

enumerator BT_AUDIO_LOCATION_BOTTOM_FRONT_RIGHT = *BIT*(23)
Bottom Front Right.

enumerator BT_AUDIO_LOCATION_FRONT_LEFT_WIDE = *BIT*(24)
Front Left Wide.

enumerator BT_AUDIO_LOCATION_FRONT_RIGHT_WIDE = *BIT*(25)
Front Right Wide.

enumerator BT_AUDIO_LOCATION_LEFT_SURROUND = *BIT*(26)
Left Surround.

enumerator BT_AUDIO_LOCATION_RIGHT_SURROUND = *BIT*(27)
Right Surround.

enum **bt_audio_dir**

Audio direction from the perspective of the BAP Unicast Server / BAP Broadcast Sink.

Values:

enumerator **BT_AUDIO_DIR_SINK** = 0x01

Audio direction sink.

For a BAP Unicast Client or Broadcast Source this is considered outgoing audio (TX). For a BAP Unicast Server or Broadcast Sink this is considered incoming audio (RX).

enumerator **BT_AUDIO_DIR_SOURCE** = 0x02

Audio direction source.

For a BAP Unicast Client or Broadcast Source this is considered incoming audio (RX). For a BAP Unicast Server or Broadcast Sink this is considered outgoing audio (TX).

enum **bt_audio_codec_qos_framing**

Codec QoS Framing.

Values:

enumerator **BT_AUDIO_CODEC_QOS_FRAMING_UNFRAMED** = 0x00

Packets may be framed or unframed.

enumerator **BT_AUDIO_CODEC_QOS_FRAMING_FRAMED** = 0x01

Packets are always framed.

Codec QoS Preferred PHY.

Values:

enumerator **BT_AUDIO_CODEC_QOS_1M** = *BIT*(0)

LE 1M PHY.

enumerator **BT_AUDIO_CODEC_QOS_2M** = *BIT*(1)

LE 2M PHY.

enumerator **BT_AUDIO_CODEC_QOS_CODED** = *BIT*(2)

LE Coded PHY.

Functions

int **bt_audio_data_parse**(const uint8_t ltv[], size_t size, bool (*func)(struct *bt_data* *data, void *user_data), void *user_data)

Helper for parsing length-type-value data.

Parameters

- **ltv** – Length-type-value (LTV) encoded data.
- **size** – Size of the `ltv` data.

- `func` – Callback function which will be called for each element that's found in the data. The callback should return true to continue parsing, or false to stop parsing.
- `user_data` – User data to be passed to the callback.

Return values

- `0` – if all entries were parsed.
- `-EINVAL` – if the data is incorrectly encoded
- `-ECANCELED` – if parsing was prematurely cancelled by the callback

uint8_t **bt_audio_get_chan_count**(enum *bt_audio_location* chan_allocation)

Function to get the number of channels from the channel allocation.

Parameters

- `chan_allocation` – The channel allocation

Returns

The number of channels

struct **bt_audio_codec_octets_per_codec_frame**

#include <*audio.h*> struct to hold minimum and maximum supported codec frame sizes

Public Members

uint16_t **min**

Minimum number of octets supported per codec frame.

uint16_t **max**

Maximum number of octets supported per codec frame.

struct **bt_audio_codec_cap**

#include <*audio.h*> Codec capability structure.

Public Members

uint8_t **path_id**

Data path ID.

BT_ISO_DATA_PATH_HCI for HCI path, or any other value for vendor specific ID.

bool **ctlr_transcode**

Whether or not the local controller should transcode.

This effectively sets the coding format for the ISO data path to BT_HCI_CODING_FORMAT_TRANSPARENT if false, else uses the *bt_audio_codec_cfg::id*.

uint8_t **id**

Codec ID.

uint16_t **cid**
Codec Company ID.

uint16_t **vid**
Codec Company Vendor ID.

size_t **data_len**
Codec Specific Capabilities Data count.

uint8_t **data**[CONFIG_BT_AUDIO_CODEC_CAP_MAX_DATA_SIZE]
Codec Specific Capabilities Data.

size_t **meta_len**
Codec Specific Capabilities Metadata count.

uint8_t **meta**[CONFIG_BT_AUDIO_CODEC_CAP_MAX_METADATA_SIZE]
Codec Specific Capabilities Metadata.

struct **bt_audio_codec_cfg**
#include <*audio.h*> Codec specific configuration structure.

Public Members

uint8_t **path_id**
Data path ID.

BT_ISO_DATA_PATH_HCI for HCI path, or any other value for vendor specific ID.

bool **ctlr_transcode**
Whether or not the local controller should transcode.

This effectively sets the coding format for the ISO data path to BT_HCI_CODING_FORMAT_TRANSPARENT if false, else uses the *bt_audio_codec_cfg::id*.

uint8_t **id**
Codec ID.

uint16_t **cid**
Codec Company ID.

uint16_t **vid**
Codec Company Vendor ID.

size_t **data_len**
Codec Specific Capabilities Data count.

uint8_t **data**[CONFIG_BT_AUDIO_CODEC_CFG_MAX_DATA_SIZE]
Codec Specific Capabilities Data.

size_t **meta_len**

Codec Specific Capabilities Metadata count.

uint8_t **meta**[CONFIG_BT_AUDIO_CODEC_CFG_MAX_METADATA_SIZE]

Codec Specific Capabilities Metadata.

struct **bt_audio_codec_qos**

#include <*audio.h*> Codec QoS structure.

Public Members

uint32_t **pd**

Presentation Delay in microseconds.

This value can be changed up and until *bt_bap_stream_qos()* has been called. Once a stream has been QoS configured, modifying this field does not modify the value. It is however possible to modify this field and call *bt_bap_stream_qos()* again to update the value, assuming that the stream is in the correct state.

Value range 0 to *BT_AUDIO_PD_MAX*.

enum *bt_audio_codec_qos_framing* **framing**

QoS Framing.

uint8_t **phy**

PHY.

Allowed values are *BT_AUDIO_CODEC_QOS_1M*, *BT_AUDIO_CODEC_QOS_2M* and *BT_AUDIO_CODEC_QOS_CODED*.

uint8_t **rtn**

Retransmission Number.

This a recommendation to the controller, and the actual retransmission number may be different than this.

uint16_t **sdu**

Maximum SDU size.

Value range BT_ISO_MIN_SDU to BT_ISO_MAX_SDU.

uint16_t **latency**

Maximum Transport Latency.

Not used for the `CONFIG_BT_BAP_BROADCAST_SINK` role.

uint32_t **interval**

SDU Interval.

Value range BT_ISO_SDU_INTERVAL_MIN to BT_ISO_SDU_INTERVAL_MAX

uint16_t **max_pdu**

Maximum PDU size.

Maximum size, in octets, of the payload from link layer to link layer.

Value range BT_ISO_CONNECTED_PDU_MIN to BT_ISO_PDU_MAX for connected ISO.

Value range BT_ISO_BROADCAST_PDU_MIN to BT_ISO_PDU_MAX for broadcast ISO.

uint8_t **burst_number**

Burst number.

Value range BT_ISO_BN_MIN to BT_ISO_BN_MAX.

uint8_t **num_subevents**

Number of subevents.

Maximum number of subevents in each CIS or BIS event.

Value range BT_ISO_NSE_MIN to BT_ISO_NSE_MAX.

struct bt_audio_codec_qos

Connected Isochronous Group (CIG) parameters.

The fields in this struct affect the value sent to the controller via HCI when creating the CIG. Once the group has been created with *bt_bap_unicast_group_create()*, modifying these fields will not affect the group.

struct **bt_audio_codec_qos_pref**

#include <audio.h> Audio Stream Quality of Service Preference structure.

Public Members

bool **unframed_supported**

Unframed PDUs supported.

Unlike the other fields, this is not a preference but whether the codec supports unframed ISOAL PDUs.

uint8_t **phy**

Preferred PHY.

uint8_t **rtn**

Preferred Retransmission Number.

uint16_t **latency**

Preferred Transport Latency.

uint32_t **pd_min**

Minimum Presentation Delay in microseconds.

Unlike the other fields, this is not a preference but a minimum requirement.

Value range 0 to *BT_AUDIO_PD_MAX*, or *BT_AUDIO_PD_PREF_NONE* to indicate no preference.

uint32_t **pd_max**

Maximum Presentation Delay.

Unlike the other fields, this is not a preference but a maximum requirement.

Value range 0 to *BT_AUDIO_PD_MAX*, or *BT_AUDIO_PD_PREF_NONE* to indicate no preference.

uint32_t **pref_pd_min**

Preferred minimum Presentation Delay.

Value range 0 to *BT_AUDIO_PD_MAX*.

uint32_t **pref_pd_max**

Preferred maximum Presentation Delay.

Value range 0 to *BT_AUDIO_PD_MAX*.

group **bt_audio_codec_cfg**

Audio codec Config APIs.

Functions to parse codec config data when formatted as LTV wrapped into *Codec config parsing APIs*.

Functions

int **bt_audio_codec_cfg_freq_to_freq_hz**(enum *bt_audio_codec_cfg_freq* freq)

Convert assigned numbers frequency to frequency value.

Parameters

- **freq** – The assigned numbers frequency to convert.

Return values

- **-EINVAL** – if arguments are invalid.
- **The** – converted frequency value in Hz.

int **bt_audio_codec_cfg_freq_hz_to_freq**(uint32_t freq_hz)

Convert frequency value to assigned numbers frequency.

Parameters

- **freq_hz** – The frequency value to convert.

Return values

- **-EINVAL** – if arguments are invalid.
- **The** – assigned numbers frequency (*bt_audio_codec_cfg_freq*).

int **bt_audio_codec_cfg_get_freq**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract the frequency from a codec configuration.

Parameters

- **codec_cfg** – The codec configuration to extract data from.

Return values

- **A** – *bt_audio_codec_cfg_freq* value

- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size or value

int **bt_audio_codec_cfg_set_freq**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_codec_cfg_freq* freq)

Set the frequency of a codec configuration.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **freq** – The assigned numbers frequency to set.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_frame_dur_to_frame_dur_us**(enum *bt_audio_codec_cfg_frame_dur* frame_dur)

Convert assigned numbers frame duration to duration in microseconds.

Parameters

- **frame_dur** – The assigned numbers frame duration to convert.

Return values

- **-EINVAL** – if arguments are invalid.
- **The** – converted frame duration value in microseconds.

int **bt_audio_codec_cfg_frame_dur_us_to_frame_dur**(uint32_t frame_dur_us)

Convert frame duration in microseconds to assigned numbers frame duration.

Parameters

- **frame_dur_us** – The frame duration in microseconds to convert.

Return values

- **-EINVAL** – if arguments are invalid.
- **The** – assigned numbers frame duration (*bt_audio_codec_cfg_frame_dur*).

int **bt_audio_codec_cfg_get_frame_dur**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract frame duration from BT codec config.

Parameters

- **codec_cfg** – The codec configuration to extract data from.

Return values

- **A** – *bt_audio_codec_cfg_frame_dur* value
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size or value

int **bt_audio_codec_cfg_set_frame_dur**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_codec_cfg_frame_dur* frame_dur)

Set the frame duration of a codec configuration.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **frame_dur** – The assigned numbers frame duration to set.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_get_chan_allocation**(const struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_location* *chan_allocation, bool fallback_to_default)

Extract channel allocation from BT codec config.

The value returned is a bit field representing one or more audio locations as specified by *bt_audio_location* Shall match one or more of the bits set in BT_PAC_SNK_LOC/BT_PAC_SRC_LOC.

Up to the configured *BT_AUDIO_CODEC_CAP_TYPE_CHAN_COUNT* number of channels can be present.

Parameters

- **codec_cfg** – The codec configuration to extract data from.
- **chan_allocation** – Pointer to the variable to store the extracted value in.
- **fallback_to_default** – If true this function will provide the default value of *BT_AUDIO_LOCATION_MONO_AUDIO* if the type is not found when codec_cfg.id is BT_HCI_CODING_FORMAT_LC3.

Return values

- **0** – if value is found and stored in the pointer provided
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size or value

int **bt_audio_codec_cfg_set_chan_allocation**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_location* chan_allocation)

Set the channel allocation of a codec configuration.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **chan_allocation** – The channel allocation to set.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_get_octets_per_frame**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract frame size in octets from BT codec config.

The overall SDU size will be octets_per_frame * blocks_per_sdu.

The Bluetooth specifications are not clear about this value - it does not state that the codec shall use this SDU size only. A codec like LC3 supports variable bit-rate (per SDU) hence it might be allowed for an encoder to reduce the frame size below this value. Hence it is recommended to use the received SDU size and divide by blocks_per_sdu rather than relying on this octets_per_sdu value to be fixed.

Parameters

- **codec_cfg** – The codec configuration to extract data from.

Return values

- **Frame** – length in octets
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size or value

int **bt_audio_codec_cfg_set_octets_per_frame**(struct *bt_audio_codec_cfg* *codec_cfg, uint16_t octets_per_frame)

Set the octets per codec frame of a codec configuration.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **octets_per_frame** – The octets per codec frame to set.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_get_frame_blocks_per_sdu**(const struct *bt_audio_codec_cfg* *codec_cfg, bool fallback_to_default)

Extract number of audio frame blocks in each SDU from BT codec config.

The overall SDU size will be octets_per_frame * frame_blocks_per_sdu * number-of-channels.

If this value is not present a default value of 1 shall be used.

A frame block is one or more frames that represents data for the same period of time but for different channels. If the stream have two audio channels and this value is two there will be four frames in the SDU.

Parameters

- **codec_cfg** – The codec configuration to extract data from.
- **fallback_to_default** – If true this function will return the default value of 1 if the type is not found when `codec_cfg.id` is BT_HCI_CODING_FORMAT_LC3.

Return values

- **The** – count of codec frame blocks in each SDU.
- **-EINVAL** – if arguments are invalid

- -ENODATA – if not found
- -EBADMSG – if found value has invalid size or value

int bt_audio_codec_cfg_set_frame_blocks_per_sdu(struct *bt_audio_codec_cfg* *codec_cfg, uint8_t frame_blocks)

Set the frame blocks per SDU of a codec configuration.

Parameters

- codec_cfg – The codec configuration to set data for.
- frame_blocks – The frame blocks per SDU to set.

Return values

- The – data_len of codec_cfg on success
- -EINVAL – if arguments are invalid
- -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_get_val(const struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_codec_cfg_type* type, const uint8_t **data)

Lookup a specific codec configuration value.

Parameters

- codec_cfg – **[in]** The codec data to search in.
- type – **[in]** The type id to look for
- data – **[out]** Pointer to the data-pointer to update when item is found

Return values

- Length – of found data (may be 0)
- -EINVAL – if arguments are invalid
- -ENODATA – if not found

int bt_audio_codec_cfg_set_val(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_codec_cfg_type* type, const uint8_t *data, size_t data_len)

Set or add a specific codec configuration value.

Parameters

- codec_cfg – The codec data to set the value in.
- type – The type id to set
- data – Pointer to the data-pointer to set
- data_len – Length of data

Return values

- The – data_len of codec_cfg on success
- -EINVAL – if arguments are invalid
- -ENOMEM – if the new value could not set or added due to memory

int bt_audio_codec_cfg_unset_val(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_codec_cfg_type* type)

Unset a specific codec configuration value.

The type and the value will be removed from the codec configuration.

Parameters

- **codec_cfg** – The codec data to set the value in.
- **type** – The type id to unset.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid

int **bt_audio_codec_cfg_meta_get_val**(const struct *bt_audio_codec_cfg* *codec_cfg, uint8_t type, const uint8_t **data)

Lookup a specific metadata value based on type.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **type** – **[in]** The type id to look for
- **data** – **[out]** Pointer to the data-pointer to update when item is found

Return values

- **Length** – of found data (may be 0)
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

int **bt_audio_codec_cfg_meta_set_val**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_metadata_type* type, const uint8_t *data, size_t data_len)

Set or add a specific codec configuration metadata value.

Parameters

- **codec_cfg** – The codec configuration to set the value in.
- **type** – The type id to set.
- **data** – Pointer to the data-pointer to set.
- **data_len** – Length of data.

Return values

- **The** – meta_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_unset_val**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_metadata_type* type)

Unset a specific codec configuration metadata value.

The type and the value will be removed from the codec configuration metadata.

Parameters

- **codec_cfg** – The codec data to set the value in.
- **type** – The type id to unset.

Return values

- **The** – meta_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid

int **bt_audio_codec_cfg_meta_get_pref_context**(const struct *bt_audio_codec_cfg* *codec_cfg, bool fallback_to_default)

Extract preferred contexts.

See *BT_AUDIO_METADATA_TYPE_PREF_CONTEXT* for more information about this value.

Parameters

- **codec_cfg** – The codec data to search in.
- **fallback_to_default** – If true this function will provide the default value of *BT_AUDIO_CONTEXT_TYPE_UNSPECIFIED* if the type is not found when `codec_cfg.id` is BT_HCI_CODING_FORMAT_LC3.

Return values

- **The** – preferred context type if positive or 0
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size

int **bt_audio_codec_cfg_meta_set_pref_context**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_context* ctx)

Set the preferred context of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **ctx** – The preferred context to set.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_stream_context**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract stream contexts.

See *BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT* for more information about this value.

Parameters

- **codec_cfg** – The codec data to search in.

Return values

- **The** – stream context type if positive or 0
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size

int **bt_audio_codec_cfg_meta_set_stream_context**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_context* ctx)

Set the stream context of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.

- **ctx** – The stream context to set.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_program_info**(const struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t **program_info)

Extract program info.

See *BT_AUDIO_METADATA_TYPE_PROGRAM_INFO* for more information about this value.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **program_info** – **[out]** Pointer to the UTF-8 formatted program info.

Return values

- **The** – length of the program_info (may be 0)
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

int **bt_audio_codec_cfg_meta_set_program_info**(struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t *program_info, size_t program_info_len)

Set the program info of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **program_info** – The program info to set.
- **program_info_len** – The length of program_info.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_lang**(const struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t **lang)

Extract language.

See *BT_AUDIO_METADATA_TYPE_LANG* for more information about this value.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **lang** – **[out]** Pointer to the language bytes (of length BT_AUDIO_LANG_SIZE)

Return values

- **The** – language if positive or 0
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

- **-EBADMSG** – if found value has invalid size

int **bt_audio_codec_cfg_meta_set_lang**(struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t lang[3])

Set the language of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **lang** – The 24-bit language to set.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_ccid_list**(const struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t **ccid_list)

Extract CCID list.

See *BT_AUDIO_METADATA_TYPE_CCID_LIST* for more information about this value.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **ccid_list** – **[out]** Pointer to the array containing 8-bit CCIDs.

Return values

- **The** – length of the `ccid_list` (may be 0)
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

int **bt_audio_codec_cfg_meta_set_ccid_list**(struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t *ccid_list, size_t ccid_list_len)

Set the CCID list of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **ccid_list** – The program info to set.
- **ccid_list_len** – The length of `ccid_list`.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_parental_rating**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract parental rating.

See *BT_AUDIO_METADATA_TYPE_PARENTAL_RATING* for more information about this value.

Parameters

- **codec_cfg** – The codec data to search in.

Return values

- **The** – parental rating if positive or 0
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size

int **bt_audio_codec_cfg_meta_set_parental_rating**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_parental_rating* parental_rating)

Set the parental rating of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **parental_rating** – The parental rating to set.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_program_info_uri**(const struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t **program_info_uri)

Extract program info URI.

See *BT_AUDIO_METADATA_TYPE_PROGRAM_INFO_URI* for more information about this value.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **program_info_uri** – **[out]** Pointer to the UTF-8 formatted program info URI.

Return values

- **The** – length of the `ccid_list` (may be 0)
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

int **bt_audio_codec_cfg_meta_set_program_info_uri**(struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t *program_info_uri, size_t program_info_uri_len)

Set the program info URI of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **program_info_uri** – The program info URI to set.
- **program_info_uri_len** – The length of `program_info_uri`.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_audio_active_state**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract audio active state.

See *BT_AUDIO_METADATA_TYPE_AUDIO_STATE* for more information about this value.

Parameters

- **codec_cfg** – The codec data to search in.

Return values

- **The** – preferred context type if positive or 0
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found
- **-EBADMSG** – if found value has invalid size

int **bt_audio_codec_cfg_meta_set_audio_active_state**(struct *bt_audio_codec_cfg* *codec_cfg, enum *bt_audio_active_state* state)

Set the audio active state of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **state** – The audio active state to set.

Return values

- **The** – data_len of `codec_cfg` on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_bcast_audio_immediate_rend_flag**(const struct *bt_audio_codec_cfg* *codec_cfg)

Extract broadcast audio immediate rendering flag.

See *BT_AUDIO_METADATA_TYPE_BROADCAST_IMMEDIATE* for more information about this value.

Parameters

- **codec_cfg** – The codec data to search in.

Return values

- **0** – if the flag was found
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not the flag was not found

int **bt_audio_codec_cfg_meta_set_bcast_audio_immediate_rend_flag**(struct *bt_audio_codec_cfg* *codec_cfg)

Set the broadcast audio immediate rendering flag of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_extended**(const struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t **extended_meta)

Extract extended metadata.

See *BT_AUDIO_METADATA_TYPE_EXTENDED* for more information about this value.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **extended_meta** – **[out]** Pointer to the extended metadata.

Return values

- **The** – length of the ccid_list (may be 0)
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

int **bt_audio_codec_cfg_meta_set_extended**(struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t *extended_meta, size_t extended_meta_len)

Set the extended metadata of a codec configuration metadata.

Parameters

- **codec_cfg** – The codec configuration to set data for.
- **extended_meta** – The extended metadata to set.
- **extended_meta_len** – The length of extended_meta.

Return values

- **The** – data_len of codec_cfg on success
- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the new value could not set or added due to memory

int **bt_audio_codec_cfg_meta_get_vendor**(const struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t **vendor_meta)

Extract vendor specific metadata.

See *BT_AUDIO_METADATA_TYPE_VENDOR* for more information about this value.

Parameters

- **codec_cfg** – **[in]** The codec data to search in.
- **vendor_meta** – **[out]** Pointer to the vendor specific metadata.

Return values

- **The** – length of the ccid_list (may be 0)
- **-EINVAL** – if arguments are invalid
- **-ENODATA** – if not found

int **bt_audio_codec_cfg_meta_set_vendor**(struct *bt_audio_codec_cfg* *codec_cfg, const uint8_t *vendor_meta, size_t vendor_meta_len)

Set the vendor specific metadata of a codec configuration metadata.

Parameters

- `codec_cfg` – The codec configuration to set data for.
- `vendor_meta` – The vendor specific metadata to set.
- `vendor_meta_len` – The length of `vendor_meta`.

Return values

- `The` – data_len of `codec_cfg` on success
- `-EINVAL` – if arguments are invalid
- `-ENOMEM` – if the new value could not set or added due to memory

Basic Audio Profile

Related code samples

Bluetooth: Broadcast Audio Assistant
Use LE Audio Broadcast Assistant functionality

Bluetooth: Common Audio Profile Acceptor
CAP Acceptor sample that advertises audio availability to CAP Initiators.

Bluetooth: Common Audio Profile Initiator
CAP Initiator sample that connects to CAP Acceptors and setup unicast audio streaming, or broadcast audio streams.

API Reference

group `bt_bap`

Bluetooth Basic Audio Profile (BAP)

The Basic Audio Profile (BAP) allows for both unicast and broadcast Audio Stream control.

Since
3.0

Version
0.8.0

Defines

`BT_BAP_PA_INTERVAL_UNKNOWN`

Value indicating that the periodic advertising interval is unknown.

`BT_BAP_BIS_SYNC_NO_PREF`

Broadcast Assistant no BIS sync preference.

Value indicating that the Broadcast Assistant has no preference to which BIS the Scan Delegator syncs to

BT_BAP_ASCS_RSP(c, r)

Macro used to initialise the object storing values of ASE Control Point notification.

Parameters

- c – Response Code field
- r – Reason field - *bt_bap_ascs_reason* or *bt_audio_metadata_type* (see notes in *bt_bap_ascs_rsp*).

Typedefs

typedef bool (*bt_bap_scan_delegator_state_func_t)(const struct *bt_bap_scan_delegator_recv_state* *recv_state, void *user_data)

Callback function for Scan Delegator receive state search functions.

Param recv_state
The receive state.

Param user_data
User data.

Retval true
to stop iterating. If this is used in the context of *bt_bap_scan_delegator_find_state()*, the recv_state will be returned by *bt_bap_scan_delegator_find_state()*

Retval false
to continue iterating

typedef void (*bt_bap_broadcast_assistant_write_cb)(struct bt_conn *conn, int err)

Callback function for writes.

Param conn
The connection to the peer device.

Param err
Error value. 0 on success, GATT error on fail.

Enums

enum bt_bap_pa_state

Periodic advertising state reported by the Scan Delegator.

Values:

enumerator BT_BAP_PA_STATE_NOT_SYNCED = 0x00

The periodic advertising has not been synchronized.

enumerator BT_BAP_PA_STATE_INFO_REQ = 0x01

Waiting for SyncInfo from Broadcast Assistant.

enumerator BT_BAP_PA_STATE_SYNCED = 0x02

Synchronized to periodic advertising.

enumerator BT_BAP_PA_STATE_FAILED = 0x03
Failed to synchronized to periodic advertising.

enumerator BT_BAP_PA_STATE_NO_PAST = 0x04
No periodic advertising sync transfer receiver from Broadcast Assistant.

enum bt_bap_big_enc_state
Broadcast Isochronous Group encryption state reported by the Scan Delegator.
Values:

enumerator BT_BAP_BIG_ENC_STATE_NO_ENC = 0x00
The Broadcast Isochronous Group not encrypted.

enumerator BT_BAP_BIG_ENC_STATE_BCODE_REQ = 0x01
The Broadcast Isochronous Group broadcast code requested.

enumerator BT_BAP_BIG_ENC_STATE_DEC = 0x02
The Broadcast Isochronous Group decrypted.

enumerator BT_BAP_BIG_ENC_STATE_BAD_CODE = 0x03
The Broadcast Isochronous Group bad broadcast code.

enum bt_bap_bass_att_err
Broadcast Audio Scan Service (BASS) specific ATT error codes.
Values:

enumerator BT_BAP_BASS_ERR_OPCODE_NOT_SUPPORTED = 0x80
Opcode not supported.

enumerator BT_BAP_BASS_ERR_INVALID_SRC_ID = 0x81
Invalid source ID supplied.

enum bt_bap_ep_state
Endpoint states.
Values:

enumerator BT_BAP_EP_STATE_IDLE = 0x00
Audio Stream Endpoint Idle state.

enumerator BT_BAP_EP_STATE_CODEC_CONFIGURED = 0x01
Audio Stream Endpoint Codec Configured state.

enumerator BT_BAP_EP_STATE_QOS_CONFIGURED = 0x02
Audio Stream Endpoint QoS Configured state.

enumerator BT_BAP_EP_STATE_ENABLING = 0x03
Audio Stream Endpoint Enabling state.

enumerator BT_BAP_EP_STATE_STREAMING = 0x04
Audio Stream Endpoint Streaming state.

enumerator BT_BAP_EP_STATE_DISABLING = 0x05
Audio Stream Endpoint Disabling state.

enumerator BT_BAP_EP_STATE_RELEASING = 0x06
Audio Stream Endpoint Streaming state.

enum bt_bap_ascs_rsp_code
Response Status Code.
These are sent by the server to the client when a stream operation is requested.
Values:

enumerator BT_BAP_ASCS_RSP_CODE_SUCCESS = 0x00
Server completed operation successfully.

enumerator BT_BAP_ASCS_RSP_CODE_NOT_SUPPORTED = 0x01
Server did not support operation by client.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_LENGTH = 0x02
Server rejected due to invalid operation length.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_ASE = 0x03
Invalid ASE ID.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_ASE_STATE = 0x04
Invalid ASE state.

enumerator BT_BAP_ASCS_RSP_CODE_INVALID_DIR = 0x05
Invalid operation for direction.

enumerator BT_BAP_ASCS_RSP_CODE_CAP_UNSUPPORTED = 0x06
Capabilities not supported by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED = 0x07
Configuration parameters not supported by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_REJECTED = 0x08
Configuration parameters rejected by server.

enumerator BT_BAP_ASCS_RSP_CODE_CONF_INVALID = 0x09
Invalid Configuration parameters.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_UNSUPPORTED = 0x0a
Unsupported metadata.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_REJECTED = 0x0b
Metadata rejected by server.

enumerator BT_BAP_ASCS_RSP_CODE_METADATA_INVALID = 0x0c
Invalid metadata.

enumerator BT_BAP_ASCS_RSP_CODE_NO_MEM = 0x0d
Server has insufficient resources.

enumerator BT_BAP_ASCS_RSP_CODE_UNSPECIFIED = 0x0e
Unspecified error.

enum bt_bap_ascs_reason
Response Reasons.

These are used if the *bt_bap_ascs_rsp_code* value is *BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED*, *BT_BAP_ASCS_RSP_CODE_CONF_REJECTED* or *BT_BAP_ASCS_RSP_CODE_CONF_INVALID*.

Values:

enumerator BT_BAP_ASCS_REASON_NONE = 0x00
No reason.

enumerator BT_BAP_ASCS_REASON_CODEC = 0x01
Codec ID.

enumerator BT_BAP_ASCS_REASON_CODEC_DATA = 0x02
Codec configuration.

enumerator BT_BAP_ASCS_REASON_INTERVAL = 0x03
SDU interval.

enumerator BT_BAP_ASCS_REASON_FRAMING = 0x04
Framing.

enumerator BT_BAP_ASCS_REASON_PHY = 0x05
PHY.

enumerator BT_BAP_ASCS_REASON_SDU = 0x06
Maximum SDU size.

enumerator BT_BAP_ASCS_REASON_RTN = 0x07
RTN.

enumerator BT_BAP_ASCS_REASON_LATENCY = 0x08
Max transport latency.

enumerator BT_BAP_ASCS_REASON_PD = 0x09
Presendation delay.

enumerator **BT_BAP_ASCS_REASON_CIS** = 0x0a

Invalid CIS mapping.

Functions

int **bt_bap_ep_get_info**(const struct bt_bap_ep *ep, struct *bt_bap_ep_info* *info)

Return structure holding information of audio stream endpoint.

Parameters

- **ep** – The audio stream endpoint object.
- **info** – The structure object to be filled with the info.

Return values

- **0** – in case of success
- **-EINVAL** – if ep or info are NULL

void **bt_bap_stream_cb_register**(struct *bt_bap_stream* *stream, struct *bt_bap_stream_ops* *ops)

Register Audio callbacks for a stream.

Register Audio callbacks for a stream.

Parameters

- **stream** – Stream object.
- **ops** – Stream operations structure.

int **bt_bap_stream_config**(struct bt_conn *conn, struct *bt_bap_stream* *stream, struct bt_bap_ep *ep, struct *bt_audio_codec_cfg* *codec_cfg)

Configure Audio Stream.

This procedure is used by a client to configure a new stream using the remote endpoint, local capability and codec configuration.

Parameters

- **conn** – Connection object
- **stream** – Stream object being configured
- **ep** – Remote Audio Endpoint being configured
- **codec_cfg** – Codec configuration

Returns

Allocated Audio Stream object or NULL in case of error.

int **bt_bap_stream_reconfig**(struct *bt_bap_stream* *stream, struct *bt_audio_codec_cfg* *codec_cfg)

Reconfigure Audio Stream.

This procedure is used by a unicast client or unicast server to reconfigure a stream to use a different local codec configuration.

This can only be done for unicast streams.

Parameters

- **stream** – Stream object being reconfigured
- **codec_cfg** – Codec configuration

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_qos**(struct bt_conn *conn, struct bt_bap_unicast_group *group)

Configure Audio Stream QoS.

This procedure is used by a client to configure the Quality of Service of streams in a unicast group. All streams in the group for the specified conn will have the Quality of Service configured. This shall only be used to configure unicast streams.

Parameters

- **conn** – Connection object
- **group** – Unicast group object

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_enable**(struct *bt_bap_stream* *stream, const uint8_t meta[], size_t meta_len)

Enable Audio Stream.

This procedure is used by a client to enable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters

- **stream** – Stream object
- **meta** – Metadata
- **meta_len** – Metadata length

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_metadata**(struct *bt_bap_stream* *stream, const uint8_t meta[], size_t meta_len)

Change Audio Stream Metadata.

This procedure is used by a unicast client or unicast server to change the metadata of a stream.

Parameters

- **stream** – Stream object
- **meta** – Metadata
- **meta_len** – Metadata length

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_disable**(struct *bt_bap_stream* *stream)

Disable Audio Stream.

This procedure is used by a unicast client or unicast server to disable a stream.

This shall only be called for unicast streams, as broadcast streams will always be enabled once created.

Parameters

- **stream** – Stream object

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_connect**(struct *bt_bap_stream* *stream)

Connect unicast audio stream.

This procedure is used by a unicast client to connect the connected isochronous stream (CIS) associated with the audio stream. If two audio streams share a CIS, then this only needs to be done once for those streams. This can only be done for streams in the QoS configured or enabled states.

The *bt_bap_stream_ops.connected()* callback will be called on the streams once this has finished.

This shall only be called for unicast streams, and only as the unicast client (`CONFIG_BT_BAP_UNICAST_CLIENT`).

Parameters

- **stream** – Stream object

Return values

- **0** – in case of success
- **-EINVAL** – if the stream, endpoint, ISO channel or connection is NULL
- **-EBADMSG** – if the stream or ISO channel is in an invalid state for connection
- **-EOPNOTSUPP** – if the role of the stream is not BT_HCI_ROLE_CENTRAL
- **-EALREADY** – if the ISO channel is already connecting or connected
- **-EBUSY** – if another ISO channel is connecting
- **-ENOEXEC** – if otherwise rejected by the ISO layer

int **bt_bap_stream_start**(struct *bt_bap_stream* *stream)

Start Audio Stream.

This procedure is used by a unicast client or unicast server to make a stream start streaming.

For the unicast client, this will send the receiver start ready command to the unicast server for *BT_AUDIO_DIR_SOURCE* ASEs. The CIS is required to be connected first by *bt_bap_stream_connect()* before the command can be sent.

For the unicast server, this will execute the receiver start ready command on the unicast server for *BT_AUDIO_DIR_SINK* ASEs. If the CIS is not connected yet, the stream will go into the streaming state as soon as the CIS is connected.

This shall only be called for unicast streams.

Broadcast sinks will always be started once synchronized, and broadcast source streams shall be started with *bt_bap_broadcast_source_start()*.

Parameters

- **stream** – Stream object

Returns

0 in case of success or negative value in case of error.

int **bt_bap_stream_stop**(struct *bt_bap_stream* *stream)

Stop Audio Stream.

This procedure is used by a client to make a stream stop streaming.

This shall only be called for unicast streams. Broadcast sinks cannot be stopped. Broadcast sources shall be stopped with *bt_bap_broadcast_source_stop()*.

Parameters

- **stream** – Stream object

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_release**(struct *bt_bap_stream* *stream)

Release Audio Stream.

This procedure is used by a unicast client or unicast server to release a unicast stream.

Broadcast sink streams cannot be released, but can be deleted by *bt_bap_broadcast_sink_delete()*. Broadcast source streams cannot be released, but can be deleted by *bt_bap_broadcast_source_delete()*.

Parameters

- **stream** – Stream object

Returns
0 in case of success or negative value in case of error.

int **bt_bap_stream_send**(struct *bt_bap_stream* *stream, struct *net_buf* *buf, uint16_t seq_num)

Send data to Audio stream without timestamp.

Send data from buffer to the stream.

Note

Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX .

Parameters

- **stream** – Stream object.
- **buf** – Buffer containing data to be sent.
- **seq_num** – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.

Returns
Bytes sent in case of success or negative value in case of error.

int **bt_bap_stream_send_ts**(struct *bt_bap_stream* *stream, struct *net_buf* *buf, uint16_t seq_num, uint32_t ts)

Send data to Audio stream with timestamp.

Send data from buffer to the stream.

Note

Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX .

Parameters

- **stream** – Stream object.
- **buf** – Buffer containing data to be sent.
- **seq_num** – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.

- **ts** – Timestamp of the SDU in microseconds (us). This value can be used to transmit multiple SDUs in the same SDU interval in a CIG or BIG.

Returns
Bytes sent in case of success or negative value in case of error.

int **bt_bap_stream_get_tx_sync**(struct *bt_bap_stream* *stream, struct bt_iso_tx_info *info)

Get ISO transmission timing info for a Basic Audio Profile stream.

Reads timing information for transmitted ISO packet on an ISO channel. The HCI_LE_Read_ISO_TX_Sync HCI command is used to retrieve this information from the controller.

Note

An SDU must have already been successfully transmitted on the ISO channel for this function to return successfully. Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX .

Parameters

- **stream** – **[in]** Stream object.
- **info** – **[out]** Transmit info object.

Return values

- **0** – on success
- **-EINVAL** – if the stream is invalid, if the stream is not configured for sending or if it is not connected with a isochronous stream
- **Any** – return value from bt_iso_chan_get_tx_sync()

void **bt_bap_scan_delegator_register_cb**(struct *bt_bap_scan_delegator_cb* *cb)

Register the callbacks for the Basic Audio Profile Scan Delegator.

Only one set of callbacks can be registered at any one time, and calling this function multiple times will override any previously registered callbacks.

Parameters

- **cb** – Pointer to the callback struct

int **bt_bap_scan_delegator_set_pa_state**(uint8_t src_id, enum *bt_bap_pa_state* pa_state)

Set the periodic advertising sync state to syncing.

Set the periodic advertising sync state for a receive state to syncing, notifying Broadcast Assistants.

Parameters

- **src_id** – The source id used to identify the receive state.
- **pa_state** – The Periodic Advertising sync state to set. BT_BAP_PA_STATE_NOT_SYNCED and BT_BAP_PA_STATE_SYNCED is not necessary to provide, as they are handled internally.

Returns
int Error value. 0 on success, errno on fail.

int **bt_bap_scan_delegator_set_bis_sync_state**(uint8_t src_id, uint32_t bis_synced[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS])

Set the sync state of a receive state in the server.

Parameters

- `src_id` – The source id used to identify the receive state.
- `bis_synced` – Array of bitfields to set the BIS sync state for each subgroup.

Returns
int Error value. 0 on success, ERRNO on fail.

int `bt_bap_scan_delegator_add_src`(const struct *bt_bap_scan_delegator_add_src_param* *param)

Add a receive state source locally.

This will notify any connected clients about the new source. This allows them to modify and even remove it.

If `CONFIG_BT_BAP_BROADCAST_SINK` is enabled, any Broadcast Sink sources are autonomously added.

Parameters

- `param` – The parameters for adding the new source

Returns
int errno on failure, or source ID on success.

int `bt_bap_scan_delegator_mod_src`(const struct *bt_bap_scan_delegator_mod_src_param* *param)

Add a receive state source locally.

This will notify any connected clients about the new source. This allows them to modify and even remove it.

If `CONFIG_BT_BAP_BROADCAST_SINK` is enabled, any Broadcast Sink sources are autonomously modified.

Parameters

- `param` – The parameters for adding the new source

Returns
int errno on failure, or source ID on success.

int `bt_bap_scan_delegator_rem_src`(uint8_t src_id)

Remove a receive state source.

This will remove the receive state. If the receive state periodic advertising is synced, *bt_bap_scan_delegator_cb.pa_sync_term_req()* will be called.

If `CONFIG_BT_BAP_BROADCAST_SINK` is enabled, any Broadcast Sink sources are autonomously removed.

Parameters

- `src_id` – The source ID to remove

Returns
int Error value. 0 on success, errno on fail.

void `bt_bap_scan_delegator_foreach_state`(*bt_bap_scan_delegator_state_func_t* func, void *user_data)

Iterate through all existing receive states.

Parameters

- `func` – The callback function
- `user_data` – User specified data that sent to the callback function

const struct *bt_bap_scan_delegator_recv_state* ***bt_bap_scan_delegator_find_state**(*bt_bap_scan_delegato*
func,
void
*user_data)

Find and return a receive state based on a compare function.

Parameters

- **func** – The compare callback function
- **user_data** – User specified data that sent to the callback function

Returns
The first receive state where the func returned true, or NULL

int **bt_bap_broadcast_assistant_discover**(struct bt_conn *conn)

Discover Broadcast Audio Scan Service on the server.

Warning: Only one connection can be active at any time; discovering for a new connection, will delete all previous data.

Parameters

- **conn** – The connection

Returns
int Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_scan_start**(struct bt_conn *conn, bool start_scan)

Scan start for BISes for a remote server.

This will let the Broadcast Audio Scan Service server know that this device is actively scanning for broadcast sources. The function can optionally also start scanning, if the caller does not want to start scanning itself.

Scan results, if start_scan is true, is sent to the bt_bap_broadcast_assistant_scan_cb callback.

Parameters

- **conn** – Connection to the Broadcast Audio Scan Service server. Used to let the server know that we are scanning.
- **start_scan** – Start scanning if true. If false, the application should enable scan itself.

Returns
int Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_scan_stop**(struct bt_conn *conn)

Stop remote scanning for BISes for a server.

Parameters

- **conn** – Connection to the server.

Returns
int Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_register_cb**(struct *bt_bap_broadcast_assistant_cb* *cb)

Registers the callbacks used by Broadcast Audio Scan Service client.

Parameters

- **cb** – The callback structure.

Return values

- **0** – on success

- **-EINVAL** – if cb is NULL
- **-EALREADY** – if cb was already registered

int **bt_bap_broadcast_assistant_unregister_cb**(struct *bt_bap_broadcast_assistant_cb* *cb)

Unregisters the callbacks used by the Broadcast Audio Scan Service client.

Parameters

- **cb** – The callback structure.

Return values

- **0** – on success
- **-EINVAL** – if cb is NULL
- **-EALREADY** – if cb was not registered

int **bt_bap_broadcast_assistant_add_src**(struct bt_conn *conn, const struct *bt_bap_broadcast_assistant_add_src_param* *param)

Add a source on the server.

Parameters

- **conn** – Connection to the server.
- **param** – Parameter struct.

Returns
Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_mod_src**(struct bt_conn *conn, const struct *bt_bap_broadcast_assistant_mod_src_param* *param)

Modify a source on the server.

Parameters

- **conn** – Connection to the server.
- **param** – Parameter struct.

Returns
Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_set_broadcast_code**(struct bt_conn *conn, uint8_t src_id, const uint8_t broadcast_code[*BT_AUDIO_BROADCAST_CODE_SIZE*])

Set a broadcast code to the specified receive state.

Parameters

- **conn** – Connection to the server.
- **src_id** – Source ID of the receive state.
- **broadcast_code** – The broadcast code.

Returns
Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_rem_src**(struct bt_conn *conn, uint8_t src_id)

Remove a source from the server.

Parameters

- **conn** – Connection to the server.

- **src_id** – Source ID of the receive state.

Returns
Error value. 0 on success, GATT error or ERRNO on fail.

int **bt_bap_broadcast_assistant_read_recv_state**(struct bt_conn *conn, uint8_t idx)

Read the specified receive state from the server.

Parameters

- **conn** – Connection to the server.
- **idx** – The index of the receive start (0 up to the value from bt_bap_broadcast_assistant_discover_cb)

Returns
Error value. 0 on success, GATT error or ERRNO on fail.

struct **bt_bap_ascs_rsp**

#include <bap.h> Structure storing values of fields of ASE Control Point notification.

Public Members

enum *bt_bap_ascs_rsp_code* **code**

Value of the Response Code field.

The following response codes are accepted:
- *BT_BAP_ASCS_RSP_CODE_SUCCESS*
- *BT_BAP_ASCS_RSP_CODE_CAP_UNSUPPORTED*
- *BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED*
- *BT_BAP_ASCS_RSP_CODE_CONF_REJECTED*
- *BT_BAP_ASCS_RSP_CODE_METADATA_UNSUPPORTED*
- *BT_BAP_ASCS_RSP_CODE_METADATA_REJECTED*
- *BT_BAP_ASCS_RSP_CODE_NO_MEM*
- *BT_BAP_ASCS_RSP_CODE_UNSPECIFIED*

enum *bt_bap_ascs_reason* **reason**

Response reason.

If the Response Code is one of the following:
- *BT_BAP_ASCS_RSP_CODE_CONF_UNSUPPORTED*
- *BT_BAP_ASCS_RSP_CODE_CONF_REJECTED* all values from *bt_bap_ascs_reason* can be used.

If the Response Code is one of the following:
- *BT_BAP_ASCS_RSP_CODE_SUCCESS*
- *BT_BAP_ASCS_RSP_CODE_CAP_UNSUPPORTED*
- *BT_BAP_ASCS_RSP_CODE_NO_MEM*
- *BT_BAP_ASCS_RSP_CODE_UNSPECIFIED* only value *BT_BAP_ASCS_REASON_NONE* shall be used.

enum *bt_audio_metadata_type* **metadata_type**

Response metadata type.

If the Response Code is one of the following:
- *BT_BAP_ASCS_RSP_CODE_METADATA_UNSUPPORTED*
- *BT_BAP_ASCS_RSP_CODE_METADATA_REJECTED* the value of the Metadata Type shall be used.

union **bt_bap_ascs_rsp**

Value of the Reason field.

The meaning of this value depend on the Response Code field.

struct **bt_bap_bass_subgroup**

#include <*bap.h*> Struct to hold subgroup specific information for the receive state.

Public Members

uint32_t **bis_sync**

BIS synced bitfield.

uint8_t **metadata_len**

Length of the metadata.

uint8_t **metadata**[CONFIG_BT_AUDIO_CODEC_CFG_MAX_METADATA_SIZE]

The metadata.

struct **bt_bap_scan_delegator_recv_state**

#include <*bap.h*> Represents the Broadcast Audio Scan Service receive state.

Public Members

uint8_t **src_id**

The source ID

bt_addr_le_t **addr**

The Bluetooth address.

uint8_t **adv_sid**

The advertising set ID.

enum *bt_bap_pa_state* **pa_sync_state**

The periodic adverting sync state.

enum *bt_bap_big_enc_state* **encrypt_state**

The broadcast isochronous group encryption state.

uint32_t **broadcast_id**

The 24-bit broadcast ID.

uint8_t **bad_code**[*BT_AUDIO_BROADCAST_CODE_SIZE*]

The bad broadcast code.

Only valid if encrypt_state is *BT_BAP_BIG_ENC_STATE_BCODE_REQ*

uint8_t **num_subgroups**

Number of subgroups.

struct *bt_bap_bass_subgroup* **subgroups**[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]

Subgroup specific information.

struct **bt_bap_scan_delegator_cb**

#include <*bap.h*> Struct to hold the Basic Audio Profile Scan Delegator callbacks.

These can be registered for usage with *bt_bap_scan_delegator_register_cb()*.

Public Members

void (***recv_state_updated**)(struct bt_conn *conn, const struct *bt_bap_scan_delegator_recv_state* *recv_state)

Receive state updated.

Param conn
Pointer to the connection to a remote device if the change was caused by it, otherwise NULL.

Param recv_state
Pointer to the receive state that was updated.

Return
0 in case of success or negative value in case of error.

int (***pa_sync_req**)(struct bt_conn *conn, const struct *bt_bap_scan_delegator_recv_state* *recv_state, bool past_avail, uint16_t pa_interval)

Periodic advertising sync request.

Request from peer device to synchronize with the periodic advertiser denoted by the `recv_state`. To notify the Broadcast Assistant about any pending sync

Param conn
Pointer to the connection requesting the periodic advertising sync.

Param recv_state
Pointer to the receive state that is being requested for periodic advertising sync.

Param past_avail
True if periodic advertising sync transfer is available.

Param pa_interval
The periodic advertising interval.

Return
0 in case of accept, or other value to reject.

int (***pa_sync_term_req**)(struct bt_conn *conn, const struct *bt_bap_scan_delegator_recv_state* *recv_state)

Periodic advertising sync termination request.

Request from peer device to terminate the periodic advertiser sync denoted by the `recv_state`.

Param conn
Pointer to the connection requesting the periodic advertising sync termination.

Param recv_state
Pointer to the receive state that is being requested for periodic advertising sync.

Return
0 in case of success or negative value in case of error.

void (*`broadcast_code`)(struct bt_conn *conn, const struct *bt_bap_scan_delegator_recv_state* *recv_state, const uint8_t broadcast_code[*BT_AUDIO_BROADCAST_CODE_SIZE*])

Broadcast code received.

Broadcast code received from a broadcast assistant

Param conn
Pointer to the connection providing the broadcast code.
Param recv_state
Pointer to the receive state the broadcast code is being provided for.
Param broadcast_code
The 16-octet broadcast code

int (*`bis_sync_req`)(struct bt_conn *conn, const struct *bt_bap_scan_delegator_recv_state* *recv_state, const uint32_t bis_sync_req[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS])

Broadcast Isochronous Stream synchronize request.

Request from Broadcast Assistant device to modify the Broadcast Isochronous Stream states. The request shall be fulfilled with accordance to the `bis_sync_req` within reasonable time. The Broadcast Assistant may also request fewer, or none, indexes to be synchronized.

Param conn
[in] Pointer to the connection of the Broadcast Assistant requesting the sync.
Param recv_state
[in] Pointer to the receive state that is being requested for the sync.
Param bis_sync_req
[in] Array of bitfields of which BIS indexes that is requested to sync for each subgroup by the Broadcast Assistant. A value of 0 indicates a request to terminate the BIG sync.
Return
0 in case of accept, or other value to reject.

struct `bt_bap_ep_info`

#include <*bap.h*> Structure holding information of audio stream endpoint.

Public Members

uint8_t `id`

The ID of the endpoint.

enum *bt_bap_ep_state* `state`

The state of the endpoint.

enum *bt_audio_dir* `dir`

Capabilities type.

struct bt_iso_chan *`iso_chan`

The isochronous channel associated with the endpoint.

bool **can_send**

True if the stream associated with the endpoint is able to send data.

bool **can_recv**

True if the stream associated with the endpoint is able to receive data.

struct bt_bap_ep ***paired_ep**

Pointer to paired endpoint if the endpoint is part of a bidirectional CIS, otherwise NULL.

const struct *bt_audio_codec_qos_pref* ***qos_pref**

Pointer to the preferred QoS settings associated with the endpoint.

struct **bt_bap_stream**

#include <bap.h> Basic Audio Profile stream structure.

Streams represents a stream configuration of a Remote Endpoint and a Local Capability.

Note

Streams are unidirectional but can be paired with other streams to use a bidirectional connected isochronous stream.

Public Members

struct bt_conn ***conn**

Connection reference.

struct bt_bap_ep ***ep**

Endpoint reference.

struct *bt_audio_codec_cfg* ***codec_cfg**

Codec Configuration.

struct *bt_audio_codec_qos* ***qos**

QoS Configuration.

struct *bt_bap_stream_ops* ***ops**

Audio stream operations.

void ***user_data**

Stream user data.

struct **bt_bap_stream_ops**

#include <bap.h> Stream operation.

Public Members

void (*`configured`)(struct *bt_bap_stream* *stream, const struct *bt_audio_codec_qos_pref* *pref)

Stream configured callback.

Configured callback is called whenever an Audio Stream has been configured.

Param stream
Stream object that has been configured.

Param pref
Remote QoS preferences.

void (*`qos_set`)(struct *bt_bap_stream* *stream)

Stream QoS set callback.

QoS set callback is called whenever an Audio Stream Quality of Service has been set or updated.

Param stream
Stream object that had its QoS updated.

void (*`enabled`)(struct *bt_bap_stream* *stream)

Stream enabled callback.

Enabled callback is called whenever an Audio Stream has been enabled.

Param stream
Stream object that has been enabled.

void (*`metadata_updated`)(struct *bt_bap_stream* *stream)

Stream metadata updated callback.

Metadata Updated callback is called whenever an Audio Stream's metadata has been updated.

Param stream
Stream object that had its metadata updated.

void (*`disabled`)(struct *bt_bap_stream* *stream)

Stream disabled callback.

Disabled callback is called whenever an Audio Stream has been disabled.

Param stream
Stream object that has been disabled.

void (*`released`)(struct *bt_bap_stream* *stream)

Stream released callback.

Released callback is called whenever a Audio Stream has been released and can be deallocated.

Param stream
Stream object that has been released.

void (*`started`)(struct *bt_bap_stream* *stream)

Stream started callback.

Started callback is called whenever an Audio Stream has been started and will be usable for streaming.

Param stream
Stream object that has been started.

void (*stopped)(struct *bt_bap_stream* *stream, uint8_t reason)

Stream stopped callback.

Stopped callback is called whenever an Audio Stream has been stopped.

Param stream
Stream object that has been stopped.

Param reason
BT_HCI_ERR_* reason for the disconnection.

void (*recv)(struct *bt_bap_stream* *stream, const struct bt_iso_recv_info *info, struct *net_buf* *buf)

Stream audio HCI receive callback.

This callback is only used if the ISO data path is HCI.

Param stream
Stream object.

Param info
Pointer to the metadata for the buffer. The lifetime of the pointer is linked to the lifetime of the *net_buf*. Metadata such as sequence number and timestamp can be provided by the bluetooth controller.

Param buf
Buffer containing incoming audio data.

void (*sent)(struct *bt_bap_stream* *stream)

Stream audio HCI sent callback.

This callback will be called once the controller marks the SDU as completed. When the controller does so is implementation dependent. It could be after the SDU is enqueued for transmission, or after it is sent on air or flushed.

This callback is only used if the ISO data path is HCI.

Param stream
Stream object.

void (*connected)(struct *bt_bap_stream* *stream)

Isochronous channel connected callback.

If this callback is provided it will be called whenever the isochronous channel for the stream has been connected. This does not mean that the stream is ready to be used, which is indicated by the *bt_bap_stream_ops::started* callback.

If the stream shares an isochronous channel with another stream, then this callback may still be called, without the stream going into the started state.

Param stream
Stream object.

void (*disconnected)(struct *bt_bap_stream* *stream, uint8_t reason)

Isochronous channel disconnected callback.

If this callback is provided it will be called whenever the isochronous channel is disconnected, including when a connection gets rejected.

If the stream shares an isochronous channel with another stream, then this callback may not be called, even if the stream is leaving the streaming state.

Param stream
Stream object.

Param reason
BT_HCI_ERR_* reason for the disconnection.

struct **bt_bap_scan_delegator_add_src_param**

#include <bap.h> Parameters for *bt_bap_scan_delegator_add_src()*

Public Members

bt_addr_le_t **addr**

Periodic Advertiser Address.

uint8_t **sid**

Advertiser SID.

enum *bt_bap_big_enc_state* **encrypt_state**

The broadcast isochronous group encryption state.

uint32_t **broadcast_id**

The 24-bit broadcast ID.

uint8_t **num_subgroups**

Number of subgroups.

struct *bt_bap_bass_subgroup* **subgroups**[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]

Subgroup specific information.

struct **bt_bap_scan_delegator_mod_src_param**

#include <bap.h> Parameters for *bt_bap_scan_delegator_mod_src()*

Public Members

uint8_t **src_id**

The periodic adverting sync.

enum *bt_bap_big_enc_state* **encrypt_state**

The broadcast isochronous group encryption state.

uint32_t **broadcast_id**

The 24-bit broadcast ID.

uint8_t **num_subgroups**

Number of subgroups.

struct *bt_bap_bass_subgroup* **subgroups**[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]

Subgroup specific information.

If a subgroup's metadata_len is set to 0, the existing metadata for the subgroup will remain unchanged

struct `bt_bap_broadcast_assistant_cb`

#include <bap.h> Struct to hold the Basic Audio Profile Broadcast Assistant callbacks.

These can be registered for usage with *bt_bap_broadcast_assistant_register_cb()*.

Public Members

void (*`discover`)(struct bt_conn *conn, int err, uint8_t recv_state_count)

Callback function for bt_bap_broadcast_assistant_discover.

Param conn
The connection that was used to discover Broadcast Audio Scan Service.

Param err
Error value. 0 on success, GATT error or ERRNO on fail.

Param recv_state_count
Number of receive states on the server.

void (*`scan`)(const struct *bt_le_scan_recv_info* *info, uint32_t broadcast_id)

Callback function for Broadcast Audio Scan Service client scan results.

Called when the scanner finds an advertiser that advertises the BT_UUID_BROADCAST_AUDIO UUID.

Param info
Advertiser information.

Param broadcast_id
24-bit broadcast ID.

void (*`recv_state`)(struct bt_conn *conn, int err, const struct *bt_bap_scan_delegator_recv_state* *state)

Callback function for when a receive state is read or updated.

Called whenever a receive state is read or updated.

Param conn
The connection to the Broadcast Audio Scan Service server.

Param err
Error value. 0 on success, GATT error on fail.

Param state
The receive state or NULL if the receive state is empty.

void (*`recv_state_removed`)(struct bt_conn *conn, uint8_t src_id)

Callback function for when a receive state is removed.

Param conn
The connection to the Broadcast Audio Scan Service server.

Param src_id
The receive state.

void (*`scan_start`)(struct bt_conn *conn, int err)

Callback function for *bt_bap_broadcast_assistant_scan_start()*.

Param conn
The connection to the peer device.

Param err
Error value. 0 on success, GATT error on fail.

void (*`scan_stop`)(struct bt_conn *conn, int err)

Callback function for *bt_bap_broadcast_assistant_scan_stop()*.

Param conn
The connection to the peer device.
Param err
Error value. 0 on success, GATT error on fail.

void (*`add_src`)(struct bt_conn *conn, int err)

Callback function for *bt_bap_broadcast_assistant_add_src()*.
Param conn
The connection to the peer device.
Param err
Error value. 0 on success, GATT error on fail.

void (*`mod_src`)(struct bt_conn *conn, int err)

Callback function for *bt_bap_broadcast_assistant_mod_src()*.
Param conn
The connection to the peer device.
Param err
Error value. 0 on success, GATT error on fail.

void (*`broadcast_code`)(struct bt_conn *conn, int err)

Callback function for bt_bap_broadcast_assistant_broadcast_code().
Param conn
The connection to the peer device.
Param err
Error value. 0 on success, GATT error on fail.

void (*`rem_src`)(struct bt_conn *conn, int err)

Callback function for *bt_bap_broadcast_assistant_rem_src()*.
Param conn
The connection to the peer device.
Param err
Error value. 0 on success, GATT error on fail.

struct `bt_bap_broadcast_assistant_add_src_param`

#include <bap.h> Parameters for adding a source to a Broadcast Audio Scan Service server.

Public Members

bt_addr_le_t `addr`

Address of the advertiser.

uint8_t `adv_sid`

SID of the advertising set.

bool `pa_sync`

Whether to sync to periodic advertisements.

uint32_t `broadcast_id`

24-bit broadcast ID

uint16_t **pa_interval**
Periodic advertising interval in milliseconds.
BT_BAP_PA_INTERVAL_UNKNOWN if unknown.

uint8_t **num_subgroups**
Number of subgroups.

struct *bt_bap_bass_subgroup* ***subgroups**
Pointer to array of subgroups.

struct **bt_bap_broadcast_assistant_mod_src_param**
#include <bap.h> Parameters for modifying a source.

Public Members

uint8_t **src_id**
Source ID of the receive state.

bool **pa_sync**
Whether to sync to periodic advertisements.

uint16_t **pa_interval**
Periodic advertising interval.
BT_BAP_PA_INTERVAL_UNKNOWN if unknown.

uint8_t **num_subgroups**
Number of subgroups.

struct *bt_bap_bass_subgroup* ***subgroups**
Pointer to array of subgroups.

group **bt_bap_unicast_client**

Functions

int **bt_bap_unicast_group_create**(struct *bt_bap_unicast_group_param* *param, struct bt_bap_unicast_group **unicast_group)
Create audio unicast group.
Create a new audio unicast group with one or more audio streams as a unicast client. Streams in a unicast group shall share the same interval, framing and latency (see *bt_audio_codec_qos*).

Parameters
- **param** – **[in]** The unicast group create parameters.
- **unicast_group** – **[out]** Pointer to the unicast group created.

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_unicast_group_add_streams**(struct bt_bap_unicast_group *unicast_group, struct *bt_bap_unicast_group_stream_pair_param* params[], size_t num_param)

Add streams to a unicast group as a unicast client.

This function can be used to add additional streams to a bt_bap_unicast_group.

This can be called at any time before any of the streams in the group has been started (see *bt_bap_stream_ops.started()*). This can also be called after the streams have been stopped (see *bt_bap_stream_ops.stopped()*).

Once a stream has been added to a unicast group, it cannot be removed. To remove a stream from a group, the group must be deleted with *bt_bap_unicast_group_delete()*, but this will require all streams in the group to be released first.

Parameters

- **unicast_group** – Pointer to the unicast group
- **params** – Array of stream parameters with streams being added to the group.
- **num_param** – Number of parameters in `params`.

Returns
0 in case of success or negative value in case of error.

int **bt_bap_unicast_group_delete**(struct bt_bap_unicast_group *unicast_group)

Delete audio unicast group.

Delete a audio unicast group as a client. All streams in the group shall be in the idle or configured state.

Parameters

- **unicast_group** – Pointer to the unicast group to delete

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_unicast_client_register_cb**(const struct *bt_bap_unicast_client_cb* *cb)

Register unicast client callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

Parameters

- **cb** – Unicast client callback structure.

Returns
0 in case of success or negative value in case of error.

int **bt_bap_unicast_client_discover**(struct bt_conn *conn, enum *bt_audio_dir* dir)

Discover remote capabilities and endpoints.

This procedure is used by a client to discover remote capabilities and endpoints and notifies via params callback.

Parameters

- **conn** – Connection object
- **dir** – The type of remote endpoints and capabilities to discover.

struct **bt_bap_unicast_group_stream_param**

#include <bap.h> Parameter struct for each stream in the unicast group.

Public Members

struct *bt_bap_stream* ***stream**

Pointer to a stream object.

struct *bt_audio_codec_qos* ***qos**

The QoS settings for the stream object.

struct **bt_bap_unicast_group_stream_pair_param**

#include <*bap.h*> Parameter struct for the unicast group functions.

Parameter struct for the *bt_bap_unicast_group_create()* and *bt_bap_unicast_group_add_streams()* functions.

Public Members

struct *bt_bap_unicast_group_stream_param* ***rx_param**

Pointer to a receiving stream parameters.

struct *bt_bap_unicast_group_stream_param* ***tx_param**

Pointer to a transmitting stream parameters.

struct **bt_bap_unicast_group_param**

#include <*bap.h*> Parameters for the creating unicast groups with *bt_bap_unicast_group_create()*

Public Members

size_t **params_count**

The number of parameters in `params`.

struct *bt_bap_unicast_group_stream_pair_param* ***params**

Array of stream parameters.

uint8_t **packing**

Unicast Group packing mode.

BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

> **Note**
>
> This is a recommendation to the controller, which the controller may ignore.

uint8_t **c_to_p_ft**

Central to Peripheral flush timeout.

The flush timeout in multiples of ISO_Interval for each payload sent from the Central to Peripheral.

Value range from BT_ISO_FT_MIN to BT_ISO_FT_MAX

uint8_t **p_to_c_ft**

Peripheral to Central flush timeout.

The flush timeout in multiples of ISO_Interval for each payload sent from the Peripheral to Central.

Value range from BT_ISO_FT_MIN to BT_ISO_FT_MAX.

uint16_t **iso_interval**

ISO interval.

Time between consecutive CIS anchor points.

Value range from BT_ISO_ISO_INTERVAL_MIN to BT_ISO_ISO_INTERVAL_MAX.

struct **bt_bap_unicast_client_cb**

#include <*bap.h*> Unicast Client callback structure.

Public Members

void (***location**)(struct bt_conn *conn, enum *bt_audio_dir* dir, enum *bt_audio_location* loc)

Remote Unicast Server Audio Locations.

This callback is called whenever the audio locations is read from the server or otherwise notified to the client.

Param conn
Connection to the remote unicast server.

Param dir
Direction of the location.

Param loc
The location bitfield value.

Return
0 in case of success or negative value in case of error.

void (***available_contexts**)(struct bt_conn *conn, enum *bt_audio_context* snk_ctx, enum *bt_audio_context* src_ctx)

Remote Unicast Server Available Contexts.

This callback is called whenever the available contexts are read from the server or otherwise notified to the client.

Param conn
Connection to the remote unicast server.

Param snk_ctx
The sink context bitfield value.

Param src_ctx
The source context bitfield value.

Return
0 in case of success or negative value in case of error.

void (***config**)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_config()* and *bt_bap_stream_reconfig()*.

Called when the codec configure operation is completed on the server.

Param stream
Stream the operation was performed on.

Param rsp_code
Response code.
Param reason
Reason code.

void (*qos)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_qos()*.

Called when the QoS configure operation is completed on the server. This will be called for each stream in the group that was being QoS configured.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.
Param rsp_code
Response code.
Param reason
Reason code.

void (*enable)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_enable()*.

Called when the enable operation is completed on the server.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.
Param rsp_code
Response code.
Param reason
Reason code.

void (*start)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_start()*.

Called when the start operation is completed on the server. This will only be called if the stream supplied to *bt_bap_stream_start()* is for a *BT_AUDIO_DIR_SOURCE* endpoint.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.
Param rsp_code
Response code.
Param reason
Reason code.

void (*stop)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_stop()*.

Called when the stop operation is completed on the server. This will only be called if the stream supplied to *bt_bap_stream_stop()* is for a *BT_AUDIO_DIR_SOURCE* endpoint.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.

Param rsp_code
Response code.
Param reason
Reason code.

void (*`disable`)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_disable()*.

Called when the disable operation is completed on the server.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.
Param rsp_code
Response code.
Param reason
Reason code.

void (*`metadata`)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_metadata()*.

Called when the metadata operation is completed on the server.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.
Param rsp_code
Response code.
Param reason
Reason code.

void (*`release`)(struct *bt_bap_stream* *stream, enum *bt_bap_ascs_rsp_code* rsp_code, enum *bt_bap_ascs_reason* reason)

Callback function for *bt_bap_stream_release()*.

Called when the release operation is completed on the server.
Param stream
Stream the operation was performed on. May be NULL if there is no stream associated with the ASE ID sent by the server.
Param rsp_code
Response code.
Param reason
Reason code.

void (*`pac_record`)(struct bt_conn *conn, enum *bt_audio_dir* dir, const struct *bt_audio_codec_cap* *codec_cap)

Remote Published Audio Capability (PAC) record discovered.

Called when a PAC record has been discovered as part of the discovery procedure.

The `codec` is only valid while in the callback, so the values must be stored by the receiver if future use is wanted.

If discovery procedure has complete both `codec` and `ep` are set to NULL.
Param conn
Connection to the remote unicast server.
Param dir
The type of remote endpoints and capabilities discovered.

Param codec_cap
Remote capabilities.

void (*`endpoint`)(struct bt_conn *conn, enum *bt_audio_dir* dir, struct bt_bap_ep *ep)

Remote Audio Stream Endpoint (ASE) discovered.

Called when an ASE has been discovered as part of the discovery procedure.

If discovery procedure has complete both `codec` and `ep` are set to NULL.

Param conn
Connection to the remote unicast server.
Param dir
The type of remote endpoints and capabilities discovered.
Param ep
Remote endpoint.

void (*`discover`)(struct bt_conn *conn, int err, enum *bt_audio_dir* dir)

BAP discovery callback function.

If discovery procedure has completed `ep` is set to NULL and `err` is 0.

If discovery procedure has complete both `codec` and `ep` are set to NULL.

Param conn
Connection to the remote unicast server.
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param dir
The type of remote endpoints and capabilities discovered.

group `bt_bap_unicast_server`

Typedefs

typedef void (*`bt_bap_ep_func_t`)(struct bt_bap_ep *ep, void *user_data)

The callback function called for each endpoint.

Param ep
The structure object with endpoint info.

Param user_data
Data to pass to the function.

Functions

int `bt_bap_unicast_server_register_cb`(const struct *bt_bap_unicast_server_cb* *cb)

Register unicast server callbacks.

Only one callback structure can be registered, and attempting to registering more than one will result in an error.

Parameters

- `cb` – Unicast server callback structure.

Returns
0 in case of success or negative value in case of error.

int **bt_bap_unicast_server_unregister_cb**(const struct *bt_bap_unicast_server_cb* *cb)

Unregister unicast server callbacks.

May only unregister a callback structure that has previously been registered by *bt_bap_unicast_server_register_cb()*.

Parameters

- **cb** – Unicast server callback structure.

Returns
0 in case of success or negative value in case of error.

void **bt_bap_unicast_server_foreach_ep**(struct bt_conn *conn, *bt_bap_ep_func_t* func, void *user_data)

Iterate through all endpoints of the given connection.

Parameters

- **conn** – Connection object
- **func** – Function to call for each endpoint.
- **user_data** – Data to pass to the callback function.

int **bt_bap_unicast_server_config_ase**(struct bt_conn *conn, struct *bt_bap_stream* *stream, struct *bt_audio_codec_cfg* *codec_cfg, const struct *bt_audio_codec_qos_pref* *qos_pref)

Initialize and configure a new ASE.

Parameters

- **conn** – Connection object
- **stream** – Configured stream object to be attached to the ASE
- **codec_cfg** – Codec configuration
- **qos_pref** – Audio Stream Quality of Service Preference

Returns
0 in case of success or negative value in case of error.

struct **bt_bap_unicast_server_cb**

#include <bap.h> Unicast Server callback structure.

Public Members

int (***config**)(struct bt_conn *conn, const struct bt_bap_ep *ep, enum *bt_audio_dir* dir, const struct *bt_audio_codec_cfg* *codec_cfg, struct *bt_bap_stream* **stream, struct *bt_audio_codec_qos_pref* *const pref, struct *bt_bap_ascs_rsp* *rsp)

Endpoint config request callback.

Config callback is called whenever an endpoint is requested to be configured
Param conn
[in] Connection object.
Param ep
[in] Local Audio Endpoint being configured.
Param dir
[in] Direction of the endpoint.

Param codec_cfg
[in] Codec configuration.
Param stream
[out] Pointer to stream that will be configured for the endpoint.
Param pref
[out] Pointer to a QoS preference object that shall be populated with values. Invalid values will reject the codec configuration request.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`reconfig`)(struct *bt_bap_stream* *stream, enum *bt_audio_dir* dir, const struct *bt_audio_codec_cfg* *codec_cfg, struct *bt_audio_codec_qos_pref* *const pref, struct *bt_bap_ascs_rsp* *rsp)

Stream reconfig request callback.

Reconfig callback is called whenever an Audio Stream needs to be reconfigured with different codec configuration.

Param stream
[in] Stream object being reconfigured.
Param dir
[in] Direction of the endpoint.
Param codec_cfg
[in] Codec configuration.
Param pref
[out] Pointer to a QoS preference object that shall be populated with values. Invalid values will reject the codec configuration request.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`qos`)(struct *bt_bap_stream* *stream, const struct *bt_audio_codec_qos* *qos, struct *bt_bap_ascs_rsp* *rsp)

Stream QoS request callback.

QoS callback is called whenever an Audio Stream Quality of Service needs to be configured.

Param stream
[in] Stream object being reconfigured.
Param qos
[in] Quality of Service configuration.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`enable`)(struct *bt_bap_stream* *stream, const uint8_t meta[], size_t meta_len, struct *bt_bap_ascs_rsp* *rsp)

Stream Enable request callback.

Enable callback is called whenever an Audio Stream is requested to be enabled to stream.

Param stream
[in] Stream object being enabled.
Param meta
[in] Metadata entries.
Param meta_len
[in] Length of metadata.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`start`)(struct *bt_bap_stream* *stream, struct *bt_bap_ascs_rsp* *rsp)

Stream Start request callback.

Start callback is called whenever an Audio Stream is requested to start streaming.

Param stream
[in] Stream object.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`metadata`)(struct *bt_bap_stream* *stream, const uint8_t meta[], size_t meta_len, struct *bt_bap_ascs_rsp* *rsp)

Stream Metadata update request callback.

Metadata callback is called whenever an Audio Stream is requested to update its metadata.

Param stream
[in] Stream object.
Param meta
[in] Metadata entries.
Param meta_len
[in] Length of metadata.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`disable`)(struct *bt_bap_stream* *stream, struct *bt_bap_ascs_rsp* *rsp)

Stream Disable request callback.

Disable callback is called whenever an Audio Stream is requested to disable the stream.

Param stream
[in] Stream object being disabled.
Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.
Return
0 in case of success or negative value in case of error.

int (*`stop`)(struct *bt_bap_stream* *stream, struct *bt_bap_ascs_rsp* *rsp)

Stream Stop callback.

Stop callback is called whenever an Audio Stream is requested to stop streaming.

Param stream
[in] Stream object.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

int (*`release`)(struct *bt_bap_stream* *stream, struct *bt_bap_ascs_rsp* *rsp)

Stream release callback.

Release callback is called whenever a new Audio Stream needs to be released and thus deallocated.

Param stream
[in] Stream object.

Param rsp
[out] Object for the ASE operation response. Only used if the return value is non-zero.

Return
0 in case of success or negative value in case of error.

group `bt_bap_broadcast`

BAP Broadcast APIs.

Functions

const struct bt_bap_base *`bt_bap_base_get_base_from_ad`(const struct *bt_data* *ad)

Generate a pointer to a BASE from periodic advertising data.

Parameters

- `ad` – The periodic advertising data

Return values

- `NULL` – if the data does not contain a BASE
- `Pointer` – to a bt_bap_base structure

int `bt_bap_base_get_size`(const struct bt_bap_base *base)

Get the size of a BASE.

Parameters

- `base` – The BASE pointer

Return values

- `-EINVAL` – if arguments are invalid
- `The` – size of the BASE

int `bt_bap_base_get_pres_delay`(const struct bt_bap_base *base)

Get the presentation delay value of a BASE.

Parameters

- `base` – The BASE pointer

Return values

- `-EINVAL` – if arguments are invalid

- **The** – 24-bit presentation delay value

int **bt_bap_base_get_subgroup_count**(const struct bt_bap_base *base)

Get the subgroup count of a BASE.

Parameters

- **base** – The BASE pointer

Return values

- **-EINVAL** – if arguments are invalid
- **The** – 8-bit subgroup count value

int **bt_bap_base_get_bis_indexes**(const struct bt_bap_base *base, uint32_t *bis_indexes)

Get all BIS indexes of a BASE.

Parameters

- **base** – **[in]** The BASE pointer
- **bis_indexes** – **[out]** 32-bit BIS index bitfield that will be populated

Return values

- **-EINVAL** – if arguments are invalid
- **0** – on success

int **bt_bap_base_foreach_subgroup**(const struct bt_bap_base *base, bool (*func)(const struct bt_bap_base_subgroup *subgroup, void *user_data), void *user_data)

Iterate on all subgroups in the BASE.

Parameters

- **base** – The BASE pointer
- **func** – Callback function. Return true to continue iterating, or false to stop.
- **user_data** – Userdata supplied to `func`

Return values

- **-EINVAL** – if arguments are invalid
- **-ECANCELED** – if iterating over the subgroups stopped prematurely by `func`
- **0** – if all subgroups were iterated

int **bt_bap_base_get_subgroup_codec_id**(const struct bt_bap_base_subgroup *subgroup, struct *bt_bap_base_codec_id* *codec_id)

Get the codec ID of a subgroup.

Parameters

- **subgroup** – **[in]** The subgroup pointer
- **codec_id** – **[out]** Pointer to the struct where the results are placed

Return values

- **-EINVAL** – if arguments are invalid
- **0** – on success

int **bt_bap_base_get_subgroup_codec_data**(const struct bt_bap_base_subgroup *subgroup, uint8_t **data)

Get the codec configuration data of a subgroup.

Parameters

- **subgroup** – **[in]** The subgroup pointer
- **data** – **[out]** Pointer that will point to the resulting codec configuration data

Return values

- **-EINVAL** – if arguments are invalid
- **0** – on success

int **bt_bap_base_get_subgroup_codec_meta**(const struct bt_bap_base_subgroup *subgroup, uint8_t **meta)

Get the codec metadata of a subgroup.

Parameters

- **subgroup** – **[in]** The subgroup pointer
- **meta** – **[out]** Pointer that will point to the resulting codec metadata

Return values

- **-EINVAL** – if arguments are invalid
- **0** – on success

int **bt_bap_base_subgroup_codec_to_codec_cfg**(const struct bt_bap_base_subgroup *subgroup, struct *bt_audio_codec_cfg* *codec_cfg)

Store subgroup codec data in a *Codec config parsing APIs*.

Parameters

- **subgroup** – **[in]** The subgroup pointer
- **codec_cfg** – **[out]** Pointer to the struct where the results are placed

Return values

- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the codec_cfg cannot store the subgroup codec data
- **0** – on success

int **bt_bap_base_get_subgroup_bis_count**(const struct bt_bap_base_subgroup *subgroup)

Get the BIS count of a subgroup.

Parameters

- **subgroup** – The subgroup pointer

Return values

- **-EINVAL** – if arguments are invalid
- **The** – 8-bit BIS count value

int **bt_bap_base_subgroup_get_bis_indexes**(const struct bt_bap_base_subgroup *subgroup, uint32_t *bis_indexes)

Get all BIS indexes of a subgroup.

Parameters

- **subgroup** – **[in]** The subgroup pointer
- **bis_indexes** – **[out]** 32-bit BIS index bitfield that will be populated

Return values

- **-EINVAL** – if arguments are invalid
- **0** – on success

int **bt_bap_base_subgroup_foreach_bis**(const struct bt_bap_base_subgroup *subgroup, bool (*func)(const struct *bt_bap_base_subgroup_bis* *bis, void *user_data), void *user_data)

Iterate on all BIS in the subgroup.

Parameters

- **subgroup** – The subgroup pointer
- **func** – Callback function. Return true to continue iterating, or false to stop.
- **user_data** – Userdata supplied to `func`

Return values

- **-EINVAL** – if arguments are invalid
- **-ECANCELED** – if iterating over the subgroups stopped prematurely by `func`
- **0** – if all BIS were iterated

int **bt_bap_base_subgroup_bis_codec_to_codec_cfg**(const struct *bt_bap_base_subgroup_bis* *bis, struct *bt_audio_codec_cfg* *codec_cfg)

Store BIS codec configuration data in a *Codec config parsing APIs*.

This only sets the *Codec config parsing APIs* data and *Codec config parsing APIs* data_len, but is useful to use the BIS codec configuration data with the bt_audio_codec_cfg_* functions.

Parameters

- **bis** – **[in]** The BIS pointer
- **codec_cfg** – **[out]** Pointer to the struct where the results are placed

Return values

- **-EINVAL** – if arguments are invalid
- **-ENOMEM** – if the `codec_cfg` cannot store the `subgroup` codec data
- **0** – on success

struct **bt_bap_base_codec_id**

#include <bap.h> Codec ID structure for a Broadcast Audio Source Endpoint (BASE)

Public Members

uint8_t **id**

Codec ID.

uint16_t **cid**

Codec Company ID.

uint16_t **vid**

Codec Company Vendor ID.

struct **bt_bap_base_subgroup_bis**

#include <*bap.h*> BIS structure for each BIS in a Broadcast Audio Source Endpoint (BASE) subgroup.

Public Members

uint8_t **index**

Unique index of the BIS.

uint8_t **data_len**

Codec Specific Data length.

uint8_t ***data**

Codec Specific Data.

group **bt_bap_broadcast_sink**

BAP Broadcast Sink APIs.

Functions

int **bt_bap_broadcast_sink_register_cb**(struct *bt_bap_broadcast_sink_cb* *cb)

Register Broadcast sink callbacks.

It is possible to register multiple struct of callbacks, but a single struct can only be registered once. Registering the same callback multiple times is undefined behavior and may break the stack.

Parameters

- **cb** – Broadcast sink callback structure.

Return values

- **0** – in case of success
- **-EINVAL** – if cb is NULL

int **bt_bap_broadcast_sink_create**(struct bt_le_per_adv_sync *pa_sync, uint32_t broadcast_id, struct bt_bap_broadcast_sink **sink)

Create a Broadcast Sink from a periodic advertising sync.

This should only be done after verifying that the periodic advertising sync is from a Broadcast Source.

The created Broadcast Sink will need to be supplied to *bt_bap_broadcast_sink_sync()* in order to synchronize to the broadcast audio.

bt_bap_broadcast_sink_cb.pa_synced() will be called with the Broadcast Sink object created if this is successful.

Parameters

- `pa_sync` – Pointer to the periodic advertising sync object.
- `broadcast_id` – 24-bit broadcast ID.
- `sink` – **[out]** Pointer to the Broadcast Sink created.

Returns
0 in case of success or errno value in case of error.

int `bt_bap_broadcast_sink_sync`(struct bt_bap_broadcast_sink *sink, uint32_t indexes_bitfield, struct *bt_bap_stream* *streams[], const uint8_t broadcast_code[16])

Sync to a broadcaster's audio.

Example: The string "Broadcast Code" shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

Parameters

- `sink` – Pointer to the sink object from the base_recv callback.
- `indexes_bitfield` – Bitfield of the BIS index to sync to. To sync to e.g. BIS index 1 and 2, this should have the value of *BIT(1)* | *BIT(2)*.
- `streams` – Stream object pointers to be used for the receiver. If multiple BIS indexes shall be synchronized, multiple streams shall be provided.
- `broadcast_code` – The 16-octet broadcast code. Shall be supplied if the broadcast is encrypted (see *bt_bap_broadcast_sink_cb::syncable*). If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

Returns
0 in case of success or negative value in case of error.

int `bt_bap_broadcast_sink_stop`(struct bt_bap_broadcast_sink *sink)

Stop audio broadcast sink.

Stop an audio broadcast sink. The broadcast sink will stop receiving BIGInfo, and audio data can no longer be streamed.

Parameters

- `sink` – Pointer to the broadcast sink

Returns
Zero on success or (negative) error code otherwise.

int `bt_bap_broadcast_sink_delete`(struct bt_bap_broadcast_sink *sink)

Release a broadcast sink.

Once a broadcast sink has been allocated after the pa_synced callback, it can be deleted using this function. If the sink has synchronized to any broadcast audio streams, these must first be stopped using bt_bap_stream_stop.

Parameters

- `sink` – Pointer to the sink object to delete.

Returns
0 in case of success or negative value in case of error.

struct `bt_bap_broadcast_sink_cb`

#include <bap.h> Broadcast Audio Sink callback structure.

Public Members

void (*base_recv)(struct bt_bap_broadcast_sink *sink, const struct bt_bap_base *base, size_t base_size)

Broadcast Audio Source Endpoint (BASE) received.

Callback for when we receive a BASE from a broadcaster after syncing to the broadcaster's periodic advertising.

Param sink
Pointer to the sink structure.

Param base
Broadcast Audio Source Endpoint (BASE).

Param base_size
Size of the base

void (*syncable)(struct bt_bap_broadcast_sink *sink, const struct bt_iso_biginfo *biginfo)

Broadcast sink is syncable.

Called whenever a broadcast sink is not synchronized to audio, but the audio is synchronizable. This is inferred when a BIGInfo report is received.

Once this callback has been called, it is possible to call *bt_bap_broadcast_sink_sync()* to synchronize to the audio stream(s).

Param sink
Pointer to the sink structure.

Param biginfo
The BIGInfo report.

group bt_bap_broadcast_source

BAP Broadcast Source APIs.

Functions

int bt_bap_broadcast_source_create(struct *bt_bap_broadcast_source_param* *param, struct bt_bap_broadcast_source **source)

Create audio broadcast source.

Create a new audio broadcast source with one or more audio streams.

The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.

No audio data can be sent until *bt_bap_broadcast_source_start()* has been called and no audio information (BIGInfo) will be visible to scanners (see *bt_le_per_adv_sync_cb*).

Parameters

- param – **[in]** Pointer to parameters used to create the broadcast source.
- source – **[out]** Pointer to the broadcast source created

Returns
Zero on success or (negative) error code otherwise.

int bt_bap_broadcast_source_reconfig(struct bt_bap_broadcast_source *source, struct *bt_bap_broadcast_source_param* *param)

Reconfigure audio broadcast source.

Reconfigure an audio broadcast source with a new codec and codec quality of service parameters. This can only be done when the source is stopped.

Since this may modify the Broadcast Audio Source Endpoint (BASE), *bt_bap_broadcast_source_get_base()* should be called after this to get the new BASE information.

If the `param.params_count` is smaller than the number of subgroups that have been created in the Broadcast Source, only the first `param.params_count` subgroups are updated. If a stream exist in a subgroup not part of `param`, then that stream is left as is (i.e. it is not removed; the only way to remove a stream from a Broadcast Source is to recreate the Broadcast Source).

Parameters

- **source** – Pointer to the broadcast source
- **param** – Pointer to parameters used to reconfigure the broadcast source.

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_broadcast_source_update_metadata**(struct bt_bap_broadcast_source *source, const uint8_t meta[], size_t meta_len)

Modify the metadata of an audio broadcast source.

Modify the metadata an audio broadcast source. This can only be done when the source is started. To update the metadata in the stopped state, use *bt_bap_broadcast_source_reconfig()*.

Parameters

- **source** – Pointer to the broadcast source.
- **meta** – Metadata.
- **meta_len** – Length of metadata.

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_broadcast_source_start**(struct bt_bap_broadcast_source *source, struct bt_le_ext_adv *adv)

Start audio broadcast source.

Start an audio broadcast source with one or more audio streams. The broadcast source will start advertising BIGInfo, and audio data can be streamed.

Parameters

- **source** – Pointer to the broadcast source
- **adv** – Pointer to an extended advertising set with periodic advertising configured.

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_broadcast_source_stop**(struct bt_bap_broadcast_source *source)

Stop audio broadcast source.

Stop an audio broadcast source. The broadcast source will stop advertising BIGInfo, and audio data can no longer be streamed.

Parameters

- **source** – Pointer to the broadcast source

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_broadcast_source_delete**(struct bt_bap_broadcast_source *source)

Delete audio broadcast source.

Delete an audio broadcast source. The broadcast source will stop advertising entirely, and the source can no longer be used.

Parameters

- **source** – Pointer to the broadcast source

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_broadcast_source_get_id**(struct bt_bap_broadcast_source *source, uint32_t *const broadcast_id)

Get the broadcast ID of a broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with *BT_UUID_BROADCAST_AUDIO_VAL* as *BT_DATA_SVC_DATA16*.

See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

Parameters

- **source** – **[in]** Pointer to the broadcast source.
- **broadcast_id** – **[out]** Pointer to the 3-octet broadcast ID.

Returns
Zero on success or (negative) error code otherwise.

int **bt_bap_broadcast_source_get_base**(struct bt_bap_broadcast_source *source, struct *net_buf_simple* *base_buf)

Get the Broadcast Audio Stream Endpoint of a broadcast source.

This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see *bt_le_per_adv_set_data()*).

See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters

- **source** – Pointer to the broadcast source.
- **base_buf** – Pointer to a buffer where the BASE will be inserted.

Returns
Zero on success or (negative) error code otherwise.

struct **bt_bap_broadcast_source_stream_param**

#include <bap.h> Broadcast Source stream parameters.

Public Members

struct *bt_bap_stream* ***stream**

Audio stream.

size_t **data_len**

The number of elements in the `data` array.

The BIS specific data may be omitted and this set to 0.

uint8_t ***data**

BIS Codec Specific Configuration.

struct **bt_bap_broadcast_source_subgroup_param**

#include <bap.h> Broadcast Source subgroup parameters.

Public Members

size_t **params_count**

The number of parameters in `stream_params`.

struct *bt_bap_broadcast_source_stream_param* ***params**

Array of stream parameters.

struct *bt_audio_codec_cfg* ***codec_cfg**

Subgroup Codec configuration.

struct **bt_bap_broadcast_source_param**

#include <bap.h> Broadcast Source create parameters.

Public Members

size_t **params_count**

The number of parameters in `subgroup_params`.

struct *bt_bap_broadcast_source_subgroup_param* ***params**

Array of stream parameters.

struct *bt_audio_codec_qos* ***qos**

Quality of Service configuration.

uint8_t **packing**

Broadcast Source packing mode.

BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

> **Note**
>
> This is a recommendation to the controller, which the controller may ignore.

bool **encryption**

Whether or not to encrypt the streams.

uint8_t **broadcast_code**[*BT_AUDIO_BROADCAST_CODE_SIZE*]

Broadcast code.

If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

uint8_t **irc**

Immediate Repetition Count.

The number of times the scheduled payloads are transmitted in a given event.

Value range from BT_ISO_IRC_MIN to BT_ISO_IRC_MAX.

uint8_t **pto**

Pre-transmission offset.

Offset used for pre-transmissions.

Value range from BT_ISO_PTO_MIN to BT_ISO_PTO_MAX.

uint16_t **iso_interval**

ISO interval.

Time between consecutive BIS anchor points.

Value range from BT_ISO_ISO_INTERVAL_MIN to BT_ISO_ISO_INTERVAL_MAX.

Common Audio Profile

Related code samples

Bluetooth: Common Audio Profile Acceptor
CAP Acceptor sample that advertises audio availability to CAP Initiators.

Bluetooth: Common Audio Profile Initiator
CAP Initiator sample that connects to CAP Acceptors and setup unicast audio streaming, or broadcast audio streams.

API Reference

group **bt_cap**

Common Audio Profile (CAP)

Common Audio Profile (CAP) provides procedures to start, update, and stop unicast and broadcast Audio Streams on individual or groups of devices using procedures in the Basic Audio Profile (BAP). This profile also provides procedures to control volume and device input on groups of devices using procedures in the Volume Control Profile (VCP) and the Microphone Control Profile (MICP). This profile specification also refers to the Common Audio Service (CAS).

Since
3.2

Version
0.8.0

Enums

enum **bt_cap_set_type**

Type of CAP set.

Values:

enumerator **BT_CAP_SET_TYPE_AD_HOC**

The set is an ad-hoc set.

enumerator **BT_CAP_SET_TYPE_CSIP**

The set is a CSIP Coordinated Set.

Functions

int **bt_cap_acceptor_register**(const struct *bt_csip_set_member_register_param* *param,
struct bt_csip_set_member_svc_inst **svc_inst)

Register the Common Audio Service.

This will register and enable the service and make it discoverable by clients. This will also register a Coordinated Set Identification Service instance.

This shall only be done as a server, and requires BT_CAP_ACCEPTOR_SET_MEMBER . If BT_CAP_ACCEPTOR_SET_MEMBER is not enabled, the Common Audio Service will by statically registered.

Parameters

- **param** – **[in]** Coordinated Set Identification Service register parameters.
- **svc_inst** – **[out]** Pointer to the registered Coordinated Set Identification Service.

Returns
0 if success, errno on failure.

int **bt_cap_initiator_unicast_discover**(struct bt_conn *conn)

Discovers audio support on a remote device.

This will discover the Common Audio Service (CAS) on the remote device, to verify if the remote device supports the Common Audio Profile.

Parameters

- **conn** – Connection to a remote server.

Return values

- **0** – Success
- **-EINVAL** – conn is NULL
- **-ENOTCONN** – conn is not connected
- **-ENOMEM** – Could not allocated memory for the request

void **bt_cap_stream_ops_register**(struct *bt_cap_stream* *stream, struct *bt_bap_stream_ops* *ops)

Register Audio operations for a Common Audio Profile stream.

Register Audio operations for a stream.

Parameters

- **stream** – Stream object.
- **ops** – Stream operations structure.

int **bt_cap_stream_send**(struct *bt_cap_stream* *stream, struct *net_buf* *buf, uint16_t seq_num)

Send data to Common Audio Profile stream without timestamp.

See *bt_bap_stream_send()* for more information

Note

Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX .

Parameters

- **stream** – Stream object.
- **buf** – Buffer containing data to be sent.
- **seq_num** – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.

Return values

- **-EINVAL** – if stream object is NULL
- **Any** – return value from *bt_bap_stream_send()*

int **bt_cap_stream_send_ts**(struct *bt_cap_stream* *stream, struct *net_buf* *buf, uint16_t seq_num, uint32_t ts)

Send data to Common Audio Profile stream with timestamp.

See *bt_bap_stream_send()* for more information

Note

Support for sending must be supported, determined by CONFIG_BT_AUDIO_TX .

Parameters

- **stream** – Stream object.
- **buf** – Buffer containing data to be sent.
- **seq_num** – Packet Sequence number. This value shall be incremented for each call to this function and at least once per SDU interval for a specific channel.
- **ts** – Timestamp of the SDU in microseconds (us). This value can be used to transmit multiple SDUs in the same SDU interval in a CIG or BIG.

Return values

- **-EINVAL** – if stream object is NULL

- `Any` – return value from *bt_bap_stream_send()*

int **bt_cap_stream_get_tx_sync**(struct *bt_cap_stream* *stream, struct bt_iso_tx_info *info)

Get ISO transmission timing info for a Common Audio Profile stream.

See *bt_bap_stream_get_tx_sync()* for more information

Note

Support for sending must be supported, determined by `CONFIG_BT_AUDIO_TX` .

Parameters

- `stream` – **[in]** Stream object.
- `info` – **[out]** Transmit info object.

Return values

- `-EINVAL` – if stream object is NULL
- `Any` – return value from *bt_bap_stream_get_tx_sync()*

int **bt_cap_initiator_register_cb**(const struct *bt_cap_initiator_cb* *cb)

Register Common Audio Profile Initiator callbacks.

Parameters

- `cb` – The callback structure. Shall remain static.

Returns

0 on success or negative error value on failure.

int **bt_cap_initiator_unregister_cb**(const struct *bt_cap_initiator_cb* *cb)

Unregister Common Audio Profile Initiator callbacks.

Parameters

- `cb` – The callback structure that was previously registered.

Return values

- `0` – Success
- `-EINVAL` – cb is NULL or cb was not registered

int **bt_cap_initiator_unicast_audio_start**(const struct *bt_cap_unicast_audio_start_param* *param)

Setup and start unicast audio streams for a set of devices.

The result of this operation is that the streams in `param` will be initialized and will be usable for streaming audio data. The `unicast_group` value can be used to update and stop the streams.

Note

`CONFIG_BT_CAP_INITIATOR` and `CONFIG_BT_BAP_UNICAST_CLIENT` must be enabled for this function to be enabled.

Parameters

- `param` – Parameters to start the audio streams.

Returns
0 on success or negative error value on failure.

int **bt_cap_initiator_unicast_audio_update**(const struct *bt_cap_unicast_audio_update_param* *param)

Update unicast audio streams.

This will update the metadata of one or more streams.

Note

CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

Parameters

- **param** – Update parameters.

Returns
0 on success or negative error value on failure.

int **bt_cap_initiator_unicast_audio_stop**(const struct *bt_cap_unicast_audio_stop_param* *param)

Stop unicast audio streams.

This will stop one or more streams.

Note

CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_UNICAST_CLIENT must be enabled for this function to be enabled.

Parameters

- **param** – Stop parameters.

Returns
0 on success or negative error value on failure.

int **bt_cap_initiator_unicast_audio_cancel**(void)

Cancel any current Common Audio Profile procedure.

This will stop the current procedure from continuing and making it possible to run a new Common Audio Profile procedure.

It is recommended to do this if any existing procedure takes longer time than expected, which could indicate a missing response from the Common Audio Profile Acceptor.

This does not send any requests to any Common Audio Profile Acceptors involved with the current procedure, and thus notifications from the Common Audio Profile Acceptors may arrive after this has been called. It is thus recommended to either only use this if a procedure has stalled, or wait a short while before starting any new Common Audio Profile procedure after this has been called to avoid getting notifications from the cancelled procedure. The wait time depends on the connection interval, the number of devices in the previous procedure and the behavior of the Common Audio Profile Acceptors.

The respective callbacks of the procedure will be called as part of this with the connection pointer set to 0 and the err value set to -ECANCELED.

Return values

- `0` – on success
- `-EALREADY` – if no procedure is active

int **bt_cap_initiator_broadcast_audio_create**(const struct *bt_cap_initiator_broadcast_create_param* *param, struct bt_cap_broadcast_source **broadcast_source)

Create a Common Audio Profile broadcast source.

Create a new audio broadcast source with one or more audio streams.

> **Note**
>
> CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters

- `param` – **[in]** Parameters to start the audio streams.
- `broadcast_source` – **[out]** Pointer to the broadcast source created.

Returns

0 on success or negative error value on failure.

int **bt_cap_initiator_broadcast_audio_start**(struct bt_cap_broadcast_source *broadcast_source, struct bt_le_ext_adv *adv)

Start Common Audio Profile broadcast source.

The broadcast source will be visible for scanners once this has been called, and the device will advertise audio announcements.

This will allow the streams in the broadcast source to send audio by calling *bt_bap_stream_send()*.

> **Note**
>
> CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters

- `broadcast_source` – Pointer to the broadcast source.
- `adv` – Pointer to an extended advertising set with periodic advertising configured.

Returns

0 on success or negative error value on failure.

int **bt_cap_initiator_broadcast_audio_update**(struct bt_cap_broadcast_source *broadcast_source, const uint8_t meta[], size_t meta_len)

Update broadcast audio streams for a Common Audio Profile broadcast source.

> **Note**
>
> CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters

- **broadcast_source** – The broadcast source to update.
- **meta** – The new metadata. The metadata shall contain a list of CCIDs as well as a non-0 context bitfield.
- **meta_len** – The length of meta.

Returns

0 on success or negative error value on failure.

int **bt_cap_initiator_broadcast_audio_stop**(struct bt_cap_broadcast_source *broadcast_source)

Stop broadcast audio streams for a Common Audio Profile broadcast source.

> **Note**
>
> CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters

- **broadcast_source** – The broadcast source to stop. The audio streams in this will be stopped and reset.

Returns

0 on success or negative error value on failure.

int **bt_cap_initiator_broadcast_audio_delete**(struct bt_cap_broadcast_source *broadcast_source)

Delete Common Audio Profile broadcast source.

This can only be done after the broadcast source has been stopped by calling *bt_cap_initiator_broadcast_audio_stop()* and after the *bt_bap_stream_ops.stopped()* callback has been called for all streams in the broadcast source.

> **Note**
>
> CONFIG_BT_CAP_INITIATOR and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters

- **broadcast_source** – The broadcast source to delete. The broadcast_source will be invalidated.

Returns

0 on success or negative error value on failure.

int **bt_cap_initiator_broadcast_get_id**(const struct bt_cap_broadcast_source *broadcast_source, uint32_t *const broadcast_id)

Get the broadcast ID of a Common Audio Profile broadcast source.

This will return the 3-octet broadcast ID that should be advertised in the extended advertising data with *BT_UUID_BROADCAST_AUDIO_VAL* as *BT_DATA_SVC_DATA16*.

See table 3.14 in the Basic Audio Profile v1.0.1 for the structure.

Parameters

- `broadcast_source` – **[in]** Pointer to the broadcast source.
- `broadcast_id` – **[out]** Pointer to the 3-octet broadcast ID.

Returns
int 0 if on success, errno on error.

int `bt_cap_initiator_broadcast_get_base`(struct bt_cap_broadcast_source *broadcast_source, struct *net_buf_simple* *base_buf)

Get the Broadcast Audio Stream Endpoint of a Common Audio Profile broadcast source.

This will encode the BASE of a broadcast source into a buffer, that can be used for advertisement. The encoded BASE will thus be encoded as little-endian. The BASE shall be put into the periodic advertising data (see *bt_le_per_adv_set_data()*).

See table 3.15 in the Basic Audio Profile v1.0.1 for the structure.

Parameters

- `broadcast_source` – Pointer to the broadcast source.
- `base_buf` – Pointer to a buffer where the BASE will be inserted.

Returns
int 0 if on success, errno on error.

int `bt_cap_initiator_unicast_to_broadcast`(const struct *bt_cap_unicast_to_broadcast_param* *param, struct bt_cap_broadcast_source **source)

Hands over the data streams in a unicast group to a broadcast source.

The streams in the unicast group will be stopped and the unicast group will be deleted. This can only be done for source streams.

Note

`CONFIG_BT_CAP_INITIATOR`, `CONFIG_BT_BAP_UNICAST_CLIENT` and `CONFIG_BT_BAP_BROADCAST_SOURCE` must be enabled for this function to be enabled.

Parameters

- `param` – The parameters for the handover.
- `source` – The resulting broadcast source.

Returns
0 on success or negative error value on failure.

int `bt_cap_initiator_broadcast_to_unicast`(const struct *bt_cap_broadcast_to_unicast_param* *param, struct bt_bap_unicast_group **unicast_group)

Hands over the data streams in a broadcast source to a unicast group.

The streams in the broadcast source will be stopped and the broadcast source will be deleted.

> **Note**
>
> CONFIG_BT_CAP_INITIATOR , CONFIG_BT_BAP_UNICAST_CLIENT and CONFIG_BT_BAP_BROADCAST_SOURCE must be enabled for this function to be enabled.

Parameters

- **param** – **[in]** The parameters for the handover.
- **unicast_group** – **[out]** The resulting broadcast source.

Returns

0 on success or negative error value on failure.

int **bt_cap_commander_register_cb**(const struct *bt_cap_commander_cb* *cb)

Register Common Audio Profile Commander callbacks.

Parameters

- **cb** – The callback structure. Shall remain static.

Return values

- **0** – Success
- **-EINVAL** – cb is NULL
- **-EALREADY** – Callbacks are already registered

int **bt_cap_commander_unregister_cb**(const struct *bt_cap_commander_cb* *cb)

Unregister Common Audio Profile Commander callbacks.

Parameters

- **cb** – The callback structure that was previously registered.

Return values

- **0** – Success
- **-EINVAL** – cb is NULL or cb was not registered

int **bt_cap_commander_discover**(struct bt_conn *conn)

Discovers audio support on a remote device.

This will discover the Common Audio Service (CAS) on the remote device, to verify if the remote device supports the Common Audio Profile.

> **Note**
>
> CONFIG_BT_CAP_COMMANDER must be enabled for this function. If CONFIG_BT_CAP_INITIATOR is also enabled, it does not matter if *bt_cap_commander_discover()* or *bt_cap_initiator_unicast_discover()* is used.

Parameters

- **conn** – Connection to a remote server.

Return values

- `0` – Success
- `-EINVAL` – conn is NULL
- `-ENOTCONN` – conn is not connected
- `-ENOMEM` – Could not allocated memory for the request
- `-EBUSY` – Already doing discovery for conn

int **bt_cap_commander_cancel**(void)

Cancel any current Common Audio Profile commander procedure.

This will stop the current procedure from continuing and making it possible to run a new Common Audio Profile procedure.

It is recommended to do this if any existing procedure takes longer time than expected, which could indicate a missing response from the Common Audio Profile Acceptor.

This does not send any requests to any Common Audio Profile Acceptors involved with the current procedure, and thus notifications from the Common Audio Profile Acceptors may arrive after this has been called. It is thus recommended to either only use this if a procedure has stalled, or wait a short while before starting any new Common Audio Profile procedure after this has been called to avoid getting notifications from the cancelled procedure. The wait time depends on the connection interval, the number of devices in the previous procedure and the behavior of the Common Audio Profile Acceptors.

The respective callbacks of the procedure will be called as part of this with the connection pointer set to NULL and the err value set to -ECANCELED.

Return values

- `0` – on success
- `-EALREADY` – if no procedure is active

int **bt_cap_commander_broadcast_reception_start**(const struct *bt_cap_commander_broadcast_reception_start_param* *param)

Starts the reception of broadcast audio on one or more remote Common Audio Profile Acceptors.

Parameters

- `param` – The parameters to start the broadcast audio

Returns

0 on success or negative error value on failure.

int **bt_cap_commander_broadcast_reception_stop**(const struct *bt_cap_commander_broadcast_reception_stop_param* *param)

Stops the reception of broadcast audio on one or more remote Common Audio Profile Acceptors.

Parameters

- `param` – The parameters to stop the broadcast audio

Returns

0 on success or negative error value on failure.

int **bt_cap_commander_change_volume**(const struct *bt_cap_commander_change_volume_param* *param)

Change the volume on one or more Common Audio Profile Acceptors.

Parameters

- `param` – The parameters for the volume change

Returns
0 on success or negative error value on failure.

int `bt_cap_commander_change_volume_offset`(const struct *bt_cap_commander_change_volume_offset_param* *param)

Change the volume offset on one or more Common Audio Profile Acceptors.

Parameters

- `param` – The parameters for the volume offset change

Returns
0 on success or negative error value on failure.

int `bt_cap_commander_change_volume_mute_state`(const struct *bt_cap_commander_change_volume_mute_state_param* *param)

Change the volume mute state on one or more Common Audio Profile Acceptors.

Parameters

- `param` – The parameters for the volume mute state change

Returns
0 on success or negative error value on failure.

int `bt_cap_commander_change_microphone_mute_state`(const struct *bt_cap_commander_change_microphone_mute_sta* *param)

Change the microphone mute state on one or more Common Audio Profile Acceptors.

Parameters

- `param` – The parameters for the microphone mute state change

Returns
0 on success or negative error value on failure.

int `bt_cap_commander_change_microphone_gain_setting`(const struct *bt_cap_commander_change_microphone_gain_s* *param)

Change the microphone gain setting on one or more Common Audio Profile Acceptors.

Parameters

- `param` – The parameters for the microphone gain setting change

Returns
0 on success or negative error value on failure.

struct `bt_cap_initiator_cb`

#include <cap.h> Callback structure for CAP procedures.

Public Members

void (*`unicast_discovery_complete`)(struct bt_conn *conn, int err, const struct *bt_csip_set_coordinator_set_member* *member, const struct *bt_csip_set_coordinator_csis_inst* *csis_inst)

Callback for *bt_cap_initiator_unicast_discover()*.

Param conn
The connection pointer supplied to *bt_cap_initiator_unicast_discover()*.

Param err
0 if Common Audio Service was found else -ENODATA.

Param member
Pointer to the set member. NULL if err != 0.

Param csis_inst
The Coordinated Set Identification Service if Common Audio Service was found and includes a Coordinated Set Identification Service. NULL on error or if remote device does not include Coordinated Set Identification Service. NULL if err != 0.

void (*`unicast_start_complete`)(int err, struct bt_conn *conn)

Callback for *bt_cap_initiator_unicast_audio_start()*.

Param err
0 if success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_initiator_unicast_audio_cancel()*.

Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_initiator_unicast_audio_cancel()*

void (*`unicast_update_complete`)(int err, struct bt_conn *conn)

Callback for *bt_cap_initiator_unicast_audio_update()*.

Param err
0 if success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_initiator_unicast_audio_cancel()*.

Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_initiator_unicast_audio_cancel()*

void (*`unicast_stop_complete`)(int err, struct bt_conn *conn)

Callback for *bt_cap_initiator_unicast_audio_stop()*.

Param err
0 if success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_initiator_unicast_audio_cancel()*.

Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_initiator_unicast_audio_cancel()*

union `bt_cap_set_member`

#include <cap.h> Represents a Common Audio Set member that are either in a Coordinated or ad-hoc set.

Public Members

struct bt_conn *`member`

Connection pointer if the type is BT_CAP_SET_TYPE_AD_HOC.

struct *bt_csip_set_coordinator_csis_inst* ***csip**

CSIP Coordinated Set struct used if type is BT_CAP_SET_TYPE_CSIP.

struct **bt_cap_stream**

#include <*cap.h*> Common Audio Profile stream structure.

Streams represents a Basic Audio Profile (BAP) stream and operation callbacks. See *bt_bap_stream* for additional information.

Public Members

struct *bt_bap_stream* **bap_stream**

The underlying BAP audio stream.

struct *bt_bap_stream_ops* ***ops**

Audio stream operations.

struct **bt_cap_unicast_audio_start_stream_param**

#include <*cap.h*> Stream specific parameters for the *bt_cap_initiator_unicast_audio_start()* function.

Public Members

union *bt_cap_set_member* **member**

Coordinated or ad-hoc set member.

struct *bt_cap_stream* ***stream**

Stream for the `member`.

struct bt_bap_ep ***ep**

Endpoint reference for the `stream`.

struct *bt_audio_codec_cfg* ***codec_cfg**

Codec configuration.

The `codec_cfg.meta` shall include a list of CCIDs (*BT_AUDIO_METADATA_TYPE_CCID_LIST*) as well as a non-0 stream context (*BT_AUDIO_METADATA_TYPE_STREAM_CONTEXT*) bitfield.

This value is assigned to the `stream`, and shall remain valid while the stream is non-idle.

struct **bt_cap_unicast_audio_start_param**

#include <*cap.h*> Parameters for the *bt_cap_initiator_unicast_audio_start()* function.

Public Members

enum *bt_cap_set_type* **type**
The type of the set.

size_t **count**
The number of parameters in `stream_params`.

struct *bt_cap_unicast_audio_start_stream_param* ***stream_params**
Array of stream parameters.

struct **bt_cap_unicast_audio_update_stream_param**
#include <*cap.h*> Stream specific parameters for the *bt_cap_initiator_unicast_audio_update()* function.

Public Members

struct *bt_cap_stream* ***stream**
Stream to update.

size_t **meta_len**
The length of `meta`.

uint8_t ***meta**
The new metadata.
The metadata shall contain a list of CCIDs as well as a non-0 context bitfield.

struct **bt_cap_unicast_audio_update_param**
#include <*cap.h*> Parameters for the *bt_cap_initiator_unicast_audio_update()* function.

Public Members

enum *bt_cap_set_type* **type**
The type of the set.

size_t **count**
The number of parameters in `stream_params`.

struct *bt_cap_unicast_audio_update_stream_param* ***stream_params**
Array of stream parameters.

struct **bt_cap_unicast_audio_stop_param**
#include <*cap.h*> Parameters for the *bt_cap_initiator_unicast_audio_stop()* function.

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

size_t **count**

The number of streams in `streams`.

struct *bt_cap_stream* ****streams**

Array of streams to stop.

struct **bt_cap_initiator_broadcast_stream_param**

#include <*cap.h*> Parameters part of *bt_cap_initiator_broadcast_subgroup_param* for *bt_cap_initiator_broadcast_audio_create()*

Public Members

struct *bt_cap_stream* ***stream**

Audio stream.

size_t **data_len**

The length of the p data array.

The BIS specific data may be omitted and this set to 0.

uint8_t ***data**

BIS Codec Specific Configuration.

struct **bt_cap_initiator_broadcast_subgroup_param**

#include <*cap.h*> Parameters part of *bt_cap_initiator_broadcast_create_param* for *bt_cap_initiator_broadcast_audio_create()*

Public Members

size_t **stream_count**

The number of parameters in `stream_params`.

struct *bt_cap_initiator_broadcast_stream_param* ***stream_params**

Array of stream parameters.

struct *bt_audio_codec_cfg* ***codec_cfg**

Subgroup Codec configuration.

struct **bt_cap_initiator_broadcast_create_param**

#include <*cap.h*> Parameters for * *bt_cap_initiator_broadcast_audio_create()*

Public Members

size_t **subgroup_count**

The number of parameters in `subgroup_params`.

struct *bt_cap_initiator_broadcast_subgroup_param* ***subgroup_params**

Array of stream parameters.

struct *bt_audio_codec_qos* ***qos**

Quality of Service configuration.

uint8_t **packing**

Broadcast Source packing mode.

BT_ISO_PACKING_SEQUENTIAL or BT_ISO_PACKING_INTERLEAVED.

> **Note**
>
> This is a recommendation to the controller, which the controller may ignore.

bool **encryption**

Whether or not to encrypt the streams.

uint8_t **broadcast_code**[*BT_AUDIO_BROADCAST_CODE_SIZE*]

16-octet broadcast code.

Only valid if `encrypt` is true.

If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

uint8_t **irc**

Immediate Repetition Count.

The number of times the scheduled payloads are transmitted in a given event.

Value range from BT_ISO_IRC_MIN to BT_ISO_IRC_MAX.

uint8_t **pto**

Pre-transmission offset.

Offset used for pre-transmissions.

Value range from BT_ISO_PTO_MIN to BT_ISO_PTO_MAX.

uint16_t **iso_interval**

ISO interval.

Time between consecutive BIS anchor points.

Value range from BT_ISO_ISO_INTERVAL_MIN to BT_ISO_ISO_INTERVAL_MAX.

struct **bt_cap_unicast_to_broadcast_param**

#include <*cap.h*> Parameters for *bt_cap_initiator_unicast_to_broadcast()*

Public Members

struct bt_bap_unicast_group ***unicast_group**

The source unicast group with the streams.

bool **encrypt**

Whether or not to encrypt the streams.

If set to true, then the broadcast code in `broadcast_code` will be used to encrypt the streams.

uint8_t **broadcast_code**[BT_ISO_BROADCAST_CODE_SIZE]

16-octet broadcast code.

Only valid if `encrypt` is true.

If the value is a string or a the value is less than 16 octets, the remaining octets shall be 0.

Example: The string “Broadcast Code” shall be [42 72 6F 61 64 63 61 73 74 20 43 6F 64 65 00 00]

struct **bt_cap_broadcast_to_unicast_param**

#include <*cap.h*> Parameters for *bt_cap_initiator_broadcast_to_unicast()*

Public Members

struct bt_cap_broadcast_source ***broadcast_source**

The source broadcast source with the streams.

The broadcast source will be stopped and deleted.

enum *bt_cap_set_type* **type**

The type of the set.

size_t **count**

The number of set members in `members`.

This value shall match the number of streams in the `broadcast_source`.

union *bt_cap_set_member* ****members**

Coordinated or ad-hoc set members.

struct **bt_cap_commander_cb**

#include <*cap.h*> Callback structure for CAP procedures.

Public Members

void (***discovery_complete**)(struct bt_conn *conn, int err, const struct *bt_csip_set_coordinator_set_member* *member, const struct *bt_csip_set_coordinator_csis_inst* *csis_inst)

Callback for *bt_cap_initiator_unicast_discover()*.

Param conn
The connection pointer supplied to *bt_cap_initiator_unicast_discover()*.
Param err
0 if Common Audio Service was found else -ENODATA.
Param member
Pointer to the set member. NULL if err != 0.
Param csis_inst
The Coordinated Set Identification Service if Common Audio Service was found and includes a Coordinated Set Identification Service. NULL on error or if remote device does not include Coordinated Set Identification Service. NULL if err != 0.

void (*`volume_changed`)(struct bt_conn *conn, int err)

Callback for *bt_cap_commander_change_volume()*.
Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_commander_cancel()*
Param err
0 on success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_commander_cancel()*.

void (*`volume_mute_changed`)(struct bt_conn *conn, int err)

Callback for *bt_cap_commander_change_volume_mute_state()*.
Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_commander_cancel()*
Param err
0 on success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_commander_cancel()*.

void (*`volume_offset_changed`)(struct bt_conn *conn, int err)

Callback for *bt_cap_commander_change_volume_offset()*.
Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_commander_cancel()*
Param err
0 on success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_commander_cancel()*.

void (*`microphone_mute_changed`)(struct bt_conn *conn, int err)

Callback for *bt_cap_commander_change_microphone_mute_state()*.
Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_commander_cancel()*
Param err
0 on success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_commander_cancel()*.

void (*`microphone_gain_changed`)(struct bt_conn *conn, int err)

Callback for *bt_cap_commander_change_microphone_gain_setting()*.
Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_commander_cancel()*
Param err
0 on success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_commander_cancel()*.

void (*broadcast_reception_start)(struct bt_conn *conn, int err)

Callback for *bt_cap_commander_broadcast_reception_start()*.

Param conn
Pointer to the connection where the error occurred. NULL if `err` is 0 or if cancelled by *bt_cap_commander_cancel()*

Param err
0 on success, *BT_GATT_ERR()* with a specific ATT (BT_ATT_ERR_*) error code or -ECANCELED if cancelled by *bt_cap_commander_cancel()*.

struct bt_cap_commander_broadcast_reception_start_member_param

#include <*cap.h*> Parameters part of *bt_cap_commander_broadcast_reception_start_param* for *bt_cap_commander_broadcast_reception_start()*

Public Members

union *bt_cap_set_member* member

Coordinated or ad-hoc set member.

bt_addr_le_t addr

Address of the advertiser.

uint8_t adv_sid

SID of the advertising set.

uint16_t pa_interval

Periodic advertising interval in milliseconds.

BT_BAP_PA_INTERVAL_UNKNOWN if unknown.

uint32_t broadcast_id

24-bit broadcast ID

struct *bt_bap_bass_subgroup* subgroups[CONFIG_BT_BAP_BASS_MAX_SUBGROUPS]

Pointer to array of subgroups.

At least one bit in one of the subgroups bis_sync parameters shall be set.

size_t num_subgroups

Number of subgroups.

struct bt_cap_commander_broadcast_reception_start_param

#include <*cap.h*> Parameters for starting broadcast reception

Public Members

enum *bt_cap_set_type* type

The type of the set.

struct *bt_cap_commander_broadcast_reception_start_member_param* ***param**

The set of devices for this procedure.

size_t **count**

The number of parameters in `param`.

struct **bt_cap_commander_broadcast_reception_stop_param**

#include <*cap.h*> Parameters for stopping broadcast reception

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

union *bt_cap_set_member* ***members**

Coordinated or ad-hoc set member.

size_t **count**

The number of members in `members`.

struct **bt_cap_commander_change_volume_param**

#include <*cap.h*> Parameters for changing absolute volume

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

union *bt_cap_set_member* ***members**

Coordinated or ad-hoc set member.

size_t **count**

The number of members in `members`.

uint8_t **volume**

The absolute volume to set.

struct **bt_cap_commander_change_volume_offset_member_param**

#include <*cap.h*> Parameters part of *bt_cap_commander_change_volume_offset_param* for *bt_cap_commander_change_volume_offset()*

Public Members

union *bt_cap_set_member* **member**

Coordinated or ad-hoc set member.

int16_t **offset**

The offset to set.

Value shall be between BT_VOCS_MIN_OFFSET and BT_VOCS_MAX_OFFSET

struct **bt_cap_commander_change_volume_offset_param**

#include <*cap.h*> Parameters for changing volume offset.

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

struct *bt_cap_commander_change_volume_offset_member_param* ***param**

The set of devices for this procedure.

size_t **count**

The number of parameters in `param`.

struct **bt_cap_commander_change_volume_mute_state_param**

#include <*cap.h*> Parameters for changing volume mute state.

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

union *bt_cap_set_member* ***members**

Coordinated or ad-hoc set member.

size_t **count**

The number of members in `members`.

bool **mute**

The volume mute state to set.

true to mute, and false to unmute

struct **bt_cap_commander_change_microphone_mute_state_param**

#include <*cap.h*> Parameters for changing microphone mute state.

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

union *bt_cap_set_member* ***members**

Coordinated or ad-hoc set member.

size_t **count**

The number of members in `members`.

bool **mute**

The microphone mute state to set.

true to mute, and false to unmute

struct **bt_cap_commander_change_microphone_gain_setting_member_param**

#include <*cap.h*> Parameters part of *bt_cap_commander_change_microphone_gain_setting_param* for *bt_cap_commander_change_microphone_gain_setting()*

Public Members

union *bt_cap_set_member* **member**

Coordinated or ad-hoc set member.

int8_t **gain**

The microphone gain setting to set.

struct **bt_cap_commander_change_microphone_gain_setting_param**

#include <*cap.h*> Parameters for changing microphone mute state.

Public Members

enum *bt_cap_set_type* **type**

The type of the set.

struct *bt_cap_commander_change_microphone_gain_setting_member_param* ***param**

The set of devices for this procedure.

size_t **count**

The number of parameters in `param`.

Coordinated Set Identification Profile (CSIP)

Published Audio Capabilities Service (PACS)

The Coordinated Set Identification Profile (CSIP) provides procedures to discover and coordinate sets of devices.

Since
3.0

Version
0.8.0

The Published Audio Capabilities Service (PACS) is used to expose capabilities to remote devices.

Since
3.0

Version
0.8.0

Defines

`BT_CSIP_SET_COORDINATOR_DISCOVER_TIMER_VALUE`
Recommended timer for member discovery.

`BT_CSIP_SET_COORDINATOR_MAX_CSIS_INSTANCES`
Defines the maximum number of Coordinated Set Identification service instances for the Coordinated Set Identification Set Coordinator.

`BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT`
Accept the request to read the SIRK as plaintext.

`BT_CSIP_READ_SIRK_REQ_RSP_ACCEPT_ENC`
Accept the request to read the SIRK, but return encrypted SIRK.

`BT_CSIP_READ_SIRK_REQ_RSP_REJECT`
Reject the request to read the SIRK.

`BT_CSIP_READ_SIRK_REQ_RSP_OOB_ONLY`
SIRK is available only via an OOB procedure.

`BT_CSIP_SIRK_SIZE`
Size of the Set Identification Resolving Key (SIRK)

`BT_CSIP_RSI_SIZE`
Size of the Resolvable Set Identifier (RSI)

`BT_CSIP_ERROR_LOCK_DENIED`
Service is already locked.

`BT_CSIP_ERROR_LOCK_RELEASE_DENIED`
Service is not locked.

`BT_CSIP_ERROR_LOCK_INVAL_VALUE`
Invalid lock value.

BT_CSIP_ERROR_SIRK_OOB_ONLY
: SIRK only available out-of-band.

BT_CSIP_ERROR_LOCK_ALREADY_GRANTED
: Client is already owner of the lock.

BT_CSIP_DATA_RSI(_rsi)
: Helper to declare *bt_data* array including RSI.

  This macro is mainly for creating an array of struct *bt_data* elements which is then passed to e.g. *bt_le_ext_adv_start()*.

  Parameters

  - **_rsi** – Pointer to the RSI value

Typedefs

typedef void (***bt_csip_set_coordinator_discover_cb**)(struct bt_conn *conn, const struct *bt_csip_set_coordinator_set_member* *member, int err, size_t set_count)

Callback for discovering Coordinated Set Identification Services.

Param conn
Pointer to the remote device.

Param member
Pointer to the set member.

Param err
0 on success, or an errno value on error.

Param set_count
Number of sets on the member.

typedef void (***bt_csip_set_coordinator_lock_set_cb**)(int err)

Callback for locking a set across one or more devices.

Param err
0 on success, or an errno value on error.

typedef void (***bt_csip_set_coordinator_lock_changed_cb**)(struct *bt_csip_set_coordinator_csis_inst* *inst, bool locked)

Callback when the lock value on a set of a connected device changes.

Param inst
The Coordinated Set Identification Service instance that was changed.

Param locked
Whether the lock is locked or release.

Return
int Return 0 on success, or an errno value on error.

typedef void (***bt_csip_set_coordinator_sirk_changed_cb**)(struct *bt_csip_set_coordinator_csis_inst* *inst)

Callback when the SIRK value of a set of a connected device changes.

Param inst
The Coordinated Set Identification Service instance that was changed. The new SIRK can be accessed via the `inst.info`.

typedef void (*bt_csip_set_coordinator_ordered_access_cb_t)(const struct *bt_csip_set_coordinator_set_info* *set_info, int err, bool locked, struct *bt_csip_set_coordinator_set_member* *member)

Callback for *bt_csip_set_coordinator_ordered_access()*

If any of the set members supplied to *bt_csip_set_coordinator_ordered_access()* is in the locked state, this will be called with `locked` true and `member` will be the locked member, and the ordered access procedure is cancelled. Likewise, if any error occurs, the procedure will also be aborted.

Param set_info
Pointer to the a specific set_info struct.

Param err
Error value. 0 on success, GATT error or errno on fail.

Param locked
Whether the lock is locked or release.

Param member
The locked member if `locked` is true, otherwise NULL.

typedef bool (*bt_csip_set_coordinator_ordered_access_t)(const struct *bt_csip_set_coordinator_set_info* *set_info, struct *bt_csip_set_coordinator_set_member* *members[], size_t count)

Callback function definition for *bt_csip_set_coordinator_ordered_access()*

Param set_info
Pointer to the a specific set_info struct.

Param members
Array of members ordered by rank. The procedure shall be done on the members in ascending order.

Param count
Number of members in `members`.

Return
true if the procedures can be successfully done, or false to stop the procedure.

typedef bool (*bt_pacs_cap_foreach_func_t)(const struct *bt_pacs_cap* *cap, void *user_data)

Published Audio Capability iterator callback.

Param cap
Capability found.

Param user_data
Data given.

Return
true to continue to the next capability

Return
false to stop the iteration

Functions

void *bt_csip_set_member_svc_decl_get(const struct bt_csip_set_member_svc_inst *svc_inst)

Get the service declaration attribute.

The first service attribute can be included in any other GATT service.

Parameters

- svc_inst – Pointer to the Coordinated Set Identification Service.

Returns

The first CSIS attribute instance.

int bt_csip_set_member_register(const struct *bt_csip_set_member_register_param* *param, struct bt_csip_set_member_svc_inst **svc_inst)

Register a Coordinated Set Identification Service instance.

This will register and enable the service and make it discoverable by clients.

This shall only be done as a server.

Parameters

- param – Coordinated Set Identification Service register parameters.
- svc_inst – **[out]** Pointer to the registered Coordinated Set Identification Service.

Returns

0 if success, errno on failure.

int bt_csip_set_member_unregister(struct bt_csip_set_member_svc_inst *svc_inst)

Unregister a Coordinated Set Identification Service instance.

This will unregister and disable the service instance.

Parameters

- svc_inst – Pointer to the registered Coordinated Set Identification Service.

Returns

0 if success, errno on failure.

int bt_csip_set_member_sirk(struct bt_csip_set_member_svc_inst *svc_inst, const uint8_t sirk[16])

Set the SIRK of a service instance.

Parameters

- svc_inst – Pointer to the registered Coordinated Set Identification Service.
- sirk – The new SIRK.

int bt_csip_set_member_get_sirk(struct bt_csip_set_member_svc_inst *svc_inst, uint8_t sirk[16])

Get the SIRK of a service instance.

Parameters

- svc_inst – **[in]** Pointer to the registered Coordinated Set Identification Service.
- sirk – **[out]** Array to store the SIRK in.

int **bt_csip_set_member_generate_rsi**(const struct bt_csip_set_member_svc_inst *svc_inst, uint8_t rsi[6])

Generate the Resolvable Set Identifier (RSI) value.

This will generate RSI for given `svc_inst` instance.

Parameters

- **svc_inst** – Pointer to the Coordinated Set Identification Service.
- **rsi** – Pointer to the 6-octet newly generated RSI data in little-endian.

Returns
int 0 if on success, errno on error.

int **bt_csip_set_member_lock**(struct bt_csip_set_member_svc_inst *svc_inst, bool lock, bool force)

Locks a specific Coordinated Set Identification Service instance on the server.

Parameters

- **svc_inst** – Pointer to the Coordinated Set Identification Service.
- **lock** – If true lock the set, if false release the set.
- **force** – This argument only have meaning when `lock` is false (release) and will force release the lock, regardless of who took the lock.

Returns
0 on success, GATT error on error.

int **bt_csip_set_coordinator_discover**(struct bt_conn *conn)

Initialise the csip_set_coordinator instance for a connection.

This will do a discovery on the device and prepare the instance for following commands.

Parameters

- **conn** – Pointer to remote device to perform discovery on.

Returns
int Return 0 on success, or an errno value on error.

struct *bt_csip_set_coordinator_set_member* ***bt_csip_set_coordinator_set_member_by_conn**(const struct bt_conn *conn)

Get the set member from a connection pointer.

Get the Coordinated Set Identification Profile Set Coordinator pointer from a connection pointer. Only Set Coordinators that have been initiated via *bt_csip_set_coordinator_discover()* can be retrieved.

Parameters

- **conn** – Connection pointer.

Return values

- **Pointer** – to a Coordinated Set Identification Profile Set Coordinator instance
- **NULL** – if `conn` is NULL or if the connection has not done discovery yet

bool **bt_csip_set_coordinator_is_set_member**(const uint8_t sirk[16], struct *bt_data* *data)

Check if advertising data indicates a set member.

Parameters

- `sirk` – The SIRK of the set to check against
- `data` – The advertising data

Returns
true if the advertising data indicates a set member, false otherwise

int `bt_csip_set_coordinator_register_cb`(struct *bt_csip_set_coordinator_cb* *cb)

Registers callbacks for csip_set_coordinator.

Parameters

- `cb` – Pointer to the callback structure.

Returns
Return 0 on success, or an errno value on error.

int `bt_csip_set_coordinator_ordered_access`(const struct *bt_csip_set_coordinator_set_member* *members[], uint8_t count, const struct *bt_csip_set_coordinator_set_info* *set_info, *bt_csip_set_coordinator_ordered_access_t* cb)

Access Coordinated Set devices in an ordered manner as a client.

This function will read the lock state of all devices and if all devices are in the unlocked state, then `cb` will be called with the same members as provided by `members`, but where the members are ordered by rank (if present). Once this procedure is finished or an error occurs, *bt_csip_set_coordinator_cb::ordered_access* will be called.

This procedure only works if all the members have the lock characteristic, and all either has rank = 0 or unique ranks.

If any of the members are in the locked state, the procedure will be cancelled.

This can only be done on members that are bonded.

Parameters

- `members` – Array of set members to access.
- `count` – Number of set members in `members`.
- `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.
- `cb` – The callback function to be called for each member.

int `bt_csip_set_coordinator_lock`(const struct *bt_csip_set_coordinator_set_member* **members, uint8_t count, const struct *bt_csip_set_coordinator_set_info* *set_info)

Lock an array of set members.

The members will be locked starting from lowest rank going up.

TODO: If locking fails, the already locked members will not be unlocked.

Parameters

- `members` – Array of set members to lock.
- `count` – Number of set members in `members`.
- `set_info` – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

Returns
Return 0 on success, or an errno value on error.

int **bt_csip_set_coordinator_release**(const struct *bt_csip_set_coordinator_set_member* **members, uint8_t count, const struct *bt_csip_set_coordinator_set_info* *set_info)

Release an array of set members.

The members will be released starting from highest rank going down.

Parameters

- **members** – Array of set members to lock.
- **count** – Number of set members in `members`.
- **set_info** – Pointer to the a specific set_info struct, as a member may be part of multiple sets.

Returns

Return 0 on success, or an errno value on error.

void **bt_pacs_cap_foreach**(enum *bt_audio_dir* dir, *bt_pacs_cap_foreach_func_t* func, void *user_data)

Published Audio Capability iterator.

Iterate capabilities with endpoint direction specified.

Parameters

- **dir** – Direction of the endpoint to look capability for.
- **func** – Callback function.
- **user_data** – Data to pass to the callback.

int **bt_pacs_cap_register**(enum *bt_audio_dir* dir, struct *bt_pacs_cap* *cap)

Register Published Audio Capability.

Register Audio Local Capability.

Parameters

- **dir** – Direction of the endpoint to register capability for.
- **cap** – Capability structure.

Returns

0 in case of success or negative value in case of error.

int **bt_pacs_cap_unregister**(enum *bt_audio_dir* dir, struct *bt_pacs_cap* *cap)

Unregister Published Audio Capability.

Unregister Audio Local Capability.

Parameters

- **dir** – Direction of the endpoint to unregister capability for.
- **cap** – Capability structure.

Returns

0 in case of success or negative value in case of error.

int **bt_pacs_set_location**(enum *bt_audio_dir* dir, enum *bt_audio_location* location)

Set the location for an endpoint type.

Parameters

- **dir** – Direction of the endpoints to change location for.
- **location** – The location to be set.

Returns
0 in case of success or negative value in case of error.

int **bt_pacs_set_available_contexts**(enum *bt_audio_dir* dir, enum *bt_audio_context* contexts)

Set the available contexts for an endpoint type.

Parameters

- **dir** – Direction of the endpoints to change available contexts for.
- **contexts** – The contexts to be set.

Returns
0 in case of success or negative value in case of error.

enum *bt_audio_context* **bt_pacs_get_available_contexts**(enum *bt_audio_dir* dir)

Get the available contexts for an endpoint type.

Parameters

- **dir** – Direction of the endpoints to get contexts for.

Returns
Bitmask of available contexts.

int **bt_pacs_conn_set_available_contexts_for_conn**(struct bt_conn *conn, enum *bt_audio_dir* dir, enum *bt_audio_context* *contexts)

Set the available contexts for a given connection.

This function sets the available contexts value for a given `conn` connection object. If the `contexts` parameter is NULL the available contexts value is reset to default. The default value of the available contexts is set using *bt_pacs_set_available_contexts* function. The Available Context Value is reset to default on ACL disconnection.

Parameters

- **conn** – Connection object.
- **dir** – Direction of the endpoints to change available contexts for.
- **contexts** – The contexts to be set or NULL to reset to default.

Returns
0 in case of success or negative value in case of error.

enum *bt_audio_context* **bt_pacs_get_available_contexts_for_conn**(struct bt_conn *conn, enum *bt_audio_dir* dir)

Get the available contexts for a given connection.

This server function returns the available contexts value for a given `conn` connection object. The value returned is the one set with *bt_pacs_conn_set_available_contexts_for_conn* function or the default value set with *bt_pacs_set_available_contexts* function.

Parameters

- **conn** – Connection object.
- **dir** – Direction of the endpoints to get contexts for.

Return values
BT_AUDIO_CONTEXT_TYPE_PROHIBITED – if `conn` or `dir` are invalid

Returns
Bitmask of available contexts.

int **bt_pacs_set_supported_contexts**(enum *bt_audio_dir* dir, enum *bt_audio_context* contexts)

Set the supported contexts for an endpoint type.

Parameters

- **dir** – Direction of the endpoints to change available contexts for.
- **contexts** – The contexts to be set.

Returns

0 in case of success or negative value in case of error.

struct **bt_csip_set_member_cb**

#include <csip.h> Callback structure for the Coordinated Set Identification Service.

Public Members

void (***lock_changed**)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst, bool locked)

Callback whenever the lock changes on the server.

Param conn
The connection to the client that changed the lock. NULL if server changed it, either by calling *bt_csip_set_member_lock()* or by timeout.

Param svc_inst
Pointer to the Coordinated Set Identification Service.

Param locked
Whether the lock was locked or released.

uint8_t (***sirk_read_req**)(struct bt_conn *conn, struct bt_csip_set_member_svc_inst *svc_inst)

Request from a peer device to read the sirk.

If this callback is not set, all clients will be allowed to read the SIRK unencrypted.

Param conn
The connection to the client that requested to read the SIRK.

Param svc_inst
Pointer to the Coordinated Set Identification Service.

Return
A BT_CSIP_READ_SIRK_REQ_RSP_* response code.

struct **bt_csip_set_member_register_param**

#include <csip.h> Register structure for Coordinated Set Identification Service.

Public Members

uint8_t **set_size**

Size of the set.

If set to 0, the set size characteristic won't be initialized.

uint8_t **sirk**[16]

The unique Set Identity Resolving Key (SIRK)

This shall be unique between different sets, and shall be the same for each set member for each set.

bool **lockable**

Boolean to set whether the set is lockable by clients.

Setting this to false will disable the lock characteristic.

uint8_t **rank**

Rank of this device in this set.

If the lockable parameter is set to true, this shall be > 0 and <= to the set_size. If the lockable parameter is set to false, this may be set to 0 to disable the rank characteristic.

struct *bt_csip_set_member_cb* ***cb**

Pointer to the callback structure.

const struct *bt_gatt_service* ***parent**

Parent service pointer.

Mandatory parent service pointer if this CSIS instance is included by another service. All CSIS instances when `CONFIG_BT_CSIP_SET_MEMBER_MAX_INSTANCE_COUNT` is above 1 shall be included by another service, as per the Coordinated Set Identification Profile (CSIP).

struct **bt_csip_set_coordinator_set_info**

#include <*csip.h*> Information about a specific set.

Public Members

uint8_t **sirk**[16]

The 16 octet set Set Identity Resolving Key (SIRK)

The SIRK may not be exposed by the server over Bluetooth, and may require an out-of-band solution.

uint8_t **set_size**

The size of the set.

Will be 0 if not exposed by the server.

uint8_t **rank**

The rank of the set on the remote device.

Will be 0 if not exposed by the server.

bool **lockable**

Whether or not the set can be locked on this device.

struct **bt_csip_set_coordinator_csis_inst**

#include <*csip.h*> Struct representing a coordinated set instance on a remote device.

The values in this struct will be populated during discovery of sets (*bt_csip_set_coordinator_discover()*).

Public Members

struct *bt_csip_set_coordinator_set_info* **info**
Information about the coordinated set.

void ***svc_inst**
Internally used pointer value.

struct **bt_csip_set_coordinator_set_member**
#include <*csip.h*> Struct representing a remote device as a set member.

Public Members

struct *bt_csip_set_coordinator_csis_inst* **insts**[0]
Array of Coordinated Set Identification Service instances for the remote device.

struct **bt_csip_set_coordinator_cb**
#include <*csip.h*> Struct to hold the Coordinated Set Identification Profile Set Coordinator callbacks.

These can be registered for usage with *bt_csip_set_coordinator_register_cb()*.

Public Members

bt_csip_set_coordinator_discover_cb **discover**
Callback when discovery has finished.

bt_csip_set_coordinator_lock_set_cb **lock_set**
Callback when locking a set has finished.

bt_csip_set_coordinator_lock_set_cb **release_set**
Callback when unlocking a set has finished.

bt_csip_set_coordinator_lock_changed_cb **lock_changed**
Callback when a set's lock state has changed.

bt_csip_set_coordinator_sirk_changed_cb **sirk_changed**
Callback when a set's SIRK has changed.

bt_csip_set_coordinator_ordered_access_cb_t **ordered_access**
Callback for the ordered access procedure.

struct **bt_pacs_cap**
#include <*pacs.h*> Published Audio Capability structure.

Public Members

const struct *bt_audio_codec_cap* *codec_cap

Codec capability reference.

Bluetooth Media

API Reference

Media Control Service

group bt_mcs

Media Control Service (MCS)

Definitions and types related to the Media Control Service and Media Control Profile specifications.

Since
3.0

Version
0.8.0

Playback speeds

The playback speed (s) is calculated by the value of 2 to the power of p divided by 64.

All values from -128 to 127 allowed, only some examples defined.

BT_MCS_PLAYBACK_SPEED_MIN

Minimum playback speed, resulting in 25 % speed.

BT_MCS_PLAYBACK_SPEED_QUARTER

Quarter playback speed, resulting in 25 % speed.

BT_MCS_PLAYBACK_SPEED_HALF

Half playback speed, resulting in 50 % speed.

BT_MCS_PLAYBACK_SPEED_UNITY

Unity playback speed, resulting in 100 % speed.

BT_MCS_PLAYBACK_SPEED_DOUBLE

Double playback speed, resulting in 200 % speed.

BT_MCS_PLAYBACK_SPEED_MAX

Max playback speed, resulting in 395.7 % speed (nearly 400 %)

Seeking speed

The allowed values for seeking speed are the range -64 to -4 (endpoints included), the value 0, and the range 4 to 64 (endpoints included).

`BT_MCS_SEEKING_SPEED_FACTOR_MAX`
: Maximum seeking speed - Can be negated.

`BT_MCS_SEEKING_SPEED_FACTOR_MIN`
: Minimum seeking speed - Can be negated.

`BT_MCS_SEEKING_SPEED_FACTOR_ZERO`
: No seeking.

Playing orders

`BT_MCS_PLAYING_ORDER_SINGLE_ONCE`
: A single track is played once; there is no next track.

`BT_MCS_PLAYING_ORDER_SINGLE_REPEAT`
: A single track is played repeatedly; the next track is the current track.

`BT_MCS_PLAYING_ORDER_INORDER_ONCE`
: The tracks within a group are played once in track order.

`BT_MCS_PLAYING_ORDER_INORDER_REPEAT`
: The tracks within a group are played in track order repeatedly.

`BT_MCS_PLAYING_ORDER_OLDEST_ONCE`
: The tracks within a group are played once only from the oldest first.

`BT_MCS_PLAYING_ORDER_OLDEST_REPEAT`
: The tracks within a group are played from the oldest first repeatedly.

`BT_MCS_PLAYING_ORDER_NEWEST_ONCE`
: The tracks within a group are played once only from the newest first.

`BT_MCS_PLAYING_ORDER_NEWEST_REPEAT`
: The tracks within a group are played from the newest first repeatedly.

`BT_MCS_PLAYING_ORDER_SHUFFLE_ONCE`
: The tracks within a group are played in random order once.

`BT_MCS_PLAYING_ORDER_SHUFFLE_REPEAT`
: The tracks within a group are played in random order repeatedly.

Playing orders supported

A bitmap, in the same order as the playing orders above.

Note that playing order 1 corresponds to bit 0, and so on.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_SINGLE_ONCE`
: A single track is played once; there is no next track.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_SINGLE_REPEAT`
: A single track is played repeatedly; the next track is the current track.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_INORDER_ONCE`
: The tracks within a group are played once in track order.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_INORDER_REPEAT`
: The tracks within a group are played in track order repeatedly.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_OLDEST_ONCE`
: The tracks within a group are played once only from the oldest first.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_OLDEST_REPEAT`
: The tracks within a group are played from the oldest first repeatedly.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_NEWEST_ONCE`
: The tracks within a group are played once only from the newest first.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_NEWEST_REPEAT`
: The tracks within a group are played from the newest first repeatedly.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_SHUFFLE_ONCE`
: The tracks within a group are played in random order once.

`BT_MCS_PLAYING_ORDERS_SUPPORTED_SHUFFLE_REPEAT`
: The tracks within a group are played in random order repeatedly.

Media states

`BT_MCS_MEDIA_STATE_INACTIVE`
: The current track is invalid, and no track has been selected.

`BT_MCS_MEDIA_STATE_PLAYING`
: The media player is playing the current track.

`BT_MCS_MEDIA_STATE_PAUSED`
: The current track is paused.

  The media player has a current track, but it is not being played

`BT_MCS_MEDIA_STATE_SEEKING`
: The current track is fast forwarding or fast rewinding.

Media control point opcodes

`BT_MCS_OPC_PLAY`
: Start playing the current track.

`BT_MCS_OPC_PAUSE`
: Pause playing the current track.

`BT_MCS_OPC_FAST_REWIND`
: Fast rewind the current track.

`BT_MCS_OPC_FAST_FORWARD`
: Fast forward the current track.

`BT_MCS_OPC_STOP`
: Stop current activity and return to the paused state and set the current track position to the start of the current track.

`BT_MCS_OPC_MOVE_RELATIVE`
: Set a new current track position relative to the current track position.

`BT_MCS_OPC_PREV_SEGMENT`
: Set the current track position to the starting position of the previous segment of the current track.

`BT_MCS_OPC_NEXT_SEGMENT`
: Set the current track position to the starting position of the next segment of the current track.

`BT_MCS_OPC_FIRST_SEGMENT`
: Set the current track position to the starting position of the first segment of the current track.

`BT_MCS_OPC_LAST_SEGMENT`
: Set the current track position to the starting position of the last segment of the current track.

`BT_MCS_OPC_GOTO_SEGMENT`
: Set the current track position to the starting position of the nth segment of the current track.

`BT_MCS_OPC_PREV_TRACK`
: Set the current track to the previous track based on the playing order.

`BT_MCS_OPC_NEXT_TRACK`
: Set the current track to the next track based on the playing order.

`BT_MCS_OPC_FIRST_TRACK`
: Set the current track to the first track based on the playing order.

BT_MCS_OPC_LAST_TRACK
: Set the current track to the last track based on the playing order.

BT_MCS_OPC_GOTO_TRACK
: Set the current track to the nth track based on the playing order.

BT_MCS_OPC_PREV_GROUP
: Set the current group to the previous group in the sequence of groups.

BT_MCS_OPC_NEXT_GROUP
: Set the current group to the next group in the sequence of groups.

BT_MCS_OPC_FIRST_GROUP
: Set the current group to the first group in the sequence of groups.

BT_MCS_OPC_LAST_GROUP
: Set the current group to the last group in the sequence of groups.

BT_MCS_OPC_GOTO_GROUP
: Set the current group to the nth group in the sequence of groups.

Media control point supported opcodes values

BT_MCS_OPC_SUP_PLAY
: Support the Play opcode.

BT_MCS_OPC_SUP_PAUSE
: Support the Pause opcode.

BT_MCS_OPC_SUP_FAST_REWIND
: Support the Fast Rewind opcode.

BT_MCS_OPC_SUP_FAST_FORWARD
: Support the Fast Forward opcode.

BT_MCS_OPC_SUP_STOP
: Support the Stop opcode.

BT_MCS_OPC_SUP_MOVE_RELATIVE
: Support the Move Relative opcode.

BT_MCS_OPC_SUP_PREV_SEGMENT
: Support the Previous Segment opcode.

BT_MCS_OPC_SUP_NEXT_SEGMENT
: Support the Next Segment opcode.

BT_MCS_OPC_SUP_FIRST_SEGMENT
: Support the First Segment opcode.

BT_MCS_OPC_SUP_LAST_SEGMENT
: Support the Last Segment opcode.

BT_MCS_OPC_SUP_GOTO_SEGMENT
: Support the Goto Segment opcode.

BT_MCS_OPC_SUP_PREV_TRACK
: Support the Previous Track opcode.

BT_MCS_OPC_SUP_NEXT_TRACK
: Support the Next Track opcode.

BT_MCS_OPC_SUP_FIRST_TRACK
: Support the First Track opcode.

BT_MCS_OPC_SUP_LAST_TRACK
: Support the Last Track opcode.

BT_MCS_OPC_SUP_GOTO_TRACK
: Support the Goto Track opcode.

BT_MCS_OPC_SUP_PREV_GROUP
: Support the Previous Group opcode.

BT_MCS_OPC_SUP_NEXT_GROUP
: Support the Next Group opcode.

BT_MCS_OPC_SUP_FIRST_GROUP
: Support the First Group opcode.

BT_MCS_OPC_SUP_LAST_GROUP
: Support the Last Group opcode.

BT_MCS_OPC_SUP_GOTO_GROUP
: Support the Goto Group opcode.

Media control point notification result codes

BT_MCS_OPC_NTF_SUCCESS
: Action requested by the opcode write was completed successfully.

BT_MCS_OPC_NTF_NOT_SUPPORTED
: An invalid or unsupported opcode was used for the Media Control Point write.

BT_MCS_OPC_NTF_PLAYER_INACTIVE
: The Media Player State characteristic value is Inactive when the opcode is received or the result of the requested action of the opcode results in the Media Player State characteristic being set to Inactive.

BT_MCS_OPC_NTF_CANNOT_BE_COMPLETED
: The requested action of any Media Control Point write cannot be completed successfully because of a condition within the player.

Search control point type values

Reference: Media Control Service spec v1.0 section 3.20.2

BT_MCS_SEARCH_TYPE_TRACK_NAME
: Search for Track Name.

BT_MCS_SEARCH_TYPE_ARTIST_NAME
: Search for Artist Name.

BT_MCS_SEARCH_TYPE_ALBUM_NAME
: Search for Album Name.

BT_MCS_SEARCH_TYPE_GROUP_NAME
: Search for Group Name.

BT_MCS_SEARCH_TYPE_EARLIEST_YEAR
: Search for Earliest Year.

BT_MCS_SEARCH_TYPE_LATEST_YEAR
: Search for Latest Year.

BT_MCS_SEARCH_TYPE_GENRE
: Search for Genre.

BT_MCS_SEARCH_TYPE_ONLY_TRACKS
: Search for Tracks only.

BT_MCS_SEARCH_TYPE_ONLY_GROUPS
: Search for Groups only.

Search notification result codes

Reference: Media Control Service spec v1.0 section 3.20.2

BT_MCS_SCP_NTF_SUCCESS
: Search request was accepted; search has started.

BT_MCS_SCP_NTF_FAILURE
: Search request was invalid; no search started.

Group object object types

Reference: Media Control Service spec v1.0 section 4.4.1

`BT_MCS_GROUP_OBJECT_TRACK_TYPE`
: Group object type is track.

`BT_MCS_GROUP_OBJECT_GROUP_TYPE`
: Group object type is group.

Defines

`BT_MCS_ERR_LONG_VAL_CHANGED`
: A characteristic value has changed while a Read Long Value Characteristic sub-procedure is in progress.

`BT_MCS_OPCODES_SUPPORTED_LEN`
: Media control point supported opcodes length.

`SEARCH_LEN_MIN`
: Search control point minimum length.

  At least one search control item (SCI), consisting of the length octet and the type octet. (The * parameter field may be empty.)

`SEARCH_LEN_MAX`
: Search control point maximum length.

`SEARCH_SCI_LEN_MIN`
: Search control point item (SCI) minimum length.

  An SCI length can be as little as one byte, for an SCI that has only the type field. (The SCI len is the length of type + param.)

`SEARCH_PARAM_MAX`
: Search parameters maximum length

Media Proxy

group `bt_media_proxy`
: Media proxy module.

  The media proxy module is the connection point between media players and media controllers.

  Since
  : 3.0

  Version
  : 0.8.0

A media player has (access to) media content and knows how to navigate and play this content. A media controller reads or gets information from a player and controls the player by setting player parameters and giving the player commands.

The media proxy module allows media player implementations to make themselves available to media controllers. And it allows controllers to access, and get updates from, any player.

The media proxy module allows both local and remote control of local player instances: A media controller may be a local application, or it may be a Media Control Service relaying requests from a remote Media Control Client. There may be either local or remote control, or both, or even multiple instances of each.

Playback speed parameters

All values from -128 to 127 allowed, only some defined

`MEDIA_PROXY_PLAYBACK_SPEED_MIN`
: Minimum playback speed, resulting in 25 % speed.

`MEDIA_PROXY_PLAYBACK_SPEED_QUARTER`
: Quarter playback speed, resulting in 25 % speed.

`MEDIA_PROXY_PLAYBACK_SPEED_HALF`
: Half playback speed, resulting in 50 % speed.

`MEDIA_PROXY_PLAYBACK_SPEED_UNITY`
: Unity playback speed, resulting in 100 % speed.

`MEDIA_PROXY_PLAYBACK_SPEED_DOUBLE`
: Double playback speed, resulting in 200 % speed.

`MEDIA_PROXY_PLAYBACK_SPEED_MAX`
: Max playback speed, resulting in 395.7 % speed (nearly 400 %)

Seeking speed factors

The allowed values for seeking speed are the range -64 to -4 (endpoints included), the value 0, and the range 4 to 64 (endpoints included).

`MEDIA_PROXY_SEEKING_SPEED_FACTOR_MAX`
: Maximum seeking speed - Can be negated.

`MEDIA_PROXY_SEEKING_SPEED_FACTOR_MIN`
: Minimum seeking speed - Can be negated.

`MEDIA_PROXY_SEEKING_SPEED_FACTOR_ZERO`
: No seeking.

Playing orders

`MEDIA_PROXY_PLAYING_ORDER_SINGLE_ONCE`
A single track is played once; there is no next track.

`MEDIA_PROXY_PLAYING_ORDER_SINGLE_REPEAT`
A single track is played repeatedly; the next track is the current track.

`MEDIA_PROXY_PLAYING_ORDER_INORDER_ONCE`
The tracks within a group are played once in track order.

`MEDIA_PROXY_PLAYING_ORDER_INORDER_REPEAT`
The tracks within a group are played in track order repeatedly.

`MEDIA_PROXY_PLAYING_ORDER_OLDEST_ONCE`
The tracks within a group are played once only from the oldest first.

`MEDIA_PROXY_PLAYING_ORDER_OLDEST_REPEAT`
The tracks within a group are played from the oldest first repeatedly.

`MEDIA_PROXY_PLAYING_ORDER_NEWEST_ONCE`
The tracks within a group are played once only from the newest first.

`MEDIA_PROXY_PLAYING_ORDER_NEWEST_REPEAT`
The tracks within a group are played from the newest first repeatedly.

`MEDIA_PROXY_PLAYING_ORDER_SHUFFLE_ONCE`
The tracks within a group are played in random order once.

`MEDIA_PROXY_PLAYING_ORDER_SHUFFLE_REPEAT`
The tracks within a group are played in random order repeatedly.

Playing orders supported

A bitmap, in the same order as the playing orders above.

Note that playing order 1 corresponds to bit 0, and so on.

`MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_SINGLE_ONCE`
A single track is played once; there is no next track.

`MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_SINGLE_REPEAT`
A single track is played repeatedly; the next track is the current track.

`MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_INORDER_ONCE`
The tracks within a group are played once in track order.

`MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_INORDER_REPEAT`
The tracks within a group are played in track order repeatedly.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_OLDEST_ONCE
: The tracks within a group are played once only from the oldest first.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_OLDEST_REPEAT
: The tracks within a group are played from the oldest first repeatedly.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_NEWEST_ONCE
: The tracks within a group are played once only from the newest first.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_NEWEST_REPEAT
: The tracks within a group are played from the newest first repeatedly.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_SHUFFLE_ONCE
: The tracks within a group are played in random order once.

MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_SHUFFLE_REPEAT
: The tracks within a group are played in random order repeatedly.

Media player states

MEDIA_PROXY_STATE_INACTIVE
: The current track is invalid, and no track has been selected.

MEDIA_PROXY_STATE_PLAYING
: The media player is playing the current track.

MEDIA_PROXY_STATE_PAUSED
: The current track is paused.

  The media player has a current track, but it is not being played

MEDIA_PROXY_STATE_SEEKING
: The current track is fast forwarding or fast rewinding.

MEDIA_PROXY_STATE_LAST
: Used internally as the last state value.

Media player command opcodes

MEDIA_PROXY_OP_PLAY
: Start playing the current track.

MEDIA_PROXY_OP_PAUSE
: Pause playing the current track.

MEDIA_PROXY_OP_FAST_REWIND
: Fast rewind the current track.

MEDIA_PROXY_OP_FAST_FORWARD
: Fast forward the current track.

MEDIA_PROXY_OP_STOP
: Stop current activity and return to the paused state and set the current track position to the start of the current track.

MEDIA_PROXY_OP_MOVE_RELATIVE
: Set a new current track position relative to the current track position.

MEDIA_PROXY_OP_PREV_SEGMENT
: Set the current track position to the starting position of the previous segment of the current track.

MEDIA_PROXY_OP_NEXT_SEGMENT
: Set the current track position to the starting position of the next segment of the current track.

MEDIA_PROXY_OP_FIRST_SEGMENT
: Set the current track position to the starting position of the first segment of the current track.

MEDIA_PROXY_OP_LAST_SEGMENT
: Set the current track position to the starting position of the last segment of the current track.

MEDIA_PROXY_OP_GOTO_SEGMENT
: Set the current track position to the starting position of the nth segment of the current track.

MEDIA_PROXY_OP_PREV_TRACK
: Set the current track to the previous track based on the playing order.

MEDIA_PROXY_OP_NEXT_TRACK
: Set the current track to the next track based on the playing order.

MEDIA_PROXY_OP_FIRST_TRACK
: Set the current track to the first track based on the playing order.

MEDIA_PROXY_OP_LAST_TRACK
: Set the current track to the last track based on the playing order.

MEDIA_PROXY_OP_GOTO_TRACK
: Set the current track to the nth track based on the playing order.

MEDIA_PROXY_OP_PREV_GROUP
: Set the current group to the previous group in the sequence of groups.

MEDIA_PROXY_OP_NEXT_GROUP
: Set the current group to the next group in the sequence of groups.

MEDIA_PROXY_OP_FIRST_GROUP
: Set the current group to the first group in the sequence of groups.

MEDIA_PROXY_OP_LAST_GROUP
: Set the current group to the last group in the sequence of groups.

MEDIA_PROXY_OP_GOTO_GROUP
: Set the current group to the nth group in the sequence of groups.

Unnamed Group

MEDIA_PROXY_OP_SUP_PLAY
: Media player supported command opcodes.

  Support the Play opcode

MEDIA_PROXY_OP_SUP_PAUSE
: Support the Pause opcode.

MEDIA_PROXY_OP_SUP_FAST_REWIND
: Support the Fast Rewind opcode.

MEDIA_PROXY_OP_SUP_FAST_FORWARD
: Support the Fast Forward opcode.

MEDIA_PROXY_OP_SUP_STOP
: Support the Stop opcode.

MEDIA_PROXY_OP_SUP_MOVE_RELATIVE
: Support the Move Relative opcode.

MEDIA_PROXY_OP_SUP_PREV_SEGMENT
: Support the Previous Segment opcode.

MEDIA_PROXY_OP_SUP_NEXT_SEGMENT
: Support the Next Segment opcode.

MEDIA_PROXY_OP_SUP_FIRST_SEGMENT
: Support the First Segment opcode.

MEDIA_PROXY_OP_SUP_LAST_SEGMENT
: Support the Last Segment opcode.

MEDIA_PROXY_OP_SUP_GOTO_SEGMENT
: Support the Goto Segment opcode.

MEDIA_PROXY_OP_SUP_PREV_TRACK
: Support the Previous Track opcode.

MEDIA_PROXY_OP_SUP_NEXT_TRACK
: Support the Next Track opcode.

MEDIA_PROXY_OP_SUP_FIRST_TRACK
: Support the First Track opcode.

MEDIA_PROXY_OP_SUP_LAST_TRACK
: Support the Last Track opcode.

MEDIA_PROXY_OP_SUP_GOTO_TRACK
: Support the Goto Track opcode.

MEDIA_PROXY_OP_SUP_PREV_GROUP
: Support the Previous Group opcode.

MEDIA_PROXY_OP_SUP_NEXT_GROUP
: Support the Next Group opcode.

MEDIA_PROXY_OP_SUP_FIRST_GROUP
: Support the First Group opcode.

MEDIA_PROXY_OP_SUP_LAST_GROUP
: Support the Last Group opcode.

MEDIA_PROXY_OP_SUP_GOTO_GROUP
: Support the Goto Group opcode.

Media player command result codes

MEDIA_PROXY_CMD_SUCCESS
: Action requested by the opcode write was completed successfully.

MEDIA_PROXY_CMD_NOT_SUPPORTED
: An invalid or unsupported opcode was used for the Media Control Point write.

MEDIA_PROXY_CMD_PLAYER_INACTIVE
: The Media Player State characteristic value is Inactive when the opcode is received or the result of the requested action of the opcode results in the Media Player State characteristic being set to Inactive.

MEDIA_PROXY_CMD_CANNOT_BE_COMPLETED
: The requested action of any Media Control Point write cannot be completed successfully because of a condition within the player.

Search operation type values

MEDIA_PROXY_SEARCH_TYPE_TRACK_NAME
: Search for Track Name.

MEDIA_PROXY_SEARCH_TYPE_ARTIST_NAME
: Search for Artist Name.

MEDIA_PROXY_SEARCH_TYPE_ALBUM_NAME
: Search for Album Name.

MEDIA_PROXY_SEARCH_TYPE_GROUP_NAME
: Search for Group Name.

MEDIA_PROXY_SEARCH_TYPE_EARLIEST_YEAR
: Search for Earliest Year.

MEDIA_PROXY_SEARCH_TYPE_LATEST_YEAR
: Search for Latest Year.

MEDIA_PROXY_SEARCH_TYPE_GENRE
: Search for Genre.

MEDIA_PROXY_SEARCH_TYPE_ONLY_TRACKS
: Search for Tracks only.

MEDIA_PROXY_SEARCH_TYPE_ONLY_GROUPS
: Search for Groups only.

Search notification result codes

MEDIA_PROXY_SEARCH_SUCCESS
: Search request was accepted; search has started.

MEDIA_PROXY_SEARCH_FAILURE
: Search request was invalid; no search started.

Group object object types

MEDIA_PROXY_GROUP_OBJECT_TRACK_TYPE
: Group object type is track.

MEDIA_PROXY_GROUP_OBJECT_GROUP_TYPE
: Group object type is group.

Defines

MEDIA_PROXY_OPCODES_SUPPORTED_LEN

Media player supported opcodes length.

Functions

int **media_proxy_ctrl_register**(struct *media_proxy_ctrl_cbs* *ctrl_cbs)

Register a controller with the media_proxy.

Parameters

- **ctrl_cbs** – Callbacks to the controller

Returns

0 if success, errno on failure

int **media_proxy_ctrl_discover_player**(struct bt_conn *conn)

Discover a remote media player.

Discover a remote media player instance. The remote player instance will be discovered, and accessed, using Bluetooth, via the media control client and a remote media control service. This call will start a GATT discovery of the Media Control Service on the peer, and setup handles and subscriptions.

This shall be called once before any other actions can be executed for the remote player. The remote player instance will be returned in the discover_player() callback.

Parameters

- **conn** – The connection to do discovery for

Returns

0 if success, errno on failure

int **media_proxy_ctrl_get_player_name**(struct media_player *player)

Read Media Player Name.

Parameters

- **player** – Media player instance pointer

Returns

0 if success, errno on failure.

int **media_proxy_ctrl_get_icon_id**(struct media_player *player)

Read Icon Object ID.

Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.

Requires Object Transfer Service

Parameters

- **player** – Media player instance pointer

Returns

0 if success, errno on failure.

int `media_proxy_ctrl_get_icon_url`(struct media_player *player)

Read Icon URL.

Get a URL to the media player's icon.

Parameters

- `player` – Media player instance pointer

int `media_proxy_ctrl_get_track_title`(struct media_player *player)

Read Track Title.

Parameters

- `player` – Media player instance pointer

Returns

0 if success, errno on failure.

int `media_proxy_ctrl_get_track_duration`(struct media_player *player)

Read Track Duration.

The duration of a track is measured in hundredths of a second.

Parameters

- `player` – Media player instance pointer

Returns

0 if success, errno on failure.

int `media_proxy_ctrl_get_track_position`(struct media_player *player)

Read Track Position.

The position of the player (the playing position) is measured in hundredths of a second from the beginning of the track

Parameters

- `player` – Media player instance pointer

Returns

0 if success, errno on failure.

int `media_proxy_ctrl_set_track_position`(struct media_player *player, int32_t position)

Set Track Position.

Set the playing position of the media player in the current track. The position is given in hundredths of a second, from the beginning of the track of the track for positive values, and (backwards) from the end of the track for negative values.

Parameters

- `player` – Media player instance pointer
- `position` – The track position to set

Returns

0 if success, errno on failure.

int `media_proxy_ctrl_get_playback_speed`(struct media_player *player)

Get Playback Speed.

The playback speed parameter is related to the actual playback speed as follows: actual playback speed = 2^(speed_parameter/64)

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at "normal" speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_set_playback_speed`(struct media_player *player, int8_t speed)

Set Playback Speed.

See the get_playback_speed() function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Parameters

- `player` – Media player instance pointer
- `speed` – The playback speed parameter to set

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_seeking_speed`(struct media_player *player)

Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of “fast rewind” of “fast forward” commands.

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_track_segments_id`(struct media_player *player)

Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_current_track_id`(struct media_player *player)

Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_set_current_track_id`(struct media_player *player, uint64_t id)

Set Current Track Object ID.

Change the player's current track to the track given by the ID. (Behaves similarly to the goto track command.)

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer
- `id` – The ID of a track object

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_next_track_id`(struct media_player *player)

Read Next Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_set_next_track_id`(struct media_player *player, uint64_t id)

Set Next Track Object ID.

Change the player's next track to the track given by the ID.

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer
- `id` – The ID of a track object

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_parent_group_id`(struct media_player *player)

Read Parent Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service

The parent group is the parent of the current group.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_current_group_id`(struct media_player *player)

Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_set_current_group_id`(struct media_player *player, uint64_t id)

Set Current Group Object ID.

Change the player's current group to the group given by the ID, and the current track to the first track in that group.

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer
- `id` – The ID of a group object

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_playing_order`(struct media_player *player)

Read Playing Order.

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_set_playing_order`(struct media_player *player, uint8_t order)

Set Playing Order.

Set the media player's playing order

Parameters

- `player` – Media player instance pointer
- `order` – The playing order to set

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_playing_orders_supported`(struct media_player *player)

Read Playing Orders Supported.

Read a bitmap containing the media player's supported playing orders.

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_media_state`(struct media_player *player)

Read Media State.

Read the media player's state

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_send_command`(struct media_player *player, const struct *mpl_cmd* *command)

Send Command.

Send a command to the media player. Commands may cause the media player to change its state May result in two callbacks - one for the actual sending of the command to the player, one for the result of the command from the player.

Parameters

- `player` – Media player instance pointer
- `command` – The command to send

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_get_commands_supported`(struct media_player *player)

Read Commands Supported.

Read a bitmap containing the media player's supported command opcodes.

Parameters

- `player` – Media player instance pointer

Returns
0 if success, errno on failure.

int `media_proxy_ctrl_send_search`(struct media_player *player, const struct *mpl_search* *search)

Set Search.

Write a search to the media player. If the search is successful, the search results will be available as a group object in the Object Transfer Service (OTS).

May result in up to three callbacks

- one for the actual sending of the search to the player
- one for the result code for the search from the player
- if the search is successful, one for the search results object ID in the OTs

Requires Object Transfer Service

Parameters

- `player` – Media player instance pointer
- `search` – The search to write

Returns
0 if success, errno on failure.

int **media_proxy_ctrl_get_search_results_id**(struct media_player *player)

Read Search Results Object ID.

Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service

The search results object is a group object. The search results object only exists if a successful search operation has been done.

Requires Object Transfer Service

Parameters

- **player** – Media player instance pointer

Returns
0 if success, errno on failure.

uint8_t **media_proxy_ctrl_get_content_ctrl_id**(struct media_player *player)

Read Content Control ID.

The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

Parameters

- **player** – Media player instance pointer

Returns
0 if success, errno on failure.

int **media_proxy_pl_register**(struct *media_proxy_pl_calls* *pl_calls)

Register a player with the media proxy.

Register a player with the media proxy module, for use by media controllers.

The media proxy may call any non-NULL function pointers in the supplied *media_proxy_pl_calls* structure.

Parameters

- **pl_calls** – Function pointers to the media player's calls

Returns
0 if success, errno on failure

int **media_proxy_pl_init**(void)

Initialize player.

TODO: Move to player header file

struct bt_ots ***bt_mcs_get_ots**(void)

Get the pointer of the Object Transfer Service used by the Media Control Service.

TODO: Find best location for this call, and move this one also

void **media_proxy_pl_name_cb**(const char *name)

Player name changed callback.

To be called when the player's name is changed.

Parameters

- **name** – The name of the player

void media_proxy_pl_icon_url_cb(const char *url)

Player icon URL changed callback.

To be called when the player's icon URL is changed.

Parameters

- url – The URL of the player's icon

void media_proxy_pl_track_changed_cb(void)

Track changed callback.

To be called when the player's current track is changed

void media_proxy_pl_track_title_cb(char *title)

Track title callback.

To be called when the player's current track is changed

Parameters

- title – The title of the track

void media_proxy_pl_track_duration_cb(int32_t duration)

Track duration callback.

To be called when the current track's duration is changed (e.g. due to a track change)

The track duration is given in hundredths of a second.

Parameters

- duration – The track duration

void media_proxy_pl_track_position_cb(int32_t position)

Track position callback.

To be called when the media player's position in the track is changed, or when the player is paused or similar.

Exception: This callback should not be called when the position changes during regular playback, i.e. while the player is playing and playback happens at a constant speed.

The track position is given in hundredths of a second from the start of the track.

Parameters

- position – The media player's position in the track

void media_proxy_pl_playback_speed_cb(int8_t speed)

Playback speed callback.

To be called when the playback speed is changed.

Parameters

- speed – The playback speed parameter

void media_proxy_pl_seeking_speed_cb(int8_t speed)

Seeking speed callback.

To be called when the seeking speed is changed.

Parameters

- speed – The seeking speed factor

void media_proxy_pl_current_track_id_cb(uint64_t id)
Current track object ID callback.

To be called when the ID of the current track is changed (e.g. due to a track change).

Parameters

- id – The ID of the current track object in the OTS

void media_proxy_pl_next_track_id_cb(uint64_t id)
Next track object ID callback.

To be called when the ID of the current track is changes

Parameters

- id – The ID of the next track object in the OTS

void media_proxy_pl_parent_group_id_cb(uint64_t id)
Parent group object ID callback.

To be called when the ID of the parent group is changed

Parameters

- id – The ID of the parent group object in the OTS

void media_proxy_pl_current_group_id_cb(uint64_t id)
Current group object ID callback.

To be called when the ID of the current group is changed

Parameters

- id – The ID of the current group object in the OTS

void media_proxy_pl_playing_order_cb(uint8_t order)
Playing order callback.

To be called when the playing order is changed

Parameters

- order – The playing order

void media_proxy_pl_media_state_cb(uint8_t state)
Media state callback.

To be called when the media state is changed

Parameters

- state – The media player's state

void media_proxy_pl_command_cb(const struct *mpl_cmd_ntf* *cmd_ntf)
Command callback.

To be called when a command has been sent, to notify whether the command was successfully performed or not. See the MEDIA_PROXY_CMD_* result code defines.

Parameters

- cmd_ntf – The result of the command

void media_proxy_pl_commands_supported_cb(uint32_t opcodes)
Commands supported callback.

To be called when the set of commands supported is changed

Parameters

- opcodes – The supported commands opcodes

void **media_proxy_pl_search_cb**(uint8_t result_code)

Search callback.

To be called when a search has been set to notify whether the search was successfully performed or not. See the MEDIA_PROXY_SEARCH_* result code defines.

The actual results of the search, if successful, can be found in the search results object.

Parameters

- **result_code** – The result (success or failure) of the search

void **media_proxy_pl_search_results_id_cb**(uint64_t id)

Search Results object ID callback.

To be called when the ID of the search results is changed (typically as the result of a new successful search).

Parameters

- **id** – The ID of the search results object in the OTS

struct **mpl_cmd**

#include <media_proxy.h> Media player command.

Public Members

uint8_t **opcode**

The opcode.

See the MEDIA_PROXY_OP_* values

bool **use_param**

Whether or not the *mpl_cmd::param* is used.

int32_t **param**

A 32-bit signed parameter.

The parameter value depends on the *mpl_cmd::opcode*

struct **mpl_cmd_ntf**

#include <media_proxy.h> Media command notification.

Public Members

uint8_t **requested_opcode**

The opcode that was sent.

uint8_t **result_code**

The result of the operation

struct **mpl_sci**

#include <media_proxy.h> Search control item.

Public Members

uint8_t **len**

Length of type and parameter.

uint8_t **type**

MEDIA_PROXY_SEARCH_TYPE_<...>

char **param**[62]

Search parameter.

struct **mpl_search**

#include <*media_proxy.h*> Search.

Public Members

uint8_t **len**

The length of the *mpl_search::search* value.

char **search**[64]

Concatenated search control items - (type, length, param)

struct **media_proxy_ctrl_cbs**

#include <*media_proxy.h*> Callbacks to a controller, from the media proxy.

Given by a controller when registering

Public Members

void (***local_player_instance**)(struct media_player *player, int err)

Media Player Instance callback.

Called when the local Media Player instance is registered or read (TODO). Also called if the local player instance is already registered when the controller is registered. Provides the controller with the pointer to the local player instance.

Param player
Media player instance pointer

Param err
Error value. 0 on success, or errno on negative value.

void (***player_name_recv**)(struct media_player *player, int err, const char *name)

Media Player Name receive callback.

Called when the Media Player Name is read or changed See also media_proxy_ctrl_name_get()

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param name
The name of the media player

void (*`icon_id_recv`)(struct media_player *player, int err, uint64_t id)

Media Player Icon Object ID receive callback.

Called when the Media Player Icon Object ID is read See also *media_proxy_ctrl_get_icon_id()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID of the Icon object in the Object Transfer Service (48 bits)

void (*`icon_url_recv`)(struct media_player *player, int err, const char *url)

Media Player Icon URL receive callback.

Called when the Media Player Icon URL is read See also *media_proxy_ctrl_get_icon_url()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param url
The URL of the icon

void (*`track_changed_recv`)(struct media_player *player, int err)

Track changed receive callback.

Called when the Current Track is changed

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*`track_title_recv`)(struct media_player *player, int err, const char *title)

Track Title receive callback.

Called when the Track Title is read or changed See also *media_proxy_ctrl_get_track_title()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param title
The title of the current track

void (*`track_duration_recv`)(struct media_player *player, int err, int32_t duration)

Track Duration receive callback.

Called when the Track Duration is read or changed See also *media_proxy_ctrl_get_track_duration()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param duration
The duration of the current track

void (*`track_position_recv`)(struct media_player *player, int err, int32_t position)

Track Position receive callback.

Called when the Track Position is read or changed See also *media_proxy_ctrl_get_track_position()* and *media_proxy_ctrl_set_track_position()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param position
The player's position in the track

void (*`track_position_write`)(struct media_player *player, int err, int32_t position)

Track Position write callback.

Called when the Track Position is written See also *media_proxy_ctrl_set_track_position()*.
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param position
The position given attempted to write

void (*`playback_speed_recv`)(struct media_player *player, int err, int8_t speed)

Playback Speed receive callback.

Called when the Playback Speed is read or changed See also *media_proxy_ctrl_get_playback_speed()* and *media_proxy_ctrl_set_playback_speed()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param speed
The playback speed parameter

void (*`playback_speed_write`)(struct media_player *player, int err, int8_t speed)

Playback Speed write callback.

Called when the Playback Speed is written See also *media_proxy_ctrl_set_playback_speed()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param speed
The playback speed parameter attempted to write

void (*`seeking_speed_recv`)(struct media_player *player, int err, int8_t speed)

Seeking Speed receive callback.

Called when the Seeking Speed is read or changed See also *media_proxy_ctrl_get_seeking_speed()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param speed
The seeking speed factor

void (*`track_segments_id_recv`)(struct media_player *player, int err, uint64_t id)

Track Segments Object ID receive callback.

Called when the Track Segments Object ID is read See also *media_proxy_ctrl_get_track_segments_id()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID of the track segments object in Object Transfer Service (48 bits)

void (*`current_track_id_recv`)(struct media_player *player, int err, uint64_t id)

Current Track Object ID receive callback.

Called when the Current Track Object ID is read or changed See also *media_proxy_ctrl_get_current_track_id()* and *media_proxy_ctrl_set_current_track_id()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID of the current track object in Object Transfer Service (48 bits)

void (*`current_track_id_write`)(struct media_player *player, int err, uint64_t id)

Current Track Object ID write callback.

Called when the Current Track Object ID is written See also *media_proxy_ctrl_set_current_track_id()*

Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID (48 bits) attempted to write

void (*`next_track_id_recv`)(struct media_player *player, int err, uint64_t id)

Next Track Object ID receive callback.

Called when the Next Track Object ID is read or changed See also *media_proxy_ctrl_get_next_track_id()* and *media_proxy_ctrl_set_next_track_id()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID of the next track object in Object Transfer Service (48 bits)

void (*`next_track_id_write`)(struct media_player *player, int err, uint64_t id)

Next Track Object ID write callback.

Called when the Next Track Object ID is written See also *media_proxy_ctrl_set_next_track_id()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID (48 bits) attempted to write

void (*`parent_group_id_recv`)(struct media_player *player, int err, uint64_t id)

Parent Group Object ID receive callback.

Called when the Parent Group Object ID is read or changed See also *media_proxy_ctrl_get_parent_group_id()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID of the parent group object in Object Transfer Service (48 bits)

void (*`current_group_id_recv`)(struct media_player *player, int err, uint64_t id)

Current Group Object ID receive callback.

Called when the Current Group Object ID is read or changed See also *media_proxy_ctrl_get_current_group_id()* and *media_proxy_ctrl_set_current_group_id()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID of the current group object in Object Transfer Service (48 bits)

void (*`current_group_id_write`)(struct media_player *player, int err, uint64_t id)

Current Group Object ID write callback.

Called when the Current Group Object ID is written See also *media_proxy_ctrl_set_current_group_id()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param id
The ID (48 bits) attempted to write

void (*`playing_order_recv`)(struct media_player *player, int err, uint8_t order)

Playing Order receive callback.

Called when the Playing Order is read or changed See also *media_proxy_ctrl_get_playing_order()* and *media_proxy_ctrl_set_playing_order()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param order
The playing order

void (*`playing_order_write`)(struct media_player *player, int err, uint8_t order)

Playing Order write callback.

Called when the Playing Order is written See also *media_proxy_ctrl_set_playing_order()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param order
The playing order attempted to write

void (*`playing_orders_supported_recv`)(struct media_player *player, int err, uint16_t orders)

Playing Orders Supported receive callback.

Called when the Playing Orders Supported is read See also *media_proxy_ctrl_get_playing_orders_supported()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param orders
The playing orders supported

void (*`media_state_recv`)(struct media_player *player, int err, uint8_t state)

Media State receive callback.

Called when the Media State is read or changed See also *media_proxy_ctrl_get_media_state()* and *media_proxy_ctrl_send_command()*
Param player
Media player instance pointer
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param state
The media player state

void (*command_send)(struct media_player *player, int err, const struct *mpl_cmd* *cmd)

Command send callback.

Called when a command has been sent See also *media_proxy_ctrl_send_command()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param cmd
The command sent

void (*command_recv)(struct media_player *player, int err, const struct *mpl_cmd_ntf* *result)

Command result receive callback.

Called when a command result has been received See also *media_proxy_ctrl_send_command()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param result
The result received

void (*commands_supported_recv)(struct media_player *player, int err, uint32_t opcodes)

Commands supported receive callback.

Called when the Commands Supported is read or changed See also *media_proxy_ctrl_get_commands_supported()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param opcodes
The supported command opcodes (bitmap)

void (*search_send)(struct media_player *player, int err, const struct *mpl_search* *search)

Search send callback.

Called when a search has been sent See also *media_proxy_ctrl_send_search()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param search
The search sent

void (*search_recv)(struct media_player *player, int err, uint8_t result_code)

Search result code receive callback.

Called when a search result code has been received See also *media_proxy_ctrl_send_search()*

The search result code tells whether the search was successful or not. For a successful search, the actual results of the search (i.e. what was found as a result of the search)can be accessed using the Search Results Object ID. The Search Results Object ID has a separate callback - *search_results_id_recv()*.

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param result_code
Search result code

void (*`search_results_id_recv`)(struct media_player *player, int err, uint64_t id)

Search Results Object ID receive callback See also *media_proxy_ctrl_get_search_results_id()*

Called when the Search Results Object ID is read or changed

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param id
The ID of the search results object in Object Transfer Service (48 bits)

void (*`content_ctrl_id_recv`)(struct media_player *player, int err, uint8_t ccid)

Content Control ID receive callback.

Called when the Content Control ID is read See also *media_proxy_ctrl_get_content_ctrl_id()*

Param player
Media player instance pointer

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param ccid
The content control ID

struct `media_proxy_pl_calls`

#include <media_proxy.h> Available calls in a player, that the media proxy can call.

Given by a player when registering.

Public Members

const char *(*`get_player_name`)(void)

Read Media Player Name.

Return
The name of the media player

uint64_t (*`get_icon_id`)(void)

Read Icon Object ID.

Get an ID (48 bit) that can be used to retrieve the Icon Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.2 and 4.1 for a description of the Icon Object.

Return
The Icon Object ID

const char *(***get_icon_url**)(void)

Read Icon URL.

Get a URL to the media player's icon.

Return
The URL of the Icon

const char *(***get_track_title**)(void)

Read Track Title.

Return
The title of the current track

int32_t (***get_track_duration**)(void)

Read Track Duration.

The duration of a track is measured in hundredths of a second.

Return
The duration of the current track

int32_t (***get_track_position**)(void)

Read Track Position.

The position of the player (the playing position) is measured in hundredths of a second from the beginning of the track

Return
The position of the player in the current track

void (***set_track_position**)(int32_t position)

Set Track Position.

Set the playing position of the media player in the current track. The position is given in hundredths of a second, from the beginning of the track of the track for positive values, and (backwards) from the end of the track for negative values.

Param position
The player position to set

int8_t (***get_playback_speed**)(void)

Get Playback Speed.

The playback speed parameter is related to the actual playback speed as follows: actual playback speed = 2^(speed_parameter/64)

A speed parameter of 0 corresponds to unity speed playback (i.e. playback at "normal" speed). A speed parameter of -128 corresponds to playback at one fourth of normal speed, 127 corresponds to playback at almost four times the normal speed.

Return
The playback speed parameter

void (***set_playback_speed**)(int8_t speed)

Set Playback Speed.

See the *get_playback_speed()* function for an explanation of the playback speed parameter.

Note that the media player may not support all possible values of the playback speed parameter. If the value given is not supported, and is higher than the current value, the player should set the playback speed to the next higher supported value. (And correspondingly to the next lower supported value for given values lower than the current value.)

Param speed
The playback speed parameter to set

int8_t (*`get_seeking_speed`)(void)

Get Seeking Speed.

The seeking speed gives the speed with which the player is seeking. It is a factor, relative to real-time playback speed - a factor four means seeking happens at four times the real-time playback speed. Positive values are for forward seeking, negative values for backwards seeking.

The seeking speed is not settable - a non-zero seeking speed is the result of "fast rewind" of "fast forward" commands.

Return
The seeking speed factor

uint64_t (*`get_track_segments_id`)(void)

Read Current Track Segments Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Segments Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.10 and 4.2 for a description of the Track Segments Object.

Return
Current The Track Segments Object ID

uint64_t (*`get_current_track_id`)(void)

Read Current Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.11 and 4.3 for a description of the Current Track Object.

Return
The Current Track Object ID

void (*`set_current_track_id`)(uint64_t id)

Set Current Track Object ID.

Change the player's current track to the track given by the ID. (Behaves similarly to the goto track command.)

Param id
The ID of a track object

uint64_t (*`get_next_track_id`)(void)

Read Next Track Object ID.

Get an ID (48 bit) that can be used to retrieve the Next Track Object from an Object Transfer Service

Return
The Next Track Object ID

void (*set_next_track_id)(uint64_t id)

Set Next Track Object ID.

Change the player's next track to the track given by the ID.

Param id
The ID of a track object

uint64_t (*get_parent_group_id)(void)

Read Parent Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Parent Track Object from an Object Transfer Service

The parent group is the parent of the current group.

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Track Object.

Return
The Current Group Object ID

uint64_t (*get_current_group_id)(void)

Read Current Group Object ID.

Get an ID (48 bit) that can be used to retrieve the Current Track Object from an Object Transfer Service

See the Media Control Service spec v1.0 sections 3.14 and 4.4 for a description of the Current Group Object.

Return
The Current Group Object ID

void (*set_current_group_id)(uint64_t id)

Set Current Group Object ID.

Change the player's current group to the group given by the ID, and the current track to the first track in that group.

Param id
The ID of a group object

uint8_t (*get_playing_order)(void)

Read Playing Order.

return The media player's current playing order

void (*set_playing_order)(uint8_t order)

Set Playing Order.

Set the media player's playing order. See the MEDIA_PROXY_PLAYING_ORDER_* defines.

Param order
The playing order to set

uint16_t (*get_playing_orders_supported)(void)

Read Playing Orders Supported.

Read a bitmap containing the media player's supported playing orders. See the MEDIA_PROXY_PLAYING_ORDERS_SUPPORTED_* defines.

Return
The media player's supported playing orders

uint8_t (*get_media_state)(void)

Read Media State.

Read the media player's state See the MEDIA_PROXY_MEDIA_STATE_* defines.

Return
The media player's state

void (*send_command)(const struct *mpl_cmd* *command)

Send Command.

Send a command to the media player. For command opcodes (play, pause, ...) - see the MEDIA_PROXY_OP_* defines.

Param command
The command to send

uint32_t (*get_commands_supported)(void)

Read Commands Supported.

Read a bitmap containing the media player's supported command opcodes. See the MEDIA_PROXY_OP_SUP_* defines.

Return
The media player's supported command opcodes

void (*send_search)(const struct *mpl_search* *search)

Set Search.

Write a search to the media player. (For the formatting of a search, see the Media Control Service spec and the mcs.h file.)

Param search
The search to write

uint64_t (*get_search_results_id)(void)

Read Search Results Object ID.

Get an ID (48 bit) that can be used to retrieve the Search Results Object from an Object Transfer Service

The search results object is a group object. The search results object only exists if a successful search operation has been done.

Return
The Search Results Object ID

uint8_t (*get_content_ctrl_id)(void)

Read Content Control ID.

The content control ID identifies a content control service on a device, and links it to the corresponding audio stream.

Return
The content control ID for the media player

Media Control Client

group bt_gatt_mcc

Bluetooth Media Control Client (MCC) interface.

Updated to the Media Control Profile specification revision 1.0

Since
3.0

Version
0.8.0

Typedefs

typedef void (*`bt_mcc_discover_mcs_cb`)(struct bt_conn *conn, int err)

Callback function for *bt_mcc_discover_mcs()*

Called when a media control server is discovered

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

typedef void (*`bt_mcc_read_player_name_cb`)(struct bt_conn *conn, int err, const char *name)

Callback function for *bt_mcc_read_player_name()*

Called when the player name is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param name
Player name

typedef void (*`bt_mcc_read_icon_obj_id_cb`)(struct bt_conn *conn, int err, uint64_t icon_id)

Callback function for *bt_mcc_read_icon_obj_id()*

Called when the icon object ID is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param icon_id
The ID of the Icon Object. This is a UINT48 in a uint64_t

typedef void (*`bt_mcc_read_icon_url_cb`)(struct bt_conn *conn, int err, const char *icon_url)

Callback function for *bt_mcc_read_icon_url()*

Called when the icon URL is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param icon_url
The URL of the Icon

typedef void (*bt_mcc_track_changed_ntf_cb)(struct bt_conn *conn, int err)

Callback function for track changed notifications.

Called when a track change is notified.

The track changed characteristic is a special case. It can not be read or set, it can only be notified.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

typedef void (*bt_mcc_read_track_title_cb)(struct bt_conn *conn, int err, const char *title)

Callback function for *bt_mcc_read_track_title()*

Called when the track title is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param title
The title of the track

typedef void (*bt_mcc_read_track_duration_cb)(struct bt_conn *conn, int err, int32_t dur)

Callback function for *bt_mcc_read_track_duration()*

Called when the track duration is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param dur
The duration of the track

typedef void (*bt_mcc_read_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)

Callback function for *bt_mcc_read_track_position()*

Called when the track position is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param pos
The Track Position

typedef void (*bt_mcc_set_track_position_cb)(struct bt_conn *conn, int err, int32_t pos)

Callback function for *bt_mcc_set_track_position()*

Called when the track position is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param pos
The Track Position set (or attempted to set)

typedef void (*`bt_mcc_read_playback_speed_cb`)(struct bt_conn *conn, int err, int8_t speed)

Callback function for *bt_mcc_read_playback_speed()*

Called when the playback speed is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param speed
The Playback Speed

typedef void (*`bt_mcc_set_playback_speed_cb`)(struct bt_conn *conn, int err, int8_t speed)

Callback function for *bt_mcc_set_playback_speed()*

Called when the playback speed is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param speed
The Playback Speed set (or attempted to set)

typedef void (*`bt_mcc_read_seeking_speed_cb`)(struct bt_conn *conn, int err, int8_t speed)

Callback function for *bt_mcc_read_seeking_speed()*

Called when the seeking speed is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param speed
The Seeking Speed

typedef void (*`bt_mcc_read_segments_obj_id_cb`)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_segments_obj_id()*

Called when the track segments object ID is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Track Segments Object ID (UINT48)

typedef void (*bt_mcc_read_current_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_current_track_obj_id()*

Called when the current track object ID is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Current Track Object ID (UINT48)

typedef void (*bt_mcc_set_current_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_set_current_track_obj_id()*

Called when the current track object ID is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Object ID (UINT48) set (or attempted to set)

typedef void (*bt_mcc_read_next_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for bt_mcc_read_next_track_obj_id_obj()

Called when the next track object ID is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Next Track Object ID (UINT48)

typedef void (*bt_mcc_set_next_track_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_set_next_track_obj_id()*

Called when the next track object ID is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Object ID (UINT48) set (or attempted to set)

typedef void (*bt_mcc_read_parent_group_obj_id_cb)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_parent_group_obj_id()*

Called when the parent group object ID is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Parent Group Object ID (UINT48)

typedef void (*`bt_mcc_read_current_group_obj_id_cb`)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_current_group_obj_id()*

Called when the current group object ID is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Current Group Object ID (UINT48)

typedef void (*`bt_mcc_set_current_group_obj_id_cb`)(struct bt_conn *conn, int err, uint64_t obj_id)

Callback function for *bt_mcc_set_current_group_obj_id()*

Called when the current group object ID is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param obj_id
The Object ID (UINT48) set (or attempted to set)

typedef void (*`bt_mcc_read_playing_order_cb`)(struct bt_conn *conn, int err, uint8_t order)

Callback function for *bt_mcc_read_playing_order()*

Called when the playing order is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param order
The playback order

typedef void (*`bt_mcc_set_playing_order_cb`)(struct bt_conn *conn, int err, uint8_t order)

Callback function for *bt_mcc_set_playing_order()*

Called when the playing order is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param order
The Playing Order set (or attempted to set)

typedef void (*`bt_mcc_read_playing_orders_supported_cb`)(struct bt_conn *conn, int err, uint16_t orders)

Callback function for *bt_mcc_read_playing_orders_supported()*

Called when the supported playing orders are read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param orders
The playing orders supported (bitmap)

typedef void (*`bt_mcc_read_media_state_cb`)(struct bt_conn *conn, int err, uint8_t state)

Callback function for *bt_mcc_read_media_state()*

Called when the media state is read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param state
The Media State

typedef void (*`bt_mcc_send_cmd_cb`)(struct bt_conn *conn, int err, const struct *mpl_cmd* *cmd)

Callback function for *bt_mcc_send_cmd()*

Called when a command is sent, i.e. when the media control point is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param cmd
The command sent

typedef void (*`bt_mcc_cmd_ntf_cb`)(struct bt_conn *conn, int err, const struct *mpl_cmd_ntf* *ntf)

Callback function for command notifications.

Called when the media control point is notified

Notifications for commands (i.e. for writes to the media control point) use a different parameter structure than what is used for sending commands (writing to the media control point)

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ntf
The command notification

typedef void (*`bt_mcc_read_opcodes_supported_cb`)(struct bt_conn *conn, int err, uint32_t opcodes)

Callback function for *bt_mcc_read_opcodes_supported()*

Called when the supported opcodes (commands) are read or notified

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param opcodes
The supported opcodes

typedef void (*`bt_mcc_send_search_cb`)(struct bt_conn *conn, int err, const struct *mpl_search* *search)

Callback function for *bt_mcc_send_search()*

Called when a search is sent, i.e. when the search control point is set

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param search
The search set (or attempted to set)

typedef void (*`bt_mcc_search_ntf_cb`)(struct bt_conn *conn, int err, uint8_t result_code)

Callback function for search notifications.

Called when the search control point is notified

Notifications for searches (i.e. for writes to the search control point) use a different parameter structure than what is used for sending searches (writing to the search control point)

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param result_code
The search notification

typedef void (*`bt_mcc_read_search_results_obj_id_cb`)(struct bt_conn *conn, int err, uint64_t id)

Callback function for *bt_mcc_read_search_results_obj_id()*

Called when the search results object ID is read or notified

Note that the Search Results Object ID value may be zero, in case the characteristic does not exist on the server. (This will be the case if there has not been a successful search.)

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param id
The Search Results Object ID (UINT48)

typedef void (*`bt_mcc_read_content_control_id_cb`)(struct bt_conn *conn, int err, uint8_t ccid)

Callback function for *bt_mcc_read_content_control_id()*

Called when the content control ID is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param ccid
The Content Control ID

typedef void (*`bt_mcc_otc_obj_selected_cb`)(struct bt_conn *conn, int err)

Callback function for object selected.

Called when an object is selected

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

typedef void (*`bt_mcc_otc_obj_metadata_cb`)(struct bt_conn *conn, int err)

Callback function for *bt_mcc_otc_read_object_metadata()*

Called when object metadata is read

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

typedef void (*`bt_mcc_otc_read_icon_object_cb`)(struct bt_conn *conn, int err, struct *net_buf_simple* *buf)

Callback function for *bt_mcc_otc_read_icon_object()*

Called when the icon object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_track_segments_object_cb)(struct bt_conn *conn, int err, struct *net_buf_simple* *buf)

Callback function for *bt_mcc_otc_read_track_segments_object()*

Called when the track segments object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_current_track_object_cb)(struct bt_conn *conn, int err, struct *net_buf_simple* *buf)

Callback function for *bt_mcc_otc_read_current_track_object()*

Called when the current track object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_next_track_object_cb)(struct bt_conn *conn, int err, struct *net_buf_simple* *buf)

Callback function for *bt_mcc_otc_read_next_track_object()*

Called when the next track object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*bt_mcc_otc_read_parent_group_object_cb)(struct bt_conn *conn, int err, struct *net_buf_simple* *buf)

Callback function for *bt_mcc_otc_read_parent_group_object()*

Called when the parent group object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

typedef void (*`bt_mcc_otc_read_current_group_object_cb`)(struct bt_conn *conn, int err, struct *net_buf_simple* *buf)

Callback function for *bt_mcc_otc_read_current_group_object()*

Called when the current group object is read

If err is EMSGSIZE, the object contents have been truncated.

Param conn
The connection that was used to initialise the media control client

Param err
Error value. 0 on success, GATT error or errno on fail

Param buf
Buffer containing the object contents

Functions

int `bt_mcc_init`(struct *bt_mcc_cb* *cb)

Initialize Media Control Client.

Parameters

- `cb` – Callbacks to be used

Returns
0 if success, errno on failure.

int `bt_mcc_discover_mcs`(struct bt_conn *conn, bool subscribe)

Discover Media Control Service.

Discover Media Control Service (MCS) on the server given by the connection Optionally subscribe to notifications.

Shall be called once, after media control client initialization and before using other media control client functionality.

Parameters

- `conn` – Connection to the peer device
- `subscribe` – Whether to subscribe to notifications

Returns
0 if success, errno on failure.

int `bt_mcc_read_player_name`(struct bt_conn *conn)

Read Media Player Name.

Parameters

- `conn` – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_icon_obj_id(struct bt_conn *conn)
Read Icon Object ID.

Parameters

- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_icon_url(struct bt_conn *conn)
Read Icon Object URL.

Parameters

- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_title(struct bt_conn *conn)
Read Track Title.

Parameters

- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_duration(struct bt_conn *conn)
Read Track Duration.

Parameters

- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_read_track_position(struct bt_conn *conn)
Read Track Position.

Parameters

- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int bt_mcc_set_track_position(struct bt_conn *conn, int32_t pos)
Set Track position.

Parameters

- conn – Connection to the peer device
- pos – Track position

Returns
0 if success, errno on failure.

int bt_mcc_read_playback_speed(struct bt_conn *conn)
Read Playback speed.

Parameters

- conn – Connection to the peer device

Returns
0 if success, errno on failure.

int **bt_mcc_set_playback_speed**(struct bt_conn *conn, int8_t speed)

Set Playback Speed.

Parameters

- **conn** – Connection to the peer device
- **speed** – Playback speed

Returns

0 if success, errno on failure.

int **bt_mcc_read_seeking_speed**(struct bt_conn *conn)

Read Seeking speed.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_read_segments_obj_id**(struct bt_conn *conn)

Read Track Segments Object ID.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_read_current_track_obj_id**(struct bt_conn *conn)

Read Current Track Object ID.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_set_current_track_obj_id**(struct bt_conn *conn, uint64_t id)

Set Current Track Object ID.

Set the Current Track to the track given by the `id` parameter

Parameters

- **conn** – Connection to the peer device
- **id** – Object Transfer Service ID (UINT48) of the track to set as the current track

Returns

0 if success, errno on failure.

int **bt_mcc_read_next_track_obj_id**(struct bt_conn *conn)

Read Next Track Object ID.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_set_next_track_obj_id**(struct bt_conn *conn, uint64_t id)

Set Next Track Object ID.

Set the Next Track to the track given by the `id` parameter

Parameters

- **conn** – Connection to the peer device
- **id** – Object Transfer Service ID (UINT48) of the track to set as the next track

Returns

0 if success, errno on failure.

int **bt_mcc_read_current_group_obj_id**(struct bt_conn *conn)

Read Current Group Object ID.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_set_current_group_obj_id**(struct bt_conn *conn, uint64_t id)

Set Current Group Object ID.

Set the Current Group to the group given by the `id` parameter

Parameters

- **conn** – Connection to the peer device
- **id** – Object Transfer Service ID (UINT48) of the group to set as the current group

Returns

0 if success, errno on failure.

int **bt_mcc_read_parent_group_obj_id**(struct bt_conn *conn)

Read Parent Group Object ID.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_read_playing_order**(struct bt_conn *conn)

Read Playing Order.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_set_playing_order**(struct bt_conn *conn, uint8_t order)

Set Playing Order.

Parameters

- **conn** – Connection to the peer device
- **order** – Playing order

Returns

0 if success, errno on failure.

int **bt_mcc_read_playing_orders_supported**(struct bt_conn *conn)

Read Playing Orders Supported.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_read_media_state**(struct bt_conn *conn)

Read Media State.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_send_cmd**(struct bt_conn *conn, const struct *mpl_cmd* *cmd)

Send a command.

Write a command (e.g. “play”, “pause”) to the server’s media control point.

Parameters

- **conn** – Connection to the peer device
- **cmd** – The command to send

Returns

0 if success, errno on failure.

int **bt_mcc_read_opcodes_supported**(struct bt_conn *conn)

Read Opcodes Supported.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_send_search**(struct bt_conn *conn, const struct *mpl_search* *search)

Send a Search command.

Write a search to the server’s search control point.

Parameters

- **conn** – Connection to the peer device
- **search** – The search

Returns

0 if success, errno on failure.

int **bt_mcc_read_search_results_obj_id**(struct bt_conn *conn)

Search Results Group Object ID.

Parameters

- **conn** – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_read_content_control_id(struct bt_conn *conn)

Read Content Control ID.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_otc_read_object_metadata(struct bt_conn *conn)

Read the current object metadata.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_otc_read_icon_object(struct bt_conn *conn)

Read the Icon Object.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_otc_read_track_segments_object(struct bt_conn *conn)

Read the Track Segments Object.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_otc_read_current_track_object(struct bt_conn *conn)

Read the Current Track Object.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_otc_read_next_track_object(struct bt_conn *conn)

Read the Next Track Object.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int bt_mcc_otc_read_current_group_object(struct bt_conn *conn)

Read the Current Group Object.

Parameters

- conn – Connection to the peer device

Returns

0 if success, errno on failure.

int **bt_mcc_otc_read_parent_group_object**(struct bt_conn *conn)
Read the Parent Group Object.

Parameters

- **conn** – Connection to the peer device

Returns
0 if success, errno on failure.

struct *bt_ots_client* ***bt_mcc_otc_inst**(struct bt_conn *conn)
Look up MCC OTC instance.

Parameters

- **conn** – The connection to the MCC server.

Returns
Pointer to a MCC OTC instance if found else NULL.

struct **bt_mcc_cb**
#include <mcc.h> Media control client callbacks.

Public Members

bt_mcc_discover_mcs_cb **discover_mcs**
Callback when discovery has finished.

bt_mcc_read_player_name_cb **read_player_name**
Callback when reading the player name.

bt_mcc_read_icon_obj_id_cb **read_icon_obj_id**
Callback when reading the icon object ID.

bt_mcc_read_icon_url_cb **read_icon_url**
Callback when reading the icon URL.

bt_mcc_track_changed_ntf_cb **track_changed_ntf**
Callback when getting a track changed notification.

bt_mcc_read_track_title_cb **read_track_title**
Callback when reading the track title.

bt_mcc_read_track_duration_cb **read_track_duration**
Callback when reading the track duration.

bt_mcc_read_track_position_cb **read_track_position**
Callback when reading the track position.

bt_mcc_set_track_position_cb **set_track_position**
Callback when setting the track position.

bt_mcc_read_playback_speed_cb **read_playback_speed**
Callback when reading the playback speed.

bt_mcc_set_playback_speed_cb `set_playback_speed`
Callback when setting the playback speed.

bt_mcc_read_seeking_speed_cb `read_seeking_speed`
Callback when reading the seeking speed.

bt_mcc_read_segments_obj_id_cb `read_segments_obj_id`
Callback when reading the segments object ID.

bt_mcc_read_current_track_obj_id_cb `read_current_track_obj_id`
Callback when reading the current track object ID.

bt_mcc_set_current_track_obj_id_cb `set_current_track_obj_id`
Callback when setting the current track object ID.

bt_mcc_read_next_track_obj_id_cb `read_next_track_obj_id`
Callback when reading the next track object ID.

bt_mcc_set_next_track_obj_id_cb `set_next_track_obj_id`
Callback when setting the next track object ID.

bt_mcc_read_current_group_obj_id_cb `read_current_group_obj_id`
Callback when reading the current group object ID.

bt_mcc_set_current_group_obj_id_cb `set_current_group_obj_id`
Callback when setting the current group object ID.

bt_mcc_read_parent_group_obj_id_cb `read_parent_group_obj_id`
Callback when reading the parent group object ID.

bt_mcc_read_playing_order_cb `read_playing_order`
Callback when reading the playing order.

bt_mcc_set_playing_order_cb `set_playing_order`
Callback when setting the playing order.

bt_mcc_read_playing_orders_supported_cb `read_playing_orders_supported`
Callback when reading the supported playing orders.

bt_mcc_read_media_state_cb `read_media_state`
Callback when reading the media state.

bt_mcc_send_cmd_cb `send_cmd`
Callback when sending a command.

bt_mcc_cmd_ntf_cb `cmd_ntf`
Callback command notifications.

bt_mcc_read_opcodes_supported_cb `read_opcodes_supported`
Callback when reading the supported opcodes.

bt_mcc_send_search_cb `send_search`
Callback when sending the a search query.

bt_mcc_search_ntf_cb `search_ntf`
Callback when receiving a search notification.

bt_mcc_read_search_results_obj_id_cb `read_search_results_obj_id`
Callback when reading the search results object ID.

bt_mcc_read_content_control_id_cb `read_content_control_id`
Callback when reading the content control ID.

bt_mcc_otc_obj_selected_cb `otc_obj_selected`
Callback when selecting an object.

bt_mcc_otc_obj_metadata_cb `otc_obj_metadata`
Callback when receiving the current object metadata.

bt_mcc_otc_read_icon_object_cb `otc_icon_object`
Callback when reading the current icon object.

bt_mcc_otc_read_track_segments_object_cb `otc_track_segments_object`
Callback when reading the track segments object.

bt_mcc_otc_read_current_track_object_cb `otc_current_track_object`
Callback when reading the current track object.

bt_mcc_otc_read_next_track_object_cb `otc_next_track_object`
Callback when reading the next track object.

bt_mcc_otc_read_current_group_object_cb `otc_current_group_object`
Callback when reading the current group object.

bt_mcc_otc_read_parent_group_object_cb `otc_parent_group_object`
Callback when reading the parent group object.

Bluetooth Microphone Control

API Reference

group `bt_gatt_micp`
Microphone Control Profile (MICP)

Since
2.7

Version
0.8.0

Application error codes

`BT_MICP_ERR_MUTE_DISABLED`
Mute/unmute commands are disabled.

Microphone Control Profile mute states

`BT_MICP_MUTE_UNMUTED`
The microphone state is unmuted.

`BT_MICP_MUTE_MUTED`
The microphone state is muted.

`BT_MICP_MUTE_DISABLED`
The microphone state is disabled and cannot be muted or unmuted.

Defines

`BT_MICP_MIC_DEV_AICS_CNT`
Defines the maximum number of Microphone Control Service instances for the Microphone Control Profile Microphone Device.

Functions

int **bt_micp_mic_dev_register**(struct *bt_micp_mic_dev_register_param* *param)
Initialize the Microphone Control Profile Microphone Device.

This will enable the Microphone Control Service instance and make it discoverable by Microphone Controllers.

Parameters

- `param` – Pointer to an initialization structure.

Returns
0 if success, errno on failure.

int **bt_micp_mic_dev_included_get**(struct *bt_micp_included* *included)
Get Microphone Device included services.

Returns a pointer to a struct that contains information about the Microphone Device included Audio Input Control Service instances.

Requires that `CONFIG_BT_MICP_MIC_DEV_AICS` is enabled.

Parameters

- `included` – Pointer to store the result in.

Returns
0 if success, errno on failure.

int **bt_micp_mic_dev_unmute**(void)

Unmute the Microphone Device.

Returns
0 on success, GATT error value on fail.

int **bt_micp_mic_dev_mute**(void)

Mute the Microphone Device.

Returns
0 on success, GATT error value on fail.

int **bt_micp_mic_dev_mute_disable**(void)

Disable the mute functionality on the Microphone Device.

Can be reenabled by called *bt_micp_mic_dev_mute* or *bt_micp_mic_dev_unmute*.

Returns
0 on success, GATT error value on fail.

int **bt_micp_mic_dev_mute_get**(void)

Read the mute state on the Microphone Device.

Returns
0 on success, GATT error value on fail.

int **bt_micp_mic_ctlr_included_get**(struct bt_micp_mic_ctlr *mic_ctlr, struct *bt_micp_included* *included)

Get Microphone Control Profile included services.

Returns a pointer to a struct that contains information about the Microphone Control Profile included services instances, such as pointers to the Audio Input Control Service instances.

Requires that `CONFIG_BT_MICP_MIC_CTLR_AICS` is enabled.

Parameters

- **mic_ctlr** – Microphone Controller instance pointer.
- **included** – **[out]** Pointer to store the result in.

Returns
0 if success, errno on failure.

int **bt_micp_mic_ctlr_conn_get**(const struct bt_micp_mic_ctlr *mic_ctlr, struct bt_conn **conn)

Get the connection pointer of a Microphone Controller instance.

Get the Bluetooth connection pointer of a Microphone Controller instance.

Parameters

- **mic_ctlr** – Microphone Controller instance pointer.
- **conn** – Connection pointer.

Returns
0 if success, errno on failure.

struct bt_micp_mic_ctlr ***bt_micp_mic_ctlr_get_by_conn**(const struct bt_conn *conn)

Get the volume controller from a connection pointer.

Get the Volume Control Profile Volume Controller pointer from a connection pointer. Only volume controllers that have been initiated via *bt_micp_mic_ctlr_discover()* can be retrieved.

Parameters

- **conn** – Connection pointer.

Return values

- **Pointer** – to a Microphone Control Profile Microphone Controller instance
- **NULL** – if conn is NULL or if the connection has not done discovery yet

int **bt_micp_mic_ctlr_discover**(struct bt_conn *conn, struct bt_micp_mic_ctlr **mic_ctlr)

Discover Microphone Control Service.

This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the *bt_micp_mic_ctlr_cb::discover* callback will notify when it is possible to start remote operations.

-

Parameters

- **conn** – The connection to initialize the profile for.
- **mic_ctlr** – **[out]** Valid remote instance object on success.

Returns

0 on success, GATT error value on fail.

int **bt_micp_mic_ctlr_unmute**(struct bt_micp_mic_ctlr *mic_ctlr)

Unmute a remote Microphone Device.

Parameters

- **mic_ctlr** – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

int **bt_micp_mic_ctlr_mute**(struct bt_micp_mic_ctlr *mic_ctlr)

Mute a remote Microphone Device.

Parameters

- **mic_ctlr** – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

int **bt_micp_mic_ctlr_mute_get**(struct bt_micp_mic_ctlr *mic_ctlr)

Read the mute state of a remote Microphone Device.

Parameters

- **mic_ctlr** – Microphone Controller instance pointer.

Returns

0 on success, GATT error value on fail.

int **bt_micp_mic_ctlr_cb_register**(struct *bt_micp_mic_ctlr_cb* *cb)

Registers the callbacks used by Microphone Controller.

This can only be done as the client.

Parameters

- **cb** – The callback structure.

Returns

0 if success, errno on failure.

struct **bt_micp_mic_dev_register_param**

#include <micp.h> Register parameters structure for Microphone Control Service.

Public Members

struct bt_aics_register_param **aics_param**[0]

Register parameter structure for Audio Input Control Services.

struct *bt_micp_mic_dev_cb* ***cb**

Microphone Control Profile callback structure.

struct **bt_micp_included**

#include <micp.h> Microphone Control Profile included services.

Used for to represent the Microphone Control Profile included service instances, for either a Microphone Controller or a Microphone Device. The instance pointers either represent local service instances, or remote service instances.

Public Members

uint8_t **aics_cnt**

Number of Audio Input Control Service instances.

struct bt_aics ****aics**

Array of pointers to Audio Input Control Service instances.

struct **bt_micp_mic_dev_cb**

#include <micp.h> Struct to hold the Microphone Device callbacks.

These can be registered for usage with *bt_micp_mic_dev_register()*.

Public Members

void (***mute**)(uint8_t mute)

Callback function for Microphone Device mute.

Called when the value is read with *bt_micp_mic_dev_mute_get()*, or if the value is changed by either the Microphone Device or a Microphone Controller.

Param mute

The mute setting of the Microphone Control Service.

struct **bt_micp_mic_ctlr_cb**

#include <micp.h> Struct to hold the Microphone Controller callbacks.

These can be registered for usage with *bt_micp_mic_ctlr_cb_register()*.

Public Members

void (*`mute`)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t mute)

Callback function for Microphone Control Profile mute.

Called when the value is read, or if the value is changed by either the Microphone Device or a Microphone Controller.

Param mic_ctlr
Microphone Controller instance pointer.

Param err
Error value. 0 on success, GATT error or errno on fail. For notifications, this will always be 0.

Param mute
The mute setting of the Microphone Control Service.

void (*`discover`)(struct bt_micp_mic_ctlr *mic_ctlr, int err, uint8_t aics_count)

Callback function for *bt_micp_mic_ctlr_discover()*.

Param mic_ctlr
Microphone Controller instance pointer.

Param err
Error value. 0 on success, GATT error or errno on fail.

Param aics_count
Number of Audio Input Control Service instances on peer device.

void (*`mute_written`)(struct bt_micp_mic_ctlr *mic_ctlr, int err)

Callback function for Microphone Control Profile mute/unmute.

Param mic_ctlr
Microphone Controller instance pointer.

Param err
Error value. 0 on success, GATT error or errno on fail.

void (*`unmute_written`)(struct bt_micp_mic_ctlr *mic_ctlr, int err)

Callback function for Microphone Control Profile mute/unmute.

Param mic_ctlr
Microphone Controller instance pointer.

Param err
Error value. 0 on success, GATT error or errno on fail.

Bluetooth Audio Volume Control

API Reference

group `bt_gatt_vcp`

Volume Control Profile (VCP)

The Volume Control Profile (VCP) provides procedures to control the volume level and mute state on audio devices.

Since
2.7

Version
0.8.0

Volume Control Service Error codes

`BT_VCP_ERR_INVALID_COUNTER`
: The Change_Counter operand value does not match the Change_Counter field value of the Volume State characteristic.

`BT_VCP_ERR_OP_NOT_SUPPORTED`
: An invalid opcode has been used in a control point procedure.

Volume Control Service Mute Values

`BT_VCP_STATE_UNMUTED`
: The volume state is unmuted.

`BT_VCP_STATE_MUTED`
: The volume state is muted.

Defines

`BT_VCP_VOL_REND_VOCS_CNT`
: Defines the maximum number of Volume Offset Control service instances for the Volume Control Profile Volume Renderer.

`BT_VCP_VOL_REND_AICS_CNT`
: Defines the maximum number of Audio Input Control service instances for the Volume Control Profile Volume Renderer.

Functions

int **bt_vcp_vol_rend_included_get**(struct *bt_vcp_included* *included)

Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

Parameters

- `included` – **[out]** Pointer to store the result in.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_rend_register**(struct *bt_vcp_vol_rend_register_param* *param)

Register the Volume Control Service.

This will register and enable the service and make it discoverable by clients.

Parameters

- `param` – Volume Control Service register parameters.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_rend_set_step**(uint8_t volume_step)

Set the Volume Control Service volume step size.

Set the value that the volume changes, when changed relatively with e.g. *bt_vcp_vol_rend_vol_down* or *bt_vcp_vol_rend_vol_up*.

This can only be done as the server.

Parameters

- **volume_step** – The volume step size (1-255).

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_get_state**(void)

Get the Volume Control Service volume state.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_get_flags**(void)

Get the Volume Control Service flags.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_vol_down**(void)

Turn the volume down by one step on the server.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_vol_up**(void)

Turn the volume up by one step on the server.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_unmute_vol_down**(void)

Turn the volume down and unmute the server.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_unmute_vol_up**(void)

Turn the volume up and unmute the server.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_set_vol**(uint8_t volume)

Set the volume on the server.

Parameters

- **volume** – The absolute volume to set.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_unmute**(void)

Unmute the server.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_rend_mute**(void)

Mute the server.

Returns

0 if success, errno on failure.

int **bt_vcp_vol_ctlr_cb_register**(struct *bt_vcp_vol_ctlr_cb* *cb)

Registers the callbacks used by the Volume Controller.

Parameters

- **cb** – The callback structure.

Return values

- **0** – on success
- **-EINVAL** – if cb is NULL
- **-EALREADY** – if cb was already registered

int **bt_vcp_vol_ctlr_cb_unregister**(struct *bt_vcp_vol_ctlr_cb* *cb)

Unregisters the callbacks used by the Volume Controller.

Parameters

- **cb** – The callback structure.

Return values

- **0** – on success
- **-EINVAL** – if cb is NULL
- **-EALREADY** – if cb was not registered

int **bt_vcp_vol_ctlr_discover**(struct bt_conn *conn, struct bt_vcp_vol_ctlr **vol_ctlr)

Discover Volume Control Service and included services.

This will start a GATT discovery and setup handles and subscriptions. This shall be called once before any other actions can be executed for the peer device, and the *bt_vcp_vol_ctlr_cb::discover* callback will notify when it is possible to start remote operations.

This shall only be done as the client,

Parameters

- **conn** – The connection to discover Volume Control Service for.
- **vol_ctlr** – **[out]** Valid remote instance object on success.

Returns

0 if success, errno on failure.

struct bt_vcp_vol_ctlr ***bt_vcp_vol_ctlr_get_by_conn**(const struct bt_conn *conn)

Get the volume controller from a connection pointer.

Get the Volume Control Profile Volume Controller pointer from a connection pointer. Only volume controllers that have been initiated via *bt_vcp_vol_ctlr_discover()* can be retrieved.

Parameters

- **conn** – Connection pointer.

Return values

- **Pointer** – to a Volume Control Profile Volume Controller instance
- **NULL** – if conn is NULL or if the connection has not done discovery yet

int **bt_vcp_vol_ctlr_conn_get**(const struct bt_vcp_vol_ctlr *vol_ctlr, struct bt_conn **conn)

Get the connection pointer of a client instance.

Get the Bluetooth connection pointer of a Volume Control Service client instance.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.
- **conn** – **[out]** Connection pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_included_get**(struct bt_vcp_vol_ctlr *vol_ctlr, struct *bt_vcp_included* *included)

Get Volume Control Service included services.

Returns a pointer to a struct that contains information about the Volume Control Service included service instances, such as pointers to the Volume Offset Control Service (Volume Offset Control Service) or Audio Input Control Service (AICS) instances.

Requires that CONFIG_BT_VCP_VOL_CTLR_VOCS or CONFIG_BT_VCP_VOL_CTLR_AICS is enabled.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.
- **included** – **[out]** Pointer to store the result in.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_read_state**(struct bt_vcp_vol_ctlr *vol_ctlr)

Read the volume state of a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_read_flags**(struct bt_vcp_vol_ctlr *vol_ctlr)

Read the volume flags of a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_vol_down**(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume down one step on a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_vol_up**(struct bt_vcp_vol_ctlr *vol_ctlr)

Turn the volume up one step on a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_unmute_vol_down**(struct bt_vcp_vol_ctlr *vol_ctlr)
Turn the volume down one step and unmute on a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_unmute_vol_up**(struct bt_vcp_vol_ctlr *vol_ctlr)
Turn the volume up one step and unmute on a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_set_vol**(struct bt_vcp_vol_ctlr *vol_ctlr, uint8_t volume)
Set the absolute volume on a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.
- **volume** – The absolute volume to set.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_unmute**(struct bt_vcp_vol_ctlr *vol_ctlr)
Unmute a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

int **bt_vcp_vol_ctlr_mute**(struct bt_vcp_vol_ctlr *vol_ctlr)
Mute a remote Volume Renderer.

Parameters

- **vol_ctlr** – Volume Controller instance pointer.

Returns
0 if success, errno on failure.

struct **bt_vcp_vol_rend_register_param**
#include <vcp.h> Register structure for Volume Control Service.

Public Members

uint8_t **step**
Initial step size (1-255)

uint8_t **mute**
: Initial mute state (0-1)

uint8_t **volume**
: Initial volume level (0-255)

struct bt_vocs_register_param **vocs_param**[0]
: Register parameters for Volume Offset Control Services.

struct bt_aics_register_param **aics_param**[0]
: Register parameters for Audio Input Control Services.

struct *bt_vcp_vol_rend_cb* ***cb**
: Volume Control Service callback structure.

struct **bt_vcp_included**

#include <*vcp.h*> Volume Control Service included services.

Used for to represent the Volume Control Service included service instances, for either a client or a server. The instance pointers either represent local server instances, or remote service instances.

Public Members

uint8_t **vocs_cnt**
: Number of Volume Offset Control Service instances.

struct bt_vocs ****vocs**
: Array of pointers to Volume Offset Control Service instances.

uint8_t **aics_cnt**
: Number of Audio Input Control Service instances.

struct bt_aics ****aics**
: Array of pointers to Audio Input Control Service instances.

struct **bt_vcp_vol_rend_cb**

#include <*vcp.h*> Struct to hold the Volume Renderer callbacks.

These can be registered for usage with *bt_vcp_vol_rend_register()*.

Public Members

void (***state**)(int err, uint8_t volume, uint8_t mute)
: Callback function for Volume Control Service volume state.

  Called when the value is locally read with *bt_vcp_vol_rend_get_state()*, or if the state is changed by either the Volume Renderer or a remote Volume Controller.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param volume
The volume of the Volume Control Service server.
Param mute
The mute setting of the Volume Control Service server.

void (*`flags`)(int err, uint8_t flags)

Callback function for Volume Control Service flags.

Called when the value is locally read as the server. Called when the value is remotely read as the client. Called if the value is changed by either the server or client.
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param flags
The flags of the Volume Control Service server.

struct `bt_vcp_vol_ctlr_cb`

#include <*vcp.h*> Struct to hold the Volume Controller callbacks.

These can be registered for usage with *bt_vcp_vol_ctlr_cb_register()*.

Public Members

void (*`state`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t volume, uint8_t mute)

Callback function for Volume Control Profile volume state.

Called when the value is remotely read as the Volume Controller. Called if the value is changed by either the Volume Renderer or Volume Controller, and notified to the to Volume Controller.
Param vol_ctlr
Volume Controller instance pointer.
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.
Param volume
The volume of the Volume Renderer.
Param mute
The mute setting of the Volume Renderer.

void (*`flags`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t flags)

Callback function for Volume Control Profile volume flags.

Called when the value is remotely read as the Volume Controller. Called if the value is changed by the Volume Renderer.

A non-zero value indicates the volume has been changed on the Volume Renderer since it was booted.
Param vol_ctlr
Volume Controller instance pointer.
Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param flags
The flags of the Volume Renderer.

void (*`discover`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err, uint8_t vocs_count, uint8_t aics_count)

Callback function for *bt_vcp_vol_ctlr_discover()*.

This callback is called once the discovery procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

Param vocs_count
Number of Volume Offset Control Service instances on the remote Volume Renderer.

Param aics_count
Number of Audio Input Control Service instances the remote Volume Renderer.

void (*`vol_down`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for *bt_vcp_vol_ctlr_vol_down()*.

Called when the volume down procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*`vol_up`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for *bt_vcp_vol_ctlr_vol_up()*.

Called when the volume up procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*`mute`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for *bt_vcp_vol_ctlr_mute()*.

Called when the mute procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*`unmute`)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for *bt_vcp_vol_ctlr_unmute()*.

Called when the unmute procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_down_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for bt_vcp_vol_ctlr_vol_down_unmute().

Called when the volume down and unmute procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_up_unmute)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for bt_vcp_vol_ctlr_vol_up_unmute().

Called when the volume up and unmute procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

void (*vol_set)(struct bt_vcp_vol_ctlr *vol_ctlr, int err)

Callback function for bt_vcp_vol_ctlr_vol_set().

Called when the set absolute volume procedure is completed.

Param vol_ctlr
Volume Controller instance pointer.

Param err
Error value. 0 on success, GATT error on positive value or errno on negative value.

struct bt_vocs_cb vocs_cb

Volume Offset Control Service callbacks.

struct bt_aics_cb aics_cb

Audio Input Control Service callbacks.

Bluetooth: Basic Audio Profile This document describes how to run Basic Audio Profile functionality which includes:

- Capabilities and Endpoint discovery
- Audio Stream Endpoint procedures

Commands

```
bap --help
Subcommands:
   init
   select_broadcast       : <stream>
   create_broadcast       : [preset <preset_name>] [enc <broadcast_code>]
   start_broadcast        :
   stop_broadcast         :
   delete_broadcast       :
```

(continues on next page)

(continued from previous page)

                           supported, available>
```

Table 14: State Machine Transitions

Command	Depends	Allowed States	Next States
init	none	any	none
discover	init	any	any
config	discover	idle/codec-configured/qos-configured	codec-configured
qos	config	codec-configured/qos-configured	qos-configured
enable	qos	qos-configured	enabling
connect	qos/enable	qos-configured/enabling	qos-configured/enabling
[start]	enable/connect	enabling	streaming
disable	enable	enabling/streaming	disabling
[stop]	disable	disabling	qos-configure/idle
release	config	any	releasing/codec-configure/idle
list	none	any	none
select_unicast	none	any	none
send	enable	streaming	none

Example Central Connect and establish a sink stream:

```
uart:~$ bt init
uart:~$ bap init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ bap discover sink
uart:~$ bap config sink 0
uart:~$ bap qos
uart:~$ bap enable
uart:~$ bap connect
```

Connect and establish a source stream:

```
uart:~$ bt init
uart:~$ bap init
uart:~$ bt connect <address>
uart:~$ gatt exchange-mtu
uart:~$ bap discover source
uart:~$ bap config source 0
uart:~$ bap qos
uart:~$ bap enable
uart:~$ bap connect
uart:~$ bap start
```

Disconnect and release:

```
uart:~$ bap disable
uart:~$ bap release
```

Example Peripheral Listen:

```
uart:~$ bt init
uart:~$ bap init
uart:~$ bt advertise on
```

Server initiated disable and release:

```
uart:~$ bap disable
uart:~$ bap release
```

Example Broadcast Source Create and establish a broadcast source stream:

```
uart:~$ bap init
uart:~$ bap create_broadcast
uart:~$ bap start_broadcast
```

Stop and release a broadcast source stream:

```
uart:~$ bap stop_broadcast
uart:~$ bap delete_broadcast
```

Example Broadcast Sink Scan for and establish a broadcast sink stream. The command `bap create_broadcast_sink` will either use existing periodic advertising sync (if exist) or start scanning and sync to the periodic advertising with the provided broadcast ID before syncing to the BIG.

```
uart:~$ bap init
uart:~$ bap create_broadcast_sink 0xEF6716
No PA sync available, starting scanning for broadcast_id
Found broadcaster with ID 0xEF6716 and addr 03:47:95:75:C0:08 (random) and sid 0x00
Attempting to PA sync to the broadcaster
PA synced to broadcast with broadcast ID 0xEF6716
Attempting to sync to the BIG

```

(continues on next page)

(continued from previous page)

```
Sink 0x20019110 is ready to sync without encryption
uart:~$ bap sync_broadcast 0x01
```

Syncing to encrypted broadcast If the broadcast is encrypted, the broadcast code can be entered with the `bap sync_broadcast` command as such:

```
Sink 0x20019110 is ready to sync with encryption
uart:~$ bap sync_broadcast 0x01 bcode 0102030405060708090a0b0c0d0e0f
```

The broadcast code can be 1-16 values, either as a string or a hexadecimal value.

```
Sink 0x20019110 is ready to sync with encryption
uart:~$ bap sync_broadcast 0x01 bcode_str thisismycode
```

Stop and release a broadcast sink stream:

```
uart:~$ bap stop_broadcast_sink
uart:~$ bap term_broadcast_sink
```

Init The `init` command register local PAC records which are necessary to be able to configure stream and properly manage capabilities in use.

Table 15: State Machine Transitions

Depends	Allowed States	Next States
none	any	none

```
uart:~$ bap init
```

Discover PAC(s) and ASE(s) Once connected the `discover` command discover PAC records and ASE characteristics representing remote endpoints.

Table 16: State Machine Transitions

Depends	Allowed States	Next States
init	any	any

Note

Use command `gatt exchange-mtu` to make sure the MTU is configured properly.

```
uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful
uart:~$ bap discover [type: sink, source]
uart:~$ bap discover sink

Configure Codec The `config` command attempts to configure a stream for the given direction using a preset codec configuration which can either be passed directly or in case it is omitted the default preset is used.

Table 17: State Machine Transitions

Depends	Allowed States	Next States
discover	idle/codec-configured/qos-configured	codec-configured

```
uart:~$ bap config <direction: sink, source> <index> [loc <loc_bits>] [preset <preset_name>]
uart:~$ bap config sink 0
Setting location to 0x00000000
ASE config: preset 16_2_1
stream 0x2000df70 config operation rsp_code 0 reason 0
```

Configure Stream QoS The `stream_qos` Sets a new stream QoS.

```
uart:~$ bap stream_qos <interval> [framing] [latency] [pd] [sdu] [phy] [rtn]
uart:~$ bap stream_qos 10
```

Configure QoS The `qos` command attempts to configure the stream QoS using the preset configuration, each individual QoS parameter can be set with use optional parameters.

Table 18: State Machine Transitions

Depends	Allowed States	Next States
config	qos-configured/codec-configured	qos-configured

```
uart:~$ bap qos
```

Enable The `enable` command attempts to enable the stream previously configured.

Table 19: State Machine Transitions

Depends	Allowed States	Next States
qos	qos-configured	enabling

```
uart:~$ bap enable [context]
uart:~$ bap enable Media
```

Connect The `connect` command attempts to connect the stream previously configured. Sink streams will have to be started by the unicast server, and source streams will have to be started by the unicast client.

Table 20: State Machine Transitions

Depends	Allowed States	Next States
qos/enable	qos-configured/enabling	qos-configured/enabling

```
uart:~$ bap connect
```

Start The `start` command is only necessary when starting a source stream.

Table 21: State Machine Transitions

Depends	Allowed States	Next States
enable/connect	enabling	streaming

```
uart:~$ bap start
```

Disable The `disable` command attempts to disable the stream previously enabled, if the remote peer accepts then the ISO disconnection procedure is also initiated.

Table 22: State Machine Transitions

Depends	Allowed States	Next States
enable	enabling/streaming	disabling

```
uart:~$ bap disable
```

Stop The `stop` command is only necessary when acting as a sink as it indicates to the source the stack is ready to stop receiving data.

Table 23: State Machine Transitions

Depends	Allowed States	Next States
disable	disabling	qos-configure/idle

```
uart:~$ bap stop
```

Release The `release` command releases the current stream and its configuration.

Table 24: State Machine Transitions

Depends	Allowed States	Next States
config	any	releasing/codec-configure/idle

```
uart:~$ bap release
```

List The `list` command list the available streams.

Table 25: State Machine Transitions

Depends	Allowed States	Next States
none	any	none

```
uart:~$ bap list
*0: ase 0x01 dir 0x01 state 0x01
```

Select Unicast The `select_unicast` command set a unicast stream as default.

Table 26: State Machine Transitions

Depends	Allowed States	Next States
none	any	none

```
uart:~$ bap select <ase>
uart:~$ bap select 0x01
Default stream: 1
```

To select a broadcast stream:

```
uart:~$ bap select 0x01 broadcast
Default stream: 1 (broadcast)
```

Send The send command sends data over BAP Stream.

Table 27: State Machine Transitions

Depends	Allowed States	Next States
enable	streaming	none

```
uart:~$ bap send [count]
uart:~$ bap send
Audio sending...
```

Bluetooth: Broadcast Audio Profile Broadcast Assistant This document describes how to run the BAP Broadcast Assistant functionality. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Broadcast Assistant is responsible for offloading scan for a resource restricted device, such that scanning does not drain the battery. The Broadcast Assistant shall support scanning for periodic advertisements and may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Broadcast Assistant will typically be phones or laptops. The Broadcast Assistant scans for periodic advertisements and transfer information to the server.

It is necessary to have `CONFIG_BT_BAP_BROADCAST_ASSISTANT_LOG_LEVEL_DBG` enabled for using the Broadcast Assistant interactively.

When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the Broadcast Assistant can discover BASS on the connected device calling `bap_broadcast_assistant discover`, which will start a discovery for the BASS UUIDs and store the handles, and subscribe to all notifications.

```
uart:~$ bap_broadcast_assistant --help
bap_broadcast_assistant - Bluetooth BAP broadcast assistant client shell
                          commands
Subcommands:
discover          : Discover BASS on the server
scan_start        : Start scanning for broadcasters
scan_stop         : Stop scanning for BISs
add_src           : Add a source <address: XX:XX:XX:XX:XX:XX> <type:
                     public/random> <adv_sid> <sync_pa> <broadcast_id>
                     [<pa_interval>] [<sync_bis>] [<metadata>]
add_broadcast_id  : Add a source by broadcast ID <broadcast_id> <sync_pa>
                     [<sync_bis>] [<metadata>]
add_pa_sync       : Add a PA sync as a source <sync_pa> <broadcast_id>
                     [bis_index [bis_index [bix_index [...]]]]>
mod_src           : Set sync <src_id> <sync_pa> [<pa_interval> | "unknown"] [<sync_bis>]
                     [<metadata>]
broadcast_code    : Send a string-based broadcast code of up to 16 bytes
                     <src_id> <broadcast code>
rem_src           : Remove a source <src_id>
read_state        : Remove a source <index>
```

Example usage

Setup

```
uart:~$ bt init
uart:~$ bap init
uart:~$ bt connect xx:xx:xx:xx:xx:xx public
```

When connected

> **Note**
>
> The Broadcast Assistant will not actually start scanning for periodic advertisements, as that feature is still, at the time of writing, not implemented.

Start scanning for periodic advertisements for a server:

```
uart:~$ bap_broadcast_assistant discover
BASS discover done with 1 recv states
```

(continues on next page)

(continued from previous page)

```
uart:~$ bap_broadcast_assistant scan_start true
BASS scan start successful
Found broadcaster with ID 0x05BD38 and addr 1E:4D:0A:AA:6E:49 (random) and sid 0x00
```

Adding a source to the receive state with add_src:

```
uart:~$ bap_broadcast_assistant add_src 11:22:33:44:55:66 public 5 1 1
BASS recv state: src_id 0, addr 11:22:33:44:55:66 (public), sid 5, sync_state 1, encrypt_
↪state 00000000000000000000000000000000
     [0]: BIS sync 0, metadata_len 0
```

Adding a source to the receive state with add_broadcast_id (recommended):

```
uart:~$ bap_broadcast_assistant add_broadcast_id 0x05BD38 true
[DEVICE]: 1E:4D:0A:AA:6E:49 (random), AD evt type 5, RSSI -28 Broadcast Audio Source C:0␣
↪S:0 D:0 SR:0 E:1 Prim: LE 1M, Secn: LE 2M, Interval: 0x03c0 (1200000 us), SID: 0x0
Found BAP broadcast source with address 1E:4D:0A:AA:6E:49 (random) and ID 0x05BD38
BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 0, encrypt_
↪state 0
      [0]: BIS sync 0x0000, metadata_len 0
BASS add source successful
BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 2, encrypt_
↪state 0
      [0]: BIS sync 0x0000, metadata_len 0
BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 2, encrypt_
↪state 0
      [0]: BIS sync 0x0000, metadata_len 4
               Metadata length 2, type 2, data: 0100
```

Modifying a receive state:

```
uart:~$ bap_broadcast_assistant mod_src 0 true 0x03c0 0x02
BASS modify source successful
BASS recv state: src_id 0, addr 1E:4D:0A:AA:6E:49 (random), sid 0, sync_state 2, encrypt_
↪state 0
      [0]: BIS sync 0x0001, metadata_len 4
               Metadata length 2, type 2, data: 0100
```

Supplying a broadcast code:

```
uart:~$ bap_broadcast_assistant broadcast_code 0 secretCode
Sending broadcast code:
00000000: 73 65 63 72 65 74 43 6f 64 65 00 00 00 00 00 00 |secretCo de....|
uart:~$ BASS broadcast code successful
```

Bluetooth: Broadcast Audio Profile Scan Delegator This document describes how to run the Scan Delegator functionality, Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

The Scan Delegator may optionally support the periodic advertisements synchronization transfer (PAST) protocol.

The Scan Delegator server typically resides on devices that have inputs or outputs.

It is necessary to have `CONFIG_BT_BAP_SCAN_DELEGATOR_LOG_LEVEL_DBG` enabled for using the Scan Delegator interactively.

The Scan Delegator can currently only set the sync state of a receive state, but does not actually support syncing with periodic advertisements yet.

```
bap_scan_delegator --help
bap_scan_delegator - Bluetooth BAP Scan Delegator shell commands
Subcommands:
  init                : Initialize the service and register callbacks
  set_past_pref       : Set PAST preference <true || false>
  sync_pa             : Sync to PA <src_id>
  term_pa             : Terminate PA sync <src_id>
  add_src             : Add a PA as source <addr> <sid> <broadcast_id>
                        <enc_state> [bis_sync [metadata]]
  add_src_by_pa_sync  : Add a PA as source <broadcast_id> <enc_state> [bis_sync
                        [metadata]]
  mod_src             : Modify source <src_id> <broadcast_id> <enc_state>
                        [bis_sync [metadata]]
  rem_src             : Remove source <src_id>
  synced              : Set server scan state <src_id> <bis_syncs>
```

Example Usage

Setup

```
uart:~$ bt init
uart:~$ bap_scan_delegator init
uart:~$ bt advertise on
Advertising started
```

Adding a source

```
uart:~$ bap_scan_delegator add_src 11:22:33:44:55:66 public 0 1234 0
Receive state with ID 0 updated
```

Adding a source from a PA sync

```
uart:~$ bt scan on
Found broadcaster with ID 0x681A22 and addr 2C:44:05:82:EB:82 (random) and sid 0x00␣
↪(looking for 0x1000000)
uart:~$ bt scan off
uart:~$ bt per-adv-sync-create 2C:44:05:82:EB:82 (random) 0
PA 0x2003e9b0 synced
uart:~$ bap_scan_delegator add_src_by_pa_sync 0x681A22 0
Receive state with ID 0 updated
```

When connected Set sync state for a source:

```
uart:~$ bap_scan_delegator synced 0 1 3 0
```

Bluetooth: Common Audio Profile Shell This document describes how to run the Common Audio Profile functionality.

CAP Acceptor The Acceptor will typically be a resource-constrained device, such as a headset, earbud or hearing aid. The Acceptor can initialize a Coordinated Set Identification Service instance, if it is in a pair with one or more other CAP Acceptors.

Using the CAP Acceptor When the Bluetooth stack has been initialized (`bt init`), the Acceptor can be registered by calling `cap_acceptor init`, which will register the CAS and CSIS services, as well as register callbacks.

```
cap_acceptor --help
cap_acceptor - Bluetooth CAP acceptor shell commands
Subcommands:
  init          :Initialize the service and register callbacks [size <int>]
                 [rank <int>] [not-lockable] [sirk <data>]
  lock          :Lock the set
  release       :Release the set [force]
  sirk          :Set the currently used SIRK <sirk>
  get_sirk      :Get the currently used SIRK
  sirk_rsp      :Set the response used in SIRK requests <accept, accept_enc,
                 reject, oob>
```

Besides initializing the CAS and the CSIS, there are also commands to lock and release the CSIS instance, as well as printing and modifying access to the SIRK of the CSIS.

Setting a new SIRK This command can modify the currently used SIRK. To get the new RSI to advertise on air, `bt adv-data` or `bt advertise` must be called again to set the new advertising data. If `CONFIG_BT_CSIP_SET_MEMBER_NOTIFIABLE` is enabled, this will also notify connected clients.

```
uart:~$ cap_acceptor sirk 00112233445566778899aabbccddeeff
SIRK updated
```

Getting the current SIRK This command can get the currently used SIRK.

```
uart:~$ cap_acceptor get_sirk
SIRK
36 04 9a dc 66 3a a1 a1 |6...f:..
1d 9a 2f 41 01 73 3e 01 |../A.s>.
```

CAP Initiator The Initiator will typically be a resource-rich device, such as a phone or PC. The Initiator can discover CAP Acceptors's CAS and optional CSIS services. The CSIS service can be read to provide information about other CAP Acceptors in the same Coordinated Set. The Initiator can execute stream control procedures on sets of devices, either ad-hoc or Coordinated, and thus provides an easy way to setup multiple streams on multiple devices at once.

Using the CAP Initiator When the Bluetooth stack has been initialized (`bt init`), the Initiator can discover CAS and the optionally included CSIS instance by calling (`cap_initiator discover`). The CAP initiator also supports broadcast audio as a source.

```
uart:~$ cap_initiator --help
cap_initiator - Bluetooth CAP initiator shell commands
Subcommands:
  discover          : Discover CAS
  unicast_start     : Unicast Start [csip] [sinks <cnt> (default 1)] [sources
                      <cnt> (default 1)] [conns (<cnt> | all) (default 1)]
  unicast_list      : Unicast list streams
  unicast_update    : Unicast Update <all | stream [stream [stream...]]>
  unicast_stop      : Unicast stop streams [stream [stream [stream...]]] (all by default)
  unicast_cancel    : Unicast cancel current procedure
  ac_1              : Unicast audio configuration 1
  ac_2              : Unicast audio configuration 2
```

(continues on next page)

(continued from previous page)

```
  ac_3              : Unicast audio configuration 3
  ac_4              : Unicast audio configuration 4
  ac_5              : Unicast audio configuration 5
  ac_6_i            : Unicast audio configuration 6(i)
  ac_6_ii           : Unicast audio configuration 6(ii)
  ac_7_i            : Unicast audio configuration 7(i)
  ac_7_ii           : Unicast audio configuration 7(ii)
  ac_8_i            : Unicast audio configuration 8(i)
  ac_8_ii           : Unicast audio configuration 8(ii)
  ac_9_i            : Unicast audio configuration 9(i)
  ac_9_ii           : Unicast audio configuration 9(ii)
  ac_10             : Unicast audio configuration 10
  ac_11_i           : Unicast audio configuration 11(i)
  ac_11_ii          : Unicast audio configuration 11(ii)
  broadcast_start   :
  broadcast_update  : <meta>
  broadcast_stop    :
  broadcast_delete  :
  ac_12             : Broadcast audio configuration 12
  ac_13             : Broadcast audio configuration 13
  ac_14             : Broadcast audio configuration 14
```

Before being able to perform any stream operation, the device must also perform the `bap discover` operation to discover the ASEs and PAC records. The `bap init` command also needs to be called.

When connected Discovering CAS and CSIS on a device:

```
uart:~$ cap_initiator discover
discovery completed with CSIS
```

Discovering ASEs and PAC records on a device:

```
uart:~$ bap discover
conn 0x81cc260: #0: codec 0x81d5b28 dir 0x01

Conn: 0x81cc260, Source #1: ep 0x81e60e8
Discover complete: err 0
```

Both of the above commands should be done for each device that you want to use in the set. To use multiple devices, simply connect to more and then use `bt select` the device to execute the commands on.

Once all devices have been connected and the respective discovery commands have been called, the `cap_initiator unicast_start` command can be used to put one or more streams into the streaming state.

```
uart:~$ cap_initiator unicast_start sinks 1 sources 0 conns all
Setting up 1 sinks and 0 sources on each (2) conn
Starting 1 streams
Unicast start completed
```

To stop all the streams that has been started, the `cap_initiator unicast_stop` command can be used.

```
uart:~$ cap_initiator unicast_stop all
Unicast stop completed
```

When doing broadcast To start a broadcast as the CAP initiator there are a few steps to be done:

1. Create and configure an extended advertising set with periodic advertising
2. Create and configure a broadcast source
3. Setup extended and periodic advertising data

The following commands will setup a CAP broadcast source using the 16_2_1 preset (defined by BAP):

```
bt init
bap init
bt adv-create nconn-nscan ext-adv name
bt per-adv-param
bap preset broadcast 16_2_1
cap_initiator ac_12
bt adv-data discov
bt per-adv-data
cap_initiator broadcast_start
```

The broadcast source is created by the `cap_initiator ac_12`, `cap_initiator ac_13`, and `cap_initiator ac_14` commands, configuring the broadcast source for the defined audio configurations from BAP. The broadcast source can then be stopped with `cap_initiator broadcast_stop` or deleted with `cap_initiator broadcast_delete`.

The metadata of the broadcast source can be updated at any time, including when it is already streaming. To update the metadata the `cap_initiator broadcast_update` command can be used. The command takes an array of data, and the only requirement (besides having valid data) is that the streaming context shall be set. For example to set the streaming context to media, the command can be used as

```
cap_initiator broadcast_update 03020400
CAP Broadcast source updated with new metadata. Update the advertised base via `bt per-adv-
```

(continues on next page)

(continued from previous page)

```
↪data`
bt per-adv-data
```

The `bt per-adv-data` command should be used afterwards to update the data is the advertised BASE. The data must be little-endian, so in the above example the metadata `03020400` is setting the metadata entry with `03` as the length, `02` as the type (streaming context) and `0400` as the value `BT_AUDIO_CONTEXT_TYPE_MEDIA` (which has the numeric value of 0x).

CAP Commander The Commander will typically be a either co-located with a CAP Initiator or be on a separate resource-rich mobile device, such as a phone or smartwatch. The Commander can discover CAP Acceptors's CAS and optional CSIS services. The CSIS service can be read to provide information about other CAP Acceptors in the same Coordinated Set. The Commander can provide information about broadcast sources to CAP Acceptors or coordinate capture and rendering information such as mute or volume states.

Using the CAP Commander When the Bluetooth stack has been initialized (`bt init`), the Commander can discover CAS and the optionally included CSIS instance by calling (`cap_commander discover`).

```
cap_commander --help
cap_commander - Bluetooth CAP commander shell commands
Subcommands:
  discover                :Discover CAS
  cancel                  :CAP commander cancel current procedure
  change_volume           :Change volume on all connections <volume>
  change_volume_mute      :Change volume mute state on all connections <mute>
  change_volume_offset    :Change volume offset per connection <volume_offset
                           [volume_offset [...]]>
  change_microphone_mute  :Change microphone mute state on all connections <mute>
  change_microphone_gain  :Change microphone gain per connection <gain
                           [gain [...]]>
```

Before being able to perform any stream operation, the device must also perform the `bap discover` operation to discover the ASEs and PAC records. The `bap init` command also needs to be called.

When connected

Discovering CAS and CSIS on a device

```
uart:~$ cap_commander discover
discovery completed with CSIS
```

Setting the volume on all connected devices

```
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$ cap_commander change_volume 15
uart:~$ cap_commander change_volume 15
Setting volume to 15 on 2 connections
VCP volume 15, mute 0
VCP vol_set done
VCP volume 15, mute 0
VCP flags 0x01
VCP vol_set done
Volume change completed
```

Setting the volume offset on one or more devices The offsets are set by connection index, so connection index 0 gets the first offset, and index 1 gets the second offset, etc.:

```
uart:~$ bt connect <device A>
Connected: <device A>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ bt connect <device B>
Connected: <device B>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ cap_commander change_volume_offset 10
Setting volume offset on 1 connections
VOCS inst 0x200140a4 offset 10
Offset set for inst 0x200140a4
Volume offset change completed
uart:~$
uart:~$ cap_commander change_volume_offset 10 15
Setting volume offset on 2 connections
Offset set for inst 0x200140a4
VOCS inst 0x20014188 offset 15
Offset set for inst 0x20014188
Volume offset change completed
```

Setting the volume mute on all connected devices

```
uart:~$ bt connect <device A>
Connected: <device A>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ bt connect <device B>
Connected: <device B>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ vcp_vol_ctlr discover
VCP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ cap_commander change_volume_mute 1
Setting volume mute to 1 on 2 connections
VCP volume 100, mute 1
VCP mute done
VCP volume 100, mute 1
VCP mute done
Volume mute change completed
uart:~$ cap_commander change_volume_mute 0
Setting volume mute to 0 on 2 connections
VCP volume 100, mute 0
VCP unmute done
VCP volume 100, mute 0
VCP unmute done
Volume mute change completed
```

Setting the microphone mute on all connected devices

```
uart:~$ bt connect <device A>
Connected: <device A>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ micp_mic_ctlr discover
MICP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ bt connect <device B>
Connected: <device B>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ micp_mic_ctlr discover
MICP discover done with 1 VOCS and 1 AICS
uart:~$
uart:~$ cap_commander change_microphone_mute 1
Setting microphone mute to 1 on 2 connections
MICP microphone 100, mute 1
MICP mute done
MICP microphone 100, mute 1
MICP mute done
Microphone mute change completed
uart:~$ cap_commander change_microphone_mute 0
Setting microphone mute to 0 on 2 connections
MICP microphone 100, mute 0
MICP unmute done
MICP microphone 100, mute 0
MICP unmute done
Microphone mute change completed
```

Setting the microphone gain on one or more devices The gains are set by connection index, so connection index 0 gets the first offset, and index 1 gets the second offset, etc.:

```
uart:~$ bt connect <device A>
Connected: <device A>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ micp_mic_ctlr discover
MICP discover done with 1 AICS
uart:~$
uart:~$ bt connect <device B>
Connected: <device B>
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ micp_mic_ctlr discover
MICP discover done with 1 AICS
uart:~$
uart:~$ cap_commander change_microphone_gain 10
Setting microphone gain on 1 connections
AICS inst 0x200140a4 state gain 10, mute 0, mode 0
Gain set for inst 0x200140a4
Microphone gain change completed
uart:~$
uart:~$ cap_commander change_microphone_gain 10 15
Setting microphone gain on 2 connections
Gain set for inst 0x200140a4
AICS inst 0x20014188 state gain 15, mute 0, mode 0
Gain set for inst 0x20014188
Microphone gain change completed
```

Starting a broadcast reception

```
uart:~$ bt connect <device A>
Connected: <device A>
uart:~$ bap_init
uart:~$ cap_commander discover
discovery completed with CSIS
uart:~$ bap_broadcast_assistant discover
BASS discover done with 1 recv states
uart:~$ cap_commander broadcast_reception_start <device B> 0 4
Starting broadcast reception on 1 connection(s)
```

Bluetooth: Call Control Profile This document describes how to run the call control functionality, both as a client and as a (telephone bearer service (TBS)) server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

Telephone Bearer Service Client The telephone bearer service client will typically exist on a resource restricted device, such as headphones, but may also exist on e.g. phones or laptops. The call control client will also thus typically be the advertiser. The client can control the states of calls on a server using the call control point.

It is necessary to have `CONFIG_BT_TBS_CLIENT_LOG_LEVEL_DBG` enabled for using the client interactively.

Using the telephone bearer service client When the Bluetooth stack has been initialized (`bt init`), and a device has been connected, the telephone bearer service client can discover TBS on the connected device calling `tbs_client discover`, which will start a discovery for the TBS UUIDs and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Since a server may have multiple TBS instances, most of the tbs_client commands will take an index (starting from 0) as input. Joining calls require at least 2 call IDs, and all call indexes shall be on the same TBS instance.

A server may also have a GTBS instance, which is an abstraction layer for all the telephone bearers on the server. If the server has both GTBS and TBS, the client may subscribe and use either when sending requests if `BT_TBS_CLIENT_GTBS` is enabled.

```
tbs_client --help
tbs_client - Bluetooth TBS_CLIENT shell commands
Subcommands:
   discover                       :Discover TBS [subscribe]
   set_signal_reporting_interval  :Set the signal reporting interval
                                   [<{instance_index, gtbs}>] <interval>
   originate                      :Originate a call [<{instance_index, gtbs}>]
                                   <uri>
   terminate                      :terminate a call [<{instance_index, gtbs}>]
                                   <id>
   accept                         :Accept a call [<{instance_index, gtbs}>] <id>
   hold                           :Place a call on hold [<{instance_index,
                                   gtbs}>] <id>
   retrieve                       :Retrieve a held call [<{instance_index,
                                   gtbs}>] <id>
   read_provider_name             :Read the bearer name [<{instance_index,
                                   gtbs}>]
   read_bearer_uci                :Read the bearer UCI [<{instance_index, gtbs}>]
   read_technology                :Read the bearer technology [<{instance_index,
                                   gtbs}>]
```

(continues on next page)

(continued from previous page)

```
   read_uri_list                  :Read the bearer's supported URI list
                                    [<{instance_index, gtbs}>]
   read_signal_strength           :Read the bearer signal strength
                                    [<{instance_index, gtbs}>]
   read_signal_interval           :Read the bearer signal strength reporting
                                    interval [<{instance_index, gtbs}>]
   read_current_calls             :Read the current calls [<{instance_index,
                                    gtbs}>]
   read_ccid                      :Read the CCID [<{instance_index, gtbs}>]
   read_status_flags              :Read the in feature and status value
                                    [<{instance_index, gtbs}>]
   read_uri                       :Read the incoming call target URI
                                    [<{instance_index, gtbs}>]
   read_call_state                :Read the call state [<{instance_index, gtbs}>]
   read_remote_uri                :Read the incoming remote URI
                                    [<{instance_index, gtbs}>]
   read_friendly_name             :Read the friendly name of an incoming call
                                    [<{instance_index, gtbs}>]
   read_optional_opcodes          :Read the optional opcodes [<{instance_index,
                                    gtbs}>]
```

In the following examples, notifications from GTBS is ignored, unless otherwise specified.

Example usage

Setup

```
uart:~$ bt init
uart:~$ bt advertise on
Advertising started
```

When connected Placing a call:

```
uart:~$ tbs_client discover
<dbg> bt_tbs_client.primary_discover_func: Discover complete, found 1 instances (GTBS found)
<dbg> bt_tbs_client.discover_func: Setup complete for 1 / 1 TBS
<dbg> bt_tbs_client.discover_func: Setup complete GTBS
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state with␣
↪URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode for␣
↪call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state with␣
↪URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state with URI␣
↪tel:123
```

Placing a call on GTBS:

```
uart:~$ tbs_client originate 0 tel:123
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the dialing state with␣
↪URI tel:123
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the originate opcode for␣
```

(continues on next page)

(continued from previous page)

```
↪call 0x00
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the alerting state with␣
↪URI tel:123
<call answered by peer device, and status notified by TBS server>
<dbg> bt_tbs_client.notify_handler: Index 0
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x01 is in the active state with URI␣
↪tel:123
```

It is necessary to set an outgoing caller ID before placing a call.

Accepting incoming call from peer device:

```
<dbg> bt_tbs_client.incoming_uri_notify_handler: tel:123
<dbg> bt_tbs_client.in_call_notify_handler: tel:456
<dbg> bt_tbs_client.friendly_name_notify_handler: Peter
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the incoming state with␣
↪URI tel:456
uart:~$ tbs_client accept 0 5
<dbg> bt_tbs_client.call_cp_callback_handler: Status: success for the accept opcode for␣
↪call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler: Call 0x05 is in the active state with URI␣
↪tel
```

Terminate call:

```
uart:~$ tbs_client terminate 0 5
<dbg> bt_tbs_client.termination_reason_notify_handler: ID 0x05, reason 0x06
<dbg> bt_tbs_client.call_cp_notify_handler: Status: success for the terminate opcode for␣
↪call 0x05
<dbg> bt_tbs_client.current_calls_notify_handler:
```

Telephone Bearer Service (TBS) The telephone bearer service is a service that typically resides on devices that can make calls, including calls from apps such as Skype, e.g. (smart)phones and PCs.

It is necessary to have `CONFIG_BT_TBS_LOG_LEVEL_DBG` enabled for using the TBS server interactively.

Using the telephone bearer service TBS can be controlled locally, or by a remote device (when in a call). For example a remote device may initiate a call to the device with the TBS server, or the TBS server may initiate a call to remote device, without a TBS_CLIENT client. The TBS implementation is capable of fully controlling any call.

```
tbs --help
tbs - Bluetooth TBS shell commands
Subcommands:
   init                        :Initialize TBS
   authorize                   :Authorize the current connection
   accept                      :Accept call <call_index>
   terminate                   :Terminate call <call_index>
   hold                        :Hold call <call_index>
   retrieve                    :Retrieve call <call_index>
   originate                   :Originate call [<instance_index>] <uri>
   join                        :Join calls <id> <id> [<id> [<id> [...]]]
   incoming                    :Simulate incoming remote call [<{instance_index,
                                gtbs}>] <local_uri> <remote_uri>
                                <remote_friendly_name>
   remote_answer               :Simulate remote answer outgoing call <call_index>
```

(continues on next page)

(continued from previous page)

```
   remote_retrieve             :Simulate remote retrieve <call_index>
   remote_terminate            :Simulate remote terminate <call_index>
   remote_hold                 :Simulate remote hold <call_index>
   set_bearer_provider_name    :Set the bearer provider name [<{instance_index,
                                gtbs}>] <name>
   set_bearer_technology       :Set the bearer technology [<{instance_index,
                                gtbs}>] <technology>
   set_bearer_signal_strength  :Set the bearer signal strength [<{instance_index,
                                gtbs}>] <strength>

   set_uri_scheme              :Set the URI prefix list <bearer_idx> <uri1 [uri2
                                [uri3 [...]]]>
   print_calls                 :Output all calls in the debug log
```

Example Usage

Setup

```
uart:~$ bt init
uart:~$ bt connect xx:xx:xx:xx:xx:xx public
```

When connected Answering a call for a peer device originated by a client:

```
<dbg> bt_tbs.write_call_cp: Index 0: Processing the originate opcode
<dbg> bt_tbs.originate_call: New call with call index 1
<dbg> bt_tbs.write_call_cp: Index 0: Processed the originate opcode with status success for␣
↪call index 1
uart:~$ tbs remote_answer 1
TBS succeeded for call_id: 1
```

Incoming call from a peer device, accepted by client:

```
uart:~$ tbs incoming 0 tel:123 tel:456 Peter
TBS succeeded for call_id: 4
<dbg> bt_tbs.bt_tbs_remote_incoming: New call with call index 4
<dbg> bt_tbs.write_call_cp: Index 0: Processed the accept opcode with status success for␣
↪call index 4
```

Bluetooth: Coordinated Set Identification Profile This document describes how to run the coordinated set identification functionality, both as a client and as a server. Note that in the examples below, some lines of debug have been removed to make this shorter and provide a better overview.

Set Coordinator (Client) The client will typically be a resource-rich device, such as a smartphone or a laptop. The client is able to lock and release members of a coordinated set. While the coordinated set is locked, no other clients may lock the set.

To lock a set, the client must connect to each of the set members it wants to lock. This implementation will always try to connect to all the members of the set, and at the same time. Thus if the set size is 3, then `BT_MAX_CONN` shall be at least 3.

If the locks on set members shall persists through disconnects, it is necessary to bond with the set members. If you need to bond with multiple set members, make sure that `BT_MAX_PAIRED` is correctly configured.

Using the Set Coordinator When the Bluetooth stack has been initialized (`bt init`), and a set member device has been connected, the call control client can be initialized by calling `csip_set_coordinator init`, which will start a discovery for the TBS uuids and store the handles, and optionally subscribe to all notifications (default is to subscribe to all).

Once the client has connected and discovered the handles, then it can read the set information, which is needed to identify other set members. The client can then scan for and connect to the remaining set members, and once all the members has been connected to, it can lock and release the set.

It is necessary to enable `CONFIG_BT_CSIP_SET_COORDINATOR_LOG_LEVEL_DBG` to properly use the set coordinator.

```
csip_set_coordinator --help
csip_set_coordinator - Bluetooth CSIP_SET_COORDINATOR shell commands
Subcommands:
   init              :Initialize CSIP_SET_COORDINATOR
   discover          :Run discover for CSIS on peer device [member_index]
   discover_members  :Scan for set members <set_pointer>
   lock_set          :Lock set
   release_set       :Release set
   lock              :Lock specific member [member_index]
   release           :Release specific member [member_index]
   lock_get          :Get the lock value of the specific member and instance
                      [member_index [inst_idx]]
```

Example usage

Setup

```
uart:~$ init
uart:~$ bt connect xx:xx:xx:xx:xx:xx public
```

When connected Discovering sets on a device:

```
uart:~$ csip_set_coordinator init
<dbg> bt_csip_set_coordinator.primary_discover_func: [ATTRIBUTE] handle 0x0048
<dbg> bt_csip_set_coordinator.primary_discover_func: Discover complete, found 1 instances
<dbg> bt_csip_set_coordinator.discover_func: Setup complete for 1 / 1
Found 1 sets on device
uart:~$ csip_set_coordinator discover_sets

Set released
```

Coordinated Set Member (Server) The server on devices that are part of a set, consisting of at least two devices, e.g. a pair of earbuds.

Using the Set Member

```
csip_set_member --help
csip_set_member - Bluetooth CSIP set member shell commands
Subcommands:
   register      :Initialize the service and register callbacks [size <int>]
                  [rank <int>] [not-lockable] [sirk <data>]
   lock          :Lock the set
   release       :Release the set [force]
   sirk          :Set the currently used SIRK <sirk>
   get_sirk      :Get the currently used SIRK
   sirk_rsp      :Set the response used in SIRK requests <accept, accept_enc,
                  reject, oob>
```

Example Usage

Setup

```
uart:~$ bt init
uart:~$ csip_set_member register
```

Setting a new SIRK This command can modify the currently used SIRK. To get the new RSI to advertise on air, `bt adv-data` or `bt advertise` must be called again to set the new advertising data. If `CONFIG_BT_CSIP_SET_MEMBER_NOTIFIABLE` is enabled, this will also notify connected clients.

```
uart:~$ csip_set_member sirk 00112233445566778899aabbccddeeff
SIRK updated
```

Getting the current SIRK This command can get the currently used SIRK.

```
uart:~$ csip_set_member get_sirk
SIRK
36 04 9a dc 66 3a a1 a1 |6...f:..
1d 9a 2f 41 01 73 3e 01 |../A.s>.
```

Bluetooth: Gaming Audio Profile Shell This document describes how to run the Gaming Audio Profile shell functionality. Unlike most other low-layer profiles, GMAP is a profile that exists and has a service (GMAS) on all devices. Thus both the initiator and acceptor (or central and peripheral) should do a discovery of the remote device's GMAS to see what GMAP roles and features they support.

Using the GMAP Shell When the Bluetooth stack has been initialized (`bt init`), the GMAS can be registered by by calling `gmap init`. It is also strongly suggested to enable BAP via `bap init`.

```
uart:~$ gmap --help
gmap - Bluetooth GMAP shell commands
Subcommands:
  init      : [none]
  set_role  : [ugt | ugg | bgr | bgs]
  discover  : [none]
  ac_1      : Unicast audio configuration 1
  ac_2      : Unicast audio configuration 2
  ac_3      : Unicast audio configuration 3
  ac_4      : Unicast audio configuration 4
  ac_5      : Unicast audio configuration 5
  ac_6_i    : Unicast audio configuration 6(i)
  ac_6_ii   : Unicast audio configuration 6(ii)
  ac_7_ii   : Unicast audio configuration 7(ii)
  ac_8_i    : Unicast audio configuration 8(i)
  ac_8_ii   : Unicast audio configuration 8(ii)
  ac_11_i   : Unicast audio configuration 11(i)
  ac_11_ii  : Unicast audio configuration 11(ii)
  ac_12     : Broadcast audio configuration 12
  ac_13     : Broadcast audio configuration 13
  ac_14     : Broadcast audio configuration 14
```

The `set_role` command can be used to change the role at runtime, assuming that the device supports the role (the GMAP roles depend on some BAP configurations).

Example Central with GMAP UGT role Connect and establish Gaming Audio streams using Audio Configuration (AC) 3 (some logging has been omitted for clarity):

```
uart:~$ bt init
uart:~$ bap init
uart:~$ gmap init
uart:~$ bt connect <address>
```

(continues on next page)

(continued from previous page)

Media control for Generic Audio Content Control This document describes how to run the media control functionality, using the shell, both as a client and as a server.

The media control server consists of to parts. There is a media player (mpl) that contains the logic to handle media, and there is a media control service (mcs) that serves as a GATT-based interface to the player. The media control client consists of one part, the GATT based client (mcc).

The media control server may include an object transfer service (ots) and the media control client may include an object transfer client (otc). When these are included, a richer set of functionality is available.

The media control server and client both implement the Generic Media Control Service (only), and do not use any underlying Media Control Services.

Note that in the examples below, in many cases the debug output has been removed and long outputs may have been shortened to make the examples shorter and clearer.

Also note that this documentation does not list all shell commands, it just shows examples of some of them. The set of commands is explorable from the mcc shell and the mpl shell, by typing `mcc` or `mpl` and pressing TAB. A help text for each command can be found by doing `mcc` *<command>* `help` or `mpl` *<command>* `help`.

Overview A media player has a *name* and an *icon* that allows identification of the player for the user.

The content of the media player is structured into tracks and groups. A media player has a number of groups. A group contains tracks and other groups. (In this implementation, a group only contains tracks, not other groups.) Tracks can be divided into segments.

An active player will have a *current track*. This is the track that is playing now (if the player is playing). The current track has a *title*, a *duration* (given in hundredths of a second) and a *position* - the current position of the player within the track.

There is also a *current group* (the group of the current track), a *parent group* (the parent group of the current group) and a *next track*.

The media player is in a *state*, which will be one of playing, paused, seeking or inactive. When playing, playback happens at a given *playback speed*, and the tracks are played according to the *playing order*, which is one of the *playing orders supported*. Track changes are signalled as notifications of the *track changed* characteristic. When seeking (fast forward or fast rewind), the track position is moved according to the *seeking speed*.

The *opcodes supported* tells which operations are supported by the player by writing to the *media control point*. There is also a *search control point* that allows to search for groups and tracks according to various criteria, with the result returned in the *search results*.

Finally, the *content control ID* is used to associate the media player with an audio stream.

Media Control Client (MCP) The media control client is used to control, and to get information from, a media control server. Control is done by writing to one of the two control points, or by writing to other writable characteristics. Getting information is done by reading characteristics, or by configuring the server to send notifications.

Using the media control client Before use, the media control client must be initialized by the command `mcc init`.

To achieve a connection to the peer, the `bt` commands must be used - `bt init` followed by `bt advertise on` (or `bt connect` if the server is advertising).

When the media control client is connected to a media control server, the client can discover the server's Generic Media Control Service, by giving the command `mcc discover_mcs`. This will store the handles of the service, and (optionally, but default) subscribe to all notifications.

After discovery, the media control client can read and write characteristics, including the media control point and the search control point.

Example usage

Setup

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mcc init
MCC init complete

uart:~$ bt advertise on
Advertising started
Connected: F6:58:DC:27:F3:57 (random)
```

When connected Service discovery (GMCS and included OTS):

```
uart:~$ mcc discover_mcs
<dbg> bt_mcc.bt_mcc_discover_mcs: start discovery of MCS primary service
<dbg> bt_mcc.discover_primary_func: [ATTRIBUTE] handle 0x00ae
<dbg> bt_mcc.discover_primary_func: Primary discovery complete
<dbg> bt_mcc.discover_primary_func: UUID: 2800
```

(continues on next page)

(continued from previous page)

```
<dbg> bt_mcc.discover_primary_func: UUID: 8fd7
<dbg> bt_mcc.discover_primary_func: Start discovery of MCS characteristics
<dbg> bt_mcc.discover_mcs_char_func: [ATTRIBUTE] handle 0x00b0

<dbg> bt_mcc.discover_otc_char_func: Setup complete for OTS 1 / 1
uart:~$
```

Reading characteristics - the player name and the track duration as examples:

```
uart:~$ mcc read_player_name
Player name: My media player
4d 79 20 6d 65 64 69 61  20 70 6c 61 79 65 72    |My media  player

uart:~$ mcc read_track_duration
Track duration: 6300
```

Note that the value of some characteristics may be truncated due to being too long to fit in the ATT packet. Increasing the ATT MTU may help:

```
uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for

uart:~$ gatt exchange-mtu
Exchange pending
Exchange successful

uart:~$ mcc read_track_title
Track title: Interlude #1 (Song for Alison)
```

Writing characteristics - track position as an example:

The track position is where the player “is” in the current track. Read the track position, change it by writing to it, confirm by reading it again.

```
uart:~$ mcc read_track_position
Track Position: 0
```

(continues on next page)

(continued from previous page)

```
uart:~$ mcc set_track_position 500
Track Position: 500

uart:~$ mcc read_track_position
Track Position: 500
```

Controlling the player via the control point:

Writing to the control point allows the client to request the server to do operations like play, pause, fast forward, change track, change group and so on. Some operations (e.g. goto track) take an argument. Currently, raw opcode values are used as input to the control point shell command. These opcode values can be found in the mpl.h header file.

Send the play command (opcode "1"), the command to go to track (opcode "52") number three, and the pause command (opcode "2"):

```
uart:~$ mcc set_cp 1
Media State: 1
Operation: 1, result: 1
Operation: 1, param: 0

uart:~$ mcc set_cp 52 3
Track changed
Track title: Interlude #3 (Levanto Seventy)
Track duration: 7800
Track Position: 0
Current Track Object ID: 0x000000000104
Next Track Object ID: 0x000000000105
Operation: 52, result: 1
Operation: 52, param: 3

uart:~$ mcc set_cp 2
Media State: 2
Operation: 2, result: 1
Operation: 2, param: 0
```

Using the included object transfer client When object transfer is supported by both the client and the server, a larger set of characteristics is available. These include object IDs for the various track and group objects. These IDs can be used to select and download the corresponding objects from the server's object transfer service.

Read the object ID of the current group object:

```
uart:~$ mcc read_current_group_obj_id
Current Group Object ID: 0x000000000107
```

Select the object with that ID:

```
uart:~$ mcc ots_select 0x107
Selecting object succeeded
```

Read the object's metadata:

```
uart:~$ mcc ots_read_metadata
Reading object metadata succeeded
<inf> bt_mcc: Object's meta data:
<inf> bt_mcc:        Current size    :35
<inf> bt_otc: --- Displaying 1 metadata records ---
<inf> bt_otc: Object ID: 0x000000000107
<inf> bt_otc: Object name: Joe Pass - Guitar Inte
```

(continues on next page)

(continued from previous page)

```
<inf> bt_otc: Object Current Size: 35
<inf> bt_otc: Object Allocate Size: 35
<inf> bt_otc: Type: Group Obj Type
<inf> bt_otc: Properties:0x4
<inf> bt_otc:  - read permitted
```

Read the object itself:

The object received is a group object. It consists of a series of records consisting of a type (track or group) and an object ID.

```
uart:~$ mcc ots_read_current_group_object
<dbg> bt_mcc.on_group_content: Object type: 0, object  ID: 0x000000000102
<dbg> bt_mcc.on_group_content: Object type: 0, object  ID: 0x000000000103
<dbg> bt_mcc.on_group_content: Object type: 0, object  ID: 0x000000000104
<dbg> bt_mcc.on_group_content: Object type: 0, object  ID: 0x000000000105
<dbg> bt_mcc.on_group_content: Object type: 0, object  ID: 0x000000000106
```

Search The search control point takes as its input a sequence of search control items, each consisting of length, type (e.g. track name or artist name) and parameter (the track name or artist name to search for). If the result is successful, the search results are stored in an object in the object transfer service. The ID of the search results ID object can be read from the search results object ID characteristic. The search result object can then be downloaded as for the current group object above. (Note that the search results object ID is empty until a search has been done.)

This implementation has a working implementation of the search functionality interface and the server-side search control point parameter parsing. But the **actual searching is faked**, the same results are returned no matter what is searched for.

There are two commands for search, one (`mcc set_scp_raw`) allows to input the search control point parameter (the sequence of search control items) as a string. The other (`mcc set_scp_ioptest`) does preset IOP test searches and takes the round number of the IOP search control point test as a parameter.

Before the search, the search results object ID is empty

```
uart:~$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000000
<dbg> bt_mcc.mcc_read_search_results_obj_id_cb: Zero-length Search Results Object ID
```

Run the search corresponding to the fourth round of the IOP test:

The search control point parameter generated by this command and parameter has one search control item. The length field (first octet) is 16 (0x10). (The length of the length field itself is not included.) The type field (second octet) is 0x04 (search for a group name). The parameter (the group name to search for) is “TSPX_Group_Name”.

```
uart:~$ mcc set_scp_ioptest 4
Search string:
00000000: 10 04 54 53 50 58 5f 47  72 6f 75 70 5f 4e 61 6d |..TSPX_G roup_Nam|
00000010: 65                                              |e                |
Search control point notification result code: 1
Search Results Object ID: 0x000000000107
Search Control Point set
```

After the successful search, the search results object ID has a value:

```
uart:~$ mcc read_search_results_obj_id
Search Results Object ID: 0x000000000107
```

Media Control Service (MCS) The media control service (mcs) and the associated media player (mpl) typically reside on devices that can provide access to, and serve, media content, like PCs and smartphones.

As mentioned above, the media player (mpl) has the player logic, while the media control service (mcs) has the GATT-based interface. This separation is done so that the media player can also be used without the GATT-based interface.

Using the media control service and the media player The media control service and the media player are in general controlled remotely, from the media control client.

Before use, the media control client must be initialized by the command `mpl init`.

As for the client, the `bt` commands are used for connecting - `bt init` followed by `bt connect <address> <address type>` (or `bt advertise on` if the server is advertising).

Example Usage

Setup

```
uart:~$ bt init
Bluetooth initialized

uart:~$ mpl init
[Large amounts of debug output]

uart:~$ bt connect F9:33:3B:67:D2:A7 (random)
Connection pending
Connected: F9:33:3B:67:D2:A7 (random)
```

When connected Control is done from the client.

The server will give debug output related to the various operations performed by the client.

Example: Debug output by the server when the client gives the "next track" command:

```
[00:13:29.932,373] <dbg> bt_mcs.control_point_write: Opcode: 49
[00:13:29.932,403] <dbg> bt_mpl.mpl_operation_set: opcode: 49, param: 536880068
[00:13:29.932,403] <dbg> bt_mpl.paused_state_operation_handler: Operation opcode: 49
[00:13:29.932,495] <dbg> bt_mpl.do_next_track: Track ID before: 0x000000000104
[00:13:29.932,586] <dbg> bt_mpl.do_next_track: Track ID after: 0x000000000105
[00:13:29.932,617] <dbg> bt_mcs.mpl_track_changed_cb: Notifying track change
[00:13:29.932,708] <dbg> bt_mcs.mpl_track_title_cb: Notifying track title: Interlude #4␣
↪(Vesper Dreams)
[00:13:29.932,800] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 13500
[00:13:29.932,861] <dbg> bt_mcs.mpl_track_position_cb: Notifying track position: 0
[00:13:29.933,044] <dbg> bt_mcs.mpl_current_track_id_cb: Notifying current track ID:␣
↪0x000000000105
[00:13:29.933,258] <dbg> bt_mcs.mpl_next_track_id_cb: Notifying next track ID:␣
↪0x000000000106
[00:13:29.933,380] <dbg> bt_mcs.mpl_operation_cb: Notifying control point - opcode: 49,␣
↪result: 1
```

Some server commands are available. These commands force notifications of the various characteristics, for testing that the client receives notifications. The values sent in the notifications caused by these testing commands are independent of the media player, so they do not correspond the actual values of the characteristics nor to the actual state of the media player.

Example: Force (fake value) notification of the track duration:

```
uart:~$ mpl duration_changed_cb
[00:15:17.491,058] <dbg> bt_mcs.mpl_track_duration_cb: Notifying track duration: 12000
```

Bluetooth: Telephone and Media Audio Profile Shell This document describes how to run the Telephone and Media Audio Profile functionality. Unlike most other low-layer profiles, TMAP is a profile that exists and has a service (TMAS) on all devices. Thus both the initiator and acceptor (or central and peripheral) should do a discovery of the remote device's TMAS to see what TMAP roles they support.

Using the TMAP Shell When the Bluetooth stack has been initialized (`bt init`), the TMAS can be registered by calling `tmap init`.

```
tmap --help
tmap - Bluetooth TMAP shell commands
Subcommands:
  init          :Initialize and register the TMAS
  discover      :Discover TMAS on remote device
```

Bluetooth: Public Broadcast Profile Shell This document describes how to run the Public Broadcast Profile functionality. PBP does not have an associated service. Its purpose is to enable a faster, more efficient discovery of Broadcast Sources that are transmitting audio with commonly used codec configurations.

Using the PBP Shell When the Bluetooth stack has been initialized (`bt init`), the Public Broadcast Profile is ready to run. To set the Public Broadcast Announcement features call `pbp set_features`.

```
pbp --help
pbp - Bluetooth PBP shell commands
Subcommands:
  set_features    :Set the Public Broadcast Announcement features
```

Bluetooth LE Host

Bluetooth standard services

Battery Service

group **bt_bas**

Battery Service (BAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Functions

uint8_t **bt_bas_get_battery_level**(void)

Read battery level value.

Read the characteristic value of the battery level

Returns
The battery level in percent.

int `bt_bas_set_battery_level`(uint8_t level)

Update battery level value.

Update the characteristic value of the battery level This will send a GATT notification to all current subscribers.

Parameters

- `level` – The battery level in percent.

Returns
Zero in case of success and error code in case of error.

Heart Rate Service

group `bt_hrs`

Heart Rate Service (HRS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Functions

int `bt_hrs_cb_register`(struct *bt_hrs_cb* *cb)

Heart rate service callback register.

This function will register callbacks that will be called in certain events related to Heart rate service.

Parameters

- `cb` – Pointer to callbacks structure. Must point to memory that remains valid until unregistered.

Returns
0 on success

Returns
-EINVAL in case cb is NULL

int `bt_hrs_cb_unregister`(struct *bt_hrs_cb* *cb)

Heart rate service callback unregister.

This function will unregister callback from Heart rate service.

Parameters

- `cb` – Pointer to callbacks structure

Returns
0 on success

Returns
-EINVAL in case cb is NULL

Returns
-ENOENT in case the cb was not found in registered callbacks

int `bt_hrs_notify`(uint16_t heartrate)

Notify heart rate measurement.

This will send a GATT notification to all current subscribers.

Parameters

- `heartrate` – The heartrate measurement in beats per minute.

Returns
Zero in case of success and error code in case of error.

struct `bt_hrs_cb`

#include <hrs.h> Heart rate service callback structure.

Public Members

void (*`ntf_changed`)(bool enabled)

Heart rate notifications changed.

Param enabled
Flag that is true if notifications were enabled, false if they were disabled.

Immediate Alert Service

group `bt_ias`

Immediate Alert Service (IAS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

`BT_IAS_CB_DEFINE`(_name)

Register a callback structure for immediate alert events.

Parameters

- `_name` – Name of callback structure.

Enums

enum `bt_ias_alert_lvl`

Values:

enumerator `BT_IAS_ALERT_LVL_NO_ALERT`

No alerting should be done on device.

enumerator `BT_IAS_ALERT_LVL_MILD_ALERT`

Device shall alert.

enumerator `BT_IAS_ALERT_LVL_HIGH_ALERT`

Device should alert in strongest possible way.

Functions

int **bt_ias_local_alert_stop**(void)
Method for stopping alert locally.

Returns
Zero in case of success and error code in case of error.

int **bt_ias_client_alert_write**(struct bt_conn *conn, enum *bt_ias_alert_lvl*)
Set alert level.

Parameters

- **conn** – Bluetooth connection object
- **bt_ias_alert_lvl** – Level of alert to write

Returns
Zero in case of success and error code in case of error.

int **bt_ias_discover**(struct bt_conn *conn)
Discover Immediate Alert Service.

Parameters

- **conn** – Bluetooth connection object

Returns
Zero in case of success and error code in case of error.

int **bt_ias_client_cb_register**(const struct *bt_ias_client_cb* *cb)
Register Immediate Alert Client callbacks.

Parameters

- **cb** – The callback structure

Returns
Zero in case of success and error code in case of error.

struct **bt_ias_cb**
#include <ias.h> Immediate Alert Service callback structure.

Public Members

void (***no_alert**)(void)
Callback function to stop alert.

This callback is called when peer commands to disable alert.

void (***mild_alert**)(void)
Callback function for alert level value.

This callback is called when peer commands to alert.

void (***high_alert**)(void)
Callback function for alert level value.

This callback is called when peer commands to alert in the strongest possible way.

struct **bt_ias_client_cb**
#include <ias.h>

Public Members

void (*`discover`)(struct bt_conn *conn, int err)

Callback function for bt_ias_discover.

This callback is called when discovery procedure is complete.

Param conn
Bluetooth connection object.

Param err
0 on success, ATT error or negative errno otherwise

Object Transfer Service

group `bt_ots`

Object Transfer Service (OTS)

[Experimental] Users should note that the APIs can change as a part of ongoing development.

Defines

`BT_OTS_OBJ_ID_SIZE`

Size of OTS object ID (in bytes).

`BT_OTS_OBJ_ID_MIN`

Minimum allowed value for object ID (except ID for directory listing)

`BT_OTS_OBJ_ID_MAX`

Maximum allowed value for object ID (except ID for directory listing)

`OTS_OBJ_ID_DIR_LIST`

ID of the Directory Listing Object.

`BT_OTS_OBJ_ID_MASK`

Mask for OTS object IDs, preserving the 48 bits.

`BT_OTS_OBJ_ID_STR_LEN`

Length of OTS object ID string (in bytes).

`BT_OTS_OBJ_SET_PROP_DELETE`(prop)

Set *BT_OTS_OBJ_PROP_DELETE* property.

Parameters

- `prop` – Object properties.

`BT_OTS_OBJ_SET_PROP_EXECUTE`(prop)

Set *BT_OTS_OBJ_PROP_EXECUTE* property.

Parameters

- `prop` – Object properties.

BT_OTS_OBJ_SET_PROP_READ(prop)
Set *BT_OTS_OBJ_PROP_READ* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_SET_PROP_WRITE(prop)
Set *BT_OTS_OBJ_PROP_WRITE* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_SET_PROP_APPEND(prop)
Set *BT_OTS_OBJ_PROP_APPEND* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_SET_PROP_TRUNCATE(prop)
Set *BT_OTS_OBJ_PROP_TRUNCATE* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_SET_PROP_PATCH(prop)
Set *BT_OTS_OBJ_PROP_PATCH* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_SET_PROP_MARKED(prop)
Set *BT_OTS_OBJ_SET_PROP_MARKED* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_DELETE(prop)
Get *BT_OTS_OBJ_PROP_DELETE* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_EXECUTE(prop)
Get *BT_OTS_OBJ_PROP_EXECUTE* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_READ(prop)
Get *BT_OTS_OBJ_PROP_READ* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_WRITE(prop)
Get *BT_OTS_OBJ_PROP_WRITE* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_APPEND(prop)
Get *BT_OTS_OBJ_PROP_APPEND* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_TRUNCATE(prop)
Get *BT_OTS_OBJ_PROP_TRUNCATE* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_PATCH(prop)
Get *BT_OTS_OBJ_PROP_PATCH* property.

Parameters

- **prop** – Object properties.

BT_OTS_OBJ_GET_PROP_MARKED(prop)
Get *BT_OTS_OBJ_PROP_MARKED* property.

Parameters

- **prop** – Object properties.

BT_OTS_OACP_SET_FEAT_CREATE(feat)
Set *BT_OTS_OACP_SET_FEAT_CREATE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_DELETE(feat)
Set *BT_OTS_OACP_FEAT_DELETE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_CHECKSUM(feat)
Set *BT_OTS_OACP_FEAT_CHECKSUM* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_EXECUTE(feat)
Set *BT_OTS_OACP_FEAT_EXECUTE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_READ(feat)
Set *BT_OTS_OACP_FEAT_READ* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_WRITE(feat)
Set *BT_OTS_OACP_FEAT_WRITE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_APPEND(feat)
Set *BT_OTS_OACP_FEAT_APPEND* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_TRUNCATE(feat)
Set *BT_OTS_OACP_FEAT_TRUNCATE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_PATCH(feat)
Set *BT_OTS_OACP_FEAT_PATCH* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_SET_FEAT_ABORT(feat)
Set *BT_OTS_OACP_FEAT_ABORT* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_CREATE(feat)
Get *BT_OTS_OACP_FEAT_CREATE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_DELETE(feat)
Get *BT_OTS_OACP_FEAT_DELETE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_CHECKSUM(feat)
Get *BT_OTS_OACP_FEAT_CHECKSUM* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_EXECUTE(feat)
Get *BT_OTS_OACP_FEAT_EXECUTE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_READ(feat)
Get *BT_OTS_OACP_FEAT_READ* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_WRITE(feat)
Get *BT_OTS_OACP_FEAT_WRITE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_APPEND(feat)
Get *BT_OTS_OACP_FEAT_APPEND* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_TRUNCATE(feat)
Get *BT_OTS_OACP_FEAT_TRUNCATE* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_PATCH(feat)
Get *BT_OTS_OACP_FEAT_PATCH* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OACP_GET_FEAT_ABORT(feat)
Get *BT_OTS_OACP_FEAT_ABORT* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_SET_FEAT_GO_TO(feat)
Set *BT_OTS_OLCP_FEAT_GO_TO* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_SET_FEAT_ORDER(feat)
Set *BT_OTS_OLCP_FEAT_ORDER* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_SET_FEAT_NUM_REQ(feat)
Set *BT_OTS_OLCP_FEAT_NUM_REQ* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_SET_FEAT_CLEAR(feat)
Set *BT_OTS_OLCP_FEAT_CLEAR* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_GET_FEAT_GO_TO(feat)
Get *BT_OTS_OLCP_GET_FEAT_GO_TO* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_GET_FEAT_ORDER(feat)
Get *BT_OTS_OLCP_GET_FEAT_ORDER* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_GET_FEAT_NUM_REQ(feat)

Get *BT_OTS_OLCP_GET_FEAT_NUM_REQ* feature.

Parameters

- **feat** – OTS features.

BT_OTS_OLCP_GET_FEAT_CLEAR(feat)

Get *BT_OTS_OLCP_GET_FEAT_CLEAR* feature.

Parameters

- **feat** – OTS features.

BT_OTS_DATE_TIME_FIELD_SIZE

BT_OTS_STOP

BT_OTS_CONTINUE

Typedefs

typedef int (*bt_ots_client_dirlisting_cb)(struct *bt_ots_obj_metadata* *meta)

Directory listing object metadata callback.

If a directory listing is decoded using *bt_ots_client_decode_dirlisting()*, this callback will be called for each object in the directory listing.

Param meta
The metadata of the decoded object

Return
int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop the decoding.

Enums

Properties of an OTS object.

Values:

enumerator BT_OTS_OBJ_PROP_DELETE = 0

Bit 0 Deletion of this object is permitted.

enumerator BT_OTS_OBJ_PROP_EXECUTE = 1

Bit 1 Execution of this object is permitted.

enumerator BT_OTS_OBJ_PROP_READ = 2

Bit 2 Reading this object is permitted.

enumerator BT_OTS_OBJ_PROP_WRITE = 3

Bit 3 Writing data to this object is permitted.

enumerator **BT_OTS_OBJ_PROP_APPEND** = 4

Bit 4 Appending data to this object is permitted.

```
Appending data increases its Allocated Size.
```

enumerator **BT_OTS_OBJ_PROP_TRUNCATE** = 5

Bit 5 Truncation of this object is permitted.

enumerator **BT_OTS_OBJ_PROP_PATCH** = 6

Bit 6 Patching this object is permitted.

```
Patching this object overwrites some of
the object's existing contents.
```

enumerator **BT_OTS_OBJ_PROP_MARKED** = 7

Bit 7 This object is a marked object.

Object Action Control Point Feature bits.

Values:

enumerator **BT_OTS_OACP_FEAT_CREATE** = 0

Bit 0 OACP Create Op Code Supported.

enumerator **BT_OTS_OACP_FEAT_DELETE** = 1

Bit 1 OACP Delete Op Code Supported

enumerator **BT_OTS_OACP_FEAT_CHECKSUM** = 2

Bit 2 OACP Calculate Checksum Op Code Supported.

enumerator **BT_OTS_OACP_FEAT_EXECUTE** = 3

Bit 3 OACP Execute Op Code Supported.

enumerator **BT_OTS_OACP_FEAT_READ** = 4

Bit 4 OACP Read Op Code Supported.

enumerator **BT_OTS_OACP_FEAT_WRITE** = 5

Bit 5 OACP Write Op Code Supported.

enumerator **BT_OTS_OACP_FEAT_APPEND** = 6

Bit 6 Appending Additional Data to Objects Supported

enumerator **BT_OTS_OACP_FEAT_TRUNCATE** = 7

Bit 7 Truncation of Objects Supported.

enumerator **BT_OTS_OACP_FEAT_PATCH** = 8

Bit 8 Patching of Objects Supported

enumerator **BT_OTS_OACP_FEAT_ABORT** = 9
Bit 9 OACP Abort Op Code Supported.

enum **bt_ots_oacp_write_op_mode**
Values:

enumerator **BT_OTS_OACP_WRITE_OP_MODE_NONE** = 0

enumerator **BT_OTS_OACP_WRITE_OP_MODE_TRUNCATE** = *BIT*(1)

Object List Control Point Feature bits.
Values:

enumerator **BT_OTS_OLCP_FEAT_GO_TO** = 0
Bit 0 OLCP Go To Op Code Supported.

enumerator **BT_OTS_OLCP_FEAT_ORDER** = 1
Bit 1 OLCP Order Op Code Supported.

enumerator **BT_OTS_OLCP_FEAT_NUM_REQ** = 2
Bit 2 OLCP Request Number of Objects Op Code Supported.

enumerator **BT_OTS_OLCP_FEAT_CLEAR** = 3
Bit 3 OLCP Clear Marking Op Code Supported.

Object metadata request bit field values.
Values:

enumerator **BT_OTS_METADATA_REQ_NAME** = *BIT*(0)
Request object name.

enumerator **BT_OTS_METADATA_REQ_TYPE** = *BIT*(1)
Request object type.

enumerator **BT_OTS_METADATA_REQ_SIZE** = *BIT*(2)
Request object size.

enumerator **BT_OTS_METADATA_REQ_CREATED** = *BIT*(3)
Request object first created time.

enumerator **BT_OTS_METADATA_REQ_MODIFIED** = *BIT*(4)
Request object last modified time.

enumerator **BT_OTS_METADATA_REQ_ID** = *BIT*(5)
Request object ID.

enumerator **BT_OTS_METADATA_REQ_PROPS** = *BIT*(6)

Request object properties.

enumerator **BT_OTS_METADATA_REQ_ALL** = 0x7F

Request all object metadata.

Functions

int **bt_ots_obj_add**(struct bt_ots *ots, const struct *bt_ots_obj_add_param* *param)

Add an object to the OTS instance.

This function adds an object to the OTS database. When the object is being added, a callback obj_created() is called to notify the user about a new object ID.

Parameters

- **ots** – OTS instance.
- **param** – Object addition parameters.

Returns

ID of created object in case of success.

Returns

negative value in case of error.

int **bt_ots_obj_delete**(struct bt_ots *ots, uint64_t id)

Delete an object from the OTS instance.

This function deletes an object from the OTS database. When the object is deleted a callback obj_deleted() is called to notify the user about this event. At this point, it is possible to free allocated buffer for object data.

Parameters

- **ots** – OTS instance.
- **id** – ID of the object to be deleted (uint48).

Returns

0 in case of success or negative value in case of error.

void ***bt_ots_svc_decl_get**(struct bt_ots *ots)

Get the service declaration attribute.

This function is enabled for CONFIG_BT_OTS_SECONDARY_SVC configuration. The first service attribute can be included in any other GATT service.

Parameters

- **ots** – OTS instance.

Returns

The first OTS attribute instance.

int **bt_ots_init**(struct bt_ots *ots, struct *bt_ots_init_param* *ots_init)

Initialize the OTS instance.

Parameters

- **ots** – OTS instance.
- **ots_init** – OTS initialization descriptor.

Returns

0 in case of success or negative value in case of error.

struct bt_ots *bt_ots_free_instance_get(void)

Get a free instance of OTS from the pool.

Returns
OTS instance in case of success or NULL in case of error.

int bt_ots_client_register(struct *bt_ots_client* *ots_inst)

Register an Object Transfer Service Instance.

Register an Object Transfer Service instance discovered on the peer. Call this function when an OTS instance is discovered (discovery is to be handled by the higher layer).

Parameters

- ots_inst – **[in]** Discovered OTS instance.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_unregister(uint8_t index)

Unregister an Object Transfer Service Instance.

Unregister an Object Transfer Service instance when disconnect from the peer. Call this function when an ACL using OTS instance is disconnected.

Parameters

- index – **[in]** Index of OTS instance.

Returns
int 0 if success, ERRNO on failure.

uint8_t bt_ots_client_indicate_handler(struct bt_conn *conn, struct *bt_gatt_subscribe_params* *params, const void *data, uint16_t length)

OTS Indicate Handler function.

Set this function as callback for indicate handler when discovering OTS.

Parameters

- conn – Connection object. May be NULL, indicating that the peer is being unpaired.
- params – Subscription parameters.
- data – Attribute value data. If NULL then subscription was removed.
- length – Attribute value length.

int bt_ots_client_read_feature(struct *bt_ots_client* *otc_inst, struct bt_conn *conn)

Read the OTS feature characteristic.

Parameters

- otc_inst – Pointer to the OTC instance.
- conn – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int bt_ots_client_select_id(struct *bt_ots_client* *otc_inst, struct bt_conn *conn, uint64_t obj_id)

Select an object by its Object ID.

Parameters

- otc_inst – Pointer to the OTC instance.

- **conn** – Pointer to the connection object.
- **obj_id** – Object's ID.

Returns
int 0 if success, ERRNO on failure.

int **bt_ots_client_select_first**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn)
Select the first object.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int **bt_ots_client_select_last**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn)
Select the last object.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int **bt_ots_client_select_next**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn)
Select the next object.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int **bt_ots_client_select_prev**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn)
Select the previous object.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

Returns
int 0 if success, ERRNO on failure.

int **bt_ots_client_read_object_metadata**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn, uint8_t metadata)
Read the metadata of the current object.

The metadata are returned in the obj_metadata_read() callback.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.
- **metadata** – Bitfield (`BT_OTS_METADATA_REQ_*`) of the metadata to read.

Returns
int 0 if success, ERRNO on failure.

int **bt_ots_client_read_object_data**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn)

Read the data of the current selected object.

This will trigger an OACP read operation for the current size of the object with a 0 offset and then expect receiving the content via the L2CAP CoC.

The data of the object are returned in the obj_data_read() callback.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.

Returns

int 0 if success, ERRNO on failure.

int **bt_ots_client_write_object_data**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn, const void *buf, size_t len, off_t offset, enum *bt_ots_oacp_write_op_mode* mode)

Write the data of the current selected object.

This will trigger an OACP write operation for the current object with a specified offset and then expect transferring the content via the L2CAP CoC.

The length of the data written to object is returned in the obj_data_written() callback.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.
- **buf** – Pointer to the data buffer to be written.
- **len** – Size of data.
- **offset** – Offset to write, usually 0.
- **mode** – Mode Parameter for OACP Write Op Code. See *bt_ots_oacp_write_op_mode*.

Returns

int 0 if success, ERRNO on failure.

int **bt_ots_client_get_object_checksum**(struct *bt_ots_client* *otc_inst, struct bt_conn *conn, off_t offset, size_t len)

Get the checksum of the current selected object.

This will trigger an OACP calculate checksum operation for the current object with a specified offset and length.

The checksum goes to OACP IND and obj_checksum_calculated() callback.

Parameters

- **otc_inst** – Pointer to the OTC instance.
- **conn** – Pointer to the connection object.
- **offset** – Offset to calculate, usually 0.
- **len** – Len of data to calculate checksum for. May be less than the current object's size, but shall not be larger.

Returns

int 0 if success, ERRNO on failure.

int **bt_ots_client_decode_dirlisting**(uint8_t *data, uint16_t length, *bt_ots_client_dirlisting_cb* cb)

Decode Directory Listing object into object metadata.

If the Directory Listing object contains multiple objects, then the callback will be called for each of them.

Parameters

- **data** – The data received for the directory listing object.
- **length** – Length of the data.
- **cb** – The callback that will be called for each object.

static inline int **bt_ots_obj_id_to_str**(uint64_t obj_id, char *str, size_t len)

Converts binary OTS Object ID to string.

Parameters

- **obj_id** – Object ID.
- **str** – Address of user buffer with enough room to store formatted string containing binary Object ID.
- **len** – Length of data to be copied to user string buffer. Refer to BT_OTS_OBJ_ID_STR_LEN about recommended value.

Returns

Number of successfully formatted bytes from binary ID.

void **bt_ots_metadata_display**(struct *bt_ots_obj_metadata* *metadata, uint16_t count)

Displays one or more object metadata as text with LOG_INF.

Parameters

- **metadata** – Pointer to the first (or only) metadata in an array.
- **count** – Number of metadata objects to display information of.

struct **bt_ots_obj_type**

#include <*ots.h*> Type of an OTS object.

struct **bt_ots_obj_size**

#include <*ots.h*> Descriptor for OTS Object Size parameter.

Public Members

uint32_t **cur**

Current Size.

uint32_t **alloc**

Allocated Size.

struct **bt_ots_feat**

#include <*ots.h*> Features of the OTS.

struct **bt_ots_date_time**

#include <*ots.h*> Date and Time structure.

struct **bt_ots_obj_metadata**

#include <*ots.h*> Metadata of an OTS object.

Used by the server as a descriptor for OTS object initialization. Used by the client to present object metadata to the application.

Public Members

struct *bt_ots_obj_type* **type**

Object Type.

struct *bt_ots_obj_size* **size**

Object Size.

uint32_t **props**

Object Properties.

struct **bt_ots_obj_add_param**

#include <*ots.h*> Descriptor for OTS object addition.

Public Members

uint32_t **size**

Object size to allocate.

struct *bt_ots_obj_type* **type**

Object type.

struct **bt_ots_obj_created_desc**

#include <*ots.h*> Descriptor for OTS created object.

Descriptor for OTS object created by the application. This descriptor is returned by *bt_ots_cb::obj_created* callback which contains further documentation on distinguishing between server and client object creation.

Public Members

char ***name**

Object name.

The object name as a NULL terminated string.

When the server creates a new object the name shall be > 0 and <= BT_OTS_OBJ_MAX_NAME_LEN When the client creates a new object the name shall be an empty string

struct *bt_ots_obj_size* **size**

Object size.

bt_ots_obj_size::alloc shall be >= *bt_ots_obj_add_param::size*

When the server creates a new object *bt_ots_obj_size::cur* shall be <= *bt_ots_obj_add_param::size* When the client creates a new object *bt_ots_obj_size::cur* shall be 0

uint32_t **props**

Object properties.

struct **bt_ots_cb**

#include <*ots.h*> OTS callback structure.

Public Members

int (***obj_created**)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const struct *bt_ots_obj_add_param* *add_param, struct *bt_ots_obj_created_desc* *created_desc)

Object created callback.

This callback is called whenever a new object is created. Application can reject this request by returning an error when it does not have necessary resources to hold this new object. This callback is also triggered when the server creates a new object with *bt_ots_obj_add()* API.

Param ots
OTS instance.

Param conn
The connection that is requesting object creation or NULL if object is created by *bt_ots_obj_add()*.

Param id
Object ID.

Param add_param
Object creation requested parameters.

Param created_desc
Created object descriptor that shall be filled by the receiver of this callback.

Return
0 in case of success or negative value in case of error.

Return
-ENOTSUP if object type is not supported

Return
-ENOMEM if no available space for new object.

Return
-EINVAL if an invalid parameter is provided

Return
other negative values are treated as a generic operation failure

int (***obj_deleted**)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object deleted callback.

This callback is called whenever an object is deleted. It is also triggered when the server deletes an object with *bt_ots_obj_delete()* API.

Param ots
OTS instance.

Param conn
The connection that deleted the object or NULL if this request came from the server.
Param id
Object ID.
Retval When
an error is indicated by using a negative value, the object delete procedure is aborted and a corresponding failed status is returned to the client.
Return
0 in case of success.
Return
-EBUSY if the object is locked. This is generally not expected to be returned by the application as the OTS layer tracks object accesses. An object locked status is returned to the client.
Return
Other negative values in case of error. A generic operation failed status is returned to the client.

void (*`obj_selected`)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id)

Object selected callback.

This callback is called on successful object selection.
Param ots
OTS instance.
Param conn
The connection that selected new object.
Param id
Object ID.

ssize_t (*`obj_read`)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, void **data, size_t len, off_t offset)

Object read callback.

This callback is called multiple times during the Object read operation. OTS module will keep requesting successive Object fragments from the application until the read operation is completed. The end of read operation is indicated by NULL data parameter.
Param ots
OTS instance.
Param conn
The connection that read object.
Param id
Object ID.
Param data
In: NULL once the read operations is completed. Out: Next chunk of data to be sent.
Param len
Remaining length requested by the client.
Param offset
Object data offset.
Return
Data length to be sent via data parameter. This value shall be smaller or equal to the len parameter.
Return
Negative value in case of an error.

ssize_t (*`obj_write`)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const void *data, size_t len, off_t offset, size_t rem)

Object write callback.

This callback is called multiple times during the Object write operation. OTS module will keep providing successive Object fragments to the application until the write operation is completed. The offset and length of each write fragment is validated by the OTS module to be within the allocated size of the object. The remaining length indicates data length remaining to be written and will decrease each write iteration until it reaches 0 in the last write fragment.

Param ots
OTS instance.
Param conn
The connection that wrote object.
Param id
Object ID.
Param data
Next chunk of data to be written.
Param len
Length of the current chunk of data in the buffer.
Param offset
Object data offset.
Param rem
Remaining length in the write operation.
Return
Number of bytes written in case of success, if the number of bytes written does not match len, -EIO is returned to the L2CAP layer.
Return
A negative value in case of an error.
Return
-EINPROGRESS has a special meaning and is unsupported at the moment. It should not be returned.

void (*`obj_name_written`)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, const char *cur_name, const char *new_name)

Object name written callback.

This callback is called when the object name is written. This is a notification to the application that the object name will be updated by the OTS service implementation.

Param ots
OTS instance.
Param conn
The connection that wrote object name.
Param id
Object ID.
Param cur_name
Current object name.
Param new_name
New object name.

int (*`obj_cal_checksum`)(struct bt_ots *ots, struct bt_conn *conn, uint64_t id, off_t offset, size_t len, void **data)

Object Calculate checksum callback.

This callback is called when the OACP Calculate Checksum procedure is performed. Because object data is opaque to OTS, the application is the only one who knows where data is and should return pointer of actual object data.

Param ots
[in] OTS instance.

Param conn
[in] The connection that wrote object.
Param id
[in] Object ID.
Param offset
[in] The first octet of the object contents need to be calculated.
Param len
[in] The length number of octets object name.
Param data
[out] Pointer of actual object data.
Return
0 to accept, or any negative value to reject.

struct **bt_ots_init_param**

#include <*ots.h*> Descriptor for OTS initialization.

struct **bt_ots_client**

#include <*ots.h*> OTS client instance.

struct **bt_ots_client_cb**

#include <*ots.h*> OTS client callback structure.

Public Members

void (***obj_selected**)(struct *bt_ots_client* *ots_inst, struct bt_conn *conn, int err)

Callback function when a new object is selected.

Called when the a new object is selected and the current object has changed. The `cur_object` in `ots_inst` will have been reset, and metadata should be read again with *bt_ots_client_read_object_metadata()*.

Param ots_inst
Pointer to the OTC instance.
Param conn
The connection to the peer device.
Param err
Error code (bt_ots_olcp_res_code).

int (***obj_data_read**)(struct *bt_ots_client* *ots_inst, struct bt_conn *conn, uint32_t offset, uint32_t len, uint8_t *data_p, bool is_complete)

Callback function for the data of the selected object.

Called when the data of the selected object are read using *bt_ots_client_read_object_data()*.

Param ots_inst
Pointer to the OTC instance.
Param conn
The connection to the peer device.
Param offset
Offset of the received data.
Param len
Length of the received data.
Param data_p
Pointer to the received data.
Param is_complete
Indicate if the whole object has been received.

Return
int BT_OTS_STOP or BT_OTS_CONTINUE. BT_OTS_STOP can be used to stop reading.

void (*`obj_metadata_read`)(struct *bt_ots_client* *ots_inst, struct bt_conn *conn, int err, uint8_t metadata_read)

Callback function for metadata of the selected object.

Called when metadata of the selected object are read using *bt_ots_client_read_object_metadata()*. Not all of the metadata may have been initialized.

Param ots_inst
Pointer to the OTC instance.
Param conn
The connection to the peer device.
Param err
Error value. 0 on success, GATT error or ERRNO on fail.
Param metadata_read
Bitfield of the metadata that was successfully read.

void (*`obj_data_written`)(struct *bt_ots_client* *ots_inst, struct bt_conn *conn, size_t len)

Callback function for the data of the write object.

Called when the data of the selected object is written using *bt_ots_client_write_object_data()*.

Param ots_inst
Pointer to the OTC instance.
Param conn
The connection to the peer device.
Param len
Length of the written data.

void (*`obj_checksum_calculated`)(struct *bt_ots_client* *ots_inst, struct bt_conn *conn, int err, uint32_t checksum)

Callback function when checksum indication is received.

Called when the oacp_ind_handler received response of OP BT_GATT_OTS_OACP_PROC_CHECKSUM_CALC.

Param ots_inst
Pointer to the OTC instance.
Param conn
The connection to the peer device.
Param err
Error code (bt_gatt_ots_oacp_res_code).
Param checksum
Checksum if error code is BT_GATT_OTS_OACP_RES_SUCCESS, otherwise 0.

Generic Access Profile (GAP)

API Reference

group `bt_gap`

Generic Access Profile (GAP)

Since
1.0

Version
1.0.0

Defines

`BT_ID_DEFAULT`

Convenience macro for specifying the default identity.

This helps make the code more readable, especially when only one identity is supported.

`BT_DATA_SERIALIZED_SIZE`(data_len)

Bluetooth data serialized size.

Get the size of a serialized *bt_data* given its data length.

Size of 'AD Structure'->'Length' field, equal to 1. Size of 'AD Structure'->'Data'->'AD Type' field, equal to 1. Size of 'AD Structure'->'Data'->'AD Data' field, equal to data_len.

See Core Specification Version 5.4 Vol. 3 Part C, 11, Figure 11.1.

`BT_DATA`(_type, _data, _data_len)

Helper to declare elements of *bt_data* arrays.

This macro is mainly for creating an array of struct *bt_data* elements which is then passed to e.g. *bt_le_adv_start()*.

Parameters

- **_type** – Type of advertising data field
- **_data** – Pointer to the data field payload
- **_data_len** – Number of bytes behind the _data pointer

`BT_DATA_BYTES`(_type, _bytes...)

Helper to declare elements of *bt_data* arrays.

This macro is mainly for creating an array of struct *bt_data* elements which is then passed to e.g. *bt_le_adv_start()*.

Parameters

- **_type** – Type of advertising data field
- **_bytes** – Variable number of single-byte parameters

`BT_LE_ADV_PARAM_INIT`(_options, _int_min, _int_max, _peer)

Initialize advertising parameters.

Parameters

- **_options** – Advertising Options
- **_int_min** – Minimum advertising interval
- **_int_max** – Maximum advertising interval
- **_peer** – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

BT_LE_ADV_PARAM(_options, _int_min, _int_max, _peer)

Helper to declare advertising parameters inline.

Parameters

- **_options** – Advertising Options
- **_int_min** – Minimum advertising interval
- **_int_max** – Maximum advertising interval
- **_peer** – Peer address, set to NULL for undirected advertising or address of peer for directed advertising.

BT_LE_ADV_CONN_DIR(_peer)

BT_LE_ADV_CONN

BT_LE_ADV_CONN_ONE_TIME

This is the recommended default for connectable advertisers.

BT_LE_ADV_CONN_NAME

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

BT_LE_ADV_CONN_NAME_AD

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

BT_LE_ADV_CONN_DIR_LOW_DUTY(_peer)

BT_LE_ADV_NCONN

Non-connectable advertising with private address.

BT_LE_ADV_NCONN_NAME

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Non-connectable advertising with *BT_LE_ADV_OPT_USE_NAME*

BT_LE_ADV_NCONN_IDENTITY

Non-connectable advertising with *BT_LE_ADV_OPT_USE_IDENTITY*.

BT_LE_EXT_ADV_CONN

Connectable extended advertising.

BT_LE_EXT_ADV_CONN_NAME

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Connectable extended advertising with *BT_LE_ADV_OPT_USE_NAME*

BT_LE_EXT_ADV_SCAN

Scannable extended advertising.

BT_LE_EXT_ADV_SCAN_NAME

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Scannable extended advertising with *BT_LE_ADV_OPT_USE_NAME*

BT_LE_EXT_ADV_NCONN

Non-connectable extended advertising with private address.

BT_LE_EXT_ADV_NCONN_NAME

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Non-connectable extended advertising with *BT_LE_ADV_OPT_USE_NAME*

BT_LE_EXT_ADV_NCONN_IDENTITY

Non-connectable extended advertising with *BT_LE_ADV_OPT_USE_IDENTITY*.

BT_LE_EXT_ADV_CODED_NCONN

Non-connectable extended advertising on coded PHY with private address.

BT_LE_EXT_ADV_CODED_NCONN_NAME

Deprecated:

This macro will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Non-connectable extended advertising on coded PHY with *BT_LE_ADV_OPT_USE_NAME*

BT_LE_EXT_ADV_CODED_NCONN_IDENTITY

Non-connectable extended advertising on coded PHY with *BT_LE_ADV_OPT_USE_IDENTITY*.

BT_LE_EXT_ADV_START_PARAM_INIT(_timeout, _n_evts)

Helper to initialize extended advertising start parameters inline.

Parameters

- **_timeout** – Advertiser timeout
- **_n_evts** – Number of advertising events

BT_LE_EXT_ADV_START_PARAM(_timeout, _n_evts)

Helper to declare extended advertising start parameters inline.

Parameters

- **_timeout** – Advertiser timeout
- **_n_evts** – Number of advertising events

BT_LE_EXT_ADV_START_DEFAULT

BT_LE_PER_ADV_PARAM_INIT(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline.

Parameters

- **_int_min** – Minimum periodic advertising interval
- **_int_max** – Maximum periodic advertising interval
- **_options** – Periodic advertising properties bitfield.

BT_LE_PER_ADV_PARAM(_int_min, _int_max, _options)
Helper to declare periodic advertising parameters inline.

Parameters

- **_int_min** – Minimum periodic advertising interval
- **_int_max** – Maximum periodic advertising interval
- **_options** – Periodic advertising properties bitfield.

BT_LE_PER_ADV_DEFAULT

BT_LE_SCAN_OPT_FILTER_WHITELIST

BT_LE_SCAN_PARAM_INIT(_type, _options, _interval, _window)
Initialize scan parameters.

Parameters

- **_type** – Scan Type, BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE.
- **_options** – Scan options
- **_interval** – Scan Interval (N * 0.625 ms)
- **_window** – Scan Window (N * 0.625 ms)

BT_LE_SCAN_PARAM(_type, _options, _interval, _window)
Helper to declare scan parameters inline.

Parameters

- **_type** – Scan Type, BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE.
- **_options** – Scan options
- **_interval** – Scan Interval (N * 0.625 ms)
- **_window** – Scan Window (N * 0.625 ms)

BT_LE_SCAN_ACTIVE
Helper macro to enable active scanning to discover new devices.

BT_LE_SCAN_ACTIVE_CONTINUOUS
Helper macro to enable active scanning to discover new devices with window == interval.

Continuous scanning should be used to maximize the chances of receiving advertising packets.

BT_LE_SCAN_PASSIVE

Helper macro to enable passive scanning to discover new devices.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

BT_LE_SCAN_PASSIVE_CONTINUOUS

Helper macro to enable passive scanning to discover new devices with window==interval.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

BT_LE_SCAN_CODED_ACTIVE

Helper macro to enable active scanning to discover new devices.

Include scanning on Coded PHY in addition to 1M PHY.

BT_LE_SCAN_CODED_PASSIVE

Helper macro to enable passive scanning to discover new devices.

Include scanning on Coded PHY in addition to 1M PHY.

This macro should be used if information required for device identification (e.g., UUID) are known to be placed in Advertising Data.

Typedefs

typedef void (*bt_ready_cb_t)(int err)

Callback for notifying that Bluetooth has been enabled.

Param err
zero on success or (negative) error code otherwise.

typedef void bt_le_scan_cb_t(const *bt_addr_le_t* *addr, int8_t rssi, uint8_t adv_type, struct *net_buf_simple* *buf)

Callback type for reporting LE scan results.

A function of this type is given to the *bt_le_scan_start()* function and will be called for any discovered LE device.

Param addr
Advertiser LE address and type.

Param rssi
Strength of advertiser signal.

Param adv_type
Type of advertising response from advertiser. Uses the BT_GAP_ADV_TYPE_* values.

Param buf
Buffer containing advertiser data.

typedef void bt_br_discovery_cb_t(struct *bt_br_discovery_result* *results, size_t count)

Callback type for reporting BR/EDR discovery (inquiry) results.

A callback of this type is given to the *bt_br_discovery_start()* function and will be called at the end of the discovery with information about found devices populated in the results array.

Param results
Storage used for discovery results

Param count
Number of valid discovery results.

Enums

Advertising options.

Values:

enumerator BT_LE_ADV_OPT_NONE = 0

Convenience value when no options are specified.

enumerator BT_LE_ADV_OPT_CONNECTABLE = *BIT*(0)

Advertise as connectable.

Advertise as connectable. If not connectable then the type of advertising is determined by providing scan response data. The advertiser address is determined by the type of advertising and/or enabling privacy CONFIG_BT_PRIVACY .

enumerator BT_LE_ADV_OPT_ONE_TIME = *BIT*(1)

Advertise one time.

Don't try to resume connectable advertising after a connection. This option is only meaningful when used together with BT_LE_ADV_OPT_CONNECTABLE. If set the advertising will be stopped when *bt_le_adv_stop()* is called or when an incoming (peripheral) connection happens. If this option is not set the stack will take care of keeping advertising enabled even as connections occur. If Advertising directed or the advertiser was started with *bt_le_ext_adv_start* then this behavior is the default behavior and this flag has no effect.

enumerator BT_LE_ADV_OPT_USE_IDENTITY = *BIT*(2)

Advertise using identity address.

Advertise using the identity address as the advertiser address.

Note

The address used for advertising will not be the same as returned by *bt_le_oob_get_local*, instead *bt_id_get* should be used to get the LE address.

Warning

This will compromise the privacy of the device, so care must be taken when using this option.

enumerator BT_LE_ADV_OPT_USE_NAME = *BIT*(3)

Advertise using GAP device name.

Deprecated:

This option will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Include the GAP device name automatically when advertising. By default the GAP device name is put at the end of the scan response data. When advertising using *BT_LE_ADV_OPT_EXT_ADV* and not *BT_LE_ADV_OPT_SCANNABLE* then it will be put at the end of the advertising data. If the GAP device name does not fit into advertising data it will be converted to a shortened name if possible. *BT_LE_ADV_OPT_FORCE_NAME_IN_AD* can be used to force the device name to appear in the advertising data of an advert with scan response data.

The application can set the device name itself by including the following in the advertising data.

```
BT_DATA(BT_DATA_NAME_COMPLETE, name, sizeof(name) - 1)
```

enumerator **BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY** = *BIT*(4)

Low duty cycle directed advertising.

Use low duty directed advertising mode, otherwise high duty mode will be used.

enumerator **BT_LE_ADV_OPT_DIR_ADDR_RPA** = *BIT*(5)

Directed advertising to privacy-enabled peer.

Enable use of Resolvable Private Address (RPA) as the target address in directed advertisements. This is required if the remote device is privacy-enabled and supports address resolution of the target address in directed advertisement. It is the responsibility of the application to check that the remote device supports address resolution of directed advertisements by reading its Central Address Resolution characteristic.

enumerator **BT_LE_ADV_OPT_FILTER_SCAN_REQ** = *BIT*(6)

Use filter accept list to filter devices that can request scan response data.

enumerator **BT_LE_ADV_OPT_FILTER_CONN** = *BIT*(7)

Use filter accept list to filter devices that can connect.

enumerator **BT_LE_ADV_OPT_NOTIFY_SCAN_REQ** = *BIT*(8)

Notify the application when a scan response data has been sent to an active scanner.

enumerator **BT_LE_ADV_OPT_SCANNABLE** = *BIT*(9)

Support scan response data.

When used together with *BT_LE_ADV_OPT_EXT_ADV* then this option cannot be used together with the *BT_LE_ADV_OPT_CONNECTABLE* option. When used together with *BT_LE_ADV_OPT_EXT_ADV* then scan response data must be set.

enumerator **BT_LE_ADV_OPT_EXT_ADV** = *BIT*(10)

Advertise with extended advertising.

This options enables extended advertising in the advertising set. In extended advertising the advertising set will send a small header packet on the three primary advertising channels. This small header points to the advertising data packet that will be sent on one of the 37 secondary advertising channels. The advertiser will

send primary advertising on LE 1M PHY, and secondary advertising on LE 2M PHY. Connections will be established on LE 2M PHY.

Without this option the advertiser will send advertising data on the three primary advertising channels.

Note

Enabling this option requires extended advertising support in the peer devices scanning for advertisement packets.

Note

This cannot be used with *bt_le_adv_start()*.

enumerator `BT_LE_ADV_OPT_NO_2M` = *BIT*(11)

Disable use of LE 2M PHY on the secondary advertising channel.

Disabling the use of LE 2M PHY could be necessary if scanners don't support the LE 2M PHY. The advertiser will send primary advertising on LE 1M PHY, and secondary advertising on LE 1M PHY. Connections will be established on LE 1M PHY.

Note

Cannot be set if BT_LE_ADV_OPT_CODED is set.

Note

Requires *BT_LE_ADV_OPT_EXT_ADV*.

enumerator `BT_LE_ADV_OPT_CODED` = *BIT*(12)

Advertise on the LE Coded PHY (Long Range).

The advertiser will send both primary and secondary advertising on the LE Coded PHY. This gives the advertiser increased range with the trade-off of lower data rate and higher power consumption. Connections will be established on LE Coded PHY.

Note

Requires *BT_LE_ADV_OPT_EXT_ADV*

enumerator `BT_LE_ADV_OPT_ANONYMOUS` = *BIT*(13)

Advertise without a device address (identity or RPA).

Note

Requires *BT_LE_ADV_OPT_EXT_ADV*

enumerator BT_LE_ADV_OPT_USE_TX_POWER = *BIT*(14)

Advertise with transmit power.

> **Note**
>
> Requires *BT_LE_ADV_OPT_EXT_ADV*

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_37 = *BIT*(15)

Disable advertising on channel index 37.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_38 = *BIT*(16)

Disable advertising on channel index 38.

enumerator BT_LE_ADV_OPT_DISABLE_CHAN_39 = *BIT*(17)

Disable advertising on channel index 39.

enumerator BT_LE_ADV_OPT_FORCE_NAME_IN_AD = *BIT*(18)

Put GAP device name into advert data.

Deprecated:

This option will be removed in the near future, see https://github.com/zephyrproject-rtos/zephyr/issues/71686

Will place the GAP device name into the advertising data rather than the scan response data.

> **Note**
>
> Requires *BT_LE_ADV_OPT_USE_NAME*

enumerator BT_LE_ADV_OPT_USE_NRPA = *BIT*(19)

Advertise using a Non-Resolvable Private Address.

A new NRPA is set when updating the advertising parameters.

This is an advanced feature; most users will want to enable CONFIG_BT_EXT_ADV instead.

> **Note**
>
> Not implemented when CONFIG_BT_PRIVACY .

> **Note**
>
> Mutually exclusive with BT_LE_ADV_OPT_USE_IDENTITY.

Periodic Advertising options.

Values:

enumerator BT_LE_PER_ADV_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_OPT_USE_TX_POWER = *BIT*(1)
Advertise with transmit power.

> **Note**
> Requires *BT_LE_ADV_OPT_EXT_ADV*

enumerator BT_LE_PER_ADV_OPT_INCLUDE_ADI = *BIT*(2)
Advertise with included AdvDataInfo (ADI).

> **Note**
> Requires *BT_LE_ADV_OPT_EXT_ADV*

Periodic advertising sync options.

Values:

enumerator BT_LE_PER_ADV_SYNC_OPT_NONE = 0
Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST = *BIT*(0)
Use the periodic advertising list to sync with advertiser.
When this option is set, the address and SID of the parameters are ignored.

enumerator BT_LE_PER_ADV_SYNC_OPT_REPORTING_INITIALLY_DISABLED = *BIT*(1)
Disables periodic advertising reports.
No advertisement reports will be handled until enabled.

enumerator BT_LE_PER_ADV_SYNC_OPT_FILTER_DUPLICATE = *BIT*(2)
Filter duplicate Periodic Advertising reports.

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOA = *BIT*(3)
Sync with Angle of Arrival (AoA) constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_1US = *BIT*(4)
Sync with Angle of Departure (AoD) 1 us constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_OPT_DONT_SYNC_AOD_2US = *BIT*(5)
Sync with Angle of Departure (AoD) 2 us constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_OPT_SYNC_ONLY_CONST_TONE_EXT = *BIT*(6)

Do not sync to packets without a constant tone extension.

Periodic Advertising Sync Transfer options.

Values:

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_NONE = 0

Convenience value when no options are specified.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOA = *BIT*(0)

No Angle of Arrival (AoA)

Do not sync with Angle of Arrival (AoA) constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_1US = *BIT*(1)

No Angle of Departure (AoD) 1 us.

Do not sync with Angle of Departure (AoD) 1 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_NO_AOD_2US = *BIT*(2)

No Angle of Departure (AoD) 2.

Do not sync with Angle of Departure (AoD) 2 us constant tone extension

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_SYNC_ONLY_CTE = *BIT*(3)

Only sync to packets with constant tone extension.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_REPORTING_INITIALLY_DISABLED = *BIT*(4)

Sync to received PAST packets but don't generate sync reports.

This option must not be set at the same time as *BT_LE_PER_ADV_SYNC_TRANSFER_OPT_FILTER_DUPLICATES*.

enumerator BT_LE_PER_ADV_SYNC_TRANSFER_OPT_FILTER_DUPLICATES = *BIT*(5)

Sync to received PAST packets and generate sync reports with duplicate filtering.

This option must not be set at the same time as *BT_LE_PER_ADV_SYNC_TRANSFER_OPT_REPORTING_INITIALLY_DISABLED*.

Values:

enumerator BT_LE_SCAN_OPT_NONE = 0

Convenience value when no options are specified.

enumerator BT_LE_SCAN_OPT_FILTER_DUPLICATE = *BIT*(0)

Filter duplicates.

enumerator BT_LE_SCAN_OPT_FILTER_ACCEPT_LIST = *BIT*(1)

Filter using filter accept list.

enumerator **BT_LE_SCAN_OPT_CODED** = *BIT*(2)

Enable scan on coded PHY (Long Range).

enumerator **BT_LE_SCAN_OPT_NO_1M** = *BIT*(3)

Disable scan on 1M phy.

> **Note**
>
> Requires *BT_LE_SCAN_OPT_CODED*.

Values:

enumerator **BT_LE_SCAN_TYPE_PASSIVE** = 0x00

Scan without requesting additional information from advertisers.

enumerator **BT_LE_SCAN_TYPE_ACTIVE** = 0x01

Scan and request additional information from advertisers.

Using this scan type will automatically send scan requests to all devices. Scan responses are received in the same manner and using the same callbacks as advertising reports.

Functions

int **bt_enable**(*bt_ready_cb_t* cb)

Enable Bluetooth.

Enable Bluetooth. Must be the called before any calls that require communication with the local Bluetooth hardware.

When CONFIG_BT_SETTINGS is enabled, the application must load the Bluetooth settings after this API call successfully completes before Bluetooth APIs can be used. Loading the settings before calling this function is insufficient. Bluetooth settings can be loaded with *settings_load()* or *settings_load_subtree()* with argument "bt". The latter selectively loads only Bluetooth settings and is recommended if *settings_load()* has been called earlier.

Parameters

- **cb** – Callback to notify completion or NULL to perform the enabling synchronously. The callback is called from the system workqueue.

Returns

Zero on success or (negative) error code otherwise.

int **bt_disable**(void)

Disable Bluetooth.

Disable Bluetooth. Can't be called before bt_enable has completed.

This API will clear all configured identities and keys that are not persistently stored with CONFIG_BT_SETTINGS . These can be restored with *settings_load()* before reenabling the stack.

This API does *not* clear previously registered callbacks like *bt_le_scan_cb_register* and *bt_conn_cb_register*. That is, the application shall not re-register them when the Bluetooth subsystem is re-enabled later.

Close and release HCI resources. Result is architecture dependent.

Returns
Zero on success or (negative) error code otherwise.

bool **bt_is_ready**(void)

Check if Bluetooth is ready.

Returns
true when Bluetooth is ready, false otherwise

int **bt_set_name**(const char *name)

Set Bluetooth Device Name.

Set Bluetooth GAP Device Name.

When advertising with device name in the advertising data the name should be updated by calling *bt_le_adv_update_data* or *bt_le_ext_adv_set_data*.

See also

CONFIG_BT_DEVICE_NAME_MAX.

Note

Requires CONFIG_BT_DEVICE_NAME_DYNAMIC.

Parameters

- **name** – New name

Returns
Zero on success or (negative) error code otherwise.

const char ***bt_get_name**(void)

Get Bluetooth Device Name.

Get Bluetooth GAP Device Name.

Returns
Bluetooth Device Name

uint16_t **bt_get_appearance**(void)

Get local Bluetooth appearance.

Bluetooth Appearance is a description of the external appearance of a device in terms of an Appearance Value.

See also

https://specificationrefs.bluetooth.com/assigned-values/Appearance%20Values.pdf

Returns
Appearance Value of local Bluetooth host.

int **bt_set_appearance**(uint16_t new_appearance)

Set local Bluetooth appearance.

Automatically preserves the new appearance across reboots if CONFIG_BT_SETTINGS is enabled.

This symbol is linkable if CONFIG_BT_DEVICE_APPEARANCE_DYNAMIC is enabled.

Parameters

- **new_appearance** – Appearance Value

Return values

- **0** – Success.
- **other** – Persistent storage failed. Appearance was not updated.

void **bt_id_get**(*bt_addr_le_t* *addrs, size_t *count)

Get the currently configured identities.

Returns an array of the currently configured identity addresses. To make sure all available identities can be retrieved, the number of elements in the *addrs* array should be CONFIG_BT_ID_MAX. The identity identifier that some APIs expect (such as advertising parameters) is simply the index of the identity in the *addrs* array.

If *addrs* is passed as NULL, then returned *count* contains the count of all available identities that can be retrieved with a subsequent call to this function with non-NULL *addrs* parameter.

Note

Deleted identities may show up as *BT_ADDR_LE_ANY* in the returned array.

Parameters

- **addrs** – Array where to store the configured identities.
- **count** – Should be initialized to the array size. Once the function returns it will contain the number of returned identities.

int **bt_id_create**(*bt_addr_le_t* *addr, uint8_t *irk)

Create a new identity.

Create a new identity using the given address and IRK. This function can be called before calling *bt_enable()*. However, the new identity will only be stored persistently in flash when this API is used after *bt_enable()*. The reason is that the persistent settings are loaded after *bt_enable()* and would therefore cause potential conflicts with the stack blindly overwriting what's stored in flash. The identity will also not be written to flash in case a pre-defined address is provided, since in such a situation the app clearly has some place it got the address from and will be able to repeat the procedure on every power cycle, i.e. it would be redundant to also store the information in flash.

Generating random static address or random IRK is not supported when calling this function before *bt_enable()*.

If the application wants to have the stack randomly generate identities and store them in flash for later recovery, the way to do it would be to first initialize the stack (using bt_enable), then call *settings_load()*, and after that check with *bt_id_get()* how many identities were recovered. If an insufficient amount of identities were recovered the app may then call *bt_id_create()* to create new ones.

If supported by the HCI driver (indicated by setting CONFIG_BT_HCI_SET_PUBLIC_ADDR), the first call to this function can be used to set the controller's public identity address.

This call must happen before calling *bt_enable()*. Subsequent calls always add/generate random static addresses.

Parameters

- **addr** – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new random static address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- **irk** – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy CONFIG_BT_PRIVACY is not enabled this parameter must be NULL.

Returns

Identity identifier (>= 0) in case of success, or a negative error code on failure.

int **bt_id_reset**(uint8_t id, *bt_addr_le_t* *addr, uint8_t *irk)

Reset/reclaim an identity for reuse.

The semantics of the *addr* and *irk* parameters of this function are the same as with *bt_id_create()*. The difference is the first *id* parameter that needs to be an existing identity (if it doesn't exist this function will return an error). When given an existing identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then create a new identity in the same slot, based on the *addr* and *irk* parameters.

Note

the default identity (BT_ID_DEFAULT) cannot be reset, i.e. this API will return an error if asked to do that.

Parameters

- **id** – Existing identity identifier.
- **addr** – Address to use for the new identity. If NULL or initialized to BT_ADDR_LE_ANY the stack will generate a new static random address for the identity and copy it to the given parameter upon return from this function (in case the parameter was non-NULL).
- **irk** – Identity Resolving Key (16 bytes) to be used with this identity. If set to all zeroes or NULL, the stack will generate a random IRK for the identity and copy it back to the parameter upon return from this function (in case the parameter was non-NULL). If privacy CONFIG_BT_PRIVACY is not enabled this parameter must be NULL.

Returns

Identity identifier (>= 0) in case of success, or a negative error code on failure.

int **bt_id_delete**(uint8_t id)

Delete an identity.

When given a valid identity this function will disconnect any connections created using it, remove any pairing keys or other data associated with it, and then flag is as deleted, so that it can not be used for any operations. To take back into use the slot the identity was occupying the *bt_id_reset()* API needs to be used.

Note

the default identity (BT_ID_DEFAULT) cannot be deleted, i.e. this API will return an error if asked to do that.

Parameters

- `id` – Existing identity identifier.

Returns
0 in case of success, or a negative error code on failure.

size_t **bt_data_get_len**(const struct *bt_data* data[], size_t data_count)

Get the total size (in bytes) of a given set of *bt_data* structures.

Parameters

- `data` – **[in]** Array of *bt_data* structures.
- `data_count` – **[in]** Number of *bt_data* structures in `data`.

Returns
Size of the concatenated data, built from the *bt_data* structure set.

size_t **bt_data_serialize**(const struct *bt_data* *input, uint8_t *output)

Serialize a *bt_data* struct into an advertising structure (a flat byte array).

The data are formatted according to the Bluetooth Core Specification v. 5.4, vol. 3, part C, 11.

Parameters

- `input` – **[in]** Single *bt_data* structure to read from.
- `output` – **[out]** Buffer large enough to store the advertising structure in `input`. The size of it must be at least the size of the `input->data_len + 2` (for the type and the length).

Returns
Number of bytes written in `output`.

int **bt_le_adv_start**(const struct *bt_le_adv_param* *param, const struct *bt_data* *ad, size_t ad_len, const struct *bt_data* *sd, size_t sd_len)

Start advertising.

Set advertisement data, scan response data, advertisement parameters and start advertising.

When the advertisement parameter peer address has been set the advertising will be directed to the peer. In this case advertisement data and scan response data parameters are ignored. If the mode is high duty cycle the timeout will be *BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT*.

This function cannot be used with *BT_LE_ADV_OPT_EXT_ADV* in the `param.options`. For extended advertising, the bt_le_ext_adv_* functions must be used.

Parameters

- `param` – Advertising parameters.
- `ad` – Data to be used in advertisement packets.
- `ad_len` – Number of elements in ad
- `sd` – Data to be used in scan response packets.
- `sd_len` – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.

Returns
-ENOMEM No free connection objects available for connectable advertiser.

Returns
-ECONNREFUSED When connectable advertising is requested and there is already maximum number of connections established in the controller. This error code is only guaranteed when using Zephyr controller, for other controllers code returned in this case may be -EIO.

int **bt_le_adv_update_data**(const struct *bt_data* *ad, size_t ad_len, const struct *bt_data* *sd, size_t sd_len)

Update advertising.

Update advertisement and scan response data.

Parameters

- **ad** – Data to be used in advertisement packets.
- **ad_len** – Number of elements in ad
- **sd** – Data to be used in scan response packets.
- **sd_len** – Number of elements in sd

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_adv_stop**(void)

Stop advertising.

Stops ongoing advertising.

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_ext_adv_create**(const struct *bt_le_adv_param* *param, const struct *bt_le_ext_adv_cb* *cb, struct bt_le_ext_adv **adv)

Create advertising set.

Create a new advertising set and set advertising parameters. Advertising parameters can be updated with *bt_le_ext_adv_update_param*.

Parameters

- **param** – **[in]** Advertising parameters.
- **cb** – **[in]** Callback struct to notify about advertiser activity. Can be NULL. Must point to valid memory during the lifetime of the advertising set.
- **adv** – **[out]** Valid advertising set object on success.

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_ext_adv_start**(struct bt_le_ext_adv *adv, const struct *bt_le_ext_adv_start_param* *param)

Start advertising with the given advertising set.

If the advertiser is limited by either the timeout or number of advertising events the application will be notified by the advertiser sent callback once the limit is reached. If the advertiser is limited by both the timeout and the number of advertising events then the limit that is reached first will stop the advertiser.

Parameters

- **adv** – Advertising set object.
- **param** – Advertise start parameters.

int **bt_le_ext_adv_stop**(struct bt_le_ext_adv *adv)

Stop advertising with the given advertising set.

Stop advertising with a specific advertising set. When using this function the advertising sent callback will not be called.

Parameters

- **adv** – Advertising set object.

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_ext_adv_set_data**(struct bt_le_ext_adv *adv, const struct *bt_data* *ad, size_t ad_len, const struct *bt_data* *sd, size_t sd_len)

Set an advertising set's advertising or scan response data.

Set advertisement data or scan response data. If the advertising set is currently advertising then the advertising data will be updated in subsequent advertising events.

When both *BT_LE_ADV_OPT_EXT_ADV* and *BT_LE_ADV_OPT_SCANNABLE* are enabled then advertising data is ignored. When *BT_LE_ADV_OPT_SCANNABLE* is not enabled then scan response data is ignored.

If the advertising set has been configured to send advertising data on the primary advertising channels then the maximum data length is *BT_GAP_ADV_MAX_ADV_DATA_LEN* bytes. If the advertising set has been configured for extended advertising, then the maximum data length is defined by the controller with the maximum possible of *BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN* bytes.

Note

Not all scanners support extended data length advertising data.

Note

When updating the advertising data while advertising the advertising data and scan response data length must be smaller or equal to what can be fit in a single advertising packet. Otherwise the advertiser must be stopped.

Parameters

- **adv** – Advertising set object.
- **ad** – Data to be used in advertisement packets.
- **ad_len** – Number of elements in ad
- **sd** – Data to be used in scan response packets.
- **sd_len** – Number of elements in sd

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_ext_adv_update_param**(struct bt_le_ext_adv *adv, const struct *bt_le_adv_param* *param)

Update advertising parameters.

Update the advertising parameters. The function will return an error if the advertiser set is currently advertising. Stop the advertising set before calling this function.

> **Note**
>
> When changing the option *BT_LE_ADV_OPT_USE_NAME* then *bt_le_ext_adv_set_data* needs to be called in order to update the advertising data and scan response data.

Parameters

- **adv** – Advertising set object.
- **param** – Advertising parameters.

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_ext_adv_delete**(struct bt_le_ext_adv *adv)

Delete advertising set.

Delete advertising set. This will free up the advertising set and make it possible to create a new advertising set.

Returns

Zero on success or (negative) error code otherwise.

uint8_t **bt_le_ext_adv_get_index**(struct bt_le_ext_adv *adv)

Get array index of an advertising set.

This function is used to map bt_adv to index of an array of advertising sets. The array has CONFIG_BT_EXT_ADV_MAX_ADV_SET elements.

Parameters

- **adv** – Advertising set.

Returns

Index of the advertising set object. The range of the returned value is 0..CONFIG_BT_EXT_ADV_MAX_ADV_SET-1

int **bt_le_ext_adv_get_info**(const struct bt_le_ext_adv *adv, struct *bt_le_ext_adv_info* *info)

Get advertising set info.

Parameters

- **adv** – Advertising set object
- **info** – Advertising set info object

Returns

Zero on success or (negative) error code on failure.

int **bt_le_per_adv_set_param**(struct bt_le_ext_adv *adv, const struct *bt_le_per_adv_param* *param)

Set or update the periodic advertising parameters.

The periodic advertising parameters can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

Parameters

- `adv` – Advertising set object.
- `param` – Advertising parameters.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_set_data`(const struct bt_le_ext_adv *adv, const struct *bt_data* *ad, size_t ad_len)

Set or update the periodic advertising data.

The periodic advertisement data can only be set or updated on an extended advertisement set which is neither scannable, connectable nor anonymous.

Parameters

- `adv` – Advertising set object.
- `ad` – Advertising data.
- `ad_len` – Advertising data length.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_set_subevent_data`(const struct bt_le_ext_adv *adv, uint8_t num_subevents, const struct *bt_le_per_adv_subevent_data_params* *params)

Set the periodic advertising with response subevent data.

Set the data for one or more subevents of a Periodic Advertising with Responses Advertiser in reply data request.

Parameters

- `adv` – The extended advertiser the PAwR train belongs to.
- `num_subevents` – The number of subevents to set data for.
- `params` – Subevent parameters.

Pre
There are `num_subevents` elements in `params`.

Pre
The controller has requested data for the subevents in `params`.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_start`(struct bt_le_ext_adv *adv)

Starts periodic advertising.

Enabling the periodic advertising can be done independently of extended advertising, but both periodic advertising and extended advertising shall be enabled before any periodic advertising data is sent. The periodic advertising and extended advertising can be enabled in any order.

Once periodic advertising has been enabled, it will continue advertising until *bt_le_per_adv_stop()* has been called, or if the advertising set is deleted by *bt_le_ext_adv_delete()*. Calling *bt_le_ext_adv_stop()* will not stop the periodic advertising.

Parameters

- `adv` – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_stop**(struct bt_le_ext_adv *adv)

Stops periodic advertising.

Disabling the periodic advertising can be done independently of extended advertising. Disabling periodic advertising will not disable extended advertising.

Parameters

- **adv** – Advertising set object.

Returns
Zero on success or (negative) error code otherwise.

uint8_t **bt_le_per_adv_sync_get_index**(struct bt_le_per_adv_sync *per_adv_sync)

Get array index of an periodic advertising sync object.

This function is get the index of an array of periodic advertising sync objects. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

Parameters

- **per_adv_sync** – The periodic advertising sync object.

Returns
Index of the periodic advertising sync object. The range of the returned value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

struct bt_le_per_adv_sync ***bt_le_per_adv_sync_lookup_index**(uint8_t index)

Get a periodic advertising sync object from the array index.

This function is to get the periodic advertising sync object from the array index. The array has CONFIG_BT_PER_ADV_SYNC_MAX elements.

Parameters

- **index** – The index of the periodic advertising sync object. The range of the index value is 0..CONFIG_BT_PER_ADV_SYNC_MAX-1

Returns
The periodic advertising sync object of the array index or NULL if invalid index.

int **bt_le_per_adv_sync_get_info**(struct bt_le_per_adv_sync *per_adv_sync, struct *bt_le_per_adv_sync_info* *info)

Get periodic adv sync information.

Parameters

- **per_adv_sync** – Periodic advertising sync object.
- **info** – Periodic advertising sync info object

Returns
Zero on success or (negative) error code on failure.

struct bt_le_per_adv_sync ***bt_le_per_adv_sync_lookup_addr**(const *bt_addr_le_t* *adv_addr, uint8_t sid)

Look up an existing periodic advertising sync object by advertiser address.

Parameters

- **adv_addr** – Advertiser address.
- **sid** – The advertising set ID.

Returns
Periodic advertising sync object or NULL if not found.

int **bt_le_per_adv_sync_create**(const struct *bt_le_per_adv_sync_param* *param, struct bt_le_per_adv_sync **out_sync)

Create a periodic advertising sync object.

Create a periodic advertising sync object that can try to synchronize to periodic advertising reports from an advertiser. Scan shall either be disabled or extended scan shall be enabled.

This function does not timeout, and will continue to look for an advertiser until it either finds it or *bt_le_per_adv_sync_delete()* is called. It is thus suggested to implement a timeout when using this, if it is expected to find the advertiser within a reasonable timeframe.

Parameters

- **param** – **[in]** Periodic advertising sync parameters.
- **out_sync** – **[out]** Periodic advertising sync object on.

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_sync_delete**(struct bt_le_per_adv_sync *per_adv_sync)

Delete periodic advertising sync.

Delete the periodic advertising sync object. Can be called regardless of the state of the sync. If the syncing is currently syncing, the syncing is cancelled. If the sync has been established, it is terminated. The periodic advertising sync object will be invalidated afterwards.

If the state of the sync object is syncing, then a new periodic advertising sync object may not be created until the controller has finished canceling this object.

Parameters

- **per_adv_sync** – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_sync_cb_register**(struct *bt_le_per_adv_sync_cb* *cb)

Register periodic advertising sync callbacks.

Adds the callback structure to the list of callback structures for periodic advertising syncs.

This callback will be called for all periodic advertising sync activity, such as synced, terminated and when data is received.

Parameters

- **cb** – Callback struct. Must point to memory that remains valid.

Return values

- **0** – Success.
- **-EEXIST** – if cb was already registered.

int **bt_le_per_adv_sync_recv_enable**(struct bt_le_per_adv_sync *per_adv_sync)

Enables receiving periodic advertising reports for a sync.

If the sync is already receiving the reports, -EALREADY is returned.

Parameters

- **per_adv_sync** – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_sync_recv_disable`(struct bt_le_per_adv_sync *per_adv_sync)

Disables receiving periodic advertising reports for a sync.

If the sync report receiving is already disabled, -EALREADY is returned.

Parameters

- `per_adv_sync` – The periodic advertising sync object.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_sync_transfer`(const struct bt_le_per_adv_sync *per_adv_sync, const struct bt_conn *conn, uint16_t service_data)

Transfer the periodic advertising sync information to a peer device.

This will allow another device to quickly synchronize to the same periodic advertising train that this device is currently synced to.

Parameters

- `per_adv_sync` – The periodic advertising sync to transfer.
- `conn` – The peer device that will receive the sync information.
- `service_data` – Application service data provided to the remote host.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_set_info_transfer`(const struct bt_le_ext_adv *adv, const struct bt_conn *conn, uint16_t service_data)

Transfer the information about a periodic advertising set.

This will allow another device to quickly synchronize to periodic advertising set from this device.

Parameters

- `adv` – The periodic advertising set to transfer info of.
- `conn` – The peer device that will receive the information.
- `service_data` – Application service data provided to the remote host.

Returns
Zero on success or (negative) error code otherwise.

int `bt_le_per_adv_sync_transfer_subscribe`(const struct bt_conn *conn, const struct *bt_le_per_adv_sync_transfer_param* *param)

Subscribe to periodic advertising sync transfers (PASTs).

Sets the parameters and allow other devices to transfer periodic advertising syncs.

Parameters

- `conn` – The connection to set the parameters for. If NULL default parameters for all connections will be set. Parameters set for specific connection will always have precedence.
- `param` – The periodic advertising sync transfer parameters.

Returns
Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_sync_transfer_unsubscribe**(const struct bt_conn *conn)

Unsubscribe from periodic advertising sync transfers (PASTs).

Remove the parameters that allow other devices to transfer periodic advertising syncs.

Parameters

- **conn** – The connection to remove the parameters for. If NULL default parameters for all connections will be removed. Unsubscribing for a specific device, will still allow other devices to transfer periodic advertising syncs.

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_list_add**(const *bt_addr_le_t* *addr, uint8_t sid)

Add a device to the periodic advertising list.

Add peer device LE address to the periodic advertising list. This will make it possibly to automatically create a periodic advertising sync to this device.

Parameters

- **addr** – Bluetooth LE identity address.
- **sid** – The advertising set ID. This value is obtained from the *bt_le_scan_recv_info* in the scan callback.

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_list_remove**(const *bt_addr_le_t* *addr, uint8_t sid)

Remove a device from the periodic advertising list.

Removes peer device LE address from the periodic advertising list.

Parameters

- **addr** – Bluetooth LE identity address.
- **sid** – The advertising set ID. This value is obtained from the *bt_le_scan_recv_info* in the scan callback.

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_per_adv_list_clear**(void)

Clear the periodic advertising list.

Clears the entire periodic advertising list.

Returns

Zero on success or (negative) error code otherwise.

int **bt_le_scan_start**(const struct *bt_le_scan_param* *param, *bt_le_scan_cb_t* cb)

Start (LE) scanning.

Start LE scanning with given parameters and provide results through the specified callback.

Note

The LE scanner by default does not use the Identity Address of the local device when CONFIG_BT_PRIVACY is disabled. This is to prevent the active scanner from disclosing the identity information when requesting additional information from advertisers. In order to enable directed advertiser reports then CONFIG_BT_SCAN_WITH_IDENTITY must be enabled.

Note

Setting the `param.timeout` parameter is not supported when `CONFIG_BT_PRIVACY` is enabled, when the param.type is *BT_LE_SCAN_TYPE_ACTIVE*. Supplying a non-zero timeout will result in an -EINVAL error code.

Parameters

- **param** – Scan parameters.
- **cb** – Callback to notify scan results. May be NULL if callback registration through *bt_le_scan_cb_register* is preferred.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int **bt_le_scan_stop**(void)

Stop (LE) scanning.

Stops ongoing LE scanning.

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int **bt_le_scan_cb_register**(struct *bt_le_scan_cb* *cb)

Register scanner packet callbacks.

Adds the callback structure to the list of callback structures that monitors scanner activity.

This callback will be called for all scanner activity, regardless of what API was used to start the scanner.

Parameters

- **cb** – Callback struct. Must point to memory that remains valid.

Return values

- **0** – Success.
- **-EEXIST** – if cb was already registered.

void **bt_le_scan_cb_unregister**(struct *bt_le_scan_cb* *cb)

Unregister scanner packet callbacks.

Remove the callback structure from the list of scanner callbacks.

Parameters

- **cb** – Callback struct. Must point to memory that remains valid.

int **bt_le_filter_accept_list_add**(const *bt_addr_le_t* *addr)

Add device (LE) to filter accept list.

Add peer device LE address to the filter accept list.

Note

The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Parameters

- `addr` – Bluetooth LE identity address.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int `bt_le_filter_accept_list_remove`(const *bt_addr_le_t* *addr)

Remove device (LE) from filter accept list.

Remove peer device LE address from the filter accept list.

> **Note**
>
> The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Parameters

- `addr` – Bluetooth LE identity address.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int `bt_le_filter_accept_list_clear`(void)

Clear filter accept list.

Clear all devices from the filter accept list.

> **Note**
>
> The filter accept list cannot be modified when an LE role is using the filter accept list, i.e advertiser or scanner using a filter accept list or automatic connecting to devices using filter accept list.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int `bt_le_set_chan_map`(uint8_t chan_map[5])

Set (LE) channel map.

Parameters

- `chan_map` – Channel map.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int `bt_le_set_rpa_timeout`(uint16_t new_rpa_timeout)

Set the Resolvable Private Address timeout in runtime.

The new RPA timeout value will be used for the next RPA rotation and all subsequent rotations until another override is scheduled with this API.

Initially, the if `CONFIG_BT_RPA_TIMEOUT` is used as the RPA timeout.

This symbol is linkable if CONFIG_BT_RPA_TIMEOUT_DYNAMIC is enabled.

Parameters

- **new_rpa_timeout** – Resolvable Private Address timeout in seconds

Return values

- **0** – Success.
- **-EINVAL** – RPA timeout value is invalid. Valid range is 1s - 3600s.

void **bt_data_parse**(struct *net_buf_simple* *ad, bool (*func)(struct *bt_data* *data, void *user_data), void *user_data)

Helper for parsing advertising (or EIR or OOB) data.

A helper for parsing the basic data types used for Extended Inquiry Response (EIR), Advertising Data (AD), and OOB data blocks. The most common scenario is to call this helper on the advertising data received in the callback that was given to *bt_le_scan_start()*.

Warning

This helper function will consume ad when parsing. The user should make a copy if the original data is to be used afterwards

Parameters

- **ad** – Advertising data as given to the bt_le_scan_cb_t callback.
- **func** – Callback function which will be called for each element that's found in the data. The callback should return true to continue parsing, or false to stop parsing.
- **user_data** – User data to be passed to the callback.

int **bt_le_oob_get_local**(uint8_t id, struct *bt_le_oob* *oob)

Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy CONFIG_BT_PRIVACY is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for CONFIG_BT_RPA_TIMEOUT seconds. This address will be used for advertising started by *bt_le_adv_start*, active scanning and connection creation.

Note

If privacy is enabled the RPA cannot be refreshed in the following cases:

- Creating a connection in progress, wait for the connected callback. In addition when extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller:
- Advertiser is enabled using a Random Static Identity Address for a different local identity.
- The local identity conflicts with the local identity used by other roles.

Parameters

- **id** – **[in]** Local identity, in most cases BT_ID_DEFAULT.

- `oob` – **[out]** LE OOB information

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int **bt_le_ext_adv_oob_get_local**(struct bt_le_ext_adv *adv, struct *bt_le_oob* *oob)

Get local LE Out of Band (OOB) information.

This function allows to get local information that are useful for Out of Band pairing or connection creation.

If privacy `CONFIG_BT_PRIVACY` is enabled this will result in generating new Resolvable Private Address (RPA) that is valid for `CONFIG_BT_RPA_TIMEOUT` seconds. This address will be used by the advertising set.

Note

When generating OOB information for multiple advertising set all OOB information needs to be generated at the same time.

Note

If privacy is enabled the RPA cannot be refreshed in the following cases:

- Creating a connection in progress, wait for the connected callback.

Parameters

- `adv` – **[in]** The advertising set object
- `oob` – **[out]** LE OOB information

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int **bt_br_discovery_start**(const struct *bt_br_discovery_param* *param, struct *bt_br_discovery_result* *results, size_t count, *bt_br_discovery_cb_t* cb)

Start BR/EDR discovery.

Start BR/EDR discovery (inquiry) and provide results through the specified callback. When bt_br_discovery_cb_t is called it indicates that discovery has completed. If more inquiry results were received during session than fits in provided result storage, only ones with highest RSSI will be reported.

Parameters

- `param` – Discovery parameters.
- `results` – Storage for discovery results.
- `count` – Number of results in storage. Valid range: 1-255.
- `cb` – Callback to notify discovery results.

Returns
Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error

int **bt_br_discovery_stop**(void)

Stop BR/EDR discovery.

Stops ongoing BR/EDR discovery. If discovery was stopped by this call results won't be reported

Returns

Zero on success or error code otherwise, positive in case of protocol error or negative (POSIX) in case of stack internal error.

int **bt_br_oob_get_local**(struct *bt_br_oob* *oob)

Get BR/EDR local Out Of Band information.

This function allows to get local controller information that are useful for Out Of Band pairing or connection creation process.

Parameters

- **oob** – Out Of Band information

int **bt_br_set_discoverable**(bool enable)

Enable/disable set controller in discoverable state.

Allows make local controller to listen on INQUIRY SCAN channel and responds to devices making general inquiry. To enable this state it's mandatory to first be in connectable state.

Parameters

- **enable** – Value allowing/disallowing controller to become discoverable.

Returns

Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int **bt_br_set_connectable**(bool enable)

Enable/disable set controller in connectable state.

Allows make local controller to be connectable. It means the controller start listen to devices requests on PAGE SCAN channel. If disabled also resets discoverability if was set.

Parameters

- **enable** – Value allowing/disallowing controller to be connectable.

Returns

Negative if fail set to requested state or requested state has been already set. Zero if done successfully.

int **bt_unpair**(uint8_t id, const *bt_addr_le_t* *addr)

Clear pairing information.

Parameters

- **id** – Local identity (mostly just BT_ID_DEFAULT).
- **addr** – Remote address, NULL or BT_ADDR_LE_ANY to clear all remote devices.

Returns

0 on success or negative error value on failure.

void **bt_foreach_bond**(uint8_t id, void (*func)(const struct *bt_bond_info* *info, void *user_data), void *user_data)

Iterate through all existing bonds.

Parameters

- `id` – Local identity (mostly just BT_ID_DEFAULT).
- `func` – Function to call for each bond.
- `user_data` – Data to pass to the callback function.

int `bt_configure_data_path`(uint8_t dir, uint8_t id, uint8_t vs_config_len, const uint8_t *vs_config)

Configure vendor data path.

Request the Controller to configure the data transport path in a given direction between the Controller and the Host.

Parameters

- `dir` – Direction to be configured, BT_HCI_DATAPATH_DIR_HOST_TO_CTLR or BT_HCI_DATAPATH_DIR_CTLR_TO_HOST
- `id` – Vendor specific logical transport channel ID, range [BT_HCI_DATAPATH_ID_VS..BT_HCI_DATAPATH_ID_VS_END]
- `vs_config_len` – Length of additional vendor specific configuration data
- `vs_config` – Pointer to additional vendor specific configuration data

Returns
0 in case of success or negative value in case of error.

int `bt_le_per_adv_sync_subevent`(struct bt_le_per_adv_sync *per_adv_sync, struct *bt_le_per_adv_sync_subevent_params* *params)

Synchronize with a subset of subevents.

Until this command is issued, the subevent(s) the controller is synchronized to is unspecified.

Parameters

- `per_adv_sync` – The periodic advertising sync object.
- `params` – Parameters.

Returns
0 in case of success or negative value in case of error.

int `bt_le_per_adv_set_response_data`(struct bt_le_per_adv_sync *per_adv_sync, const struct *bt_le_per_adv_response_params* *params, const struct *net_buf_simple* *data)

Set the data for a response slot in a specific subevent of the PAwR.

This function is called by the application to set the response data. The data for a response slot shall be transmitted only once.

Parameters

- `per_adv_sync` – The periodic advertising sync object.
- `params` – Parameters.
- `data` – The response data to send.

Returns
Zero on success or (negative) error code otherwise.

struct `bt_le_ext_adv_sent_info`

#include <bluetooth.h>

Public Members

uint8_t **num_sent**
The number of advertising events completed.

struct **bt_le_ext_adv_connected_info**
#include <bluetooth.h>

Public Members

struct bt_conn ***conn**
Connection object of the new connection.

struct **bt_le_ext_adv_scanned_info**
#include <bluetooth.h>

Public Members

bt_addr_le_t ***addr**
Active scanner LE address and type.

struct **bt_le_per_adv_data_request**
#include <bluetooth.h>

Public Members

uint8_t **start**
The first subevent data can be set for.

uint8_t **count**
The number of subevents data can be set for.

struct **bt_le_per_adv_response_info**
#include <bluetooth.h>

Public Members

uint8_t **subevent**
The subevent the response was received in.

uint8_t **tx_status**
Status of the subevent indication.

0 if subevent indication was transmitted. 1 if subevent indication was not transmitted. All other values RFU.

int8_t **tx_power**

The TX power of the response in dBm.

int8_t **rssi**

The RSSI of the response in dBm.

uint8_t **cte_type**

The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

uint8_t **response_slot**

The slot the response was received in.

struct **bt_le_ext_adv_cb**

#include <bluetooth.h>

Public Members

void (***sent**)(struct bt_le_ext_adv *adv, struct *bt_le_ext_adv_sent_info* *info)

The advertising set has finished sending adv data.

This callback notifies the application that the advertising set has finished sending advertising data. The advertising set can either have been stopped by a timeout or because the specified number of advertising events has been reached.

Param adv
The advertising set object.

Param info
Information about the sent event.

void (***connected**)(struct bt_le_ext_adv *adv, struct *bt_le_ext_adv_connected_info* *info)

The advertising set has accepted a new connection.

This callback notifies the application that the advertising set has accepted a new connection.

Param adv
The advertising set object.

Param info
Information about the connected event.

void (***scanned**)(struct bt_le_ext_adv *adv, struct *bt_le_ext_adv_scanned_info* *info)

The advertising set has sent scan response data.

This callback notifies the application that the advertising set has has received a Scan Request packet, and has sent a Scan Response packet.

Param adv
The advertising set object.

Param addr
Information about the scanned event.

struct **bt_data**

#include <bluetooth.h> Bluetooth data.

Description of different data types that can be encoded into advertising data. Used to form arrays that are passed to the *bt_le_adv_start()* function.

struct **bt_le_adv_param**

#include <bluetooth.h> LE Advertising Parameters.

Public Members

uint8_t **id**

Local identity.

> **Note**
>
> When extended advertising CONFIG_BT_EXT_ADV is not enabled or not supported by the controller it is not possible to scan and advertise simultaneously using two different random addresses.

uint8_t **sid**

Advertising Set Identifier, valid range 0x00 - 0x0f.

> **Note**
>
> Requires *BT_LE_ADV_OPT_EXT_ADV*

uint8_t **secondary_max_skip**

Secondary channel maximum skip count.

Maximum advertising events the advertiser can skip before it must send advertising data on the secondary advertising channel.

> **Note**
>
> Requires *BT_LE_ADV_OPT_EXT_ADV*

uint32_t **options**

Bit-field of advertising options.

uint32_t **interval_min**

Minimum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval.

The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

uint32_t **interval_max**

Maximum Advertising Interval (N * 0.625 milliseconds) Minimum Advertising Interval shall be less than or equal to the Maximum Advertising Interval.

The Minimum Advertising Interval and Maximum Advertising Interval should not be the same value (as stated in Bluetooth Core Spec 5.2, section 7.8.5) Range: 0x0020 to 0x4000

const *bt_addr_le_t* ***peer**

Directed advertising to peer.

When this parameter is set the advertiser will send directed advertising to the remote device.

The advertising type will either be high duty cycle, or low duty cycle if the BT_LE_ADV_OPT_DIR_MODE_LOW_DUTY option is enabled. When using *BT_LE_ADV_OPT_EXT_ADV* then only low duty cycle is allowed.

In case of connectable high duty cycle if the connection could not be established within the timeout the connected() callback will be called with the status set to BT_HCI_ERR_ADV_TIMEOUT.

struct **bt_le_per_adv_param**

#include <bluetooth.h>

Public Members

uint16_t **interval_min**

Minimum Periodic Advertising Interval (N * 1.25 ms)

Shall be greater or equal to BT_GAP_PER_ADV_MIN_INTERVAL and less or equal to interval_max.

uint16_t **interval_max**

Maximum Periodic Advertising Interval (N * 1.25 ms)

Shall be less or equal to BT_GAP_PER_ADV_MAX_INTERVAL and greater or equal to interval_min.

uint32_t **options**

Bit-field of periodic advertising options.

struct **bt_le_ext_adv_start_param**

#include <bluetooth.h>

Public Members

uint16_t **timeout**

Advertiser timeout (N * 10 ms).

Application will be notified by the advertiser sent callback. Set to zero for no timeout.

When using high duty cycle directed connectable advertising then this parameters must be set to a non-zero value less than or equal to the maximum of *BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT*.

If privacy `CONFIG_BT_PRIVACY` is enabled then the timeout must be less than `CONFIG_BT_RPA_TIMEOUT`.

uint8_t **num_events**

Number of advertising events.

Application will be notified by the advertiser sent callback. Set to zero for no limit.

struct **bt_le_ext_adv_info**

#include <bluetooth.h> Advertising set info structure.

Public Members

int8_t **tx_power**

Currently selected Transmit Power (dBM).

const *bt_addr_le_t* ***addr**

Current local advertising address used.

struct **bt_le_per_adv_subevent_data_params**

#include <bluetooth.h>

Public Members

uint8_t **subevent**

The subevent to set data for.

uint8_t **response_slot_start**

The first response slot to listen to.

uint8_t **response_slot_count**

The number of response slots to listen to.

const struct *net_buf_simple* ***data**

The data to send.

struct **bt_le_per_adv_sync_synced_info**

#include <bluetooth.h>

Public Members

const *bt_addr_le_t* ***addr**

Advertiser LE address and type.

uint8_t **sid**

Advertiser SID.

uint16_t **interval**

Periodic advertising interval (N * 1.25 ms)

uint8_t **phy**
Advertiser PHY.

bool **recv_enabled**
True if receiving periodic advertisements, false otherwise.

uint16_t **service_data**
Service Data provided by the peer when sync is transferred.
Will always be 0 when the sync is locally created.

struct bt_conn ***conn**
Peer that transferred the periodic advertising sync.
Will always be 0 when the sync is locally created.

struct **bt_le_per_adv_sync_term_info**
#include <bluetooth.h>

Public Members

const *bt_addr_le_t* ***addr**
Advertiser LE address and type.

uint8_t **sid**
Advertiser SID.

uint8_t **reason**
Cause of periodic advertising termination.

struct **bt_le_per_adv_sync_recv_info**
#include <bluetooth.h>

Public Members

const *bt_addr_le_t* ***addr**
Advertiser LE address and type.

uint8_t **sid**
Advertiser SID.

int8_t **tx_power**
The TX power of the advertisement.

int8_t **rssi**
The RSSI of the advertisement excluding any CTE.

uint8_t **cte_type**

The Constant Tone Extension (CTE) of the advertisement (bt_df_cte_type)

struct **bt_le_per_adv_sync_state_info**

#include <bluetooth.h>

Public Members

bool **recv_enabled**

True if receiving periodic advertisements, false otherwise.

struct **bt_le_per_adv_sync_cb**

#include <bluetooth.h>

Public Members

void (***synced**)(struct bt_le_per_adv_sync *sync, struct *bt_le_per_adv_sync_synced_info* *info)

The periodic advertising has been successfully synced.

This callback notifies the application that the periodic advertising set has been successfully synced, and will now start to receive periodic advertising reports.

Param sync
The periodic advertising sync object.

Param info
Information about the sync event.

void (***term**)(struct bt_le_per_adv_sync *sync, const struct *bt_le_per_adv_sync_term_info* *info)

The periodic advertising sync has been terminated.

This callback notifies the application that the periodic advertising sync has been terminated, either by local request, remote request or because due to missing data, e.g. by being out of range or sync.

Param sync
The periodic advertising sync object.

void (***recv**)(struct bt_le_per_adv_sync *sync, const struct *bt_le_per_adv_sync_recv_info* *info, struct *net_buf_simple* *buf)

Periodic advertising data received.

This callback notifies the application of an periodic advertising report.

Param sync
The advertising set object.

Param info
Information about the periodic advertising event.

Param buf
Buffer containing the periodic advertising data. NULL if the controller failed to receive a subevent indication. Only happens if `CONFIG_BT_PER_ADV_SYNC_RSP` is enabled.

void (*state_changed)(struct bt_le_per_adv_sync *sync, const struct *bt_le_per_adv_sync_state_info* *info)

The periodic advertising sync state has changed.

This callback notifies the application about changes to the sync state. Initialize sync and termination is handled by their individual callbacks, and won't be notified here.

Param sync
The periodic advertising sync object.

Param info
Information about the state change.

void (*biginfo)(struct bt_le_per_adv_sync *sync, const struct bt_iso_biginfo *biginfo)

BIGInfo advertising report received.

This callback notifies the application of a BIGInfo advertising report. This is received if the advertiser is broadcasting isochronous streams in a BIG. See iso.h for more information.

Param sync
The advertising set object.

Param biginfo
The BIGInfo report.

void (*cte_report_cb)(struct bt_le_per_adv_sync *sync, struct bt_df_per_adv_sync_iq_samples_report const *info)

Callback for IQ samples report collected when sampling CTE received with periodic advertising PDU.

Param sync
The periodic advertising sync object.

Param info
Information about the sync event.

struct bt_le_per_adv_sync_param

#include <bluetooth.h>

Public Members

bt_addr_le_t addr

Periodic Advertiser Address.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

uint8_t sid

Advertiser SID.

Only valid if not using the periodic advertising list (BT_LE_PER_ADV_SYNC_OPT_USE_PER_ADV_LIST)

uint32_t options

Bit-field of periodic advertising sync options.

uint16_t skip

Maximum event skip.

Maximum number of periodic advertising events that can be skipped after a successful receive. Range: 0x0000 to 0x01F3

uint16_t **timeout**

Synchronization timeout (N * 10 ms)

Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

struct **bt_le_per_adv_sync_info**

#include <*bluetooth.h*> Advertising set info structure.

Public Members

bt_addr_le_t **addr**

Periodic Advertiser Address.

uint8_t **sid**

Advertiser SID.

uint16_t **interval**

Periodic advertising interval (N * 1.25 ms)

uint8_t **phy**

Advertiser PHY.

struct **bt_le_per_adv_sync_transfer_param**

#include <*bluetooth.h*>

Public Members

uint16_t **skip**

Maximum event skip.

The number of periodic advertising packets that can be skipped after a successful receive.

uint16_t **timeout**

Synchronization timeout (N * 10 ms)

Synchronization timeout for the periodic advertising sync. Range 0x000A to 0x4000 (100 ms to 163840 ms)

uint32_t **options**

Periodic Advertising Sync Transfer options.

struct **bt_le_scan_param**

#include <*bluetooth.h*> LE scan parameters.

Public Members

uint8_t **type**

Scan type (BT_LE_SCAN_TYPE_ACTIVE or BT_LE_SCAN_TYPE_PASSIVE)

uint32_t **options**

Bit-field of scanning options.

uint16_t **interval**

Scan interval (N * 0.625 ms)

uint16_t **window**

Scan window (N * 0.625 ms)

uint16_t **timeout**

Scan timeout (N * 10 ms)

Application will be notified by the scan timeout callback. Set zero to disable timeout.

uint16_t **interval_coded**

Scan interval LE Coded PHY (N * 0.625 MS)

Set zero to use same as LE 1M PHY scan interval.

uint16_t **window_coded**

Scan window LE Coded PHY (N * 0.625 MS)

Set zero to use same as LE 1M PHY scan window.

struct **bt_le_scan_recv_info**

#include <*bluetooth.h*> LE advertisement and scan response packet information.

Public Members

const *bt_addr_le_t* ***addr**

Advertiser LE address and type.

If advertiser is anonymous then this address will be *BT_ADDR_LE_ANY*.

uint8_t **sid**

Advertising Set Identifier.

int8_t **rssi**

Strength of advertiser signal.

int8_t **tx_power**

Transmit power of the advertiser.

uint8_t **adv_type**

Advertising packet type.

Uses the BT_GAP_ADV_TYPE_* value.

May indicate that this is a scan response if the type is *BT_GAP_ADV_TYPE_SCAN_RSP*.

uint16_t **adv_props**

Advertising packet properties bitfield.

Uses the BT_GAP_ADV_PROP_* values. May indicate that this is a scan response if the value contains the *BT_GAP_ADV_PROP_SCAN_RESPONSE* bit.

uint16_t **interval**

Periodic advertising interval (N * 1.25 ms).

If 0 there is no periodic advertising.

uint8_t **primary_phy**

Primary advertising channel PHY.

uint8_t **secondary_phy**

Secondary advertising channel PHY.

struct **bt_le_scan_cb**

#include <*bluetooth.h*> Listener context for (LE) scanning.

Public Members

void (***recv**)(const struct *bt_le_scan_recv_info* *info, struct *net_buf_simple* *buf)

Advertisement packet and scan response received callback.

Param info
Advertiser packet and scan response information.

Param buf
Buffer containing advertiser data.

void (***timeout**)(void)

The scanner has stopped scanning after scan timeout.

struct **bt_le_oob_sc_data**

#include <*bluetooth.h*> LE Secure Connections pairing Out of Band data.

Public Members

uint8_t **r**[16]

Random Number.

uint8_t **c**[16]

Confirm Value.

struct **bt_le_oob**

#include <bluetooth.h> LE Out of Band information.

Public Members

bt_addr_le_t **addr**

LE address.

If privacy is enabled this is a Resolvable Private Address.

struct *bt_le_oob_sc_data* **le_sc_data**

LE Secure Connections pairing Out of Band data.

struct **bt_br_discovery_result**

#include <bluetooth.h> BR/EDR discovery result structure.

Public Members

bt_addr_t **addr**

Remote device address.

int8_t **rssi**

RSSI from inquiry.

uint8_t **cod**[3]

Class of Device.

uint8_t **eir**[240]

Extended Inquiry Response.

struct **bt_br_discovery_param**

#include <bluetooth.h> BR/EDR discovery parameters.

Public Members

uint8_t **length**

Maximum length of the discovery in units of 1.28 seconds.

Valid range is 0x01 - 0x30.

bool **limited**

True if limited discovery procedure is to be used.

struct **bt_br_oob**

#include <bluetooth.h>

Public Members

bt_addr_t **addr**
BR/EDR address.

struct **bt_bond_info**
#include <bluetooth.h> Information about a bond with a remote device.

Public Members

bt_addr_le_t **addr**
Address of the remote device.

struct **bt_le_per_adv_sync_subevent_params**
#include <bluetooth.h>

Public Members

uint16_t **properties**
Periodic Advertising Properties.
Bit 6 is include TxPower, all others RFU.

uint8_t **num_subevents**
Number of subevents to sync to.

uint8_t ***subevents**
The subevent(s) to synchronize with.
The array must have *num_subevents* elements.

struct **bt_le_per_adv_response_params**
#include <bluetooth.h>

Public Members

uint16_t **request_event**
The periodic event counter of the request the response is sent to.
bt_le_per_adv_sync_recv_info

> **Note**
> The response can be sent up to one periodic interval after the request was received.

uint8_t **request_subevent**
The subevent counter of the request the response is sent to.
bt_le_per_adv_sync_recv_info

uint8_t **response_subevent**
The subevent the response shall be sent in.

uint8_t **response_slot**
The response slot the response shall be sent in.

group **bt_addr**

Defines

BT_ADDR_LE_PUBLIC

BT_ADDR_LE_RANDOM

BT_ADDR_LE_PUBLIC_ID

BT_ADDR_LE_RANDOM_ID

BT_ADDR_LE_UNRESOLVED

BT_ADDR_LE_ANONYMOUS

BT_ADDR_SIZE
Length in bytes of a standard Bluetooth address.

BT_ADDR_LE_SIZE
Length in bytes of an LE Bluetooth address.
Not packed, so no sizeof()

BT_ADDR_ANY
Bluetooth device “any” address, not a valid address.

BT_ADDR_NONE
Bluetooth device “none” address, not a valid address.

BT_ADDR_LE_ANY
Bluetooth LE device “any” address, not a valid address.

BT_ADDR_LE_NONE
Bluetooth LE device “none” address, not a valid address.

`BT_ADDR_IS_RPA`(a)
: Check if a Bluetooth LE random address is resolvable private address.

`BT_ADDR_IS_NRPA`(a)
: Check if a Bluetooth LE random address is a non-resolvable private address.

`BT_ADDR_IS_STATIC`(a)
: Check if a Bluetooth LE random address is a static address.

`BT_ADDR_SET_RPA`(a)
: Set a Bluetooth LE random address as a resolvable private address.

`BT_ADDR_SET_NRPA`(a)
: Set a Bluetooth LE random address as a non-resolvable private address.

`BT_ADDR_SET_STATIC`(a)
: Set a Bluetooth LE random address as a static address.

`BT_ADDR_STR_LEN`
: Recommended length of user string buffer for Bluetooth address.

  The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

`BT_ADDR_LE_STR_LEN`
: Recommended length of user string buffer for Bluetooth LE address.

  The recommended length guarantee the output of address conversion will not lose valuable information about address being processed.

Functions

static inline int **bt_addr_cmp**(const *bt_addr_t* *a, const *bt_addr_t* *b)
: Compare Bluetooth device addresses.

  Parameters

  - **a** – First Bluetooth device address to compare
  - **b** – Second Bluetooth device address to compare

  Returns
  negative value if $a < b$, 0 if $a == b$, else positive

static inline bool **bt_addr_eq**(const *bt_addr_t* *a, const *bt_addr_t* *b)
: Determine equality of two Bluetooth device addresses.

  Return values

  - **true** – if the two addresses are equal
  - **false** – otherwise

static inline int **bt_addr_le_cmp**(const *bt_addr_le_t* *a, const *bt_addr_le_t* *b)
: Compare Bluetooth LE device addresses.

See also

bt_addr_le_eq

Parameters

- `a` – First Bluetooth LE device address to compare
- `b` – Second Bluetooth LE device address to compare

Returns
negative value if *a* < *b*, 0 if *a* == *b*, else positive

static inline bool **bt_addr_le_eq**(const *bt_addr_le_t* *a, const *bt_addr_le_t* *b)

Determine equality of two Bluetooth LE device addresses.

The Bluetooth LE addresses are equal if and only if both the types and the 48-bit addresses are numerically equal.

Return values

- `true` – if the two addresses are equal
- `false` – otherwise

static inline void **bt_addr_copy**(*bt_addr_t* *dst, const *bt_addr_t* *src)

Copy Bluetooth device address.

Parameters

- `dst` – Bluetooth device address destination buffer.
- `src` – Bluetooth device address source buffer.

static inline void **bt_addr_le_copy**(*bt_addr_le_t* *dst, const *bt_addr_le_t* *src)

Copy Bluetooth LE device address.

Parameters

- `dst` – Bluetooth LE device address destination buffer.
- `src` – Bluetooth LE device address source buffer.

int **bt_addr_le_create_nrpa**(*bt_addr_le_t* *addr)

Create a Bluetooth LE random non-resolvable private address.

int **bt_addr_le_create_static**(*bt_addr_le_t* *addr)

Create a Bluetooth LE random static address.

static inline bool **bt_addr_le_is_rpa**(const *bt_addr_le_t* *addr)

Check if a Bluetooth LE address is a random private resolvable address.

Parameters

- `addr` – Bluetooth LE device address.

Returns
true if address is a random private resolvable address.

static inline bool **bt_addr_le_is_identity**(const *bt_addr_le_t* *addr)

Check if a Bluetooth LE address is valid identity address.

Valid Bluetooth LE identity addresses are either public address or random static address.

Parameters

- `addr` – Bluetooth LE device address.

Returns
true if address is a valid identity address.

static inline int **bt_addr_to_str**(const *bt_addr_t* *addr, char *str, size_t len)

Converts binary Bluetooth address to string.

Parameters

- **addr** – Address of buffer containing binary Bluetooth address.
- **str** – Address of user buffer with enough room to store formatted string containing binary address.
- **len** – Length of data to be copied to user string buffer. Refer to BT_ADDR_STR_LEN about recommended value.

Returns

Number of successfully formatted bytes from binary address.

static inline int **bt_addr_le_to_str**(const *bt_addr_le_t* *addr, char *str, size_t len)

Converts binary LE Bluetooth address to string.

Parameters

- **addr** – Address of buffer containing binary LE Bluetooth address.
- **str** – Address of user buffer with enough room to store formatted string containing binary LE address.
- **len** – Length of data to be copied to user string buffer. Refer to BT_ADDR_LE_STR_LEN about recommended value.

Returns

Number of successfully formatted bytes from binary address.

int **bt_addr_from_str**(const char *str, *bt_addr_t* *addr)

Convert Bluetooth address from string to binary.

Parameters

- **str** – **[in]** The string representation of a Bluetooth address.
- **addr** – **[out]** Address of buffer to store the Bluetooth address

Return values

0 – Success. The parsed address is stored in addr.

Returns

-EINVAL Invalid address string. str is not a well-formed Bluetooth address.

int **bt_addr_le_from_str**(const char *str, const char *type, *bt_addr_le_t* *addr)

Convert LE Bluetooth address from string to binary.

Parameters

- **str** – **[in]** The string representation of an LE Bluetooth address.
- **type** – **[in]** The string representation of the LE Bluetooth address type.
- **addr** – **[out]** Address of buffer to store the LE Bluetooth address

Returns

Zero on success or (negative) error code otherwise.

Variables

const *bt_addr_t* **bt_addr_any**

const *bt_addr_t* **bt_addr_none**

const *bt_addr_le_t* **bt_addr_le_any**

const *bt_addr_le_t* **bt_addr_le_none**

struct **bt_addr_t**

#include <*addr.h*> Bluetooth Device Address.

struct **bt_addr_le_t**

#include <*addr.h*> Bluetooth LE Device Address.

group **bt_gap_defines**

: Garden Light.

BT_APPEARANCE_LIGHT_FIXTURES_POLE_TOP
: Pole-top Light.

BT_APPEARANCE_SPOT_LIGHT
: Spotlight.

BT_APPEARANCE_LIGHT_FIXTURES_LINEAR
: Linear Light.

BT_APPEARANCE_LIGHT_FIXTURES_STREET
: Street Light.

BT_APPEARANCE_LIGHT_FIXTURES_SHELVES
: Shelves Light.

BT_APPEARANCE_LIGHT_FIXTURES_BAY
: Bay Light.

BT_APPEARANCE_LIGHT_FIXTURES_EMERGENCY_EXIT
: Emergency Exit Light.

BT_APPEARANCE_LIGHT_FIXTURES_CONTROLLER
: Light Controller.

BT_APPEARANCE_LIGHT_FIXTURES_DRIVER
: Light Driver.

BT_APPEARANCE_LIGHT_FIXTURES_BULB
: Bulb.

BT_APPEARANCE_LIGHT_FIXTURES_LOW_BAY
: Low-bay Light.

BT_APPEARANCE_LIGHT_FIXTURES_HIGH_BAY
: High-bay Light.

BT_APPEARANCE_GENERIC_FAN
: Generic Fan.

BT_APPEARANCE_FAN_CEILING
: Ceiling Fan.

BT_APPEARANCE_FAN_AXIAL
: Axial Fan.

BT_APPEARANCE_FAN_EXHAUST
: Exhaust Fan.

BT_APPEARANCE_FAN_PEDESTAL
: Pedestal Fan.

BT_APPEARANCE_FAN_DESK
: Desk Fan.

BT_APPEARANCE_FAN_WALL
: Wall Fan.

BT_APPEARANCE_GENERIC_HVAC
: Generic HVAC.

BT_APPEARANCE_HVAC_THERMOSTAT
: Thermostat.

BT_APPEARANCE_HVAC_HUMIDIFIER
: Humidifier.

BT_APPEARANCE_HVAC_DEHUMIDIFIER
: De-humidifier.

BT_APPEARANCE_HVAC_HEATER
: Heater.

BT_APPEARANCE_HVAC_RADIATOR
: Radiator.

BT_APPEARANCE_HVAC_BOILER
: Boiler.

BT_APPEARANCE_HVAC_HEAT_PUMP
: Heat Pump.

BT_APPEARANCE_HVAC_INFRARED_HEATER
: Infrared Heater.

BT_APPEARANCE_HVAC_RADIANT_PANEL_HEATER
: Radiant Panel Heater.

BT_APPEARANCE_HVAC_FAN_HEATER
: Fan Heater.

: Air Curtain.

BT_APPEARANCE_GENERIC_AIR_CONDITIONING
: Generic Air Conditioning.

BT_APPEARANCE_GENERIC_HUMIDIFIER
: Generic Humidifier.

BT_APPEARANCE_GENERIC_HEATING
: Generic Heating.

BT_APPEARANCE_HEATING_RADIATOR
: Radiator.

BT_APPEARANCE_HEATING_BOILER
: Boiler.

BT_APPEARANCE_HEATING_HEAT_PUMP
: Heat Pump.

BT_APPEARANCE_HEATING_INFRARED_HEATER
: Infrared Heater.

BT_APPEARANCE_HEATING_RADIANT_PANEL_HEATER
: Radiant Panel Heater.

BT_APPEARANCE_HEATING_FAN_HEATER
: Fan Heater.

BT_APPEARANCE_HEATING_AIR_CURTAIN
: Air Curtain.

BT_APPEARANCE_GENERIC_ACCESS_CONTROL
: Generic Access Control.

BT_APPEARANCE_CONTROL_ACCESS_DOOR
: Access Door.

BT_APPEARANCE_CONTROL_GARAGE_DOOR
: Garage Door.

BT_APPEARANCE_CONTROL_EMERGENCY_EXIT_DOOR
: Emergency Exit Door.

BT_APPEARANCE_CONTROL_ACCESS_LOCK
: Access Lock.

BT_APPEARANCE_CONTROL_ELEVATOR
: Elevator.

BT_APPEARANCE_CONTROL_WINDOW
: Window.

BT_APPEARANCE_CONTROL_ENTRANCE_GATE
: Entrance Gate.

BT_APPEARANCE_CONTROL_DOOR_LOCK
: Door Lock.

BT_APPEARANCE_CONTROL_LOCKER
: Locker.

BT_APPEARANCE_GENERIC_MOTORIZED_DEVICE
: Generic Motorized Device.

BT_APPEARANCE_MOTORIZED_GATE
: Motorized Gate.

BT_APPEARANCE_MOTORIZED_AWNING
: Awning.

BT_APPEARANCE_MOTORIZED_BLINDS_OR_SHADES
: Blinds or Shades.

BT_APPEARANCE_MOTORIZED_CURTAINS
: Curtains.

BT_APPEARANCE_MOTORIZED_SCREEN
: Screen.

BT_APPEARANCE_GENERIC_POWER_DEVICE
: Generic Power Device.

BT_APPEARANCE_POWER_OUTLET
: Power Outlet.

BT_APPEARANCE_POWER_STRIP
: Power Strip.

BT_APPEARANCE_POWER_PLUG
: Plug.

BT_APPEARANCE_POWER_SUPPLY
: Power Supply.

BT_APPEARANCE_POWER_LED_DRIVER
: LED Driver.

BT_APPEARANCE_POWER_FLUORESCENT_LAMP_GEAR
: Fluorescent Lamp Gear.

BT_APPEARANCE_POWER_HID_LAMP_GEAR
: HID Lamp Gear.

BT_APPEARANCE_POWER_CHARGE_CASE
: Charge Case.

BT_APPEARANCE_POWER_POWER_BANK
: Power Bank.

BT_APPEARANCE_GENERIC_LIGHT_SOURCE
: Generic Light Source.

BT_APPEARANCE_LIGHT_SOURCE_INCANDESCENT_BULB
: Incandescent Light Bulb.

BT_APPEARANCE_LIGHT_SOURCE_LED_LAMP
: LED Lamp.

BT_APPEARANCE_LIGHT_SOURCE_HID_LAMP
: HID Lamp.

BT_APPEARANCE_LIGHT_SOURCE_FLUORESCENT_LAMP
: Fluorescent Lamp.

BT_APPEARANCE_LIGHT_SOURCE_LED_ARRAY
: LED Array.

BT_APPEARANCE_LIGHT_SOURCE_MULTICOLOR_LED_ARRAY
: Multi-Color LED Array.

BT_APPEARANCE_LIGHT_SOURCE_LOW_VOLTAGE_HALOGEN
: Low voltage halogen.

BT_APPEARANCE_LIGHT_SOURCE_OLED
: Organic light emitting diode.

BT_APPEARANCE_GENERIC_WINDOW_COVERING
: Generic Window Covering.

BT_APPEARANCE_WINDOW_SHADES
: Window Shades.

BT_APPEARANCE_WINDOW_BLINDS
: Window Blinds.

BT_APPEARANCE_WINDOW_AWNING
: Window Awning.

BT_APPEARANCE_WINDOW_CURTAIN
: Window Curtain.

BT_APPEARANCE_WINDOW_EXTERIOR_SHUTTER
: Exterior Shutter.

BT_APPEARANCE_WINDOW_EXTERIOR_SCREEN
: Exterior Screen.

BT_APPEARANCE_GENERIC_AUDIO_SINK
: Generic Audio Sink.

BT_APPEARANCE_AUDIO_SINK_STANDALONE_SPEAKER
: Standalone Speaker.

BT_APPEARANCE_AUDIO_SINK_SOUNDBAR
: Soundbar.

BT_APPEARANCE_AUDIO_SINK_BOOKSHELF_SPEAKER
: Bookshelf Speaker.

BT_APPEARANCE_AUDIO_SINK_STANDMOUNTED_SPEAKER
: Standmounted Speaker.

BT_APPEARANCE_AUDIO_SINK_SPEAKERPHONE
: Speakerphone.

BT_APPEARANCE_GENERIC_AUDIO_SOURCE
: Generic Audio Source.

BT_APPEARANCE_AUDIO_SOURCE_MICROPHONE
: Microphone.

BT_APPEARANCE_AUDIO_SOURCE_ALARM
: Alarm.

BT_APPEARANCE_AUDIO_SOURCE_BELL
: Bell.

BT_APPEARANCE_AUDIO_SOURCE_HORN
: Horn.

BT_APPEARANCE_AUDIO_SOURCE_BROADCASTING_DEVICE
: Broadcasting Device.

: Dryer.

BT_APPEARANCE_APPLIANCE_COFFEE_MAKER
: Coffee maker.

BT_APPEARANCE_APPLIANCE_CLOTHES_IRON
: Clothes iron.

BT_APPEARANCE_APPLIANCE_CURLING_IRON
: Curling iron.

BT_APPEARANCE_APPLIANCE_HAIR_DRYER
: Hair dryer.

BT_APPEARANCE_APPLIANCE_VACUUM_CLEANER
: Vacuum cleaner.

BT_APPEARANCE_APPLIANCE_ROBOTIC_VACUUM_CLEANER
: Robotic vacuum cleaner.

BT_APPEARANCE_APPLIANCE_RICE_COOKER
: Rice cooker.

BT_APPEARANCE_APPLIANCE_CLOTHES_STEAMER
: Clothes steamer.

BT_APPEARANCE_GENERIC_WEARABLE_AUDIO_DEVICE
: Generic Wearable Audio Device.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_EARBUD
: Earbud.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_HEADSET
: Headset.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_HEADPHONES
: Headphones.

BT_APPEARANCE_WEARABLE_AUDIO_DEVICE_NECK_BAND
: Neck Band.

BT_APPEARANCE_GENERIC_AIRCRAFT
: Generic Aircraft.

BT_APPEARANCE_AIRCRAFT_LIGHT
: Light Aircraft.

BT_APPEARANCE_AIRCRAFT_MICROLIGHT
: Microlight.

BT_APPEARANCE_AIRCRAFT_PARAGLIDER
: Paraglider.

BT_APPEARANCE_AIRCRAFT_LARGE_PASSENGER
: Large Passenger Aircraft.

BT_APPEARANCE_GENERIC_AV_EQUIPMENT
: Generic AV Equipment.

BT_APPEARANCE_AV_EQUIPMENT_AMPLIFIER
: Amplifier.

BT_APPEARANCE_AV_EQUIPMENT_RECEIVER
: Receiver.

BT_APPEARANCE_AV_EQUIPMENT_RADIO
: Radio.

BT_APPEARANCE_AV_EQUIPMENT_TUNER
: Tuner.

BT_APPEARANCE_AV_EQUIPMENT_TURNTABLE
: Turntable.

BT_APPEARANCE_AV_EQUIPMENT_CD_PLAYER
: CD Player.

BT_APPEARANCE_AV_EQUIPMENT_DVD_PLAYER
: DVD Player.

BT_APPEARANCE_AV_EQUIPMENT_BLURAY_PLAYER
: Bluray Player.

BT_APPEARANCE_AV_EQUIPMENT_OPTICAL_DISC_PLAYER
: Optical Disc Player.

BT_APPEARANCE_AV_EQUIPMENT_SET_TOP_BOX
: Set-Top Box.

BT_APPEARANCE_GENERIC_DISPLAY_EQUIPMENT
: Generic Display Equipment.

BT_APPEARANCE_DISPLAY_EQUIPMENT_TELEVISION
: Television.

BT_APPEARANCE_DISPLAY_EQUIPMENT_MONITOR
: Monitor.

BT_APPEARANCE_DISPLAY_EQUIPMENT_PROJECTOR
: Projector.

BT_APPEARANCE_GENERIC_HEARING_AID
: Generic Hearing aid.

BT_APPEARANCE_HEARING_AID_IN_EAR
: In-ear hearing aid.

BT_APPEARANCE_HEARING_AID_BEHIND_EAR
: Behind-ear hearing aid.

BT_APPEARANCE_HEARING_AID_COCHLEAR_IMPLANT
: Cochlear Implant.

BT_APPEARANCE_GENERIC_GAMING
: Generic Gaming.

BT_APPEARANCE_HOME_VIDEO_GAME_CONSOLE
: Home Video Game Console.

BT_APPEARANCE_PORTABLE_HANDHELD_CONSOLE
: Portable handheld console.

BT_APPEARANCE_GENERIC_SIGNAGE
: Generic Signage.

BT_APPEARANCE_SIGNAGE_DIGITAL
: Digital Signage.

BT_APPEARANCE_SIGNAGE_ELECTRONIC_LABEL
: Electronic Label.

BT_APPEARANCE_GENERIC_PULSE_OXIMETER
: Generic Pulse Oximeter.

BT_APPEARANCE_PULSE_OXIMETER_FINGERTIP
: Fingertip Pulse Oximeter.

BT_APPEARANCE_PULSE_OXIMETER_WRIST
: Wrist Worn Pulse Oximeter.

BT_APPEARANCE_GENERIC_WEIGHT_SCALE
: Generic Weight Scale.

BT_APPEARANCE_GENERIC_PERSONAL_MOBILITY_DEVICE
: Generic Personal Mobility Device.

BT_APPEARANCE_MOBILITY_POWERED_WHEELCHAIR
: Powered Wheelchair.

BT_APPEARANCE_MOBILITY_SCOOTER
: Mobility Scooter.

BT_APPEARANCE_CONTINUOUS_GLUCOSE_MONITOR
: Continuous Glucose Monitor.

BT_APPEARANCE_GENERIC_INSULIN_PUMP
: Generic Insulin Pump.

BT_APPEARANCE_INSULIN_PUMP_DURABLE
: Insulin Pump, durable pump.

BT_APPEARANCE_INSULIN_PUMP_PATCH
: Insulin Pump, patch pump.

BT_APPEARANCE_INSULIN_PEN
: Insulin Pen.

BT_APPEARANCE_GENERIC_MEDICATION_DELIVERY
: Generic Medication Delivery.

BT_APPEARANCE_GENERIC_SPIROMETER
: Generic Spirometer.

BT_APPEARANCE_SPIROMETER_HANDHELD
: Handheld Spirometer.

BT_APPEARANCE_GENERIC_OUTDOOR_SPORTS
: Generic Outdoor Sports Activity.

BT_APPEARANCE_OUTDOOR_SPORTS_LOCATION
: Location Display.

BT_APPEARANCE_OUTDOOR_SPORTS_LOCATION_AND_NAV
: Location and Navigation Display.

BT_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD
: Location Pod.

BT_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV
: Location and Navigation Pod.

Defines

BT_GAP_ADV_MAX_ADV_DATA_LEN
: Maximum advertising data length.

BT_GAP_ADV_MAX_EXT_ADV_DATA_LEN
: Maximum extended advertising data length.

> **Note**
>
> The maximum advertising data length that can be sent by an extended advertiser is defined by the controller.

BT_GAP_TX_POWER_INVALID

BT_GAP_RSSI_INVALID

BT_GAP_SID_INVALID

BT_GAP_NO_TIMEOUT

BT_GAP_ADV_HIGH_DUTY_CYCLE_MAX_TIMEOUT

BT_GAP_DATA_LEN_DEFAULT
: Default data length.

BT_GAP_DATA_LEN_MAX
: Maximum data length.

BT_GAP_DATA_TIME_DEFAULT
: Default data time.

BT_GAP_DATA_TIME_MAX
: Maximum data time.

BT_GAP_SID_MAX
: Maximum advertising set number.

BT_GAP_PER_ADV_MAX_SKIP
: Maximum number of consecutive periodic advertisement events that can be skipped after a successful receive.

BT_GAP_PER_ADV_MIN_TIMEOUT
: Minimum Periodic Advertising Timeout (N * 10 ms)

BT_GAP_PER_ADV_MAX_TIMEOUT
: Maximum Periodic Advertising Timeout (N * 10 ms)

BT_GAP_PER_ADV_MIN_INTERVAL
: Minimum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_MAX_INTERVAL
: Maximum Periodic Advertising Interval (N * 1.25 ms)

BT_GAP_PER_ADV_INTERVAL_TO_MS(interval)
: Convert periodic advertising interval (N * 1.25 ms) to milliseconds.

  5 / 4 represents 1.25 ms unit.

BT_LE_SUPP_FEAT_40_ENCODE(w64)
: Encode 40 least significant bits of 64-bit LE Supported Features into array values in little-endian format.

Helper macro to encode 40 least significant bits of 64-bit LE Supported Features value into advertising data. The number of bits that are encoded is a number of LE Supported Features defined by BT 5.3 Core specification.

Example of how to encode the `0x000000DFF00DF00D` into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_40_
↪ENCODE(0x000000DFF00DF00D))
```

Parameters

- **w64** – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for *BT_DATA_BYTES*.

`BT_LE_SUPP_FEAT_32_ENCODE`(w64)

Encode 4 least significant bytes of 64-bit LE Supported Features into 4 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 4 least significant bytes into advertising data. Other 4 bytes are not encoded.

Example of how to encode the `0x000000DFF00DF00D` into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_32_
↪ENCODE(0x000000DFF00DF00D))
```

Parameters

- **w64** – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for *BT_DATA_BYTES*.

`BT_LE_SUPP_FEAT_24_ENCODE`(w64)

Encode 3 least significant bytes of 64-bit LE Supported Features into 3 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 5 bytes are not encoded.

Example of how to encode the `0x000000DFF00DF00D` into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_24_
↪ENCODE(0x000000DFF00DF00D))
```

Parameters

- **w64** – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for *BT_DATA_BYTES*.

BT_LE_SUPP_FEAT_16_ENCODE(w64)

Encode 2 least significant bytes of 64-bit LE Supported Features into 2 bytes long array of values in little-endian format.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes 3 least significant bytes into advertising data. Other 6 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_16_
↪ENCODE(0x000000DFF00DF00D))
```

Parameters

- **w64** – LE Supported Features value (64-bits)

Returns

The comma separated values for LE Supported Features value that may be used directly as an argument for *BT_DATA_BYTES*.

BT_LE_SUPP_FEAT_8_ENCODE(w64)

Encode the least significant byte of 64-bit LE Supported Features into single byte long array.

Helper macro to encode 64-bit LE Supported Features value into advertising data. The macro encodes the least significant byte into advertising data. Other 7 bytes are not encoded.

Example of how to encode the 0x000000DFF00DF00D into advertising data.

```
BT_DATA_BYTES(BT_DATA_LE_SUPPORTED_FEATURES, BT_LE_SUPP_FEAT_8_
↪ENCODE(0x000000DFF00DF00D))
```

Parameters

- **w64** – LE Supported Features value (64-bits)

Returns

The value of least significant byte of LE Supported Features value that may be used directly as an argument for *BT_DATA_BYTES*.

BT_LE_SUPP_FEAT_VALIDATE(w64)

Validate whether LE Supported Features value does not use bits that are reserved for future use.

Helper macro to check if w64 has zeros as bits 40-63. The macro is compliant with BT 5.3 Core Specification where bits 0-40 has assigned values. In case of invalid value, build time error is reported.

Enums

LE PHY types.

Values:

enumerator BT_GAP_LE_PHY_NONE = 0

Convenience macro for when no PHY is set.

enumerator BT_GAP_LE_PHY_1M = *BIT*(0)
LE 1M PHY.

enumerator BT_GAP_LE_PHY_2M = *BIT*(1)
LE 2M PHY.

enumerator BT_GAP_LE_PHY_CODED = *BIT*(2)
LE Coded PHY.

Advertising PDU types.

Values:

enumerator BT_GAP_ADV_TYPE_ADV_IND = 0x00
Scannable and connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_DIRECT_IND = 0x01
Directed connectable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_SCAN_IND = 0x02
Non-connectable and scannable advertising.

enumerator BT_GAP_ADV_TYPE_ADV_NONCONN_IND = 0x03
Non-connectable and non-scannable advertising.

enumerator BT_GAP_ADV_TYPE_SCAN_RSP = 0x04
Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_TYPE_EXT_ADV = 0x05
Extended advertising, see advertising properties.

Advertising PDU properties.

Values:

enumerator BT_GAP_ADV_PROP_CONNECTABLE = *BIT*(0)
Connectable advertising.

enumerator BT_GAP_ADV_PROP_SCANNABLE = *BIT*(1)
Scannable advertising.

enumerator BT_GAP_ADV_PROP_DIRECTED = *BIT*(2)
Directed advertising.

enumerator BT_GAP_ADV_PROP_SCAN_RESPONSE = *BIT*(3)
Additional advertising data requested by an active scanner.

enumerator BT_GAP_ADV_PROP_EXT_ADV = *BIT*(4)
Extended advertising.

Constant Tone Extension (CTE) types.

Values:

enumerator BT_GAP_CTE_AOA = 0x00
Angle of Arrival.

enumerator BT_GAP_CTE_AOD_1US = 0x01
Angle of Departure with 1 us slots.

enumerator BT_GAP_CTE_AOD_2US = 0x02
Angle of Departure with 2 us slots.

enumerator BT_GAP_CTE_NONE = 0xFF
No extensions.

Peripheral sleep clock accuracy (SCA) in ppm (parts per million)

Values:

enumerator BT_GAP_SCA_UNKNOWN = 0
Unknown.

enumerator BT_GAP_SCA_251_500 = 0
251 ppm to 500 ppm

enumerator BT_GAP_SCA_151_250 = 1
151 ppm to 250 ppm

enumerator BT_GAP_SCA_101_150 = 2
101 ppm to 150 ppm

enumerator BT_GAP_SCA_76_100 = 3
76 ppm to 100 ppm

enumerator BT_GAP_SCA_51_75 = 4
51 ppm to 75 ppm

enumerator BT_GAP_SCA_31_50 = 5
31 ppm to 50 ppm

enumerator BT_GAP_SCA_21_30 = 6
21 ppm to 30 ppm

enumerator BT_GAP_SCA_0_20 = 7
0 ppm to 20 ppm

Bluetooth: Isochronous Channels

Commands

```
iso --help
iso - Bluetooth ISO shell commands
Subcommands:
   cig_create  :[dir=tx,rx,txrx] [interval] [packing] [framing] [latency] [sdu]
               [phy] [rtn]
   cig_term    :Terminate the CIG
   connect     :Connect ISO Channel
   listen      :<dir=tx,rx,txrx> [security level]
   send        :Send to ISO Channel [count]
   disconnect  :Disconnect ISO Channel
   create-big  :Create a BIG as a broadcaster [enc <broadcast code>]
   broadcast   :Broadcast on ISO channels
   sync-big    :Synchronize to a BIG as a receiver <BIS bitfield> [mse] [timeout]
               [enc <broadcast code>]
   term-big    :Terminate a BIG
```

1. [Central] Create CIG:

Requires to be connected:

```
uart:~$ iso cig_create
CIG created
```

2. [Peripheral] Listen to ISO connections

```
uart:~$ iso listen txrx
```

3. [Central] Connect ISO channel:

```
uart:~$ iso connect
ISO Connect pending...
ISO Channel 0x20000f88 connected
```

4. Send data:

```
uart:~$ iso send
send: 40 bytes of data
ISO sending...
```

5. Disconnect ISO channel:

```
uart:~$ iso disconnect
ISO Disconnect pending...
ISO Channel 0x20000f88 disconnected with reason 0x16
```

Generic Attribute Profile (GATT) GATT layer manages the service database providing APIs for service registration and attribute declaration.

Services can be registered using *bt_gatt_service_register()* API which takes the *bt_gatt_service* struct that provides the list of attributes the service contains. The helper macro *BT_GATT_SERVICE()* can be used to declare a service.

Attributes can be declared using the *bt_gatt_attr* struct or using one of the helper macros:

BT_GATT_PRIMARY_SERVICE
: Declares a Primary Service.

BT_GATT_SECONDARY_SERVICE
: Declares a Secondary Service.

BT_GATT_INCLUDE_SERVICE
: Declares a Include Service.

BT_GATT_CHARACTERISTIC
: Declares a Characteristic.

BT_GATT_DESCRIPTOR
: Declares a Descriptor.

BT_GATT_ATTRIBUTE
: Declares an Attribute.

BT_GATT_CCC
: Declares a Client Characteristic Configuration.

BT_GATT_CEP
: Declares a Characteristic Extended Properties.

BT_GATT_CUD
: Declares a Characteristic User Format.

Each attribute contain a `uuid`, which describes their type, a `read` callback, a `write` callback and a set of permission. Both read and write callbacks can be set to NULL if the attribute permission don't allow their respective operations.

Note

32-bit UUIDs are not supported in GATT. All 32-bit UUIDs shall be converted to 128-bit UUIDs when the UUID is contained in an ATT PDU.

Note

Attribute `read` and `write` callbacks are called directly from RX Thread thus it is not recommended to block for long periods of time in them.

Attribute value changes can be notified using *bt_gatt_notify()* API, alternatively there is *bt_gatt_notify_cb()* where it is possible to pass a callback to be called when it is necessary to know the exact instant when the data has been transmitted over the air. Indications are supported by *bt_gatt_indicate()* API.

Client procedures can be enabled with the configuration option: `CONFIG_BT_GATT_CLIENT`

Discover procedures can be initiated with the use of *bt_gatt_discover()* API which takes the *bt_gatt_discover_params* struct which describes the type of discovery. The parameters also serves as a filter when setting the `uuid` field only attributes which matches will be discovered, in contrast setting it to NULL allows all attributes to be discovered.

Note

Caching discovered attributes is not supported.

Read procedures are supported by *bt_gatt_read()* API which takes the *bt_gatt_read_params* struct as parameters. In the parameters one or more attributes can be set, though setting multiple handles requires the option: `CONFIG_BT_GATT_READ_MULTIPLE`

Write procedures are supported by *bt_gatt_write()* API and takes *bt_gatt_write_params* struct as parameters. In case the write operation don't require a response *bt_gatt_write_without_response()* or *bt_gatt_write_without_response_cb()* APIs can be used, with the later working similarly to *bt_gatt_notify_cb()*.

Subscriptions to notification and indication can be initiated with use of *bt_gatt_subscribe()* API which takes *bt_gatt_subscribe_params* as parameters. Multiple subscriptions to the same attribute are supported so there could be multiple `notify` callback being triggered for the same attribute. Subscriptions can be removed with use of *bt_gatt_unsubscribe()* API.

Note

When subscriptions are removed `notify` callback is called with the data set to NULL.

Related code samples

BLE logging backend
Send log messages over BLE using the BLE logging backend.

API Reference

group `bt_gatt`

Generic Attribute Profile (GATT)

Defines

`BT_GATT_ERR`(_att_err)

Construct error return value for attribute read and write callbacks.

Parameters

- **`_att_err`** – ATT error code

Returns
Appropriate error code for the attribute callbacks.

`BT_GATT_CHRC_BROADCAST`

Characteristic Properties Bit field values.

Characteristic broadcast property.

If set, permits broadcasts of the Characteristic Value using Server Characteristic Configuration Descriptor.

`BT_GATT_CHRC_READ`

Characteristic read property.

If set, permits reads of the Characteristic Value.

`BT_GATT_CHRC_WRITE_WITHOUT_RESP`

Characteristic write without response property.

If set, permits write of the Characteristic Value without response.

`BT_GATT_CHRC_WRITE`

Characteristic write with response property.

If set, permits write of the Characteristic Value with response.

BT_GATT_CHRC_NOTIFY

Characteristic notify property.

If set, permits notifications of a Characteristic Value without acknowledgment.

BT_GATT_CHRC_INDICATE

Characteristic indicate property.

If set, permits indications of a Characteristic Value with acknowledgment.

BT_GATT_CHRC_AUTH

Characteristic Authenticated Signed Writes property.

If set, permits signed writes to the Characteristic Value.

BT_GATT_CHRC_EXT_PROP

Characteristic Extended Properties property.

If set, additional characteristic properties are defined in the Characteristic Extended Properties Descriptor.

BT_GATT_CEP_RELIABLE_WRITE

Characteristic Extended Properties Bit field values.

BT_GATT_CEP_WRITABLE_AUX

BT_GATT_CCC_NOTIFY

Client Characteristic Configuration Values.

Client Characteristic Configuration Notification.

If set, changes to Characteristic Value shall be notified.

BT_GATT_CCC_INDICATE

Client Characteristic Configuration Indication.

If set, changes to Characteristic Value shall be indicated.

BT_GATT_SCC_BROADCAST

Server Characteristic Configuration Values.

Server Characteristic Configuration Broadcast

If set, the characteristic value shall be broadcast in the advertising data when the server is advertising.

Typedefs

typedef ssize_t (***bt_gatt_attr_read_func_t**)(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Attribute read callback.

The callback can also be used locally to read the contents of the attribute in which case no connection will be set.

Param conn
The connection that is requesting to read

Param attr
The attribute that's being read

Param buf
Buffer to place the read result in

Param len
Length of data to read

Param offset
Offset to start reading from

Return
Number of bytes read, or in case of an error *BT_GATT_ERR()* with a specific BT_ATT_ERR_* error code.

typedef ssize_t (***bt_gatt_attr_write_func_t**)(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)

Attribute write callback.

Param conn
The connection that is requesting to write

Param attr
The attribute that's being written

Param buf
Buffer with the data to write

Param len
Number of bytes in the buffer

Param offset
Offset to start writing from

Param flags
Flags (BT_GATT_WRITE_FLAG_*)

Return
Number of bytes written, or in case of an error *BT_GATT_ERR()* with a specific BT_ATT_ERR_* error code.

Enums

enum **bt_gatt_perm**

GATT attribute permission bit field values.

Values:

enumerator **BT_GATT_PERM_NONE** = 0

No operations supported, e.g.

for notify-only

enumerator **BT_GATT_PERM_READ** = *BIT*(0)

Attribute read permission.

enumerator **BT_GATT_PERM_WRITE** = *BIT*(1)

Attribute write permission.

enumerator **BT_GATT_PERM_READ_ENCRYPT** = *BIT*(2)

Attribute read permission with encryption.

```
If set, requires encryption for read access.
```

enumerator **BT_GATT_PERM_WRITE_ENCRYPT** = *BIT*(3)

Attribute write permission with encryption.

```
If set, requires encryption for write access.
```

enumerator **BT_GATT_PERM_READ_AUTHEN** = *BIT*(4)

Attribute read permission with authentication.

```
If set, requires encryption using authenticated link-key for read
access.
```

enumerator **BT_GATT_PERM_WRITE_AUTHEN** = *BIT*(5)

Attribute write permission with authentication.

```
If set, requires encryption using authenticated link-key for write
access.
```

enumerator **BT_GATT_PERM_PREPARE_WRITE** = *BIT*(6)

Attribute prepare write permission.

```
If set, allows prepare writes with use of ``BT_GATT_WRITE_FLAG_PREPARE``
passed to write callback.
```

enumerator **BT_GATT_PERM_READ_LESC** = *BIT*(7)

Attribute read permission with LE Secure Connection encryption.

```
If set, requires that LE Secure Connections is used for read access.
```

enumerator **BT_GATT_PERM_WRITE_LESC** = *BIT*(8)

Attribute write permission with LE Secure Connection encryption.

```
If set, requires that LE Secure Connections is used for write access.
```

GATT attribute write flags.

Values:

enumerator **BT_GATT_WRITE_FLAG_PREPARE** = *BIT*(0)

Attribute prepare write flag.

```
If set, write callback should only check if the device is
authorized but no data shall be written.
```

enumerator **BT_GATT_WRITE_FLAG_CMD** = *BIT*(1)

Attribute write command flag.

```
If set, indicates that write operation is a command (Write without
response) which doesn't generate any response.
```

enumerator **BT_GATT_WRITE_FLAG_EXECUTE** = *BIT*(2)

Attribute write execute flag.

```
If set, indicates that write operation is a execute, which indicates
the end of a long write, and will come after 1 or more
@ref BT_GATT_WRITE_FLAG_PREPARE.
```

struct **bt_gatt_attr**

#include <*gatt.h*> GATT Attribute structure.

Public Members

const struct *bt_uuid* ***uuid**

Attribute UUID.

bt_gatt_attr_read_func_t **read**

Attribute read callback.

bt_gatt_attr_write_func_t **write**

Attribute write callback.

void ***user_data**

Attribute user data.

uint16_t **handle**

Attribute handle.

uint16_t **perm**

Attribute permissions.

Will be 0 if returned from *bt_gatt_discover()*.

struct **bt_gatt_service_static**

#include <*gatt.h*> GATT Service structure.

Public Members

const struct *bt_gatt_attr* ***attrs**

Service Attributes.

size_t **attr_count**

Service Attribute count.

struct **bt_gatt_service**

#include <*gatt.h*> GATT Service structure.

Public Members

struct *bt_gatt_attr* ***attrs**
Service Attributes.

size_t **attr_count**
Service Attribute count.

struct **bt_gatt_service_val**
#include <*gatt.h*> Service Attribute Value.

Public Members

const struct *bt_uuid* ***uuid**
Service UUID.

uint16_t **end_handle**
Service end handle.

struct **bt_gatt_include**
#include <*gatt.h*> Include Attribute Value.

Public Members

const struct *bt_uuid* ***uuid**
Service UUID.

uint16_t **start_handle**
Service start handle.

uint16_t **end_handle**
Service end handle.

struct **bt_gatt_cb**
#include <*gatt.h*> GATT callback structure.

Public Members

void (***att_mtu_updated**)(struct bt_conn *conn, uint16_t tx, uint16_t rx)
The maximum ATT MTU on a connection has changed.

This callback notifies the application that the maximum TX or RX ATT MTU has increased.

Param conn
Connection object.

Param tx
Updated TX ATT MTU.

Param rx
Updated RX ATT MTU.

struct **bt_gatt_authorization_cb**

#include <*gatt.h*> GATT authorization callback structure.

Public Members

bool (***read_authorize**)(struct bt_conn *conn, const struct *bt_gatt_attr* *attr)

Authorize the GATT read operation.

This callback allows the application to authorize the GATT read operation for the attribute that is being read.

Param conn
Connection object.
Param attr
The attribute that is being read.
Retval true
Authorize the operation and allow it to execute.
Retval false
Reject the operation and prevent it from executing.

bool (***write_authorize**)(struct bt_conn *conn, const struct *bt_gatt_attr* *attr)

Authorize the GATT write operation.

This callback allows the application to authorize the GATT write operation for the attribute that is being written.

Param conn
Connection object.
Param attr
The attribute that is being written.
Retval true
Authorize the operation and allow it to execute.
Retval false
Reject the operation and prevent it from executing.

struct **bt_gatt_chrc**

#include <*gatt.h*> Characteristic Attribute Value.

Public Members

const struct *bt_uuid* ***uuid**

Characteristic UUID.

uint16_t **value_handle**

Characteristic Value handle.

uint8_t **properties**

Characteristic properties.

struct **bt_gatt_cep**

#include <*gatt.h*> Characteristic Extended Properties Attribute Value.

Public Members

uint16_t **properties**
Characteristic Extended properties.

struct **bt_gatt_ccc**
#include <*gatt.h*> Client Characteristic Configuration Attribute Value.

Public Members

uint16_t **flags**
Client Characteristic Configuration flags.

struct **bt_gatt_scc**
#include <*gatt.h*> Server Characteristic Configuration Attribute Value.

Public Members

uint16_t **flags**
Server Characteristic Configuration flags.

struct **bt_gatt_cpf**
#include <*gatt.h*> GATT Characteristic Presentation Format Attribute Value.

Public Members

uint8_t **format**
Format of the value of the characteristic.

int8_t **exponent**
Exponent field to determine how the value of this characteristic is further formatted.

uint16_t **unit**
Unit of the characteristic.

uint8_t **name_space**
Name space of the description.

uint16_t **description**
Description of the characteristic as defined in a higher layer profile.

GATT Server

group **bt_gatt_server**

Defines

BT_GATT_SERVICE_DEFINE(_name, ...)

Statically define and register a service.

Helper macro to statically define and register a service.

Parameters

- **_name** – Service name.

BT_GATT_SERVICE_INSTANCE_DEFINE(_name, _instances, _instance_num, _attrs_def)

Statically define service structure array.

Helper macro to statically define service structure array. Each element of the array is linked to the service attribute array which is also defined in this scope using `_attrs_def` macro.

Parameters

- **_name** – Name of service structure array.
- **_instances** – Array of instances to pass as user context to the attribute callbacks.
- **_instance_num** – Number of elements in instance array.
- **_attrs_def** – Macro provided by the user that defines attribute array for the service. This macro should accept single parameter which is the instance context.

BT_GATT_SERVICE(_attrs)

Service Structure Declaration Macro.

Helper macro to declare a service structure.

Parameters

- **_attrs** – Service attributes.

BT_GATT_PRIMARY_SERVICE(_service)

Primary Service Declaration Macro.

Helper macro to declare a primary service attribute.

Parameters

- **_service** – Service attribute value.

BT_GATT_SECONDARY_SERVICE(_service)

Secondary Service Declaration Macro.

Helper macro to declare a secondary service attribute.

> **Note**
>
> A secondary service is only intended to be included from a primary service or another secondary service or other higher layer specification.

Parameters

- **_service** – Service attribute value.

BT_GATT_INCLUDE_SERVICE(_service_incl)

Include Service Declaration Macro.

Helper macro to declare database internal include service attribute.

Parameters

- **_service_incl** – the first service attribute of service to include

BT_GATT_CHRC_INIT(_uuid, _handle, _props)

BT_GATT_CHARACTERISTIC(_uuid, _props, _perm, _read, _write, _user_data)

Characteristic and Value Declaration Macro.

Helper macro to declare a characteristic attribute along with its attribute value.

Parameters

- **_uuid** – Characteristic attribute uuid.
- **_props** – Characteristic attribute properties, a bitmap of BT_GATT_CHRC_* macros.
- **_perm** – Characteristic Attribute access permissions, a bitmap of *bt_gatt_perm* values.
- **_read** – Characteristic Attribute read callback (*bt_gatt_attr_read_func_t*).
- **_write** – Characteristic Attribute write callback (*bt_gatt_attr_write_func_t*).
- **_user_data** – Characteristic Attribute user data.

BT_GATT_CCC_MAX

BT_GATT_CCC_INITIALIZER(_changed, _write, _match)

Initialize Client Characteristic Configuration Declaration Macro.

Helper macro to initialize a Managed CCC attribute value.

Parameters

- **_changed** – Configuration changed callback.
- **_write** – Configuration write callback.
- **_match** – Configuration match callback.

BT_GATT_CCC_MANAGED(_ccc, _perm)

Managed Client Characteristic Configuration Declaration Macro.

Helper macro to declare a Managed CCC attribute.

Parameters

- **_ccc** – CCC attribute user data, shall point to a _bt_gatt_ccc.
- **_perm** – CCC access permissions, a bitmap of *bt_gatt_perm* values.

BT_GATT_CCC(_changed, _perm)

Client Characteristic Configuration Declaration Macro.

Helper macro to declare a CCC attribute.

Parameters

- **_changed** – Configuration changed callback.
- **_perm** – CCC access permissions, a bitmap of *bt_gatt_perm* values.

BT_GATT_CEP(_value)

Characteristic Extended Properties Declaration Macro.

Helper macro to declare a CEP attribute.

Parameters

- **_value** – Pointer to a struct *bt_gatt_cep*.

BT_GATT_CUD(_value, _perm)

Characteristic User Format Descriptor Declaration Macro.

Helper macro to declare a CUD attribute.

Parameters

- **_value** – User description NULL-terminated C string.
- **_perm** – Descriptor attribute access permissions, a bitmap of *bt_gatt_perm* values.

BT_GATT_CPF(_value)

Characteristic Presentation Format Descriptor Declaration Macro.

Helper macro to declare a CPF attribute.

Parameters

- **_value** – Pointer to a struct *bt_gatt_cpf*.

BT_GATT_DESCRIPTOR(_uuid, _perm, _read, _write, _user_data)

Descriptor Declaration Macro.

Helper macro to declare a descriptor attribute.

Parameters

- **_uuid** – Descriptor attribute uuid.
- **_perm** – Descriptor attribute access permissions, a bitmap of *bt_gatt_perm* values.
- **_read** – Descriptor attribute read callback (*bt_gatt_attr_read_func_t*).
- **_write** – Descriptor attribute write callback (*bt_gatt_attr_write_func_t*).
- **_user_data** – Descriptor attribute user data.

BT_GATT_ATTRIBUTE(_uuid, _perm, _read, _write, _user_data)

Attribute Declaration Macro.

Helper macro to declare an attribute.

Parameters

- **_uuid** – Attribute uuid.
- **_perm** – Attribute access permissions, a bitmap of *bt_gatt_perm* values.
- **_read** – Attribute read callback (*bt_gatt_attr_read_func_t*).
- **_write** – Attribute write callback (*bt_gatt_attr_write_func_t*).
- **_user_data** – Attribute user data.

Typedefs

typedef uint8_t (***bt_gatt_attr_func_t**)(const struct *bt_gatt_attr* *attr, uint16_t handle, void *user_data)

Attribute iterator callback.

Param attr
Attribute found.

Param handle
Attribute handle found.

Param user_data
Data given.

Return
`BT_GATT_ITER_CONTINUE` if should continue to the next attribute.

Return
`BT_GATT_ITER_STOP` to stop.

typedef void (***bt_gatt_complete_func_t**)(struct bt_conn *conn, void *user_data)

Notification complete result callback.

Param conn
Connection object.

Param user_data
Data passed in by the user.

typedef void (***bt_gatt_indicate_func_t**)(struct bt_conn *conn, struct *bt_gatt_indicate_params* *params, uint8_t err)

Indication complete result callback.

Param conn
Connection object.

Param params
Indication params object.

Param err
ATT error code

typedef void (***bt_gatt_indicate_params_destroy_t**)(struct *bt_gatt_indicate_params* *params)

Enums

Values:

enumerator **BT_GATT_ITER_STOP** = 0

enumerator **BT_GATT_ITER_CONTINUE**

Functions

static inline const char *bt_gatt_err_to_str(int gatt_err)

Converts a GATT error to string.

The GATT errors are created with *BT_GATT_ERR*.

The error codes are described in the Bluetooth Core specification, Vol 3, Part F, Section 3.4.1.1.

The ATT and GATT documentation found in Vol 4, Part F and Part G describe when the different error codes are used.

See also the defined BT_ATT_ERR_* macros.

Returns
The string representation of the GATT error code. If CONFIG_BT_ATT_ERR_TO_STR is not enabled, this just returns the empty string.

void bt_gatt_cb_register(struct *bt_gatt_cb* *cb)

Register GATT callbacks.

Register callbacks to monitor the state of GATT. The callback struct must remain valid for the remainder of the program.

Parameters

- **cb** – Callback struct.

int bt_gatt_authorization_cb_register(const struct *bt_gatt_authorization_cb* *cb)

Register GATT authorization callbacks.

Register callbacks to perform application-specific authorization of GATT operations on all registered GATT attributes. The callback structure must remain valid throughout the entire duration of the Bluetooth subsys activity.

The CONFIG_BT_GATT_AUTHORIZATION_CUSTOM Kconfig must be enabled to make this API functional.

This API allows the user to register only one callback structure concurrently. Passing NULL unregisters the previous set of callbacks and makes it possible to register a new one.

Parameters

- **cb** – Callback struct.

Returns
Zero on success or negative error code otherwise

int bt_gatt_service_register(struct *bt_gatt_service* *svc)

Register GATT service.

Register GATT service. Applications can make use of macros such as BT_GATT_PRIMARY_SERVICE, BT_GATT_CHARACTERISTIC, BT_GATT_DESCRIPTOR, etc.

When using CONFIG_BT_SETTINGS then all services that should have bond configuration loaded, i.e. CCC values, must be registered before calling *settings_load*.

When using CONFIG_BT_GATT_CACHING and CONFIG_BT_SETTINGS then all services that should be included in the GATT Database Hash calculation should be added before calling *settings_load*. All services registered after settings_load will trigger a new database hash calculation and a new hash stored.

There are two situations where this function can be called: either before bt_init() has been called, or after *settings_load()* has been called. Registering a service in the middle is not supported and will return an error.

Parameters

- **svc** – Service containing the available attributes

Returns
0 in case of success or negative value in case of error.

Returns
-EAGAIN if `bt_init()` has been called but *settings_load()* hasn't yet.

int **bt_gatt_service_unregister**(struct *bt_gatt_service* *svc)

Unregister GATT service.

Parameters

- **svc** – Service to be unregistered.

Returns
0 in case of success or negative value in case of error.

bool **bt_gatt_service_is_registered**(const struct *bt_gatt_service* *svc)

Check if GATT service is registered.

Parameters

- **svc** – Service to be checked.

Returns
true if registered or false if not register.

void **bt_gatt_foreach_attr_type**(uint16_t start_handle, uint16_t end_handle, const struct *bt_uuid* *uuid, const void *attr_data, uint16_t num_matches, *bt_gatt_attr_func_t* func, void *user_data)

Attribute iterator by type.

Iterate attributes in the given range matching given UUID and/or data.

Parameters

- **start_handle** – Start handle.
- **end_handle** – End handle.
- **uuid** – UUID to match, passing NULL skips UUID matching.
- **attr_data** – Attribute data to match, passing NULL skips data matching.
- **num_matches** – Number matches, passing 0 makes it unlimited.
- **func** – Callback function.
- **user_data** – Data to pass to the callback.

static inline void **bt_gatt_foreach_attr**(uint16_t start_handle, uint16_t end_handle, *bt_gatt_attr_func_t* func, void *user_data)

Attribute iterator.

Iterate attributes in the given range.

Parameters

- **start_handle** – Start handle.
- **end_handle** – End handle.
- **func** – Callback function.
- **user_data** – Data to pass to the callback.

struct *bt_gatt_attr* ***bt_gatt_attr_next**(const struct *bt_gatt_attr* *attr)

Iterate to the next attribute.

Iterate to the next attribute following a given attribute.

Parameters

- **attr** – Current Attribute.

Returns

The next attribute or NULL if it cannot be found.

struct *bt_gatt_attr* ***bt_gatt_find_by_uuid**(const struct *bt_gatt_attr* *attr, uint16_t attr_count, const struct *bt_uuid* *uuid)

Find Attribute by UUID.

Find the attribute with the matching UUID. To limit the search to a service set the attr to the service attributes and the `attr_count` to the service attribute count .

Parameters

- **attr** – Pointer to an attribute that serves as the starting point for the search of a match for the UUID. Passing NULL will search the entire range.
- **attr_count** – The number of attributes from the starting point to search for a match for the UUID. Set to 0 to search until the end.
- **uuid** – UUID to match.

uint16_t **bt_gatt_attr_get_handle**(const struct *bt_gatt_attr* *attr)

Get Attribute handle.

Parameters

- **attr** – Attribute object.

Returns

Handle of the corresponding attribute or zero if the attribute could not be found.

uint16_t **bt_gatt_attr_value_handle**(const struct *bt_gatt_attr* *attr)

Get the handle of the characteristic value descriptor.

Note

The `user_data` of the attribute must of type *bt_gatt_chrc*.

Parameters

- **attr** – A Characteristic Attribute.

Returns

the handle of the corresponding Characteristic Value. The value will be zero (the invalid handle) if `attr` was not a characteristic attribute.

ssize_t **bt_gatt_attr_read**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t buf_len, uint16_t offset, const void *value, uint16_t value_len)

Generic Read Attribute value helper.

Read attribute value from local database storing the result into buffer.

Parameters

- **conn** – Connection object.

- **attr** – Attribute to read.
- **buf** – Buffer to store the value.
- **buf_len** – Buffer length.
- **offset** – Start offset.
- **value** – Attribute value.
- **value_len** – Length of the attribute value.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_service**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Service Attribute helper.

Read service attribute value from local database storing the result into buffer after encoding it.

Note

Only use this with attributes which `user_data` is a *bt_uuid*.

Parameters

- **conn** – Connection object.
- **attr** – Attribute to read.
- **buf** – Buffer to store the value read.
- **len** – Buffer length.
- **offset** – Start offset.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_included**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Include Attribute helper.

Read include service attribute value from local database storing the result into buffer after encoding it.

Note

Only use this with attributes which user_data is a *bt_gatt_include*.

Parameters

- **conn** – Connection object.
- **attr** – Attribute to read.
- **buf** – Buffer to store the value read.
- **len** – Buffer length.
- **offset** – Start offset.

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_chrc**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Attribute helper.

Read characteristic attribute value from local database storing the result into buffer after encoding it.

> **Note**
>
> Only use this with attributes which `user_data` is a *`bt_gatt_chrc`*.

Parameters

- **conn** – Connection object.
- **attr** – Attribute to read.
- **buf** – Buffer to store the value read.
- **len** – Buffer length.
- **offset** – Start offset.

Returns

number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_ccc**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Client Characteristic Configuration Attribute helper.

Read CCC attribute value from local database storing the result into buffer after encoding it.

> **Note**
>
> Only use this with attributes which user_data is a _bt_gatt_ccc.

Parameters

- **conn** – Connection object.
- **attr** – Attribute to read.
- **buf** – Buffer to store the value read.
- **len** – Buffer length.
- **offset** – Start offset.

Returns

number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_write_ccc**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, const void *buf, uint16_t len, uint16_t offset, uint8_t flags)

Write Client Characteristic Configuration Attribute helper.

Write value in the buffer into CCC attribute.

> **Note**
>
> Only use this with attributes which user_data is a _bt_gatt_ccc.

Parameters

- `conn` – Connection object.
- `attr` – Attribute to read.
- `buf` – Buffer to store the value read.
- `len` – Buffer length.
- `offset` – Start offset.
- `flags` – Write flags.

Returns
number of bytes written in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_cep**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Extended Properties Attribute helper.

Read CEP attribute value from local database storing the result into buffer after encoding it.

> **Note**
>
> Only use this with attributes which user_data is a *bt_gatt_cep*.

Parameters

- `conn` – Connection object
- `attr` – Attribute to read
- `buf` – Buffer to store the value read
- `len` – Buffer length
- `offset` – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_cud**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic User Description Descriptor Attribute helper.

Read CUD attribute value from local database storing the result into buffer after encoding it.

> **Note**
>
> Only use this with attributes which user_data is a NULL-terminated C string.

Parameters

- `conn` – Connection object
- `attr` – Attribute to read
- `buf` – Buffer to store the value read
- `len` – Buffer length

- **offset** – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

ssize_t **bt_gatt_attr_read_cpf**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, void *buf, uint16_t len, uint16_t offset)

Read Characteristic Presentation format Descriptor Attribute helper.

Read CPF attribute value from local database storing the result into buffer after encoding it.

Note

Only use this with attributes which user_data is a bt_gatt_pf.

Parameters

- **conn** – Connection object
- **attr** – Attribute to read
- **buf** – Buffer to store the value read
- **len** – Buffer length
- **offset** – Start offset

Returns
number of bytes read in case of success or negative values in case of error.

int **bt_gatt_notify_cb**(struct bt_conn *conn, struct *bt_gatt_notify_params* *params)

Notify attribute value change.

This function works in the same way as *bt_gatt_notify*. With the addition that after sending the notification the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the `CONFIG_BT_CONN_TX_MAX` option.

Alternatively it is possible to notify by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

Parameters

- **conn** – Connection object.
- **params** – Notification parameters.

Returns
0 in case of success or negative value in case of error.

int **bt_gatt_notify_multiple**(struct bt_conn *conn, uint16_t num_params, struct *bt_gatt_notify_params* params[])

Send multiple notifications in a single PDU.

The GATT Server will send a single ATT_MULTIPLE_HANDLE_VALUE_NTF PDU containing all the notifications passed to this API.

All `params` must have the same `func` and `user_data` (due to implementation limitation). But `func(user_data)` will be invoked for each parameter.

As this API may block to wait for Bluetooth Host resources, it is not recommended to call it from a cooperative thread or a Bluetooth callback.

The peer's GATT Client must write to this device's Client Supported Features attribute and set the bit for Multiple Handle Value Notifications before this API can be used.

Only use this API to force the use of the ATT_MULTIPLE_HANDLE_VALUE_NTF PDU. For standard applications, `bt_gatt_notify_cb` is preferred, as it will use this PDU if supported and automatically fallback to ATT_HANDLE_VALUE_NTF when not supported by the peer.

This API has an additional limitation: it only accepts valid attribute references and not UUIDs like `bt_gatt_notify` and `bt_gatt_notify_cb`.

Parameters

- **conn** – Target client. Notifying all connected clients by passing `NULL` is not yet supported, please use `bt_gatt_notify` instead.
- **num_params** – Element count of `params` array. Has to be greater than 1.
- **params** – Array of notification parameters. It is okay to free this after calling this function.

Return values

- **0** – Success. The PDU is queued for sending.
- **-EINVAL** –
  - One of the attribute handles is invalid.
  - Only one parameter was passed. This API expects 2 or more.
  - Not all `func` were equal or not all `user_data` were equal.
  - One of the characteristics is not notifiable.
  - An UUID was passed in one of the parameters.
- **-ERANGE** –
  - The notifications cannot all fit in a single ATT_MULTIPLE_HANDLE_VALUE_NTF.
  - They exceed the MTU of all open ATT bearers.
- **-EPERM** – The connection has a lower security level than required by one of the attributes.
- **-EOPNOTSUPP** – The peer hasn't yet communicated that it supports this PDU type.

static inline int **bt_gatt_notify**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, const void *data, uint16_t len)

Notify attribute value change.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

Parameters

- **conn** – Connection object.
- **attr** – Characteristic or Characteristic Value attribute.

- `data` – Pointer to Attribute data.
- `len` – Attribute value length.

Returns
0 in case of success or negative value in case of error.

static inline int **bt_gatt_notify_uuid**(struct bt_conn *conn, const struct *bt_uuid* *uuid, const struct *bt_gatt_attr* *attr, const void *data, uint16_t len)

Notify attribute value change by UUID.

Send notification of attribute value change, if connection is NULL notify all peer that have notification enabled via CCC otherwise do a direct notification only on the given connection.

The attribute object is the starting point for the search of the UUID.

Parameters

- `conn` – Connection object.
- `uuid` – The UUID. If the server contains multiple services with the same UUID, then the first occurrence, starting from the attr given, is used.
- `attr` – Pointer to an attribute that serves as the starting point for the search of a match for the UUID.
- `data` – Pointer to Attribute data.
- `len` – Attribute value length.

Returns
0 in case of success or negative value in case of error.

int **bt_gatt_indicate**(struct bt_conn *conn, struct *bt_gatt_indicate_params* *params)

Indicate attribute value change.

Send an indication of attribute value change. if connection is NULL indicate all peer that have notification enabled via CCC otherwise do a direct indication only the given connection.

The attribute object on the parameters can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC.

Alternatively it is possible to indicate by UUID by setting it on the parameters, when using this method the attribute if provided is used as the start range when looking up for possible matches.

Note

This procedure is asynchronous therefore the parameters need to remains valid while it is active. The procedure is active until the destroy callback is run.

Parameters

- `conn` – Connection object.
- `params` – Indicate parameters.

Returns
0 in case of success or negative value in case of error.

bool **bt_gatt_is_subscribed**(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, uint16_t ccc_type)

Check if connection have subscribed to attribute.

Check if connection has subscribed to attribute value change.

The attribute object can be the so called Characteristic Declaration, which is usually declared with BT_GATT_CHARACTERISTIC followed by BT_GATT_CCC, or the Characteristic Value Declaration which is automatically created after the Characteristic Declaration when using BT_GATT_CHARACTERISTIC, or the Client Characteristic Configuration Descriptor (CCCD) which is created by BT_GATT_CCC.

Parameters

- **conn** – Connection object.
- **attr** – Attribute object.
- **ccc_type** – The subscription type, *BT_GATT_CCC_NOTIFY* and/or *BT_GATT_CCC_INDICATE*.

Returns
true if the attribute object has been subscribed.

uint16_t **bt_gatt_get_mtu**(struct bt_conn *conn)

Get ATT MTU for a connection.

Get negotiated ATT connection MTU, note that this does not equal the largest amount of attribute data that can be transferred within a single packet.

Parameters

- **conn** – Connection object.

Returns
MTU in bytes

struct **bt_gatt_ccc_cfg**

#include <gatt.h> GATT CCC configuration entry.

Public Members

uint8_t **id**

Local identity, BT_ID_DEFAULT in most cases.

bt_addr_le_t **peer**

Remote peer address.

uint16_t **value**

Configuration value.

struct **bt_gatt_notify_params**

#include <gatt.h>

Public Members

const struct *bt_uuid* ***uuid**

Notification Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.

const struct *bt_gatt_attr* ***attr**

Notification Attribute object.

Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

const void ***data**

Notification Value data.

uint16_t **len**

Notification Value length.

bt_gatt_complete_func_t **func**

Notification Value callback.

void ***user_data**

Notification Value callback user data.

struct **bt_gatt_indicate_params**

#include <*gatt.h*> GATT Indicate Value parameters.

Public Members

const struct *bt_uuid* ***uuid**

Indicate Attribute UUID type.

Optional, use to search for an attribute with matching UUID when the attribute object pointer is not known.

const struct *bt_gatt_attr* ***attr**

Indicate Attribute object.

Optional if uuid is provided, in this case it will be used as start range to search for the attribute with the given UUID.

bt_gatt_indicate_func_t **func**

Indicate Value callback.

bt_gatt_indicate_params_destroy_t **destroy**

Indicate operation complete callback.

const void ***data**

Indicate Value data.

uint16_t **len**

Indicate Value length.

GATT Client

group `bt_gatt_client`

Typedefs

typedef uint8_t (***bt_gatt_discover_func_t**)(struct bt_conn *conn, const struct *bt_gatt_attr* *attr, struct *bt_gatt_discover_params* *params)

Discover attribute callback function.

If discovery procedure has completed this callback will be called with attr set to NULL. This will not happen if procedure was stopped by returning BT_GATT_ITER_STOP.

The attribute object as well as its UUID and value objects are temporary and must be copied to in order to cache its information. Only the following fields of the attribute contains valid information:

- uuid UUID representing the type of attribute.
- handle Handle in the remote database.
- user_data The value of the attribute, if the discovery type maps to an ATT operation that provides this information. NULL otherwise. See below.

The effective type of `attr->user_data` is determined by `params`. Note that the fields `params->type` and `params->uuid` are left unchanged by the discovery procedure.

params->type	params->uuid	Type of attr->user_data
BT_GATT_DISCOVER_PRIMARY	any	*bt_gatt_service_val*
BT_GATT_DISCOVER_SECONDARY	any	*bt_gatt_service_val*
BT_GATT_DISCOVER_INCLUDE	any	*bt_gatt_include*
BT_GATT_DISCOVER_CHARACTERIST	any	*bt_gatt_chrc*
BT_GATT_DISCOVER_STD_CHAR_DES	*BT_UUID_GATT_CEP*	*bt_gatt_cep*
BT_GATT_DISCOVER_STD_CHAR_DES	*BT_UUID_GATT_CCC*	*bt_gatt_ccc*
BT_GATT_DISCOVER_STD_CHAR_DES	*BT_UUID_GATT_SCC*	*bt_gatt_scc*
BT_GATT_DISCOVER_STD_CHAR_DES	*BT_UUID_GATT_CPF*	*bt_gatt_cpf*
BT_GATT_DISCOVER_DESCRIPTOR	any	NULL
BT_GATT_DISCOVER_ATTRIBUTE	any	NULL

Also consider if using read-by-type instead of discovery is more convenient. See *bt_gatt_read* with *bt_gatt_read_params::handle_count* set to `0`.

Param conn
Connection object.

Param attr
Attribute found, or NULL if not found.

Param params
Discovery parameters given.

Return
BT_GATT_ITER_CONTINUE to continue discovery procedure.

Return
BT_GATT_ITER_STOP to stop discovery procedure.

typedef uint8_t (*bt_gatt_read_func_t)(struct bt_conn *conn, uint8_t err, struct *bt_gatt_read_params* *params, const void *data, uint16_t length)

Read callback function.

When reading using by_uuid, `params->start_handle` is the attribute handle for this `data` item.

Param conn
Connection object.

Param err
ATT error code.

Param params
Read parameters used.

Param data
Attribute value data. NULL means read has completed.

Param length
Attribute value length.

Return
BT_GATT_ITER_CONTINUE if should continue to the next attribute.

Return
BT_GATT_ITER_STOP to stop.

typedef void (*bt_gatt_write_func_t)(struct bt_conn *conn, uint8_t err, struct *bt_gatt_write_params* *params)

Write callback function.

Param conn
Connection object.

Param err
ATT error code.

Param params
Write parameters used.

typedef uint8_t (*bt_gatt_notify_func_t)(struct bt_conn *conn, struct *bt_gatt_subscribe_params* *params, const void *data, uint16_t length)

Notification callback function.

In the case of an empty notification, the `data` pointer will be non-NULL while the `length` will be 0, which is due to the special case where a `data` NULL pointer means unsubscribed.

Param conn
Connection object. May be NULL, indicating that the peer is being unpaired

Param params
Subscription parameters.

Param data
Attribute value data. If NULL then subscription was removed.

Param length
Attribute value length.

Return
BT_GATT_ITER_CONTINUE to continue receiving value notifications. BT_GATT_ITER_STOP to unsubscribe from value notifications.

typedef void (*bt_gatt_subscribe_func_t)(struct bt_conn *conn, uint8_t err, struct *bt_gatt_subscribe_params* *params)

Subscription callback function.

Param conn
Connection object.

Param err
ATT error code.

Param params
Subscription parameters used.

Enums

GATT Discover types.

Values:

enumerator BT_GATT_DISCOVER_PRIMARY

Discover Primary Services.

enumerator BT_GATT_DISCOVER_SECONDARY

Discover Secondary Services.

enumerator BT_GATT_DISCOVER_INCLUDE

Discover Included Services.

enumerator BT_GATT_DISCOVER_CHARACTERISTIC

Discover Characteristic Values.

```
Discover Characteristic Value and its properties.
```

enumerator BT_GATT_DISCOVER_DESCRIPTOR

Discover Descriptors.

```
Discover Attributes which are not services or characteristics.

@note The use of this type of discover is not recommended for
      discovering in ranges across multiple services/characteristics
      as it may incur in extra round trips.
```

enumerator BT_GATT_DISCOVER_ATTRIBUTE

Discover Attributes.

```
Discover Attributes of any type.

@note The use of this type of discover is not recommended for
      discovering in ranges across multiple services/characteristics
      as it may incur in more round trips.
```

enumerator BT_GATT_DISCOVER_STD_CHAR_DESC

Discover standard characteristic descriptor values.

```
   Discover standard characteristic descriptor values and their
   properties.
   Supported descriptors:
    - Characteristic Extended Properties
    - Client Characteristic Configuration
    - Server Characteristic Configuration
    - Characteristic Presentation Format
```

Subscription flags.

Values:

enumerator **BT_GATT_SUBSCRIBE_FLAG_VOLATILE**

Persistence flag.

```
   If set, indicates that the subscription is not saved
   on the GATT server side. Therefore, upon disconnection,
   the subscription will be automatically removed
   from the client's subscriptions list and
   when the client reconnects, it will have to
   issue a new subscription.
```

enumerator **BT_GATT_SUBSCRIBE_FLAG_NO_RESUB**

No resubscribe flag.

```
   By default when BT_GATT_SUBSCRIBE_FLAG_VOLATILE is unset, the
   subscription will be automatically renewed when the client
   reconnects, as a workaround for GATT servers that do not persist
   subscriptions.

   This flag will disable the automatic resubscription. It is useful
   if the application layer knows that the GATT server remembers
   subscriptions from previous connections and wants to avoid renewing
   the subscriptions.
```

enumerator **BT_GATT_SUBSCRIBE_FLAG_WRITE_PENDING**

Write pending flag.

```
   If set, indicates write operation is pending waiting remote end to
   respond.

   @note Internal use only.
```

enumerator **BT_GATT_SUBSCRIBE_FLAG_SENT**

Sent flag.

```
   If set, indicates that a subscription request (CCC write) has
   already been sent in the active connection.

   Used to avoid sending subscription requests multiple times when the
   \htmlonly <code>CONFIG_BT_GATT_AUTO_RESUBSCRIBE</code> \endhtmlonly \
↪xmlonly <verbatim>embed:rst:inline :kconfig:option:`CONFIG_BT_GATT_AUTO_
↪RESUBSCRIBE`</verbatim> \endxmlonly quirk is enabled.

   @note Internal use only.
```

enumerator BT_GATT_SUBSCRIBE_NUM_FLAGS

Functions

int **bt_gatt_exchange_mtu**(struct bt_conn *conn, struct *bt_gatt_exchange_params* *params)

Exchange MTU.

This client procedure can be used to set the MTU to the maximum possible size the buffers can hold.

The Response comes in callback `params->func`. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. `params` must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Note

Shall only be used once per connection.

Parameters

- **conn** – Connection object.
- **params** – Exchange MTU parameters.

Return values

- **0** – Successfully queued request. Will call `params->func` on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT` .
- **-EALREADY** – The MTU exchange procedure has been already performed.

int **bt_gatt_discover**(struct bt_conn *conn, struct *bt_gatt_discover_params* *params)

GATT Discover function.

This procedure is used by a client to discover attributes on a server.

Primary Service Discovery: Procedure allows to discover primary services either by Discover All Primary Services or Discover Primary Services by Service UUID. Include Service Discovery: Procedure allows to discover all Include Services within specified range. Characteristic Discovery: Procedure allows to discover all characteristics within specified handle range as well as discover characteristics with specified UUID. Descriptors Discovery: Procedure allows to discover all characteristic descriptors within specified range.

For each attribute found the callback is called which can then decide whether to continue discovering or stop.

The Response comes in callback `params->func`. The callback is run from the BT RX thread. `params` must remain valid until start of callback where iter `attr` is `NULL` or callback will return `BT_GATT_ITER_STOP`.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

- **conn** – Connection object.
- **params** – Discover parameters.

Return values

- **0** – Successfully queued request. Will call `params->func` on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.

int **bt_gatt_read**(struct bt_conn *conn, struct *bt_gatt_read_params* *params)

Read Attribute Value by handle.

This procedure read the attribute value and return it to the callback.

When reading attributes by UUID the callback can be called multiple times depending on how many instances of given the UUID exists with the start_handle being updated for each instance.

To perform a GATT Long Read procedure, start with a Characteristic Value Read (by setting `offset 0` and `handle_count 1`) and then return *BT_GATT_ITER_CONTINUE* from the callback. This is equivalent to calling *bt_gatt_read* again, but with the correct offset to continue the read. This may be repeated until the procedure is complete, which is signaled by the callback being called with `data` set to `NULL`.

Note that returning *BT_GATT_ITER_CONTINUE* is really starting a new ATT operation, so this can fail to allocate resources. However, all API errors are reported as if the server returned *BT_ATT_ERR_UNLIKELY*. There is no way to distinguish between this condition and a *BT_ATT_ERR_UNLIKELY* response from the server itself.

Note that the effect of returning *BT_GATT_ITER_CONTINUE* from the callback varies depending on the type of read operation.

The Response comes in callback `params->func`. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. `params` must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

- **conn** – Connection object.
- **params** – Read parameters.

Return values

- **0** – Successfully queued request. Will call `params->func` on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.

int **bt_gatt_write**(struct bt_conn *conn, struct *bt_gatt_write_params* *params)

Write Attribute Value by handle.

The Response comes in callback `params->func`. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. `params` must remain valid until start of callback.

This function will block while the ATT request queue is full, except when called from Bluetooth event context. When called from Bluetooth context, this function will instead instead return -ENOMEM if it would block to avoid a deadlock.

Parameters

- **conn** – Connection object.
- **params** – Write parameters.

Return values

- **0** – Successfully queued request. Will call params->func on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside Bluetooth event context to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT .

int **bt_gatt_write_without_response_cb**(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign, *bt_gatt_complete_func_t* func, void *user_data)

Write Attribute Value by handle without response with callback.

This function works in the same way as *bt_gatt_write_without_response*. With the addition that after sending the write the callback function will be called.

The callback is run from System Workqueue context. When called from the System Workqueue context this API will not wait for resources for the callback but instead return an error. The number of pending callbacks can be increased with the CONFIG_BT_CONN_TX_MAX option.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Note

By using a callback it also disable the internal flow control which would prevent sending multiple commands without waiting for their transmissions to complete, so if that is required the caller shall not submit more data until the callback is called.

Parameters

- **conn** – Connection object.
- **handle** – Attribute handle.
- **data** – Data to be written.
- **length** – Data length.
- **sign** – Whether to sign data
- **func** – Transmission complete callback.
- **user_data** – User data to be passed back to callback.

Return values

- **0** – Successfully queued request.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT .

static inline int **bt_gatt_write_without_response**(struct bt_conn *conn, uint16_t handle, const void *data, uint16_t length, bool sign)

Write Attribute Value by handle without response.

This procedure write the attribute value without requiring an acknowledgment that the write was successfully performed

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

- **conn** – Connection object.
- **handle** – Attribute handle.
- **data** – Data to be written.
- **length** – Data length.
- **sign** – Whether to sign data

Return values

- **0** – Successfully queued request.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by `CONFIG_BT_ATT_TX_COUNT`.

int **bt_gatt_subscribe**(struct bt_conn *conn, struct *bt_gatt_subscribe_params* *params)

Subscribe Attribute Value Notification.

This procedure subscribe to value notification using the Client Characteristic Configuration handle. If notification received subscribe value callback is called to return notified value. One may then decide whether to unsubscribe directly from this callback. Notification callback with NULL data will not be called if subscription was removed by this method.

The Response comes in callback `params->subscribe`. The callback is run from the context specified by 'config BT_RECV_CONTEXT'. The Notification callback `params->notify` is also called from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Note

Notifications are asynchronous therefore the `params` must remain valid while subscribed and cannot be reused for additional subscriptions whilst active.

Parameters

- **conn** – Connection object.
- **params** – Subscribe parameters.

Return values

- **0** – Successfully queued request. Will call `params->write` on resolution.

- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT .
- **-EALREADY** – if there already exist a subscription using the params.
- **-EBUSY** – if params.ccc_handle is 0 and CONFIG_BT_GATT_AUTO_DISCOVER_CCC is enabled and discovery for the params is already in progress.

int **bt_gatt_resubscribe**(uint8_t id, const *bt_addr_le_t* *peer, struct *bt_gatt_subscribe_params* *params)

Resubscribe Attribute Value Notification subscription.

Resubscribe to Attribute Value Notification when already subscribed from a previous connection. The GATT server will remember subscription from previous connections when bonded, so resubscribing can be done without performing a new subscribe procedure after a power cycle.

Note

Notifications are asynchronous therefore the parameters need to remain valid while subscribed.

Parameters

- **id** – Local identity (in most cases BT_ID_DEFAULT).
- **peer** – Remote address.
- **params** – Subscribe parameters.

Returns

0 in case of success or negative value in case of error.

int **bt_gatt_unsubscribe**(struct bt_conn *conn, struct *bt_gatt_subscribe_params* *params)

Unsubscribe Attribute Value Notification.

This procedure unsubscribe to value notification using the Client Characteristic Configuration handle. Notification callback with NULL data will be called if subscription was removed by this call, until then the parameters cannot be reused.

The Response comes in callback params->func. The callback is run from the BT RX thread.

This function will block while the ATT request queue is full, except when called from the BT RX thread, as this would cause a deadlock.

Parameters

- **conn** – Connection object.
- **params** – Subscribe parameters. The parameters shall be a *bt_gatt_subscribe_params* from a previous call to *bt_gatt_subscribe()*.

Return values

- **0** – Successfully queued request. Will call params->write on resolution.
- **-ENOMEM** – ATT request queue is full and blocking would cause deadlock. Allow a pending request to resolve before retrying, or call this function outside the BT RX thread to get blocking behavior. Queue size is controlled by CONFIG_BT_ATT_TX_COUNT .

void **bt_gatt_cancel**(struct bt_conn *conn, void *params)

Try to cancel the first pending request identified by `params`.

This function does not release `params` for reuse. The usual callbacks for the request still apply. A successful cancel simulates a *BT_ATT_ERR_UNLIKELY* response from the server.

This function can cancel the following request functions:

- *bt_gatt_exchange_mtu*
- *bt_gatt_discover*
- *bt_gatt_read*
- *bt_gatt_write*
- *bt_gatt_subscribe*
- *bt_gatt_unsubscribe*

Parameters

- **conn** – The connection the request was issued on.
- **params** – The address `params` used in the request function call.

struct **bt_gatt_exchange_params**

#include <*gatt.h*> GATT Exchange MTU parameters.

Public Members

void (***func**)(struct bt_conn *conn, uint8_t err, struct *bt_gatt_exchange_params* *params)

Response callback.

struct **bt_gatt_discover_params**

#include <*gatt.h*> GATT Discover Attributes parameters.

Public Members

const struct *bt_uuid* ***uuid**

Discover UUID type.

bt_gatt_discover_func_t **func**

Discover attribute callback.

uint16_t **attr_handle**

Include service attribute declaration handle.

uint16_t **start_handle**

Included service start handle.

Discover start handle.

uint16_t **end_handle**

Included service end handle.

Discover end handle.

uint8_t **type**

Discover type.

struct *bt_gatt_subscribe_params* ***sub_params**

Only for stack-internal use, used for automatic discovery.

struct **bt_gatt_read_params**

#include <gatt.h> GATT Read parameters.

Public Members

bt_gatt_read_func_t **func**

Read attribute callback.

size_t **handle_count**

If equals to 1 single.handle and single.offset are used.

If greater than 1 multiple.handles are used. If equals to 0 by_uuid is used for Read Using Characteristic UUID.

uint16_t **handle**

Attribute handle.

uint16_t **offset**

Attribute data offset.

uint16_t ***handles**

Attribute handles to read with Read Multiple Characteristic Values.

bool **variable**

If true use Read Multiple Variable Length Characteristic Values procedure.

The values of the set of attributes may be of variable or unknown length. If false use Read Multiple Characteristic Values procedure. The values of the set of attributes must be of a known fixed length, with the exception of the last value that can have a variable length.

uint16_t **start_handle**

First requested handle number.

uint16_t **end_handle**

Last requested handle number.

const struct *bt_uuid* ***uuid**

2 or 16 octet UUID.

struct **bt_gatt_write_params**

#include <gatt.h> GATT Write parameters.

Public Members

bt_gatt_write_func_t **func**

Response callback.

uint16_t **handle**

Attribute handle.

uint16_t **offset**

Attribute data offset.

const void ***data**

Data to be written.

uint16_t **length**

Length of the data.

struct **bt_gatt_subscribe_params**

#include <gatt.h> GATT Subscribe parameters.

Public Members

bt_gatt_notify_func_t **notify**

Notification value callback.

bt_gatt_subscribe_func_t **subscribe**

Subscribe CCC write request response callback If given, called with the subscription parameters given when subscribing.

uint16_t **value_handle**

Subscribe value handle.

uint16_t **ccc_handle**

Subscribe CCC handle.

uint16_t **end_handle**

Subscribe End handle (for automatic discovery)

struct *bt_gatt_discover_params* ***disc_params**

Discover parameters used when ccc_handle = 0.

uint16_t **value**

Subscribe value.

bt_security_t **min_security**

Minimum required security for received notification.

Notifications and indications received over a connection with a lower security level are silently discarded.

atomic_t **flags**[*ATOMIC_BITMAP_SIZE*(BT_GATT_SUBSCRIBE_NUM_FLAGS)]

Subscription flags.

Attribute Protocol (ATT)

API Reference

group **bt_att**

Attribute Protocol (ATT)

Defines

BT_ATT_ERR_SUCCESS

The ATT operation was successful.

BT_ATT_ERR_INVALID_HANDLE

The attribute handle given was not valid on the server.

BT_ATT_ERR_READ_NOT_PERMITTED

The attribute cannot be read.

BT_ATT_ERR_WRITE_NOT_PERMITTED

The attribute cannot be written.

BT_ATT_ERR_INVALID_PDU

The attribute PDU was invalid.

BT_ATT_ERR_AUTHENTICATION

The attribute requires authentication before it can be read or written.

BT_ATT_ERR_NOT_SUPPORTED

The ATT Server does not support the request received from the client.

BT_ATT_ERR_INVALID_OFFSET

Offset specified was past the end of the attribute.

BT_ATT_ERR_AUTHORIZATION

The attribute requires authorization before it can be read or written.

BT_ATT_ERR_PREPARE_QUEUE_FULL

Too many prepare writes have been queued.

BT_ATT_ERR_ATTRIBUTE_NOT_FOUND
: No attribute found within the given attribute handle range.

BT_ATT_ERR_ATTRIBUTE_NOT_LONG
: The attribute cannot be read using the ATT_READ_BLOB_REQ PDU.

BT_ATT_ERR_ENCRYPTION_KEY_SIZE
: The Encryption Key Size used for encrypting this link is too short.

BT_ATT_ERR_INVALID_ATTRIBUTE_LEN
: The attribute value length is invalid for the operation.

BT_ATT_ERR_UNLIKELY
: The attribute request that was requested has encountered an error that was unlikely.

  The attribute request could therefore not be completed as requested

BT_ATT_ERR_INSUFFICIENT_ENCRYPTION
: The attribute requires encryption before it can be read or written.

BT_ATT_ERR_UNSUPPORTED_GROUP_TYPE
: The attribute type is not a supported grouping attribute.

  The attribute type is not a supported grouping attribute as defined by a higher layer specification.

BT_ATT_ERR_INSUFFICIENT_RESOURCES
: Insufficient Resources to complete the request.

BT_ATT_ERR_DB_OUT_OF_SYNC
: The server requests the client to rediscover the database.

BT_ATT_ERR_VALUE_NOT_ALLOWED
: The attribute parameter value was not allowed.

BT_ATT_ERR_WRITE_REQ_REJECTED
: Write Request Rejected.

BT_ATT_ERR_CCC_IMPROPER_CONF
: Client Characteristic Configuration Descriptor Improperly Configured.

BT_ATT_ERR_PROCEDURE_IN_PROGRESS
: Procedure Already in Progress.

BT_ATT_ERR_OUT_OF_RANGE
: Out of Range.

BT_ATT_MAX_ATTRIBUTE_LEN

BT_ATT_FIRST_ATTRIBUTE_HANDLE

BT_ATT_LAST_ATTRIBUTE_HANDLE

Enums

enum **bt_att_chan_opt**

ATT channel option bit field values.

> **Note**
>
> *BT_ATT_CHAN_OPT_UNENHANCED_ONLY* and *BT_ATT_CHAN_OPT_ENHANCED_ONLY* are mutually exclusive and both bits may not be set.

Values:

enumerator **BT_ATT_CHAN_OPT_NONE** = 0x0

Both Enhanced and Unenhanced channels can be used

enumerator **BT_ATT_CHAN_OPT_UNENHANCED_ONLY** = *BIT*(0)

Only Unenhanced channels will be used

enumerator **BT_ATT_CHAN_OPT_ENHANCED_ONLY** = *BIT*(1)

Only Enhanced channels will be used

Functions

static inline const char ***bt_att_err_to_str**(uint8_t att_err)

Converts a ATT error to string.

The error codes are described in the Bluetooth Core specification, Vol 3, Part F, Section 3.4.1.1 and in The Supplement to the Bluetooth Core Specification (CSS), v11, Part B, Section 1.2.

The ATT and GATT documentation found in Vol 4, Part F and Part G describe when the different error codes are used.

See also the defined BT_ATT_ERR_* macros.

Returns

The string representation of the ATT error code. If CONFIG_BT_ATT_ERR_TO_STR is not enabled, this just returns the empty string

int **bt_eatt_connect**(struct bt_conn *conn, size_t num_channels)

Connect Enhanced ATT channels.

Sends a series of Credit Based Connection Requests to connect `num_channels` Enhanced ATT channels. The peer may have limited resources and fewer channels may be created.

Parameters

- **conn** – The connection to send the request on
- **num_channels** – The number of Enhanced ATT beares to request. Must be in the range 1 - CONFIG_BT_EATT_MAX , inclusive.

Return values

- **-EINVAL** – if num_channels is not in the allowed range or conn is NULL.
- **-ENOMEM** – if less than num_channels are allocated.
- **0** – in case of success

Returns
0 in case of success or negative value in case of error.

size_t **bt_eatt_count**(struct bt_conn *conn)
Get number of EATT channels connected.

Parameters

- **conn** – The connection to get the number of EATT channels for.

Returns
The number of EATT channels connected. Returns 0 if conn is NULL or not connected.

Bluetooth Mesh

Bluetooth Mesh Profile The Bluetooth Mesh profile adds secure wireless multi-hop communication for Bluetooth Low Energy. This module implements the Bluetooth Mesh Protocol Specification v1.1.

Read more about Bluetooth Mesh on the Bluetooth SIG Website.

Core The core provides functionality for managing the general Bluetooth Mesh state.

Low Power Node The Low Power Node (LPN) role allows battery powered devices to participate in a mesh network as a leaf node. An LPN interacts with the mesh network through a Friend node, which is responsible for relaying any messages directed to the LPN. The LPN saves power by keeping its radio turned off, and only wakes up to either send messages or poll the Friend node for any incoming messages.

The radio control and polling is managed automatically by the mesh stack, but the LPN API allows the application to trigger the polling at any time through *bt_mesh_lpn_poll()*. The LPN operation parameters, including poll interval, poll event timing and Friend requirements is controlled through the CONFIG_BT_MESH_LOW_POWER option and related configuration options.

When using the LPN feature with logging, it is strongly recommended to only use the CONFIG_LOG_MODE_DEFERRED option. Log modes other than the deferred may cause unintended delays during processing of log messages. This in turns will affect scheduling of the receive delay and receive window. The same limitation applies for the CONFIG_BT_MESH_FRIEND option.

Replay Protection List The Replay Protection List (RPL) is used to hold recently received sequence numbers from elements within the mesh network to perform protection against replay attacks.

To keep a node protected against replay attacks after reboot, it needs to store the entire RPL in the persistent storage before it is powered off. Depending on the amount of traffic in a mesh network, storing recently seen sequence numbers can make flash wear out sooner or later. To mitigate this, CONFIG_BT_MESH_RPL_STORE_TIMEOUT can be used. This option postpones storing of RPL entries in the persistent storage.

This option, however, doesn't completely solve the issue as the node may get powered off before the timer to store the RPL is fired. To ensure that messages can not be replayed, the node can initiate storage of the pending RPL entry (or entries) at any time (or sufficiently before power loss)

by calling *bt_mesh_rpl_pending_store()*. This is up to the node to decide, which RPL entries are to be stored in this case.

Setting CONFIG_BT_MESH_RPL_STORE_TIMEOUT to -1 allows to completely switch off the timer, which can help to significantly reduce flash wear out. This moves the responsibility of storing RPL to the user application and requires that sufficient power backup is available from the time this API is called until all RPL entries are written to the flash.

Finding the right balance between CONFIG_BT_MESH_RPL_STORE_TIMEOUT and calling *bt_mesh_rpl_pending_store()* may reduce a risk of security vulnerability and flash wear out.

Persistent storage The mesh stack uses the *Settings Subsystem* for storing the device configuration persistently. When the stack configuration changes and the change needs to be stored persistently, the stack schedules a work item. The delay between scheduling the work item and submitting it to the workqueue is defined by the CONFIG_BT_MESH_STORE_TIMEOUT option. Once storing of data is scheduled, it can not be rescheduled until the work item is processed. Exceptions are made in certain cases as described below.

When IV index, Sequence Number or CDB configuration have to be stored, the work item is submitted to the workqueue without the delay. If the work item was previously scheduled, it will be rescheduled without the delay.

The Replay Protection List uses the same work item to store RPL entries. If storing of RPL entries is requested and no other configuration is pending to be stored, the delay is set to CONFIG_BT_MESH_RPL_STORE_TIMEOUT. If other stack configuration has to be stored, the delay defined by the CONFIG_BT_MESH_STORE_TIMEOUT option is less than CONFIG_BT_MESH_RPL_STORE_TIMEOUT, and the work item was scheduled by the Replay Protection List, the work item will be rescheduled.

When the work item is running, the stack will store all pending configuration, including the RPL entries.

Work item execution context The CONFIG_BT_MESH_SETTINGS_WORKQ option configures the context from which the work item is executed. This option is enabled by default, and results in stack using a dedicated cooperative thread to process the work item. This allows the stack to process other incoming and outgoing messages, as well as other work items submitted to the system workqueue, while the stack configuration is being stored.

When this option is disabled, the work item is submitted to the system workqueue. This means that the system workqueue is blocked for the time it takes to store the stack's configuration. It is not recommended to disable this option as this will make the device non-responsive for a noticeable amount of time.

Advertisement identity All mesh stack bearers advertise data with the *BT_ID_DEFAULT* local identity. The value is preset in the mesh stack implementation. When Bluetooth® Low Energy (LE) and Bluetooth Mesh coexist on the same device, the application should allocate and configure another local identity for Bluetooth LE purposes before starting the communication.

API reference

group `bt_mesh`

Bluetooth Mesh.

Defines

BT_MESH_NET_PRIMARY

Primary Network Key index.

BT_MESH_FEAT_RELAY

Relay feature.

BT_MESH_FEAT_PROXY

GATT Proxy feature.

BT_MESH_FEAT_FRIEND

Friend feature.

BT_MESH_FEAT_LOW_POWER

Low Power Node feature.

BT_MESH_FEAT_SUPPORTED

Supported heartbeat publication features.

BT_MESH_LPN_CB_DEFINE(_name)

Register a callback structure for Friendship events.

Parameters

- **_name** – Name of callback structure.

BT_MESH_FRIEND_CB_DEFINE(_name)

Register a callback structure for Friendship events.

Registers a callback structure that will be called whenever Friendship gets established or terminated.

Parameters

- **_name** – Name of callback structure.

Functions

int **bt_mesh_init**(const struct *bt_mesh_prov* *prov, const struct *bt_mesh_comp* *comp)

Initialize Mesh support.

After calling this API, the node will not automatically advertise as unprovisioned, rather the *bt_mesh_prov_enable()* API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

Parameters

- **prov** – Node provisioning information.
- **comp** – Node Composition.

Returns

Zero on success or (negative) error code otherwise.

void **bt_mesh_reset**(void)

Reset the state of the local Mesh node.

Resets the state of the node, which means that it needs to be reprovisioned to become an active node in a Mesh network again.

After calling this API, the node will not automatically advertise as unprovisioned, rather the *bt_mesh_prov_enable()* API needs to be called to enable unprovisioned advertising on one or more provisioning bearers.

int **bt_mesh_suspend**(void)

Suspend the Mesh network temporarily.

This API can be used for power saving purposes, but the user should be aware that leaving the local node suspended for a long period of time may cause it to become permanently disconnected from the Mesh network. If at all possible, the Friendship feature should be used instead, to make the node into a Low Power Node.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_resume**(void)

Resume a suspended Mesh network.

This API resumes the local node, after it has been suspended using the *bt_mesh_suspend()* API.

Returns
0 on success, or (negative) error code on failure.

void **bt_mesh_iv_update_test**(bool enable)

Toggle the IV Update test mode.

This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

Parameters

- **enable** – true to enable IV Update test mode, false to disable it.

bool **bt_mesh_iv_update**(void)

Toggle the IV Update state.

This API is only available if the IV Update test mode has been enabled in Kconfig. It is needed for passing most of the IV Update qualification test cases.

Returns
true if IV Update In Progress state was entered, false otherwise.

int **bt_mesh_lpn_set**(bool enable)

Toggle the Low Power feature of the local device.

Enables or disables the Low Power feature of the local device. This is exposed as a runtime feature, since the device might want to change this e.g. based on being plugged into a stable power source or running from a battery power source.

Parameters

- **enable** – true to enable LPN functionality, false to disable it.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_lpn_poll**(void)

Send out a Friend Poll message.

Send a Friend Poll message to the Friend of this node. If there is no established Friendship the function will return an error.

Returns
Zero on success or (negative) error code otherwise.

int **bt_mesh_friend_terminate**(uint16_t lpn_addr)

Terminate Friendship.

Terminated Friendship for given LPN.

Parameters

- **lpn_addr** – Low Power Node address.

Returns

Zero on success or (negative) error code otherwise.

void **bt_mesh_rpl_pending_store**(uint16_t addr)

Store pending RPL entry(ies) in the persistent storage.

This API allows the user to store pending RPL entry(ies) in the persistent storage without waiting for the timeout.

> **Note**
>
> When flash is used as the persistent storage, calling this API too frequently may wear it out.

Parameters

- **addr** – Address of the node which RPL entry needs to be stored or *BT_MESH_ADDR_ALL_NODES* to store all pending RPL entries.

const uint8_t ***bt_mesh_va_uuid_get**(uint16_t addr, const uint8_t *uuid, uint16_t *retaddr)

Iterate stored Label UUIDs.

When `addr` is *BT_MESH_ADDR_UNASSIGNED*, this function iterates over all available addresses starting with `uuid`. In this case, use `retaddr` to get virtual address representation of the returned Label UUID. When `addr` is a virtual address, this function returns next Label UUID corresponding to the `addr`. When `uuid` is NULL, this function returns the first available UUID. If `uuid` is previously returned uuid, this function returns following uuid.

Parameters

- **addr** – Virtual address to search for, or *BT_MESH_ADDR_UNASSIGNED*.
- **uuid** – Pointer to the previously returned Label UUID or NULL.
- **retaddr** – Pointer to a memory where virtual address representation of the returning UUID is to be stored to.

Returns

Pointer to Label UUID, or NULL if no more entries found.

struct **bt_mesh_lpn_cb**

#include <main.h> Low Power Node callback functions.

Public Members

void (***established**)(uint16_t net_idx, uint16_t friend_addr, uint8_t queue_size, uint8_t recv_window)

Friendship established.

This callback notifies the application that friendship has been successfully established.

Param net_idx
NetKeyIndex used during friendship establishment.
Param friend_addr
Friend address.
Param queue_size
Friend queue size.
Param recv_window
Low Power Node's listens duration for Friend response.

void (*`terminated`)(uint16_t net_idx, uint16_t friend_addr)

Friendship terminated.

This callback notifies the application that friendship has been terminated.
Param net_idx
NetKeyIndex used during friendship establishment.
Param friend_addr
Friend address.

void (*`polled`)(uint16_t net_idx, uint16_t friend_addr, bool retry)

Local Poll Request.

This callback notifies the application that the local node has polled the friend node.

This callback will be called before *bt_mesh_lpn_cb::established* when attempting to establish a friendship.
Param net_idx
NetKeyIndex used during friendship establishment.
Param friend_addr
Friend address.
Param retry
Retry or first poll request for each transaction.

struct `bt_mesh_friend_cb`

#include <main.h> Friend Node callback functions.

Public Members

void (*`established`)(uint16_t net_idx, uint16_t lpn_addr, uint8_t recv_delay, uint32_t polltimeout)

Friendship established.

This callback notifies the application that friendship has been successfully established.
Param net_idx
NetKeyIndex used during friendship establishment.
Param lpn_addr
Low Power Node address.
Param recv_delay
Receive Delay in units of 1 millisecond.
Param polltimeout
PollTimeout in units of 1 millisecond.

void (*`terminated`)(uint16_t net_idx, uint16_t lpn_addr)

Friendship terminated.

This callback notifies the application that friendship has been terminated.

Param net_idx
NetKeyIndex used during friendship establishment.
Param lpn_addr
Low Power Node address.

void (*`polled`)(uint16_t net_idx, uint16_t lpn_addr)

Friend Poll Request.

This callback notifies the application that the low power node has polled the friend node.

This callback will be called before *bt_mesh_friend_cb::established* when attempting to establish a friendship.
Param net_idx
NetKeyIndex used during friendship establishment.
Param lpn_addr
LPN address.

Access layer The access layer is the application's interface to the Bluetooth Mesh network. The access layer provides mechanisms for compartmentalizing the node behavior into elements and models, which are implemented by the application.

Mesh models The functionality of a mesh node is represented by models. A model implements a single behavior the node supports, like being a light, a sensor or a thermostat. The mesh models are grouped into *elements*. Each element is assigned its own unicast address, and may only contain one of each type of model. Conventionally, each element represents a single aspect of the mesh node behavior. For instance, a node that contains a sensor, two lights and a power outlet would spread this functionality across four elements, with each element instantiating all the models required for a single aspect of the supported behavior.

The node's element and model structure is specified in the node composition data, which is passed to `bt_mesh_init()` during initialization. The Bluetooth SIG have defined a set of foundation models (see *Mesh models*) and a set of models for implementing common behavior in the Bluetooth Mesh Model Specification. All models not specified by the Bluetooth SIG are vendor models, and must be tied to a Company ID.

Mesh models have several parameters that can be configured either through initialization of the mesh stack or with the *Configuration Server*:

Opcode list The opcode list contains all message opcodes the model can receive, as well as the minimum acceptable payload length and the callback to pass them to. Models can support any number of opcodes, but each opcode can only be listed by one model in each element.

The full opcode list must be passed to the model structure in the composition data, and cannot be changed at runtime. The end of the opcode list is determined by the special `BT_MESH_MODEL_OP_END` entry. This entry must always be present in the opcode list, unless the list is empty. In that case, `BT_MESH_MODEL_NO_OPS` should be used in place of a proper opcode list definition.

AppKey list The AppKey list contains all the application keys the model can receive messages on. Only messages encrypted with application keys in the AppKey list will be passed to the model.

The maximum number of supported application keys each model can hold is configured with the `CONFIG_BT_MESH_MODEL_KEY_COUNT` configuration option. The contents of the AppKey list is managed by the *Configuration Server*.

Subscription list A model will process all messages addressed to the unicast address of their element (given that the utilized application key is present in the AppKey list). Additionally, the model will process packets addressed to any group or virtual address in its subscription list. This allows nodes to address multiple nodes throughout the mesh network with a single message.

The maximum number of supported addresses in the Subscription list each model can hold is configured with the `CONFIG_BT_MESH_MODEL_GROUP_COUNT` configuration option. The contents of the subscription list is managed by the *Configuration Server*.

Model publication The models may send messages in two ways:

- By specifying a set of message parameters in a *bt_mesh_msg_ctx*, and calling *bt_mesh_model_send()*.
- By setting up a *bt_mesh_model_pub* structure and calling *bt_mesh_model_publish()*.

When publishing messages with *bt_mesh_model_publish()*, the model will use the publication parameters configured by the *Configuration Server*. This is the recommended way to send unprompted model messages, as it passes the responsibility of selecting message parameters to the network administrator, which likely knows more about the mesh network than the individual nodes will.

To support publishing with the publication parameters, the model must allocate a packet buffer for publishing, and pass it to *bt_mesh_model_pub.msg*. The Config Server may also set up period publication for the publication message. To support this, the model must populate the *bt_mesh_model_pub.update* callback. The *bt_mesh_model_pub.update* callback will be called right before the message is published, allowing the model to change the payload to reflect its current state.

By setting *bt_mesh_model_pub.retr_update* to 1, the model can configure the *bt_mesh_model_pub.update* callback to be triggered on every retransmission. This can, for example, be used by models that make use of a Delay parameter, which can be adjusted for every retransmission. The *bt_mesh_model_pub_is_retransmission()* function can be used to differentiate a first publication and a retransmission. The *BT_MESH_PUB_MSG_TOTAL* and *BT_MESH_PUB_MSG_NUM* macros can be used to return total number of transmissions and the retransmission number within one publication interval.

Extended models The Bluetooth Mesh specification allows the mesh models to extend each other. When a model extends another, it inherits that model's functionality, and extension can be used to construct complex models out of simple ones, leveraging the existing model functionality to avoid defining new opcodes. Models may extend any number of models, from any element. When one model extends another in the same element, the two models will share subscription lists. The mesh stack implements this by merging the subscription lists of the two models into one, combining the number of subscriptions the models can have in total. Models may extend models that extend others, creating an "extension tree". All models in an extension tree share a single subscription list per element it spans.

Model extensions are done by calling *bt_mesh_model_extend()* during initialization. A model can only be extended by one other model, and extensions cannot be circular. Note that binding of node states and other relationships between the models must be defined by the model implementations.

The model extension concept adds some overhead in the access layer packet processing, and must be explicitly enabled with `CONFIG_BT_MESH_MODEL_EXTENSIONS` to have any effect.

Model data storage Mesh models may have data associated with each model instance that needs to be stored persistently. The access API provides a mechanism for storing this data, leveraging the internal model instance encoding scheme. Models can store one user defined data entry per instance by calling *bt_mesh_model_data_store()*. To be able to read out the data

the next time the device reboots, the model's *bt_mesh_model_cb.settings_set* callback must be populated. This callback gets called when model specific data is found in the persistent storage. The model can retrieve the data by calling the `read_cb` passed as a parameter to the callback. See the *Settings* module documentation for details.

When model data changes frequently, storing it on every change may lead to increased wear of flash. To reduce the wear, the model can postpone storing of data by calling *bt_mesh_model_data_store_schedule()*. The stack will schedule a work item with delay defined by the `CONFIG_BT_MESH_STORE_TIMEOUT` option. When the work item is running, the stack will call the *bt_mesh_model_cb.pending_store* callback for every model that has requested storing of data. The model can then call *bt_mesh_model_data_store()* to store the data.

If `CONFIG_BT_MESH_SETTINGS_WORKQ` is enabled, the *bt_mesh_model_cb.pending_store* callback is called from a dedicated thread. This allows the stack to process other incoming and outgoing messages while model data is being stored. It is recommended to use this option and the *bt_mesh_model_data_store_schedule()* function when large amount of data needs to be stored.

Composition Data The Composition Data provides information about a mesh device. A device's Composition Data holds information about the elements on the device, the models that it supports, and other features. The Composition Data is split into different pages, where each page contains specific feature information about the device. In order to access this information, the user may use the *Configuration Server* model or, if supported, the *Large Composition Data Server* model.

Composition Data Page 0 Composition Data Page 0 provides the fundamental information about a device, and is mandatory for all mesh devices. It contains the element and model composition, the supported features, and manufacturer information.

Composition Data Page 1 Composition Data Page 1 provides information about the relationships between models, and is mandatory for all mesh devices. A model may extend and/or correspond to one or more models. A model can extend another model by calling *bt_mesh_model_extend()*, or correspond to another model by calling *bt_mesh_model_correspond()*. `CONFIG_BT_MESH_MODEL_EXTENSION_LIST_SIZE` specifies how many model relations can be stored in the composition on a device, and this number should reflect the number of *bt_mesh_model_extend()* and *bt_mesh_model_correspond()* calls.

Composition Data Page 2 Composition Data Page 2 provides information for supported mesh profiles. Mesh profile specifications define product requirements for devices that want to support a specific Bluetooth SIG defined profile. Currently supported profiles can be found in section 3.12 in Bluetooth SIG Assigned Numbers. Composition Data Page 2 is only mandatory for devices that claim support for one or more mesh profile(s).

Composition Data Pages 128, 129 and 130 Composition Data Pages 128, 129 and 130 mirror Composition Data Pages 0, 1 and 2 respectively. They are used to represent the new content of the mirrored pages when the Composition Data will change after a firmware update. See *Composition Data and Models Metadata* for details.

Delayable messages The delayable message functionality is enabled with Kconfig option `CONFIG_BT_MESH_ACCESS_DELAYABLE_MSG`. This is an optional functionality that implements specification recommendations for messages that are transmitted by a model in a response to a received message, also called response messages.

Response messages should be sent with the following random delays:

- Between 20 and 50 milliseconds if the received message was sent to a unicast address

- Between 20 and 500 milliseconds if the received message was sent to a group or virtual address

The delayable message functionality is triggered if the *bt_mesh_msg_ctx.rnd_delay* flag is set. The delayable message functionality stores messages in the local memory while they are waiting for the random delay expiration.

If the transport layer doesn't have sufficient memory to send a message at the moment the random delay expires, the message is postponed for another 10 milliseconds. If the transport layer cannot send a message for any other reason, the delayable message functionality raises the *bt_mesh_send_cb.start* callback with a transport layer error code.

If the delayable message functionality cannot find enough free memory to store an incoming message, it will send messages with delay close to expiration to free memory.

When the mesh stack is suspended or reset, messages not yet sent are removed and the *bt_mesh_send_cb.start* callback is raised with an error code.

Note

When a model sends several messages in a row, it may happen that the messages are not sent in the order they were passed to the access layer. This is because some messages can be delayed for a longer time than the others.

Disable the randomization by setting the *bt_mesh_msg_ctx.rnd_delay* to `false`, when a set of messages originated by the same model needs to be sent in a certain order.

Delayable publications The delayable publication functionality implements the specification recommendations for message publication delays in the following cases:

- Between 20 to 500 milliseconds when the Bluetooth Mesh stack starts or when the publication is triggered by the *bt_mesh_model_publish()* function
- Between 20 to 50 milliseconds for periodically published messages

This feature is optional and enabled with the `CONFIG_BT_MESH_DELAYABLE_PUBLICATION` Kconfig option. When enabled, each model can enable or disable the delayable publication by setting the *bt_mesh_model_pub.delayable* bit field to `1` or `0` correspondingly. This bit field can be changed at any time.

BT_MESH_MODEL_ID_DFD_CLI
: Firmware Distribution Client.

Defines

BT_MESH_ADDR_IS_UNICAST(addr)
: Check if a Bluetooth Mesh address is a unicast address.

BT_MESH_ADDR_IS_GROUP(addr)
: Check if a Bluetooth Mesh address is a group address.

BT_MESH_ADDR_IS_FIXED_GROUP(addr)
: Check if a Bluetooth Mesh address is a fixed group address.

BT_MESH_ADDR_IS_VIRTUAL(addr)
: Check if a Bluetooth Mesh address is a virtual address.

BT_MESH_ADDR_IS_RFU(addr)
Check if a Bluetooth Mesh address is an RFU address.

BT_MESH_IS_DEV_KEY(key)
Check if a Bluetooth Mesh key is a device key.

BT_MESH_APP_SEG_SDU_MAX
Maximum size of an access message segment (in octets).

BT_MESH_APP_UNSEG_SDU_MAX
Maximum payload size of an unsegmented access message (in octets).

BT_MESH_RX_SEG_MAX
Maximum number of segments supported for incoming messages.

BT_MESH_TX_SEG_MAX
Maximum number of segments supported for outgoing messages.

BT_MESH_TX_SDU_MAX
Maximum possible payload size of an outgoing access message (in octets).

BT_MESH_RX_SDU_MAX
Maximum possible payload size of an incoming access message (in octets).

BT_MESH_ELEM(_loc, _mods, _vnd_mods)
Helper to define a mesh element within an array.

In case the element has no SIG or Vendor models the helper macro BT_MESH_MODEL_NONE can be given instead.

Parameters

- **_loc** – Location Descriptor.
- **_mods** – Array of models.
- **_vnd_mods** – Array of vendor models.

BT_MESH_MODEL_OP_1(b0)

BT_MESH_MODEL_OP_2(b0, b1)

BT_MESH_MODEL_OP_3(b0, cid)

BT_MESH_LEN_EXACT(len)
Macro for encoding exact message length for fixed-length messages.

BT_MESH_LEN_MIN(len)
Macro for encoding minimum message length for variable-length messages.

BT_MESH_MODEL_OP_END
End of the opcode list.

Must always be present.

BT_MESH_MODEL_NO_OPS
Helper to define an empty opcode list.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

BT_MESH_MODEL_NONE

Helper to define an empty model array.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

BT_MESH_MODEL_CNT_CB(_id, _op, _pub, _user_data, _keys, _grps, _cb)

Composition data SIG model entry with callback functions with specific number of keys & groups.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.
- **_keys** – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT .
- **_grps** – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT .
- **_cb** – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_CNT_VND_CB(_company, _id, _op, _pub, _user_data, _keys, _grps, _cb)

Composition data vendor model entry with callback functions with specific number of keys & groups.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_company** – Company ID.
- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.
- **_keys** – Number of keys that can be bound to the model. Shall not exceed CONFIG_BT_MESH_MODEL_KEY_COUNT .
- **_grps** – Number of addresses that the model can be subscribed to. Shall not exceed CONFIG_BT_MESH_MODEL_GROUP_COUNT .
- **_cb** – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_CB(_id, _op, _pub, _user_data, _cb)

Composition data SIG model entry with callback functions.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_id** – Model ID.
- **_op** – Array of model opcode handlers.

- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.
- **_cb** – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_METADATA_CB(_id, _op, _pub, _user_data, _cb, _metadata)

Composition data SIG model entry with callback functions and metadata.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.
- **_cb** – Callback structure, or NULL to keep no callbacks.
- **_metadata** – Metadata structure. Used if CONFIG_BT_MESH_LARGE_COMP_DATA_SRV is enabled.

BT_MESH_MODEL_VND_CB(_company, _id, _op, _pub, _user_data, _cb)

Composition data vendor model entry with callback functions.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_company** – Company ID.
- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.
- **_cb** – Callback structure, or NULL to keep no callbacks.

BT_MESH_MODEL_VND_METADATA_CB(_company, _id, _op, _pub, _user_data, _cb, _metadata)

Composition data vendor model entry with callback functions and metadata.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_company** – Company ID.
- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.
- **_cb** – Callback structure, or NULL to keep no callbacks.
- **_metadata** – Metadata structure. Used if CONFIG_BT_MESH_LARGE_COMP_DATA_SRV is enabled.

BT_MESH_MODEL(_id, _op, _pub, _user_data)

Composition data SIG model entry.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.

BT_MESH_MODEL_VND(_company, _id, _op, _pub, _user_data)

Composition data vendor model entry.

This macro uses compound literal feature of C99 standard and thus is available only from C, not C++.

Parameters

- **_company** – Company ID.
- **_id** – Model ID.
- **_op** – Array of model opcode handlers.
- **_pub** – Model publish parameters.
- **_user_data** – User data for the model.

BT_MESH_TRANSMIT(count, int_ms)

Encode transmission count & interval steps.

Parameters

- **count** – Number of retransmissions (first transmission is excluded).
- **int_ms** – Interval steps in milliseconds. Must be greater than 0, less than or equal to 320, and a multiple of 10.

Returns

Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_TRANSMIT_COUNT(transmit)

Decode transmit count from a transmit value.

Parameters

- **transmit** – Encoded transmit count & interval value.

Returns

Transmission count (actual transmissions is N + 1).

BT_MESH_TRANSMIT_INT(transmit)

Decode transmit interval from a transmit value.

Parameters

- **transmit** – Encoded transmit count & interval value.

Returns

Transmission interval in milliseconds.

BT_MESH_PUB_TRANSMIT(count, int_ms)

Encode Publish Retransmit count & interval steps.

Parameters

- **count** – Number of retransmissions (first transmission is excluded).
- **int_ms** – Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

Returns

Mesh transmit value that can be used e.g. for the default values of the configuration model data.

BT_MESH_PUB_TRANSMIT_COUNT(transmit)

Decode Publish Retransmit count from a given value.

Parameters

- **transmit** – Encoded Publish Retransmit count & interval value.

Returns

Retransmission count (actual transmissions is N + 1).

BT_MESH_PUB_TRANSMIT_INT(transmit)

Decode Publish Retransmit interval from a given value.

Parameters

- **transmit** – Encoded Publish Retransmit count & interval value.

Returns

Transmission interval in milliseconds.

BT_MESH_PUB_MSG_TOTAL(pub)

Get total number of messages within one publication interval including initial publication.

Parameters

- **pub** – Model publication context.

Returns

total number of messages.

BT_MESH_PUB_MSG_NUM(pub)

Get message number within one publication interval.

Meant to be used inside *bt_mesh_model_pub::update*.

Parameters

- **pub** – Model publication context.

Returns

message number starting from 1.

BT_MESH_MODEL_PUB_DEFINE(_name, _update, _msg_len)

Define a model publication context.

Parameters

- **_name** – Variable name given to the context.
- **_update** – Optional message update callback (may be NULL).
- **_msg_len** – Length of the publication message.

BT_MESH_MODELS_METADATA_ENTRY(_len, _id, _data)

Initialize a Models Metadata entry structure in a list.

Parameters

- **_len** – Length of the metadata entry.
- **_id** – ID of the Models Metadata entry.
- **_data** – Pointer to a contiguous memory that contains the metadata.

BT_MESH_MODELS_METADATA_NONE

Helper to define an empty Models metadata array.

BT_MESH_MODELS_METADATA_END

End of the Models Metadata list.

Must always be present.

BT_MESH_TTL_DEFAULT

Special TTL value to request using configured default TTL.

BT_MESH_TTL_MAX

Maximum allowed TTL value.

Functions

int **bt_mesh_model_send**(const struct *bt_mesh_model* *model, struct *bt_mesh_msg_ctx* *ctx, struct *net_buf_simple* *msg, const struct *bt_mesh_send_cb* *cb, void *cb_data)

Send an Access Layer message.

Parameters

- **model** – Mesh (client) Model that the message belongs to.
- **ctx** – Message context, includes keys, TTL, etc.
- **msg** – Access Layer payload (the actual message to be sent).
- **cb** – Optional "message sent" callback.
- **cb_data** – User data to be passed to the callback.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_model_publish**(const struct *bt_mesh_model* *model)

Send a model publication message.

Before calling this function, the user needs to ensure that the model publication message (*bt_mesh_model_pub::msg*) contains a valid message to be sent. Note that this API is only to be used for non-period publishing. For periodic publishing the app only needs to make sure that *bt_mesh_model_pub::msg* contains a valid message whenever the *bt_mesh_model_pub::update* callback is called.

Parameters

- **model** – Mesh (client) Model that's publishing the message.

Returns

0 on success, or (negative) error code on failure.

static inline bool **bt_mesh_model_pub_is_retransmission**(const struct *bt_mesh_model* *model)

Check if a message is being retransmitted.

Meant to be used inside the *bt_mesh_model_pub::update* callback.

Parameters

- **model** – Mesh Model that supports publication.

Returns
true if this is a retransmission, false if this is a first publication.

const struct *bt_mesh_elem* ***bt_mesh_model_elem**(const struct *bt_mesh_model* *mod)

Get the element that a model belongs to.

Parameters

- **mod** – Mesh model.

Returns
Pointer to the element that the given model belongs to.

const struct *bt_mesh_model* ***bt_mesh_model_find**(const struct *bt_mesh_elem* *elem, uint16_t id)

Find a SIG model.

Parameters

- **elem** – Element to search for the model in.
- **id** – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no SIG model with the given ID exists in the given element.

const struct *bt_mesh_model* ***bt_mesh_model_find_vnd**(const struct *bt_mesh_elem* *elem, uint16_t company, uint16_t id)

Find a vendor model.

Parameters

- **elem** – Element to search for the model in.
- **company** – Company ID of the model.
- **id** – Model ID of the model.

Returns
A pointer to the Mesh model matching the given parameters, or NULL if no vendor model with the given ID exists in the given element.

static inline bool **bt_mesh_model_in_primary**(const struct *bt_mesh_model* *mod)

Get whether the model is in the primary element of the device.

Parameters

- **mod** – Mesh model.

Returns
true if the model is on the primary element, false otherwise.

int **bt_mesh_model_data_store**(const struct *bt_mesh_model* *mod, bool vnd, const char *name, const void *data, size_t data_len)

Immediately store the model's user data in persistent storage.

Parameters

- **mod** – Mesh model.
- **vnd** – This is a vendor model.
- **name** – Name/key of the settings item. Only *SETTINGS_MAX_DIR_DEPTH* bytes will be used at most.
- **data** – Model data to store, or NULL to delete any model data.
- **data_len** – Length of the model data.

Returns
0 on success, or (negative) error code on failure.

void **bt_mesh_model_data_store_schedule**(const struct *bt_mesh_model* *mod)

Schedule the model's user data store in persistent storage.

This function triggers the *bt_mesh_model_cb::pending_store* callback for the corresponding model after delay defined by CONFIG_BT_MESH_STORE_TIMEOUT .

The delay is global for all models. Once scheduled, the callback can not be re-scheduled until previous schedule completes.

Parameters

- **mod** – Mesh model.

int **bt_mesh_model_extend**(const struct *bt_mesh_model* *extending_mod, const struct *bt_mesh_model* *base_mod)

Let a model extend another.

Mesh models may be extended to reuse their functionality, forming a more complex model. A Mesh model may extend any number of models, in any element. The extensions may also be nested, ie a model that extends another may itself be extended.

A set of models that extend each other form a model extension list.

All models in an extension list share one subscription list per element. The access layer will utilize the combined subscription list of all models in an extension list and element, giving the models extended subscription list capacity.

If CONFIG_BT_MESH_COMP_PAGE_1 is enabled, it is not allowed to call this function before the *bt_mesh_model_cb::init* callback is called for both models, except if it is called as part of the final callback.

Parameters

- **extending_mod** – Mesh model that is extending the base model.
- **base_mod** – The model being extended.

Return values
0 – Successfully extended the base_mod model.

int **bt_mesh_model_correspond**(const struct *bt_mesh_model* *corresponding_mod, const struct *bt_mesh_model* *base_mod)

Let a model correspond to another.

Mesh models may correspond to each other, which means that if one is present, other must be present too. A Mesh model may correspond to any number of models, in any element. All models connected together via correspondence form single Correspondence Group, which has it's unique Correspondence ID. Information about Correspondence is used to construct Composition Data Page 1.

This function must be called on already initialized base_mod. Because this function is designed to be called in corresponding_mod initializer, this means that base_mod shall be initialized before corresponding_mod is.

Parameters

- `corresponding_mod` – Mesh model that is corresponding to the base model.
- `base_mod` – The model being corresponded to.

Return values

- `0` – Successfully saved correspondence to the base_mod model.
- `-ENOMEM` – There is no more space to save this relation.
- `-ENOTSUP` – Composition Data Page 1 is not supported.

bool `bt_mesh_model_is_extended`(const struct *bt_mesh_model* *model)

Check if model is extended by another model.

Parameters

- `model` – The model to check.

Return values

`true` – If model is extended by another model, otherwise false

int `bt_mesh_comp_change_prepare`(void)

Indicate that the composition data will change on next bootup.

Tell the config server that the composition data is expected to change on the next bootup, and the current composition data should be backed up.

Returns

Zero on success or (negative) error code otherwise.

int `bt_mesh_models_metadata_change_prepare`(void)

Indicate that the metadata will change on next bootup.

Tell the config server that the models metadata is expected to change on the next bootup, and the current models metadata should be backed up.

Returns

Zero on success or (negative) error code otherwise.

int `bt_mesh_comp2_register`(const struct *bt_mesh_comp2* *comp2)

Register composition data page 2 of the device.

Register Mesh Profiles information (Ref section 3.12 in Bluetooth SIG Assigned Numbers) for composition data page 2 of the device.

Note

There must be at least one record present in `comp2`

Parameters

- `comp2` – Pointer to composition data page 2.

Returns

Zero on success or (negative) error code otherwise.

struct `bt_mesh_elem`

#include <access.h> Abstraction that describes a Mesh Element.

Public Members

const uint16_t **loc**
Location Descriptor (GATT Bluetooth Namespace Descriptors)

const uint8_t **model_count**
The number of SIG models in this element.

const uint8_t **vnd_model_count**
The number of vendor models in this element.

const struct *bt_mesh_model* *const **models**
The list of SIG models in this element.

const struct *bt_mesh_model* *const **vnd_models**
The list of vendor models in this element.

struct **bt_mesh_elem_rt_ctx**
#include <*access.h*> Mesh Element runtime information.

Public Members

uint16_t **addr**
Unicast Address.

Set at runtime during provisioning.

struct **bt_mesh_model_op**
#include <*access.h*> Model opcode handler.

Public Members

const uint32_t **opcode**
OpCode encoded using the BT_MESH_MODEL_OP_* macros.

const ssize_t **len**
Message length.

If the message has variable length then this value indicates minimum message length and should be positive. Handler function should verify precise length based on the contents of the message. If the message has fixed length then this value should be negative. Use BT_MESH_LEN_* macros when defining this value.

int (*const **func**)(const struct *bt_mesh_model* *model, struct *bt_mesh_msg_ctx* *ctx, struct *net_buf_simple* *buf)
Handler function for this opcode.
Param model
Model instance receiving the message.
Param ctx
Message context for the message.

Param buf
Message buffer containing the message payload, not including the opcode.
Return
Zero on success or (negative) error code otherwise.

struct `bt_mesh_model_pub`

#include <*access.h*> Model publication context.

The context should primarily be created using the BT_MESH_MODEL_PUB_DEFINE macro.

Public Members

const struct *bt_mesh_model* ***mod**

The model the context belongs to.

Initialized by the stack.

uint16_t **addr**

Publish Address.

const uint8_t ***uuid**

Label UUID if Publish Address is Virtual Address.

uint16_t **key**

Publish AppKey Index.

uint16_t **cred**

Friendship Credentials Flag.

uint16_t **send_rel**

Force reliable sending (segment acks)

uint16_t **fast_period**

Use FastPeriodDivisor.

uint16_t **retr_update**

Call update callback on every retransmission.

uint8_t **ttl**

Publish Time to Live.

uint8_t **retransmit**

Retransmit Count & Interval Steps.

uint8_t **period**

Publish Period.

uint8_t **period_div**

Divisor for the Period.

uint8_t **count**

Transmissions left.

uint8_t **delayable**

Use random delay for publishing.

uint32_t **period_start**

Start of the current period.

struct *net_buf_simple* ***msg**

Publication buffer, containing the publication message.

This will get correctly created when the publication context has been defined using the BT_MESH_MODEL_PUB_DEFINE macro.

```
BT_MESH_MODEL_PUB_DEFINE(name, update, size);
```

int (***update**)(const struct *bt_mesh_model* *mod)

Callback for updating the publication buffer.

When set to NULL, the model is assumed not to support periodic publishing. When set to non-NULL the callback will be called periodically and is expected to update *bt_mesh_model_pub::msg* with a valid publication message.

If the callback returns non-zero, the publication is skipped and will resume on the next periodic publishing interval.

When *bt_mesh_model_pub::retr_update* is set to 1, the callback will be called on every retransmission.

Param mod
The Model the Publication Context belongs to.

Return
Zero on success or (negative) error code otherwise.

struct *k_work_delayable* **timer**

Publish Period Timer.

Only for stack-internal use.

struct **bt_mesh_models_metadata_entry**

#include <*access.h*> Models Metadata Entry struct.

The struct should primarily be created using the BT_MESH_MODELS_METADATA_ENTRY macro.

struct **bt_mesh_model_cb**

#include <*access.h*> Model callback functions.

Public Members

int (*const **settings_set**)(const struct *bt_mesh_model* *model, const char *name, size_t len_rd, *settings_read_cb* read_cb, void *cb_arg)

Set value handler of user data tied to the model.

See also

settings_handler::h_set

Param model
Model to set the persistent data of.
Param name
Name/key of the settings item.
Param len_rd
The size of the data found in the backend.
Param read_cb
Function provided to read the data from the backend.
Param cb_arg
Arguments for the read function provided by the backend.
Return
0 on success, error otherwise.

int (*const **start**)(const struct *bt_mesh_model* *model)

Callback called when the mesh is started.

This handler gets called after the node has been provisioned, or after all mesh data has been loaded from persistent storage.

When this callback fires, the mesh model may start its behavior, and all Access APIs are ready for use.

Param model
Model this callback belongs to.
Return
0 on success, error otherwise.

int (*const **init**)(const struct *bt_mesh_model* *model)

Model init callback.

Called on every model instance during mesh initialization.

If any of the model init callbacks return an error, the Mesh subsystem initialization will be aborted, and the error will be returned to the caller of *bt_mesh_init*.

Param model
Model to be initialized.
Return
0 on success, error otherwise.

void (*const **reset**)(const struct *bt_mesh_model* *model)

Model reset callback.

Called when the mesh node is reset. All model data is deleted on reset, and the model should clear its state.

Note

If the model stores any persistent data, this needs to be erased manually.

Param model
Model this callback belongs to.

void (*const **pending_store**)(const struct *bt_mesh_model* *model)

Callback used to store pending model's user data.

Triggered by *bt_mesh_model_data_store_schedule*.

To store the user data, call *bt_mesh_model_data_store*.

Param model
Model this callback belongs to.

struct **bt_mesh_mod_id_vnd**

#include <access.h> Vendor model ID.

Public Members

uint16_t **company**

Vendor's company ID.

uint16_t **id**

Model ID.

struct **bt_mesh_model**

#include <access.h> Abstraction that describes a Mesh Model instance.

Public Members

const uint16_t **id**

SIG model ID.

const struct *bt_mesh_mod_id_vnd* **vnd**

Vendor model ID.

struct *bt_mesh_model_pub* *const **pub**

Model Publication.

uint16_t *const **keys**

AppKey List.

uint16_t *const **groups**

Subscription List (group or virtual addresses)

const uint8_t **const **uuids**

List of Label UUIDs the model is subscribed to.

const struct *bt_mesh_model_op* *const **op**

Opcode handler list.

const struct *bt_mesh_model_cb* *const **cb**

Model callback structure.

struct **bt_mesh_model_rt_ctx**

#include <access.h>

Public Members

void *user_data
Model-specific user data.

struct bt_mesh_send_cb
#include <access.h> Callback structure for monitoring model message sending.

Public Members

void (*start)(uint16_t duration, int err, void *cb_data)
Handler called at the start of the transmission.
Param duration
The duration of the full transmission.
Param err
Error occurring during sending.
Param cb_data
Callback data, as passed to the send API.

void (*end)(int err, void *cb_data)
Handler called at the end of the transmission.
Param err
Error occurring during sending.
Param cb_data
Callback data, as passed to the send API.

struct bt_mesh_comp
#include <access.h> Node Composition.

Public Members

uint16_t cid
Company ID.

uint16_t pid
Product ID.

uint16_t vid
Version ID.

size_t elem_count
The number of elements in this device.

const struct *bt_mesh_elem* *elem
List of elements.

struct bt_mesh_comp2_record
#include <access.h> Composition data page 2 record.

Public Members

uint16_t **id**
Mesh profile ID.

uint8_t **x**
Major version.

uint8_t **y**
Minor version.

uint8_t **z**
Z version.

struct *bt_mesh_comp2_record* **version**
Mesh Profile Version.

uint8_t **elem_offset_cnt**
Element offset count.

const uint8_t ***elem_offset**
Element offset list.

uint16_t **data_len**
Length of additional data.

const void ***data**
Additional data.

struct **bt_mesh_comp2**
#include <access.h> Node Composition data page 2.

Public Members

size_t **record_cnt**
The number of Mesh Profile records on a device.

const struct *bt_mesh_comp2_record* ***record**
List of records.

Mesh models

Foundation models The Bluetooth Mesh specification defines foundation models that can be used by network administrators to configure and diagnose mesh nodes.

Configuration Client The Configuration Client model is a foundation model defined by the Bluetooth Mesh specification. It provides functionality for configuring most parameters of a mesh node, including encryption keys, model configuration and feature enabling.

The Configuration Client model communicates with a *Configuration Server* model using the device key of the target node. The Configuration Client model may communicate with servers on other nodes or self-configure through the local Configuration Server model.

All configuration functions in the Configuration Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and primary unicast address that the target node was provisioned with.

The Configuration Client model is optional, and it must only be instantiated on the primary element if present in the Composition Data.

API reference

group `bt_mesh_cfg_cli`

Configuration Client Model.

Defines

`BT_MESH_MODEL_CFG_CLI`(cli_data)

Generic Configuration Client model composition data entry.

Parameters

- **`cli_data`** – Pointer to a *Configuration Client Model* instance.

`BT_MESH_PUB_PERIOD_100MS`(steps)

Helper macro to encode model publication period in units of 100ms.

Parameters

- **`steps`** – Number of 100ms steps.

Returns

Encoded value that can be assigned to *bt_mesh_cfg_cli_mod_pub.period*

`BT_MESH_PUB_PERIOD_SEC`(steps)

Helper macro to encode model publication period in units of 1 second.

Parameters

- **`steps`** – Number of 1 second steps.

Returns

Encoded value that can be assigned to *bt_mesh_cfg_cli_mod_pub.period*

`BT_MESH_PUB_PERIOD_10SEC`(steps)

Helper macro to encode model publication period in units of 10 seconds.

Parameters

- **`steps`** – Number of 10 second steps.

Returns

Encoded value that can be assigned to *bt_mesh_cfg_cli_mod_pub.period*

`BT_MESH_PUB_PERIOD_10MIN`(steps)

Helper macro to encode model publication period in units of 10 minutes.

Parameters

- **`steps`** – Number of 10 minute steps.

Returns
Encoded value that can be assigned to *bt_mesh_cfg_cli_mod_pub.period*

Functions

int **bt_mesh_cfg_cli_node_reset**(uint16_t net_idx, uint16_t addr, bool *status)

Reset the target node and remove it from the network.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **status** – Status response parameter

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_comp_data_get**(uint16_t net_idx, uint16_t addr, uint8_t page, uint8_t *rsp, struct *net_buf_simple* *comp)

Get the target node's composition data.

If the other device does not have the given composition data page, it will return the largest page number it supports that is less than the requested page index. The actual page the device responds with is returned in `rsp`.

This method can be used asynchronously by setting `rsp` and `comp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **page** – Composition data page, or 0xff to request the first available page.
- **rsp** – Return parameter for the returned page number, or NULL.
- **comp** – Composition data buffer to fill.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_beacon_get**(uint16_t net_idx, uint16_t addr, uint8_t *status)

Get the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **status** – Status response parameter, returns one of *BT_MESH_BEACON_DISABLED* or *BT_MESH_BEACON_ENABLED* on success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_krp_get**(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *phase)

Get the target node's network key refresh phase state.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **status** – Status response parameter.
- **phase** – Pointer to the Key Refresh variable to fill.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_krp_set**(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t transition, uint8_t *status, uint8_t *phase)

Set the target node's network key refresh phase parameters.

This method can be used asynchronously by setting `status` and `phase` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **transition** – Transition parameter.
- **status** – Status response parameter.
- **phase** – Pointer to the new Key Refresh phase. Will return the actual Key Refresh phase after updating.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_beacon_set**(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)

Set the target node's network beacon state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – New network beacon state, should be one of *BT_MESH_BEACON_DISABLED* or *BT_MESH_BEACON_ENABLED*.
- **status** – Status response parameter. Returns one of *BT_MESH_BEACON_DISABLED* or *BT_MESH_BEACON_ENABLED* on success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_ttl_get**(uint16_t net_idx, uint16_t addr, uint8_t *ttl)

Get the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **ttl** – TTL response buffer.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_ttl_set**(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *ttl)

Set the target node's Time To Live value.

This method can be used asynchronously by setting `ttl` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – New Time To Live value.
- **ttl** – TTL response buffer.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_friend_get**(uint16_t net_idx, uint16_t addr, uint8_t *status)

Get the target node's Friend feature status.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **status** – Status response parameter. Returns one of *BT_MESH_FRIEND_DISABLED*, *BT_MESH_FRIEND_ENABLED* or *BT_MESH_FRIEND_NOT_SUPPORTED* on success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_friend_set**(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)

Set the target node's Friend feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.

- **addr** – Target node address.
- **val** – New Friend feature state. Should be one of *BT_MESH_FRIEND_DISABLED* or *BT_MESH_FRIEND_ENABLED*.
- **status** – Status response parameter. Returns one of *BT_MESH_FRIEND_DISABLED*, *BT_MESH_FRIEND_ENABLED* or *BT_MESH_FRIEND_NOT_SUPPORTED* on success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_gatt_proxy_get**(uint16_t net_idx, uint16_t addr, uint8_t *status)

Get the target node's Proxy feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **status** – Status response parameter. Returns one of *BT_MESH_GATT_PROXY_DISABLED*, *BT_MESH_GATT_PROXY_ENABLED* or *BT_MESH_GATT_PROXY_NOT_SUPPORTED* on success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_gatt_proxy_set**(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *status)

Set the target node's Proxy feature state.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – New Proxy feature state. Must be one of *BT_MESH_GATT_PROXY_DISABLED* or *BT_MESH_GATT_PROXY_ENABLED*.
- **status** – Status response parameter. Returns one of *BT_MESH_GATT_PROXY_DISABLED*, *BT_MESH_GATT_PROXY_ENABLED* or *BT_MESH_GATT_PROXY_NOT_SUPPORTED* on success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_net_transmit_get**(uint16_t net_idx, uint16_t addr, uint8_t *transmit)

Get the target node's network_transmit state.

This method can be used asynchronously by setting `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.

- **addr** – Target node address.
- **transmit** – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT*.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_net_transmit_set**(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *transmit)

Set the target node's network transmit parameters.

This method can be used asynchronously by setting `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

BT_MESH_TRANSMIT.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – New encoded network transmit parameters.
- **transmit** – Network transmit response parameter. Returns the encoded network transmission parameters on success. Decoded with *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT*.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_relay_get**(uint16_t net_idx, uint16_t addr, uint8_t *status, uint8_t *transmit)

Get the target node's Relay feature state.

This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **status** – Status response parameter. Returns one of *BT_MESH_RELAY_DISABLED*, *BT_MESH_RELAY_ENABLED* or *BT_MESH_RELAY_NOT_SUPPORTED* on success.
- **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT*.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_relay_set**(uint16_t net_idx, uint16_t addr, uint8_t new_relay, uint8_t new_transmit, uint8_t *status, uint8_t *transmit)

Set the target node's Relay parameters.

This method can be used asynchronously by setting `status` and `transmit` as NULL. This way the method will not wait for response and will return immediately after sending the command.

See also

BT_MESH_TRANSMIT.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **new_relay** – New relay state. Must be one of *BT_MESH_RELAY_DISABLED* or *BT_MESH_RELAY_ENABLED*.
- **new_transmit** – New encoded relay transmit parameters.
- **status** – Status response parameter. Returns one of *BT_MESH_RELAY_DISABLED*, *BT_MESH_RELAY_ENABLED* or *BT_MESH_RELAY_NOT_SUPPORTED* on success.
- **transmit** – Transmit response parameter. Returns the encoded relay transmission parameters on success. Decoded with *BT_MESH_TRANSMIT_COUNT* and *BT_MESH_TRANSMIT_INT*.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_net_key_add**(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

Add a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **key_net_idx** – Network key index.
- **net_key** – Network key.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_net_key_get**(uint16_t net_idx, uint16_t addr, uint16_t *keys, size_t *key_cnt)

Get a list of the target node's network key indexes.

This method can be used asynchronously by setting `keys` or `key_cnt` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `keys` – Net key index list response parameter. Will be filled with all the returned network key indexes it can fill.
- `key_cnt` – Net key index list length. Should be set to the capacity of the `keys` list when calling. Will return the number of returned network key indexes upon success.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_net_key_del**(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status)

Delete a network key from the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_app_key_add**(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)

Add an application key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `app_key` – Application key.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_app_key_get**(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint16_t *keys, size_t *key_cnt)

Get a list of the target node's application key indexes for a specific network key.

This method can be used asynchronously by setting `status` and (`keys` or `key_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index to request the app key indexes of.
- `status` – Status response parameter.
- `keys` – App key index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `key_cnt` – App key index list length. Should be set to the capacity of the `keys` list when calling. Will return the number of returned application key indexes upon success.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_app_key_del`(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, uint8_t *status)

Delete an application key from the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_mod_app_bind`(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)

Bind an application to a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_app_idx` – Application index to bind.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_app_unbind**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint8_t *status)

Unbind an application from a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to unbind.
- **mod_id** – Model ID.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_app_bind_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Bind an application to a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_app_idx** – Application index to bind.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_app_unbind_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_app_idx, uint16_t mod_id, uint16_t cid, uint8_t *status)

Unbind an application from a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.

- `mod_app_idx` – Application index to unbind.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_mod_app_get`(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *apps, size_t *app_cnt)

Get a list of all applications bound to a SIG model on the target node.

This method can be used asynchronously by setting `status` and (`apps` or `app_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_mod_app_get_vnd`(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *apps, size_t *app_cnt)

Get a list of all applications bound to a vendor model on the target node.

This method can be used asynchronously by setting `status` and (`apps` or `app_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.
- `apps` – App index list response parameter. Will be filled with all the returned application key indexes it can fill.
- `app_cnt` – App index list length. Should be set to the capacity of the `apps` list when calling. Will return the number of returned application key indexes upon success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_pub_get**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, struct *bt_mesh_cfg_cli_mod_pub* *pub, uint8_t *status)

Get publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **pub** – Publication parameter return buffer.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_pub_get_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct *bt_mesh_cfg_cli_mod_pub* *pub, uint8_t *status)

Get publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **pub** – Publication parameter return buffer.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_pub_set**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, struct *bt_mesh_cfg_cli_mod_pub* *pub, uint8_t *status)

Set publish parameters for a SIG model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **pub** – Publication parameters.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_pub_set_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct *bt_mesh_cfg_cli_mod_pub* *pub, uint8_t *status)

Set publish parameters for a vendor model on the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **pub** – Publication parameters.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_add**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Add a group address to a SIG model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.
- **mod_id** – Model ID.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_add_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Add a group address to a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_del**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Delete a group address in a SIG model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.
- **mod_id** – Model ID.
- **status** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_del_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Delete a group address in a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **sub_addr** – Group address to add to the subscription list.

- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_mod_sub_overwrite`(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_mod_sub_overwrite_vnd`(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t sub_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a group address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `sub_addr` – Group address to add to the subscription list.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_va_add**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Add a virtual address to a SIG model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_va_add_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)

Add a virtual address to a vendor model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_va_del**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Delete a virtual address in a SIG model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- label – Virtual address parameter to add to the subscription list.
- mod_id – Model ID.
- virt_addr – Virtual address response parameter.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_va_del_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)

Delete a virtual address in a vendor model's subscription list.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- label – Virtual address label to add to the subscription list.
- mod_id – Model ID.
- cid – Company ID of the model.
- virt_addr – Virtual address response parameter.
- status – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_va_overwrite**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t *virt_addr, uint8_t *status)

Overwrite all addresses in a SIG model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- net_idx – Network index to encrypt with.
- addr – Target node address.
- elem_addr – Element address the model is in.
- label – Virtual address label to add to the subscription list.
- mod_id – Model ID.

- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_va_overwrite_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, const uint8_t label[16], uint16_t mod_id, uint16_t cid, uint16_t *virt_addr, uint8_t *status)

Overwrite all addresses in a vendor model's subscription list with a virtual address.

Deletes all subscriptions in the model's subscription list, and adds a single group address instead.

This method can be used asynchronously by setting `status` and `virt_addr` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **label** – Virtual address label to add to the subscription list.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **virt_addr** – Virtual address response parameter.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_get**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status, uint16_t *subs, size_t *sub_cnt)

Get the subscription list of a SIG model on the target node.

This method can be used asynchronously by setting `status` and (`subs` or `sub_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **status** – Status response parameter.
- **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- **sub_cnt** – Subscription list element count. Should be set to the capacity of the `subs` list when calling. Will return the number of returned subscriptions upon success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_get_vnd**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status, uint16_t *subs, size_t *sub_cnt)

Get the subscription list of a vendor model on the target node.

This method can be used asynchronously by setting `status` and (`subs` or `sub_cnt`) as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **elem_addr** – Element address the model is in.
- **mod_id** – Model ID.
- **cid** – Company ID of the model.
- **status** – Status response parameter.
- **subs** – Subscription list response parameter. Will be filled with all the returned subscriptions it can fill.
- **sub_cnt** – Subscription list element count. Should be set to the capacity of the `subs` list when calling. Will return the number of returned subscriptions upon success.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_hb_sub_set**(uint16_t net_idx, uint16_t addr, struct *bt_mesh_cfg_cli_hb_sub* *sub, uint8_t *status)

Set the target node's Heartbeat subscription parameters.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`sub` shall not be null.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **sub** – New Heartbeat subscription parameters.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_hb_sub_get**(uint16_t net_idx, uint16_t addr, struct *bt_mesh_cfg_cli_hb_sub* *sub, uint8_t *status)

Get the target node's Heartbeat subscription parameters.

This method can be used asynchronously by setting `status` and `sub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.

- **addr** – Target node address.
- **sub** – Heartbeat subscription parameter return buffer.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_hb_pub_set**(uint16_t net_idx, uint16_t addr, const struct *bt_mesh_cfg_cli_hb_pub* *pub, uint8_t *status)

Set the target node's Heartbeat publication parameters.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

`pub` shall not be NULL;

Note

The target node must already have received the specified network key.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **pub** – New Heartbeat publication parameters.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_hb_pub_get**(uint16_t net_idx, uint16_t addr, struct *bt_mesh_cfg_cli_hb_pub* *pub, uint8_t *status)

Get the target node's Heartbeat publication parameters.

This method can be used asynchronously by setting `status` and `pub` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **pub** – Heartbeat publication parameter return buffer.
- **status** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_mod_sub_del_all**(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint8_t *status)

Delete all group addresses in a SIG model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_mod_sub_del_all_vnd`(uint16_t net_idx, uint16_t addr, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, uint8_t *status)

Delete all group addresses in a vendor model's subscription list.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `elem_addr` – Element address the model is in.
- `mod_id` – Model ID.
- `cid` – Company ID of the model.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_net_key_update`(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, const uint8_t net_key[16], uint8_t *status)

Update a network key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index.
- `net_key` – Network key.
- `status` – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_app_key_update`(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint16_t key_app_idx, const uint8_t app_key[16], uint8_t *status)

Update an application key to the target node.

This method can be used asynchronously by setting `status` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `key_app_idx` – Application key index.
- `app_key` – Application key.
- `status` – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_node_identity_set`(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t new_identity, uint8_t *status, uint8_t *identity)

Set the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `new_identity` – New identity state. Must be one of *BT_MESH_NODE_IDENTITY_STOPPED* or *BT_MESH_NODE_IDENTITY_RUNNING*
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.
- `identity` – Identity response parameter.

Returns

0 on success, or (negative) error code on failure.

int `bt_mesh_cfg_cli_node_identity_get`(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, uint8_t *status, uint8_t *identity)

Get the Node Identity parameters.

This method can be used asynchronously by setting `status` and `identity` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network key index the application key belongs to.
- `status` – Status response parameter.

- **identity** – Identity response parameter. Must be one of *BT_MESH_NODE_IDENTITY_STOPPED* or *BT_MESH_NODE_IDENTITY_RUNNING*

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_cfg_cli_lpn_timeout_get**(uint16_t net_idx, uint16_t addr, uint16_t unicast_addr, int32_t *polltimeout)

Get the Low Power Node Polltimeout parameters.

This method can be used asynchronously by setting `polltimeout` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **unicast_addr** – LPN unicast address.
- **polltimeout** – Poll timeout response parameter.

Returns
0 on success, or (negative) error code on failure.

int32_t **bt_mesh_cfg_cli_timeout_get**(void)

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void **bt_mesh_cfg_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

Parameters

- **timeout** – The new transmission timeout.

int **bt_mesh_comp_p0_get**(struct *bt_mesh_comp_p0* *comp, struct *net_buf_simple* *buf)

Create a composition data page 0 representation from a buffer.

The composition data page object will take ownership over the buffer, which should not be manipulated directly after this call.

This function can be used in combination with *bt_mesh_cfg_cli_comp_data_get* to read out composition data page 0 from other devices:

```
NET_BUF_SIMPLE_DEFINE(buf, BT_MESH_RX_SDU_MAX);
struct bt_mesh_comp_p0 comp;

err = bt_mesh_cfg_cli_comp_data_get(net_idx, addr, 0, &page, &buf);
if (!err) {
        bt_mesh_comp_p0_get(&comp, &buf);
}
```

Parameters

- **buf** – Network buffer containing composition data.
- **comp** – Composition data structure to fill.

Returns
0 on success, or (negative) error code on failure.

struct *bt_mesh_comp_p0_elem* ***bt_mesh_comp_p0_elem_pull**(const struct *bt_mesh_comp_p0* *comp, struct *bt_mesh_comp_p0_elem* *elem)

Pull a composition data page 0 element from a composition data page 0 instance.

Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

Parameters

- **comp** – Composition data page
- **elem** – Element to fill.

Returns

A pointer to `elem` on success, or NULL if no more elements could be pulled.

uint16_t **bt_mesh_comp_p0_elem_mod**(struct *bt_mesh_comp_p0_elem* *elem, int idx)

Get a SIG model from the given composition data page 0 element.

Parameters

- **elem** – Element to read the model from.
- **idx** – Index of the SIG model to read.

Returns

The Model ID of the SIG model at the given index, or 0xffff if the index is out of bounds.

struct *bt_mesh_mod_id_vnd* **bt_mesh_comp_p0_elem_mod_vnd**(struct *bt_mesh_comp_p0_elem* *elem, int idx)

Get a vendor model from the given composition data page 0 element.

Parameters

- **elem** – Element to read the model from.
- **idx** – Index of the vendor model to read.

Returns

The model ID of the vendor model at the given index, or {0xffff, 0xffff} if the index is out of bounds.

struct *bt_mesh_comp_p1_elem* ***bt_mesh_comp_p1_elem_pull**(struct *net_buf_simple* *buf, struct *bt_mesh_comp_p1_elem* *elem)

Pull a Composition Data Page 1 Element from a composition data page 1 instance.

Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

Parameters

- **buf** – Composition data page 1 buffer
- **elem** – Element to fill.

Returns

A pointer to `elem` on success, or NULL if no more elements could be pulled.

struct *bt_mesh_comp_p1_model_item* ***bt_mesh_comp_p1_item_pull**(struct *bt_mesh_comp_p1_elem* *elem, struct *bt_mesh_comp_p1_model_item* *item)

Pull a Composition Data Page 1 Model Item from a Composition Data Page 1 Element.

Each call to this function will pull out a new item from the Composition Data Page 1 Element, until all items have been pulled.

Parameters

- **elem** – Composition data page 1 Element
- **item** – Model Item to fill.

Returns
A pointer to `item` on success, or NULL if no more elements could be pulled.

struct *bt_mesh_comp_p1_ext_item* ***bt_mesh_comp_p1_pull_ext_item**(struct *bt_mesh_comp_p1_model_item* *item, struct *bt_mesh_comp_p1_ext_item* *ext_item)

Pull Extended Model Item contained in Model Item.

Each call to this function will pull out a new element from the Extended Model Item, until all elements have been pulled.

Parameters

- **item** – Model Item to pull Extended Model Items from
- **ext_item** – Extended Model Item to fill

Returns
A pointer to `ext_item` on success, or NULL if item could not be pulled

struct *bt_mesh_comp_p2_record* ***bt_mesh_comp_p2_record_pull**(struct *net_buf_simple* *buf, struct *bt_mesh_comp_p2_record* *record)

Pull a Composition Data Page 2 Record from a composition data page 2 instance.

Each call to this function will pull out a new element from the composition data page, until all elements have been pulled.

Parameters

- **buf** – Composition data page 2 buffer
- **record** – Record to fill.

Returns
A pointer to `record` on success, or NULL if no more elements could be pulled.

int **bt_mesh_key_idx_unpack_list**(struct *net_buf_simple* *buf, uint16_t *dst_arr, size_t *dst_cnt)

Unpack a list of key index entries from a buffer.

On success, `dst_cnt` is set to the amount of unpacked key index entries.

Parameters

- **buf** – Message buffer containing encoded AppKey or NetKey Indexes.
- **dst_arr** – Destination array for the unpacked list.

- **dst_cnt** – Size of the destination array.

Returns
0 on success.

Returns
-EMSGSIZE if dst_arr size is to small to parse full message.

struct **bt_mesh_cfg_cli_cb**

#include <*cfg_cli.h*> Mesh Configuration Client Status messages callback.

Public Members

void (***comp_data**)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t page, struct *net_buf_simple* *buf)

Optional callback for Composition data messages.

Handles received Composition data messages from a server.

> **Note**
>
> For decoding buf, please refer to *bt_mesh_comp_p0_get* and *bt_mesh_comp_p1_elem_pull*.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param page
Composition data page.
Param buf
Composition data buffer.

void (***mod_pub_status**)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct *bt_mesh_cfg_cli_mod_pub* *pub)

Optional callback for Model Pub status messages.

Handles received Model Pub status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status code for the message.
Param elem_addr
Address of the element.
Param mod_id
Model ID.
Param cid
Company ID.
Param pub
Publication configuration parameters.

void (***mod_sub_status**)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t sub_addr, uint32_t mod_id)

Optional callback for Model Sub Status messages.

Handles received Model Sub Status messages from a server.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param elem_addr
The unicast address of the element.
Param sub_addr
The sub address.
Param mod_id
The model ID within the element.

void (*`mod_sub_list`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct *net_buf_simple* *buf)

Optional callback for Model Sub list messages.

Handles received Model Sub list messages from a server.

> **Note**
>
> The `buf` parameter should be decoded using *net_buf_simple_pull_le16* in iteration, as long as `buf->len` is greater than or equal to 2.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status code for the message.
Param elem_addr
Address of the element.
Param mod_id
Model ID.
Param cid
Company ID.
Param buf
Message buffer containing subscription addresses.

void (*`node_reset_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr)

Optional callback for Node Reset Status messages.

Handles received Node Reset Status messages from a server.

Param cli
Client that received the status message.
Param addr
Address of the sender.

void (*`beacon_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status)

Optional callback for Beacon Status messages.

Handles received Beacon Status messages from a server.

Param cli
Client that received the status message.

Param addr
Address of the sender.
Param status
Status Code for requesting message.

void (*`ttl_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status)

Optional callback for Default TTL Status messages.

Handles received Default TTL Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.

void (*`friend_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status)

Optional callback for Friend Status messages.

Handles received Friend Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.

void (*`gatt_proxy_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status)

Optional callback for GATT Proxy Status messages.

Handles received GATT Proxy Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.

void (*`network_transmit_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status)

Optional callback for Network Transmit Status messages.

Handles received Network Transmit Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.

void (*`relay_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint8_t transmit)

Optional callback for Relay Status messages.

Handles received Relay Status messages from a server.
Param cli
Client that received the status message.

Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param transmit
The relay retransmit count and interval steps.

void (*`net_key_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t net_idx)

Optional callback for NetKey Status messages.

Handles received NetKey Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param net_idx
The index of the NetKey.

void (*`net_key_list`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, struct *net_buf_simple* *buf)

Optional callback for Netkey list messages.

Handles received Netkey list messages from a server.

> **Note**
>
> The `buf` parameter should be decoded using the *bt_mesh_key_idx_unpack_list* helper function.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param buf
Message buffer containing key indexes.

void (*`app_key_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint16_t app_idx)

Optional callback for AppKey Status messages.

Handles received AppKey Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param net_idx
The index of the NetKey.
Param app_idx
The index of the AppKey.

void (*`app_key_list`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t net_idx, struct *net_buf_simple* *buf)

Optional callback for Appkey list messages.

Handles received Appkey list messages from a server.

> **Note**
>
> The `buf` parameter should be decoded using the *bt_mesh_key_idx_unpack_list* helper function.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status code for the message.
Param net_idx
The index of the NetKey.
Param buf
Message buffer containing key indexes.

void (*`mod_app_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t app_idx, uint32_t mod_id)

Optional callback for Model App Status messages.

Handles received Model App Status messages from a server.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param elem_addr
The unicast address of the element.
Param app_idx
The sub address.
Param mod_id
The model ID within the element.

void (*`mod_app_list`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t elem_addr, uint16_t mod_id, uint16_t cid, struct *net_buf_simple* *buf)

Optional callback for Model App list messages.

Handles received Model App list messages from a server.

> **Note**
>
> The `buf` parameter should be decoded using the *bt_mesh_key_idx_unpack_list* helper function.

Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status code for the message.

Param elem_addr
Address of the element.
Param mod_id
Model ID.
Param cid
Company ID.
Param buf
Message buffer containing key indexes.

void (*`node_identity_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t identity)

Optional callback for Node Identity Status messages.

Handles received Node Identity Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status Code for requesting message.
Param net_idx
The index of the NetKey.
Param identity
The node identity state.

void (*`lpn_timeout_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint16_t elem_addr, uint32_t timeout)

Optional callback for LPN PollTimeout Status messages.

Handles received LPN PollTimeout Status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param elem_addr
The unicast address of the LPN.
Param timeout
Current value of PollTimeout timer of the LPN.

void (*`krp_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, uint16_t net_idx, uint8_t phase)

Optional callback for Key Refresh Phase status messages.

Handles received Key Refresh Phase status messages from a server.
Param cli
Client that received the status message.
Param addr
Address of the sender.
Param status
Status code for the message.
Param net_idx
The index of the NetKey.
Param phase
Phase of the KRP.

void (*`hb_pub_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, struct *bt_mesh_cfg_cli_hb_pub* *pub)

Optional callback for Heartbeat pub status messages.

Handles received Heartbeat pub status messages from a server.

Param cli
Client that received the status message.

Param addr
Address of the sender.

Param status
Status code for the message.

Param pub
HB publication configuration parameters.

void (*`hb_sub_status`)(struct *bt_mesh_cfg_cli* *cli, uint16_t addr, uint8_t status, struct *bt_mesh_cfg_cli_hb_sub* *sub)

Optional callback for Heartbeat Sub status messages.

Handles received Heartbeat Sub status messages from a server.

Param cli
Client that received the status message.

Param addr
Address of the sender.

Param status
Status code for the message.

Param sub
HB subscription configuration parameters.

struct `bt_mesh_cfg_cli`

#include <*cfg_cli.h*> Mesh Configuration Client Model Context.

Public Members

const struct *bt_mesh_model* *`model`

Composition data model entry pointer.

const struct *bt_mesh_cfg_cli_cb* *`cb`

Optional callback for Mesh Configuration Client Status messages.

struct `bt_mesh_cfg_cli_mod_pub`

#include <*cfg_cli.h*> Model publication configuration parameters.

Public Members

uint16_t `addr`

Publication destination address.

const uint8_t *`uuid`

Virtual address UUID, or NULL if this is not a virtual address.

uint16_t `app_idx`

Application index to publish with.

bool `cred_flag`

Friendship credential flag.

uint8_t **ttl**

Time To Live to publish with.

uint8_t **period**

Encoded publish period.

See also

BT_MESH_PUB_PERIOD_100MS, *BT_MESH_PUB_PERIOD_SEC*, *BT_MESH_PUB_PERIOD_10SEC*, *BT_MESH_PUB_PERIOD_10MIN*

uint8_t **transmit**

Encoded transmit parameters.

See also

BT_MESH_TRANSMIT

struct **bt_mesh_cfg_cli_hb_sub**

#include <*cfg_cli.h*> Heartbeat subscription configuration parameters.

Public Members

uint16_t **src**

Source address to receive Heartbeat messages from.

uint16_t **dst**

Destination address to receive Heartbeat messages on.

uint8_t **period**

Logarithmic subscription period to keep listening for.

The decoded subscription period is (1 « (period - 1)) seconds, or 0 seconds if period is 0.

uint8_t **count**

Logarithmic Heartbeat subscription receive count.

The decoded Heartbeat count is (1 « (count - 1)) if count is between 1 and 0xfe, 0 if count is 0 and 0xffff if count is 0xff.

Ignored in Heartbeat subscription set.

uint8_t **min**

Minimum hops in received messages, ie the shortest registered path from the publishing node to the subscribing node.

A Heartbeat received from an immediate neighbor has hop count = 1.

Ignored in Heartbeat subscription set.

uint8_t **max**

Maximum hops in received messages, ie the longest registered path from the publishing node to the subscribing node.

A Heartbeat received from an immediate neighbor has hop count = 1.

Ignored in Heartbeat subscription set.

struct **bt_mesh_cfg_cli_hb_pub**

#include <*cfg_cli.h*> Heartbeat publication configuration parameters.

Public Members

uint16_t **dst**

Heartbeat destination address.

uint8_t **count**

Logarithmic Heartbeat count.

Decoded as (1 « (count - 1)) if count is between 1 and 0x11, 0 if count is 0, or "indefinitely" if count is 0xff.

When used in Heartbeat publication set, this parameter denotes the number of Heartbeat messages to send.

When returned from Heartbeat publication get, this parameter denotes the number of Heartbeat messages remaining to be sent.

uint8_t **period**

Logarithmic Heartbeat publication transmit interval in seconds.

Decoded as (1 « (period - 1)) if period is between 1 and 0x11. If period is 0, Heartbeat publication is disabled.

uint8_t **ttl**

Publication message Time To Live value.

uint16_t **feat**

Bitmap of features that trigger Heartbeat publications.

Legal values are *BT_MESH_FEAT_RELAY*, *BT_MESH_FEAT_PROXY*, *BT_MESH_FEAT_FRIEND* and *BT_MESH_FEAT_LOW_POWER*

uint16_t **net_idx**

Network index to publish with.

struct **bt_mesh_comp_p0**

#include <*cfg_cli.h*> Parsed Composition data page 0 representation.

Should be pulled from the return buffer passed to *bt_mesh_cfg_cli_comp_data_get* using *bt_mesh_comp_p0_get*.

Public Members

uint16_t **cid**
Company ID.

uint16_t **pid**
Product ID.

uint16_t **vid**
Version ID.

uint16_t **crpl**
Replay protection list size.

uint16_t **feat**
Supported features, see *BT_MESH_FEAT_SUPPORTED*.

struct **bt_mesh_comp_p0_elem**
#include <cfg_cli.h> Composition data page 0 element representation.

Public Members

uint16_t **loc**
Element location.

size_t **nsig**
The number of SIG models in this element.

size_t **nvnd**
The number of vendor models in this element.

struct **bt_mesh_comp_p1_elem**
#include <cfg_cli.h> Composition data page 1 element representation.

Public Members

size_t **nsig**
The number of SIG models in this element.

size_t **nvnd**
The number of vendor models in this element.

struct **bt_mesh_comp_p1_model_item**
#include <cfg_cli.h> Composition data page 1 model item representation.

Public Members

bool **cor_present**
Corresponding_Group_ID field indicator.

bool **format**
Determines the format of Extended Model Item.

uint8_t **ext_item_cnt**
Number of items in Extended Model Items.

uint8_t **cor_id**
Buffer containing Extended Model Items.
If cor_present is set to 1 it starts with Corresponding_Group_ID

struct **bt_mesh_comp_p1_item_short**
#include <cfg_cli.h> Extended Model Item in short representation.

Public Members

uint8_t **elem_offset**
Element address modifier.

uint8_t **mod_item_idx**
Model Index.

struct **bt_mesh_comp_p1_item_long**
#include <cfg_cli.h> Extended Model Item in long representation.

Public Members

uint8_t **elem_offset**
Element address modifier.

uint8_t **mod_item_idx**
Model Index.

struct **bt_mesh_comp_p1_ext_item**
#include <cfg_cli.h> Extended Model Item.

Public Members

struct *bt_mesh_comp_p1_item_short* **short_item**
Item in short representation.

struct *bt_mesh_comp_p1_item_long* **long_item**
Item in long representation.

struct **bt_mesh_comp_p2_record**
#include <cfg_cli.h> Composition data page 2 record parsing structure.

Public Members

uint16_t **id**
Mesh profile ID.

uint8_t **x**
Major version.

uint8_t **y**
Minor version.

uint8_t **z**
Z version.

struct *bt_mesh_comp_p2_record* **version**
Mesh Profile Version.

struct *net_buf_simple* ***elem_buf**
Element offset buffer.

struct *net_buf_simple* ***data_buf**
Additional data buffer.

Configuration Server The Configuration Server model is a foundation model defined by the Bluetooth Mesh specification. The Configuration Server model controls most parameters of the mesh node. It does not have an API of its own, but relies on a *Configuration Client* to control it.

The Configuration Server model is mandatory on all Bluetooth Mesh nodes, and must only be instantiated on the primary element.

API reference

group **bt_mesh_cfg_srv**
Configuration Server Model.

Defines

BT_MESH_MODEL_CFG_SRV
Generic Configuration Server model composition data entry.

Health Client The Health Client model interacts with a Health Server model to read out diagnostics and control the node's attention state.

All message passing functions in the Health Client API have `cli` as their first parameter. This is a pointer to the client model instance to be used in this function call. The second parameter is the `ctx` or message context. Message context contains netkey index, appkey index and unicast address that the target node uses.

The Health Client model is optional, and may be instantiated on any element. However, if a Health Client model is instantiated on an element other than the primary, an instance must also be present on the primary element.

See *Health faults* for a list of specification defined fault values.

API reference

group `bt_mesh_health_cli`

Health Client Model.

Defines

`BT_MESH_MODEL_HEALTH_CLI`(cli_data)

Generic Health Client model composition data entry.

Parameters

- **cli_data** – Pointer to a *Health Client Model* instance.

Functions

int **bt_mesh_health_cli_fault_get**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)

Get the registered fault state for the given Company ID.

This method can be used asynchronously by setting `test_id` and (`faults` or `fault_count`) as NULL This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in *`bt_mesh_health_cli`* struct.

See also

Health faults

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to get the registered faults of.
- **test_id** – Test ID response buffer.
- **faults** – Fault array response buffer.

- **fault_count** – Fault count response buffer.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_fault_clear**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint16_t cid, uint8_t *test_id, uint8_t *faults, size_t *fault_count)

Clear the registered faults for the given Company ID.

This method can be used asynchronously by setting `test_id` and (`faults` or `fault_count`) as NULL This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in *bt_mesh_health_cli* struct.

See also

Health faults

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to clear the registered faults for.
- **test_id** – Test ID response buffer.
- **faults** – Fault array response buffer.
- **fault_count** – Fault count response buffer.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_fault_clear_unack**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint16_t cid)

Clear the registered faults for the given Company ID (unacked).

See also

Health faults

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to clear the registered faults for.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_fault_test**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint16_t cid, uint8_t test_id, uint8_t *faults, size_t *fault_count)

Invoke a self-test procedure for the given Company ID.

This method can be used asynchronously by setting `faults` or `fault_count` as NULL This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `fault_status` callback in *bt_mesh_health_cli* struct.

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to invoke the test for.
- **test_id** – Test ID response buffer.
- **faults** – Fault array response buffer.
- **fault_count** – Fault count response buffer.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_fault_test_unack**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint16_t cid, uint8_t test_id)

Invoke a self-test procedure for the given Company ID (unacked).

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **cid** – Company ID to invoke the test for.
- **test_id** – Test ID response buffer.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_period_get**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t *divisor)

Get the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by (1 « divisor). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting `divisor` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `period_status` callback in *bt_mesh_health_cli* struct.

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **divisor** – Health period divisor response buffer.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_period_set**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t divisor, uint8_t *updated_divisor)

Set the target node's Health fast period divisor.

The health period divisor is used to increase the publish rate when a fault is registered. Normally, the Health server will publish with the period in the configured publish parameters. When a fault is registered, the publish period is divided by (1 « divisor). For example, if the target node's Health server is configured to publish with a period of 16 seconds, and the Health fast period divisor is 5, the Health server will publish with an interval of 500 ms when a fault is registered.

This method can be used asynchronously by setting `updated_divisor` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `period_status` callback in *`bt_mesh_health_cli`* struct.

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **divisor** – New Health period divisor.
- **updated_divisor** – Health period divisor response buffer.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_period_set_unack**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t divisor)

Set the target node's Health fast period divisor (unacknowledged).

This is an unacknowledged version of this API.

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **divisor** – New Health period divisor.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_attention_get**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t *attention)

Get the current attention timer value.

This method can be used asynchronously by setting `attention` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `attention_status` callback in *bt_mesh_health_cli* struct.

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **attention** – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_attention_set**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t attention, uint8_t *updated_attention)

Set the attention timer.

This method can be used asynchronously by setting `updated_attention` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `attention_status` callback in *bt_mesh_health_cli* struct.

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **attention** – New attention timer time, in seconds.
- **updated_attention** – Attention timer response buffer, measured in seconds.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_health_cli_attention_set_unack**(struct *bt_mesh_health_cli* *cli, struct *bt_mesh_msg_ctx* *ctx, uint8_t attention)

Set the attention timer (unacknowledged).

Parameters

- **cli** – Client model to send on.
- **ctx** – Message context, or NULL to use the configured publish parameters.
- **attention** – New attention timer time, in seconds.

Returns
0 on success, or (negative) error code on failure.

int32_t **bt_mesh_health_cli_timeout_get**(void)

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void **bt_mesh_health_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

Parameters

- **timeout** – The new transmission timeout.

struct **bt_mesh_health_cli**

#include <health_cli.h> Health Client Model Context.

Public Members

const struct *bt_mesh_model* ***model**

Composition data model entry pointer.

struct *bt_mesh_model_pub* **pub**

Publication structure instance.

struct *net_buf_simple* **pub_buf**

Publication buffer.

uint8_t **pub_data**[*BT_MESH_MODEL_BUF_LEN*(*BT_MESH_MODEL_OP_2*(0x80, 0x32), 3)]

Publication data.

void (***period_status**)(struct *bt_mesh_health_cli* *cli, uint16_t addr, uint8_t divisor)

Optional callback for Health Period Status messages.

Handles received Health Period Status messages from a Health server. The `divisor` param represents the period divisor value.

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param divisor
Health Period Divisor value.

void (***attention_status**)(struct *bt_mesh_health_cli* *cli, uint16_t addr, uint8_t attention)

Optional callback for Health Attention Status messages.

Handles received Health Attention Status messages from a Health server. The `attention` param represents the current attention value.

Param cli
Health client that received the status message.

Param addr
Address of the sender.

Param attention
Current attention value.

void (***fault_status**)(struct *bt_mesh_health_cli* *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)

Optional callback for Health Fault Status messages.

Handles received Health Fault Status messages from a Health server. The `fault` array represents all faults that are currently present in the server's element.

See also

Health faults

Param cli
Health client that received the status message.
Param addr
Address of the sender.
Param test_id
Identifier of a most recently performed test.
Param cid
Company Identifier of the node.
Param faults
Array of faults.
Param fault_count
Number of faults in the fault array.

void (*`current_status`)(struct *bt_mesh_health_cli* *cli, uint16_t addr, uint8_t test_id, uint16_t cid, uint8_t *faults, size_t fault_count)

Optional callback for Health Current Status messages.

Handles received Health Current Status messages from a Health server. The `fault` array represents all faults that are currently present in the server's element.

See also

Health faults

Param cli
Health client that received the status message.
Param addr
Address of the sender.
Param test_id
Identifier of a most recently performed test.
Param cid
Company Identifier of the node.
Param faults
Array of faults.
Param fault_count
Number of faults in the fault array.

Health Server The Health Server model provides attention callbacks and node diagnostics for *Health Client* models. It is primarily used to report faults in the mesh node and map the mesh nodes to their physical location.

If present, the Health Server model must be instantiated on the primary element.

Faults The Health Server model may report a list of faults that have occurred in the device's lifetime. Typically, the faults are events or conditions that may alter the behavior of the node, like power outages or faulty peripherals. Faults are split into warnings and errors. Warnings indicate conditions that are close to the limits of what the node is designed to withstand, but not necessarily damaging to the device. Errors indicate conditions that are outside of the node's design limits, and may have caused invalid behavior or permanent damage to the device.

Fault values `0x01` to `0x7f` are reserved for the Bluetooth Mesh specification, and the full list of specification defined faults are available in *Health faults*. Fault values `0x80` to `0xff` are vendor specific. The list of faults are always reported with a company ID to help interpreting the vendor specific faults.

Attention state The attention state is used to make the device call attention to itself through some physical behavior like blinking, playing a sound or vibrating. The attention state may be used during provisioning to let the user know which device they're provisioning, as well as through the Health models at runtime.

The attention state is always assigned a timeout in the range of one to 255 seconds when enabled. The Health Server API provides two callbacks for the application to run their attention calling behavior: *bt_mesh_health_srv_cb.attn_on* is called at the beginning of the attention period, *bt_mesh_health_srv_cb.attn_off* is called at the end.

The remaining time for the attention period may be queried through *bt_mesh_health_srv.attn_timer*.

API reference

group `bt_mesh_health_srv`

Health Server Model.

Defines

`BT_MESH_HEALTH_PUB_DEFINE`(_name, _max_faults)

A helper to define a health publication context.

Parameters

- **_name** – Name given to the publication context variable.
- **_max_faults** – Maximum number of faults the element can have.

`BT_MESH_MODEL_HEALTH_SRV`(srv, pub, ...)

Define a new health server model.

Note that this API needs to be repeated for each element that the application wants to have a health server model on. Each instance also needs a unique *bt_mesh_health_srv* and *bt_mesh_model_pub* context.

Parameters

- **srv** – Pointer to a unique struct *bt_mesh_health_srv*.
- **pub** – Pointer to a unique struct *bt_mesh_model_pub*.
- **...** – Optional Health Server metadata if application is compiled with Large Composition Data Server support, otherwise this parameter is ignored.

Returns

New mesh model instance.

`BT_MESH_HEALTH_TEST_INFO_METADATA_ID`

Health Test Information Metadata ID.

`BT_MESH_HEALTH_TEST_INFO_METADATA`(tests)

`BT_MESH_HEALTH_TEST_INFO`(cid, tests...)

Define a Health Test Info Metadata array.

Parameters

- `cid` – Company ID of the Health Test suite.
- `tests` – A comma separated list of tests.

Returns

A comma separated list of values that make Health Test Info Metadata

Functions

int `bt_mesh_health_srv_fault_update`(const struct *bt_mesh_elem* *elem)

Notify the stack that the fault array state of the given element has changed.

This prompts the Health server on this element to publish the current fault array if periodic publishing is disabled.

Parameters

- `elem` – Element to update the fault state of.

Returns

0 on success, or (negative) error code otherwise.

struct `bt_mesh_health_srv_cb`

#include <health_srv.h> Callback function for the Health Server model.

Public Members

int (*`fault_get_cur`)(const struct *bt_mesh_model* *model, uint8_t *test_id, uint16_t *company_id, uint8_t *faults, uint8_t *fault_count)

Callback for fetching current faults.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

All faults shall be associated with at least one Company ID, representing the device vendor or some other vendor whose vendor specific fault values are used.

If there are multiple Company IDs that have active faults, return only the faults associated with one of them at the time. To report faults for multiple Company IDs, interleave which Company ID is reported for each call.

Param model
Health Server model instance to get faults of.

Param test_id
Test ID response buffer.

Param company_id
Company ID response buffer.

Param faults
Array to fill with current faults.

Param fault_count
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

Return
0 on success, or (negative) error code otherwise.

int (*`fault_get_reg`)(const struct *bt_mesh_model* *model, uint16_t company_id, uint8_t *test_id, uint8_t *faults, uint8_t *fault_count)

Callback for fetching all registered faults.

Registered faults are all past and current faults since the last call to `fault_clear`. Only faults associated with the given Company ID should be reported.

Fault values may either be defined by the specification, or by a vendor. Vendor specific faults should be interpreted in the context of the accompanying Company ID. Specification defined faults may be reported for any Company ID, and the same fault may be presented for multiple Company IDs.

Param model
Health Server model instance to get faults of.

Param company_id
Company ID to get faults for.

Param test_id
Test ID response buffer.

Param faults
Array to fill with registered faults.

Param fault_count
The number of faults the fault array can fit. Should be updated to reflect the number of faults copied into the array.

Return
0 on success, or (negative) error code otherwise.

int (*`fault_clear`)(const struct *bt_mesh_model* *model, uint16_t company_id)

Clear all registered faults associated with the given Company ID.

Param model
Health Server model instance to clear faults of.

Param company_id
Company ID to clear faults for.

Return
0 on success, or (negative) error code otherwise.

int (*`fault_test`)(const struct *bt_mesh_model* *model, uint8_t test_id, uint16_t company_id)

Run a self-test.

The Health server may support up to 256 self-tests for each Company ID. The behavior for all test IDs are vendor specific, and should be interpreted based on the accompanying Company ID. Test failures should result in changes to the fault array.

Param model
Health Server model instance to run test for.

Param test_id
Test ID to run.

Param company_id
Company ID to run test for.

Return
0 if the test execution was started successfully, or (negative) error code otherwise. Note that the fault array will not be reported back to the client if the test execution didn't start.

void (*`attn_on`)(const struct *bt_mesh_model* *model)

Start calling attention to the device.

The attention state is used to map an element address to a physical device. When this callback is called, the device should start some physical procedure meant to

call attention to itself, like blinking, buzzing, vibrating or moving. If there are multiple Health server instances on the device, the attention state should also help identify the specific element the server is in.

The attention calling behavior should continue until the `attn_off` callback is called.

Param model
Health Server model to start the attention state of.

void (***attn_off**)(const struct *bt_mesh_model* *model)

Stop the attention state.

Any physical activity started to call attention to the device should be stopped.

Param model

struct **bt_mesh_health_srv**

#include <*health_srv.h*> Mesh Health Server Model Context.

Public Members

const struct *bt_mesh_model* ***model**

Composition data model entry pointer.

const struct *bt_mesh_health_srv_cb* ***cb**

Optional callback struct.

struct *k_work_delayable* **attn_timer**

Attention Timer state.

Health faults

Fault values defined by the Bluetooth Mesh specification.

group **bt_mesh_health_faults**

BT_MESH_HEALTH_FAULT_VENDOR_SPECIFIC_START

Start of the vendor specific fault values.

All values below this are reserved for the Bluetooth Specification.

Large Composition Data Client The Large Composition Data Client model is a foundation model defined by the Bluetooth Mesh specification. The model is optional, and is enabled through the CONFIG_BT_MESH_LARGE_COMP_DATA_CLI option.

The Large Composition Data Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the functionality of reading pages of Composition Data that do not fit in a Config Composition Data Status message and reading the metadata of the model instances on a node that supports the *Large Composition Data Server* model.

The Large Composition Data Client model communicates with a Large Composition Data Server model using the device key of the node containing the target Large Composition Data Server model instance.

If present, the Large Composition Data Client model must only be instantiated on the primary element.

API reference

group bt_mesh_large_comp_data_cli

Defines

BT_MESH_MODEL_LARGE_COMP_DATA_CLI(cli_data)

Large Composition Data Client model Composition Data entry.

Parameters

- **cli_data** – Pointer to a *Large Composition Data Client model* instance.

Functions

int **bt_mesh_large_comp_data_get**(uint16_t net_idx, uint16_t addr, uint8_t page, size_t offset, struct *bt_mesh_large_comp_data_rsp* *rsp)

Send Large Composition Data Get message.

This API is used to read a portion of a Composition Data Page.

This API can be used asynchronously by setting rsp as NULL. This way, the method will not wait for a response and will return immediately after sending the command.

When rsp is set, the user is responsible for providing a buffer for the Composition Data in *bt_mesh_large_comp_data_rsp::data*. If a buffer is not provided, the metadata won't be copied.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node element address.
- **page** – Composition Data Page to read.
- **offset** – Offset within the Composition Data Page.

- **rsp** – Pointer to a struct storing the received response from the server, or NULL to not wait for a response.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_models_metadata_get**(uint16_t net_idx, uint16_t addr, uint8_t page, size_t offset, struct *bt_mesh_large_comp_data_rsp* *rsp)

Send Models Metadata Get message.

This API is used to read a portion of a Models Metadata Page.

This API can be used asynchronously by setting `rsp` as NULL. This way, the method will not wait for a response and will return immediately after sending the command.

When `rsp` is set, a user is responsible for providing a buffer for metadata in *bt_mesh_large_comp_data_rsp::data*. If a buffer is not provided, the metadata won't be copied.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node element address.
- **page** – Models Metadata Page to read.
- **offset** – Offset within the Models Metadata Page.
- **rsp** – Pointer to a struct storing the received response from the server, or NULL to not wait for a response.

Returns
0 on success, or (negative) error code on failure.

struct **bt_mesh_large_comp_data_rsp**

#include <*large_comp_data_cli.h*> Large Composition Data response.

Public Members

uint8_t **page**

Page number.

uint16_t **offset**

Offset within the page.

uint16_t **total_size**

Total size of the page.

struct *net_buf_simple* ***data**

Pointer to allocated buffer for storing received data.

struct **bt_mesh_large_comp_data_cli_cb**

#include <*large_comp_data_cli.h*> Large Composition Data Status messages callbacks.

Public Members

void (*`large_comp_data_status`)(struct *bt_mesh_large_comp_data_cli* *cli, uint16_t addr, struct *bt_mesh_large_comp_data_rsp* *rsp)

Optional callback for Large Composition Data Status message.

Handles received Large Composition Data Status messages from a Large Composition Data Server.

If the content of `rsp` is needed after exiting this callback, a user should deep copy it.

Param cli
Large Composition Data Client context.

Param addr
Address of the sender.

Param rsp
Response received from the server.

void (*`models_metadata_status`)(struct *bt_mesh_large_comp_data_cli* *cli, uint16_t addr, struct *bt_mesh_large_comp_data_rsp* *rsp)

Optional callback for Models Metadata Status message.

Handles received Models Metadata Status messages from a Large Composition Data Server.

If the content of `rsp` is needed after exiting this callback, a user should deep copy it.

Param cli
Large Composition Data Client context.

Param addr
Address of the sender.

Param rsp
Response received from the server.

struct `bt_mesh_large_comp_data_cli`

Public Members

const struct *bt_mesh_model* *`model`

Model entry pointer.

struct *bt_mesh_msg_ack_ctx* `ack_ctx`

Internal parameters for tracking message responses.

const struct *bt_mesh_large_comp_data_cli_cb* *`cb`

Optional callback for Large Composition Data Status messages.

Large Composition Data Server The Large Composition Data Server model is a foundation model defined by the Bluetooth Mesh specification. The model is optional, and is enabled through the `CONFIG_BT_MESH_LARGE_COMP_DATA_SRV` option.

The Large Composition Data Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of exposing pages of Composition

Data that do not fit in a Config Composition Data Status message and to expose metadata of the model instances.

The Large Composition Data Server does not have an API of its own and relies on a *Large Composition Data Client* to control it. The model only accepts messages encrypted with the node's device key.

If present, the Large Composition Data Server model must only be instantiated on the primary element.

Models metadata The Large Composition Data Server model allows each model to have a list of model's specific metadata that can be read by the Large Composition Data Client model. The metadata list can be associated with the *bt_mesh_model* through the `bt_mesh_model.metadata` field. The metadata list consists of one or more entries defined by the *bt_mesh_models_metadata_entry* structure. Each entry contains the length and ID of the metadata, and a pointer to the raw data. Entries can be created using the *BT_MESH_MODELS_METADATA_ENTRY* macro. The *BT_MESH_MODELS_METADATA_END* macro marks the end of the metadata list and must always be present. If the model has no metadata, the helper macro *BT_MESH_MODELS_METADATA_NONE* can be used instead.

Large Composition Data Server model composition data entry.

On-Demand Private Proxy Client The On-Demand Private Proxy Client model is a foundation model defined by the Bluetooth Mesh specification. The model is optional, and is enabled with the `CONFIG_BT_MESH_OD_PRIV_PROXY_CLI` option.

The On-Demand Private Proxy Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to set and retrieve the On-Demand Private GATT Proxy state. The state defines how long a node will advertise Mesh Proxy Service with Private Network Identity type after it receives a Solicitation PDU.

The On-Demand Private Proxy Client model communicates with an On-Demand Private Proxy Server model using the device key of the node containing the target On-Demand Private Proxy Server model instance.

If present, the On-Demand Private Proxy Client model must only be instantiated on the primary element.

Configurations The On-Demand Private Proxy Client model behavior can be configured with the transmission timeout option `CONFIG_BT_MESH_OD_PRIV_PROXY_CLI_TIMEOUT`. The `CONFIG_BT_MESH_OD_PRIV_PROXY_CLI_TIMEOUT` controls how long the Client waits for a state response message to arrive in milliseconds. This value can be changed at runtime using *bt_mesh_od_priv_proxy_cli_timeout_set()*.

Defines

BT_MESH_MODEL_OD_PRIV_PROXY_CLI(cli_data)

On-Demand Private Proxy Client model composition data entry.

Functions

int **bt_mesh_od_priv_proxy_cli_get**(uint16_t net_idx, uint16_t addr, uint8_t *val_rsp)

Get the target's On-Demand Private GATT Proxy state.

This method can be used asynchronously by setting `val_rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `od_status` callback in *bt_mesh_od_priv_proxy_cli* struct.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val_rsp** – Response buffer for On-Demand Private GATT Proxy value.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_od_priv_proxy_cli_set**(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *val_rsp)

Set the target's On-Demand Private GATT Proxy state.

This method can be used asynchronously by setting `val_rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `od_status` callback in *bt_mesh_od_priv_proxy_cli* struct.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **val** – On-Demand Private GATT Proxy state to be set
- **val_rsp** – Response buffer for On-Demand Private GATT Proxy value.

Returns

0 on success, or (negative) error code otherwise.

void **bt_mesh_od_priv_proxy_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

Parameters

- **timeout** – The new transmission timeout in milliseconds.

struct **bt_mesh_od_priv_proxy_cli**

#include <od_priv_proxy_cli.h> On-Demand Private Proxy Client Model Context.

Public Members

const struct *bt_mesh_model* *model

Solicitation PDU RPL model entry pointer.

void (*od_status)(struct *bt_mesh_od_priv_proxy_cli* *cli, uint16_t addr, uint8_t state)

Optional callback for On-Demand Private Proxy Status messages.

Handles received On-Demand Private Proxy Status messages from a On-Demand Private Proxy server.The `state` param represents state of On-Demand Private Proxy server.

Param cli
On-Demand Private Proxy client that received the status message.

Param addr
Address of the sender.

Param state
State value.

On-Demand Private Proxy Server The On-Demand Private Proxy Server model is a foundation model defined by the Bluetooth Mesh specification. It is enabled with the `CONFIG_BT_MESH_OD_PRIV_PROXY_SRV` option.

The On-Demand Private Proxy Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the configuration of advertising with Private Network Identity type of a node that is a recipient of Solicitation PDUs by managing its On-Demand Private GATT Proxy state.

When enabled, the *Solicitation PDU RPL Configuration Server* is also enabled. The On-Demand Private Proxy Server is dependent on the *Private Beacon Server* to be present on the node.

The On-Demand Private Proxy Server does not have an API of its own, and relies on a *On-Demand Private Proxy Client* to control it. The On-Demand Private Proxy Server model only accepts messages encrypted with the node's device key.

If present, the On-Demand Private Proxy Server model must only be instantiated on the primary element.

API reference

group `bt_mesh_od_priv_proxy_srv`

Defines

`BT_MESH_MODEL_OD_PRIV_PROXY_SRV`

On-Demand Private Proxy Server model composition data entry.

Opcodes Aggregator Client The Opcodes Aggregator Client model is a foundation model defined by the Bluetooth Mesh specification. It is an optional model, enabled with the `CONFIG_BT_MESH_OP_AGG_CLI` option.

The Opcodes Aggregator Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of dispatching a sequence of access layer messages to nodes supporting the *Opcodes Aggregator Server* model.

The Opcodes Aggregator Client model communicates with an Opcodes Aggregator Server model using the device key of the target node or the application keys configured by the Configuration Client.

If present, the Opcodes Aggregator Client model must only be instantiated on the primary element.

The Opcodes Aggregator Client model is implicitly bound to the device key on initialization. It should be bound to the same application keys as the client models that are used to produce the sequence of messages.

To be able to aggregate a message from a client model, it should support an asynchronous API, for example through callbacks.

API reference

group `bt_mesh_op_agg_cli`

Defines

`BT_MESH_MODEL_OP_AGG_CLI`

Opcodes Aggregator Client model composition data entry.

Functions

int **`bt_mesh_op_agg_cli_seq_start`**(uint16_t net_idx, uint16_t app_idx, uint16_t dst, uint16_t elem_addr)

Configure Opcodes Aggregator context.

Parameters

- `net_idx` – NetKey index to encrypt with.
- `app_idx` – AppKey index to encrypt with.
- `dst` – Target Opcodes Aggregator Server address.
- `elem_addr` – Target node element address for the sequence message.

Returns
0 on success, or (negative) error code on failure.

int **`bt_mesh_op_agg_cli_seq_send`**(void)

Opcodes Aggregator message send.

Uses previously configured context and sends aggregated message to target node.

Returns
0 on success, or (negative) error code on failure.

void **`bt_mesh_op_agg_cli_seq_abort`**(void)

Abort Opcodes Aggregator context.

bool **`bt_mesh_op_agg_cli_seq_is_started`**(void)

Check if Opcodes Aggregator Sequence context is started.

Returns
true if it is started, otherwise false.

size_t **bt_mesh_op_agg_cli_seq_tailroom**(void)

Get Opcodes Aggregator context tailroom.

Returns

Remaining tailroom of Opcodes Aggregator SDU.

int32_t **bt_mesh_op_agg_cli_timeout_get**(void)

Get the current transmission timeout value.

Returns

The configured transmission timeout in milliseconds.

void **bt_mesh_op_agg_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

Parameters

- **timeout** – The new transmission timeout.

Opcodes Aggregator Server The Opcodes Aggregator Server model is a foundation model defined by the Bluetooth mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_OP_AGG_SRV option.

The Opcodes Aggregator Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of processing a sequence of access layer messages.

The Opcodes Aggregator Server model accepts messages encrypted with the node's device key or the application keys.

If present, the Opcodes Aggregator Server model must only be instantiated on the primary element.

The targeted server models should be bound to the same application key that is used to encrypt the sequence of access layer messages sent to the Opcodes Aggregator Server.

The Opcodes Aggregator Server handles aggregated messages and dispatches them to the respective models and their message handlers. Current implementation assumes that responses are sent from the same execution context as the received message and doesn't allow to send a postponed response, for example from a work queue.

Private Beacon Client The Private Beacon Client model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_PRIV_BEACON_CLI` option.

The Private Beacon Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and provides functionality for configuring the *Private Beacon Server* models.

The Private Beacons feature adds privacy to the different Bluetooth Mesh beacons by periodically randomizing the beacon input data. This protects the mesh node from being tracked by devices outside the mesh network, and hides the network's IV index, IV update and the Key Refresh state.

The Private Beacon Client model communicates with a *Private Beacon Server* model using the device key of the target node. The Private Beacon Client model may communicate with servers on other nodes or self-configure through the local Private Beacon Server model.

All configuration functions in the Private Beacon Client API have `net_idx` and `addr` as their first parameters. These should be set to the network index and the primary unicast address the target node was provisioned with.

If present, the Private Beacon Client model must only be instantiated on the primary element.

API reference

group `bt_mesh_priv_beacon_cli`

Defines

`BT_MESH_MODEL_PRIV_BEACON_CLI`(cli_data)

Private Beacon Client model composition data entry.

Parameters

- `cli_data` – Pointer to a *Bluetooth Mesh Private Beacon Client* instance.

Functions

int `bt_mesh_priv_beacon_cli_set`(uint16_t net_idx, uint16_t addr, struct *bt_mesh_priv_beacon* *val, struct *bt_mesh_priv_beacon* *rsp)

Set the target's Private Beacon state.

This method can be used asynchronously by setting `rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Private Beacon value.
- `rsp` – If set, returns response status on success.

Returns

0 on success, or (negative) error code otherwise.

int `bt_mesh_priv_beacon_cli_get`(uint16_t net_idx, uint16_t addr, struct *bt_mesh_priv_beacon* *val)

Get the target's Private Beacon state.

Parameters

- `net_idx` – Network index to encrypt with.

- `addr` – Target node address.
- `val` – Response buffer for Private Beacon value.

Returns
0 on success, or (negative) error code otherwise.

int `bt_mesh_priv_beacon_cli_gatt_proxy_set`(uint16_t net_idx, uint16_t addr, uint8_t val, uint8_t *rsp)

Set the target's Private GATT Proxy state.

This method can be used asynchronously by setting `rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Private GATT Proxy value.
- `rsp` – If set, returns response status on success.

Returns
0 on success, or (negative) error code otherwise.

int `bt_mesh_priv_beacon_cli_gatt_proxy_get`(uint16_t net_idx, uint16_t addr, uint8_t *val)

Get the target's Private GATT Proxy state.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – Response buffer for Private GATT Proxy value.

Returns
0 on success, or (negative) error code otherwise.

int `bt_mesh_priv_beacon_cli_node_id_set`(uint16_t net_idx, uint16_t addr, struct *bt_mesh_priv_node_id* *val, struct *bt_mesh_priv_node_id* *rsp)

Set the target's Private Node Identity state.

This method can be used asynchronously by setting `rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `val` – New Private Node Identity value.
- `rsp` – If set, returns response status on success.

Returns
0 on success, or (negative) error code otherwise.

int `bt_mesh_priv_beacon_cli_node_id_get`(uint16_t net_idx, uint16_t addr, uint16_t key_net_idx, struct *bt_mesh_priv_node_id* *val)

Get the target's Private Node Identity state.

Parameters

- `net_idx` – Network index to encrypt with.
- `addr` – Target node address.
- `key_net_idx` – Network index to get the Private Node Identity state of.
- `val` – Response buffer for Private Node Identity value.

Returns
0 on success, or (negative) error code otherwise.

struct `bt_mesh_priv_beacon`

Public Members

void (*`priv_beacon_status`)(struct *bt_mesh_priv_beacon_cli* *cli, uint16_t addr, struct *bt_mesh_priv_beacon* *priv_beacon)

Optional callback for Private Beacon Status message.

Handles received Private Beacon Status messages from a Private Beacon server.

Param cli
Private Beacon client context.

Param addr
Address of the sender.

Param priv_beacon
Mesh Private Beacon state received from the server.

void (*`priv_gatt_proxy_status`)(struct *bt_mesh_priv_beacon_cli* *cli, uint16_t addr, uint8_t gatt_proxy)

Optional callback for Private GATT Proxy Status message.

Handles received Private GATT Proxy Status messages from a Private Beacon server.

Param cli
Private Beacon client context.
Param addr
Address of the sender.
Param gatt_proxy
Private GATT Proxy state received from the server.

void (*`priv_node_id_status`)(struct *bt_mesh_priv_beacon_cli* *cli, uint16_t addr, struct *bt_mesh_priv_node_id* *priv_node_id)

Optional callback for Private Node Identity Status message.

Handles received Private Node Identity Status messages from a Private Beacon server.

Param cli
Private Beacon client context.
Param addr
Address of the sender.
Param priv_node_id
Private Node Identity state received from the server.

struct `bt_mesh_priv_beacon_cli`

#include <priv_beacon_cli.h> Mesh Private Beacon Client model.

Public Members

const struct *bt_mesh_priv_beacon_cli_cb* *`cb`

Optional callback for Private Beacon Client Status messages.

Private Beacon Server The Private Beacon Server model is a foundation model defined by the Bluetooth mesh specification. It is enabled with `CONFIG_BT_MESH_PRIV_BEACON_SRV` option.

The Private Beacon Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and controls the mesh node's Private Beacon state, Private GATT Proxy state and Private Node Identity state.

The Private Beacons feature adds privacy to the different Bluetooth Mesh beacons by periodically randomizing the beacon input data. This protects the mesh node from being tracked by devices outside the mesh network, and hides the network's IV index, IV update and the Key Refresh state. The Private Beacon Server must be instantiated for the device to support sending of the private beacons, but the node will process received private beacons without it.

The Private Beacon Server does not have an API of its own, but relies on a *Private Beacon Client* to control it. The Private Beacon Server model only accepts messages encrypted with the node's device key.

The application can configure the initial parameters of the Private Beacon Server model through the `bt_mesh_priv_beacon_srv` instance passed to *`BT_MESH_MODEL_PRIV_BEACON_SRV`*. Note that if

the mesh node stored changes to this configuration in the settings subsystem, the initial values may be overwritten upon loading.

If present, the Private Beacon Server model must only be instantiated on the primary element.

API reference

group `bt_mesh_priv_beacon_srv`

Defines

`BT_MESH_MODEL_PRIV_BEACON_SRV`

Private Beacon Server model composition data entry.

Remote Provisioning Client The Remote Provisioning Client model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_RPR_CLI` option.

The Remote Provisioning Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1. This model provides functionality to remotely provision devices into a mesh network, and perform Node Provisioning Protocol Interface procedures by interacting with mesh nodes that support the *Remote Provisioning Server* model.

The Remote Provisioning Client model communicates with a Remote Provisioning Server model using the device key of the node containing the target Remote Provisioning Server model instance.

If present, the Remote Provisioning Client model must be instantiated on the primary element.

Scanning The scanning procedure is used to scan for unprovisioned devices located nearby the Remote Provisioning Server. The Remote Provisioning Client starts a scan procedure by using the *`bt_mesh_rpr_scan_start()`* call:

```
static void rpr_scan_report(struct bt_mesh_rpr_cli *cli,
            const struct bt_mesh_rpr_node *srv,
            struct bt_mesh_rpr_unprov *unprov,
            struct net_buf_simple *adv_data)
{

}

struct bt_mesh_rpr_cli rpr_cli = {
   .scan_report = rpr_scan_report,
};

const struct bt_mesh_rpr_node srv = {
   .addr = 0x0004,
   .net_idx = 0,
   .ttl = BT_MESH_TTL_DEFAULT,
};

struct bt_mesh_rpr_scan_status status;
uint8_t *uuid = NULL;
uint8_t timeout = 10;
uint8_t max_devs = 3;

bt_mesh_rpr_scan_start(&rpr_cli, &srv, uuid, timeout, max_devs, &status);
```

The above example shows pseudo code for starting a scan procedure on the target Remote Provisioning Server node. This procedure will start a ten-second, multiple-device scanning where the generated scan report will contain a maximum of three unprovisioned devices. If the UUID argument was specified, the same procedure would only scan for the device with the corresponding UUID. After the procedure completes, the server sends the scan report that will be handled in the client's *bt_mesh_rpr_cli.scan_report* callback.

Additionally, the Remote Provisioning Client model also supports extended scanning with the *bt_mesh_rpr_scan_start_ext()* call. Extended scanning supplements regular scanning by allowing the Remote Provisioning Server to report additional data for a specific device. The Remote Provisioning Server will use active scanning to request a scan response from the unprovisioned device if it is supported by the unprovisioned device.

Provisioning The Remote Provisioning Client starts a provisioning procedure by using the *bt_mesh_provision_remote()* call:

```
struct bt_mesh_rpr_cli rpr_cli;

const struct bt_mesh_rpr_node srv = {
   .addr = 0x0004,
   .net_idx = 0,
   .ttl = BT_MESH_TTL_DEFAULT,
};

uint8_t uuid[16] = { 0xaa };
uint16_t addr = 0x0006;
uint16_t net_idx = 0;

bt_mesh_provision_remote(&rpr_cli, &srv, uuid, net_idx, addr);
```

The above example shows pseudo code for remotely provisioning a device through a Remote Provisioning Server node. This procedure will attempt to provision the device with the corresponding UUID, and assign the address 0x0006 to its primary element using the network key located at index zero.

Note

During the remote provisioning, the same *bt_mesh_prov* callbacks are triggered as for ordinary provisioning. See section *Provisioning* for further details.

Re-provisioning In addition to scanning and provisioning functionality, the Remote Provisioning Client also provides means to reconfigure node addresses, device keys and Composition Data on devices that support the *Remote Provisioning Server* model. This is provided through the Node Provisioning Protocol Interface (NPPI) which supports the following three procedures:

- Device Key Refresh procedure: Used to change the device key of the Target node without a need to reconfigure the node.
- Node Address Refresh procedure: Used to change the node's device key and unicast address.
- Node Composition Refresh procedure: Used to change the device key of the node, and to add or delete models or features of the node.

The three NPPI procedures can be initiated with the *bt_mesh_reprovision_remote()* call:

```
struct bt_mesh_rpr_cli rpr_cli;
struct bt_mesh_rpr_node srv = {
   .addr = 0x0006,
   .net_idx = 0,
```

(continues on next page)

(continued from previous page)

```
   .ttl = BT_MESH_TTL_DEFAULT,
};

bool composition_changed = false;
uint16_t new_addr = 0x0009;

bt_mesh_reprovision_remote(&rpr_cli, &srv, new_addr, composition_changed);
```

The above example shows pseudo code for triggering a Node Address Refresh procedure on the Target node. The specific procedure is not chosen directly, but rather through the other parameters that are inputted. In the example we can see that the current unicast address of the Target is 0x0006, while the new address is set to 0x0009. If the two addresses were the same, and the `composition_changed` flag was set to true, this code would instead trigger a Node Composition Refresh procedure. If the two addresses were the same, and the `composition_changed` flag was set to false, this code would trigger a Device Key Refresh procedure.

API reference

group **bt_mesh_rpr_cli**

Defines

`BT_MESH_RPR_SCAN_MAX_DEVS_ANY`

Special value for the `max_devs` parameter of *bt_mesh_rpr_scan_start*.

Tells the Remote Provisioning Server not to put restrictions on the max number of devices reported to the Client.

`BT_MESH_MODEL_RPR_CLI(_cli)`

Remote Provisioning Client model composition data entry.

Parameters

- **_cli** – Pointer to a *Remote Provisioning Client model* instance.

Functions

int **bt_mesh_rpr_scan_caps_get**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, struct *bt_mesh_rpr_caps* *caps)

Get scanning capabilities of Remote Provisioning Server.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **caps** – Capabilities response buffer.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_rpr_scan_get**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, struct *bt_mesh_rpr_scan_status* *status)

Get current scanning state of Remote Provisioning Server.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **status** – Scan status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_rpr_scan_start**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint8_t timeout, uint8_t max_devs, struct *bt_mesh_rpr_scan_status* *status)

Start scanning for unprovisioned devices.

Tells the Remote Provisioning Server to start scanning for unprovisioned devices. The Server will report back the results through the *bt_mesh_rpr_cli::scan_report* callback.

Use the `uuid` parameter to scan for a specific device, or leave it as NULL to report all unprovisioned devices.

The Server will ignore duplicates, and report up to `max_devs` number of devices. Requesting a `max_devs` number that's higher than the Server's capability will result in an error.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **uuid** – Device UUID to scan for, or NULL to report all devices.
- **timeout** – Scan timeout in seconds. Must be at least 1 second.
- **max_devs** – Max number of devices to report, or 0 to report as many as possible.
- **status** – Scan status response buffer.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_rpr_scan_start_ext**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, const uint8_t uuid[16], uint8_t timeout, const uint8_t *ad_types, size_t ad_count)

Start extended scanning for unprovisioned devices.

Extended scanning supplements regular unprovisioned scanning, by allowing the Server to report additional data for a specific device. The Remote Provisioning Server will use active scanning to request a scan response from the unprovisioned device, if supported. If no UUID is provided, the Server will report a scan on its own OOB information and advertising data.

Use the ad_types array to specify which AD types to include in the scan report. Some AD types invoke special behavior:

- *BT_DATA_NAME_COMPLETE* Will report both the complete and the shortened name.
- *BT_DATA_URI* If the unprovisioned beacon contains a URI hash, the Server will extend the scanning to include packets other than the scan response, to look for URIs matching the URI hash. Only matching URIs will be reported.

The following AD types should not be used:

- *BT_DATA_NAME_SHORTENED*
- *BT_DATA_UUID16_SOME*

- *BT_DATA_UUID32_SOME*
- *BT_DATA_UUID128_SOME*

Additionally, each AD type should only occur once.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **uuid** – Device UUID to start extended scanning for, or NULL to scan the remote server.
- **timeout** – Scan timeout in seconds. Valid values from BT_MESH_RPR_EXT_SCAN_TIME_MIN to BT_MESH_RPR_EXT_SCAN_TIME_MAX. Ignored if UUID is NULL.
- **ad_types** – List of AD types to include in the scan report. Must contain 1 to CONFIG_BT_MESH_RPR_AD_TYPES_MAX entries.
- **ad_count** – Number of AD types in `ad_types`.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_rpr_scan_stop**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, struct *bt_mesh_rpr_scan_status* *status)

Stop any ongoing scanning on the Remote Provisioning Server.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **status** – Scan status response buffer.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_rpr_link_get**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_link *rsp)

Get the current link status of the Remote Provisioning Server.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **rsp** – Link status response buffer.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_rpr_link_close**(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_link *rsp)

Close any open link on the Remote Provisioning Server.

Parameters

- **cli** – Remote Provisioning Client.
- **srv** – Remote Provisioning Server.
- **rsp** – Link status response buffer.

Returns

0 on success, or (negative) error code otherwise.

int32_t **bt_mesh_rpr_cli_timeout_get**(void)

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void **bt_mesh_rpr_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

The transmission timeout controls the amount of time the Remote Provisioning Client models will wait for a response from the Server.

Parameters

- **timeout** – The new transmission timeout.

struct **bt_mesh_rpr_scan_status**

#include <*rpr_cli.h*> Scan status response.

Public Members

enum bt_mesh_rpr_status **status**

Current scan status.

enum bt_mesh_rpr_scan **scan**

Current scan state.

uint8_t **max_devs**

Max number of devices to report in current scan.

uint8_t **timeout**

Seconds remaining of the scan.

struct **bt_mesh_rpr_caps**

#include <*rpr_cli.h*> Remote Provisioning Server scanning capabilities.

Public Members

uint8_t **max_devs**

Max number of scannable devices.

bool **active_scan**

Supports active scan.

struct **bt_mesh_rpr_cli**

#include <*rpr_cli.h*> Remote Provisioning Client model instance.

Public Members

void (*scan_report)(struct *bt_mesh_rpr_cli* *cli, const struct bt_mesh_rpr_node *srv, struct bt_mesh_rpr_unprov *unprov, struct *net_buf_simple* *adv_data)

Scan report callback.

Param cli
Remote Provisioning Client.

Param srv
Remote Provisioning Server.

Param unprov
Unprovisioned device.

Param adv_data
Advertisement data for the unprovisioned device, or NULL if extended scanning hasn't been enabled. An empty buffer indicates that the extended scanning finished without collecting additional information.

Remote Provisioning Server The Remote Provisioning Server model is a foundation model defined by the Bluetooth mesh specification. It is enabled with the `CONFIG_BT_MESH_RPR_SRV` option.

The Remote Provisioning Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and is used to support the functionality of remotely provisioning devices into a mesh network.

The Remote Provisioning Server does not have an API of its own, but relies on a *Remote Provisioning Client* to control it. The Remote Provisioning Server model only accepts messages encrypted with the node's device key.

If present, the Remote Provisioning Server model must be instantiated on the primary element.

Note that after refreshing the device key, node address or Composition Data through a Node Provisioning Protocol Interface (NPPI) procedure, the *`bt_mesh_prov.reprovisioned`* callback is triggered. See section *Remote Provisioning Client* for further details.

Limitations The following limitations apply to Remote Provisioning Server model:

- Provisioning of unprovisioned device using PB-GATT is not supported.
- All Node Provisioning Protocol Interface (NPPI) procedures are supported. However, if the composition data of a device gets changed after device firmware update (see *firmware effect*), it is not possible for the device to remain provisioned. The device should be unprovisioned if its composition data is expected to change.

SAR Configuration Client The SAR Configuration Client model is a foundation model defined by the Bluetooth Mesh specification. It is an optional model, enabled with the `CONFIG_BT_MESH_SAR_CFG_CLI` configuration option.

The SAR Configuration Client model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and it supports the configuration of the lower transport layer behavior of a node that supports the *SAR Configuration Server* model.

The model can send messages to query or change the states supported by the SAR Configuration Server (SAR Transmitter and SAR Receiver) using SAR Configuration messages.

The SAR Transmitter procedure is used to determine and configure the SAR Transmitter state of a SAR Configuration Server. Function calls *bt_mesh_sar_cfg_cli_transmitter_get()* and *bt_mesh_sar_cfg_cli_transmitter_set()* are used to get and set the SAR Transmitter state of the Target node respectively.

The SAR Receiver procedure is used to determine and configure the SAR Receiver state of a SAR Configuration Server. Function calls *bt_mesh_sar_cfg_cli_receiver_get()* and *bt_mesh_sar_cfg_cli_receiver_set()* are used to get and set the SAR Receiver state of the Target node respectively.

For more information about the two states, see *SAR states*.

An element can send any SAR Configuration Client message at any time to query or change the states supported by the SAR Configuration Server model of a peer node. The SAR Configuration Client model only accepts messages encrypted with the device key of the node supporting the SAR Configuration Server model.

If present, the SAR Configuration Client model must only be instantiated on the primary element.

API reference

group `bt_mesh_sar_cfg_cli`

Bluetooth Mesh.

Defines

`BT_MESH_MODEL_SAR_CFG_CLI`(_cli)

SAR Configuration Client model composition data entry.

Parameters

- **`_cli`** – **[in]** Pointer to a *Bluetooth Mesh SAR Configuration Client Model* instance.

Functions

int **`bt_mesh_sar_cfg_cli_transmitter_get`**(uint16_t net_idx, uint16_t addr, struct bt_mesh_sar_tx *rsp)

Get the SAR Transmitter state of the target node.

Parameters

- **`net_idx`** – Network index to encrypt with.
- **`addr`** – Target node address.
- **`rsp`** – Status response parameter.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_sar_cfg_cli_transmitter_set**(uint16_t net_idx, uint16_t addr, const struct bt_mesh_sar_tx *set, struct bt_mesh_sar_tx *rsp)

Set the SAR Transmitter state of the target node.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **set** – New SAR Transmitter state to set on the target node.
- **rsp** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_sar_cfg_cli_receiver_get**(uint16_t net_idx, uint16_t addr, struct bt_mesh_sar_rx *rsp)

Get the SAR Receiver state of the target node.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **rsp** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int **bt_mesh_sar_cfg_cli_receiver_set**(uint16_t net_idx, uint16_t addr, const struct bt_mesh_sar_rx *set, struct bt_mesh_sar_rx *rsp)

Set the SAR Receiver state of the target node.

Parameters

- **net_idx** – Network index to encrypt with.
- **addr** – Target node address.
- **set** – New SAR Receiver state to set on the target node.
- **rsp** – Status response parameter.

Returns
0 on success, or (negative) error code on failure.

int32_t **bt_mesh_sar_cfg_cli_timeout_get**(void)

Get the current transmission timeout value.

Returns
The configured transmission timeout in milliseconds.

void **bt_mesh_sar_cfg_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

Parameters

- **timeout** – The new transmission timeout.

struct **bt_mesh_sar_cfg_cli**

#include <sar_cfg_cli.h> Mesh SAR Configuration Client Model Context.

Public Members

const struct *bt_mesh_model* ***model**

Access model pointer.

SAR Configuration Server The SAR Configuration Server model is a foundation model defined by the Bluetooth Mesh specification. It is an optional model, enabled with the CONFIG_BT_MESH_SAR_CFG_SRV configuration option.

The SAR Configuration Server model is introduced in the Bluetooth Mesh Protocol Specification version 1.1, and it supports the configuration of the *segmentation and reassembly (SAR)* behavior of a Bluetooth Mesh node. The model defines a set of states and messages for the SAR configuration.

The SAR Configuration Server model defines two states, SAR Transmitter state and SAR Receiver state. For more information about the two states, see *SAR states*.

The model also supports the SAR Transmitter and SAR Receiver get and set messages.

The SAR Configuration Server model does not have an API of its own, but relies on a *SAR Configuration Client* to control it. The SAR Configuration Server model only accepts messages encrypted with the node's device key.

If present, the SAR Configuration Server model must only be instantiated on the primary element.

Bluetooth Mesh.

Defines

BT_MESH_MODEL_SAR_CFG_SRV

Transport SAR Configuration Server model composition data entry.

Solicitation PDU RPL Configuration Client The Solicitation PDU RPL Configuration Client model is a foundation model defined by the Bluetooth mesh specification. The model is optional, and is enabled through the CONFIG_BT_MESH_SOL_PDU_RPL_CLI option.

The Solicitation PDU RPL Configuration Client model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and supports the functionality of removing addresses from the solicitation replay protection list (SRPL) of a node that supports the *Solicitation PDU RPL Configuration Server* model.

The Solicitation PDU RPL Configuration Client model communicates with a Solicitation PDU RPL Configuration Server model using the application keys configured by the Configuration Client.

If present, the Solicitation PDU RPL Configuration Client model must only be instantiated on the primary element.

Configurations The Solicitation PDU RPL Configuration Client model behavior can be configured with the transmission timeout option CONFIG_BT_MESH_SOL_PDU_RPL_CLI_TIMEOUT. The CONFIG_BT_MESH_SOL_PDU_RPL_CLI_TIMEOUT controls how long the Solicitation PDU RPL Configuration Client waits for a response message to arrive in milliseconds. This value can be changed at runtime using *bt_mesh_sol_pdu_rpl_cli_timeout_set()*.

API reference

group `bt_mesh_sol_pdu_rpl_cli`

Defines

`BT_MESH_MODEL_SOL_PDU_RPL_CLI`(cli_data)

Solicitation PDU RPL Client model composition data entry.

Functions

int **bt_mesh_sol_pdu_rpl_clear**(struct *bt_mesh_msg_ctx* *ctx, uint16_t range_start, uint8_t range_len, uint16_t *start_rsp, uint8_t *len_rsp)

Remove entries from Solicitation PDU RPL of addresses in given range.

This method can be used asynchronously by setting `start_rsp` or `len_rsp` as NULL. This way the method will not wait for response and will return immediately after sending the command.

To process the response arguments of an async method, register the `srpl_status` callback in *`bt_mesh_sol_pdu_rpl_cli`* struct.

Parameters

- **ctx** – Message context for the message.
- **range_start** – Start of Unicast address range.
- **range_len** – Length of Unicast address range. Valid values are 0x00 and 0x02 to 0xff.
- **start_rsp** – Range start response buffer.
- **len_rsp** – Range length response buffer.

Returns

0 on success, or (negative) error code otherwise.

int **bt_mesh_sol_pdu_rpl_clear_unack**(struct *bt_mesh_msg_ctx* *ctx, uint16_t range_start, uint8_t range_len)

Remove entries from Solicitation PDU RPL of addresses in given range (unacked).

Parameters

- **ctx** – Message context for the message.
- **range_start** – Start of Unicast address range.
- **range_len** – Length of Unicast address range. Valid values are 0x00 and 0x02 to 0xff.

Returns

0 on success, or (negative) error code otherwise.

void **bt_mesh_sol_pdu_rpl_cli_timeout_set**(int32_t timeout)

Set the transmission timeout value.

Parameters

- **timeout** – The new transmission timeout in milliseconds.

struct **bt_mesh_sol_pdu_rpl_cli**

#include <sol_pdu_rpl_cli.h> Solicitation PDU RPL Client Model Context.

Public Members

const struct *bt_mesh_model* *model

Solicitation PDU RPL model entry pointer.

void (*srpl_status)(struct *bt_mesh_sol_pdu_rpl_cli* *cli, uint16_t addr, uint16_t range_start, uint8_t range_length)

Optional callback for Solicitation PDU RPL Status messages.

Handles received Solicitation PDU RPL Status messages from a Solicitation PDU RPL server.The `start` param represents the start of range that server has cleared. The `length` param represents length of range cleared by server.

Param cli
Solicitation PDU RPL client that received the status message.

Param addr
Address of the sender.

Param range_start
Range start value.

Param range_length
Range length value.

Solicitation PDU RPL Configuration Server The Solicitation PDU RPL Configuration Server model is a foundation model defined by the Bluetooth mesh specification. The model is enabled if the node has the *On-Demand Private Proxy Server* enabled.

The Solicitation PDU RPL Configuration Server model was introduced in the Bluetooth Mesh Protocol Specification version 1.1, and manages the Solicitation Replay Protection List (SRPL) saved on the device. The SRPL is used to reject Solicitation PDUs that are already processed by a node. When a valid Solicitation PDU message is successfully processed by a node, the SSRC field and SSEQ field of the message are stored in the node's SRPL.

The Solicitation PDU RPL Configuration Server does not have an API of its own, and relies on a *Solicitation PDU RPL Configuration Client* to control it. The model only accepts messages encrypted with an application key as configured by the Configuration Client.

If present, the Solicitation PDU RPL Configuration Server model must only be instantiated on the primary element.

Configurations For the Solicitation PDU RPL Configuration Server model, the `CONFIG_BT_MESH_PROXY_SRPL_SIZE` option can be configured to set the size of the SRPL.

API reference

group `bt_mesh_sol_pdu_rpl_srv`

Defines

`BT_MESH_MODEL_SOL_PDU_RPL_SRV`

Model specification models In addition to the foundation models defined in the Bluetooth Mesh specification, the Bluetooth Mesh Model Specification defines several models, some of which are implemented in Zephyr:

BLOB Transfer models The Binary Large Object (BLOB) Transfer models implement the Bluetooth Mesh Binary Large Object Transfer Model specification version 1.0 and provide functionality for sending large binary objects from a single source to many Target nodes over the Bluetooth Mesh network. It is the underlying transport method for the *Device Firmware Update (DFU)*, but may be used for other object transfer purposes. The implementation is in experimental state.

The BLOB Transfer models support transfers of continuous binary objects of up to 4 GB (2^{32} bytes). The BLOB transfer protocol has built-in recovery procedures for packet losses, and sets up checkpoints to ensure that all targets have received all the data before moving on. Data transfer order is not guaranteed.

BLOB transfers are constrained by the transfer speed and reliability of the underlying mesh network. Under ideal conditions, the BLOBs can be transferred at a rate of up to 1 kbps, allowing a 100 kB BLOB to be transferred in 10-15 minutes. However, network conditions, transfer capabilities and other limiting factors can easily degrade the data rate by several orders of magnitude. Tuning the parameters of the transfer according to the application and network configuration, as well as scheduling it to periods with low network traffic, will offer significant improvements on the speed and reliability of the protocol. However, achieving transfer rates close to the ideal rate is unlikely in actual deployments.

There are two BLOB Transfer models:

BLOB Transfer Server The Binary Large Object (BLOB) Transfer Server model implements reliable receiving of large binary objects. It serves as the backend of the *Firmware Update Server*, but can also be used for receiving other binary images.

BLOBs As described in *BLOB Transfer models*, the binary objects transferred by the BLOB Transfer models are divided into blocks, which are divided into chunks. As the transfer is controlled by the BLOB Transfer Client model, the BLOB Transfer Server must allow blocks to come in any order. The chunks within a block may also come in any order, but all chunks in a block must be received before the next block is started.

The BLOB Transfer Server keeps track of the received blocks and chunks, and will process each block and chunk only once. The BLOB Transfer Server also ensures that any missing chunks are resent by the BLOB Transfer Client.

Usage The BLOB Transfer Server is instantiated on an element with a set of event handler callbacks:

```
static const struct bt_mesh_blob_srv_cb blob_cb = {
    /* Callbacks */
};

static struct bt_mesh_blob_srv blob_srv = {
    .cb = &blob_cb,
};

static const struct bt_mesh_model models[] = {
    BT_MESH_MODEL_BLOB_SRV(&blob_srv),
};
```

A BLOB Transfer Server is capable of receiving a single BLOB transfer at a time. Before the BLOB Transfer Server can receive a transfer, it must be prepared by the user. The transfer ID must be passed to the BLOB Transfer Server through the *bt_mesh_blob_srv_recv()* function before the transfer is started by the BLOB Transfer Client. The ID must be shared between the BLOB Transfer Client and the BLOB Transfer Server through some higher level procedure, like a vendor specific transfer management model.

Once the transfer has been set up on the BLOB Transfer Server, it's ready for receiving the BLOB. The application is notified of the transfer progress through the event handler callbacks, and the BLOB data is sent to the BLOB stream.

The interaction between the BLOB Transfer Server, BLOB stream and application is shown below:

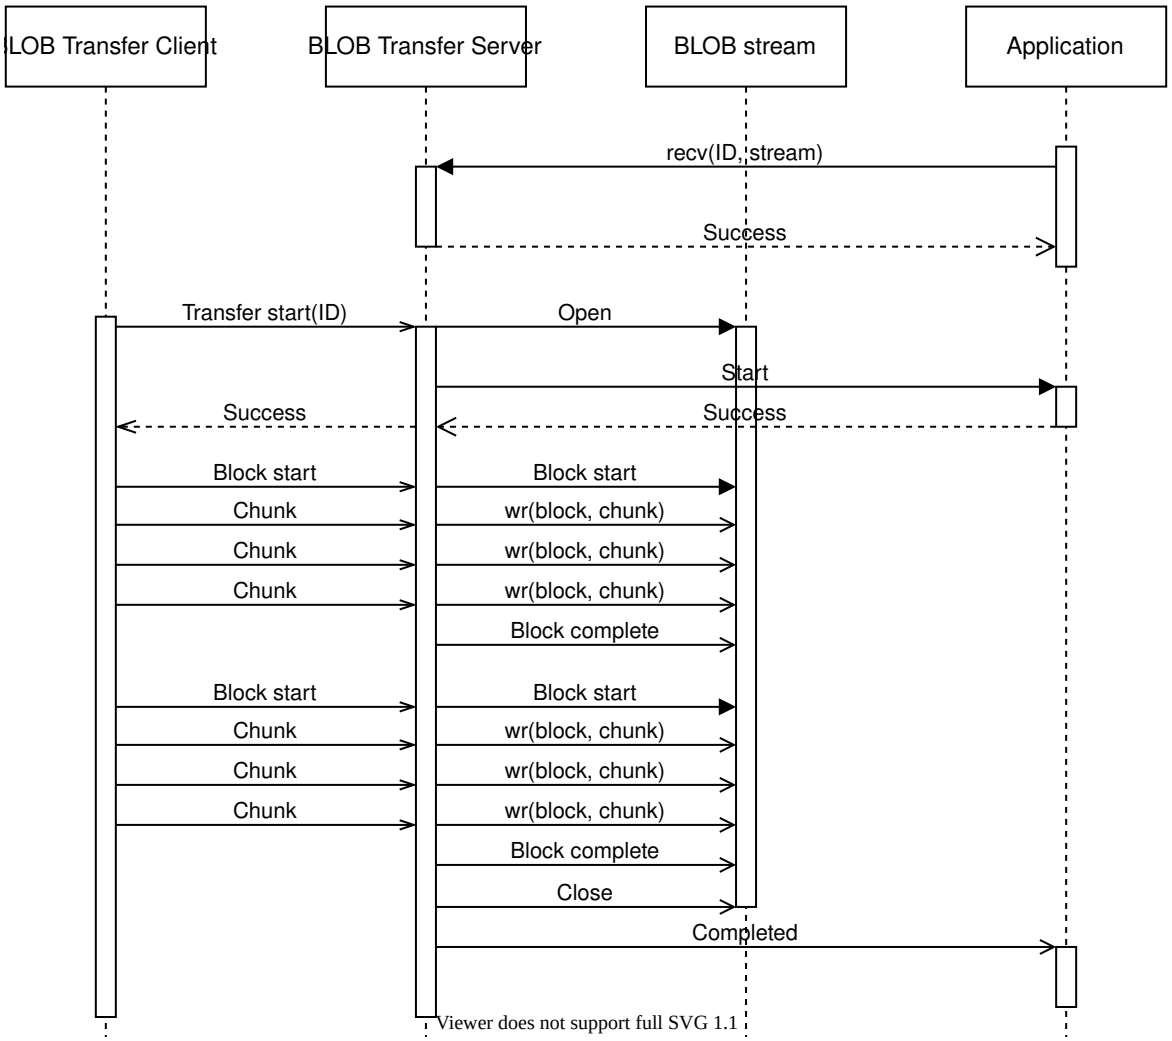

Fig. 8: BLOB Transfer Server model interaction

Transfer suspension The BLOB Transfer Server keeps a running timer during the transfer, that is reset on every received message. If the BLOB Transfer Client does not send a message before the transfer timer expires, the transfer is suspended by the BLOB Transfer Server.

The BLOB Transfer Server notifies the user of the suspension by calling the *suspended* callback. If the BLOB Transfer Server is in the middle of receiving a block, this block is discarded.

The BLOB Transfer Client may resume a suspended transfer by starting a new block transfer. The BLOB Transfer Server notifies the user by calling the *resume* callback.

Transfer recovery The state of the BLOB transfer is stored persistently. If a reboot occurs, the BLOB Transfer Server will attempt to recover the transfer. When the Bluetooth Mesh subsystem is started (for instance by calling *bt_mesh_init()*), the BLOB Transfer Server will check for aborted transfers, and call the *recover* callback if there is any. In the recover callback, the user must provide a BLOB stream to use for the rest of the transfer. If the recover callback doesn't

return successfully or does not provide a BLOB stream, the transfer is abandoned. If no recover callback is implemented, transfers are always abandoned after a reboot.

After a transfer is successfully recovered, the BLOB Transfer Server enters the suspended state. It will stay suspended until the BLOB Transfer Client resumes the transfer, or the user cancels it.

Note

The BLOB Transfer Client sending the transfer must support transfer recovery for the transfer to complete. If the BLOB Transfer Client has already given up the transfer, the BLOB Transfer Server will stay suspended until the application calls *bt_mesh_blob_srv_cancel()*.

API reference

group `bt_mesh_blob_srv`

Defines

`BT_MESH_BLOB_BLOCKS_MAX`

Max number of blocks in a single transfer.

`BT_MESH_MODEL_BLOB_SRV`(_srv)

BLOB Transfer Server model composition data entry.

Parameters

- `_srv` – Pointer to a *Bluetooth Mesh BLOB Transfer Server model API* instance.

Functions

int `bt_mesh_blob_srv_recv`(struct *bt_mesh_blob_srv* *srv, uint64_t id, const struct *bt_mesh_blob_io* *io, uint8_t ttl, uint16_t timeout_base)

Prepare BLOB Transfer Server for an incoming transfer.

Before a BLOB Transfer Server can receive a transfer, the transfer must be prepared through some application level mechanism. The BLOB Transfer Server will only accept incoming transfers with a matching BLOB ID.

Parameters

- `srv` – BLOB Transfer Server instance.
- `id` – BLOB ID to accept.
- `io` – BLOB stream to write the incoming BLOB to.
- `ttl` – Time to live value to use in responses to the BLOB Transfer Client.
- `timeout_base` – Extra time for the Client to respond in addition to the base 10 seconds, in 10-second increments.

Returns

0 on success, or (negative) error code on failure.

int **bt_mesh_blob_srv_cancel**(struct *bt_mesh_blob_srv* *srv)

Cancel the current BLOB transfer.

Tells the BLOB Transfer Client to drop this device from the list of Targets for the current transfer. Note that the client may continue sending the transfer to other Targets.

Parameters

- **srv** – BLOB Transfer Server instance.

Returns

0 on success, or (negative) error code on failure.

bool **bt_mesh_blob_srv_is_busy**(const struct *bt_mesh_blob_srv* *srv)

Get the current state of the BLOB Transfer Server.

Parameters

- **srv** – BLOB Transfer Server instance.

Returns

true if the BLOB Transfer Server is currently participating in a transfer, false otherwise.

uint8_t **bt_mesh_blob_srv_progress**(const struct *bt_mesh_blob_srv* *srv)

Get the current progress of the active transfer in percent.

Parameters

- **srv** – BLOB Transfer Server instance.

Returns

The current transfer progress, or 0 if no transfer is active.

struct **bt_mesh_blob_srv_cb**

#include <blob_srv.h> BLOB Transfer Server model event handlers.

All callbacks are optional.

Public Members

int (***start**)(struct *bt_mesh_blob_srv* *srv, struct *bt_mesh_msg_ctx* *ctx, struct *bt_mesh_blob_xfer* *xfer)

Transfer start callback.

Called when the transfer has started with the prepared BLOB ID.

Param srv
BLOB Transfer Server instance.

Param ctx
Message context for the incoming start message. The entire transfer will be sent from the same source address.

Param xfer
Transfer parameters.

Return
0 on success, or (negative) error code to reject the transfer.

void (***end**)(struct *bt_mesh_blob_srv* *srv, uint64_t id, bool success)

Transfer end callback.

Called when the transfer ends, either because it was cancelled, or because it finished successfully. A new transfer may be prepared.

> **Note**
>
> The transfer may end before it's started if the start parameters are invalid.

Param srv
BLOB Transfer Server instance.
Param id
BLOB ID of the cancelled transfer.
Param success
Whether the transfer was successful.

void (*`suspended`)(struct *bt_mesh_blob_srv* *srv)

Transfer suspended callback.

Called if the Server timed out while waiting for a transfer packet. A suspended transfer may resume later from the start of the current block. Any received chunks in the current block should be discarded, they will be received again if the transfer resumes.

The transfer will call `resumed` again when resuming.

> **Note**
>
> The BLOB Transfer Server does not run a timer in the suspended state, and it's up to the application to determine whether the transfer should be permanently cancelled. Without interaction, the transfer will be suspended indefinitely, and the BLOB Transfer Server will not accept any new transfers.

Param srv
BLOB Transfer Server instance.

void (*`resume`)(struct *bt_mesh_blob_srv* *srv)

Transfer resume callback.

Called if the transfer is resumed after being suspended.
Param srv
BLOB Transfer Server instance.

int (*`recover`)(struct *bt_mesh_blob_srv* *srv, struct *bt_mesh_blob_xfer* *xfer, const struct *bt_mesh_blob_io* **io)

Transfer recovery callback.

Called when the Bluetooth Mesh subsystem is started if the device is rebooted in the middle of a transfer.

Transfers will not be resumed after a reboot if this callback is not defined.
Param srv
BLOB Transfer Server instance.
Param xfer
Transfer to resume.
Param io
BLOB stream return parameter. Must be set to a valid BLOB stream by the callback.
Return
0 on success, or (negative) error code to abandon the transfer.

struct `bt_mesh_blob_srv`

#include <blob_srv.h> BLOB Transfer Server instance.

Public Members

const struct *bt_mesh_blob_srv_cb* ***cb**

Event handler callbacks.

struct **bt_mesh_blob_srv_state**

#include <blob_srv.h>

BLOB Transfer Client The Binary Large Object (BLOB) Transfer Client is the sender of the BLOB transfer. It supports sending BLOBs of any size to any number of Target nodes, in both Push BLOB Transfer Mode and Pull BLOB Transfer Mode.

Usage

Initialization The BLOB Transfer Client is instantiated on an element with a set of event handler callbacks:

```
static const struct bt_mesh_blob_cli_cb blob_cb = {
      /* Callbacks */
};

static struct bt_mesh_blob_cli blob_cli = {
      .cb = &blob_cb,
};

static const struct bt_mesh_model models[] = {
      BT_MESH_MODEL_BLOB_CLI(&blob_cli),
};
```

Transfer context Both the transfer capabilities retrieval procedure and the BLOB transfer uses an instance of a *bt_mesh_blob_cli_inputs* to determine how to perform the transfer. The BLOB Transfer Client Inputs structure must at least be initialized with a list of targets, an application key and a time to live (TTL) value before it is used in a procedure:

```
static struct bt_mesh_blob_target targets[3] = {
        { .addr = 0x0001 },
        { .addr = 0x0002 },
        { .addr = 0x0003 },
};
static struct bt_mesh_blob_cli_inputs inputs = {
        .app_idx = MY_APP_IDX,
        .ttl = BT_MESH_TTL_DEFAULT,
};

sys_slist_init(&inputs.targets);
sys_slist_append(&inputs.targets, &targets[0].n);
sys_slist_append(&inputs.targets, &targets[1].n);
sys_slist_append(&inputs.targets, &targets[2].n);
```

Note that all BLOB Transfer Servers in the transfer must be bound to the chosen application key.

Group address The application may additionally specify a group address in the context structure. If the group is not *BT_MESH_ADDR_UNASSIGNED*, the messages in the transfer will be sent to the group address, instead of being sent individually to each Target node. Mesh Manager must ensure that all Target nodes having the BLOB Transfer Server model subscribe to this group address.

Using group addresses for transferring the BLOBs can generally increase the transfer speed, as the BLOB Transfer Client sends each message to all Target nodes at the same time. However, sending large, segmented messages to group addresses in Bluetooth Mesh is generally less reliable than sending them to unicast addresses, as there is no transport layer acknowledgment mechanism for groups. This can lead to longer recovery periods at the end of each block, and increases the risk of losing Target nodes. Using group addresses for BLOB transfers will generally only pay off if the list of Target nodes is extensive, and the effectiveness of each addressing strategy will vary heavily between different deployments and the size of the chunks.

Transfer timeout If a Target node fails to respond to an acknowledged message within the BLOB Transfer Client's time limit, the Target node is dropped from the transfer. The application can reduce the chances of this by giving the BLOB Transfer Client extra time through the context structure. The extra time may be set in 10-second increments, up to 182 hours, in addition to the base time of 20 seconds. The wait time scales automatically with the transfer TTL.

Note that the BLOB Transfer Client only moves forward with the transfer in following cases:

- All Target nodes have responded.
- A node has been removed from the list of Target nodes.
- The BLOB Transfer Client times out.

Increasing the wait time will increase this delay.

BLOB transfer capabilities retrieval It is generally recommended to retrieve BLOB transfer capabilities before starting a transfer. The procedure populates the transfer capabilities from all Target nodes with the most liberal set of parameters that allows all Target nodes to participate in the transfer. Any Target nodes that fail to respond, or respond with incompatible transfer parameters, will be dropped.

Target nodes are prioritized according to their order in the list of Target nodes. If a Target node is found to be incompatible with any of the previous Target nodes, for instance by reporting a non-overlapping block size range, it will be dropped. Lost Target nodes will be reported through the *lost_target* callback.

The end of the procedure is signalled through the *caps* callback, and the resulting capabilities can be used to determine the block and chunk sizes required for the BLOB transfer.

BLOB transfer The BLOB transfer is started by calling *bt_mesh_blob_cli_send()* function, which (in addition to the aforementioned transfer inputs) requires a set of transfer parameters and a BLOB stream instance. The transfer parameters include the 64-bit BLOB ID, the BLOB size, the transfer mode, the block size in logarithmic representation and the chunk size. The BLOB ID is application defined, but must match the BLOB ID the BLOB Transfer Servers have been started with.

The transfer runs until it either completes successfully for at least one Target node, or it is cancelled. The end of the transfer is communicated to the application through the *end* callback. Lost Target nodes will be reported through the *lost_target* callback.

API reference

group `bt_mesh_blob_cli`

Defines

BT_MESH_MODEL_BLOB_CLI(_cli)

BLOB Transfer Client model Composition Data entry.

Parameters

- **_cli** – Pointer to a *Bluetooth Mesh BLOB Transfer Client model API* instance.

Enums

enum bt_mesh_blob_cli_state

BLOB Transfer Client state.

Values:

enumerator BT_MESH_BLOB_CLI_STATE_NONE

No transfer is active.

enumerator BT_MESH_BLOB_CLI_STATE_CAPS_GET

Retrieving transfer capabilities.

enumerator BT_MESH_BLOB_CLI_STATE_START

Sending transfer start.

enumerator BT_MESH_BLOB_CLI_STATE_BLOCK_START

Sending block start.

enumerator BT_MESH_BLOB_CLI_STATE_BLOCK_SEND

Sending block chunks.

enumerator BT_MESH_BLOB_CLI_STATE_BLOCK_CHECK

Checking block status.

enumerator BT_MESH_BLOB_CLI_STATE_XFER_CHECK

Checking transfer status.

enumerator BT_MESH_BLOB_CLI_STATE_CANCEL

Cancelling transfer.

enumerator BT_MESH_BLOB_CLI_STATE_SUSPENDED

Transfer is suspended.

enumerator BT_MESH_BLOB_CLI_STATE_XFER_PROGRESS_GET

Checking transfer progress.

Functions

int **bt_mesh_blob_cli_caps_get**(struct *bt_mesh_blob_cli* *cli, const struct *bt_mesh_blob_cli_inputs* *inputs)

Retrieve transfer capabilities for a list of Target nodes.

Queries the availability and capabilities of all Target nodes, producing a cumulative set of transfer capabilities for the Target nodes, and returning it through the *bt_mesh_blob_cli_cb::caps* callback.

Retrieving the capabilities may take several seconds, depending on the number of Target nodes and mesh network performance. The end of the procedure is indicated through the *bt_mesh_blob_cli_cb::caps* callback.

This procedure is not required, but strongly recommended as a preparation for a transfer to maximize performance and the chances of success.

Parameters

- **cli** – BLOB Transfer Client instance.
- **inputs** – Statically allocated BLOB Transfer Client transfer inputs.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_blob_cli_send**(struct *bt_mesh_blob_cli* *cli, const struct *bt_mesh_blob_cli_inputs* *inputs, const struct *bt_mesh_blob_xfer* *xfer, const struct *bt_mesh_blob_io* *io)

Perform a BLOB transfer.

Starts sending the transfer to the Target nodes. Only Target nodes with a `status` of *BT_MESH_BLOB_SUCCESS* will be considered.

The transfer will keep going either until all Target nodes have been dropped, or the full BLOB has been sent.

The BLOB transfer may take several minutes, depending on the number of Target nodes, size of the BLOB and mesh network performance. The end of the transfer is indicated through the *bt_mesh_blob_cli_cb::end* callback.

A Client only supports one transfer at the time.

Parameters

- **cli** – BLOB Transfer Client instance.
- **inputs** – Statically allocated BLOB Transfer Client transfer inputs.
- **xfer** – Statically allocated transfer parameters.
- **io** – BLOB stream to read the transfer from.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_blob_cli_suspend**(struct *bt_mesh_blob_cli* *cli)

Suspend the active transfer.

Parameters

- **cli** – BLOB Transfer Client instance.

Returns
0 on success, or (negative) error code otherwise.

int **bt_mesh_blob_cli_resume**(struct *bt_mesh_blob_cli* *cli)

Resume the suspended transfer.

Parameters

- **cli** – BLOB Transfer Client instance.

Returns
0 on success, or (negative) error code otherwise.

void **bt_mesh_blob_cli_cancel**(struct *bt_mesh_blob_cli* *cli)

Cancel an ongoing transfer.

Parameters

- **cli** – BLOB Transfer Client instance.

int **bt_mesh_blob_cli_xfer_progress_get**(struct *bt_mesh_blob_cli* *cli, const struct *bt_mesh_blob_cli_inputs* *inputs)

Get the progress of BLOB transfer.

This function can only be used if the BLOB Transfer Client is currently not performing a BLOB transfer. To get progress of the active BLOB transfer, use the *bt_mesh_blob_cli_xfer_progress_active_get* function.

Parameters

- **cli** – BLOB Transfer Client instance.
- **inputs** – Statically allocated BLOB Transfer Client transfer inputs.

Returns
0 on success, or (negative) error code otherwise.

uint8_t **bt_mesh_blob_cli_xfer_progress_active_get**(struct *bt_mesh_blob_cli* *cli)

Get the current progress of the active transfer in percent.

Parameters

- **cli** – BLOB Transfer Client instance.

Returns
The current transfer progress, or 0 if no transfer is active.

bool **bt_mesh_blob_cli_is_busy**(struct *bt_mesh_blob_cli* *cli)

Get the current state of the BLOB Transfer Client.

Parameters

- **cli** – BLOB Transfer Client instance.

Returns
true if the BLOB Transfer Client is currently participating in a transfer or retrieving the capabilities and false otherwise.

struct **bt_mesh_blob_target_pull**

#include <blob_cli.h> Target node's Pull mode (Pull BLOB Transfer Mode) context used while sending chunks to the Target node.

Public Members

int64_t **block_report_timestamp**

Timestamp when the Block Report Timeout Timer expires for this Target node.

uint8_t **missing**[*DIV_ROUND_UP*(*CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX*, 8)]

Missing chunks reported by this Target node.

struct **bt_mesh_blob_target**

#include <blob_cli.h> BLOB Transfer Client Target node.

Public Members

sys_snode_t **n**

Linked list node.

uint16_t **addr**

Target node address.

struct *bt_mesh_blob_target_pull* ***pull**

Target node's Pull mode context.

Needs to be initialized when sending a BLOB in Pull mode.

uint8_t **status**

BLOB transfer status, see *bt_mesh_blob_status*.

struct **bt_mesh_blob_xfer_info**

#include <blob_cli.h> BLOB transfer information.

If `phase` is *BT_MESH_BLOB_XFER_PHASE_INACTIVE*, the fields below `phase` are not initialized. If `phase` is *BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_START*, the fields below `id` are not initialized.

Public Members

enum *bt_mesh_blob_status* **status**

BLOB transfer status.

enum *bt_mesh_blob_xfer_mode* **mode**

BLOB transfer mode.

enum *bt_mesh_blob_xfer_phase* **phase**

BLOB transfer phase.

uint64_t **id**

BLOB ID.

uint32_t **size**

BLOB size in octets.

uint8_t **block_size_log**

Logarithmic representation of the block size.

uint16_t **mtu_size**

MTU size in octets.

const uint8_t *missing_blocks

Bit field indicating blocks that were not received.

struct bt_mesh_blob_cli_inputs

#include <*blob_cli.h*> BLOB Transfer Client transfer inputs.

Public Members

sys_slist_t targets

Linked list of Target nodes.

Each node should point to *bt_mesh_blob_target::n*.

uint16_t app_idx

AppKey index to send with.

uint16_t group

Group address destination for the BLOB transfer, or *BT_MESH_ADDR_UNASSIGNED* to send every message to each Target node individually.

uint8_t ttl

Time to live value of BLOB transfer messages.

uint16_t timeout_base

Additional response time for the Target nodes, in 10-second increments.

The extra time can be used to give the Target nodes more time to respond to messages from the Client. The actual timeout will be calculated according to the following formula:

```
*  timeout = 20 seconds + (10 seconds * timeout_base) + (100 ms * TTL)
*
```

If a Target node fails to respond to a message from the Client within the configured transfer timeout, the Target node is dropped.

struct bt_mesh_blob_cli_caps

#include <*blob_cli.h*> Transfer capabilities of a Target node.

Public Members

size_t max_size

Max BLOB size.

uint8_t min_block_size_log

Logarithmic representation of the minimum block size.

uint8_t max_block_size_log

Logarithmic representation of the maximum block size.

uint16_t **max_chunks**

Max number of chunks per block.

uint16_t **max_chunk_size**

Max chunk size.

uint16_t **mtu_size**

Max MTU size.

enum *bt_mesh_blob_xfer_mode* **modes**

Supported transfer modes.

struct **bt_mesh_blob_cli_cb**

#include <blob_cli.h> Event handler callbacks for the BLOB Transfer Client model.

All handlers are optional.

Public Members

void (***caps**)(struct *bt_mesh_blob_cli* *cli, const struct *bt_mesh_blob_cli_caps* *caps)

Capabilities retrieval completion callback.

Called when the capabilities retrieval procedure completes, indicating that a common set of acceptable transfer parameters have been established for the given list of Target nodes. All compatible Target nodes have status code *BT_MESH_BLOB_SUCCESS*.

Param cli
BLOB Transfer Client instance.

Param caps
Safe transfer capabilities if the transfer capabilities of at least one Target node has satisfied the Client, or NULL otherwise.

void (***lost_target**)(struct *bt_mesh_blob_cli* *cli, struct *bt_mesh_blob_target* *target, enum *bt_mesh_blob_status* reason)

Target node loss callback.

Called whenever a Target node has been lost due to some error in the transfer. Losing a Target node is not considered a fatal error for the Client until all Target nodes have been lost.

Param cli
BLOB Transfer Client instance.

Param target
Target node that was lost.

Param reason
Reason for the Target node loss.

void (***suspended**)(struct *bt_mesh_blob_cli* *cli)

Transfer is suspended.

Called when the transfer is suspended due to response timeout from all Target nodes.

Param cli
BLOB Transfer Client instance.

void (*end)(struct *bt_mesh_blob_cli* *cli, const struct *bt_mesh_blob_xfer* *xfer, bool success)

Transfer end callback.

Called when the transfer ends.

Param cli
BLOB Transfer Client instance.

Param xfer
Completed transfer.

Param success
Status of the transfer. Is `true` if at least one Target node received the whole transfer.

void (*xfer_progress)(struct *bt_mesh_blob_cli* *cli, struct *bt_mesh_blob_target* *target, const struct *bt_mesh_blob_xfer_info* *info)

Transfer progress callback.

The content of `info` is invalidated upon exit from the callback. Therefore it needs to be copied if it is planned to be used later.

Param cli
BLOB Transfer Client instance.

Param target
Target node that responded to the request.

Param info
BLOB transfer information.

void (*xfer_progress_complete)(struct *bt_mesh_blob_cli* *cli)

End of Get Transfer Progress procedure.

Called when all Target nodes have responded or the procedure timed-out.

Param cli
BLOB Transfer Client instance.

struct **bt_mesh_blob_cli**

#include <blob_cli.h> BLOB Transfer Client model instance.

Public Members

const struct *bt_mesh_blob_cli_cb* ***cb**

Event handler callbacks.

The BLOB Transfer Client is instantiated on the sender node, and the BLOB Transfer Server is instantiated on the receiver nodes.

Concepts The BLOB transfer protocol introduces several new concepts to implement the BLOB transfer.

BLOBs BLOBs are binary objects up to 4 GB in size, that can contain any data the application would like to transfer through the mesh network. The BLOBs are continuous data objects, divided into blocks and chunks to make the transfers reliable and easy to process. No limitations are put on the contents or structure of the BLOB, and applications are free to define any encoding or compression they'd like on the data itself.

The BLOB transfer protocol does not provide any built-in integrity checks, encryption or authentication of the BLOB data. However, the underlying encryption of the Bluetooth Mesh protocol

provides data integrity checks and protects the contents of the BLOB from third parties using network and application level encryption.

Blocks The binary objects are divided into blocks, typically from a few hundred to several thousand bytes in size. Each block is transmitted separately, and the BLOB Transfer Client ensures that all BLOB Transfer Servers have received the full block before moving on to the next. The block size is determined by the transfer's `block_size_log` parameter, and is the same for all blocks in the transfer except the last, which may be smaller. For a BLOB stored in flash memory, the block size is typically a multiple of the flash page size of the Target devices.

Chunks Each block is divided into chunks. A chunk is the smallest data unit in the BLOB transfer, and must fit inside a single Bluetooth Mesh access message excluding the opcode (379 bytes or less). The mechanism for transferring chunks depends on the transfer mode.

When operating in Push BLOB Transfer Mode, the chunks are sent as unacknowledged packets from the BLOB Transfer Client to all targeted BLOB Transfer Servers. Once all chunks in a block have been sent, the BLOB Transfer Client asks each BLOB Transfer Server if they're missing any chunks, and resends them. This is repeated until all BLOB Transfer Servers have received all chunks, or the BLOB Transfer Client gives up.

When operating in Pull BLOB Transfer Mode, the BLOB Transfer Server will request a small number of chunks from the BLOB Transfer Client at a time, and wait for the BLOB Transfer Client to send them before requesting more chunks. This repeats until all chunks have been transferred, or the BLOB Transfer Server gives up.

Read more about the transfer modes in *Transfer modes* section.

BLOB streams In the BLOB Transfer models' APIs, the BLOB data handling is separated from the high-level transfer handling. This split allows reuse of different BLOB storage and transfer strategies for different applications. While the high level transfer is controlled directly by the application, the BLOB data itself is accessed through a *BLOB stream*.

The BLOB stream is comparable to a standard library file stream. Through opening, closing, reading and writing, the BLOB Transfer model gets full access to the BLOB data, whether it's kept in flash, RAM, or on a peripheral. The BLOB stream is opened with an access mode (read or write) before it's used, and the BLOB Transfer models will move around inside the BLOB's data in blocks and chunks, using the BLOB stream as an interface.

Interaction Before the BLOB is read or written, the stream is opened by calling its `open` callback. When used with a BLOB Transfer Server, the BLOB stream is always opened in write mode, and when used with a BLOB Transfer Client, it's always opened in read mode.

For each block in the BLOB, the BLOB Transfer model starts by calling `block_start`. Then, depending on the access mode, the BLOB stream's `wr` or `rd` callback is called repeatedly to move data to or from the BLOB. When the model is done processing the block, it calls `block_end`. When the transfer is complete, the BLOB stream is closed by calling `close`.

Implementations The application may implement their own BLOB stream, or use the implementations provided by Zephyr:

BLOB Flash The BLOB Flash Readers and Writers implement BLOB reading to and writing from flash partitions defined in the *flash map*.

BLOB Flash Reader The BLOB Flash Reader interacts with the BLOB Transfer Client to read BLOB data directly from flash. It must be initialized by calling `bt_mesh_blob_flash_rd_init()` before being passed to the BLOB Transfer Client. Each BLOB Flash Reader only supports one transfer at the time.

BLOB Flash Writer The BLOB Flash Writer interacts with the BLOB Transfer Server to write BLOB data directly to flash. It must be initialized by calling `bt_mesh_blob_flash_rd_init()` before being passed to the BLOB Transfer Server. Each BLOB Flash Writer only supports one transfer at the time, and requires a block size that is a multiple of the flash page size. If a transfer is started with a block size lower than the flash page size, the transfer will be rejected.

The BLOB Flash Writer copies chunk data into a buffer to accommodate chunks that are unaligned with the flash write block size. The buffer data is padded with `0xff` if either the start or length of the chunk is unaligned.

API Reference

group `bt_mesh_blob_io_flash`

Functions

int **bt_mesh_blob_io_flash_init**(struct *bt_mesh_blob_io_flash* *flash, uint8_t area_id, off_t offset)

Initialize a flash stream.

Parameters

- `flash` – Flash stream.
- `area_id` – Flash partition identifier. See *flash_area_open*.
- `offset` – Offset into the flash area, in bytes.

Returns
0 on success or (negative) error code otherwise.

struct **bt_mesh_blob_io_flash**

#include <blob_io_flash.h> BLOB flash stream.

Public Members

uint8_t `area_id`

Flash area ID to write the BLOB to.

enum *bt_mesh_blob_io_mode* `mode`

Active stream mode.

off_t `offset`

Offset into the flash area to place the BLOB at (in bytes).

Transfer capabilities Each BLOB Transfer Server may have different transfer capabilities. The transfer capabilities of each device are controlled through the following configuration options:

- CONFIG_BT_MESH_BLOB_SIZE_MAX
- CONFIG_BT_MESH_BLOB_BLOCK_SIZE_MIN
- CONFIG_BT_MESH_BLOB_BLOCK_SIZE_MAX
- CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX

The CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX option is also used by the BLOB Transfer Client and affects memory consumption by the BLOB Transfer Client model structure.

To ensure that the transfer can be received by as many servers as possible, the BLOB Transfer Client can retrieve the capabilities of each BLOB Transfer Server before starting the transfer. The client will transfer the BLOB with the highest possible block and chunk size.

Transfer modes BLOBs can be transferred using two transfer modes, Push BLOB Transfer Mode and Pull BLOB Transfer Mode. In most cases, the transfer should be conducted in Push BLOB Transfer Mode.

In Push BLOB Transfer Mode, the send rate is controlled by the BLOB Transfer Client, which will push all the chunks of each block without any high level flow control. Push BLOB Transfer Mode supports any number of Target nodes, and should be the default transfer mode.

In Pull BLOB Transfer Mode, the BLOB Transfer Server will "pull" the chunks from the BLOB Transfer Client at its own rate. Pull BLOB Transfer Mode can be conducted with multiple Target nodes, and is intended for transferring BLOBs to Target nodes acting as *Low Power Node*. When operating in Pull BLOB Transfer Mode, the BLOB Transfer Server will request chunks from the BLOB Transfer Client in small batches, and wait for them all to arrive before requesting more chunks. This process is repeated until the BLOB Transfer Server has received all chunks in a block. Then, the BLOB Transfer Client starts the next block, and the BLOB Transfer Server requests all chunks of that block.

Transfer timeout The timeout of the BLOB transfer is based on a Timeout Base value. Both client and server use the same Timeout Base value, but they calculate timeout differently.

The BLOB Transfer Server uses the following formula to calculate the BLOB transfer timeout:

```
10 * (Timeout Base + 1) seconds
```

For the BLOB Transfer Client, the following formula is used:

```
(10000 * (Timeout Base + 2)) + (100 * TTL) milliseconds
```

where TTL is time to live value set in the transfer.

API reference This section contains types and defines common to the BLOB Transfer models.

group bt_mesh_blob

Defines

CONFIG_BT_MESH_BLOB_CHUNK_COUNT_MAX

Enums

enum `bt_mesh_blob_xfer_mode`

BLOB transfer mode.

Values:

enumerator `BT_MESH_BLOB_XFER_MODE_NONE`

No valid transfer mode.

enumerator `BT_MESH_BLOB_XFER_MODE_PUSH`

Push mode (Push BLOB Transfer Mode).

enumerator `BT_MESH_BLOB_XFER_MODE_PULL`

Pull mode (Pull BLOB Transfer Mode).

enumerator `BT_MESH_BLOB_XFER_MODE_ALL`

Both modes are valid.

enum `bt_mesh_blob_xfer_phase`

Transfer phase.

Values:

enumerator `BT_MESH_BLOB_XFER_PHASE_INACTIVE`

The BLOB Transfer Server is awaiting configuration.

enumerator `BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_START`

The BLOB Transfer Server is ready to receive a BLOB transfer.

enumerator `BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_BLOCK`

The BLOB Transfer Server is waiting for the next block of data.

enumerator `BT_MESH_BLOB_XFER_PHASE_WAITING_FOR_CHUNK`

The BLOB Transfer Server is waiting for the next chunk of data.

enumerator `BT_MESH_BLOB_XFER_PHASE_COMPLETE`

The BLOB was transferred successfully.

enumerator `BT_MESH_BLOB_XFER_PHASE_SUSPENDED`

The BLOB transfer is paused.

enum `bt_mesh_blob_status`

BLOB model status codes.

Values:

enumerator `BT_MESH_BLOB_SUCCESS`

The message was processed successfully.

enumerator BT_MESH_BLOB_ERR_INVALID_BLOCK_NUM

The Block Number field value is not within the range of blocks being transferred.

enumerator BT_MESH_BLOB_ERR_INVALID_BLOCK_SIZE

The block size is smaller than the size indicated by the Min Block Size Log state or is larger than the size indicated by the Max Block Size Log state.

enumerator BT_MESH_BLOB_ERR_INVALID_CHUNK_SIZE

The chunk size exceeds the size indicated by the Max Chunk Size state, or the number of chunks exceeds the number specified by the Max Total Chunks state.

enumerator BT_MESH_BLOB_ERR_WRONG_PHASE

The operation cannot be performed while the server is in the current phase.

enumerator BT_MESH_BLOB_ERR_INVALID_PARAM

A parameter value in the message cannot be accepted.

enumerator BT_MESH_BLOB_ERR_WRONG_BLOB_ID

The message contains a BLOB ID value that is not expected.

enumerator BT_MESH_BLOB_ERR_BLOB_TOO_LARGE

There is not enough space available in memory to receive the BLOB.

enumerator BT_MESH_BLOB_ERR_UNSUPPORTED_MODE

The transfer mode is not supported by the BLOB Transfer Server model.

enumerator BT_MESH_BLOB_ERR_INTERNAL

An internal error occurred on the node.

enumerator BT_MESH_BLOB_ERR_INFO_UNAVAILABLE

The requested information cannot be provided while the server is in the current phase.

enum bt_mesh_blob_io_mode

BLOB stream interaction mode.

Values:

enumerator BT_MESH_BLOB_READ

Read data from the stream.

enumerator BT_MESH_BLOB_WRITE

Write data to the stream.

struct bt_mesh_blob_block

#include <*blob.h*> BLOB transfer data block.

Public Members

size_t **size**
Block size in bytes.

off_t **offset**
Offset in bytes from the start of the BLOB.

uint16_t **number**
Block number.

uint16_t **chunk_count**
Number of chunks in block.

uint8_t **missing**[*DIV_ROUND_UP*(0, 8)]
Bitmap of missing chunks.

struct **bt_mesh_blob_chunk**
#include <*blob.h*> BLOB data chunk.

Public Members

off_t **offset**
Offset of the chunk data from the start of the block.

size_t **size**
Chunk data size.

uint8_t ***data**
Chunk data.

struct **bt_mesh_blob_xfer**
#include <*blob.h*> BLOB transfer.

Public Members

uint64_t **id**
BLOB ID.

size_t **size**
Total BLOB size in bytes.

enum *bt_mesh_blob_xfer_mode* **mode**
BLOB transfer mode.

uint16_t **chunk_size**
Base chunk size.

May be smaller for the last chunk.

struct **bt_mesh_blob_io**

#include <blob.h> BLOB stream.

Public Members

int (***open**)(const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_blob_xfer* *xfer, enum *bt_mesh_blob_io_mode* mode)

Open callback.

Called when the reader is opened for reading.

Param io
BLOB stream.

Param xfer
BLOB transfer.

Param mode
Direction of the stream (read/write).

Return
0 on success, or (negative) error code otherwise.

void (***close**)(const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_blob_xfer* *xfer)

Close callback.

Called when the reader is closed.

Param io
BLOB stream.

Param xfer
BLOB transfer.

int (***block_start**)(const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_blob_xfer* *xfer, const struct *bt_mesh_blob_block* *block)

Block start callback.

Called when a new block is opened for sending. Each block is only sent once, and are always sent in increasing order. The data chunks inside a single block may be requested out of order and multiple times.

Param io
BLOB stream.

Param xfer
BLOB transfer.

Param block
Block that was started.

void (***block_end**)(const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_blob_xfer* *xfer, const struct *bt_mesh_blob_block* *block)

Block end callback.

Called when the current block has been transmitted in full. No data from this block will be requested again, and the application data associated with this block may be discarded.

Param io
BLOB stream.

Param xfer
BLOB transfer.

Param block
Block that finished sending.

int (*wr)(const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_blob_xfer* *xfer, const struct *bt_mesh_blob_block* *block, const struct *bt_mesh_blob_chunk* *chunk)

Chunk data write callback.

Used by the BLOB Transfer Server on incoming data.

Each block is divided into chunks of data. This callback is called when a new chunk of data is received. Chunks may be received in any order within their block.

If the callback returns successfully, this chunk will be marked as received, and will not be received again unless the block is restarted due to a transfer suspension. If the callback returns a non-zero value, the chunk remains unreceived, and the BLOB Transfer Client will attempt to resend it later.

Note that the Client will only perform a limited number of attempts at delivering a chunk before dropping a Target node from the transfer. The number of retries performed by the Client is implementation specific.

Param io
BLOB stream.
Param xfer
BLOB transfer.
Param block
Block the chunk is part of.
Param chunk
Received chunk.
Return
0 on success, or (negative) error code otherwise.

int (*rd)(const struct *bt_mesh_blob_io* *io, const struct *bt_mesh_blob_xfer* *xfer, const struct *bt_mesh_blob_block* *block, const struct *bt_mesh_blob_chunk* *chunk)

Chunk data read callback.

Used by the BLOB Transfer Client to fetch outgoing data.
