If `assigned_okay` is true, it will return the same address already assigned to the device (*i3c_device_desc::dynamic_addr*). If no address has been assigned, it behaves as if `assigned_okay` is false. This is useful for assigning the same address to the same device (for example, hot-join after device coming back from suspend).

If `assigned_okay` is false, the device cannot have an address assigned already (that *i3c_device_desc::dynamic_addr* is not zero). This is mainly used during the initial DAA.

Parameters

- `addr_slots` – **[in]** Pointer to address slots struct.
- `dev_list` – **[in]** Pointer to the device list struct.
- `pid` – **[in]** Provisioned ID of device to be assigned address.
- `must_match` – **[in]** True if PID must match devices in the device list. False otherwise.
- `assigned_okay` – **[in]** True if it is okay to return the address already assigned to the target matching the PID (`pid`).
- `target` – **[out]** Store the pointer of the device descriptor if it matches the incoming PID (`pid`).
- `addr` – **[out]** Address to be assigned to target device.

Return values

- `0` – if successful.
- `-ENODEV` – if no device matches the PID (`pid`) in the device list and `must_match` is true.
- `-EINVAL` – if the device matching PID (`pid`) already has an address assigned or invalid function arguments.

static inline int `i3c_configure`(const struct *device* *dev, enum *i3c_config_type* type, void *config)

Configure the I3C hardware.

Parameters

- `dev` – Pointer to controller device driver instance.
- `type` – Type of configuration parameters being passed in `config`.
- `config` – Pointer to the configuration parameters.

Return values

- `0` – If successful.
- `-EINVAL` – If invalid configure parameters.
- `-EIO` – General Input/Output errors.
- `-ENOSYS` – If not implemented.

static inline int **i3c_config_get**(const struct *device* *dev, enum *i3c_config_type* type, void *config)

Get configuration of the I3C hardware.

This provides a way to get the current configuration of the I3C hardware.

This can return cached config or probed hardware parameters, but it has to be up to date with current configuration.

Note that if `type` is *I3C_CONFIG_CUSTOM*, `config` must contain the ID of the parameter to be retrieved.

Parameters

- `dev` – **[in]** Pointer to controller device driver instance.
- `type` – **[in]** Type of configuration parameters being passed in `config`.
- `config` – **[inout]** Pointer to the configuration parameters.

Return values

- `0` – If successful.
- `-EIO` – General Input/Output errors.
- `-ENOSYS` – If not implemented.

static inline int **i3c_recover_bus**(const struct *device* *dev)

Attempt bus recovery on the I3C bus.

This routine asks the controller to attempt bus recovery.

Return values

- `0` – If successful.
- `-EBUSY` – If bus recovery fails.
- `-EIO` – General input / output error.
- `-ENOSYS` – Bus recovery is not supported by the controller driver.

int **i3c_attach_i3c_device**(struct *i3c_device_desc* *target)

Attach an I3C device.

Called to attach a I3C device to the addresses. This is typically called before a SETDASA or ENTDAA to reserve the addresses. This will also call the optional api to update any registers within the driver if implemented.

Warning

Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters

- `target` – Pointer to the target device descriptor

Return values

- `0` – If successful.
- `-EINVAL` – If address is not available or if the device has already been attached before

int `i3c_reattach_i3c_device`(struct *i3c_device_desc* *target, uint8_t old_dyn_addr)

Reattach I3C device.

called after every time an I3C device has its address changed. It can be because the device has been powered down and has lost its address, or it can happen when a device had a static address and has been assigned a dynamic address with SETDASA or a dynamic address has been updated with SETNEWDA. This will also call the optional api to update any registers within the driver if implemented.

Warning

Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters

- `target` – Pointer to the target device descriptor
- `old_dyn_addr` – The old dynamic address of target device, 0 if there was no old dynamic address

Return values

- `0` – If successful.
- `-EINVAL` – If address is not available

int `i3c_detach_i3c_device`(struct *i3c_device_desc* *target)

Detach I3C Device.

called to remove an I3C device and to free up the address that it used. If it's dynamic address was not set, then it assumed that SETDASA failed and will free it's static addr. This will also call the optional api to update any registers within the driver if implemented.

Warning

Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters

- `target` – Pointer to the target device descriptor

Return values

- `0` – If successful.
- `-EINVAL` – If device is already detached

int `i3c_attach_i2c_device`(struct *i3c_i2c_device_desc* *target)

Attach an I2C device.

Called to attach a I2C device to the addresses. This will also call the optional api to update any registers within the driver if implemented.

Warning

Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters

- `target` – Pointer to the target device descriptor

Return values

- `0` – If successful.
- `-EINVAL` – If address is not available or if the device has already been attached before

int `i3c_detach_i2c_device`(struct *i3c_i2c_device_desc* *target)

Detach I2C Device.

called to remove an I2C device and to free up the address that it used. This will also call the optional api to update any registers within the driver if implemented.

Warning

Use cases involving multiple writers to the i3c/i2c devices must prevent concurrent write operations, either by preventing all writers from being preempted or by using a mutex to govern writes to the i3c/i2c devices.

Parameters

- `target` – Pointer to the target device descriptor

Return values

- `0` – If successful.
- `-EINVAL` – If device is already detached

static inline int `i3c_do_daa`(const struct *device* *dev)

Perform Dynamic Address Assignment on the I3C bus.

This routine asks the controller to perform dynamic address assignment where the controller belongs. Only the active controller of the bus should do this.

> **Note**
>
> For controller driver implementation, the controller should perform SETDASA to allow static addresses to be the dynamic addresses before actually doing ENTDAA.

Parameters

- `dev` – Pointer to the device structure for the controller driver instance.

Return values

- `0` – If successful.
- `-EBUSY` – Bus is busy.
- `-EIO` – General input / output error.
- `-ENODEV` – If a provisioned ID does not match to any target devices in the registered device list.
- `-ENOSPC` – No more free addresses can be assigned to target.
- `-ENOSYS` – Dynamic address assignment is not supported by the controller driver.

int **i3c_do_ccc**(const struct *device* *dev, struct *i3c_ccc_payload* *payload)

Send CCC to the bus.

Parameters

- `dev` – Pointer to the device structure for the controller driver instance.
- `payload` – Pointer to the structure describing the CCC payload.

Return values

- `0` – If successful.
- `-EBUSY` – Bus is busy.
- `-EIO` – General Input / output error.
- `-EINVAL` – Invalid valid set in the payload structure.
- `-ENOSYS` – Not implemented.

static inline struct *i3c_device_desc* ***i3c_device_find**(const struct *device* *dev, const struct *i3c_device_id* *id)

Find a registered I3C target device.

Controller only API.

This returns the I3C device descriptor of the I3C device matching the incoming `id`.

Parameters

- `dev` – Pointer to controller device driver instance.
- `id` – Pointer to I3C device ID.

Returns

Pointer to I3C device descriptor, or `NULL` if no I3C device found matching incoming `id`.

int **i3c_bus_init**(const struct *device* *dev, const struct *i3c_dev_list* *i3c_dev_list)

Generic helper function to perform bus initialization.

Parameters

- `dev` – Pointer to controller device driver instance.
- `i3c_dev_list` – Pointer to I3C device list.

Return values

- `0` – If successful.
- `-EBUSY` – Bus is busy.
- `-EIO` – General input / output error.
- `-ENODEV` – If a provisioned ID does not match to any target devices in the registered device list.
- `-ENOSPC` – No more free addresses can be assigned to target.
- `-ENOSYS` – Dynamic address assignment is not supported by the controller driver.

int `i3c_device_basic_info_get`(struct *i3c_device_desc* *target)

Get basic information from device and update device descriptor.

This retrieves some basic information:

- Bus Characteristics Register (GETBCR)
- Device Characteristics Register (GETDCR)
- Max Read Length (GETMRL)
- Max Write Length (GETMWL) from the device and update the corresponding fields of the device descriptor.

This only updates the field(s) in device descriptor only if CCC operations succeed.

Parameters

- `target` – **[inout]** I3C target device descriptor.

Return values

- `0` – if successful.
- `-EIO` – General Input/Output error.

struct `i3c_config_controller`

#include <*i3c.h*> Configuration parameters for I3C hardware to act as controller.

Public Members

bool `is_secondary`

True if the controller is to be the secondary controller of the bus.

False to be the primary controller.

uint32_t `i3c`

SCL frequency (in Hz) for I3C transfers.

uint32_t `i2c`

SCL frequency (in Hz) for I2C transfers.

uint8_t **supported_hdr**

Bit mask of supported HDR modes (0 - 7).

This can be used to enable or disable HDR mode supported by the hardware at runtime.

struct **i3c_config_custom**

#include <*i3c.h*> Custom I3C configuration parameters.

This can be used to configure the I3C hardware on parameters not covered by *i3c_config_controller* or *i3c_config_target*. Mostly used to configure vendor specific parameters of the I3C hardware.

Public Members

uint32_t **id**

ID of the configuration parameter.

uintptr_t **val**

Value of configuration parameter.

void ***ptr**

Pointer to configuration parameter.

Mainly used to pointer to a struct that the device driver understands.

struct **i3c_device_id**

#include <*i3c.h*> Structure used for matching I3C devices.

Public Members

const uint64_t **pid**

Device Provisioned ID.

struct **i3c_device_desc**

#include <*i3c.h*> Structure describing a I3C target device.

Instances of this are passed to the I3C controller device APIs, for example:

- i3c_device_register() to tell the controller of a target device.
- i3c_transfers() to initiate data transfers between controller and target device.

Fields *bus*, *pid* and *static_addr* must be initialized by the module that implements the target device behavior prior to passing the object reference to I3C controller device APIs. *static_addr* can be zero if target device does not have static address.

Internal field node should not be initialized or modified manually.

Public Members

const struct *device* *const **bus**

I3C bus to which this target device is attached.

const struct *device* *const **dev**

Device driver instance of the I3C device.

const uint64_t **pid**

Device Provisioned ID.

const uint8_t **static_addr**

Static address for this target device.

0 if static address is not being used, and only dynamic address is used. This means that the target device must go through ENTDAA (Dynamic Address Assignment) to get a dynamic address before it can communicate with the controller. This means SETAASA and SETDASA CCC cannot be used to set dynamic address on the target device (as both are to tell target device to use static address as dynamic address).

const uint8_t **init_dynamic_addr**

Initial dynamic address.

This is specified in the device tree property "assigned-address" to indicate the desired dynamic address during address assignment (SETDASA and ENTDAA).

0 if there is no preference.

uint8_t **dynamic_addr**

Dynamic Address for this target device used for communication.

This is to be set by the controller driver in one of the following situations:
- During Dynamic Address Assignment (during ENTDAA)
- Reset Dynamic Address Assignment (RSTDAA)
- Set All Addresses to Static Addresses (SETAASA)
- Set New Dynamic Address (SETNEWDA)
- Set Dynamic Address from Static Address (SETDASA)

0 if address has not been assigned.

uint8_t **group_addr**

Group address for this target device.

Set during:
- Reset Group Address(es) (RSTGRPA)
- Set Group Address (SETGRPA)

0 if group address has not been assigned. Only available if `CONFIG_I3C_USE_GROUP_ADDR` is set.

uint8_t **bcr**

Bus Characteristic Register (BCR)

See also

I3C_BCR

uint8_t **dcr**

Device Characteristic Register (DCR)

Describes the type of device. Refer to official documentation on what this number means.

uint8_t **maxrd**

Maximum Read Speed.

uint8_t **maxwr**

Maximum Write Speed.

uint32_t **max_read_turnaround**

Maximum Read turnaround time in microseconds.

uint16_t **mrl**

Maximum Read Length.

uint16_t **mwl**

Maximum Write Length.

uint8_t **max_ibi**

Maximum IBI Payload Size.

Valid only if BCR[2] is 1.

uint8_t **gethdrcap**

I3C v1.0 HDR Capabilities (`I3C_CCC_GETCAPS1_*`)

- Bit[0]: HDR-DDR
- Bit[1]: HDR-TSP
- Bit[2]: HDR-TSL
- Bit[7:3]: Reserved

uint8_t **getcap1**

I3C v1.1+ GETCAPS1 (`I3C_CCC_GETCAPS1_*`)

- Bit[0]: HDR-DDR
- Bit[1]: HDR-TSP
- Bit[2]: HDR-TSL
- Bit[3]: HDR-BT
- Bit[7:4]: Reserved

uint8_t **getcap2**

GETCAPS2 (`I3C_CCC_GETCAPS2_*`)

- Bit[3:0]: I3C 1.x Specification Version
- Bit[5:4]: Group Address Capabilities
- Bit[6]: HDR-DDR Write Abort
- Bit[7]: HDR-DDR Abort CRC

uint8_t **getcap3**

GETCAPS3 (`I3C_CCC_GETCAPS3_*`)

- Bit[0]: Multi-Lane (ML) Data Transfer Support
- Bit[1]: Device to Device Transfer (D2DXFER) Support
- Bit[2]: Device to Device Transfer (D2DXFER) IBI Capable
- Bit[3]: Defining Byte Support in GETCAPS
- Bit[4]: Defining Byte Support in GETSTATUS
- Bit[5]: HDR-BT CRC-32 Support
- Bit[6]: IBI MDB Support for Pending Read Notification
- Bit[7]: Reserved

uint8_t **getcap4**

GETCAPS4.

- Bit[7:0]: Reserved

struct *i3c_device_desc* **getcaps**

Describes advanced (Target) capabilities and features.

i3c_target_ibi_cb_t **ibi_cb**

In-Band Interrupt (IBI) callback.

Only available if `CONFIG_I3C_USE_IBI` is set.

struct **i3c_i2c_device_desc**

#include <*i3c.h*> Structure describing a I2C device on I3C bus.

Instances of this are passed to the I3C controller device APIs, for example: () i3c_i2c_device_register() to tell the controller of an I2C device. () i3c_i2c_transfers() to initiate data transfers between controller and I2C device.

Fields other than `node` must be initialized by the module that implements the device behavior prior to passing the object reference to I3C controller device APIs.

Public Members

const struct *device* ***bus**

I3C bus to which this I2C device is attached.

const uint16_t **addr**

Static address for this I2C device.

const uint8_t **lvr**

Legacy Virtual Register (LVR)

See also

I3C_LVR

struct `i3c_dev_attached_list`

#include <*i3c.h*> Structure for describing attached devices for a controller.

This contains slists of attached I3C and I2C devices.

This is a helper struct that can be used by controller device driver to aid in device management.

Public Members

struct *i3c_addr_slots* `addr_slots`

Address slots:

- Aid in dynamic address assignment.
- Quick way to find out if a target address is a I3C or I2C device.

sys_slist_t `i3c`

Linked list of attached I3C devices.

sys_slist_t `i2c`

Linked list of attached I2C devices.

struct `i3c_dev_list`

#include <*i3c.h*> Structure for describing known devices for a controller.

This contains arrays of known I3C and I2C devices.

This is a helper struct that can be used by controller device driver to aid in device management.

Public Members

struct *i3c_device_desc* *const `i3c`

Pointer to array of known I3C devices.

struct *i3c_i2c_device_desc* *const `i2c`

Pointer to array of known I2C devices.

const uint8_t `num_i3c`

Number of I3C devices in array.

const uint8_t `num_i2c`

Number of I2C devices in array.

struct `i3c_driver_config`

#include <*i3c.h*> This structure is common to all I3C drivers and is expected to be the first element in the object pointed to by the config field in the device structure.

Public Members

struct *i3c_dev_list* `dev_list`
I3C/I2C device list struct.

struct `i3c_driver_data`
#include <*i3c.h*> This structure is common to all I3C drivers and is expected to be the first element in the driver's struct driver_data declaration.

Public Members

struct *i3c_config_controller* `ctrl_config`
Controller Configuration.

struct *i3c_dev_attached_list* `attached_dev`
Attached I3C/I2C devices and addresses.

group `i3c_ccc`
I3C Common Command Codes.

Defines

`I3C_CCC_BROADCAST_MAX_ID`
Maximum CCC ID for broadcast.

`I3C_CCC_ENEC`(broadcast)
Enable Events Command.

Parameters

- `broadcast` – True if broadcast, false if direct.

`I3C_CCC_DISEC`(broadcast)
Disable Events Command.

Parameters

- `broadcast` – True if broadcast, false if direct.

`I3C_CCC_ENTAS`(as, broadcast)
Enter Activity State.

Parameters

- `as` – Desired activity state
- `broadcast` – True if broadcast, false if direct.

`I3C_CCC_ENTAS0`(broadcast)
Enter Activity State 0.

Parameters

- `broadcast` – True if broadcast, false if direct.

I3C_CCC_ENTAS1(broadcast)
Enter Activity State 1.

Parameters

- broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS2(broadcast)
Enter Activity State 2.

Parameters

- broadcast – True if broadcast, false if direct.

I3C_CCC_ENTAS3(broadcast)
Enter Activity State 3.

Parameters

- broadcast – True if broadcast, false if direct.

I3C_CCC_RSTDAA
Reset Dynamic Address Assignment (Broadcast)

I3C_CCC_ENTDAA
Enter Dynamic Address Assignment (Broadcast)

I3C_CCC_DEFTGTS
Define List of Targets (Broadcast)

I3C_CCC_SETMWL(broadcast)
Set Max Write Length (Broadcast or Direct)

Parameters

- broadcast – True if broadcast, false if direct.

I3C_CCC_SETMRL(broadcast)
Set Max Read Length (Broadcast or Direct)

Parameters

- broadcast – True if broadcast, false if direct.

I3C_CCC_ENTTM
Enter Test Mode (Broadcast)

I3C_CCC_SETBUSCON
Set Bus Context (Broadcast)

I3C_CCC_ENDXFER(broadcast)
Data Transfer Ending Procedure Control.

Parameters

- broadcast – True if broadcast, false if direct.

I3C_CCC_ENTHDR(x)
Enter HDR Mode (HDR-DDR) (Broadcast)

I3C_CCC_ENTHDR0
Enter HDR Mode 0 (HDR-DDR) (Broadcast)

I3C_CCC_ENTHDR1
: Enter HDR Mode 1 (HDR-TSP) (Broadcast)

I3C_CCC_ENTHDR2
: Enter HDR Mode 2 (HDR-TSL) (Broadcast)

I3C_CCC_ENTHDR3
: Enter HDR Mode 3 (HDR-BT) (Broadcast)

I3C_CCC_ENTHDR4
: Enter HDR Mode 4 (Broadcast)

I3C_CCC_ENTHDR5
: Enter HDR Mode 5 (Broadcast)

I3C_CCC_ENTHDR6
: Enter HDR Mode 6 (Broadcast)

I3C_CCC_ENTHDR7
: Enter HDR Mode 7 (Broadcast)

I3C_CCC_SETXTIME(broadcast)
: Exchange Timing Information (Broadcast or Direct)

  Parameters

  - broadcast – True if broadcast, false if direct.

I3C_CCC_SETAASA
: Set All Addresses to Static Addresses (Broadcast)

I3C_CCC_RSTACT(broadcast)
: Target Reset Action.

  Parameters

  - broadcast – True if broadcast, false if direct.

I3C_CCC_DEFGRPA
: Define List of Group Address (Broadcast)

I3C_CCC_RSTGRPA(broadcast)
: Reset Group Address.

  Parameters

  - broadcast – True if broadcast, false if direct.

I3C_CCC_MLANE(broadcast)
: Multi-Lane Data Transfer Control (Broadcast)

I3C_CCC_VENDOR(broadcast, id)
: Vendor/Standard Extension.

  Parameters

  - broadcast – True if broadcast, false if direct.
  - id – Extension ID.

`I3C_CCC_SETDASA`
: Set Dynamic Address from Static Address (Direct)

`I3C_CCC_SETNEWDA`
: Set New Dynamic Address (Direct)

`I3C_CCC_GETMWL`
: Get Max Write Length (Direct)

`I3C_CCC_GETMRL`
: Get Max Read Length (Direct)

`I3C_CCC_GETPID`
: Get Provisioned ID (Direct)

`I3C_CCC_GETBCR`
: Get Bus Characteristics Register (Direct)

`I3C_CCC_GETDCR`
: Get Device Characteristics Register (Direct)

`I3C_CCC_GETSTATUS`
: Get Device Status (Direct)

`I3C_CCC_GETACCCR`
: Get Accept Controller Role (Direct)

`I3C_CCC_SETBRGTGT`
: Set Bridge Targets (Direct)

`I3C_CCC_GETMXDS`
: Get Max Data Speed (Direct)

`I3C_CCC_GETCAPS`
: Get Optional Feature Capabilities (Direct)

`I3C_CCC_SETROUTE`
: Set Route (Direct)

`I3C_CCC_D2DXFER`
: Device to Device(s) Tunneling Control (Direct)

`I3C_CCC_GETXTIME`
: Get Exchange Timing Information (Direct)

`I3C_CCC_SETGRPA`
: Set Group Address (Direct)

I3C_CCC_ENEC_EVT_ENINTR
: Enable Events (ENEC) - Target Interrupt Requests.

I3C_CCC_ENEC_EVT_ENCR
: Enable Events (ENEC) - Controller Role Requests.

I3C_CCC_ENEC_EVT_ENHJ
: Enable Events (ENEC) - Hot-Join Event.

I3C_CCC_ENEC_EVT_ALL

I3C_CCC_DISEC_EVT_DISINTR
: Disable Events (DISEC) - Target Interrupt Requests.

I3C_CCC_DISEC_EVT_DISCR
: Disable Events (DISEC) - Controller Role Requests.

I3C_CCC_DISEC_EVT_DISHJ
: Disable Events (DISEC) - Hot-Join Event.

I3C_CCC_DISEC_EVT_ALL

I3C_CCC_EVT_INTR
: Events - Target Interrupt Requests.

I3C_CCC_EVT_CR
: Events - Controller Role Requests.

I3C_CCC_EVT_HJ
: Events - Hot-Join Event.

I3C_CCC_EVT_ALL
: Bitmask for all events.

I3C_CCC_GETSTATUS_PROTOCOL_ERR
: GETSTATUS Format 1 - Protocol Error bit.

I3C_CCC_GETSTATUS_ACTIVITY_MODE_MASK
: GETSTATUS Format 1 - Activity Mode bitmask.

I3C_CCC_GETSTATUS_ACTIVITY_MODE(status)
: GETSTATUS Format 1 - Activity Mode.

  Obtain Activity Mode from GETSTATUS Format 1 value obtained via GETSTATUS.

  Parameters

  - **status** – GETSTATUS Format 1 value

I3C_CCC_GETSTATUS_NUM_INT_MASK
: GETSTATUS Format 1 - Number of Pending Interrupts bitmask.

I3C_CCC_GETSTATUS_NUM_INT(status)

GETSTATUS Format 1 - Number of Pending Interrupts.

Obtain Number of Pending Interrupts from GETSTATUS Format 1 value obtained via GETSTATUS.

Parameters

- **status** – GETSTATUS Format 1 value

I3C_CCC_GETSTATUS_PRECR_DEEP_SLEEP_DETECTED

GETSTATUS Format 2 - PERCR - Deep Sleep Detected bit.

I3C_CCC_GETSTATUS_PRECR_HANDOFF_DELAY_NACK

GETSTATUS Format 2 - PERCR - Handoff Delay NACK.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_MAX

Get Max Data Speed (GETMXDS) - Default Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_8MHZ

Get Max Data Speed (GETMXDS) - 8MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_6MHZ

Get Max Data Speed (GETMXDS) - 6MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_4MHZ

Get Max Data Speed (GETMXDS) - 4MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_MAX_SDR_FSCL_2MHZ

Get Max Data Speed (GETMXDS) - 2MHz Max Sustained Data Rate.

I3C_CCC_GETMXDS_TSCO_8NS

Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 8ns.

I3C_CCC_GETMXDS_TSCO_9NS

Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 9ns.

I3C_CCC_GETMXDS_TSCO_10NS

Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 10ns.

I3C_CCC_GETMXDS_TSCO_11NS

Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 11ns.

I3C_CCC_GETMXDS_TSCO_12NS

Get Max Data Speed (GETMXDS) - Clock to Data Turnaround <= 12ns.

I3C_CCC_GETMXDS_TSCO_GT_12NS

Get Max Data Speed (GETMXDS) - Clock to Data Turnaround > 12ns.

I3C_CCC_GETMXDS_MAXWR_DEFINING_BYTE_SUPPORT

Get Max Data Speed (GETMXDS) - maxWr - Optional Defining Byte Support.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL_MASK

Get Max Data Speed (GETMXDS) - Max Sustained Data Rate bitmask.

I3C_CCC_GETMXDS_MAXWR_MAX_SDR_FSCL(maxwr)

Get Max Data Speed (GETMXDS) - maxWr - Max Sustained Data Rate.

Obtain Max Sustained Data Rate value from GETMXDS maxWr value obtained via GETMXDS.

Parameters

- maxwr – GETMXDS maxWr value.

I3C_CCC_GETMXDS_MAXRD_W2R_PERMITS_STOP_BETWEEN

Get Max Data Speed (GETMXDS) - maxRd - Write-to-Read Permits Stop Between.

I3C_CCC_GETMXDS_MAXRD_TSCO_MASK

Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround bitmask.

I3C_CCC_GETMXDS_MAXRD_TSCO(maxrd)

Get Max Data Speed (GETMXDS) - maxRd - Clock to Data Turnaround.

Obtain Clock to Data Turnaround value from GETMXDS maxRd value obtained via GETMXDS.

Parameters

- maxrd – GETMXDS maxRd value.

I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL_MASK

Get Max Data Speed (GETMXDS) - maxRd - Max Sustained Data Rate bitmask.

I3C_CCC_GETMXDS_MAXRD_MAX_SDR_FSCL(maxrd)

Get Max Data Speed (GETMXDS) - maxRd - Max Sustained Data Rate.

Obtain Max Sustained Data Rate value from GETMXDS maxRd value obtained via GETMXDS.

Parameters

- maxrd – GETMXDS maxRd value.

I3C_CCC_GETMXDS_CRDHLY1_SET_BUS_ACT_STATE

Get Max Data Speed (GETMXDS) - CRDHLY1 - Set Bus Activity State bit shift value.

I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE_MASK

Get Max Data Speed (GETMXDS) - CRDHLY1 - Controller Handoff Activity State bitmask.

I3C_CCC_GETMXDS_CRDHLY1_CTRL_HANDOFF_ACT_STATE(crhdly1)

Get Max Data Speed (GETMXDS) - CRDHLY1 - Controller Handoff Activity State.

Obtain Controller Handoff Activity State value from GETMXDS value obtained via GETMXDS.

Parameters

- crhdly1 – GETMXDS value.

I3C_CCC_GETCAPS1_HDR_DDR

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR-DDR mode bit.

I3C_CCC_GETCAPS1_HDR_TSP

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR-TSP mode bit.

I3C_CCC_GETCAPS1_HDR_TSL

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR-TSL mode bit.

I3C_CCC_GETCAPS1_HDR_BT

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR-BT mode bit.

I3C_CCC_GETCAPS1_HDR_MODE(x)

Get Optional Feature Capabilities Byte 1 (GETCAPS) - HDR Mode.

Get the bit corresponding to HDR mode.

Parameters

- x – HDR mode

I3C_CCC_GETCAPS1_HDR_MODE0

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 0.

I3C_CCC_GETCAPS1_HDR_MODE1

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 1.

I3C_CCC_GETCAPS1_HDR_MODE2

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 2.

I3C_CCC_GETCAPS1_HDR_MODE3

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 3.

I3C_CCC_GETCAPS1_HDR_MODE4

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 4.

I3C_CCC_GETCAPS1_HDR_MODE5

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 5.

I3C_CCC_GETCAPS1_HDR_MODE6

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 6.

I3C_CCC_GETCAPS1_HDR_MODE7

Get Optional Feature Capabilities Byte 1 (GETCAPS) Format 1 - HDR Mode 7.

I3C_CCC_GETCAPS2_HDRDDR_WRITE_ABORT

Get Optional Feature Capabilities Byte 2 (GETCAPS) Format 1 - HDR-DDR Write Abort bit.

I3C_CCC_GETCAPS2_HDRDDR_ABORT_CRC

Get Optional Feature Capabilities Byte 2 (GETCAPS) Format 1 - HDR-DDR Abort CRC bit.

I3C_CCC_GETCAPS2_GRPADDR_CAP_MASK

Get Optional Feature Capabilities Byte 2 (GETCAPS) Format 1 - Group Address Capabilities bitmask.

I3C_CCC_GETCAPS2_GRPADDR_CAP(getcaps2)

Get Optional Feature Capabilities Byte 2 (GETCAPS) Format 1 - Group Address Capabilities.

Obtain Group Address Capabilities value from GETCAPS Format 1 value obtained via GETCAPS.

Parameters

- **getcaps2** – GETCAPS2 value.

I3C_CCC_GETCAPS2_SPEC_VER_MASK

Get Optional Feature Capabilities Byte 2 (GETCAPS) Format 1 - I3C 1.x Specification Version bitmask.

I3C_CCC_GETCAPS2_SPEC_VER(getcaps2)

Get Optional Feature Capabilities Byte 2 (GETCAPS) Format 1 - I3C 1.x Specification Version.

Obtain I3C 1.x Specification Version value from GETCAPS Format 1 value obtained via GETCAPS.

Parameters

- **getcaps2** – GETCAPS2 value.

I3C_CCC_GETCAPS3_MLANE_SUPPORT

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - Multi-Lane Data Transfer Support bit.

I3C_CCC_GETCAPS3_D2DXFER_SUPPORT

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - Device to Device Transfer (D2DXFER) Support bit.

I3C_CCC_GETCAPS3_D2DXFER_IBI_CAPABLE

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - Device to Device Transfer (D2DXFER) IBI Capable bit.

I3C_CCC_GETCAPS3_GETCAPS_DEFINING_BYTE_SUPPORT

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - Defining Byte Support in GETCAPS bit.

I3C_CCC_GETCAPS3_GETSTATUS_DEFINING_BYTE_SUPPORT

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - Defining Byte Support in GETSTATUS bit.

I3C_CCC_GETCAPS3_HDRBT_CRC32_SUPPORT

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - HDR-BT CRC-32 Support bit.

I3C_CCC_GETCAPS3_IBI_MDR_PENDING_READ_NOTIFICATION

Get Optional Feature Capabilities Byte 3 (GETCAPS) Format 1 - IBI MDB Support for Pending Read Notification bit.

I3C_CCC_GETCAPS_TESTPAT1

Get Fixed Test Pattern (GETCAPS) Format 2 - Fixed Test Pattern Byte 1.

I3C_CCC_GETCAPS_TESTPAT2

Get Fixed Test Pattern (GETCAPS) Format 2 - Fixed Test Pattern Byte 2.

I3C_CCC_GETCAPS_TESTPAT3

Get Fixed Test Pattern (GETCAPS) Format 2 - Fixed Test Pattern Byte 3.

I3C_CCC_GETCAPS_TESTPAT4

Get Fixed Test Pattern (GETCAPS) Format 2 - Fixed Test Pattern Byte 4.

I3C_CCC_GETCAPS_TESTPAT

Get Fixed Test Pattern (GETCAPS) Format 2 - Fixed Test Pattern Word in Big Endian.

I3C_CCC_GETCAPS_CRCAPS1_HJ_SUPPORT

Get Controller Handoff Capabilities Byte 1 (GETCAPS) Format 2 - Hot-Join Support.

I3C_CCC_GETCAPS_CRCAPS1_GRP_MANAGEMENT_SUPPORT

Get Controller Handoff Capabilities Byte 1 (GETCAPS) Format 2 - Group Management Support.

I3C_CCC_GETCAPS_CRCAPS1_ML_SUPPORT

Get Controller Handoff Capabilities Byte 1 (GETCAPS) Format 2 - Multi-Lane Support.

I3C_CCC_GETCAPS_CRCAPS2_IBI_TIR_SUPPORT

Get Controller Handoff Capabilities Byte 2 (GETCAPS) Format 2 - In-Band Interrupt Support.

I3C_CCC_GETCAPS_CRCAPS2_CONTROLLER_PASSBACK

Get Controller Handoff Capabilities Byte 2 (GETCAPS) Format 2 - Controller Pass-Back.

I3C_CCC_GETCAPS_CRCAPS2_DEEP_SLEEP_CAPABLE

Get Controller Handoff Capabilities Byte 2 (GETCAPS) Format 2 - Deep Sleep Capable.

I3C_CCC_GETCAPS_CRCAPS2_DELAYED_CONTROLLER_HANDOFF

Get Controller Handoff Capabilities Byte 2 (GETCAPS) Format 2 - Deep Sleep Capable.

I3C_CCC_GETCAPS_VTCAP1_VITRUAL_TARGET_TYPE_MASK

Get Capabilities (GETCAPS) - VTCAP1 - Virtual Target Type bitmask.

I3C_CCC_GETCAPS_VTCAP1_VITRUAL_TARGET_TYPE(vtcap1)

Get Capabilities (GETCAPS) - VTCAP1 - Virtual Target Type.

Obtain Virtual Target Type value from VTCAP1 value obtained via GETCAPS format 2 VTCAP def byte.

Parameters

- vtcap1 – VTCAP1 value.

I3C_CCC_GETCAPS_VTCAP1_SIDE_EFFECTS

Get Virtual Target Capabilities Byte 1 (GETCAPS) Format 2 - Side Effects.

I3C_CCC_GETCAPS_VTCAP1_SHARED_PERIPH_DETECT

Get Virtual Target Capabilities Byte 1 (GETCAPS) Format 2 - Shared Peripheral Detect.

I3C_CCC_GETCAPS_VTCAP2_INTERRUPT_REQUESTS_MASK

Get Capabilities (GETCAPS) - VTCAP2 - Interrupt Requests bitmask.

I3C_CCC_GETCAPS_VTCAP2_INTERRUPT_REQUESTS(vtcap2)

Get Capabilities (GETCAPS) - VTCAP2 - Interrupt Requests.

Obtain Interrupt Requests value from VTCAP2 value obtained via GETCAPS format 2 VTCAP def byte.

Parameters

- vtcap2 – VTCAP2 value.

I3C_CCC_GETCAPS_VTCAP2_ADDRESS_REMAPPING

Get Virtual Target Capabilities Byte 2 (GETCAPS) Format 2 - Address Remapping.

I3C_CCC_GETCAPS_VTCAP2_BUS_CONTEXT_AND_COND_MASK

Get Capabilities (GETCAPS) - VTCAP2 - Bus Context and Condition bitmask.

I3C_CCC_GETCAPS_VTCAP2_BUS_CONTEXT_AND_COND(vtcap2)

Get Capabilities (GETCAPS) - VTCAP2 - Bus Context and Condition.

Obtain Bus Context and Condition value from VTCAP2 value obtained via GETCAPS format 2 VTCAP def byte.

Parameters

- vtcap2 – VTCAP2 value.

Enums

enum i3c_ccc_getstatus_fmt

Indicate which format of GETSTATUS to use.

Values:

enumerator GETSTATUS_FORMAT_1

GETSTATUS Format 1.

enumerator GETSTATUS_FORMAT_2

GETSTATUS Format 2.

enum i3c_ccc_getstatus_defbyte

Defining byte values for GETSTATUS Format 2.

Values:

enumerator GETSTATUS_FORMAT_2_TGTSTAT = 0x00U

Target status.

enumerator GETSTATUS_FORMAT_2_PRECR = 0x91U

PRECR - Alternate status format describing Controller-capable device.

enumerator GETSTATUS_FORMAT_2_INVALID = 0x100U
Invalid defining byte.

enum i3c_ccc_getcaps_fmt
Indicate which format of GETCAPS to use.
Values:

enumerator GETCAPS_FORMAT_1
GETCAPS Format 1.

enumerator GETCAPS_FORMAT_2
GETCAPS Format 2.

enum i3c_ccc_getcaps_defbyte
Enum for I3C Get Capabilities (GETCAPS) Format 2 Defining Byte Values.
Values:

enumerator GETCAPS_FORMAT_2_TGTCAPS = 0x00U
Standard Target capabilities and features.

enumerator GETCAPS_FORMAT_2_TESTPAT = 0x5AU
Fixed 32b test pattern.

enumerator GETCAPS_FORMAT_2_CRCAPS = 0x91U
Controller handoff capabilities and features.

enumerator GETCAPS_FORMAT_2_VTCAPS = 0x93U
Virtual Target capabilities and features.

enumerator GETCAPS_FORMAT_2_DBGCAPS = 0xD7U
Debug-capable Device capabilities and features.

enumerator GETCAPS_FORMAT_2_INVALID = 0x100
Invalid defining byte.

enum i3c_ccc_rstact_defining_byte
Enum for I3C Reset Action (RSTACT) Defining Byte Values.
Values:

enumerator I3C_CCC_RSTACT_NO_RESET = 0x00U
No Reset on Target Reset Pattern.

enumerator I3C_CCC_RSTACT_PERIPHERAL_ONLY = 0x01U
Reset the I3C Peripheral Only.

enumerator I3C_CCC_RSTACT_RESET_WHOLE_TARGET = 0x02U
Reset the Whole Target.

enumerator `I3C_CCC_RSTACT_DEBUG_NETWORK_ADAPTER` = 0x03U
Debug Network Adapter Reset.

enumerator `I3C_CCC_RSTACT_VIRTUAL_TARGET_DETECT` = 0x04U
Virtual Target Detect.

Functions

static inline bool `i3c_ccc_is_payload_broadcast`(const struct *i3c_ccc_payload* *payload)
Test if I3C CCC payload is for broadcast.

This tests if the CCC payload is for broadcast.

Parameters

- `payload` – **[in]** Pointer to the CCC payload.

Return values

- `true` – if payload target is broadcast
- `false` – if payload target is direct

int `i3c_ccc_do_getbcr`(struct *i3c_device_desc* *target, struct *i3c_ccc_getbcr* *bcr)
Get BCR from a target.

Helper function to get BCR (Bus Characteristic Register) from target device.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `bcr` – **[out]** Pointer to the BCR payload structure.

Returns

int `i3c_ccc_do_getdcr`(struct *i3c_device_desc* *target, struct *i3c_ccc_getdcr* *dcr)
Get DCR from a target.

Helper function to get DCR (Device Characteristic Register) from target device.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `dcr` – **[out]** Pointer to the DCR payload structure.

Returns

int `i3c_ccc_do_getpid`(struct *i3c_device_desc* *target, struct *i3c_ccc_getpid* *pid)

Get PID from a target.

Helper function to get PID (Provisioned ID) from target device.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `pid` – **[out]** Pointer to the PID payload structure.

Returns

int `i3c_ccc_do_rstact_all`(const struct *device* *controller, enum *i3c_ccc_rstact_defining_byte* action)

Broadcast RSTACT to reset I3C Peripheral.

Helper function to broadcast Target Reset Action (RSTACT) to all connected targets to Reset the I3C Peripheral Only (0x01).

See also

i3c_do_ccc

Parameters

- `controller` – **[in]** Pointer to the controller device driver instance.
- `action` – **[in]** What reset action to perform.

Returns

int `i3c_ccc_do_rstdaa_all`(const struct *device* *controller)

Broadcast RSTDAA to reset dynamic addresses for all targets.

Helper function to reset dynamic addresses of all connected targets.

See also

i3c_do_ccc

Parameters

- `controller` – **[in]** Pointer to the controller device driver instance.

Returns

int `i3c_ccc_do_setdasa`(const struct *i3c_device_desc* *target)

Set Dynamic Address from Static Address for a target.

Helper function to do SETDASA (Set Dynamic Address from Static Address) for a particular target.

Note this does not update `target` with the new dynamic address.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor where the device is configured with a static address.

Returns

int `i3c_ccc_do_setnewda`(const struct *i3c_device_desc* *target, struct *i3c_ccc_address* new_da)

Set New Dynamic Address for a target.

Helper function to do SETNEWDA(Set New Dynamic Address) for a particular target.

Note this does not update `target` with the new dynamic address.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor where the device is configured with a static address.
- `new_da` – **[in]** Pointer to the new_da struct.

Returns

int `i3c_ccc_do_events_all_set`(const struct *device* *controller, bool enable, struct *i3c_ccc_events* *events)

Broadcast ENEC/DISEC to enable/disable target events.

Helper function to broadcast Target Events Command to enable or disable target events (ENEC/DISEC).

See also

i3c_do_ccc

Parameters

- `controller` – **[in]** Pointer to the controller device driver instance.

- `enable` – **[in]** ENEC if true, DISEC if false.
- `events` – **[in]** Pointer to the event struct.

Returns

int `i3c_ccc_do_events_set`(struct *i3c_device_desc* *target, bool enable, struct *i3c_ccc_events* *events)

Direct CCC ENEC/DISEC to enable/disable target events.

Helper function to send Target Events Command to enable or disable target events (ENEC/DISEC) on a single target.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `enable` – **[in]** ENEC if true, DISEC if false.
- `events` – **[in]** Pointer to the event struct.

Returns

int `i3c_ccc_do_setmwl_all`(const struct *device* *controller, const struct *i3c_ccc_mwl* *mwl)

Broadcast SETMWL to Set Maximum Write Length.

Helper function to do SETMWL (Set Maximum Write Length) to all connected targets.

See also

i3c_do_ccc

Parameters

- `controller` – **[in]** Pointer to the controller device driver instance.
- `mwl` – **[in]** Pointer to SETMWL payload.

Returns

int `i3c_ccc_do_setmwl`(const struct *i3c_device_desc* *target, const struct *i3c_ccc_mwl* *mwl)

Single target SETMWL to Set Maximum Write Length.

Helper function to do SETMWL (Set Maximum Write Length) to one target.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `mwl` – **[in]** Pointer to SETMWL payload.

Returns

int `i3c_ccc_do_getmwl`(const struct *i3c_device_desc* *target, struct *i3c_ccc_mwl* *mwl)

Single target GETMWL to Get Maximum Write Length.

Helper function to do GETMWL (Get Maximum Write Length) of one target.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `mwl` – **[out]** Pointer to GETMWL payload.

Returns

int `i3c_ccc_do_setmrl_all`(const struct *device* *controller, const struct *i3c_ccc_mrl* *mrl, bool has_ibi_size)

Broadcast SETMRL to Set Maximum Read Length.

Helper function to do SETMRL (Set Maximum Read Length) to all connected targets.

See also

i3c_do_ccc

Parameters

- `controller` – **[in]** Pointer to the controller device driver instance.
- `mrl` – **[in]** Pointer to SETMRL payload.
- `has_ibi_size` – **[in]** True if also sending the optional IBI payload size. False if not sending.

Returns

int `i3c_ccc_do_setmrl`(const struct *i3c_device_desc* *target, const struct *i3c_ccc_mrl* *mrl)

Single target SETMRL to Set Maximum Read Length.

Helper function to do SETMRL (Set Maximum Read Length) to one target.

Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `mrl` – **[in]** Pointer to SETMRL payload.

Returns

int `i3c_ccc_do_getmrl`(const struct *i3c_device_desc* *target, struct *i3c_ccc_mrl* *mrl)

Single target GETMRL to Get Maximum Read Length.

Helper function to do GETMRL (Get Maximum Read Length) of one target.

Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `mrl` – **[out]** Pointer to GETMRL payload.

Returns

int `i3c_ccc_do_getstatus`(const struct *i3c_device_desc* *target, union *i3c_ccc_getstatus* *status, enum *i3c_ccc_getstatus_fmt* fmt, enum *i3c_ccc_getstatus_defbyte* defbyte)

Single target GETSTATUS to Get Target Status.

Helper function to do GETSTATUS (Get Target Status) of one target.

Note this uses the BCR of the target to determine whether to send the optional IBI payload size.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `status` – **[out]** Pointer to GETSTATUS payload.
- `fmt` – **[in]** Which GETSTATUS to use.
- `defbyte` – **[in]** Defining Byte if using format 2.

Returns

static inline int `i3c_ccc_do_getstatus_fmt1`(const struct *i3c_device_desc* *target, union *i3c_ccc_getstatus* *status)

Single target GETSTATUS to Get Target Status (Format 1).

Helper function to do GETSTATUS (Get Target Status, format 1) of one target.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `status` – **[out]** Pointer to GETSTATUS payload.

Returns

static inline int `i3c_ccc_do_getstatus_fmt2`(const struct *i3c_device_desc* *target, union *i3c_ccc_getstatus* *status, enum *i3c_ccc_getstatus_defbyte* defbyte)

Single target GETSTATUS to Get Target Status (Format 2).

Helper function to do GETSTATUS (Get Target Status, format 2) of one target.

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `status` – **[out]** Pointer to GETSTATUS payload.
- `defbyte` – **[in]** Defining Byte for GETSTATUS format 2.

Returns

int `i3c_ccc_do_getcaps`(const struct *i3c_device_desc* *target, union *i3c_ccc_getcaps* *caps, enum *i3c_ccc_getcaps_fmt* fmt, enum *i3c_ccc_getcaps_defbyte* defbyte)

Single target GETCAPS to Get Target Status.

Helper function to do GETCAPS (Get Capabilities) of one target.

This should only be supported if Advanced Capabilities Bit of the BCR is set

See also

i3c_do_ccc

Parameters

- `target` – **[in]** Pointer to the target device descriptor.
- `caps` – **[out]** Pointer to GETCAPS payload.
- `fmt` – **[in]** Which GETCAPS to use.
- `defbyte` – **[in]** Defining Byte if using format 2.

Returns

static inline int **i3c_ccc_do_getcaps_fmt1**(const struct *i3c_device_desc* *target, union *i3c_ccc_getcaps* *caps)

Single target GETCAPS to Get Capabilities (Format 1).

Helper function to do GETCAPS (Get Capabilities, format 1) of one target.

See also

i3c_do_ccc

Parameters

- **target** – **[in]** Pointer to the target device descriptor.
- **caps** – **[out]** Pointer to GETCAPS payload.

Returns

static inline int **i3c_ccc_do_getcaps_fmt2**(const struct *i3c_device_desc* *target, union *i3c_ccc_getcaps* *caps, enum *i3c_ccc_getcaps_defbyte* defbyte)

Single target GETCAPS to Get Capabilities (Format 2).

Helper function to do GETCAPS (Get Capabilities, format 2) of one target.

See also

i3c_do_ccc

Parameters

- **target** – **[in]** Pointer to the target device descriptor.
- **caps** – **[out]** Pointer to GETCAPS payload.
- **defbyte** – **[in]** Defining Byte for GETCAPS format 2.

Returns

struct **i3c_ccc_target_payload**

#include <*ccc.h*> Payload structure for Direct CCC to one target.

Public Members

uint8_t **addr**

Target address.

uint8_t **rnw**

`0` for Write, `1` for Read

uint8_t ***data**

- For Write CCC, pointer to the byte array of data to be sent, which may contain the Sub-Command Byte and additional data.
- For Read CCC, pointer to the byte buffer for data to be read into.

size_t **data_len**

Length in bytes for `data`.

size_t **num_xfer**

Total number of bytes transferred.

A Target can issue an EoD or the Controller can abort a transfer before the length of the buffer. It is expected for the driver to write to this after the transfer.

struct **i3c_ccc_payload**

#include <*ccc.h*> Payload structure for one CCC transaction.

Public Members

uint8_t **id**

The CCC ID (`I3C_CCC_*`).

uint8_t ***data**

Pointer to byte array of data for this CCC.

This is the bytes following the CCC command in CCC frame. Set to `NULL` if no associated data.

size_t **data_len**

Length in bytes for optional data array.

size_t **num_xfer**

Total number of bytes transferred.

A Controller can abort a transfer before the length of the buffer. It is expected for the driver to write to this after the transfer.

struct *i3c_ccc_target_payload* ***payloads**

Array of struct *i3c_ccc_target_payload*.

Each element describes the target and associated payloads for this CCC.

Use with Direct CCC.

size_t **num_targets**

Number of targets.

struct **i3c_ccc_events**

#include <*ccc.h*> Payload for ENEC/DISEC CCC (Target Events Command).

Public Members

uint8_t **events**

Event byte:

- Bit[0]: ENINT/DISINT:
  - Target Interrupt Requests
- Bit[1]: ENCR/DISCR:
  - Controller Role Requests
- Bit[3]: ENHJ/DISHJ:
  - Hot-Join Event

struct **i3c_ccc_mwl**

#include <*ccc.h*> Payload for SETMWL/GETMWL CCC (Set/Get Maximum Write Length).

> **Note**
>
> For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t **len**

Maximum Write Length.

struct **i3c_ccc_mrl**

#include <*ccc.h*> Payload for SETMRL/GETMRL CCC (Set/Get Maximum Read Length).

> **Note**
>
> For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

Public Members

uint16_t **len**

Maximum Read Length.

uint8_t **ibi_len**

Optional IBI Payload Size.

struct **i3c_ccc_deftgts_active_controller**

#include <*ccc.h*> The active controller part of payload for DEFTGTS CCC.

This is used by DEFTGTS (Define List of Targets) CCC to describe the active controller on the I3C bus.

Public Members

uint8_t **addr**

Dynamic Address of Active Controller.

uint8_t **dcr**

Device Characteristic Register of Active Controller.

uint8_t **bcr**

Bus Characteristic Register of Active Controller.

uint8_t **static_addr**

Static Address of Active Controller.

struct **i3c_ccc_deftgts_target**

#include <*ccc.h*> The target device part of payload for DEFTGTS CCC.

This is used by DEFTGTS (Define List of Targets) CCC to describe the existing target devices on the I3C bus.

Public Members

uint8_t **addr**

Dynamic Address of a target device, or a group address.

uint8_t **dcr**

Device Characteristic Register of a I3C target device or a group.

uint8_t **lvr**

Legacy Virtual Register for legacy I2C device.

uint8_t **bcr**

Bus Characteristic Register of a target device or a group.

uint8_t **static_addr**

Static Address of a target device or a group.

struct **i3c_ccc_deftgts**

#include <*ccc.h*> Payload for DEFTGTS CCC (Define List of Targets).

Note

i3c_ccc_deftgts_target is an array of targets, where the number of elements is dependent on the number of I3C targets on the bus. Please have enough space for both read and write of this CCC.

Public Members

struct *i3c_ccc_deftgts_active_controller* `active_controller`

Data describing the active controller.

struct *i3c_ccc_deftgts_target* `targets`[]

Data describing the target(s) on the bus.

struct `i3c_ccc_address`

#include <*ccc.h*> Payload for a single device address.

This is used for:

- SETDASA (Set Dynamic Address from Static Address)
- SETNEWDA (Set New Dynamic Address)
- SETGRPA (Set Group Address)
- GETACCCR (Get Accept Controller Role)

Note that the target address is encoded within struct *i3c_ccc_target_payload* instead of being encoded in this payload.

Public Members

uint8_t `addr`

- For SETDASA, Static Address to be assigned as Dynamic Address.
- For SETNEWDA, new Dynamic Address to be assigned.
- For SETGRPA, new Group Address to be set.
- For GETACCCR, the correct address of Secondary Controller.

Note

For SETDATA, SETNEWDA and SETGRAP, the address is left-shift by 1, and bit[0] is always 0.

Note

Fpr SET GETACCCR, the address is left-shift by 1, and bit[0] is the calculated odd parity bit.

struct `i3c_ccc_getpid`

#include <*ccc.h*> Payload for GETPID CCC (Get Provisioned ID).

Public Members

uint8_t `pid`[6]

48-bit Provisioned ID.

> **Note**
>
> Data is big-endian where first byte is MSB.

struct `i3c_ccc_getbcr`

#include <*ccc.h*> Payload for GETBCR CCC (Get Bus Characteristics Register).

Public Members

uint8_t `bcr`

Bus Characteristics Register.

struct `i3c_ccc_getdcr`

#include <*ccc.h*> Payload for GETDCR CCC (Get Device Characteristics Register).

Public Members

uint8_t `dcr`

Device Characteristics Register.

union `i3c_ccc_getstatus`

#include <*ccc.h*> Payload for GETSTATUS CCC (Get Device Status).

Public Members

uint16_t `status`

Device Status.

- Bit[15:8]: Reserved.
- Bit[7:6]: Activity Mode.
- Bit[5]: Protocol Error.
- Bit[4]: Reserved.
- Bit[3:0]: Number of Pending Interrupts.

> **Note**
>
> For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

struct *i3c_ccc_getstatus* `fmt1`

uint16_t `tgtstat`

Defining Byte 0x00: TGTSTAT.

See also

i3c_ccc_getstatus::fmt1::status

uint16_t **precr**

Defining Byte 0x91: PRECR.

- Bit[15:8]: Vendor Reserved
- Bit[7:2]: Reserved
- Bit[1]: Handoff Delay NACK
- Bit[0]: Deep Sleep Detected

Note

For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

uint16_t **raw_u16**

union *i3c_ccc_getstatus* **fmt2**

struct **i3c_ccc_setbrgtgt_tgt**

#include <*ccc.h*> One Bridged Target for SETBRGTGT payload.

Public Members

uint8_t **addr**

Dynamic address of the bridged target.

Note

The address is left-shift by 1, and bit[0] is always 0.

uint16_t **id**

16-bit ID for the bridged target.

Note

For drivers and help functions, the raw data coming back from target device is in big endian. This needs to be translated back to CPU endianness before passing back to function caller.

struct **i3c_ccc_setbrgtgt**

#include <*ccc.h*> Payload for SETBRGTGT CCC (Set Bridge Targets).

Note that the bridge target address is encoded within struct *i3c_ccc_target_payload* instead of being encoded in this payload.

Public Members

uint8_t **count**
Number of bridged targets.

struct *i3c_ccc_setbrgtgt_tgt* **targets**[]
Array of bridged targets.

union **i3c_ccc_getmxds**
#include <*ccc.h*> Payload for GETMXDS CCC (Get Max Data Speed).

union *i3c_ccc_getcaps* **fmt2**

group **i3c_addresses**

I3C Address-related Helper Code.

Defines

I3C_BROADCAST_ADDR

Broadcast Address on I3C bus.

I3C_MAX_ADDR

Maximum value of device addresses.

Enums

enum `i3c_addr_slot_status`

Enum to indicate whether an address is reserved, has I2C/I3C device attached, or no device attached.

Values:

enumerator `I3C_ADDR_SLOT_STATUS_FREE` = 0U

Address has not device attached.

enumerator `I3C_ADDR_SLOT_STATUS_RSVD`

Address is reserved.

enumerator `I3C_ADDR_SLOT_STATUS_I3C_DEV`

Address is associated with an I3C device.

enumerator `I3C_ADDR_SLOT_STATUS_I2C_DEV`

Address is associated with an I2C device.

enumerator `I3C_ADDR_SLOT_STATUS_MASK` = 0x03U

Bit masks used to filter status bits.

Functions

int `i3c_addr_slots_init`(const struct *device* *dev)

Initialize the I3C address slots struct.

This clears out the assigned address bits, and set the reserved address bits according to the I3C specification.

Parameters

- `dev` – Pointer to controller device driver instance.

Return values

- `0` – if successful.
- `-EINVAL` – if duplicate addresses.

void `i3c_addr_slots_set`(struct *i3c_addr_slots* *slots, uint8_t dev_addr, enum *i3c_addr_slot_status* status)

Set the address status of a device.

Parameters

- `slots` – Pointer to the address slots structure.
- `dev_addr` – Device address.
- `status` – New status for the address `dev_addr`.

enum *i3c_addr_slot_status* `i3c_addr_slots_status`(struct *i3c_addr_slots* *slots, uint8_t dev_addr)

Get the address status of a device.

Parameters

- `slots` – Pointer to the address slots structure.
- `dev_addr` – Device address.

Returns
Address status for the address `dev_addr`.

bool **i3c_addr_slots_is_free**(struct *i3c_addr_slots* *slots, uint8_t dev_addr)
Check if the address is free.

Parameters
- **slots** – Pointer to the address slots structure.
- **dev_addr** – Device address.

Return values
- **true** – if address is free.
- **false** – if address is not free.

uint8_t **i3c_addr_slots_next_free_find**(struct *i3c_addr_slots* *slots, uint8_t start_addr)
Find the next free address.

This can be used to find the next free address that can be assigned to a new device.

Parameters
- **slots** – Pointer to the address slots structure.
- **start_addr** – Where to start searching

Returns
The next free address, or 0 if none found.

static inline void **i3c_addr_slots_mark_free**(struct *i3c_addr_slots* *addr_slots, uint8_t addr)
Mark the address as free (not used) in device list.

Parameters
- **addr_slots** – Pointer to the address slots struct.
- **addr** – Device address.

static inline void **i3c_addr_slots_mark_rsvd**(struct *i3c_addr_slots* *addr_slots, uint8_t addr)
Mark the address as reserved in device list.

Parameters
- **addr_slots** – Pointer to the address slots struct.
- **addr** – Device address.

static inline void **i3c_addr_slots_mark_i3c**(struct *i3c_addr_slots* *addr_slots, uint8_t addr)
Mark the address as I3C device in device list.

Parameters
- **addr_slots** – Pointer to the address slots struct.
- **addr** – Device address.

static inline void **i3c_addr_slots_mark_i2c**(struct *i3c_addr_slots* *addr_slots, uint8_t addr)
Mark the address as I2C device in device list.

Parameters
- **addr_slots** – Pointer to the address slots struct.
- **addr** – Device address.

struct **i3c_addr_slots**

#include <addresses.h> Structure to keep track of addresses on I3C bus.

group **i3c_target_device**

I3C Target Device API.

Functions

static inline int **i3c_target_tx_write**(const struct *device* *dev, uint8_t *buf, uint16_t len, uint8_t hdr_mode)

Writes to the target's TX FIFO.

Write to the TX FIFO `dev` I3C bus driver using the provided buffer and length. Some I3C targets will NACK read requests until data is written to the TX FIFO. This function will write as much as it can to the FIFO return the total number of bytes written. It is then up to the application to utalize the target callbacks to write the remaining data. Negative returns indicate error.

Most of the existing hardware allows simultaneous support for master and target mode. This is however not guaranteed.

Parameters

- **dev** – Pointer to the device structure for an I3C controller driver configured in target mode.
- **buf** – Pointer to the buffer
- **len** – Length of the buffer
- **hdr_mode** – HDR mode see `I3C_MSG_HDR_MODE*`

Return values

- **Total** – number of bytes written
- **-ENOTSUP** – Not in Target Mode or HDR Mode not supported
- **-ENOSPC** – No space in Tx FIFO
- **-ENOSYS** – If target mode is not implemented

static inline int **i3c_target_register**(const struct *device* *dev, struct *i3c_target_config* *cfg)

Registers the provided config as target device of a controller.

Enable I3C target mode for the `dev` I3C bus driver using the provided config struct (`cfg`) containing the functions and parameters to send bus events. The I3C target will be registered at the address provided as *i3c_target_config::address* struct member. Any I3C bus events related to the target mode will be passed onto I3C target device driver via a set of callback functions provided in the 'callbacks' struct member.

Most of the existing hardware allows simultaneous support for master and target mode. This is however not guaranteed.

Parameters

- **dev** – Pointer to the device structure for an I3C controller driver configured in target mode.
- **cfg** – Config struct with functions and parameters used by the I3C target driver to send bus events

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-EIO` – General input / output error.
- `-ENOSYS` – If target mode is not implemented

static inline int **i3c_target_unregister**(const struct *device* *dev, struct *i3c_target_config* *cfg)

Unregisters the provided config as target device.

This routine disables I3C target mode for the dev I3C bus driver using the provided config struct (`cfg`) containing the functions and parameters to send bus events.

Parameters

- `dev` – Pointer to the device structure for an I3C controller driver configured in target mode.
- `cfg` – Config struct with functions and parameters used by the I3C target driver to send bus events

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-ENOSYS` – If target mode is not implemented

struct **i3c_config_target**

#include <target_device.h> Configuration parameters for I3C hardware to act as target device.

This can also be used to configure the controller if it is to act as a secondary controller on the bus.

Public Members

bool **enable**

If the hardware is to act as a target device on the bus.

uint8_t **static_addr**

I3C target address.

Used used when operates as secondary controller or as a target device.

uint64_t **pid**

Provisioned ID.

bool **pid_random**

True if lower 32-bit of Provisioned ID is random.

This sets the bit 32 of Provisioned ID which means the lower 32-bit is random value.

uint8_t **bcr**

Bus Characteristics Register (BCR).

uint8_t **dcr**

Device Characteristics Register (DCR).

uint16_t **max_read_len**

Maximum Read Length (MRL).

uint16_t **max_write_len**

Maximum Write Length (MWL).

uint8_t **supported_hdr**

Bit mask of supported HDR modes (0 - 7).

This can be used to enable or disable HDR mode supported by the hardware at runtime.

struct **i3c_target_config**

#include <target_device.h> Structure describing a device that supports the I3C target API.

Instances of this are passed to the *i3c_target_register()* and *i3c_target_unregister()* functions to indicate addition and removal of a target device, respective.

Fields other than `node` must be initialized by the module that implements the device behavior prior to passing the object reference to *i3c_target_register()*.

Public Members

uint8_t **flags**

Flags for the target device defined by I3C_TARGET_FLAGS_* constants.

uint8_t **address**

Address for this target device.

const struct *i3c_target_callbacks* ***callbacks**

Callback functions.

struct **i3c_target_callbacks**

#include <target_device.h>

Public Members

int (***write_requested_cb**)(struct *i3c_target_config* *config)

Function called when a write to the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a write operation to the address associated with a particular device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

Param config
Configuration structure associated with the device to which the operation is addressed.

Return
0 if the write is accepted, or a negative error code.

int (*`write_received_cb`)(struct *i3c_target_config* *config, uint8_t val)

Function called when a write to the device is continued.

This function is invoked by the controller when it completes reception of a byte of data in an ongoing write operation to the device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

Param config
Configuration structure associated with the device to which the operation is addressed.

Param val
the byte received by the controller.

Return
0 if more data can be accepted, or a negative error code.

int (*`read_requested_cb`)(struct *i3c_target_config* *config, uint8_t *val)

Function called when a read from the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a read operation from the address associated with a particular device.

The value returned in `val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

Param config
Configuration structure associated with the device to which the operation is addressed.

Param val
Pointer to storage for the first byte of data to return for the read request.

Return
0 if more data can be requested, or a negative error code.

int (*`read_processed_cb`)(struct *i3c_target_config* *config, uint8_t *val)

Function called when a read from the device is continued.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.

The value returned in `val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

Param config
Configuration structure associated with the device to which the operation is addressed.

Param val
Pointer to storage for the next byte of data to return for the read request.

Return
0 if data has been provided, or a negative error code.

int (*`stop_cb`)(struct *i3c_target_config* *config)

Function called when a stop condition is observed after a start condition addressed to a particular device.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.

After the function returns the controller shall enter a state where it is ready to react to new start conditions.

Param config
Configuration structure associated with the device to which the operation is addressed.

Return
Ignored.

struct `i3c_target_driver_api`

#include <target_device.h>

7.6.26 Inter-Integrated Circuit (I2C) Bus

Overview

Note

The terminology used in Zephyr I2C APIs follows that of the NXP I2C Bus Specification Rev 7.0. These changed from previous revisions as of its release October 1, 2021.

I2C (Inter-Integrated Circuit, pronounced "eye squared see") is a commonly-used two-signal shared peripheral interface bus. Many system-on-chip solutions provide controllers that communicate on an I2C bus. Devices on the bus can operate in two roles: as a "controller" that initiates transactions and controls the clock, or as a "target" that responds to transaction commands. A I2C controller on a given SoC will generally support the controller role, and some will also support the target mode. Zephyr has API for both roles.

I2C Controller API Zephyr's I2C controller API is used when an I2C peripheral controls the bus, in particularly the start and stop conditions and the clock. This is the most common mode, used to interact with I2C devices like sensors and serial memory.

This API is supported in all in-tree I2C peripheral drivers and is considered stable.

I2C Target API Zephyr's I2C target API is used when an I2C peripheral responds to transactions initiated by a different controller on the bus. It might be used for a Zephyr application with transducer roles that are controlled by another device such as a host processor.

This API is supported in very few in-tree I2C peripheral drivers. The API is considered experimental, as it is not compatible with the capabilities of all I2C peripherals supported in controller mode.

`I2C_ADDR_10_BITS`
Use 10-bit addressing.

DEPRECATED - Use I2C_MSG_ADDR_10_BITS instead.

I2C_MODE_CONTROLLER

Peripheral to act as Controller.

I2C_DT_SPEC_GET_ON_I3C(node_id)

Structure initializer for *i2c_dt_spec* from devicetree (on I3C bus)

This helper macro expands to a static initializer for a `struct i2c_dt_spec` by reading the relevant bus and address data from the devicetree.

Parameters

- **node_id** – Devicetree node identifier for the I2C device whose struct *i2c_dt_spec* to create an initializer for

I2C_DT_SPEC_GET_ON_I2C(node_id)

Structure initializer for *i2c_dt_spec* from devicetree (on I2C bus)

This helper macro expands to a static initializer for a `struct i2c_dt_spec` by reading the relevant bus and address data from the devicetree.

Parameters

- **node_id** – Devicetree node identifier for the I2C device whose struct *i2c_dt_spec* to create an initializer for

I2C_DT_SPEC_GET(node_id)

Structure initializer for *i2c_dt_spec* from devicetree.

This helper macro expands to a static initializer for a `struct i2c_dt_spec` by reading the relevant bus and address data from the devicetree.

Parameters

- **node_id** – Devicetree node identifier for the I2C device whose struct *i2c_dt_spec* to create an initializer for

I2C_DT_SPEC_INST_GET(inst)

Structure initializer for *i2c_dt_spec* from devicetree instance.

This is equivalent to *I2C_DT_SPEC_GET(DT_DRV_INST(inst))*.

Parameters

- **inst** – Devicetree instance number

I2C_MSG_WRITE

Write message to I2C bus.

I2C_MSG_READ

Read message from I2C bus.

I2C_MSG_STOP

Send STOP after this message.

I2C_MSG_RESTART

RESTART I2C transaction for this message.

Note

Not all I2C drivers have or require explicit support for this feature. Some drivers require this be present on a read message that follows a write, or vice-versa. Some

drivers will merge adjacent fragments into a single transaction using this flag; some will not.

I2C_MSG_ADDR_10_BITS

Use 10-bit addressing for this message.

Note

Not all SoC I2C implementations support this feature.

I2C_TARGET_FLAGS_ADDR_10_BITS

Target device responds to 10-bit addressing.

I2C_DEVICE_DT_DEFINE(node_id, init_fn, pm, data, config, level, prio, api, ...)

Like *DEVICE_DT_DEFINE()* with I2C specifics.

Defines a device which implements the I2C API. May generate a custom *device_state* container struct and init_fn wrapper when needed depending on I2C CONFIG_I2C_STATS.

Parameters

- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver. Can be NULL.
- **pm** – PM device resources reference (NULL if device does not use PM).
- **data** – Pointer to the device's private data.
- **config** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

I2C_DEVICE_DT_INST_DEFINE(inst, ...)

Like *I2C_DEVICE_DT_DEFINE()* for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to *I2C_DEVICE_DT_DEFINE()*.
- **...** – other parameters as expected by *I2C_DEVICE_DT_DEFINE()*.

I2C_DT_IODEV_DEFINE(name, node_id)

Define an iodev for a given dt node on the bus.

These do not need to be shared globally but doing so will save a small amount of memory.

Parameters

- **name** – Symbolic name of the iodev to define
- **node_id** – Devicetree node identifier

I2C_IODEV_DEFINE(name, _bus, _addr)

Define an iodev for a given i2c device on a bus.

These do not need to be shared globally but doing so will save a small amount of memory.

Parameters

- `name` – Symbolic name of the iodev to define
- `_bus` – Node ID for I2C bus
- `_addr` – I2C target address

Typedefs

typedef void (*`i2c_callback_t`)(const struct *device* *dev, int result, void *data)

I2C callback for asynchronous transfer requests.

Param dev
I2C device which is notifying of transfer completion or error

Param result
Result code of the transfer request. 0 is success, -errno for failure.

Param data
Transfer requester supplied data which is passed along to the callback.

typedef int (*`i2c_target_write_requested_cb_t`)(struct *i2c_target_config* *config)

Function called when a write to the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a write operation to the address associated with a particular device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

Param config
the configuration structure associated with the device to which the operation is addressed.

Return
0 if the write is accepted, or a negative error code.

typedef int (*`i2c_target_write_received_cb_t`)(struct *i2c_target_config* *config, uint8_t val)

Function called when a write to the device is continued.

This function is invoked by the controller when it completes reception of a byte of data in an ongoing write operation to the device.

A success return shall cause the controller to ACK the next byte received. An error return shall cause the controller to NACK the next byte received.

Param config
the configuration structure associated with the device to which the operation is addressed.

Param val
the byte received by the controller.

Return
0 if more data can be accepted, or a negative error code.

typedef int (*`i2c_target_read_requested_cb_t`)(struct *i2c_target_config* *config, uint8_t *val)

Function called when a read from the device is initiated.

This function is invoked by the controller when the bus completes a start condition for a read operation from the address associated with a particular device.

The value returned in `*val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

Param config
the configuration structure associated with the device to which the operation is addressed.

Param val
pointer to storage for the first byte of data to return for the read request.

Return
0 if more data can be requested, or a negative error code.

typedef int (*`i2c_target_read_processed_cb_t`)(struct *i2c_target_config* *config, uint8_t *val)

Function called when a read from the device is continued.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device.

The value returned in `*val` will be transmitted. A success return shall cause the controller to react to additional read operations. An error return shall cause the controller to ignore bus operations until a new start condition is received.

Param config
the configuration structure associated with the device to which the operation is addressed.

Param val
pointer to storage for the next byte of data to return for the read request.

Return
0 if data has been provided, or a negative error code.

typedef int (*`i2c_target_stop_cb_t`)(struct *i2c_target_config* *config)

Function called when a stop condition is observed after a start condition addressed to a particular device.

This function is invoked by the controller when the bus is ready to provide additional data for a read operation from the address associated with the device device. After the function returns the controller shall enter a state where it is ready to react to new start conditions.

Param config
the configuration structure associated with the device to which the operation is addressed.

Return
Ignored.

Functions

static inline bool **i2c_is_ready_dt**(const struct *i2c_dt_spec* *spec)

Validate that I2C bus is ready.

Parameters

- **spec** – I2C specification from devicetree

Return values

- **true** – if the I2C bus is ready for use.
- **false** – if the I2C bus is not ready for use.

static inline bool **i2c_is_read_op**(struct *i2c_msg* *msg)

Check if the current message is a read operation.

Parameters

- **msg** – The message to check

Returns

true if the I2C message is sa read operation

Returns

false if the I2C message is a write operation

void **i2c_dump_msgs_rw**(const struct *device* *dev, const struct *i2c_msg* *msgs, uint8_t num_msgs, uint16_t addr, bool dump_read)

Dump out an I2C message.

Dumps out a list of I2C messages. For any that are writes (W), the data is displayed in hex. Setting dump_read will dump the data for read messages too, which only makes sense when called after the messages have been processed.

It looks something like this (with name “testing”):

```
D: I2C msg: testing, addr=56
D:    W len=01: 06
D:    W len=0e:
D: contents:
D: 00 01 02 03 04 05 06 07 |........
D: 08 09 0a 0b 0c 0d       |......
D:    W len=01: 0f
D:    R len=01: 6c
```

Parameters

- **dev** – Target for the messages being sent. Its name will be printed in the log.
- **msgs** – Array of messages to dump.
- **num_msgs** – Number of messages to dump.
- **addr** – Address of the I2C target device.
- **dump_read** – Dump data from I2C reads, otherwise only writes have data dumped.

static inline void **i2c_dump_msgs**(const struct *device* *dev, const struct *i2c_msg* *msgs, uint8_t num_msgs, uint16_t addr)

Dump out an I2C message, before it is executed.

This is equivalent to:

```
i2c_dump_msgs_rw(dev, msgs, num_msgs, addr, false);
```

The read messages' data isn't dumped.

Parameters

- `dev` – Target for the messages being sent. Its name will be printed in the log.
- `msgs` – Array of messages to dump.
- `num_msgs` – Number of messages to dump.
- `addr` – Address of the I2C target device.

static inline void `i2c_xfer_stats`(const struct *device* *dev, struct *i2c_msg* *msgs, uint8_t num_msgs)

Updates the i2c stats for i2c transfers.

Parameters

- `dev` – I2C device to update stats for
- `msgs` – Array of struct *i2c_msg*
- `num_msgs` – Number of i2c_msgs

int `i2c_configure`(const struct *device* *dev, uint32_t dev_config)

Configure operation of a host controller.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `dev_config` – Bit-packed 32-bit value to the device runtime configuration for the I2C controller.

Return values

- `0` – If successful.
- `-EIO` – General input / output error, failed to configure device.

int `i2c_get_config`(const struct *device* *dev, uint32_t *dev_config)

Get configuration of a host controller.

This routine provides a way to get current configuration. It is allowed to call the function before i2c_configure, because some I2C ports can be configured during init process. However, if the I2C port is not configured, i2c_get_config returns an error.

i2c_get_config can return cached config or probe hardware, but it has to be up to date with current configuration.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `dev_config` – Pointer to return bit-packed 32-bit value of the I2C controller configuration.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ERANGE` – Configured I2C frequency is invalid.
- `-ENOSYS` – If get config is not implemented

int `i2c_transfer`(const struct *device* *dev, struct *i2c_msg* *msgs, uint8_t num_msgs, uint16_t addr)

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device synchronously. Use *i2c_read()*/i2c_write() for simple read or write.

The array of message *msgs* must not be NULL. The number of message *num_msgs* may be zero,in which case no transfer occurs.

Note

Not all scatter/gather transactions can be supported by all drivers. As an example, a gather write (multiple consecutive *i2c_msg* buffers all configured for `I2C_MSG_WRITE`) may be packed into a single transaction by some drivers, but others may emit each fragment as a distinct write transaction, which will not produce the same behavior. See the documentation of `struct` *i2c_msg* for limitations on support for multi-message bus transactions.

Note

The last message in the scatter/gather transaction implies a STOP whether or not it is explicitly set. This ensures the bus is in a good state for the next transaction which may be from a different call context.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `msgs` – Array of messages to transfer.
- `num_msgs` – Number of messages to transfer.
- `addr` – Address of the I2C target device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int `i2c_transfer_cb`(const struct *device* *dev, struct *i2c_msg* *msgs, uint8_t num_msgs, uint16_t addr, *i2c_callback_t* cb, void *userdata)

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device asynchronously with a callback completion.

See also

i2c_transfer()

Function properties (list may not be complete)

isr-ok

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `msgs` – Array of messages to transfer, must live until callback completes.
- `num_msgs` – Number of messages to transfer.
- `addr` – Address of the I2C target device.
- `cb` – Function pointer for completion callback.
- `userdata` – Userdata passed to callback.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If transfer async is not implemented
- `-EWOULDBLOCK` – If the device is temporarily busy doing another transfer

static inline int **i2c_transfer_cb_dt**(const struct *i2c_dt_spec* *spec, struct *i2c_msg* *msgs, uint8_t num_msgs, *i2c_callback_t* cb, void *userdata)

Perform data transfer to another I2C device in master mode asynchronously.

This is equivalent to:

```
i2c_transfer_cb(spec->bus, msgs, num_msgs, spec->addr, cb, userdata);
```

Parameters

- `spec` – I2C specification from devicetree.
- `msgs` – Array of messages to transfer.
- `num_msgs` – Number of messages to transfer.
- `cb` – Function pointer for completion callback.
- `userdata` – Userdata passed to callback.

Returns

a value from *i2c_transfer_cb()*

static inline int **i2c_write_read_cb**(const struct *device* *dev, struct *i2c_msg* *msgs, uint8_t num_msgs, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read, *i2c_callback_t* cb, void *userdata)

Write then read data from an I2C device asynchronously.

This supports the common operation “this is what I want”, “now give

it to me” transaction pair through a combined write-then-read bus transaction but using i2c_transfer_cb. This helper function expects caller to pass a message pointer with 2 and only 2 size.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in master mode.
- `msgs` – Array of messages to transfer.

- **num_msgs** – Number of messages to transfer.
- **addr** – Address of the I2C device
- **write_buf** – Pointer to the data to be written
- **num_write** – Number of bytes to write
- **read_buf** – Pointer to storage for read data
- **num_read** – Number of bytes to read
- **cb** – Function pointer for completion callback.
- **userdata** – Userdata passed to callback.

Return values

- **0** – if successful
- **negative** – on error.

static inline int **i2c_write_read_cb_dt**(const struct *i2c_dt_spec* *spec, struct *i2c_msg* *msgs, uint8_t num_msgs, const void *write_buf, size_t num_write, void *read_buf, size_t num_read, *i2c_callback_t* cb, void *userdata)

Write then read data from an I2C device asynchronously.

This is equivalent to:

```
i2c_write_read_cb(spec->bus, msgs, num_msgs,
                  spec->addr, write_buf,
                  num_write, read_buf, num_read);
```

Parameters

- **spec** – I2C specification from devicetree.
- **msgs** – Array of messages to transfer.
- **num_msgs** – Number of messages to transfer.
- **write_buf** – Pointer to the data to be written
- **num_write** – Number of bytes to write
- **read_buf** – Pointer to storage for read data
- **num_read** – Number of bytes to read
- **cb** – Function pointer for completion callback.
- **userdata** – Userdata passed to callback.

Returns

a value from *i2c_write_read_cb()*

static inline int **i2c_transfer_signal**(const struct *device* *dev, struct *i2c_msg* *msgs, uint8_t num_msgs, uint16_t addr, struct *k_poll_signal* *sig)

Perform data transfer to another I2C device in controller mode.

This routine provides a generic interface to perform data transfer to another I2C device asynchronously with a *k_poll_signal* completion.

See also

i2c_transfer_cb()

Function properties (list may not be complete)

isr-ok

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
- **msgs** – Array of messages to transfer, must live until callback completes.
- **num_msgs** – Number of messages to transfer.
- **addr** – Address of the I2C target device.
- **sig** – Signal to notify of transfer completion.

Return values

- **0** – If successful.
- **-EIO** – General input / output error.
- **-ENOSYS** – If transfer async is not implemented
- **-EWOULDBLOCK** – If the device is temporarily busy doing another transfer

static inline void **i2c_iodev_submit**(struct *rtio_iodev_sqe* *iodev_sqe)

Submit request(s) to an I2C device with RTIO.

Parameters

- **iodev_sqe** – Prepared submissions queue entry connected to an iodev defined by I2C_DT_IODEV_DEFINE.

struct *rtio_sqe* ***i2c_rtio_copy**(struct *rtio* *r, struct *rtio_iodev* *iodev, const struct *i2c_msg* *msgs, uint8_t num_msgs)

Copy the i2c_msgs into a set of RTIO requests.

Parameters

- **r** – RTIO context
- **iodev** – RTIO IODev to target for the submissions
- **msgs** – Array of messages
- **num_msgs** – Number of i2c msgs in array

Return values

- **sqe** – Last submission in the queue added
- **NULL** – Not enough memory in the context to copy the requests

static inline int **i2c_transfer_dt**(const struct *i2c_dt_spec* *spec, struct *i2c_msg* *msgs, uint8_t num_msgs)

Perform data transfer to another I2C device in controller mode.

This is equivalent to:

```
i2c_transfer(spec->bus, msgs, num_msgs, spec->addr);
```

Parameters

- **spec** – I2C specification from devicetree.
- **msgs** – Array of messages to transfer.
- **num_msgs** – Number of messages to transfer.

Returns
a value from *i2c_transfer()*

int **i2c_recover_bus**(const struct *device* *dev)

Recover the I2C bus.

Attempt to recover the I2C bus.

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.

Return values

- **0** – If successful
- **-EBUSY** – If bus is not clear after recovery attempt.
- **-EIO** – General input / output error.
- **-ENOSYS** – If bus recovery is not implemented

static inline int **i2c_target_register**(const struct *device* *dev, struct *i2c_target_config* *cfg)

Registers the provided config as Target device of a controller.

Enable I2C target mode for the 'dev' I2C bus driver using the provided 'config' struct containing the functions and parameters to send bus events. The I2C target will be registered at the address provided as 'address' struct member. Addressing mode - 7 or 10 bit - depends on the 'flags' struct member. Any I2C bus events related to the target mode will be passed onto I2C target device driver via a set of callback functions provided in the 'callbacks' struct member.

Most of the existing hardware allows simultaneous support for controller and target mode. This is however not guaranteed.

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in target mode.
- **cfg** – Config struct with functions and parameters used by the I2C driver to send bus events

Return values

- **0** – Is successful
- **-EINVAL** – If parameters are invalid
- **-EIO** – General input / output error.
- **-ENOSYS** – If target mode is not implemented

static inline int **i2c_target_unregister**(const struct *device* *dev, struct *i2c_target_config* *cfg)

Unregisters the provided config as Target device.

This routine disables I2C target mode for the 'dev' I2C bus driver using the provided 'config' struct containing the functions and parameters to send bus events.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in target mode.
- `cfg` – Config struct with functions and parameters used by the I2C driver to send bus events

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-ENOSYS` – If target mode is not implemented

int `i2c_target_driver_register`(const struct *device* *dev)

Instructs the I2C Target device to register itself to the I2C Controller.

This routine instructs the I2C Target device to register itself to the I2C Controller via its parent controller's *i2c_target_register()* API.

Parameters

- `dev` – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid
- `-EIO` – General input / output error.

int `i2c_target_driver_unregister`(const struct *device* *dev)

Instructs the I2C Target device to unregister itself from the I2C Controller.

This routine instructs the I2C Target device to unregister itself from the I2C Controller via its parent controller's *i2c_target_register()* API.

Parameters

- `dev` – Pointer to the device structure for the I2C target device (not itself an I2C controller).

Return values

- `0` – Is successful
- `-EINVAL` – If parameters are invalid

static inline int `i2c_write`(const struct *device* *dev, const uint8_t *buf, uint32_t num_bytes, uint16_t addr)

Write a set amount of data to an I2C device.

This routine writes a set amount of data synchronously.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes to write.
- `addr` – Address to the target I2C device for writing.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int **i2c_write_dt**(const struct *i2c_dt_spec* *spec, const uint8_t *buf, uint32_t num_bytes)

Write a set amount of data to an I2C device.

This is equivalent to:

```
i2c_write(spec->bus, buf, num_bytes, spec->addr);
```

Parameters

- **spec** – I2C specification from devicetree.
- **buf** – Memory pool from which the data is transferred.
- **num_bytes** – Number of bytes to write.

Returns
a value from *i2c_write()*

static inline int **i2c_read**(const struct *device* *dev, uint8_t *buf, uint32_t num_bytes, uint16_t addr)

Read a set amount of data from an I2C device.

This routine reads a set amount of data synchronously.

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
- **buf** – Memory pool that stores the retrieved data.
- **num_bytes** – Number of bytes to read.
- **addr** – Address of the I2C device being read.

Return values

- **0** – If successful.
- **-EIO** – General input / output error.

static inline int **i2c_read_dt**(const struct *i2c_dt_spec* *spec, uint8_t *buf, uint32_t num_bytes)

Read a set amount of data from an I2C device.

This is equivalent to:

```
i2c_read(spec->bus, buf, num_bytes, spec->addr);
```

Parameters

- **spec** – I2C specification from devicetree.
- **buf** – Memory pool that stores the retrieved data.
- **num_bytes** – Number of bytes to read.

Returns
a value from *i2c_read()*

static inline int **i2c_write_read**(const struct *device* *dev, uint16_t addr, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)

Write then read data from an I2C device.

This supports the common operation “this is what I want”, “now give it to me” transaction pair through a combined write-then-read bus transaction.

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
- **addr** – Address of the I2C device
- **write_buf** – Pointer to the data to be written
- **num_write** – Number of bytes to write
- **read_buf** – Pointer to storage for read data
- **num_read** – Number of bytes to read

Return values

- **0** – if successful
- **negative** – on error.

static inline int **i2c_write_read_dt**(const struct *i2c_dt_spec* *spec, const void *write_buf, size_t num_write, void *read_buf, size_t num_read)

Write then read data from an I2C device.

This is equivalent to:

```
i2c_write_read(spec->bus, spec->addr,
               write_buf, num_write,
               read_buf, num_read);
```

Parameters

- **spec** – I2C specification from devicetree.
- **write_buf** – Pointer to the data to be written
- **num_write** – Number of bytes to write
- **read_buf** – Pointer to storage for read data
- **num_read** – Number of bytes to read

Returns
a value from *i2c_write_read()*

static inline int **i2c_burst_read**(const struct *device* *dev, uint16_t dev_addr, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)

Read multiple bytes from an internal address of an I2C device.

This routine reads multiple bytes from an internal address of an I2C device synchronously.

Instances of this may be replaced by *i2c_write_read()*.

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.

- `dev_addr` – Address of the I2C device for reading.
- `start_addr` – Internal address from which the data is being read.
- `buf` – Memory pool that stores the retrieved data.
- `num_bytes` – Number of bytes being read.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int **i2c_burst_read_dt**(const struct *i2c_dt_spec* *spec, uint8_t start_addr, uint8_t *buf, uint32_t num_bytes)

Read multiple bytes from an internal address of an I2C device.

This is equivalent to:

```
i2c_burst_read(spec->bus, spec->addr, start_addr, buf, num_bytes);
```

Parameters

- `spec` – I2C specification from devicetree.
- `start_addr` – Internal address from which the data is being read.
- `buf` – Memory pool that stores the retrieved data.
- `num_bytes` – Number of bytes to read.

Returns
a value from *i2c_burst_read()*

static inline int **i2c_burst_write**(const struct *device* *dev, uint16_t dev_addr, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I2C device.

This routine writes multiple bytes to an internal address of an I2C device synchronously.

Warning

The combined write synthesized by this API may not be supported on all I2C devices. Uses of this API may be made more portable by replacing them with calls to *i2c_write()* passing a buffer containing the combined address and data.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `dev_addr` – Address of the I2C device for writing.
- `start_addr` – Internal address to which the data is being written.
- `buf` – Memory pool from which the data is transferred.
- `num_bytes` – Number of bytes being written.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int **i2c_burst_write_dt**(const struct *i2c_dt_spec* *spec, uint8_t start_addr, const uint8_t *buf, uint32_t num_bytes)

Write multiple bytes to an internal address of an I2C device.

This is equivalent to:

```
i2c_burst_write(spec->bus, spec->addr, start_addr, buf, num_bytes);
```

Parameters

- **spec** – I2C specification from devicetree.
- **start_addr** – Internal address to which the data is being written.
- **buf** – Memory pool from which the data is transferred.
- **num_bytes** – Number of bytes being written.

Returns
a value from *i2c_burst_write()*

static inline int **i2c_reg_read_byte**(const struct *device* *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t *value)

Read internal register of an I2C device.

This routine reads the value of an 8-bit internal register of an I2C device synchronously.

Parameters

- **dev** – Pointer to the device structure for an I2C controller driver configured in controller mode.
- **dev_addr** – Address of the I2C device for reading.
- **reg_addr** – Address of the internal register being read.
- **value** – Memory pool that stores the retrieved register value.

Return values

- **0** – If successful.
- **-EIO** – General input / output error.

static inline int **i2c_reg_read_byte_dt**(const struct *i2c_dt_spec* *spec, uint8_t reg_addr, uint8_t *value)

Read internal register of an I2C device.

This is equivalent to:

```
i2c_reg_read_byte(spec->bus, spec->addr, reg_addr, value);
```

Parameters

- **spec** – I2C specification from devicetree.
- **reg_addr** – Address of the internal register being read.
- **value** – Memory pool that stores the retrieved register value.

Returns
a value from *i2c_reg_read_byte()*

static inline int **i2c_reg_write_byte**(const struct *device* *dev, uint16_t dev_addr, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.

This routine writes a value to an 8-bit internal register of an I2C device synchronously.

> **Note**
>
> This function internally combines the register and value into a single bus transaction.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `dev_addr` – Address of the I2C device for writing.
- `reg_addr` – Address of the internal register being written.
- `value` – Value to be written to internal register.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int **i2c_reg_write_byte_dt**(const struct *i2c_dt_spec* *spec, uint8_t reg_addr, uint8_t value)

Write internal register of an I2C device.

This is equivalent to:

```
i2c_reg_write_byte(spec->bus, spec->addr, reg_addr, value);
```

Parameters

- `spec` – I2C specification from devicetree.
- `reg_addr` – Address of the internal register being written.
- `value` – Value to be written to internal register.

Returns

a value from *i2c_reg_write_byte()*

static inline int **i2c_reg_update_byte**(const struct *device* *dev, uint8_t dev_addr, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.

This routine updates the value of a set of bits from an 8-bit internal register of an I2C device synchronously.

> **Note**
>
> If the calculated new register value matches the value that was read this function will not generate a write operation.

Parameters

- `dev` – Pointer to the device structure for an I2C controller driver configured in controller mode.
- `dev_addr` – Address of the I2C device for updating.
- `reg_addr` – Address of the internal register being updated.
- `mask` – Bitmask for updating internal register.
- `value` – Value for updating internal register.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

static inline int **i2c_reg_update_byte_dt**(const struct *i2c_dt_spec* *spec, uint8_t reg_addr, uint8_t mask, uint8_t value)

Update internal register of an I2C device.

This is equivalent to:

```
i2c_reg_update_byte(spec->bus, spec->addr, reg_addr, mask, value);
```

Parameters

- `spec` – I2C specification from devicetree.
- `reg_addr` – Address of the internal register being updated.
- `mask` – Bitmask for updating internal register.
- `value` – Value for updating internal register.

Returns

a value from *i2c_reg_update_byte()*

Variables

const struct *rtio_iodev_api* **i2c_iodev_api**

struct **i2c_dt_spec**

#include <*i2c.h*> Complete I2C DT information.

Param bus
is the I2C bus

Param addr
is the target address

struct **i2c_msg**

#include <*i2c.h*> One I2C Message.

This defines one I2C message to transact on the I2C bus.

> **Note**
>
> Some of the configurations supported by this API may not be supported by specific SoC I2C hardware implementations, in particular features related to bus transactions intended to read or write data from different buffers within a single transaction. Invocations of *i2c_transfer()* may not indicate an error when an unsupported

configuration is encountered. In some cases drivers will generate separate transactions for each message fragment, with or without presence of *I2C_MSG_RESTART* in *flags*.

Public Members

uint8_t *buf

Data buffer in bytes.

uint32_t len

Length of buffer in bytes.

uint8_t flags

Flags for this message.

struct i2c_target_callbacks

#include <*i2c.h*> Structure providing callbacks to be implemented for devices that supports the I2C target API.

This structure may be shared by multiple devices that implement the same API at different addresses on the bus.

struct i2c_target_config

#include <*i2c.h*> Structure describing a device that supports the I2C target API.

Instances of this are passed to the *i2c_target_register()* and *i2c_target_unregister()* functions to indicate addition and removal of a target device, respective.

Fields other than node must be initialized by the module that implements the device behavior prior to passing the object reference to *i2c_target_register()*.

Public Members

sys_snode_t node

Private, do not modify.

uint8_t flags

Flags for the target device defined by I2C_TARGET_FLAGS_* constants.

uint16_t address

Address for this target device.

const struct *i2c_target_callbacks* *callbacks

Callback functions.

struct i2c_device_state

#include <*i2c.h*> I2C specific device state which allows for i2c device class specific additions.

1.0

Version
1.0.0

Typedefs

typedef void (*`ipm_callback_t`)(const struct *device* *ipmdev, void *user_data, uint32_t id, volatile void *data)

Callback API for incoming IPM messages.

These callbacks execute in interrupt context. Therefore, use only interrupt-safe APIS. Registration of callbacks is done via *ipm_register_callback*

Param ipmdev
Driver instance

Param user_data
Pointer to some private data provided at registration time.

Param id
Message type identifier.

Param data
Message data pointer. The correct amount of data to read out must be inferred using the message id/upper level protocol.

typedef int (*`ipm_send_t`)(const struct *device* *ipmdev, int wait, uint32_t id, const void *data, int size)

Callback API to send IPM messages.

See ipm_send() for argument definitions.

typedef int (*`ipm_max_data_size_get_t`)(const struct *device* *ipmdev)

Callback API to get maximum data size.

See ipm_max_data_size_get() for argument definitions.

typedef uint32_t (*`ipm_max_id_val_get_t`)(const struct *device* *ipmdev)

Callback API to get the ID's maximum value.

See ipm_max_id_val_get() for argument definitions.

typedef void (*`ipm_register_callback_t`)(const struct *device* *port, *ipm_callback_t* cb, void *user_data)

Callback API upon registration.

See ipm_register_callback() for argument definitions.

typedef int (*`ipm_set_enabled_t`)(const struct *device* *ipmdev, int enable)

Callback API upon enablement of interrupts.

See ipm_set_enabled() for argument definitions.

typedef void (*`ipm_complete_t`)(const struct *device* *ipmdev)

Callback API upon command completion.

See ipm_complete() for argument definitions.

Functions

int `ipm_send`(const struct *device* *ipmdev, int wait, uint32_t id, const void *data, int size)

Try to send a message over the IPM device.

A message is considered consumed once the remote interrupt handler finishes. If there is deferred processing on the remote side, or if outgoing messages must be queued and wait on an event/semaphore, a high-level driver can implement that.

There are constraints on how much data can be sent or the maximum value of id. Use the *ipm_max_data_size_get* and *ipm_max_id_val_get* routines to determine them.

The *size* parameter is used only on the sending side to determine the amount of data to put in the message registers. It is not passed along to the receiving side. The upper-level protocol dictates the amount of data read back.

Parameters

- `ipmdev` – Driver instance
- `wait` – If nonzero, busy-wait for remote to consume the message. The message is considered consumed once the remote interrupt handler finishes. If there is deferred processing on the remote side, or you would

like to queue outgoing messages and wait on an event/semaphore, you can implement that in a high-level driver

- `id` – Message identifier. Values are constrained by *ipm_max_data_size_get* since many boards only allow for a subset of bits in a 32-bit register to store the ID.
- `data` – Pointer to the data sent in the message.
- `size` – Size of the data.

Return values

- `-EBUSY` – If the remote hasn't yet read the last data sent.
- `-EMSGSIZE` – If the supplied data size is unsupported by the driver.
- `-EINVAL` – If there was a bad parameter, such as: too-large id value. or the device isn't an outbound IPM channel.
- `0` – On success.

static inline void **ipm_register_callback**(const struct *device* *ipmdev, *ipm_callback_t* cb, void *user_data)

Register a callback function for incoming messages.

Parameters

- `ipmdev` – Driver instance pointer.
- `cb` – Callback function to execute on incoming message interrupts.
- `user_data` – Application-specific data pointer which will be passed to the callback function when executed.

int **ipm_max_data_size_get**(const struct *device* *ipmdev)

Return the maximum number of bytes possible in an outbound message.

IPM implementations vary on the amount of data that can be sent in a single message since the data payload is typically stored in registers.

Parameters

- `ipmdev` – Driver instance pointer.

Returns

Maximum possible size of a message in bytes.

uint32_t **ipm_max_id_val_get**(const struct *device* *ipmdev)

Return the maximum id value possible in an outbound message.

Many IPM implementations store the message's ID in a register with some bits reserved for other uses.

Parameters

- `ipmdev` – Driver instance pointer.

Returns

Maximum possible value of a message ID.

int **ipm_set_enabled**(const struct *device* *ipmdev, int enable)

Enable interrupts and callbacks for inbound channels.

Parameters

- `ipmdev` – Driver instance pointer.
- `enable` – Set to 0 to disable and to nonzero to enable.

Return values

- `0` – On success.
- `-EINVAL` – If it isn't an inbound channel.

void **ipm_complete**(const struct *device* *ipmdev)

Signal asynchronous command completion.

Some IPM backends have an ability to deliver a command asynchronously. The callback will be invoked in interrupt context, but the message (including the provided data pointer) will stay "active" and unacknowledged until later code (presumably in thread mode) calls *ipm_complete()*.

This function is, obviously, a noop on drivers without async support.

Parameters

- `ipmdev` – Driver instance pointer.

struct **ipm_driver_api**

#include <ipm.h>

7.6.28 Keyboard Scan

Overview

The kscan driver (keyboard scan matrix) is used for detecting a key press in a connected matrix keyboard or any device with buttons such as joysticks. Typically, matrix keyboards are implemented using a two-dimensional configuration in order to sense several keys. This allows interfacing to many keys through fewer physical pins. Keyboard matrix drivers read the rows while applying power through the columns one at a time with the purpose of detecting key events. There is no correlation between the physical and electrical layout of keys. For, example, the physical layout may be one array of 16 or fewer keys, which may be electrically connected to a 4 x 4 array. In addition, key values are defined by a keymap provided by the keyboard manufacturer.

Configuration Options

Related configuration options:

- `CONFIG_KSCAN`

API Reference

Related code samples

HT16K33 LED driver with keyscan

Typedefs

typedef void (*`kscan_callback_t`)(const struct *device* *dev, uint32_t row, uint32_t column, bool pressed)

Keyboard scan callback called when user press/release a key on a matrix keyboard.

Param dev
Pointer to the device structure for the driver instance.

Param row
Describes row change.

Param column
Describes column change.

Param pressed
Describes the kind of key event.

Functions

int `kscan_config`(const struct *device* *dev, *kscan_callback_t* callback)

Configure a Keyboard scan instance.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `callback` – called when keyboard devices reply to a keyboard event such as key pressed/released.

Return values

- `0` – If successful.
- `Negative` – errno code if failure.

int `kscan_enable_callback`(const struct *device* *dev)

Enables callback.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `Negative` – errno code if failure.

int `kscan_disable_callback`(const struct *device* *dev)

Disables callback.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.

- `Negative` – errno code if failure.

7.6.29 Light-Emitting Diode (LED)

Overview

The LED API provides access to Light Emitting Diodes, both in individual and strip form.

Configuration Options

Related configuration options:

Typedefs

typedef int (*`led_api_blink`)(const struct *device* *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)

Callback API for blinking an LED.

> **See also**
>
> *led_blink()* for argument descriptions.

typedef int (*`led_api_get_info`)(const struct *device* *dev, uint32_t led, const struct *led_info* **info)

Optional API callback to get LED information.

> **See also**
>
> *led_get_info()* for argument descriptions.

typedef int (*`led_api_set_brightness`)(const struct *device* *dev, uint32_t led, uint8_t value)

Callback API for setting brightness of an LED.

> **See also**
>
> *led_set_brightness()* for argument descriptions.

typedef int (*`led_api_set_color`)(const struct *device* *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)

Optional API callback to set the colors of a LED.

See also

led_set_color() for argument descriptions.

typedef int (*`led_api_on`)(const struct *device* *dev, uint32_t led)

Callback API for turning on an LED.

See also

led_on() for argument descriptions.

typedef int (*`led_api_off`)(const struct *device* *dev, uint32_t led)

Callback API for turning off an LED.

See also

led_off() for argument descriptions.

typedef int (*`led_api_write_channels`)(const struct *device* *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)

Callback API for writing a strip of LED channels.

See also

led_api_write_channels() for arguments descriptions.

Functions

int `led_blink`(const struct *device* *dev, uint32_t led, uint32_t delay_on, uint32_t delay_off)

Blink an LED.

This optional routine starts blinking a LED forever with the given time period.

Parameters

- `dev` – LED device
- `led` – LED number
- `delay_on` – Time period (in milliseconds) an LED should be ON
- `delay_off` – Time period (in milliseconds) an LED should be OFF

Returns

0 on success, negative on error

int `led_get_info`(const struct *device* *dev, uint32_t led, const struct *led_info* **info)

Get LED information.

This optional routine provides information about a LED.

Parameters

- `dev` – LED device
- `led` – LED number
- `info` – Pointer to a pointer filled with LED information

Returns

0 on success, negative on error

int `led_set_brightness`(const struct *device* *dev, uint32_t led, uint8_t value)

Set LED brightness.

This optional routine sets the brightness of a LED to the given value. Calling this function after *led_blink()* won't affect blinking.

LEDs which can only be turned on or off may provide this function. These should simply turn the LED on if `value` is nonzero, and off if `value` is zero.

Parameters

- `dev` – LED device
- `led` – LED number
- `value` – Brightness value to set in percent

Returns

0 on success, negative on error

int `led_write_channels`(const struct *device* *dev, uint32_t start_channel, uint32_t num_channels, const uint8_t *buf)

Write/update a strip of LED channels.

This optional routine writes a strip of LED channels to the given array of levels. Therefore it can be used to configure several LEDs at the same time.

Calling this function after *led_blink()* won't affect blinking.

Parameters

- `dev` – LED device
- `start_channel` – Absolute number (i.e. not relative to a LED) of the first channel to update.
- `num_channels` – The number of channels to write/update.
- `buf` – array of values to configure the channels with. num_channels entries must be provided.

Returns

0 on success, negative on error

int `led_set_channel`(const struct *device* *dev, uint32_t channel, uint8_t value)

Set a single LED channel.

This optional routine sets a single LED channel to the given value.

Calling this function after *led_blink()* won't affect blinking.

Parameters

- `dev` – LED device
- `channel` – Absolute channel number (i.e. not relative to a LED)

- `value` – Value to configure the channel with

Returns
0 on success, negative on error

int `led_set_color`(const struct *device* *dev, uint32_t led, uint8_t num_colors, const uint8_t *color)

Set LED color.

This routine configures all the color channels of a LED with the given color array.

Calling this function after *led_blink()* won't affect blinking.

Parameters

- `dev` – LED device
- `led` – LED number
- `num_colors` – Number of colors in the array.
- `color` – Array of colors. It must be ordered following the color mapping of the LED controller. See the color_mapping member in struct *led_info*.

Returns
0 on success, negative on error

int `led_on`(const struct *device* *dev, uint32_t led)

Turn on an LED.

This routine turns on an LED

Parameters

- `dev` – LED device
- `led` – LED number

Returns
0 on success, negative on error

int `led_off`(const struct *device* *dev, uint32_t led)

Turn off an LED.

This routine turns off an LED

Parameters

- `dev` – LED device
- `led` – LED number

Returns
0 on success, negative on error

struct `led_info`

#include <*led.h*> LED information structure.

This structure gathers useful information about LED controller.

Public Members

const char *`label`

LED label.

uint32_t **index**
: Index of the LED on the controller.

uint8_t **num_colors**
: Number of colors per LED.

const uint8_t ***color_mapping**
: Mapping of the LED colors.

struct **led_driver_api**
: *#include* <*led.h*> LED driver API.

Related code samples

LED strip
: Control an LED strip example.

LED Strip

group **led_strip_interface**
: LED Strip Interface.

Typedefs

typedef int (***led_api_update_rgb**)(const struct *device* *dev, struct *led_rgb* *pixels, size_t num_pixels)
: Callback API for updating an RGB LED strip.

See also

led_strip_update_rgb() for argument descriptions.

typedef int (***led_api_update_channels**)(const struct *device* *dev, uint8_t *channels, size_t num_channels)
: Callback API for updating channels without an RGB interpretation.

See also

led_strip_update_channels() for argument descriptions.

typedef size_t (***led_api_length**)(const struct *device* *dev)

Callback API for getting length of an LED strip.

See also

led_strip_length() for argument descriptions.

Functions

static inline int **led_strip_update_rgb**(const struct *device* *dev, struct *led_rgb* *pixels, size_t num_pixels)

Mandatory function to update an LED strip with the given RGB array.

Warning

This routine may overwrite *pixels*.

Parameters

- `dev` – LED strip device.
- `pixels` – Array of pixel data.
- `num_pixels` – Length of pixels array.

Return values

- `0` – on success.
- `-errno` – negative errno code on failure.

static inline int **led_strip_update_channels**(const struct *device* *dev, uint8_t *channels, size_t num_channels)

Optional function to update an LED strip with the given channel array (each channel byte corresponding to an individually addressable color channel or LED.

Channels are updated linearly in strip order.

Warning

This routine may overwrite *channels*.

Parameters

- `dev` – LED strip device.
- `channels` – Array of per-channel data.
- `num_channels` – Length of channels array.

Return values

- `0` – on success.
- `-ENOSYS` – if not implemented.
- `-errno` – negative errno code on other failure.

static inline size_t **led_strip_length**(const struct *device* *dev)

Mandatory function to get chain length (in pixels) of an LED strip device.

Parameters

- **dev** – LED strip device.

Return values

Length – of LED strip device.

struct **led_rgb**

#include <*led_strip.h*> Color value for a single RGB LED.

Individual strip drivers may ignore lower-order bits if their resolution in any channel is less than a full byte.

Public Members

uint8_t **r**

Red channel.

uint8_t **g**

Green channel.

uint8_t **b**

Blue channel.

struct **led_strip_driver_api**

#include <*led_strip.h*> LED strip driver API.

This is the mandatory API any LED strip driver needs to expose.

7.6.30 Management Data Input/Output (MDIO)

Overview

MDIO is a bus that is commonly used to communicate with ethernet PHY devices. Many ethernet MAC controllers also provide hardware to communicate over MDIO bus with a peripheral device.

This API is intended to be used primarily by PHY drivers but can also be used by user firmware.

API Reference

group **mdio_interface**

MDIO Interface.

Functions

void `mdio_bus_enable`(const struct *device* *dev)

Enable MDIO bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the controller

void `mdio_bus_disable`(const struct *device* *dev)

Disable MDIO bus and tri-state drivers.

Parameters

- `dev` – **[in]** Pointer to the device structure for the controller

int `mdio_read`(const struct *device* *dev, uint8_t prtad, uint8_t regad, uint16_t *data)

Read from MDIO Bus.

This routine provides a generic interface to perform a read on the MDIO bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the controller
- `prtad` – **[in]** Port address
- `regad` – **[in]** Register address
- `data` – Pointer to receive read data

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ETIMEDOUT` – If transaction timedout on the bus
- `-ENOSYS` – if read is not supported

int `mdio_write`(const struct *device* *dev, uint8_t prtad, uint8_t regad, uint16_t data)

Write to MDIO bus.

This routine provides a generic interface to perform a write on the MDIO bus.

Parameters

- `dev` – **[in]** Pointer to the device structure for the controller
- `prtad` – **[in]** Port address
- `regad` – **[in]** Register address
- `data` – **[in]** Data to write

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ETIMEDOUT` – If transaction timedout on the bus
- `-ENOSYS` – if write is not supported

int `mdio_read_c45`(const struct *device* *dev, uint8_t prtad, uint8_t devad, uint16_t regad, uint16_t *data)

Read from MDIO Bus using Clause 45 access.

This routine provides an interface to perform a read on the MDIO bus using IEEE 802.3 Clause 45 access.

Parameters

- `dev` – **[in]** Pointer to the device structure for the controller
- `prtad` – **[in]** Port address
- `devad` – **[in]** Device address
- `regad` – **[in]** Register address
- `data` – Pointer to receive read data

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ETIMEDOUT` – If transaction timedout on the bus
- `-ENOSYS` – if write using Clause 45 access is not supported

int `mdio_write_c45`(const struct *device* *dev, uint8_t prtad, uint8_t devad, uint16_t regad, uint16_t data)

Write to MDIO bus using Clause 45 access.

This routine provides an interface to perform a write on the MDIO bus using IEEE 802.3 Clause 45 access.

Parameters

- `dev` – **[in]** Pointer to the device structure for the controller
- `prtad` – **[in]** Port address
- `devad` – **[in]** Device address
- `regad` – **[in]** Register address
- `data` – **[in]** Data to write

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ETIMEDOUT` – If transaction timedout on the bus
- `-ENOSYS` – if write using Clause 45 access is not supported

7.6.31 MIPI Display Bus Interface (DBI)

The MIPI DBI driver class implements support for MIPI DBI compliant display controllers.

MIPI DBI defines 3 interface types:

- Type A: Motorola 6800 parallel bus
- Type B: Intel 8080 parallel bus
- Type C: SPI Type serial bit bus with 3 options:
  1. 9 write clocks per byte, final bit is command/data selection bit
  2. Same as above, but 16 write clocks per byte
  3. 8 write clocks per byte. Command/data selected via GPIO pin

Currently, the API only supports Type C controllers, options 1 and 3.

API Reference

group `mipi_dbi_interface`

MIPI-DBI driver APIs.

Since
3.6

Version
0.1.0

Defines

`MIPI_DBI_SPI_CONFIG_DT`(node_id, operation_, delay_)

initialize a MIPI DBI SPI configuration struct from devicetree

This helper allows drivers to initialize a MIPI DBI SPI configuration structure using devicetree.

Parameters

- `node_id` – Devicetree node identifier for the MIPI DBI device whose struct *spi_config* to create an initializer for
- `operation_` – the desired operation field in the struct *spi_config*
- `delay_` – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

`MIPI_DBI_SPI_CONFIG_DT_INST`(inst, operation_, delay_)

Initialize a MIPI DBI SPI configuration from devicetree instance.

This helper initializes a MIPI DBI SPI configuration from a devicetree instance. It is equivalent to *MIPI_DBI_SPI_CONFIG_DT(DT_DRV_INST(inst))*

Parameters

- `inst` – Instance number to initialize configuration from
- `operation_` – the desired operation field in the struct *spi_config*
- `delay_` – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

`MIPI_DBI_CONFIG_DT`(node_id, operation_, delay_)

Initialize a MIPI DBI configuration from devicetree.

This helper allows drivers to initialize a MIPI DBI configuration structure from devicetree. It sets the MIPI DBI mode, as well as configuration fields in the SPI configuration structure

Parameters

- `node_id` – Devicetree node identifier for the MIPI DBI device to initialize
- `operation_` – the desired operation field in the struct *spi_config*
- `delay_` – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

`MIPI_DBI_CONFIG_DT_INST`(inst, operation_, delay_)

Initialize a MIPI DBI configuration from device instance.

Equivalent to *MIPI_DBI_CONFIG_DT(DT_DRV_INST(inst), operation_, delay_)*

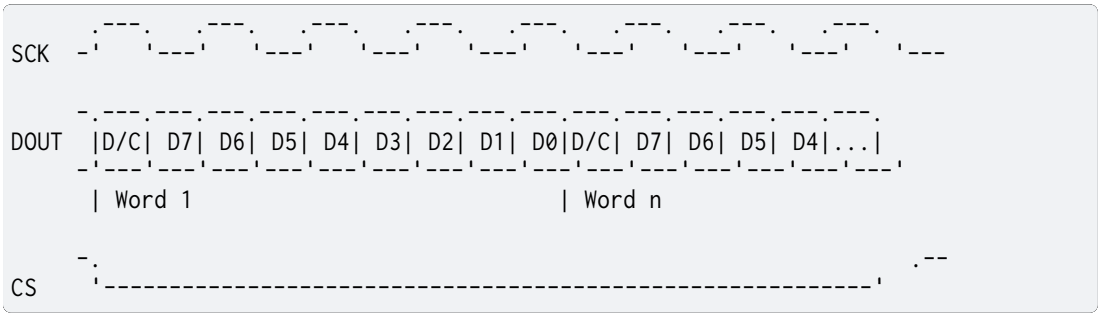
Parameters

- **inst** – Instance of the device to initialize a MIPI DBI configuration for
- **operation_** – the desired operation field in the struct *spi_config*
- **delay_** – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

MIPI_DBI_MODE_SPI_3WIRE

SPI 3 wire (Type C1).

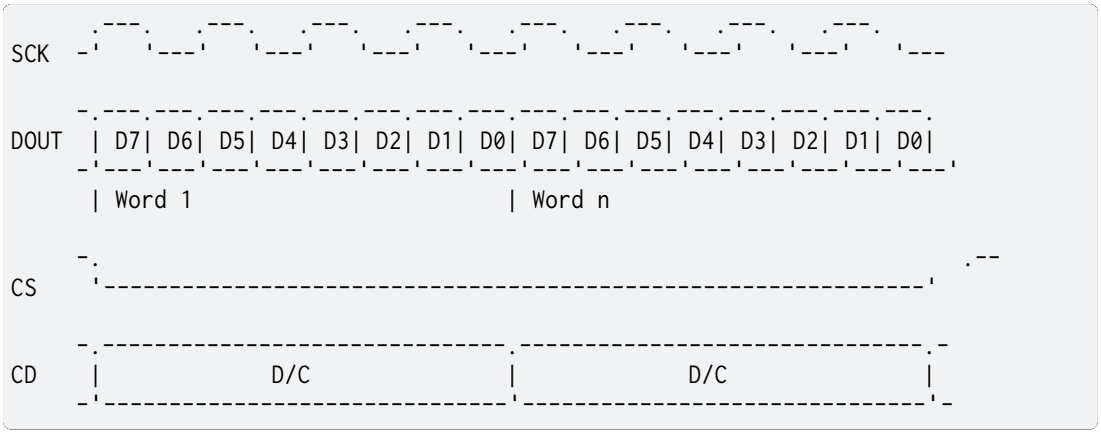
Uses 9 write clocks to send a byte of data. The bit sent on the 9th clock indicates whether the byte is a command or data byte



MIPI_DBI_MODE_SPI_4WIRE

SPI 4 wire (Type C3).

Uses 8 write clocks to send a byte of data. an additional C/D pin will be use to indicate whether the byte is a command or data byte



MIPI_DBI_MODE_6800_BUS_16_BIT

Parallel Bus protocol for MIPI DBI Type A based on Motorola 6800 bus.

(continues on next page)

(continued from previous page)

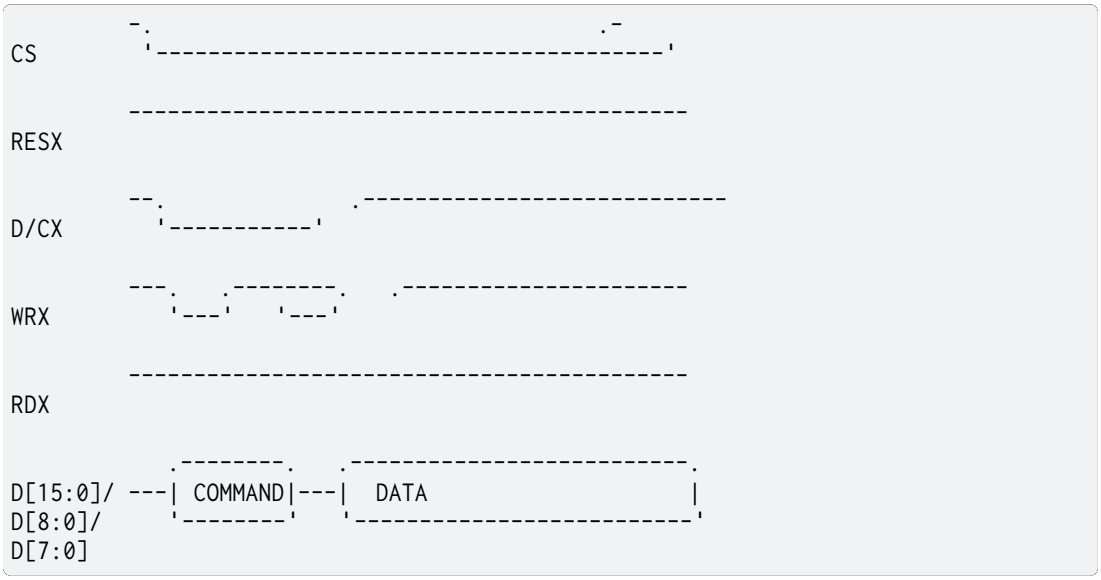
Please refer to the MIPI DBI specification for a detailed cycle diagram.

MIPI_DBI_MODE_6800_BUS_9_BIT

MIPI_DBI_MODE_6800_BUS_8_BIT

MIPI_DBI_MODE_8080_BUS_16_BIT

Parallel Bus protocol for MIPI DBI Type B based on Intel 8080 bus.



Please refer to the MIPI DBI specification for a detailed cycle diagram.

MIPI_DBI_MODE_8080_BUS_9_BIT

MIPI_DBI_MODE_8080_BUS_8_BIT

Functions

static inline int **mipi_dbi_command_write**(const struct *device* *dev, const struct *mipi_dbi_config* *config, uint8_t cmd, const uint8_t *data, size_t len)

Write a command to the display controller.

Writes a command, along with an optional data buffer to the display. If data buffer and buffer length are NULL and 0 respectively, then only a command will be sent. Note

that if the SPI configuration passed to this function locks the SPI bus, it is the caller's responsibility to release it with *mipi_dbi_release()*

Parameters

- `dev` – mipi dbi controller
- `config` – MIPI DBI configuration
- `cmd` – command to write to display controller
- `data` – optional data buffer to write after command
- `len` – size of data buffer in bytes. Set to 0 to skip sending data.

Return values

- `0` – command write succeeded
- `-EIO` – I/O error
- `-ETIMEDOUT` – transfer timed out
- `-EBUSY` – controller is busy
- `-ENOSYS` – not implemented

static inline int **mipi_dbi_command_read**(const struct *device* *dev, const struct *mipi_dbi_config* *config, uint8_t *cmds, size_t num_cmd, uint8_t *response, size_t len)

Read a command response from the display controller.

Reads a command response from the display controller.

Parameters

- `dev` – mipi dbi controller
- `config` – MIPI DBI configuration
- `cmds` – array of one byte commands to send to display controller
- `num_cmd` – number of commands to write to display controller
- `response` – response buffer, filled with display controller response
- `len` – size of response buffer in bytes.

Return values

- `0` – command read succeeded
- `-EIO` – I/O error
- `-ETIMEDOUT` – transfer timed out
- `-EBUSY` – controller is busy
- `-ENOSYS` – not implemented

static inline int **mipi_dbi_write_display**(const struct *device* *dev, const struct *mipi_dbi_config* *config, const uint8_t *framebuf, struct *display_buffer_descriptor* *desc, enum *display_pixel_format* pixfmt)

Write a display buffer to the display controller.

Writes a display buffer to the controller. If the controller requires a "Write memory" command before writing display data, this should be sent with *mipi_dbi_command_write*

Parameters

- `dev` – mipi dbi controller

- `config` – MIPI DBI configuration
- `framebuf` – framebuffer to write to display
- `desc` – descriptor of framebuffer to write. Note that the pitch must be equal to width. “buf_size” field determines how many bytes will be written.
- `pixfmt` – pixel format of framebuffer data

Return values

- `0` – buffer write succeeded.
- `-EIO` – I/O error
- `-ETIMEDOUT` – transfer timed out
- `-EBUSY` – controller is busy
- `-ENOSYS` – not implemented

static inline int **mipi_dbi_reset**(const struct *device* *dev, uint32_t delay)

Resets attached display controller.

Resets the attached display controller.

Parameters

- `dev` – mipi dbi controller
- `delay` – duration to set reset signal for, in milliseconds

Return values

- `0` – reset succeeded
- `-EIO` – I/O error
- `-ENOSYS` – not implemented
- `-ENOTSUP` – not supported

static inline int **mipi_dbi_release**(const struct *device* *dev, const struct *mipi_dbi_config* *config)

Releases a locked MIPI DBI device.

Releases a lock on a MIPI DBI device and/or the device’s CS line if and only if the given config parameter was the last one to be used in any of the above functions, and if it has the SPI_LOCK_ON bit set and/or the SPI_HOLD_ON_CS bit set into its operation bits field. This lock functions exactly like the SPI lock, and can be used if the caller needs to keep CS asserted for multiple transactions, or the MIPI DBI device locked.

Parameters

- `dev` – mipi dbi controller
- `config` – MIPI DBI configuration

Return values

- `0` – reset succeeded
- `-EIO` – I/O error
- `-ENOSYS` – not implemented
- `-ENOTSUP` – not supported

struct `mipi_dbi_config`

Defines

`MIPI_DSI_MSG_USE_LPM`

Functions

static inline int **mipi_dsi_attach**(const struct *device* *dev, uint8_t channel, const struct *mipi_dsi_device* *mdev)

Attach a new device to the MIPI-DSI bus.

Parameters

- `dev` – MIPI-DSI host device.

- `channel` – Device channel (VID).
- `mdev` – MIPI-DSI device description.

Returns
0 on success, negative on error

static inline ssize_t **mipi_dsi_transfer**(const struct *device* *dev, uint8_t channel, struct *mipi_dsi_msg* *msg)

Transfer data to/from a device attached to the MIPI-DSI bus.

Parameters

- `dev` – MIPI-DSI device.
- `channel` – Device channel (VID).
- `msg` – Message.

Returns
Size of the transferred data on success, negative on error.

ssize_t **mipi_dsi_generic_read**(const struct *device* *dev, uint8_t channel, const void *params, size_t nparams, void *buf, size_t len)

MIPI-DSI generic read.

Parameters

- `dev` – MIPI-DSI host device.
- `channel` – Device channel (VID).
- `params` – Buffer containing request parameters.
- `nparams` – Number of parameters.
- `buf` – Buffer where read data will be stored.
- `len` – Length of the reception buffer.

Returns
Size of the read data on success, negative on error.

ssize_t **mipi_dsi_generic_write**(const struct *device* *dev, uint8_t channel, const void *buf, size_t len)

MIPI-DSI generic write.

Parameters

- `dev` – MIPI-DSI host device.
- `channel` – Device channel (VID).
- `buf` – Transmission buffer.
- `len` – Length of the transmission buffer

Returns
Size of the written data on success, negative on error.

ssize_t **mipi_dsi_dcs_read**(const struct *device* *dev, uint8_t channel, uint8_t cmd, void *buf, size_t len)

MIPI-DSI DCS read.

Parameters

- `dev` – MIPI-DSI host device.
- `channel` – Device channel (VID).
- `cmd` – DCS command.

- `buf` – Buffer where read data will be stored.
- `len` – Length of the reception buffer.

Returns
Size of the read data on success, negative on error.

ssize_t **mipi_dsi_dcs_write**(const struct *device* *dev, uint8_t channel, uint8_t cmd, const void *buf, size_t len)

MIPI-DSI DCS write.

Parameters

- `dev` – MIPI-DSI host device.
- `channel` – Device channel (VID).
- `cmd` – DCS command.
- `buf` – Transmission buffer.
- `len` – Length of the transmission buffer

Returns
Size of the written data on success, negative on error.

static inline int **mipi_dsi_detach**(const struct *device* *dev, uint8_t channel, const struct *mipi_dsi_device* *mdev)

Detach a device from the MIPI-DSI bus.

Parameters

- `dev` – MIPI-DSI host device.
- `channel` – Device channel (VID).
- `mdev` – MIPI-DSI device description.

Returns
0 on success, negative on error

7.6.33 Multi-bit SPI Bus

The MSPI (multi-bit SPI) is provided as a generic API to accommodate advanced SPI peripherals and devices that typically require command, address and data phases, and multiple signal lines during these phases. While the API supports advanced features such as *XIP* and scrambling, it is also compatible with generic SPI.

- *MSPI Controller API*
  - *Transceive*
  - *Device Tree*
  - *Multi Peripheral*
- *Configuration Options*
- *API Reference*

MSPI Controller API

Zephyr's MSPI controller API may be used when a multi-bit SPI controller is present. E.g. Ambiq MSPI, QSPI, OSPI, Flexspi, etc. The API supports single to hex SDR/DDR IO with variable latency and advanced features such as *XIP* and scrambling. Applicable devices include but not limited to high-speed, high density flash/psram memory devices, displays and sensors.

The MSPI interface contains controller drivers that are SoC platform specific and implement the MSPI APIs, and device drivers that reference these APIs. The relationship between the controller and device drivers is many-to-many to allow for easy switching between platforms.

Here is a list of generic steps for initializing the MSPI controller and the MSPI bus inside the device driver initialization function:

1. Initialize the data structure of the MSPI controller driver instance. The usual device defining macros such as *DEVICE_DT_INST_DEFINE* can be used, and the initialization function, config and data provided as a parameter to the macro.
2. Initialize the hardware, including but not limited to:
   - Check `mspi_cfg` against hardware's own capabilities to prevent incorrect usages.
   - Setup default pinmux.
   - Setup the clock for the controller.
   - Power on the hardware.
   - Configure the hardware using `mspi_cfg` and possibly more platform specific settings.

- Usually, the `mspi_cfg` is filled from device tree and contains static, boot time parameters. However, if needed, one can use `mspi_config()` to re-initialize the hardware with new parameters during runtime.
- Release any lock if applicable.

3. Perform device driver initialization. As usually, *DEVICE_DT_INST_DEFINE* can be used. Inside device driver initialization function, perform the following required steps.
   1. Call `mspi_dev_config()` with device specific hardware settings obtained from device datasheets.
      - The `mspi_dev_cfg` should be filled by device tree and helper macro `MSPI_DEVICE_CONFIG_DT` can be used.
      - The controller driver should then validate the members of `mspi_dev_cfg` to prevent incorrect usage.
      - The controller driver should implement a mutex to protect from accidental access.
      - The controller driver may also switch between different devices based on `mspi_dev_id`.
   2. Call API for additional setups if supported by hardware
      - `mspi_xip_config()` for *XIP* feature
      - `mspi_scramble_config()` for scrambling feature
      - `mspi_timing_config()` for platform specific timing setup.
   3. Register any callback with `mspi_register_callback()` if needed.
   4. Release the controller mutex lock.

Transceive The transceive request is of type `mspi_xfer` which allows dynamic change to the transfer related settings once the mode of operation is determined and configured by `mspi_dev_config()`.

The API also supports bulk transfers with different starting addresses and sizes with `mspi_xfer_packet`. However, it is up to the controller implementation whether to support scatter IO and callback management. The controller can determine which user callback to trigger based on *mspi_bus_event_cb_mask* upon completion of each async/sync transfer if the callback had been registered using `mspi_register_callback()`. Or not to trigger any callback at all with *MSPI_BUS_NO_CB* even if the callbacks are already registered. In which case that a controller supports hardware command queue, user could take full advantage of the hardware performance if scatter IO and callback management are supported by the driver implementation.

Device Tree Here is an example for defining an MSPI controller in device tree: The mspi controller's bindings should reference mspi-controller.yaml as one of the base.

```
mspi0: mspi@400 {
         status = "okay";
         compatible = "zephyr,mspi-emul-controller";

         reg = < 0x400 0x4 >;
         #address-cells = < 0x1 >;
         #size-cells = < 0x0 >;

         clock-frequency = < 0x17d7840 >;
         op-mode = "MSPI_CONTROLLER";
         duplex = "MSPI_HALF_DUPLEX";
         ce-gpios = < &gpio0 0x5 0x1 >, < &gpio0 0x12 0x1 >;
         dqs-support;
```

(continues on next page)

(continued from previous page)

```
        pinctrl-0 = < &pinmux-mspi0 >;
        pinctrl-names = "default";
};
```

Here is an example for defining an MSPI device in device tree: The mspi device's bindings should reference mspi-device.yaml as one of the base.

```
&mspi0 {

        mspi_dev0: mspi_dev0@0 {
                status = "okay";
                compatible = "zephyr,mspi-emul-device";

                reg = < 0x0 >;
                size = < 0x10000 >;

                mspi-max-frequency = < 0x2dc6c00 >;
                mspi-io-mode = "MSPI_IO_MODE_QUAD";
                mspi-data-rate = "MSPI_DATA_RATE_SINGLE";
                mspi-hardware-ce-num = < 0x0 >;
                read-instruction = < 0xb >;
                write-instruction = < 0x2 >;
                instruction-length = "INSTR_1_BYTE";
                address-length = "ADDR_4_BYTE";
                rx-dummy = < 0x8 >;
                tx-dummy = < 0x0 >;
                xip-config = < 0x0 0x0 0x0 0x0 >;
                ce-break-config = < 0x0 0x0 >;
        };

};
```

User should specify target operating parameters in the DTS such as `mspi-max-frequency`, `mspi-io-mode` and `mspi-data-rate` even though they may subject to change during runtime. It should represent the typical configuration of the device during normal operations.

Multi Peripheral With `mspi_dev_id` defined as collection of the device index and CE GPIO from device tree, the API supports multiple devices on the same controller instance. The controller driver implementation may or may not support device switching, which can be performed either by software or by hardware. If the switching is handled by software, it should be performed in `mspi_dev_config()` call.

The device driver should record the current operating conditions of the device to support software controlled device switching by saving and updating `mspi_dev_cfg` and other relevant mspi struct or private data structures. In particular, `mspi_dev_id` which contains the identity of the device needs to be used for every API call.

7.6.34 Multi-Channel Inter-Processor Mailbox (MBOX)

Overview

An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

API Reference

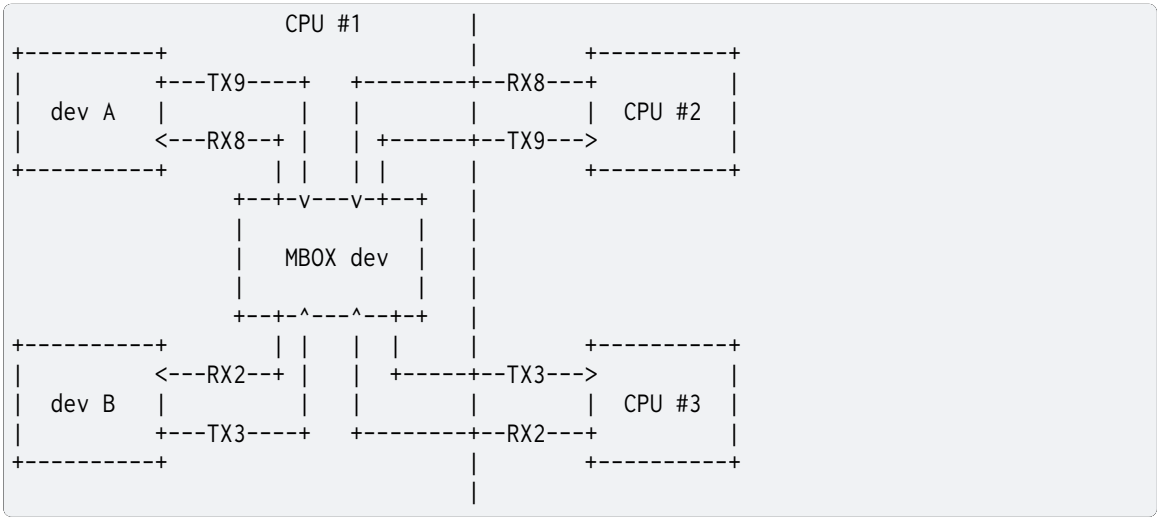
Related code samples

MBOX
Perform inter-processor mailbox communication using the MBOX API.

MBOX Data
Perform inter-processor mailbox communication using the MBOX API with data.

group `mbox_interface`

MBOX Interface.



Since
1.0

Version
0.1.0

An MBOX device is a peripheral capable of passing signals (and data depending on the peripheral) between CPUs and clusters in the system. Each MBOX instance is providing one or more channels, each one targeting one other CPU cluster (multiple channels can target the same cluster).

For example in the plot the device 'dev A' is using the TX channel 9 to signal (or send data to) the CPU #2 and it's expecting data or signals on the RX channel 8. Thus it can send the message through the channel 9, and it can register a callback on the channel 8 of the MBOX device.

This API supports two modes: signalling mode and data transfer mode.

In signalling mode:

- *mbox_mtu_get()* must return 0
- *mbox_send()* must have (msg == NULL)
- the callback must be called with (data == NULL)

In data transfer mode:

- *mbox_mtu_get()* must return a (value != 0)
- *mbox_send()* must have (msg != NULL)
- the callback must be called with (data != NULL)
- The msg content must be the same between sender and receiver

Defines

`MBOX_DT_SPEC_GET`(node_id, name)

Structure initializer for struct *mbox_dt_spec* from devicetree.

This helper macro expands to a static initializer for a struct *mbox_dt_spec* by reading the relevant device controller and channel number from the devicetree.

Example devicetree fragment:

```
n: node {
        mboxes = <&mbox1 8>,
                 <&mbox1 9>;
        mbox-names = "tx", "rx";
};
```

Example usage:

```
const struct mbox_dt_spec spec = MBOX_DT_SPEC_GET(DT_NODELABEL(n), tx);
```

Parameters

- `node_id` – Devicetree node identifier for the MBOX device
- `name` – lowercase-and-underscores name of the mboxes element

Returns

static initializer for a struct *mbox_dt_spec*

`MBOX_DT_SPEC_INST_GET`(inst, name)

Instance version of MBOX_DT_CHANNEL_GET()

Parameters

- `inst` – DT_DRV_COMPAT instance number
- `name` – lowercase-and-underscores name of the mboxes element

Returns
static initializer for a struct *mbox_dt_spec*

Typedefs

typedef uint32_t **mbox_channel_id_t**
Type for MBOX channel identifiers.

Functions

static inline bool **mbox_is_ready_dt**(const struct *mbox_dt_spec* *spec)
Validate if MBOX device instance from a struct *mbox_dt_spec* is ready.

Parameters
- **spec** – MBOX specification from devicetree

Returns
See return values for *mbox_send()*

int **mbox_send**(const struct *device* *dev, *mbox_channel_id_t* channel_id, const struct *mbox_msg* *msg)
Try to send a message over the MBOX device.

Send a message over an struct mbox_channel. The msg parameter must be NULL when the driver is used for signalling.

If the msg parameter is not NULL, this data is expected to be delivered on the receiving side using the data parameter of the receiving callback.

Parameters
- **dev** – MBOX device instance
- **channel_id** – MBOX channel identifier
- **msg** – Message

Return values
- **0** – On success.
- **-EBUSY** – If the remote hasn't yet read the last data sent.
- **-EMSGSIZE** – If the supplied data size is unsupported by the driver.
- **-EINVAL** – If there was a bad parameter, such as: too-large channel descriptor or the device isn't an outbound MBOX channel.

static inline int **mbox_send_dt**(const struct *mbox_dt_spec* *spec, const struct *mbox_msg* *msg)
Try to send a message over the MBOX device from a struct *mbox_dt_spec*.

Parameters
- **spec** – MBOX specification from devicetree
- **msg** – Message

Returns
See return values for *mbox_send()*

static inline int **mbox_register_callback**(const struct *device* *dev, *mbox_channel_id_t* channel_id, mbox_callback_t cb, void *user_data)

Register a callback function on a channel for incoming messages.

This function doesn't assume anything concerning the status of the interrupts. Use *mbox_set_enabled()* to enable or to disable the interrupts if needed.

Parameters

- **dev** – MBOX device instance
- **channel_id** – MBOX channel identifier
- **cb** – Callback function to execute on incoming message interrupts.
- **user_data** – Application-specific data pointer which will be passed to the callback function when executed.

Return values

- **0** – On success.
- **-errno** – Negative errno on error.

static inline int **mbox_register_callback_dt**(const struct *mbox_dt_spec* *spec, mbox_callback_t cb, void *user_data)

Register a callback function on a channel for incoming messages from a struct *mbox_dt_spec*.

Parameters

- **spec** – MBOX specification from devicetree
- **cb** – Callback function to execute on incoming message interrupts.
- **user_data** – Application-specific data pointer which will be passed to the callback function when executed.

Returns
See return values for *mbox_register_callback()*

int **mbox_mtu_get**(const struct *device* *dev)

Return the maximum number of bytes possible in an outbound message.

Returns the actual number of bytes that it is possible to send through an outgoing channel.

This number can be 0 when the driver only supports signalling or when on the receiving side the content and size of the message must be retrieved in an indirect way (i.e. probing some other peripheral, reading memory regions, etc...).

If this function returns 0, the msg parameter in *mbox_send()* is expected to be NULL.

Parameters

- **dev** – MBOX device instance.

Return values

- **>0** – Maximum possible size of a message in bytes
- **0** – Indicates signalling
- **-errno** – Negative errno on error.

static inline int **mbox_mtu_get_dt**(const struct *mbox_dt_spec* *spec)

Return the maximum number of bytes possible in an outbound message from struct *mbox_dt_spec*.

Parameters

- `spec` – MBOX specification from devicetree

Returns
See return values for *mbox_register_callback()*

int `mbox_set_enabled`(const struct *device* *dev, *mbox_channel_id_t* channel_id, bool enabled)

Enable (disable) interrupts and callbacks for inbound channels.

Enable interrupt for the channel when the parameter 'enable' is set to true. Disable it otherwise.

Immediately after calling this function with 'enable' set to true, the channel is considered enabled and ready to receive signal and messages (even already pending), so the user must take care of installing a proper callback (if needed) using *mbox_register_callback()* on the channel before enabling it. For this reason it is recommended that all the channels are disabled at probe time.

Enabling a channel for which there is no installed callback is considered undefined behavior (in general the driver must take care of gracefully handling spurious interrupts with no installed callback).

Parameters

- `dev` – MBOX device instance
- `channel_id` – MBOX channel identifier
- `enabled` – Enable (true) or disable (false) the channel.

Return values

- `0` – On success.
- `-EINVAL` – If it isn't an inbound channel.
- `-EALREADY` – If channel is already `enabled`.

static inline int `mbox_set_enabled_dt`(const struct *mbox_dt_spec* *spec, bool enabled)

Enable (disable) interrupts and callbacks for inbound channels from a struct *mbox_dt_spec*.

Parameters

- `spec` – MBOX specification from devicetree
- `enabled` – Enable (true) or disable (false) the channel.

Returns
See return values for *mbox_set_enabled()*

uint32_t `mbox_max_channels_get`(const struct *device* *dev)

Return the maximum number of channels.

Return the maximum number of channels supported by the hardware.

Parameters

- `dev` – MBOX device instance.

Returns
>0 Maximum possible number of supported channels on success

Returns
-errno Negative errno on error.

static inline int **mbox_max_channels_get_dt**(const struct *mbox_dt_spec* *spec)

Return the maximum number of channels from a struct *mbox_dt_spec*.

Parameters

- **spec** – MBOX specification from devicetree

Returns

See return values for *mbox_max_channels_get()*

struct **mbox_msg**

#include <*mbox.h*> Message struct (to hold data and its size).

Public Members

const void ***data**

Pointer to the data sent in the message.

size_t **size**

Size of the data.

struct **mbox_dt_spec**

#include <*mbox.h*> MBOX specification from DT.

Public Members

const struct *device* ***dev**

MBOX device pointer.

mbox_channel_id_t **channel_id**

Channel ID.

7.6.35 Peripheral Component Interconnect express Bus (PCIe)

Overview

API Reference

group **pcie_host_interface**

PCIe Host Interface.

Defines

PCIE_ID_IS_VALID(id)

PCIE_DT_ID(node_id)

Get the PCIe Vendor and Device ID for a node.

Parameters

- node_id – DTS node identifier

Returns

The VID/DID combination as pcie_id_t

PCIE_DT_INST_ID(inst)

Get the PCIe Vendor and Device ID for a node.

This is equivalent to *PCIE_DT_ID(DT_DRV_INST(inst))*

Parameters

- inst – Devicetree instance number

Returns

The VID/DID combination as pcie_id_t

DEVICE_PCIE_DECLARE(node_id)

Declare a PCIe context variable for a DTS node.

Declares a PCIe context for a DTS node. This must be done before using the *DEVICE_PCIE_INIT()* macro for the same node.

Parameters

- node_id – DTS node identifier

DEVICE_PCIE_INST_DECLARE(inst)

Declare a PCIe context variable for a DTS node.

This is equivalent to *DEVICE_PCIE_DECLARE(DT_DRV_INST(inst))*

Parameters

- inst – Devicetree instance number

DEVICE_PCIE_INIT(node_id, name)

Initialize a named struct member to point at a PCIe context.

Initialize PCIe-related information within a specific instance of a device config struct, using information from DTS. Using the macro requires having first created PCIe context struct using the *DEVICE_PCIE_DECLARE()* macro.

Example for an instance of a driver belonging to the “foo” subsystem

struct foo_config { struct *pcie_dev* *pcie; ... };

DEVICE_PCIE_ID_DECLARE(DT_DRV_INST(...)); struct foo_config my_config = { *DEVICE_PCIE_INIT(pcie, DT_DRV_INST(...))*, ... };

Parameters

- node_id – DTS node identifier
- name – Member name within config for the MMIO region

DEVICE_PCIE_INST_INIT(inst, name)

Initialize a named struct member to point at a PCIe context.

This is equivalent to *DEVICE_PCIE_INIT(DT_DRV_INST(inst), name)*

Parameters

- inst – Devicetree instance number
- name – Name of the struct member (of type struct *pcie_dev* *)

PCIE_HOST_CONTROLLER(n)

Get the BDF for a given PCI host controller.

This macro is useful when the PCI host controller behind PCIE_BDF(0, 0, 0) indicates a multifunction device. In such a case each function of this endpoint is a potential host controller itself.

Parameters

- n – Bus number

Returns

BDF value of the given host controller

PCIE_CONF_CAPPTR

PCIE_CONF_CAPPTR_FIRST(w)

PCIE_CONF_CAP_ID(w)

PCIE_CONF_CAP_NEXT(w)

PCIE_CONF_EXT_CAPPTR

PCIE_MAX_BUS

PCIE_MAX_DEV

PCIE_MAX_FUNC

PCIE_IRQ_CONNECT(bdf_p, irq_p, priority_p, isr_p, isr_param_p, flags_p)

Initialize an interrupt handler for a PCIe endpoint IRQ.

This routine is only meant to be used by drivers using PCIe bus and having fixed or MSI based IRQ (so no runtime detection of the IRQ). In case of runtime detection see *pcie_connect_dynamic_irq()*

Parameters

- **bdf_p** – PCIe endpoint BDF
- **irq_p** – IRQ line number.
- **priority_p** – Interrupt priority.
- **isr_p** – Address of interrupt service routine.
- **isr_param_p** – Parameter passed to interrupt service routine.
- **flags_p** – Architecture-specific IRQ configuration flags..

Typedefs

typedef uint32_t **pcie_bdf_t**

A unique PCI(e) endpoint (bus, device, function).

A PCI(e) endpoint is uniquely identified topologically using a (bus, device, function) tuple. The internal structure is documented in include/dt-bindings/pcie/pcie.h: see PCIE_BDF() and friends, since these tuples are referenced from devicetree.

typedef uint32_t **pcie_id_t**

A unique PCI(e) identifier (vendor ID, device ID).

The PCIE_CONF_ID register for each endpoint is a (vendor ID, device ID) pair, which is meant to tell the system what the PCI(e) endpoint is. Again, look to PCIE_ID_* macros in include/dt-bindings/pcie/pcie.h for more.

typedef bool (***pcie_scan_cb_t**)(*pcie_bdf_t* bdf, *pcie_id_t* id, void *cb_data)

Callback type used for scanning for PCI endpoints.

Param bdf
BDF value for a found endpoint.

Param id
Vendor & Device ID for the found endpoint.

Param cb_data
Custom, use case specific data.

Return
true to continue scanning, false to stop scanning.

Enums

Values:

enumerator PCIE_SCAN_RECURSIVE = *BIT*(0)

Scan all available PCI host controllers and sub-busses.

enumerator PCIE_SCAN_CB_ALL = *BIT*(1)

Do the callback for all endpoint types, including bridges.

Functions

uint32_t pcie_conf_read(*pcie_bdf_t* bdf, unsigned int reg)

Read a 32-bit word from an endpoint's configuration space.

This function is exported by the arch/SoC/board code.

Parameters

- bdf – PCI(e) endpoint
- reg – the configuration word index (not address)

Returns

the word read (0xFFFFFFFFU if nonexistent endpoint or word)

void pcie_conf_write(*pcie_bdf_t* bdf, unsigned int reg, uint32_t data)

Write a 32-bit word to an endpoint's configuration space.

This function is exported by the arch/SoC/board code.

Parameters

- bdf – PCI(e) endpoint
- reg – the configuration word index (not address)
- data – the value to write

int pcie_scan(const struct *pcie_scan_opt* *opt)

Scan for PCIe devices.

Scan the PCI bus (or buses) for available endpoints.

Parameters

- opt – Options determining how to perform the scan.

Returns

0 on success, negative POSIX error number on failure.

bool pcie_get_mbar(*pcie_bdf_t* bdf, unsigned int bar_index, struct *pcie_bar* *mbar)

Get the MBAR at a specific BAR index.

Parameters

- bdf – the PCI(e) endpoint
- bar_index – 0-based BAR index
- mbar – Pointer to struct *pcie_bar*

Returns

true if the mbar was found and is valid, false otherwise

bool pcie_probe_mbar(*pcie_bdf_t* bdf, unsigned int index, struct *pcie_bar* *mbar)

Probe the nth MMIO address assigned to an endpoint.

A PCI(e) endpoint has 0 or more memory-mapped regions. This function allows the caller to enumerate them by calling with index=0..n. Value of n has to be below 6, as there is a maximum of 6 BARs. The indices are order-preserving with respect to the endpoint BARs: e.g., index 0 will return the lowest-numbered memory BAR on the endpoint.

Parameters

- `bdf` – the PCI(e) endpoint
- `index` – (0-based) index
- `mbar` – Pointer to struct *pcie_bar*

Returns
true if the mbar was found and is valid, false otherwise

bool **pcie_get_iobar**(*pcie_bdf_t* bdf, unsigned int bar_index, struct *pcie_bar* *iobar)

Get the I/O BAR at a specific BAR index.

Parameters

- `bdf` – the PCI(e) endpoint
- `bar_index` – 0-based BAR index
- `iobar` – Pointer to struct *pcie_bar*

Returns
true if the I/O BAR was found and is valid, false otherwise

bool **pcie_probe_iobar**(*pcie_bdf_t* bdf, unsigned int index, struct *pcie_bar* *iobar)

Probe the nth I/O BAR address assigned to an endpoint.

A PCI(e) endpoint has 0 or more I/O regions. This function allows the caller to enumerate them by calling with index=0..n. Value of n has to be below 6, as there is a maximum of 6 BARs. The indices are order-preserving with respect to the endpoint BARs: e.g., index 0 will return the lowest-numbered I/O BAR on the endpoint.

Parameters

- `bdf` – the PCI(e) endpoint
- `index` – (0-based) index
- `iobar` – Pointer to struct *pcie_bar*

Returns
true if the I/O BAR was found and is valid, false otherwise

void **pcie_set_cmd**(*pcie_bdf_t* bdf, uint32_t bits, bool on)

Set or reset bits in the endpoint command/status register.

Parameters

- `bdf` – the PCI(e) endpoint
- `bits` – the powerset of bits of interest
- `on` – use true to set bits, false to reset them

unsigned int **pcie_alloc_irq**(*pcie_bdf_t* bdf)

Allocate an IRQ for an endpoint.

This function first checks the IRQ register and if it contains a valid value this is returned. If the register does not contain a valid value allocation of a new one is attempted. Such function is only exposed if CONFIG_PCIE_CONTROLLER is unset. It is thus available where architecture tied dynamic IRQ allocation for PCIe device makes sense.

Parameters

- `bdf` – the PCI(e) endpoint

Returns
the IRQ number, or PCIE_CONF_INTR_IRQ_NONE if allocation failed.

unsigned int **pcie_get_irq**(*pcie_bdf_t* bdf)

Return the IRQ assigned by the firmware/board to an endpoint.

Parameters

- **bdf** – the PCI(e) endpoint

Returns
the IRQ number, or PCIE_CONF_INTR_IRQ_NONE if unknown.

void **pcie_irq_enable**(*pcie_bdf_t* bdf, unsigned int irq)

Enable the PCI(e) endpoint to generate the specified IRQ.

If MSI is enabled and the endpoint supports it, the endpoint will be configured to generate the specified IRQ via MSI. Otherwise, it is assumed that the IRQ has been routed by the boot firmware to the specified IRQ, and the IRQ is enabled (at the I/O APIC, or wherever appropriate).

Parameters

- **bdf** – the PCI(e) endpoint
- **irq** – the IRQ to generate

uint32_t **pcie_get_cap**(*pcie_bdf_t* bdf, uint32_t cap_id)

Find a PCI(e) capability in an endpoint's configuration space.

Parameters

- **bdf** – the PCI endpoint to examine
- **cap_id** – the capability ID of interest

Returns
the index of the configuration word, or 0 if no capability.

uint32_t **pcie_get_ext_cap**(*pcie_bdf_t* bdf, uint32_t cap_id)

Find an Extended PCI(e) capability in an endpoint's configuration space.

Parameters

- **bdf** – the PCI endpoint to examine
- **cap_id** – the capability ID of interest

Returns
the index of the configuration word, or 0 if no capability.

bool **pcie_connect_dynamic_irq**(*pcie_bdf_t* bdf, unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)

Dynamically connect a PCIe endpoint IRQ to an ISR handler.

Parameters

- **bdf** – the PCI endpoint to examine
- **irq** – the IRQ to connect (see *pcie_alloc_irq()*)
- **priority** – priority of the IRQ
- **routine** – the ISR handler to connect to the IRQ
- **parameter** – the parameter to provide to the handler
- **flags** – IRQ connection flags

Returns
true if connected, false otherwise

struct **pcie_dev**
#include <pcie.h>

struct **pcie_bar**
#include <pcie.h>

struct **pcie_scan_opt**
#include <pcie.h> Options for performing a scan for PCI devices.

Public Members

uint8_t **bus**
Initial bus number to scan.

pcie_scan_cb_t **cb**
Function to call for each found endpoint.

void ***cb_data**
Custom data to pass to the scan callback.

uint32_t **flags**
Scan flags.

7.6.36 Platform Environment Control Interface (PECI)

Overview

The Platform Environment Control Interface, abbreviated as PECI, is a thermal management standard introduced in 2006 with the Intel Core 2 Duo Microprocessors. The PECI interface allows external devices to read processor temperature, perform processor manageability functions, and manage processor interface tuning and diagnostics. The PECI bus driver APIs enable the interaction between Embedded Microcontrollers and CPUs.

Functions

int peci_config(const struct *device* *dev, uint32_t bitrate)

Configures the PECI interface.

Parameters

- dev – Pointer to the device structure for the driver instance.
- bitrate – the selected bitrate expressed in Kbps.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_enable(const struct *device* *dev)

Enable PECI interface.

Parameters

- dev – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_disable(const struct *device* *dev)

Disable PECI interface.

Parameters

- dev – Pointer to the device structure for the driver instance.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int peci_transfer(const struct *device* *dev, struct *peci_msg* *msg)

Performs a PECI transaction.

Parameters

- dev – Pointer to the device structure for the driver instance.
- msg – Structure representing a PECI transaction.

Return values

- 0 – If successful.

- `Negative` – errno code if failure.

struct `peci_buf`

#include <peci.h> PECI buffer structure.

Public Members

uint8_t *`buf`

Valid pointer on a data buffer, or NULL otherwise.

size_t `len`

Length of the data buffer expected to be received without considering the frame check sequence byte.

> **Note**
>
> Frame check sequence byte is added into rx buffer: need to allocate an additional byte for this in rx buffer.

struct `peci_msg`

#include <peci.h> PECI transaction packet format.

Public Members

uint8_t `addr`

Client address.

enum *peci_command_code* `cmd_code`

Command code.

struct *peci_buf* `tx_buffer`

Pointer to buffer of write data.

struct *peci_buf* `rx_buffer`

Pointer to buffer of read data.

uint8_t `flags`

PECI msg flags.

7.6.37 PS/2

Overview

The PS/2 connector first hit the market in 1987 on IBM's desktop PC line of the same name before becoming an industry-wide standard for mouse and keyboard connections. Starting around 2007, USB superseded PS/2 and is the modern peripheral device connection standard. For legacy support on boards with a PS/2 connector, Zephyr provides these PS/2 driver APIs.

Configuration Options

Related configuration options:

- CONFIG_PS2

API Reference

Related code samples

PS/2 interface
Communicate with a PS/2 mouse.

group ps2_interface
PS/2 Driver APIs.

Typedefs

typedef void (*ps2_callback_t)(const struct *device* *dev, uint8_t data)
PS/2 callback called when user types or click a mouse.

Param dev
Pointer to the device structure for the driver instance.

Param data
Data byte passed pack to the user.

Functions

int ps2_config(const struct *device* *dev, *ps2_callback_t* callback_isr)
Configure a ps2 instance.

Parameters

- dev – Pointer to the device structure for the driver instance.
- callback_isr – called when PS/2 devices reply to a configuration command or when a mouse/keyboard send data to the client application.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int ps2_write(const struct *device* *dev, uint8_t value)
Write to PS/2 device.

Parameters

- dev – Pointer to the device structure for the driver instance.
- value – Data for the PS2 device.

Return values

- 0 – If successful.
- Negative – errno code if failure.

int `ps2_read`(const struct *device* *dev, uint8_t *value)
Read slave-to-host values from PS/2 device.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `value` – Pointer used for reading the PS/2 device.

Return values

- `0` – If successful.
- `Negative` – errno code if failure.

int `ps2_enable_callback`(const struct *device* *dev)
Enables callback.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `Negative` – errno code if failure.

int `ps2_disable_callback`(const struct *device* *dev)
Disables callback.

Parameters

- `dev` – Pointer to the device structure for the driver instance.

Return values

- `0` – If successful.
- `Negative` – errno code if failure.

7.6.38 Pulse Width Modulation (PWM)

Blink an LED using the PWM API.

PWM RGB LED
Drive an RGB LED using the PWM API.

Servomotor
Drive a servomotor using the PWM API.

group `pwm_interface`
PWM Interface.

Since
1.0

Version
1.0.0

PWM capture configuration flags

`PWM_CAPTURE_TYPE_PERIOD`
PWM pin capture captures period.

`PWM_CAPTURE_TYPE_PULSE`
PWM pin capture captures pulse width.

`PWM_CAPTURE_TYPE_BOTH`
PWM pin capture captures both period and pulse width.

`PWM_CAPTURE_MODE_SINGLE`
PWM pin capture captures a single period/pulse width.

`PWM_CAPTURE_MODE_CONTINUOUS`
PWM pin capture captures period/pulse width continuously.

PWM period set helpers

The period cell in the PWM specifier needs to be provided in nanoseconds.

However, in some applications it is more convenient to use another scale.

`PWM_NSEC(x)`
Specify PWM period in nanoseconds.

`PWM_USEC(x)`
Specify PWM period in microseconds.

`PWM_MSEC(x)`
Specify PWM period in milliseconds.

`PWM_SEC(x)`
Specify PWM period in seconds.

`PWM_HZ(x)`
Specify PWM frequency in hertz.

`PWM_KHZ(x)`
Specify PWM frequency in kilohertz.

PWM polarity flags

The `PWM_POLARITY_*` flags are used with *pwm_set_cycles()*, *pwm_set()* or *pwm_configure_capture()* to specify the polarity of a PWM channel.

The flags are on the lower 8bits of the pwm_flags_t

PWM_POLARITY_NORMAL
: PWM pin normal polarity (active-high pulse).

PWM_POLARITY_INVERTED
: PWM pin inverted polarity (active-low pulse).

Defines

PWM_DT_SPEC_GET_BY_NAME(node_id, name)
: Static initializer for a struct *pwm_dt_spec*.

  This returns a static initializer for a struct *pwm_dt_spec* given a devicetree node identifier and an index.

  Example devicetree fragment:

```
n: node {
    pwms = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
           <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
    pwm-names = "alpha", "beta";
};
```

  Example usage:

```
const struct pwm_dt_spec spec =
    PWM_DT_SPEC_GET_BY_NAME(DT_NODELABEL(n), alpha);

// Initializes 'spec' to:
// {
//         .dev = DEVICE_DT_GET(DT_NODELABEL(pwm1)),
//         .channel = 1,
//         .period = 1000,
//         .flags = PWM_POLARITY_NORMAL,
// }
```

  The device (dev) must still be checked for readiness, e.g. using *device_is_ready()*. It is an error to use this macro unless the node exists, has the 'pwms' property, and that 'pwms' property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

  See also

  PWM_DT_SPEC_INST_GET_BY_NAME

  Parameters

  - node_id – Devicetree node identifier.
  - name – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property.

  Returns
  Static initializer for a struct *pwm_dt_spec* for the property.

PWM_DT_SPEC_INST_GET_BY_NAME(inst, name)

Static initializer for a struct *pwm_dt_spec* from a DT_DRV_COMPAT instance.

See also

PWM_DT_SPEC_GET_BY_NAME

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **name** – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property.

Returns

Static initializer for a struct *pwm_dt_spec* for the property.

PWM_DT_SPEC_GET_BY_NAME_OR(node_id, name, default_value)

Like *PWM_DT_SPEC_GET_BY_NAME()*, with a fallback to a default value.

If the devicetree node identifier 'node_id' refers to a node with a property 'pwms', this expands to *PWM_DT_SPEC_GET_BY_NAME(node_id, name)*. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

See also

PWM_DT_SPEC_INST_GET_BY_NAME_OR

Parameters

- **node_id** – Devicetree node identifier.
- **name** – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property
- **default_value** – Fallback value to expand to.

Returns

Static initializer for a struct *pwm_dt_spec* for the property, or `default_value` if the node or property do not exist.

PWM_DT_SPEC_INST_GET_BY_NAME_OR(inst, name, default_value)

Like *PWM_DT_SPEC_INST_GET_BY_NAME()*, with a fallback to a default value.

See also

PWM_DT_SPEC_GET_BY_NAME_OR

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **name** – Lowercase-and-underscores name of a pwms element as defined by the node's pwm-names property.

- **default_value** – Fallback value to expand to.

Returns
Static initializer for a struct *pwm_dt_spec* for the property, or default_value if the node or property do not exist.

PWM_DT_SPEC_GET_BY_IDX(node_id, idx)

Static initializer for a struct *pwm_dt_spec*.

This returns a static initializer for a struct *pwm_dt_spec* given a devicetree node identifier and an index.

Example devicetree fragment:

```
n: node {
    pwms = <&pwm1 1 1000 PWM_POLARITY_NORMAL>,
           <&pwm2 3 2000 PWM_POLARITY_INVERTED>;
};
```

Example usage:

```
const struct pwm_dt_spec spec =
    PWM_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 1);

// Initializes 'spec' to:
// {
//         .dev = DEVICE_DT_GET(DT_NODELABEL(pwm2)),
//         .channel = 3,
//         .period = 2000,
//         .flags = PWM_POLARITY_INVERTED,
// }
```

The device (dev) must still be checked for readiness, e.g. using *device_is_ready()*. It is an error to use this macro unless the node exists, has the 'pwms' property, and that 'pwms' property specifies a PWM controller, a channel, a period in nanoseconds and optionally flags.

See also

PWM_DT_SPEC_INST_GET_BY_IDX

Parameters

- **node_id** – Devicetree node identifier.
- **idx** – Logical index into 'pwms' property.

Returns
Static initializer for a struct *pwm_dt_spec* for the property.

PWM_DT_SPEC_INST_GET_BY_IDX(inst, idx)

Static initializer for a struct *pwm_dt_spec* from a DT_DRV_COMPAT instance.

See also

PWM_DT_SPEC_GET_BY_IDX

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – Logical index into 'pwms' property.

Returns
Static initializer for a struct *pwm_dt_spec* for the property.

PWM_DT_SPEC_GET_BY_IDX_OR(node_id, idx, default_value)

Like *PWM_DT_SPEC_GET_BY_IDX()*, with a fallback to a default value.

If the devicetree node identifier 'node_id' refers to a node with a property 'pwms', this expands to *PWM_DT_SPEC_GET_BY_IDX(node_id, idx)*. The `default_value` parameter is not expanded in this case. Otherwise, this expands to `default_value`.

See also

PWM_DT_SPEC_INST_GET_BY_IDX_OR

Parameters

- **node_id** – Devicetree node identifier.
- **idx** – Logical index into 'pwms' property.
- **default_value** – Fallback value to expand to.

Returns
Static initializer for a struct *pwm_dt_spec* for the property, or `default_value` if the node or property do not exist.

PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, idx, default_value)

Like *PWM_DT_SPEC_INST_GET_BY_IDX()*, with a fallback to a default value.

See also

PWM_DT_SPEC_GET_BY_IDX_OR

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – Logical index into 'pwms' property.
- **default_value** – Fallback value to expand to.

Returns
Static initializer for a struct *pwm_dt_spec* for the property, or `default_value` if the node or property do not exist.

PWM_DT_SPEC_GET(node_id)

Equivalent to *PWM_DT_SPEC_GET_BY_IDX(node_id, 0)*.

See also

PWM_DT_SPEC_GET_BY_IDX

See also

PWM_DT_SPEC_INST_GET

Parameters

- `node_id` – Devicetree node identifier.

Returns

Static initializer for a struct *pwm_dt_spec* for the property.

`PWM_DT_SPEC_INST_GET`(inst)

Equivalent to *PWM_DT_SPEC_INST_GET_BY_IDX(inst, 0)*.

See also

PWM_DT_SPEC_INST_GET_BY_IDX

See also

PWM_DT_SPEC_GET

Parameters

- `inst` – DT_DRV_COMPAT instance number

Returns

Static initializer for a struct *pwm_dt_spec* for the property.

`PWM_DT_SPEC_GET_OR`(node_id, default_value)

Equivalent to *PWM_DT_SPEC_GET_BY_IDX_OR(node_id, 0, default_value)*.

See also

PWM_DT_SPEC_GET_BY_IDX_OR

See also

PWM_DT_SPEC_INST_GET_OR

Parameters

- `node_id` – Devicetree node identifier.
- `default_value` – Fallback value to expand to.

Returns
Static initializer for a struct *pwm_dt_spec* for the property.

`PWM_DT_SPEC_INST_GET_OR`(inst, default_value)
Equivalent to *PWM_DT_SPEC_INST_GET_BY_IDX_OR(inst, 0, default_value)*.

See also
PWM_DT_SPEC_INST_GET_BY_IDX_OR

See also
PWM_DT_SPEC_GET_OR

Parameters
- `inst` – DT_DRV_COMPAT instance number
- `default_value` – Fallback value to expand to.

Returns
Static initializer for a struct *pwm_dt_spec* for the property.

Typedefs

typedef uint16_t `pwm_flags_t`
Provides a type to hold PWM configuration flags.

The lower 8 bits are used for standard flags. The upper 8 bits are reserved for SoC specific flags.

See also
PWM_CAPTURE_FLAGS.

typedef void (*`pwm_capture_callback_handler_t`)(const struct *device* *dev, uint32_t channel, uint32_t period_cycles, uint32_t pulse_cycles, int status, void *user_data)
PWM capture callback handler function signature.

Note
The callback handler will be called in interrupt context.

Note
`CONFIG_PWM_CAPTURE` must be selected to enable PWM capture support.

Param dev
[in] PWM device instance.

Param channel
PWM channel.

Param period_cycles
Captured PWM period width (in clock cycles). HW specific.

Param pulse_cycles
Captured PWM pulse width (in clock cycles). HW specific.

Param status
Status for the PWM capture (0 if no error, negative errno otherwise. See *pwm_capture_cycles()* return value descriptions for details).

Param user_data
User data passed to *pwm_configure_capture()*

Functions

int **pwm_set_cycles**(const struct *device* *dev, uint32_t channel, uint32_t period, uint32_t pulse, *pwm_flags_t* flags)

Set the period and pulse width for a single PWM output.

The PWM period and pulse width will synchronously be set to the new values without glitches in the PWM signal, but the call will not block for the change to take effect.

Passing 0 as `pulse` will cause the pin to be driven to a constant inactive level. Passing a non-zero `pulse` equal to `period` will cause the pin to be driven to a constant active level.

Note

Not all PWM controllers support synchronous, glitch-free updates of the PWM period and pulse width. Depending on the hardware, changing the PWM period and/or pulse width may cause a glitch in the generated PWM signal.

Note

Some multi-channel PWM controllers share the PWM period across all channels. Depending on the hardware, changing the PWM period for one channel may affect the PWM period for the other channels of the same PWM controller.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `period` – Period (in clock cycles) set to the PWM. HW specific.
- `pulse` – Pulse width (in clock cycles) set to the PWM. HW specific.
- `flags` – Flags for pin configuration.

Return values

- `0` – If successful.

- `-EINVAL` – If pulse > period.
- `-errno` – Negative errno code on failure.

int **pwm_get_cycles_per_sec**(const struct *device* *dev, uint32_t channel, uint64_t *cycles)

Get the clock rate (cycles per second) for a single PWM output.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `cycles` – **[out]** Pointer to the memory to store clock rate (cycles per sec). HW specific.

Return values

- `0` – If successful.
- `-errno` – Negative errno code on failure.

static inline int **pwm_set**(const struct *device* *dev, uint32_t channel, uint32_t period, uint32_t pulse, *pwm_flags_t* flags)

Set the period and pulse width in nanoseconds for a single PWM output.

Note

Utility macros such as *PWM_MSEC()* can be used to convert from other scales or units to nanoseconds, the units used by this function.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `period` – Period (in nanoseconds) set to the PWM.
- `pulse` – Pulse width (in nanoseconds) set to the PWM.
- `flags` – Flags for pin configuration (polarity).

Return values

- `0` – If successful.
- `-ENOTSUP` – If requested period or pulse cycles are not supported.
- `-errno` – Other negative errno code on failure.

static inline int **pwm_set_dt**(const struct *pwm_dt_spec* *spec, uint32_t period, uint32_t pulse)

Set the period and pulse width in nanoseconds from a struct *pwm_dt_spec* (with custom period).

This is equivalent to:

```
pwm_set(spec->dev, spec->channel, period, pulse, spec->flags)
```

The period specified in spec is ignored. This API call can be used when the period specified in Devicetree needs to be changed at runtime.

See also

pwm_set_pulse_dt()

Parameters

- **spec** – **[in]** PWM specification from devicetree.
- **period** – Period (in nanoseconds) set to the PWM.
- **pulse** – Pulse width (in nanoseconds) set to the PWM.

Returns
A value from *pwm_set()*.

static inline int **pwm_set_pulse_dt**(const struct *pwm_dt_spec* *spec, uint32_t pulse)

Set the period and pulse width in nanoseconds from a struct *pwm_dt_spec*.

This is equivalent to:

```
pwm_set(spec->dev, spec->channel, spec->period, pulse, spec->flags)
```

See also

pwm_set_pulse_dt()

Parameters

- **spec** – **[in]** PWM specification from devicetree.
- **pulse** – Pulse width (in nanoseconds) set to the PWM.

Returns
A value from *pwm_set()*.

static inline int **pwm_cycles_to_usec**(const struct *device* *dev, uint32_t channel, uint32_t cycles, uint64_t *usec)

Convert from PWM cycles to microseconds.

Parameters

- **dev** – **[in]** PWM device instance.
- **channel** – PWM channel.
- **cycles** – Cycles to be converted.
- **usec** – **[out]** Pointer to the memory to store calculated usec.

Return values

- **0** – If successful.
- **-ERANGE** – If result is too large.
- **-errno** – Other negative errno code on failure.

static inline int **pwm_cycles_to_nsec**(const struct *device* *dev, uint32_t channel, uint32_t cycles, uint64_t *nsec)

Convert from PWM cycles to nanoseconds.

Parameters

- **dev** – **[in]** PWM device instance.

- `channel` – PWM channel.
- `cycles` – Cycles to be converted.
- `nsec` – **[out]** Pointer to the memory to store the calculated nsec.

Return values

- `0` – If successful.
- `-ERANGE` – If result is too large.
- `-errno` – Other negative errno code on failure.

static inline int `pwm_configure_capture`(const struct *device* *dev, uint32_t channel, *pwm_flags_t* flags, *pwm_capture_callback_handler_t* cb, void *user_data)

Configure PWM period/pulse width capture for a single PWM input.

After configuring PWM capture using this function, the capture can be enabled/disabled using *pwm_enable_capture()* and *pwm_disable_capture()*.

Note

This API function cannot be invoked from user space due to the use of a function callback. In user space, one of the simpler API functions (*pwm_capture_cycles()*, *pwm_capture_usec()*, or *pwm_capture_nsec()*) can be used instead.

Note

`CONFIG_PWM_CAPTURE` must be selected for this function to be available.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `flags` – PWM capture flags
- `cb` – **[in]** Application callback handler function to be called upon capture
- `user_data` – **[in]** User data to pass to the application callback handler function

Return values

- `-EINVAL` – if invalid function parameters were given
- `-ENOSYS` – if PWM capture is not supported or the given flags are not supported
- `-EIO` – if IO error occurred while configuring
- `-EBUSY` – if PWM capture is already in progress

int `pwm_enable_capture`(const struct *device* *dev, uint32_t channel)

Enable PWM period/pulse width capture for a single PWM input.

The PWM pin must be configured using *pwm_configure_capture()* prior to calling this function.

Note

CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.

Return values

- `0` – If successful.
- `-EINVAL` – if invalid function parameters were given
- `-ENOSYS` – if PWM capture is not supported
- `-EIO` – if IO error occurred while enabling PWM capture
- `-EBUSY` – if PWM capture is already in progress

int **pwm_disable_capture**(const struct *device* *dev, uint32_t channel)

Disable PWM period/pulse width capture for a single PWM input.

Note

CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.

Return values

- `0` – If successful.
- `-EINVAL` – if invalid function parameters were given
- `-ENOSYS` – if PWM capture is not supported
- `-EIO` – if IO error occurred while disabling PWM capture

int **pwm_capture_cycles**(const struct *device* *dev, uint32_t channel, *pwm_flags_t* flags, uint32_t *period, uint32_t *pulse, *k_timeout_t* timeout)

Capture a single PWM period/pulse width in clock cycles for a single PWM input.

This API function wraps calls to *pwm_configure_capture()*, *pwm_enable_capture()*, and *pwm_disable_capture()* and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

Note

CONFIG_PWM_CAPTURE must be selected for this function to be available.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `flags` – PWM capture flags.

- `period` – **[out]** Pointer to the memory to store the captured PWM period width (in clock cycles). HW specific.
- `pulse` – **[out]** Pointer to the memory to store the captured PWM pulse width (in clock cycles). HW specific.
- `timeout` – Waiting period for the capture to complete.

Return values

- `0` – If successful.
- `-EBUSY` – PWM capture already in progress.
- `-EAGAIN` – Waiting period timed out.
- `-EIO` – IO error while capturing.
- `-ERANGE` – If result is too large.

static inline int **pwm_capture_usec**(const struct *device* *dev, uint32_t channel, *pwm_flags_t* flags, uint64_t *period, uint64_t *pulse, *k_timeout_t* timeout)

Capture a single PWM period/pulse width in microseconds for a single PWM input.

This API function wraps calls to *pwm_capture_cycles()* and *pwm_cycles_to_usec()* and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

Note

`CONFIG_PWM_CAPTURE` must be selected for this function to be available.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `flags` – PWM capture flags.
- `period` – **[out]** Pointer to the memory to store the captured PWM period width (in usec).
- `pulse` – **[out]** Pointer to the memory to store the captured PWM pulse width (in usec).
- `timeout` – Waiting period for the capture to complete.

Return values

- `0` – If successful.
- `-EBUSY` – PWM capture already in progress.
- `-EAGAIN` – Waiting period timed out.
- `-EIO` – IO error while capturing.
- `-ERANGE` – If result is too large.
- `-errno` – Other negative errno code on failure.

static inline int **pwm_capture_nsec**(const struct *device* *dev, uint32_t channel, *pwm_flags_t* flags, uint64_t *period, uint64_t *pulse, *k_timeout_t* timeout)

Capture a single PWM period/pulse width in nanoseconds for a single PWM input.

This API function wraps calls to *pwm_capture_cycles()* and *pwm_cycles_to_nsec()* and passes the capture result to the caller. The function is blocking until either the PWM capture is completed or a timeout occurs.

Note

`CONFIG_PWM_CAPTURE` must be selected for this function to be available.

Parameters

- `dev` – **[in]** PWM device instance.
- `channel` – PWM channel.
- `flags` – PWM capture flags.
- `period` – **[out]** Pointer to the memory to store the captured PWM period width (in nsec).
- `pulse` – **[out]** Pointer to the memory to store the captured PWM pulse width (in nsec).
- `timeout` – Waiting period for the capture to complete.

Return values

- `0` – If successful.
- `-EBUSY` – PWM capture already in progress.
- `-EAGAIN` – Waiting period timed out.
- `-EIO` – IO error while capturing.
- `-ERANGE` – If result is too large.
- `-errno` – Other negative errno code on failure.

static inline bool **pwm_is_ready_dt**(const struct *pwm_dt_spec* *spec)

Validate that the PWM device is ready.

Parameters

- `spec` – PWM specification from devicetree

Return values

- `true` – If the PWM device is ready for use
- `false` – If the PWM device is not ready for use

struct **pwm_dt_spec**

#include <pwm.h> Container for PWM information specified in devicetree.

This type contains a pointer to a PWM device, channel number (controlled by the PWM device), the PWM signal period in nanoseconds and the flags applicable to the channel. Note that not all PWM drivers support flags. In such case, flags will be set to 0.

Public Members

const struct *device* *`dev`
PWM device instance.

uint32_t `channel`
Channel number.

uint32_t `period`
Period in nanoseconds.

pwm_flags_t `flags`
Flags.

7.6.39 Real-Time Clock (RTC)

Overview

Table 1: **Glossary**

Word	Definition
Real-time clock	Low power device tracking time using broken-down time
Real-time counter	Low power counter which can be used to track time
RTC	Acronym for real-time clock

An RTC is a low power device which tracks time using broken-down time. It should not be confused with low-power counters which sometimes share the same name, acronym, or both.

RTCs are usually optimized for low energy consumption and are usually kept running even when the system is in a low power state.

RTCs usually contain one or more alarms which can be configured to trigger at a given time. These alarms are commonly used to wake up the system from a low power state.

History of RTCs in Zephyr

RTCs have been supported before this API was created, using the *Counter* API. The unix timestamp was used to convert between broken-down time and the unix timestamp within the RTC drivers, which internally used the broken-down time representation.

The disadvantages of this approach were that hardware counters could not be set to a specific count, requiring all RTCs to use device specific APIs to set the time, converting from unix time to broken-down time, unnecessarily in some cases, and some common features missing, like input clock calibration and the update callback.

Configuration Options

Related configuration options:

- `CONFIG_RTC`
- `CONFIG_RTC_ALARM`
- `CONFIG_RTC_UPDATE`
- `CONFIG_RTC_CALIBRATION`

API Reference

group `rtc_interface`

RTC Interface.

Since
3.4

Version
0.1.0

RTC Interface Alarm

int `rtc_alarm_get_supported_fields`(const struct *device* *dev, uint16_t id, uint16_t *mask)

API for getting the supported fields of the RTC alarm time.

> **Note**
> Bits in the mask param are defined here *RTC_ALARM_TIME_MASK*.

Parameters

- `dev` – Device instance
- `id` – Id of the alarm
- `mask` – Mask of fields in the alarm time which are supported

Returns
0 if successful

Returns
-EINVAL if id is out of range or time is invalid

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

int `rtc_alarm_set_time`(const struct *device* *dev, uint16_t id, uint16_t mask, const struct *rtc_time* *timeptr)

API for setting RTC alarm time.

To enable an RTC alarm, one or more fields of the RTC alarm time must be enabled. The mask designates which fields of the RTC alarm time to enable. If the mask parameter is 0, the alarm will be disabled. The RTC alarm will trigger when all enabled fields of the alarm time match the RTC time.

Note

The timeptr param may be NULL if the mask param is 0

Note

Only the enabled fields in the timeptr param need to be configured

Note

Bits in the mask param are defined here *RTC_ALARM_TIME_MASK*

Parameters

- `dev` – Device instance
- `id` – Id of the alarm
- `mask` – Mask of fields in the alarm time to enable
- `timeptr` – The alarm time to set

Returns
0 if successful

Returns
-EINVAL if id is out of range or time is invalid

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

int **rtc_alarm_get_time**(const struct *device* *dev, uint16_t id, uint16_t *mask, struct *rtc_time* *timeptr)

API for getting RTC alarm time.

> **Note**
>
> Bits in the mask param are defined here *RTC_ALARM_TIME_MASK*

Parameters

- **dev** – Device instance
- **id** – Id of the alarm
- **mask** – Destination for mask of fields which are enabled in the alarm time
- **timeptr** – Destination for the alarm time

Returns
0 if successful

Returns
-EINVAL if id is out of range

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

int **rtc_alarm_is_pending**(const struct *device* *dev, uint16_t id)

API for testing if RTC alarm is pending.

Test whether or not the alarm with id is pending. If the alarm is pending, the pending status is cleared.

Parameters

- **dev** – Device instance
- **id** – Id of the alarm to test

Returns
1 if alarm was pending

Returns
0 if alarm was not pending

Returns
-EINVAL if id is out of range

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

int **rtc_alarm_set_callback**(const struct *device* *dev, uint16_t id, *rtc_alarm_callback* callback, void *user_data)

API for setting alarm callback.

Setting the alarm callback for an alarm, will enable the alarm callback. When the callback for an alarm is enabled, the alarm triggered event will invoke the callback, after which the alarm pending status will be cleared automatically. The alarm will remain enabled until manually disabled using *rtc_alarm_set_time()*.

To disable the alarm callback for an alarm, the `callback` and `user_data` parameters must be set to NULL. When the alarm callback for an alarm is disabled, the alarm triggered event will set the alarm status to "pending". To check if the alarm status is "pending", use *rtc_alarm_is_pending()*.

Parameters

- `dev` – Device instance
- `id` – Id of the alarm for which the callback shall be set
- `callback` – Callback called when alarm occurs
- `user_data` – Optional user data passed to callback

Returns
0 if successful

Returns
-EINVAL if id is out of range

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

RTC Interface Update

int `rtc_update_set_callback`(const struct *device* *dev, *rtc_update_callback* callback, void *user_data)

API for setting update callback.

Setting the update callback will enable the update callback. The update callback will be invoked every time the RTC clock is updated by 1 second. It can be used to synchronize the RTC clock with other clock sources.

To disable the update callback for the RTC clock, the `callback` and `user_data` parameters must be set to NULL.

Parameters

- `dev` – Device instance
- `callback` – Callback called when update occurs
- `user_data` – Optional user data passed to callback

Returns
0 if successful

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

RTC Interface Calibration

int `rtc_set_calibration`(const struct *device* *dev, int32_t calibration)

API for setting RTC calibration.

Calibration is applied to the RTC clock input. A positive calibration value will increase the frequency of the RTC clock, a negative value will decrease the frequency of the RTC clock.

See also

rtc_calibration_from_frequency()

Parameters

- `dev` – Device instance
- `calibration` – Calibration to set in parts per billion

Returns
0 if successful

Returns
-EINVAL if calibration is out of range

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

int `rtc_get_calibration`(const struct *device* *dev, int32_t *calibration)
API for getting RTC calibration.

Parameters

- `dev` – Device instance
- `calibration` – Destination for calibration in parts per billion

Returns
0 if successful

Returns
-ENOTSUP if API is not supported by hardware

Returns
-errno code if failure

RTC Interface Helpers

static inline struct tm *`rtc_time_to_tm`(struct *rtc_time* *timeptr)
Convenience function for safely casting a *rtc_time* pointer to a tm pointer.

static inline int32_t `rtc_calibration_from_frequency`(uint32_t frequency)
Determine required calibration to 1 Hertz from frequency.

Parameters

- `frequency` – Frequency of the RTC in nano Hertz

Returns
The required calibration in parts per billion

RTC Alarm Time Mask

Mask for alarm time fields to enable when setting alarm time

`RTC_ALARM_TIME_MASK_SECOND`

`RTC_ALARM_TIME_MASK_MINUTE`

`RTC_ALARM_TIME_MASK_HOUR`

`RTC_ALARM_TIME_MASK_MONTHDAY`

`RTC_ALARM_TIME_MASK_MONTH`

`RTC_ALARM_TIME_MASK_YEAR`

`RTC_ALARM_TIME_MASK_WEEKDAY`

`RTC_ALARM_TIME_MASK_YEARDAY`

`RTC_ALARM_TIME_MASK_NSEC`

Typedefs

typedef void (*`rtc_update_callback`)(const struct *device* *dev, void *user_data)

RTC update event callback.

Param dev
Device instance invoking the handler

Param user_data
Optional user data provided when update irq callback is set

typedef void (*`rtc_alarm_callback`)(const struct *device* *dev, uint16_t id, void *user_data)

RTC alarm triggered callback.

Param dev
Device instance invoking the handler

Param id
Alarm id

Param user_data
Optional user data passed with the alarm configuration

Functions

int `rtc_set_time`(const struct *device* *dev, const struct *rtc_time* *timeptr)

API for setting RTC time.

Parameters

- `dev` – Device instance
- `timeptr` – The time to set

Returns
0 if successful

Returns
-EINVAL if RTC time is invalid or exceeds hardware capabilities

Returns
-errno code if failure

int `rtc_get_time`(const struct *device* *dev, struct *rtc_time* *timeptr)

API for getting RTC time.

Parameters

- `dev` – Device instance
- `timeptr` – Destination for the time

Returns
0 if successful

Returns
-ENODATA if RTC time has not been set

Returns
-errno code if failure

struct `rtc_time`

#include <*rtc.h*> Structure for storing date and time values with sub-second precision.

The structure is 1-1 mapped to the struct tm for the members `tm_sec` to `tm_isdst` making it compatible with the standard time library.

Note

Use *rtc_time_to_tm()* to safely cast from a *rtc_time* pointer to a tm pointer.

Public Members

int `tm_sec`

Seconds [0, 59].

int `tm_min`

Minutes [0, 59].

int `tm_hour`

Hours [0, 23].

int `tm_mday`

Day of the month [1, 31].

int `tm_mon`

Month [0, 11].

int `tm_year`

Year - 1900.

int **tm_wday**
: Day of the week [0, 6] (Sunday = 0) (Unknown = -1)

int **tm_yday**
: Day of the year [0, 365] (Unknown = -1)

int **tm_isdst**
: Daylight saving time flag [-1] (Unknown = -1)

int **tm_nsec**
: Nanoseconds [0, 999999999] (Unknown = 0)

RTC device driver test suite

The test suite validates the behavior of the RTC device driver. It is designed to be portable between boards. It uses the device tree alias `rtc` to designate the RTC device to test.

This test suite tests the following:

- Setting and getting the time.
- RTC Time incrementing correctly.
- Alarms if supported by hardware, with and without callback enabled
- Calibration if supported by hardware.

The calibration test tests a range of values which are printed to the console to be manually compared. The user must review the set and gotten values to ensure they are valid.

By default, only the mandatory setting and getting of time is enabled for testing. To test the optional alarms, update event callback and clock calibration, these must be enabled by selecting `CONFIG_RTC_ALARM`, `CONFIG_RTC_UPDATE` and `CONFIG_RTC_CALIBRATION`.

The following examples build the test suite for the `native_sim` board. To build the test suite for a different board, replace the `native_sim` board with your board.

To build the test application with the default configuration, testing only the mandatory features, the following command can be used for reference:

```
# From the root of the zephyr repository
west build -b native_sim tests/drivers/rtc/rtc_api
```

To build the test with additional RTC features enabled, use menuconfig to enable the additional features by updating the configuration. The following command can be used for reference:

```
# From the root of the zephyr repository
west build -b native_sim tests/drivers/rtc/rtc_api
west build -t menuconfig
```

Then build the test application using the following command:

```
# From the root of the zephyr repository
west build -b native_sim tests/drivers/rtc/rtc_api
```

To run the test suite, flash and run the application on your board, the output will be printed to the console.

Note

The tests take up to 30 seconds each if they are testing real hardware.

RTC emulated device

The emulated RTC device fully implements the RTC API, and will behave like a real RTC device, with the following limitations:

- RTC time is not persistent across application initialization.
- RTC alarms are not persistent across application initialization.
- RTC time will drift over time.

Every time an application is initialized, the RTC's time and alarms are reset. Reading the time using *rtc_get_time()* will return -ENODATA, until the time is set using *rtc_set_time()*. The RTC will then behave as a real RTC, until the application is reset.

The emulated RTC device driver is built for the compatible `zephyr,rtc-emul` and will be included if `CONFIG_RTC` is selected.

7.6.40 Regulators

This subsystem provides control of voltage and current regulators. A common example is a GPIO that controls a transistor that supplies current to a device that is not always needed. Another example is a PMIC, typically a much more complex device.

The `*-supply` devicetree properties are used to identify the regulator(s) that a devicetree node directly depends on. Within the driver for the node the regulator API is used to issue requests for power when the device is to be active, and release the power request when the device shuts down.

The simplest case where a regulator is needed is one where there is only one client. For those situations the cost of using the regulator device infrastructure is not justified, and `*-gpios` devicetree properties should be used. There is no device interface to these regulators as they are entirely controlled within the driver for the corresponding node, e.g. a sensor.

API Reference

group `regulator_interface`

Regulator Interface.

Since
2.4

Version
0.1.0

Regulator error flags.

REGULATOR_ERROR_OVER_VOLTAGE
: Voltage is too high.

REGULATOR_ERROR_OVER_CURRENT
: Current is too high.

REGULATOR_ERROR_OVER_TEMP
: Temperature is too high.

Typedefs

typedef uint8_t **regulator_dvs_state_t**
: Opaque type to store regulator DVS states.

typedef uint8_t **regulator_mode_t**
: Opaque type to store regulator modes.

typedef uint8_t **regulator_error_flags_t**
: Opaque bit map for regulator error flags (see *REGULATOR_ERRORS*)

Functions

int **regulator_enable**(const struct *device* *dev)
: Enable a regulator.

  Reference-counted request that a regulator be turned on. A regulator is considered "on" when it has reached a stable/usable state. Regulators that are always on, or configured in devicetree with `regulator-always-on` will always stay enabled, and so this function will always succeed.

  Parameters

  - **dev** – Regulator device instance

  Return values

  - **0** – If regulator has been successfully enabled.
  - **-errno** – Negative errno in case of failure.
  - **-ENOTSUP** – If regulator enablement can not be controlled.

bool **regulator_is_enabled**(const struct *device* *dev)
: Check if a regulator is enabled.

  Parameters

  - **dev** – Regulator device instance.

  Return values

  - **true** – If regulator is enabled.
  - **false** – If regulator is disabled.

int **regulator_disable**(const struct *device* *dev)

Disable a regulator.

Release a regulator after a previous *regulator_enable()* completed successfully. Regulators that are always on, or configured in devicetree with `regulator-always-on` will always stay enabled, and so this function will always succeed.

This must be invoked at most once for each successful *regulator_enable()*.

Parameters

- `dev` – Regulator device instance.

Return values

- `0` – If regulator has been successfully disabled.
- `-errno` – Negative errno in case of failure.
- `-ENOTSUP` – If regulator disablement can not be controlled.

static inline unsigned int **regulator_count_voltages**(const struct *device* *dev)

Obtain the number of supported voltage levels.

Each voltage level supported by a regulator gets an index, starting from zero. The total number of supported voltage levels can be used together with *regulator_list_voltage()* to list all supported voltage levels.

Parameters

- `dev` – Regulator device instance.

Returns

Number of supported voltages.

static inline int **regulator_list_voltage**(const struct *device* *dev, unsigned int idx, int32_t *volt_uv)

Obtain the value of a voltage given an index.

Each voltage level supported by a regulator gets an index, starting from zero. Together with *regulator_count_voltages()*, this function can be used to iterate over all supported voltages.

Parameters

- `dev` – Regulator device instance.
- `idx` – Voltage index.
- `volt_uv` – **[out]** Where voltage for the given `index` will be stored, in microvolts.

Return values

- `0` – If `index` corresponds to a supported voltage.
- `-EINVAL` – If `index` does not correspond to a supported voltage.

bool **regulator_is_supported_voltage**(const struct *device* *dev, int32_t min_uv, int32_t max_uv)

Check if a voltage within a window is supported.

Parameters

- `dev` – Regulator device instance.
- `min_uv` – Minimum voltage in microvolts.
- `max_uv` – maximum voltage in microvolts.

Return values

- `true` – If voltage is supported.
- `false` – If voltage is not supported.

int **regulator_set_voltage**(const struct *device* *dev, int32_t min_uv, int32_t max_uv)

Set the output voltage.

The output voltage will be configured to the closest supported output voltage. *regulator_get_voltage()* can be used to obtain the actual configured voltage. The voltage will be applied to the active or selected mode. Output voltage may be limited using `regulator-min-microvolt` and/or `regulator-max-microvolt` in devicetree.

Parameters

- `dev` – Regulator device instance.
- `min_uv` – Minimum acceptable voltage in microvolts.
- `max_uv` – Maximum acceptable voltage in microvolts.

Return values

- `0` – If successful.
- `-EINVAL` – If the given voltage window is not valid.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int **regulator_get_voltage**(const struct *device* *dev, int32_t *volt_uv)

Obtain output voltage.

Parameters

- `dev` – Regulator device instance.
- `volt_uv` – **[out]** Where configured output voltage will be stored.

Return values

- `0` – If successful
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline unsigned int **regulator_count_current_limits**(const struct *device* *dev)

Obtain the number of supported current limit levels.

Each current limit level supported by a regulator gets an index, starting from zero. The total number of supported current limit levels can be used together with *regulator_list_current_limit()* to list all supported current limit levels.

Parameters

- `dev` – Regulator device instance.

Returns

Number of supported current limits.

static inline int **regulator_list_current_limit**(const struct *device* *dev, unsigned int idx, int32_t *current_ua)

Obtain the value of a current limit given an index.

Each current limit level supported by a regulator gets an index, starting from zero. Together with *regulator_count_current_limits()*, this function can be used to iterate over all supported current limits.

Parameters

- `dev` – Regulator device instance.

- `idx` – Current index.
- `current_ua` – **[out]** Where current for the given `index` will be stored, in microamps.

Return values

- `0` – If `index` corresponds to a supported current limit.
- `-EINVAL` – If `index` does not correspond to a supported current limit.

int **regulator_set_current_limit**(const struct *device* *dev, int32_t min_ua, int32_t max_ua)

Set output current limit.

The output current limit will be configured to the closest supported output current limit. *regulator_get_current_limit()* can be used to obtain the actual configured current limit. Current may be limited using `current-min-microamp` and/or `current-max-microamp` in Devicetree.

Parameters

- `dev` – Regulator device instance.
- `min_ua` – Minimum acceptable current limit in microamps.
- `max_ua` – Maximum acceptable current limit in microamps.

Return values

- `0` – If successful.
- `-EINVAL` – If the given current limit window is not valid.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int **regulator_get_current_limit**(const struct *device* *dev, int32_t *curr_ua)

Get output current limit.

Parameters

- `dev` – Regulator device instance.
- `curr_ua` – **[out]** Where output current limit will be stored.

Return values

- `0` – If successful.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

int **regulator_set_mode**(const struct *device* *dev, *regulator_mode_t* mode)

Set mode.

Regulators can support multiple modes in order to permit different voltage configuration or better power savings. This API will apply a mode for the regulator. Allowed modes may be limited using `regulator-allowed-modes` devicetree property.

Parameters

- `dev` – Regulator device instance.
- `mode` – Mode to select for this regulator.

Return values

- `0` – If successful.
- `-ENOTSUP` – If mode is not supported.

- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int **regulator_get_mode**(const struct *device* *dev, *regulator_mode_t* *mode)

Get mode.

Parameters

- `dev` – Regulator device instance.
- `mode` – **[out]** Where mode will be stored.

Return values

- `0` – If successful.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int **regulator_set_active_discharge**(const struct *device* *dev, bool active_discharge)

Set active discharge setting.

Parameters

- `dev` – Regulator device instance.
- `active_discharge` – Active discharge enable or disable.

Return values

- `0` – If successful.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int **regulator_get_active_discharge**(const struct *device* *dev, bool *active_discharge)

Get active discharge setting.

Parameters

- `dev` – Regulator device instance.
- `active_discharge` – **[out]** Where active discharge will be stored.

Return values

- `0` – If successful.
- `-ENOSYS` – If function is not implemented.
- `-errno` – In case of any other error.

static inline int **regulator_get_error_flags**(const struct *device* *dev, *regulator_error_flags_t* *flags)

Get active error flags.

Parameters

- `dev` – Regulator device instance.
- `flags` – **[out]** Where error flags will be stored.

Return values

- `0` – If successful.
- `-ENOSYS` – If function is not implemented.

- `-errno` – In case of any other error.

7.6.41 Reset Controller

Overview

Reset controllers are units that control the reset signals to multiple peripherals. The reset controller API allows peripheral drivers to request control over their reset input signals, including the ability to assert, deassert and toggle those signals. Also, the reset status of the reset input signal can be checked.

Mainly, the line_assert and line_deassert API functions are optional because in most cases we want to toggle the reset signals.

Configuration Options

Related configuration options:

- `CONFIG_RESET`

API Reference

group `reset_controller_interface`

Reset Controller Interface.

Since
3.1

Version
0.2.0

Defines

`RESET_DT_SPEC_GET_BY_IDX`(node_id, idx)

Static initializer for a *reset_dt_spec*.

This returns a static initializer for a *reset_dt_spec* structure given a devicetree node identifier, a property specifying a Reset Controller and an index.

Example devicetree fragment:

```
n: node {
   resets = <&reset 10>;
}
```

Example usage:

```
const struct reset_dt_spec spec = RESET_DT_SPEC_GET_BY_IDX(DT_NODELABEL(n), 0);
// Initializes 'spec' to:
// {
//         .dev = DEVICE_DT_GET(DT_NODELABEL(reset)),
//         .id = 10
// }
```

The 'reset' field must still be checked for readiness, e.g. using *device_is_ready()*. It is an error to use this macro unless the node exists, has the given property, and that property specifies a reset controller reset line id as shown above.

Parameters

- **node_id** – devicetree node identifier
- **idx** – logical index into "resets"

Returns
static initializer for a struct *reset_dt_spec* for the property

RESET_DT_SPEC_GET_BY_IDX_OR(node_id, idx, default_value)

Like *RESET_DT_SPEC_GET_BY_IDX()*, with a fallback to a default value.

If the devicetree node identifier 'node_id' refers to a node with a 'resets' property, this expands to *RESET_DT_SPEC_GET_BY_IDX(node_id, idx)*. The `default_value` parameter is not expanded in this case.

Otherwise, this expands to `default_value`.

Parameters

- **node_id** – devicetree node identifier
- **idx** – logical index into the 'resets' property
- **default_value** – fallback value to expand to

Returns
static initializer for a struct *reset_dt_spec* for the property, or default_value if the node or property do not exist

RESET_DT_SPEC_GET(node_id)

Equivalent to *RESET_DT_SPEC_GET_BY_IDX(node_id, 0)*.

See also

RESET_DT_SPEC_GET_BY_IDX()

Parameters

- **node_id** – devicetree node identifier

Returns
static initializer for a struct *reset_dt_spec* for the property

RESET_DT_SPEC_GET_OR(node_id, default_value)

Equivalent to *RESET_DT_SPEC_GET_BY_IDX_OR(node_id, 0, default_value)*.

Parameters

- **node_id** – devicetree node identifier
- **default_value** – fallback value to expand to

Returns
static initializer for a struct *reset_dt_spec* for the property, or default_value if the node or property do not exist

RESET_DT_SPEC_INST_GET_BY_IDX(inst, idx)

Static initializer for a *reset_dt_spec* from a DT_DRV_COMPAT instance's Reset Controller property at an index.

> **See also**
>
> *RESET_DT_SPEC_GET_BY_IDX()*

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – logical index into "resets"

Returns

static initializer for a struct *reset_dt_spec* for the property

RESET_DT_SPEC_INST_GET_BY_IDX_OR(inst, idx, default_value)

Static initializer for a *reset_dt_spec* from a DT_DRV_COMPAT instance's 'resets' property at an index, with fallback.

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **idx** – logical index into the 'resets' property
- **default_value** – fallback value to expand to

Returns

static initializer for a struct *reset_dt_spec* for the property, or default_value if the node or property do not exist

RESET_DT_SPEC_INST_GET(inst)

Equivalent to *RESET_DT_SPEC_INST_GET_BY_IDX(inst, 0)*.

> **See also**
>
> *RESET_DT_SPEC_INST_GET_BY_IDX()*

Parameters

- **inst** – DT_DRV_COMPAT instance number

Returns

static initializer for a struct *reset_dt_spec* for the property

RESET_DT_SPEC_INST_GET_OR(inst, default_value)

Equivalent to *RESET_DT_SPEC_INST_GET_BY_IDX_OR(node_id, 0, default_value)*.

Parameters

- **inst** – DT_DRV_COMPAT instance number
- **default_value** – fallback value to expand to

Returns

static initializer for a struct *reset_dt_spec* for the property, or default_value if the node or property do not exist

Functions

int **reset_status**(const struct *device* *dev, uint32_t id, uint8_t *status)

Get the reset status.

This function returns the reset status of the device.

Parameters

- **dev** – Reset controller device.
- **id** – Reset line.
- **status** – Where to write the reset status.

Return values

- **0** – On success.
- **-ENOSYS** – If the functionality is not implemented by the driver.
- **-errno** – Other negative errno in case of failure.

static inline int **reset_status_dt**(const struct *reset_dt_spec* *spec, uint8_t *status)

Get the reset status from a *reset_dt_spec*.

This is equivalent to:

reset_status(spec->dev, spec->id, status);

Parameters

- **spec** – Reset controller specification from devicetree
- **status** – Where to write the reset status.

Returns

a value from *reset_status()*

int **reset_line_assert**(const struct *device* *dev, uint32_t id)

Put the device in reset state.

This function sets/clears the reset bits of the device, depending on the logic level (active-high/active-low).

Parameters

- **dev** – Reset controller device.
- **id** – Reset line.

Return values

- **0** – On success.
- **-ENOSYS** – If the functionality is not implemented by the driver.
- **-errno** – Other negative errno in case of failure.

static inline int **reset_line_assert_dt**(const struct *reset_dt_spec* *spec)

Assert the reset state from a *reset_dt_spec*.

This is equivalent to:

```
reset_line_assert(spec->dev, spec->id);
```

Parameters

- **spec** – Reset controller specification from devicetree

Returns
a value from *reset_line_assert()*

int **reset_line_deassert**(const struct *device* *dev, uint32_t id)

Take out the device from reset state.

This function sets/clears the reset bits of the device, depending on the logic level (active-low/active-high).

Parameters

- **dev** – Reset controller device.
- **id** – Reset line.

Return values

- **0** – On success.
- **-ENOSYS** – If the functionality is not implemented by the driver.
- **-errno** – Other negative errno in case of failure.

static inline int **reset_line_deassert_dt**(const struct *reset_dt_spec* *spec)

Deassert the reset state from a *reset_dt_spec*.

This is equivalent to:

```
reset_line_deassert(spec->dev, spec->id)
```

Parameters

- **spec** – Reset controller specification from devicetree

Returns
a value from *reset_line_deassert()*

int **reset_line_toggle**(const struct *device* *dev, uint32_t id)

Reset the device.

This function performs reset for a device (assert + deassert).

Parameters

- **dev** – Reset controller device.
- **id** – Reset line.

Return values

- **0** – On success.
- **-ENOSYS** – If the functionality is not implemented by the driver.
- **-errno** – Other negative errno in case of failure.

static inline int **reset_line_toggle_dt**(const struct *reset_dt_spec* *spec)

Reset the device from a *reset_dt_spec*.

This is equivalent to:

```
reset_line_toggle(spec->dev, spec->id)
```

Parameters

- **spec** – Reset controller specification from devicetree

Returns
a value from *reset_line_toggle()*

struct **reset_dt_spec**

#include <reset.h> Reset controller device configuration.

Public Members

const struct *device* ***dev**

Reset controller device.

uint32_t **id**

Reset line.

7.6.42 Retained Memory

Overview

The retained memory driver API provides a way of reading from/writing to memory areas whereby the contents of the memory is retained whilst the device is powered (data may be lost in low power modes).

Configuration Options

Related configuration options:

- CONFIG_RETAINED_MEM
- CONFIG_RETAINED_MEM_INIT_PRIORITY
- CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE

Mutex protection

Mutex protection of retained memory drivers is enabled by default when applications are compiled with multithreading support. This means that different threads can safely call the retained memory functions without clashing with other concurrent thread function usage, but means that retained memory functions cannot be used from ISRs. It is possible to disable mutex protection globally on all retained memory drivers by enabling CONFIG_RETAINED_MEM_MUTEX_FORCE_DISABLE - users are then responsible for ensuring that the function calls do not conflict with each other.

API Reference

group **retained_mem_interface**

Retained memory driver interface.

Since
3.4

Version
0.8.0

Typedefs

typedef ssize_t (*`retained_mem_size_api`)(const struct *device* *dev)

Callback API to get size of retained memory area.

See *retained_mem_size()* for argument description.

typedef int (*`retained_mem_read_api`)(const struct *device* *dev, off_t offset, uint8_t *buffer, size_t size)

Callback API to read from retained memory area.

See *retained_mem_read()* for argument description.

typedef int (*`retained_mem_write_api`)(const struct *device* *dev, off_t offset, const uint8_t *buffer, size_t size)

Callback API to write to retained memory area.

See *retained_mem_write()* for argument description.

typedef int (*`retained_mem_clear_api`)(const struct *device* *dev)

Callback API to clear retained memory area (reset all data to 0x00).

See *retained_mem_clear()* for argument description.

Functions

ssize_t `retained_mem_size`(const struct *device* *dev)

Returns the size of the retained memory area.

Parameters

- `dev` – Retained memory device to use.

Return values

`Positive` – value indicating size in bytes on success, else negative errno code.

int `retained_mem_read`(const struct *device* *dev, off_t offset, uint8_t *buffer, size_t size)

Reads data from the Retained memory area.

Parameters

- `dev` – Retained memory device to use.
- `offset` – Offset to read data from.
- `buffer` – Buffer to store read data in.
- `size` – Size of data to read.

Return values

`0` – on success else negative errno code.

int `retained_mem_write`(const struct *device* *dev, off_t offset, const uint8_t *buffer, size_t size)

Writes data to the Retained memory area - underlying data does not need to be cleared prior to writing.

Parameters

- `dev` – Retained memory device to use.
- `offset` – Offset to write data to.

- **buffer** – Data to write.
- **size** – Size of data to be written.

Return values
0 – on success else negative errno code.

int **retained_mem_clear**(const struct *device* *dev)

Clears data in the retained memory area by setting it to 0x00.

Parameters

- **dev** – Retained memory device to use.

Return values
0 – on success else negative errno code.

struct **retained_mem_driver_api**

#include <retained_mem.h> Retained memory driver API API which can be used by a device to store data in a retained memory area.

Retained memory is memory that is retained while the device is powered but is lost when power to the device is lost (note that low power modes in some devices may clear the data also). This may be in a non-initialised RAM region, or in specific registers, but is not reset when a different application begins execution or the device is rebooted (without power loss). It must support byte-level reading and writing without a need to erase data before writing.

Note that drivers must implement all functions, none of the functions are optional.

7.6.43 Secure Digital High Capacity (SDHC)

The SDHC api offers a generic interface for interacting with an SD host controller device. It is used by the SD subsystem, and is not intended to be directly used by the application

Basic Operation

SD Host Controller An SD host controller is a device capable of sending SD commands to an attached SD card. These commands can be sent using the native SD protocol, or over SPI. Some SD host controllers are also capable of communicating with MMC devices. The SDHC api is designed to provide a generic way to send commands to and interact with attached SD devices.

Requests The core of the SDHC api is the *sdhc_request()* api. Requests contain a *sdhc_command* command structure, and an optional *sdhc_data* data structure. The caller may check the return code, or the `response` field of the SD command structure to determine if the SDHC request succeeded. The data structure allows the caller to specify a number of blocks to transfer, and a buffer location to read or write them from. Whether the provided buffer is used for sending or reading data depends on the command opcode provided.

Host Controller I/O The *sdhc_set_io()* api allows the user to change I/O settings of the SD host controller, such as clock frequency, I/O voltage, and card power. Not all controllers will support applying all I/O settings. For example, SPI mode controllers typically cannot toggle power to the SD card.

Related configuration options:

- `CONFIG_SDHC`

API Reference

group `sdhc_interface`

SDHC interface.

Since
3.1

Version
0.1.0

SD command timeouts

`SDHC_TIMEOUT_FOREVER`

Defines

`SDHC_NATIVE_RESPONSE_MASK`

`SDHC_SPI_RESPONSE_TYPE_MASK`

Typedefs

typedef void (***sdhc_interrupt_cb_t**)(const struct *device* *dev, int reason, const void *user_data)

SDHC card interrupt callback prototype.

Function prototype for SDHC card interrupt callback.

Param dev
SDHC device that produced interrupt

Param reason
one of *sdhc_interrupt_source* values.

Param user_data
User data, set via *sdhc_enable_interrupt*

Enums

enum `sdhc_bus_mode`

SD bus mode.

Most controllers will use push/pull, including spi, but SDHC controllers that implement SD host specification can support open drain mode

Values:

enumerator `SDHC_BUSMODE_OPENDRAIN` = 1

enumerator SDHC_BUSMODE_PUSHPULL = 2

enum sdhc_power

SD host controller power.

Many host controllers can control power to attached SD cards. This enum allows applications to request the host controller power off the SD card.

Values:

enumerator SDHC_POWER_OFF = 1

enumerator SDHC_POWER_ON = 2

enum sdhc_bus_width

SD host controller bus width.

Only relevant in SD mode, SPI does not support bus width. UHS cards will use 4 bit data bus, all cards start in 1 bit mode

Values:

enumerator SDHC_BUS_WIDTH1BIT = 1U

enumerator SDHC_BUS_WIDTH4BIT = 4U

enumerator SDHC_BUS_WIDTH8BIT = 8U

enum sdhc_timing_mode

SD host controller timing mode.

Used by SD host controller to determine the timing of the cards attached to the bus. Cards start with legacy timing, but UHS-II cards can go up to SDR104.

Values:

enumerator SDHC_TIMING_LEGACY = 1U

Legacy 3.3V Mode.

enumerator SDHC_TIMING_HS = 2U

Legacy High speed mode (3.3V)

enumerator SDHC_TIMING_SDR12 = 3U

Identification mode & SDR12.

enumerator SDHC_TIMING_SDR25 = 4U

High speed mode & SDR25.

enumerator SDHC_TIMING_SDR50 = 5U

SDR49 mode.

enumerator SDHC_TIMING_SDR104 = 6U

SDR104 mode.

enumerator SDHC_TIMING_DDR50 = 7U

DDR50 mode.

enumerator SDHC_TIMING_DDR52 = 8U

DDR52 mode.

enumerator SDHC_TIMING_HS200 = 9U

HS200 mode.

enumerator SDHC_TIMING_HS400 = 10U

HS400 mode.

enum sd_voltage

SD voltage.

UHS cards can run with 1.8V signalling for improved power consumption. Legacy cards may support 3.0V signalling, and all cards start at 3.3V. Only relevant for SD controllers, not SPI ones.

Values:

enumerator SD_VOL_3_3_V = 1U

card operation voltage around 3.3v

enumerator SD_VOL_3_0_V = 2U

card operation voltage around 3.0v

enumerator SD_VOL_1_8_V = 3U

card operation voltage around 1.8v

enumerator SD_VOL_1_2_V = 4U

card operation voltage around 1.2v

enum sdhc_interrupt_source

SD host controller interrupt sources.

Interrupt sources for SD host controller.

Values:

enumerator SDHC_INT_SDIO = *BIT*(0)

Card interrupt, used by SDIO cards.

enumerator SDHC_INT_INSERTED = *BIT*(1)

Card was inserted into slot.

enumerator SDHC_INT_REMOVED = *BIT*(2)

Card was removed from slot.

Functions

int **sdhc_hw_reset**(const struct *device* *dev)

reset SDHC controller state

Used when the SDHC has encountered an error. Resetting the SDHC controller should clear all errors on the SDHC, but does not necessarily reset I/O settings to boot (this can be done with *sdhc_set_io*)

Parameters

- **dev** – SD host controller device

Return values

- **0** – reset succeeded
- **-ETIMEDOUT** – controller reset timed out
- **-EIO** – reset failed

int **sdhc_request**(const struct *device* *dev, struct *sdhc_command* *cmd, struct *sdhc_data* *data)

Send command to SDHC.

Sends a command to the SD host controller, which will send this command to attached SD cards.

Parameters

- **dev** – SDHC device
- **cmd** – SDHC command
- **data** – SDHC data. Leave NULL to send SD command without data.

Return values

- **0** – command was sent successfully
- **-ETIMEDOUT** – command timed out while sending
- **-ENOTSUP** – host controller does not support command
- **-EIO** – I/O error

int **sdhc_set_io**(const struct *device* *dev, struct *sdhc_io* *io)

set I/O properties of SDHC

I/O properties should be reconfigured when the card has been sent a command to change its own SD settings. This function can also be used to toggle power to the SD card.

Parameters

- **dev** – SDHC device
- **io** – I/O properties

Returns
0 I/O was configured correctly

Returns
-ENOTSUP controller does not support these I/O settings

Returns
-EIO controller could not configure I/O settings

int **sdhc_card_present**(const struct *device* *dev)

check for SDHC card presence

Checks if card is present on the SD bus. Note that if a controller requires cards be powered up to detect presence, it should do so in this function.

Parameters

- `dev` – SDHC device

Return values

- `1` – card is present
- `0` – card is not present
- `-EIO` – I/O error

int `sdhc_execute_tuning`(const struct *device* *dev)

run SDHC tuning

SD cards require signal tuning for UHS modes SDR104 and SDR50. This function allows an application to request the SD host controller to tune the card.

Parameters

- `dev` – SDHC device

Return values

- `0` – tuning succeeded, card is ready for commands
- `-ETIMEDOUT` – tuning failed after timeout
- `-ENOTSUP` – controller does not support tuning
- `-EIO` – I/O error while tuning

int `sdhc_card_busy`(const struct *device* *dev)

check if SD card is busy

This check should generally be implemented as checking the line level of the DAT[0:3] lines of the SD bus. No SD commands need to be sent, the controller simply needs to report the status of the SD bus.

Parameters

- `dev` – SDHC device

Return values

- `0` – card is not busy
- `1` – card is busy
- `-EIO` – I/O error

int `sdhc_get_host_props`(const struct *device* *dev, struct *sdhc_host_props* *props)

Get SD host controller properties.

Gets host properties from the host controller. Host controller should initialize all values in the *sdhc_host_props* structure provided.

Parameters

- `dev` – SDHC device
- `props` – property structure to be filled by sdhc driver

Return values

- `0` – function succeeded.
- `-ENOTSUP` – host controller does not support this call

int **sdhc_enable_interrupt**(const struct *device* *dev, *sdhc_interrupt_cb_t* callback, int sources, void *user_data)

Enable SDHC interrupt sources.

Enables SDHC interrupt sources. Each subsequent call of this function should replace the previous callback set, and leave only the interrupts specified in the “sources” argument enabled.

Parameters

- `dev` – SDHC device
- `callback` – Callback called when interrupt occurs
- `sources` – bitmask of *sdhc_interrupt_source* values indicating which interrupts should produce a callback
- `user_data` – parameter that will be passed to callback function

Return values

- `0` – interrupts were enabled, and callback was installed
- `-ENOTSUP` – controller does not support this function
- `-EIO` – I/O error

int **sdhc_disable_interrupt**(const struct *device* *dev, int sources)

Disable SDHC interrupt sources.

Disables SDHC interrupt sources. If multiple sources are enabled, only the ones specified in “sources” will be masked.

Parameters

- `dev` – SDHC device
- `sources` – bitmask of *sdhc_interrupt_source* values indicating which interrupts should be disabled.

Return values

- `0` – interrupts were disabled
- `-ENOTSUP` – controller does not support this function
- `-EIO` – I/O error

struct **sdhc_command**

#include <*sdhc.h*> SD host controller command structure.

This command structure is used to send command requests to an SD host controller, which will be sent to SD devices.

Public Members

uint32_t **opcode**

SD Host specification CMD index.

uint32_t **arg**

SD host specification argument.

uint32_t **response**[4]

SD card response field.

uint32_t **response_type**

Expected SD response type.

unsigned int **retries**

Max number of retries.

int **timeout_ms**

Command timeout in milliseconds.

struct **sdhc_data**

#include <*sdhc.h*> SD host controller data structure.

This command structure is used to send data transfer requests to an SD host controller, which will be sent to SD devices.

Public Members

unsigned int **block_addr**

Block to start read from.

unsigned int **block_size**

Block size.

unsigned int **blocks**

Number of blocks.

unsigned int **bytes_xfered**

populated with number of bytes sent by SDHC

void ***data**

Data to transfer or receive.

int **timeout_ms**

data timeout in milliseconds

struct **sdhc_host_caps**

#include <*sdhc.h*> SD host controller capabilities.

SD host controller capability flags. These flags should be set by the SDHC driver, using the *sdhc_get_host_props* api.

Public Members

unsigned int **timeout_clk_freq**

Timeout clock frequency.

unsigned int `timeout_clk_unit`
Timeout clock unit.

unsigned int `sd_base_clk`
SD base clock frequency.

unsigned int `max_blk_len`
Max block length.

unsigned int `bus_8_bit_support`
8-bit Support for embedded device

unsigned int `bus_4_bit_support`
4 bit bus support

unsigned int `adma_2_support`
ADMA2 support.

unsigned int `high_spd_support`
High speed support.

unsigned int `sdma_support`
SDMA support.

unsigned int `suspend_res_support`
Suspend/Resume support.

unsigned int `vol_330_support`
Voltage support 3.3V.

unsigned int `vol_300_support`
Voltage support 3.0V.

unsigned int `vol_180_support`
Voltage support 1.8V.

unsigned int `address_64_bit_support_v4`
64-bit system address support for V4

unsigned int `address_64_bit_support_v3`
64-bit system address support for V3

unsigned int `sdio_async_interrupt_support`
Asynchronous interrupt support.

unsigned int `slot_type`
Slot type.

unsigned int **sdr50_support**
SDR50 support.

unsigned int **sdr104_support**
SDR104 support.

unsigned int **ddr50_support**
DDR50 support.

unsigned int **uhs_2_support**
UHS-II support.

unsigned int **drv_type_a_support**
Driver type A support.

unsigned int **drv_type_c_support**
Driver type C support.

unsigned int **drv_type_d_support**
Driver type D support.

unsigned int **retune_timer_count**
Timer count for re-tuning.

unsigned int **sdr50_needs_tuning**
Use tuning for SDR50.

unsigned int **retuning_mode**
Re-tuning mode.

unsigned int **clk_multiplier**
Clock multiplier.

unsigned int **adma3_support**
ADMA3 support.

unsigned int **vdd2_180_support**
1.8V VDD2 support

unsigned int **hs200_support**
HS200 support.

unsigned int **hs400_support**
HS400 support.

struct **sdhc_io**
#include <*sdhc.h*> SD host controller I/O control structure.

Controls I/O settings for the SDHC. Note that only a subset of these settings apply to host controllers in SPI mode. Populate this struct, then call *sdhc_set_io* to apply I/O settings

Public Members

enum sdhc_clock_speed **clock**
Clock rate.

enum *sdhc_bus_mode* **bus_mode**
command output mode

enum *sdhc_power* **power_mode**
SD power supply mode.

enum *sdhc_bus_width* **bus_width**
SD bus width.

enum *sdhc_timing_mode* **timing**
SD bus timing.

enum sd_driver_type **driver_type**
SD driver type.

enum *sd_voltage* **signal_voltage**
IO signalling voltage (usually 1.8 or 3.3V)

struct **sdhc_host_props**
#include <*sdhc.h*> SD host controller properties.
Populated by the host controller using *sdhc_get_host_props* api.

Public Members

unsigned int **f_max**
Max bus frequency.

unsigned int **f_min**
Min bus frequency.

unsigned int **power_delay**
Delay to allow SD to power up or down (in ms)

struct *sdhc_host_caps* **host_caps**
Host capability bitfield.

uint32_t **max_current_330**
Max current (in mA) at 3.3V.

uint32_t **max_current_300**
Max current (in mA) at 3.0V.

uint32_t **max_current_180**

Max current (in mA) at 1.8V.

bool **is_spi**

Is the host using SPI mode.

struct **sdhc_driver_api**

#include <sdhc.h>

7.6.44 Sensors

The sensor driver API provides functionality to uniformly read, configure, and setup event handling for devices that take real world measurements in meaningful units.

Sensors range from very simple temperature-reading devices that must be polled with a fixed scale to complex devices taking in readings from multitudes of sensors and themselves producing new inferred sensor data such as step counts, presence detection, orientation, and more.

Supporting this wide breadth of devices is a demanding task and the sensor API attempts to provide a uniform interface to them.

Using Sensors

Using sensors from an application there are some APIs and terms that are helpful to understand. Sensors in Zephyr are composed of *Sensor Channels*, *Sensor Attributes*, and *Sensor Triggers*. Attributes and triggers may be device or channel specific.

Note

Getting samples from sensors using the sensor API today can be done in one of two ways. A stable and long-lived API *Fetch and Get*, or a newer but rapidly stabilizing API *Read and Decode*. It's expected that in the near future *Fetch and Get* will be deprecated in favor of *Read and Decode*. Triggers are handled entirely differently for *Fetch and Get* or *Read and Decode* and the differences are noted in each of those sections.

Sensor Attributes *Attributes*, enumerated in *sensor_attribute*, are immutable and mutable properties of a sensor and its channels.

Attributes allow for obtaining metadata and changing configuration of a sensor. Common configuration parameters like channel scale, sampling frequency, adjusting channel offsets, signal filtering, power modes, on chip buffers, and event handling options are very common. Attributes provide a flexible API for inspecting and manipulating such device properties.

Attributes are specified using *sensor_attribute* which can be used with *sensor_attr_get()* and *sensor_attr_set()* to get and set a sensors attributes.

A quick example...

```
const struct device *accel_dev = DEVICE_DT_GET(DT_ALIAS(accel0));
struct sensor_value accel_sample_rate;
int rc;

rc = sensor_attr_get(accel_dev, SENSOR_CHAN_ACCEL_XYZ, SENSOR_ATTR_SAMPLING_FREQUENCY, &
↪accel_sample_rate);
```

(continues on next page)

(continued from previous page)

```
if (rc != 0) {
            printk("Failed to get sampling frequency\n");
}

printk("Sample rate for accel %p is %d.06%d\n", accel_dev, accel_sample_rate.val1, accel_
↪sample_rate.val2*1000000);

accel_sample_rate.val1 = 2000;

rc = sensor_attr_set(accel_dev, SENSOR_CHAN_ACCEL_XYZ, SENSOR_ATTR_SAMPLING_FREQUENCY,␣
↪accel_sample_rate);
if (rc != 0) {
            printk("Failed to set sampling frequency\n");
}
```

Sensor Channels *Channels*, enumerated in *sensor_channel*, are quantities that a sensor device can measure.

Sensors may have multiple channels, either to represent different axes of the same physical property (e.g. acceleration); or because they can measure different properties altogether (ambient temperature, pressure and humidity). Sensors may have multiple channels of the same measurement type to enable measuring many readings of perhaps temperature, light intensity, amperage, voltage, or capacitance for example.

A channel is specified in Zephyr using a *sensor_chan_spec* which is a pair containing both the channel type (*sensor_channel*) and channel index. At times only *sensor_channel* is used but this should be considered historical since the introduction of *sensor_chan_spec* for Zephyr 3.7.

Sensor Triggers *Triggers*, enumerated in *sensor_trigger_type*, are sensor generated events. Typically sensors allow setting up these events to cause digital line signaling for easy capture by a micro controller. The events can then commonly be inspected by reading registers to determine which event caused the digital line signaling to occur.

There are many kinds of triggers sensors provide, from informative ones such as data ready to physical events such as taps or steps.

Power Management Power management of sensors is often a non-trivial task as sensors may have multiple power states for various channels. Some sensors may allow for low noise, low power, or suspending channels potentially saving quite a bit of power at the cost of noise or sampling speed performance. In very low power states sensors may lose their state, turning off even the digital logic portion of the device.

All this is to say that power management of sensors is typically application specific! Often the channel states are mutable using *Sensor Attributes*. While total device suspending and resume can be done using the power management ref counting APIs if the device implements the necessary functionality.

Most likely the API sensors should use for their fully suspended/resume power states is *Device Runtime Power Management* using explicit calls at an application level to *pm_device_runtime_get()* and *pm_device_runtime_put()*.

In the future, with *Read and Decode* its possible that automatic management of device power management would be possible in the streaming case as the application informs the driver of usage at all times through requests to read on given events.

Device Tree In the context of sensors device tree provides the initial hardware configuration for sensors on a per device level. Each device must specify a device tree binding in Zephyr, and ideally, a set of hardware configuration options for things such as channel power modes, data rates, filters, decimation, and scales. These can then be used in a boards devicetree to configure a sensor to its initial state.

```
#include <zephyr/dt-bindings/icm42688.h>

&spi0 {
    /* SPI bus options here, not shown */

    accel_gyro0: icm42688p@0 {
        compatible = "invensense,icm42688";
        reg = <0>;
        int-gpios = <&pioc 6 GPIO_ACTIVE_HIGH>; /* SoC specific pin to select for interrupt␣
↪line */
        spi-max-frequency = <DT_FREQ_M(24)>; /* Maximum SPI bus frequency */
        accel-pwr-mode = <ICM42688_ACCEL_LN>; /* Low noise mode */
        accel-odr = <ICM42688_ACCEL_ODR_2000>; /* 2000 Hz sampling */
        accel-fs = <ICM42688_ACCEL_FS_16>; /* 16G scale */
        gyro-pwr-mode = <ICM42688_GYRO_LN>; /* Low noise mode */
        gyro-odr = <ICM42688_GYRO_ODR_2000>; /* 2000 Hz sampling */
        gyro-fs = <ICM42688_GYRO_FS_16>; /* 16G scale */
    };
 };
```

Fetch and Get The stable and long existing APIs for reading sensor data and handling triggers are:

- *sensor_sample_fetch()*
- *sensor_sample_fetch_chan()*
- *sensor_channel_get()*
- *sensor_trigger_set()*

These functions work together. The fetch APIs block the calling context which must be a thread until the requested *sensor_channel* (or all channels) has been obtained and stored into the driver instance's private data.

The channel data most recently fetched can then be obtained as a *sensor_value* by calling *sensor_channel_get()* for each channel type.

Warning

It should be noted that calling fetch and get from multiple contexts without a locking mechanism is undefined and most sensor drivers do not attempt to internally provide exclusive access to the device during or between these calls.

Polling Using fetch and get sensor can be read in a polling manner from software threads.

#include <zephyr/kernel.h>
```

(continues on next page)

(continued from previous page)

```
#include <zephyr/device.h>
#include <zephyr/drivers/sensor.h>
#include <zephyr/sys/printk.h>
#include <stdio.h>

int main(void)
{
        const struct device *const dev = DEVICE_DT_GET(DT_ALIAS(magn0));
        struct sensor_value value_x, value_y, value_z;
        int ret;

        if (!device_is_ready(dev)) {
                printk("sensor: device not ready.\n");
                return 0;
        }

        printk("Polling magnetometer data from %s.\n", dev->name);

        while (1) {
                ret = sensor_sample_fetch(dev);
                if (ret) {
                        printk("sensor_sample_fetch failed ret %d\n", ret);
                        return 0;
                }

                ret = sensor_channel_get(dev, SENSOR_CHAN_MAGN_X, &value_x);
                ret = sensor_channel_get(dev, SENSOR_CHAN_MAGN_Y, &value_y);
                ret = sensor_channel_get(dev, SENSOR_CHAN_MAGN_Z, &value_z);
                printf("( x y z ) = ( %f  %f  %f )\n",
                       sensor_value_to_double(&value_x),
                       sensor_value_to_double(&value_y),
                       sensor_value_to_double(&value_z));

                k_sleep(K_MSEC(500));
        }
        return 0;
}
```

Triggers Triggers in the stable API require enabling triggers with a device specific Kconfig. The device specific Kconfig typically allows selecting the context the trigger runs. The application then needs to register a callback with a function signature matching *sensor_trigger_handler_t* using *sensor_trigger_set()* for the specific triggers (events) to listen for.

> **Note**
>
> Triggers may not be set from user mode threads, and the callback is not run in a user mode context.

There are typically two options provided for each driver where to run trigger handlers. Either the trigger handler is run using the system work queue thread (*Workqueue Threads*) or a dedicated thread. A great example can be found in the BMI160 driver which has Kconfig options for selecting a trigger mode. See `CONFIG_BMI160_TRIGGER_NONE`, `CONFIG_BMI160_TRIGGER_GLOBAL_THREAD` (work queue), `CONFIG_BMI160_TRIGGER_OWN_THREAD` (dedicated thread).

Some notable attributes of using a driver dedicated thread vs the system work queue.

- Driver dedicated threads have dedicated stack (RAM) which only gets used for that single trigger handler function.

- Driver dedicated threads *do* get their own priority typically which lets you prioritize trigger handling among other threads.
- Driver dedicated threads will not have head of line blocking if the driver needs time to handle the trigger.

Note

In all cases it's very likely there will be variable delays from the actual interrupt to your callback function being run. In the work queue (GLOBAL_THREAD) case the work queue itself can be the source of variable latency!

#include <zephyr/drivers/sensor.h>

const struct device *const accel0 = DEVICE_DT_GET(DT_ALIAS(accel0));

static struct tap_count_state {
        struct sensor_trigger trig;
        uint32_t count;
} tap_count_state = {
        .trig = {
                .chan = SENSOR_CHAN_ACCEL_XYZ,
                .type = SENSOR_TRIG_TAP,
        },
        .count = 0,
};

void tap_handler(const struct device *dev, const struct sensor_trigger *trig)
{
        struct tap_count_state *state = CONTAINER_OF(trig, struct tap_count_state, trig);

        state->count++;

        printk("Tap! Total Taps: %u\n", state->count);
}

int main(void)
{
        int rc;

        printk("Tap Counter Example (%s)\n", CONFIG_ARCH);

        rc = sensor_trigger_set(accel0, &tap_count_state.trig, tap_handler);

        if (rc != 0) {
                printk("Failed to set trigger handler for taps, error %d\n", rc);
                return rc;
        }

        return rc;
}
```

Read and Decode The quickly stabilizing experimental APIs for reading sensor data are:

- *sensor_read()*
- *sensor_read_async_mempool()*
- *sensor_get_decoder()*
- *sensor_decode()*

Benefits over Fetch and Get These APIs allow for a wider usage of sensors, sensor types, and data flows with sensors. These are the future looking APIs in Zephyr and solve many issues that have been run into with *Fetch and Get*.

sensor_read() and similar functions acquire sensor encoded data into a buffer provided by the caller. Decode (*sensor_decode()*) then decodes the sensor specific encoded data into fixed point *q31_t* values as vectors per channel. This allows further processing using fixed point DSP functions that work on vectors of data to be done (e.g. low-pass filters, FFT, fusion, etc).

Reading is by default asynchronous in its implementation and takes advantage of *Real Time I/O (RTIO)* to enable chaining asynchronous requests, or starting requests against many sensors simultaneously from a single call context.

This enables incredibly useful code flows when working with sensors such as:

- Obtaining the raw sensor data, decoding never, later, or on a separate processor (e.g. a phone).
- Starting a read for sensors directly from an interrupt handler. No dedicated thread needed saving precious stack space. No work queue needed introducing variable latency. Starting a read for multiple sensors simultaneously from a single call context (interrupt/thread/work queue).
- Requesting multiple reads to the same device for Ping-Pong (double buffering) setups.
- Creating entire pipelines of data flow from sensors allowing for software defined virtual sensors (*Sensing Subsystem*) all from a single thread with DAG process ordering.
- Potentially pre-programming DMAs to trigger on GPIO events, leaving the CPU entirely out of the loop in handling sensor events like FIFO watermarks.

Additionally, other shortcomings of *Fetch and Get* related to memory and trigger handling are solved.

- Triggers result in enqueued events, not callbacks.
- Triggers can be setup to automatically fetch data. Potentially enabling pre-programmed DMA transfers on GPIO interrupts.
- Far less likely triggers are missed due to long held interrupt masks from callbacks and context swapping.
- Sensor FIFOs supported by wiring up FIFO triggers to read data into mempool allocated buffers.
- All sensor processing can be done in user mode (memory protected) threads.
- Multiple sensor channels of the same type are better supported.

Note

For *Read and Decode* benefits to be fully realized requires *Real Time I/O (RTIO)* compliant communication access to the sensor. Typically this means an *Real Time I/O (RTIO)* enabled bus driver for SPI or I2C.

Polling Read Polling reads with *Read and Decode* can be accomplished by instantiating a polling I/O device (akin to a file descriptor) for the sensor with the desired channels to poll. Requesting either blocking or non-blocking reads, then optionally decoding the data into fixed point values.

Polling a temperature sensor and printing its readout is likely the simplest sample to show how this all works.

}
```

Polling Read with Multiple Sensors One of the benefits of Read and Decode is the ability to concurrently read many sensors with many channels in one thread. Effectively read requests are started asynchronously for all sensors and their channels. When each read completes we then decode the sensor data. Examples speak loudly and so a sample showing how this might work with multiple temperature sensors with multiple temperature channels:

Implementing Sensor Drivers

> **Note**
>
> Implementing the driver side of the sensor API requires an understanding how the sensor APIs are used. Please read through *Using Sensors* first!

Implementing Attributes

- SHOULD implement attribute setting in a blocking manner.
- SHOULD provide the ability to get and set channel scale if supported by the device.
- SHOULD provide the ability to get and set channel sampling rate if supported by the device.

Implementing Fetch and Get

- SHOULD implement *sensor_sample_fetch_t* as a blocking call that stashes the specified channels (or all sensor channels) as driver instance data.
- SHOULD implement *sensor_channel_get_t* without side effects manipulating driver state returning stashed sensor readings.
- SHOULD implement *sensor_trigger_set_t* storing the address of the *sensor_trigger* rather than copying the contents. This is so *CONTAINER_OF* may be used for trigger callback context.

Implementing Read and Decode

- MUST implement *sensor_submit_t* as a non-blocking call.

- SHOULD implement *sensor_submit_t* using *Real Time I/O (RTIO)* to do non-blocking bus transfers if possible.
- MAY implement *sensor_submit_t* using a work queue if *Real Time I/O (RTIO)* is unsupported by the bus.
- SHOULD implement *sensor_submit_t* checking the *rtio_sqe* is of type RTIO_SQE_RX (read request).
- SHOULD implement *sensor_submit_t* checking all requested channels supported or respond with an error if not.
- SHOULD implement *sensor_submit_t* checking the provided buffer is large enough for the requested channels.
- SHOULD implement *sensor_submit_t* in a way that directly reads into the provided buffer avoiding copying of any kind, with few exceptions.
- MUST implement *sensor_decoder_api* with pure stateless functions. All state needed to convert the raw sensor readings into fixed point SI united values must be in the provided buffer.
- MUST implement *sensor_get_decoder_t* returning the *sensor_decoder_api* for that device type.

group sensor_interface

Sensor Interface.

Since
1.2

Version
1.0.0

Defines

`SENSOR_DECODE_CONTEXT_INIT`(decoder_, buffer_, channel_type_, channel_index_)
Initialize a *sensor_decode_context*.

`SENSOR_STREAM_TRIGGER_PREP`(_trigger, _opt)

`SENSOR_DT_READ_IODEV`(name, dt_node, ...)
Define a reading instance of a sensor.

Use this macro to generate a *rtio_iodev* for reading specific channels. Example:

```
 (.c)
SENSOR_DT_READ_IODEV(icm42688_accelgyro, DT_NODELABEL(icm42688),
    { SENSOR_CHAN_ACCEL_XYZ, 0 },
    { SENSOR_CHAN_GYRO_XYZ, 0 });

int main(void) {
  sensor_read_async_mempool(&icm42688_accelgyro, &rtio);
}
```

`SENSOR_DT_STREAM_IODEV`(name, dt_node, ...)
Define a stream instance of a sensor.

Use this macro to generate a *rtio_iodev* for starting a stream that's triggered by specific interrupts. Example:

```
 (.c)
SENSOR_DT_STREAM_IODEV(imu_stream, DT_ALIAS(imu),
    {SENSOR_TRIG_FIFO_WATERMARK, SENSOR_STREAM_DATA_INCLUDE},
    {SENSOR_TRIG_FIFO_FULL, SENSOR_STREAM_DATA_NOP});

int main(void) {
  struct rtio_sqe *handle;
  sensor_stream(&imu_stream, &rtio, NULL, &handle);
  k_msleep(1000);
  rtio_sqe_cancel(handle);
}
```

`SENSOR_CHANNEL_3_AXIS`(chan)
checks if a given channel is a 3-axis channel

Parameters

- `chan` – **[in]** The channel to check

Return values

- `true` – if chan is any of *SENSOR_CHAN_ACCEL_XYZ*, *SENSOR_CHAN_GYRO_XYZ*, or *SENSOR_CHAN_MAGN_XYZ*, or *SENSOR_CHAN_POS_DXYZ*
- `false` – otherwise

SENSOR_G

The value of gravitational constant in micro m/s^2.

SENSOR_PI

The value of constant PI in micros.

SENSOR_INFO_DEFINE(name, ...)

SENSOR_INFO_DT_DEFINE(node_id)

SENSOR_DEVICE_DT_DEFINE(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)

Like *DEVICE_DT_DEFINE()* with sensor specifics.

Defines a device which implements the sensor API. May define an element in the sensor info iterable section used to enumerate all sensor devices.

Parameters

- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver.
- **pm_device** – PM device resources reference (NULL if device does not use PM).
- **data_ptr** – Pointer to the device's private data.
- **cfg_ptr** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

SENSOR_DEVICE_DT_INST_DEFINE(inst, ...)

Like *SENSOR_DEVICE_DT_DEFINE()* for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to *SENSOR_DEVICE_DT_DEFINE()*.
- **...** – other parameters as expected by *SENSOR_DEVICE_DT_DEFINE()*.

Typedefs

typedef void (***sensor_trigger_handler_t**)(const struct *device* *dev, const struct *sensor_trigger* *trigger)

Callback API upon firing of a trigger.

Param dev
Pointer to the sensor device

Param trigger
The trigger

typedef int (*sensor_attr_set_t)(const struct *device* *dev, enum *sensor_channel* chan, enum *sensor_attribute* attr, const struct *sensor_value* *val)

Callback API upon setting a sensor's attributes.

See *sensor_attr_set()* for argument description

typedef int (*sensor_attr_get_t)(const struct *device* *dev, enum *sensor_channel* chan, enum *sensor_attribute* attr, struct *sensor_value* *val)

Callback API upon getting a sensor's attributes.

See *sensor_attr_get()* for argument description

typedef int (*sensor_trigger_set_t)(const struct *device* *dev, const struct *sensor_trigger* *trig, *sensor_trigger_handler_t* handler)

Callback API for setting a sensor's trigger and handler.

See *sensor_trigger_set()* for argument description

typedef int (*sensor_sample_fetch_t)(const struct *device* *dev, enum *sensor_channel* chan)

Callback API for fetching data from a sensor.

See *sensor_sample_fetch()* for argument description

typedef int (*sensor_channel_get_t)(const struct *device* *dev, enum *sensor_channel* chan, struct *sensor_value* *val)

Callback API for getting a reading from a sensor.

See *sensor_channel_get()* for argument description

typedef int (*sensor_get_decoder_t)(const struct *device* *dev, const struct *sensor_decoder_api* **api)

Get the decoder associate with the given device.

See also

sensor_get_decoder for more details

typedef void (*sensor_submit_t)(const struct *device* *sensor, struct *rtio_iodev_sqe* *sqe)

typedef void (*sensor_processing_callback_t)(int result, uint8_t *buf, uint32_t buf_len, void *userdata)

Callback function used with the helper processing function.

See also

sensor_processing_with_callback

Param result
[in] The result code of the read (0 being success)

Param buf
[in] The data buffer holding the sensor data

Param buf_len
[in] The length (in bytes) of the `buf`

Param userdata
[in] The optional userdata passed to *sensor_read_async_mempool()*

Enums

enum `sensor_channel`

Sensor channels.

Values:

enumerator `SENSOR_CHAN_ACCEL_X`
Acceleration on the X axis, in m/s^2.

enumerator `SENSOR_CHAN_ACCEL_Y`
Acceleration on the Y axis, in m/s^2.

enumerator `SENSOR_CHAN_ACCEL_Z`
Acceleration on the Z axis, in m/s^2.

enumerator `SENSOR_CHAN_ACCEL_XYZ`
Acceleration on the X, Y and Z axes.

enumerator `SENSOR_CHAN_GYRO_X`
Angular velocity around the X axis, in radians/s.

enumerator `SENSOR_CHAN_GYRO_Y`
Angular velocity around the Y axis, in radians/s.

enumerator `SENSOR_CHAN_GYRO_Z`
Angular velocity around the Z axis, in radians/s.

enumerator `SENSOR_CHAN_GYRO_XYZ`
Angular velocity around the X, Y and Z axes.

enumerator `SENSOR_CHAN_MAGN_X`
Magnetic field on the X axis, in Gauss.

enumerator `SENSOR_CHAN_MAGN_Y`
Magnetic field on the Y axis, in Gauss.

enumerator `SENSOR_CHAN_MAGN_Z`
Magnetic field on the Z axis, in Gauss.

enumerator `SENSOR_CHAN_MAGN_XYZ`
Magnetic field on the X, Y and Z axes.

enumerator SENSOR_CHAN_DIE_TEMP
Device die temperature in degrees Celsius.

enumerator SENSOR_CHAN_AMBIENT_TEMP
Ambient temperature in degrees Celsius.

enumerator SENSOR_CHAN_PRESS
Pressure in kilopascal.

enumerator SENSOR_CHAN_PROX
Proximity.
Adimensional. A value of 1 indicates that an object is close.

enumerator SENSOR_CHAN_HUMIDITY
Humidity, in percent.

enumerator SENSOR_CHAN_LIGHT
Illuminance in visible spectrum, in lux.

enumerator SENSOR_CHAN_IR
Illuminance in infra-red spectrum, in lux.

enumerator SENSOR_CHAN_RED
Illuminance in red spectrum, in lux.

enumerator SENSOR_CHAN_GREEN
Illuminance in green spectrum, in lux.

enumerator SENSOR_CHAN_BLUE
Illuminance in blue spectrum, in lux.

enumerator SENSOR_CHAN_ALTITUDE
Altitude, in meters.

enumerator SENSOR_CHAN_PM_1_0
1.0 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_2_5
2.5 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_PM_10
10 micro-meters Particulate Matter, in ug/m^3

enumerator SENSOR_CHAN_DISTANCE
Distance.
From sensor to target, in meters

enumerator SENSOR_CHAN_CO2
CO2 level, in parts per million (ppm)

enumerator SENSOR_CHAN_O2
O2 level, in parts per million (ppm)

enumerator SENSOR_CHAN_VOC
VOC level, in parts per billion (ppb)

enumerator SENSOR_CHAN_GAS_RES
Gas sensor resistance in ohms.

enumerator SENSOR_CHAN_VOLTAGE
Voltage, in volts.

enumerator SENSOR_CHAN_VSHUNT
Current Shunt Voltage in milli-volts.

enumerator SENSOR_CHAN_CURRENT
Current, in amps.

enumerator SENSOR_CHAN_POWER
Power in watts.

enumerator SENSOR_CHAN_RESISTANCE
Resistance , in Ohm.

enumerator SENSOR_CHAN_ROTATION
Angular rotation, in degrees.

enumerator SENSOR_CHAN_POS_DX
Position change on the X axis, in points.

enumerator SENSOR_CHAN_POS_DY
Position change on the Y axis, in points.

enumerator SENSOR_CHAN_POS_DZ
Position change on the Z axis, in points.

enumerator SENSOR_CHAN_POS_DXYZ
Position change on the X, Y and Z axis, in points.

enumerator SENSOR_CHAN_RPM
Revolutions per minute, in RPM.

enumerator SENSOR_CHAN_GAUGE_VOLTAGE
Voltage, in volts.

enumerator SENSOR_CHAN_GAUGE_AVG_CURRENT
Average current, in amps.

enumerator SENSOR_CHAN_GAUGE_STDBY_CURRENT
Standby current, in amps.

enumerator SENSOR_CHAN_GAUGE_MAX_LOAD_CURRENT
Max load current, in amps.

enumerator SENSOR_CHAN_GAUGE_TEMP
Gauge temperature

enumerator SENSOR_CHAN_GAUGE_STATE_OF_CHARGE
State of charge measurement in %.

enumerator SENSOR_CHAN_GAUGE_FULL_CHARGE_CAPACITY
Full Charge Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_REMAINING_CHARGE_CAPACITY
Remaining Charge Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_NOM_AVAIL_CAPACITY
Nominal Available Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_FULL_AVAIL_CAPACITY
Full Available Capacity in mAh.

enumerator SENSOR_CHAN_GAUGE_AVG_POWER
Average power in mW.

enumerator SENSOR_CHAN_GAUGE_STATE_OF_HEALTH
State of health measurement in %.

enumerator SENSOR_CHAN_GAUGE_TIME_TO_EMPTY
Time to empty in minutes.

enumerator SENSOR_CHAN_GAUGE_TIME_TO_FULL
Time to full in minutes.

enumerator SENSOR_CHAN_GAUGE_CYCLE_COUNT
Cycle count (total number of charge/discharge cycles)

enumerator SENSOR_CHAN_GAUGE_DESIGN_VOLTAGE
Design voltage of cell in V (max voltage)

enumerator SENSOR_CHAN_GAUGE_DESIRED_VOLTAGE
Desired voltage of cell in V (nominal voltage)

enumerator SENSOR_CHAN_GAUGE_DESIRED_CHARGING_CURRENT

Desired charging current in mA.

enumerator SENSOR_CHAN_ALL

All channels.

enumerator SENSOR_CHAN_COMMON_COUNT

Number of all common sensor channels.

enumerator SENSOR_CHAN_PRIV_START = *SENSOR_CHAN_COMMON_COUNT*

This and higher values are sensor specific.

Refer to the sensor header file.

enumerator SENSOR_CHAN_MAX = INT16_MAX

Maximum value describing a sensor channel type.

enum sensor_trigger_type

Sensor trigger types.

Values:

enumerator SENSOR_TRIG_TIMER

Timer-based trigger, useful when the sensor does not have an interrupt line.

enumerator SENSOR_TRIG_DATA_READY

Trigger fires whenever new data is ready.

enumerator SENSOR_TRIG_DELTA

Trigger fires when the selected channel varies significantly.

This includes any-motion detection when the channel is acceleration or gyro. If detection is based on slope between successive channel readings, the slope threshold is configured via the *SENSOR_ATTR_SLOPE_TH* and *SENSOR_ATTR_SLOPE_DUR* attributes.

enumerator SENSOR_TRIG_NEAR_FAR

Trigger fires when a near/far event is detected.

enumerator SENSOR_TRIG_THRESHOLD

Trigger fires when channel reading transitions configured thresholds.

The thresholds are configured via the *SENSOR_ATTR_LOWER_THRESH*, *SENSOR_ATTR_UPPER_THRESH*, and *SENSOR_ATTR_HYSTERESIS* attributes.

enumerator SENSOR_TRIG_TAP

Trigger fires when a single tap is detected.

enumerator SENSOR_TRIG_DOUBLE_TAP

Trigger fires when a double tap is detected.

enumerator SENSOR_TRIG_FREEFALL
Trigger fires when a free fall is detected.

enumerator SENSOR_TRIG_MOTION
Trigger fires when motion is detected.

enumerator SENSOR_TRIG_STATIONARY
Trigger fires when no motion has been detected for a while.

enumerator SENSOR_TRIG_FIFO_WATERMARK
Trigger fires when the FIFO watermark has been reached.

enumerator SENSOR_TRIG_FIFO_FULL
Trigger fires when the FIFO becomes full.

enumerator SENSOR_TRIG_COMMON_COUNT
Number of all common sensor triggers.

enumerator SENSOR_TRIG_PRIV_START = *SENSOR_TRIG_COMMON_COUNT*
This and higher values are sensor specific.
Refer to the sensor header file.

enumerator SENSOR_TRIG_MAX = INT16_MAX
Maximum value describing a sensor trigger type.

enum sensor_attribute
Sensor attribute types.
Values:

enumerator SENSOR_ATTR_SAMPLING_FREQUENCY
Sensor sampling frequency, i.e.
how many times a second the sensor takes a measurement.

enumerator SENSOR_ATTR_LOWER_THRESH
Lower threshold for trigger.

enumerator SENSOR_ATTR_UPPER_THRESH
Upper threshold for trigger.

enumerator SENSOR_ATTR_SLOPE_TH
Threshold for any-motion (slope) trigger.

enumerator SENSOR_ATTR_SLOPE_DUR
Duration for which the slope values needs to be outside the threshold for the trigger to fire.

enumerator SENSOR_ATTR_HYSTERESIS

enumerator SENSOR_ATTR_OVERSAMPLING

Oversampling factor.

enumerator SENSOR_ATTR_FULL_SCALE

Sensor range, in SI units.

enumerator SENSOR_ATTR_OFFSET

The sensor value returned will be altered by the amount indicated by offset: final_value = *sensor_value* + offset.

enumerator SENSOR_ATTR_CALIB_TARGET

Calibration target.

This will be used by the internal chip's algorithms to calibrate itself on a certain axis, or all of them.

enumerator SENSOR_ATTR_CONFIGURATION

Configure the operating modes of a sensor.

enumerator SENSOR_ATTR_CALIBRATION

Set a calibration value needed by a sensor.

enumerator SENSOR_ATTR_FEATURE_MASK

Enable/disable sensor features.

enumerator SENSOR_ATTR_ALERT

Alert threshold or alert enable/disable.

enumerator SENSOR_ATTR_FF_DUR

Free-fall duration represented in milliseconds.

If the sampling frequency is changed during runtime, this attribute should be set to adjust freefall duration to the new sampling frequency.

enumerator SENSOR_ATTR_BATCH_DURATION

Hardware batch duration in ticks.

enumerator SENSOR_ATTR_COMMON_COUNT

Number of all common sensor attributes.

enumerator SENSOR_ATTR_PRIV_START = *SENSOR_ATTR_COMMON_COUNT*

This and higher values are sensor specific.

Refer to the sensor header file.

enumerator SENSOR_ATTR_MAX = INT16_MAX

Maximum value describing a sensor attribute type.

enum sensor_stream_data_opt

Options for what to do with the associated data when a trigger is consumed.

Values:

enumerator SENSOR_STREAM_DATA_INCLUDE = 0

Include whatever data is associated with the trigger.

enumerator SENSOR_STREAM_DATA_NOP = 1

Do nothing with the associated trigger data, it may be consumed later.

enumerator SENSOR_STREAM_DATA_DROP = 2

Flush/clear whatever data is associated with the trigger.

Functions

static inline bool **sensor_chan_spec_eq**(struct *sensor_chan_spec* chan_spec0, struct *sensor_chan_spec* chan_spec1)

Check if channel specs are equivalent.

Parameters

- **chan_spec0** – First chan spec
- **chan_spec1** – Second chan spec

Return values

- **true** – If equivalent
- **false** – If not equivalent

static inline int **sensor_decode**(struct *sensor_decode_context* *ctx, void *out, uint16_t max_count)

Decode N frames using a *sensor_decode_context*.

Parameters

- **ctx** – **[inout]** The context to use for decoding
- **out** – **[out]** The output buffer
- **max_count** – **[in]** Maximum number of frames to decode

Returns

The decode result from *sensor_decoder_api*'s decode function

int **sensor_natively_supported_channel_size_info**(struct *sensor_chan_spec* channel, size_t *base_size, size_t *frame_size)

int **sensor_attr_set**(const struct *device* *dev, enum *sensor_channel* chan, enum *sensor_attribute* attr, const struct *sensor_value* *val)

Set an attribute for a sensor.

Parameters

- **dev** – Pointer to the sensor device
- **chan** – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
- **attr** – The attribute to set
- **val** – The value to set the attribute to

Returns

0 if successful, negative errno code if failure.

int **sensor_attr_get**(const struct *device* *dev, enum *sensor_channel* chan, enum *sensor_attribute* attr, struct *sensor_value* *val)

Get an attribute for a sensor.

Parameters

- **dev** – Pointer to the sensor device
- **chan** – The channel the attribute belongs to, if any. Some attributes may only be set for all channels of a device, depending on device capabilities.
- **attr** – The attribute to get
- **val** – Pointer to where to store the attribute

Returns
0 if successful, negative errno code if failure.

static inline int **sensor_trigger_set**(const struct *device* *dev, const struct *sensor_trigger* *trig, *sensor_trigger_handler_t* handler)

Activate a sensor's trigger and set the trigger handler.

The handler will be called from a thread, so I2C or SPI operations are safe. However, the thread's stack is limited and defined by the driver. It is currently up to the caller to ensure that the handler does not overflow the stack.

The user-allocated trigger will be stored by the driver as a pointer, rather than a copy, and passed back to the handler. This enables the handler to use CONTAINER_OF to retrieve a context pointer when the trigger is embedded in a larger struct and requires that the trigger is not allocated on the stack.

Function properties (list may not be complete)
supervisor

Parameters

- **dev** – Pointer to the sensor device
- **trig** – The trigger to activate
- **handler** – The function that should be called when the trigger fires

Returns
0 if successful, negative errno code if failure.

int **sensor_sample_fetch**(const struct *device* *dev)

Fetch a sample from the sensor and store it in an internal driver buffer.

Read all of a sensor's active channels and, if necessary, perform any additional operations necessary to make the values useful. The user may then get individual channel values by calling *sensor_channel_get*.

The function blocks until the fetch operation is complete.

Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the device is connected via I2C or SPI.

Parameters

- **dev** – Pointer to the sensor device

Returns
0 if successful, negative errno code if failure.

int **sensor_sample_fetch_chan**(const struct *device* *dev, enum *sensor_channel* type)

Fetch a sample from the sensor and store it in an internal driver buffer.

Read and compute compensation for one type of sensor data (magnetometer, accelerometer, etc). The user may then get individual channel values by calling *sensor_channel_get*.

This is mostly implemented by multi function devices enabling reading at different sampling rates.

The function blocks until the fetch operation is complete.

Since the function communicates with the sensor device, it is unsafe to call it in an ISR if the device is connected via I2C or SPI.

Parameters

- **dev** – Pointer to the sensor device
- **type** – The channel that needs updated

Returns

0 if successful, negative errno code if failure.

int **sensor_channel_get**(const struct *device* *dev, enum *sensor_channel* chan, struct *sensor_value* *val)

Get a reading from a sensor device.

Return a useful value for a particular channel, from the driver's internal data. Before calling this function, a sample must be obtained by calling *sensor_sample_fetch* or *sensor_sample_fetch_chan*. It is guaranteed that two subsequent calls of this function for the same channels will yield the same value, if *sensor_sample_fetch* or *sensor_sample_fetch_chan* has not been called in the meantime.

For vectorial data samples you can request all axes in just one call by passing the specific channel with _XYZ suffix. The sample will be returned at val[0], val[1] and val[2] (X, Y and Z in that order).

Parameters

- **dev** – Pointer to the sensor device
- **chan** – The channel to read
- **val** – Where to store the value

Returns

0 if successful, negative errno code if failure.

int **sensor_get_decoder**(const struct *device* *dev, const struct *sensor_decoder_api* **decoder)

Get the sensor's decoder API.

Parameters

- **dev** – **[in]** The sensor device
- **decoder** – **[in]** Pointer to the decoder which will be set upon success

Returns

0 on success

Returns

< 0 on error

int **sensor_reconfigure_read_iodev**(struct *rtio_iodev* *iodev, const struct *device* *sensor, const struct *sensor_chan_spec* *channels, size_t num_channels)

Reconfigure a reading iodev.

Allows a reconfiguration of the iodev associated with reading a sample from a sensor.

Important: If the iodev is currently servicing a read operation, the data will likely be invalid. Please be sure the flush or wait for all pending operations to complete before using the data after a configuration change.

It is also important that the `data` field of the iodev is a *sensor_read_config*.

Parameters

- `iodev` – **[in]** The iodev to reconfigure
- `sensor` – **[in]** The sensor to read from
- `channels` – **[in]** One or more channels to read
- `num_channels` – **[in]** The number of channels in `channels`

Returns
0 on success

Returns
< 0 on error

static inline int **sensor_stream**(struct *rtio_iodev* *iodev, struct *rtio* *ctx, void *userdata, struct *rtio_sqe* **handle)

static inline int **sensor_read**(struct *rtio_iodev* *iodev, struct *rtio* *ctx, uint8_t *buf, size_t buf_len)

Blocking one shot read of samples from a sensor into a buffer.

Using `cfg`, read data from the device by using the provided RTIO context `ctx`. This call will generate a *rtio_sqe* that will be given the provided buffer. The call will wait for the read to complete before returning to the caller.

Parameters

- `iodev` – **[in]** The iodev created by *SENSOR_DT_READ_IODEV*
- `ctx` – **[in]** The RTIO context to service the read
- `buf` – **[in]** Pointer to memory to read sample data into
- `buf_len` – **[in]** Size in bytes of the given memory that are valid to read into

Returns
0 on success

Returns
< 0 on error

static inline int **sensor_read_async_mempool**(struct *rtio_iodev* *iodev, struct *rtio* *ctx, void *userdata)

One shot non-blocking read with pool allocated buffer.

Using `cfg`, read one snapshot of data from the device by using the provided RTIO context `ctx`. This call will generate a *rtio_sqe* that will leverage the RTIO's internal mempool when the time comes to service the read.

Parameters

- `iodev` – **[in]** The iodev created by *SENSOR_DT_READ_IODEV*
- `ctx` – **[in]** The RTIO context to service the read

- **userdata** – **[in]** Optional userdata that will be available when the read is complete

Returns
0 on success

Returns
< 0 on error

void **sensor_processing_with_callback**(struct *rtio* *ctx, *sensor_processing_callback_t* cb)

Helper function for common processing of sensor data.

This function can be called in a blocking manner after *sensor_read()* or in a standalone thread dedicated to processing. It will wait for a cqe from the RTIO context, once received, it will decode the userdata and call the cb. Once the cb returns, the buffer will be released back into `ctx`'s mempool if available.

Parameters

- **ctx** – **[in]** The RTIO context to wait on
- **cb** – **[in]** Callback to call when data is ready for processing

static inline int32_t **sensor_ms2_to_g**(const struct *sensor_value* *ms2)

Helper function to convert acceleration from m/s^2 to Gs.

Parameters

- **ms2** – A pointer to a *sensor_value* struct holding the acceleration, in m/s^2.

Returns
The converted value, in Gs.

static inline void **sensor_g_to_ms2**(int32_t g, struct *sensor_value* *ms2)

Helper function to convert acceleration from Gs to m/s^2.

Parameters

- **g** – The G value to be converted.
- **ms2** – A pointer to a *sensor_value* struct, where the result is stored.

static inline int32_t **sensor_ms2_to_ug**(const struct *sensor_value* *ms2)

Helper function to convert acceleration from m/s^2 to micro Gs.

Parameters

- **ms2** – A pointer to a *sensor_value* struct holding the acceleration, in m/s^2.

Returns
The converted value, in micro Gs.

static inline void **sensor_ug_to_ms2**(int32_t ug, struct *sensor_value* *ms2)

Helper function to convert acceleration from micro Gs to m/s^2.

Parameters

- **ug** – The micro G value to be converted.
- **ms2** – A pointer to a *sensor_value* struct, where the result is stored.

static inline int32_t **sensor_rad_to_degrees**(const struct *sensor_value* *rad)

Helper function for converting radians to degrees.

Parameters

- **rad** – A pointer to a *sensor_value* struct, holding the value in radians.

Returns
The converted value, in degrees.

static inline void **sensor_degrees_to_rad**(int32_t d, struct *sensor_value* *rad)

Helper function for converting degrees to radians.

Parameters

- **d** – The value (in degrees) to be converted.
- **rad** – A pointer to a *sensor_value* struct, where the result is stored.

static inline int32_t **sensor_rad_to_10udegrees**(const struct *sensor_value* *rad)

Helper function for converting radians to 10 micro degrees.

When the unit is 1 micro degree, the range that the int32_t can represent is +/-2147.483 degrees. In order to increase this range, here we use 10 micro degrees as the unit.

Parameters

- **rad** – A pointer to a *sensor_value* struct, holding the value in radians.

Returns

The converted value, in 10 micro degrees.

static inline void **sensor_10udegrees_to_rad**(int32_t d, struct *sensor_value* *rad)

Helper function for converting 10 micro degrees to radians.

Parameters

- **d** – The value (in 10 micro degrees) to be converted.
- **rad** – A pointer to a *sensor_value* struct, where the result is stored.

static inline double **sensor_value_to_double**(const struct *sensor_value* *val)

Helper function for converting struct *sensor_value* to double.

Parameters

- **val** – A pointer to a *sensor_value* struct.

Returns

The converted value.

static inline float **sensor_value_to_float**(const struct *sensor_value* *val)

Helper function for converting struct *sensor_value* to float.

Parameters

- **val** – A pointer to a *sensor_value* struct.

Returns

The converted value.

static inline int **sensor_value_from_double**(struct *sensor_value* *val, double inp)

Helper function for converting double to struct *sensor_value*.

Parameters

- **val** – A pointer to a *sensor_value* struct.
- **inp** – The converted value.

Returns

0 if successful, negative errno code if failure.

static inline int **sensor_value_from_float**(struct *sensor_value* *val, float inp)

Helper function for converting float to struct *sensor_value*.

Parameters

- **val** – A pointer to a *sensor_value* struct.
- **inp** – The converted value.

Returns
0 if successful, negative errno code if failure.

static inline int64_t **sensor_value_to_milli**(const struct *sensor_value* *val)
Helper function for converting struct *sensor_value* to integer milli units.

Parameters

- **val** – A pointer to a *sensor_value* struct.

Returns
The converted value.

static inline int64_t **sensor_value_to_micro**(const struct *sensor_value* *val)
Helper function for converting struct *sensor_value* to integer micro units.

Parameters

- **val** – A pointer to a *sensor_value* struct.

Returns
The converted value.

static inline int **sensor_value_from_milli**(struct *sensor_value* *val, int64_t milli)
Helper function for converting integer milli units to struct *sensor_value*.

Parameters

- **val** – A pointer to a *sensor_value* struct.
- **milli** – The converted value.

Returns
0 if successful, negative errno code if failure.

static inline int **sensor_value_from_micro**(struct *sensor_value* *val, int64_t micro)
Helper function for converting integer micro units to struct *sensor_value*.

Parameters

- **val** – A pointer to a *sensor_value* struct.
- **micro** – The converted value.

Returns
0 if successful, negative errno code if failure.

struct **sensor_value**
#include <*sensor.h*> Representation of a sensor readout value.

The value is represented as having an integer and a fractional part, and can be obtained using the formula val1 + val2 * 10^(-6). Negative values also adhere to the above formula, but may need special attention. Here are some examples of the value representation:

```
 0.5: val1 =  0, val2 =  500000
-0.5: val1 =  0, val2 = -500000
-1.0: val1 = -1, val2 =  0
-1.5: val1 = -1, val2 = -500000
```

Public Members

int32_t **val1**
Integer part of the value.

int32_t **val2**

Fractional part of the value (in one-millionth parts).

struct **sensor_trigger**

#include <*sensor.h*> Sensor trigger spec.

Public Members

enum *sensor_trigger_type* **type**

Trigger type.

enum *sensor_channel* **chan**

Channel the trigger is set on.

struct **sensor_chan_spec**

#include <*sensor.h*> Sensor Channel Specification.

A sensor channel specification is a unique identifier per sensor device describing a measurement channel.

> **Note**
>
> Typically passed by value as the size of a *sensor_chan_spec* is a single word.

Public Members

uint16_t **chan_type**

A sensor channel type.

uint16_t **chan_idx**

A sensor channel index.

struct **sensor_decoder_api**

#include <*sensor.h*> Decodes a single raw data buffer.

Data buffers are provided on the *RTIO* context that's supplied to *sensor_read*.

Public Members

int (***get_frame_count**)(const uint8_t *buffer, struct *sensor_chan_spec* channel, uint16_t *frame_count)

Get the number of frames in the current buffer.

Param buffer
[in] The buffer provided on the *RTIO* context.
Param channel
[in] The channel to get the count for
Param frame_count
[out] The number of frames on the buffer (at least 1)

Return
0 on success
Return
-ENOTSUP if the channel/channel_idx aren't found

int (***get_size_info**)(struct *sensor_chan_spec* channel, size_t *base_size, size_t *frame_size)

Get the size required to decode a given channel.

When decoding a single frame, use `base_size`. For every additional frame, add another `frame_size`. As an example, to decode 3 frames use: 'base_size + 2 * frame_size'.

Param channel
[in] The channel to query
Param base_size
[out] The size of decoding the first frame
Param frame_size
[out] The additional size of every additional frame
Return
0 on success
Return
-ENOTSUP if the channel is not supported

int (***decode**)(const uint8_t *buffer, struct *sensor_chan_spec* channel, uint32_t *fit, uint16_t max_count, void *data_out)

Decode up to `max_count` samples from the buffer.

Decode samples of channel *sensor_channel* across multiple frames. If there exist multiple instances of the same channel, `channel_index` is used to differentiate them. As an example, assume a sensor provides 2 distance measurements:

```
// Decode the first channel instance of 'distance'
decoder->decode(buffer, SENSOR_CHAN_DISTANCE, 0, &fit, 5, out);
...

// Decode the second channel instance of 'distance'
decoder->decode(buffer, SENSOR_CHAN_DISTANCE, 1, &fit, 5, out);
```

Param buffer
[in] The buffer provided on the *RTIO* context
Param channel
[in] The channel to decode
Param fit
[inout] The current frame iterator
Param max_count
[in] The maximum number of channels to decode.
Param data_out
[out] The decoded data
Return
0 no more samples to decode
Return
>0 the number of decoded frames
Return
<0 on error

bool (***has_trigger**)(const uint8_t *buffer, enum *sensor_trigger_type* trigger)

Check if the given trigger type is present.

Param buffer
[in] The buffer provided on the *RTIO* context

Param trigger
[in] The trigger type in question
Return
Whether the trigger is present in the buffer

struct **sensor_decode_context**

#include <*sensor.h*> Used for iterating over the data frames via the *sensor_decoder_api*.

Example usage:

```
(.c)
   struct sensor_decode_context ctx = SENSOR_DECODE_CONTEXT_INIT(
       decoder, buffer, SENSOR_CHAN_ACCEL_XYZ, 0);

   while (true) {
     struct sensor_three_axis_data accel_out_data;

     num_decoded_channels = sensor_decode(ctx, &accel_out_data, 1);

     if (num_decoded_channels <= 0) {
       printk("Done decoding buffer\n");
       break;
     }

     printk("Decoded (%" PRId32 ", %" PRId32 ", %" PRId32 ")\n", accel_out_data.
↪readings[0].x,
          accel_out_data.readings[0].y, accel_out_data.readings[0].z);
   }
```

struct **sensor_stream_trigger**

#include <*sensor.h*>

struct **sensor_read_config**

#include <*sensor.h*>

struct **sensor_driver_api**

#include <*sensor.h*>

struct **sensor_data_generic_header**

#include <*sensor.h*>

group **sensor_emulator_backend**

Sensor emulator backend API.

Functions

static inline bool **emul_sensor_backend_is_supported**(const struct *emul* *target)

Check if a given sensor emulator supports the backend API.

Parameters

- **target** – Pointer to emulator instance to query

Returns

True if supported, false if unsupported or if `target` is NULL.

static inline int **emul_sensor_backend_set_channel**(const struct *emul* *target, struct *sensor_chan_spec* ch, const *q31_t* *value, int8_t shift)

Set an expected value for a given channel on a given sensor emulator.

Parameters

- **target** – Pointer to emulator instance to operate on
- **ch** – Sensor channel to set expected value for
- **value** – Expected value in fixed-point format using standard SI unit for sensor type
- **shift** – Shift value (scaling factor) applied to `value`

Returns
0 if successful

Returns
-ENOTSUP if no backend API or if channel not supported by emul

Returns
-ERANGE if provided value is not in the sensor's supported range

static inline int **emul_sensor_backend_get_sample_range**(const struct *emul* *target, struct *sensor_chan_spec* ch, *q31_t* *lower, *q31_t* *upper, *q31_t* *epsilon, int8_t *shift)

Query an emulator for a channel's supported sample value range and tolerance.

Parameters

- **target** – Pointer to emulator instance to operate on
- **ch** – The channel to request info for. If `ch` is unsupported, return `-ENOTSUP`
- **lower** – **[out]** Minimum supported sample value in SI units, fixed-point format
- **upper** – **[out]** Maximum supported sample value in SI units, fixed-point format
- **epsilon** – **[out]** Tolerance to use comparing expected and actual values to account for rounding and sensor precision issues. This can usually be set to the minimum sample value step size. Uses SI units and fixed-point format.
- **shift** – **[out]** The shift value (scaling factor) associated with `lower`, `upper`, and `epsilon`.

Returns
0 if successful

Returns
-ENOTSUP if no backend API or if channel not supported by emul

static inline int **emul_sensor_backend_set_attribute**(const struct *emul* *target, struct *sensor_chan_spec* ch, enum *sensor_attribute* attribute, const void *value)

Set the emulator's attribute values.

Parameters

- **target** – **[in]** Pointer to emulator instance to operate on

- `ch` – **[in]** The channel to request info for. If `ch` is unsupported, return `-ENOTSUP`
- `attribute` – **[in]** The attribute to set
- `value` – **[in]** the value to use (cast according to the channel/attribute pair)

Returns
0 is successful

Returns
< 0 on error

static inline int **emul_sensor_backend_get_attribute_metadata**(const struct *emul* *target, struct *sensor_chan_spec* ch, enum *sensor_attribute* attribute, *q31_t* *min, *q31_t* *max, *q31_t* *increment, int8_t *shift)

Get metadata about an attribute.

Information provided by this function includes the minimum/maximum values of the attribute as well as the increment (value per LSB) which can be used as an epsilon when comparing results.

Parameters

- `target` – **[in]** Pointer to emulator instance to operate on
- `ch` – **[in]** The channel to request info for. If `ch` is unsupported, return '-ENOTSUP'
- `attribute` – **[in]** The attribute to request info for. If `attribute` is unsupported, return '-ENOTSUP'
- `min` – **[out]** The minimum value the attribute can be set to
- `max` – **[out]** The maximum value the attribute can be set to
- `increment` – **[out]** The value that the attribute increases by for every LSB
- `shift` – **[out]** The shift for `min`, `max`, and `increment`

Returns
0 on SUCCESS

Returns
< 0 on error

7.6.45 Serial Peripheral Interface (SPI) Bus

Overview

API Reference

Related code samples

Enhanced Serial Peripheral Interface (eSPI)
Use eSPI to connect to a slave device and exchange virtual wire packets.

SPI bitbang
Use the bitbang SPI driver for communicating with a slave.

group `spi_interface`

SPI Interface.

Since
1.0

Version
1.0.0

SPI operational mode

`SPI_OP_MODE_MASTER`

Master mode.

`SPI_OP_MODE_SLAVE`

Slave mode.

`SPI_OP_MODE_GET`(_operation_)

Get SPI operational mode.

SPI Polarity & Phase Modes

`SPI_MODE_CPOL`

Clock Polarity: if set, clock idle state will be 1 and active state will be 0.

If untouched, the inverse will be true which is the default.

`SPI_MODE_CPHA`

Clock Phase: this dictates when is the data captured, and depends clock's polarity.

When SPI_MODE_CPOL is set and this bit as well, capture will occur on low to high transition and high to low if this bit is not set (default). This is fully reversed if CPOL is not set.

`SPI_MODE_LOOP`

Whatever data is transmitted is looped-back to the receiving buffer of the controller.

This is fully controller dependent as some may not support this, and can be used for testing purposes only.

`SPI_MODE_GET`(_mode_)

Get SPI polarity and phase mode bits.

SPI Transfer modes (host controller dependent)

`SPI_TRANSFER_MSB`
: Most significant bit first.

`SPI_TRANSFER_LSB`
: Least significant bit first.

SPI word size

`SPI_WORD_SIZE_GET`(_operation_)
: Get SPI word size.

`SPI_WORD_SET`(_word_size_)
: Set SPI word size.

Specific SPI devices control bits

`SPI_HOLD_ON_CS`
: Requests - if possible - to keep CS asserted after the transaction.

`SPI_LOCK_ON`
: Keep the device locked after the transaction for the current config.

  Use this with extreme caution (see *spi_release()* below) as it will prevent other callers to access the SPI device until *spi_release()* is properly called.

`SPI_CS_ACTIVE_HIGH`
: Active high logic on CS.

  Usually, and by default, CS logic is active low. However, some devices may require the reverse logic: active high. This bit will request the controller to use that logic. Note that not all controllers are able to handle that natively. In this case deferring the CS control to a gpio line through struct *spi_cs_control* would be the solution.

SPI MISO lines

Some controllers support dual, quad or octal MISO lines connected to slaves.

Default is single, which is the case most of the time. Without `CONFIG_SPI_EXTENDED_MODES` being enabled, single is the only supported one.

`SPI_LINES_SINGLE`
: Single line.

`SPI_LINES_DUAL`
: Dual lines.

`SPI_LINES_QUAD`
: Quad lines.

SPI_LINES_OCTAL
: Octal lines.

SPI_LINES_MASK
: Mask for MISO lines in spi_operation_t.

SPI duplex mode

Some controllers support half duplex transfer, which results in 3-wire usage.

By default, full duplex will prevail.

SPI_FULL_DUPLEX

SPI_HALF_DUPLEX

SPI Frame Format

2 frame formats are exposed: Motorola and TI.

The main difference is the behavior of the CS line. In Motorola it stays active the whole transfer. In TI, it's active only one serial clock period prior to actually make the transfer, it is thus inactive during the transfer, which ends when the clocks ends as well. By default, as it is the most commonly used, the Motorola frame format will prevail.

SPI_FRAME_FORMAT_MOTOROLA

SPI_FRAME_FORMAT_TI

Defines

SPI_CS_GPIOS_DT_SPEC_GET(spi_dev)
: Get a `struct gpio_dt_spec` for a SPI device's chip select pin.

  Example devicetree fragment:

```
gpio1: gpio@abcd0001 { ... };

gpio2: gpio@abcd0002 { ... };

spi@abcd0003 {
        compatible = "vnd,spi";
        cs-gpios = <&gpio1 10 GPIO_ACTIVE_LOW>,
                   <&gpio2 20 GPIO_ACTIVE_LOW>;

        a: spi-dev-a@0 {
                reg = <0>;
        };

        b: spi-dev-b@1 {
                reg = <1>;
        };
};
```

Example usage:

```
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(a)) \
      // { DEVICE_DT_GET(DT_NODELABEL(gpio1)), 10, GPIO_ACTIVE_LOW }
SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(b)) \
      // { DEVICE_DT_GET(DT_NODELABEL(gpio2)), 20, GPIO_ACTIVE_LOW }
```

Parameters

- **spi_dev** – a SPI device node identifier

Returns
gpio_dt_spec struct corresponding with spi_dev's chip select

`SPI_CS_GPIOS_DT_SPEC_INST_GET`(inst)

Get a `struct` *gpio_dt_spec* for a SPI device's chip select pin.

This is equivalent to *SPI_CS_GPIOS_DT_SPEC_GET(DT_DRV_INST(inst))*.

Parameters

- **inst** – Devicetree instance number

Returns
gpio_dt_spec struct corresponding with spi_dev's chip select

`SPI_CS_CONTROL_INIT`(node_id, delay_)

Initialize and get a pointer to a *spi_cs_control* from a devicetree node identifier.

This helper is useful for initializing a device on a SPI bus. It initializes a struct *spi_cs_control* and returns a pointer to it. Here, `node_id` is a node identifier for a SPI device, not a SPI controller.

Example devicetree fragment:

```
spi@abcd0001 {
        cs-gpios = <&gpio0 1 GPIO_ACTIVE_LOW>;
        spidev: spi-device@0 { ... };
};
```

Example usage:

```
struct spi_cs_control ctrl =
        SPI_CS_CONTROL_INIT(DT_NODELABEL(spidev), 2);
```

This example is equivalent to:

```
struct spi_cs_control ctrl = {
        .gpio = SPI_CS_GPIOS_DT_SPEC_GET(DT_NODELABEL(spidev)),
        .delay = 2,
};
```

Parameters

- **node_id** – Devicetree node identifier for a device on a SPI bus
- **delay_** – The `delay` field to set in the *spi_cs_control*

Returns
a pointer to the *spi_cs_control* structure

SPI_CS_CONTROL_INIT_INST(inst, delay_)

Get a pointer to a *spi_cs_control* from a devicetree node.

This is equivalent to *SPI_CS_CONTROL_INIT(DT_DRV_INST(inst), delay)*.

Therefore, DT_DRV_COMPAT must already be defined before using this macro.

Parameters

- **inst** – Devicetree node instance number
- **delay_** – The delay field to set in the *spi_cs_control*

Returns

a pointer to the *spi_cs_control* structure

SPI_CONFIG_DT(node_id, operation_, delay_)

Structure initializer for *spi_config* from devicetree.

This helper macro expands to a static initializer for a struct *spi_config* by reading the relevant frequency, slave, and cs data from the devicetree.

Parameters

- **node_id** – Devicetree node identifier for the SPI device whose struct *spi_config* to create an initializer for
- **operation_** – the desired operation field in the struct *spi_config*
- **delay_** – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

SPI_CONFIG_DT_INST(inst, operation_, delay_)

Structure initializer for *spi_config* from devicetree instance.

This is equivalent to *SPI_CONFIG_DT(DT_DRV_INST(inst), operation_, delay_)*.

Parameters

- **inst** – Devicetree instance number
- **operation_** – the desired operation field in the struct *spi_config*
- **delay_** – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

SPI_DT_SPEC_GET(node_id, operation_, delay_)

Structure initializer for *spi_dt_spec* from devicetree.

This helper macro expands to a static initializer for a struct *spi_dt_spec* by reading the relevant bus, frequency, slave, and cs data from the devicetree.

Important: multiple fields are automatically constructed by this macro which must be checked before use. *spi_is_ready_dt* performs the required *device_is_ready* checks.

Parameters

- **node_id** – Devicetree node identifier for the SPI device whose struct *spi_dt_spec* to create an initializer for
- **operation_** – the desired operation field in the struct *spi_config*
- **delay_** – the desired delay field in the struct *spi_config*'s *spi_cs_control*, if there is one

SPI_DT_SPEC_INST_GET(inst, operation_, delay_)

Structure initializer for *spi_dt_spec* from devicetree instance.

This is equivalent to *SPI_DT_SPEC_GET(DT_DRV_INST(inst), operation_, delay_)*.

Parameters

- **inst** – Devicetree instance number
- **operation_** – the desired `operation` field in the struct *spi_config*
- **delay_** – the desired `delay` field in the struct *spi_config*'s *spi_cs_control*, if there is one

`SPI_DEVICE_DT_DEFINE`(node_id, init_fn, pm, data, config, level, prio, api, ...)

`SPI_STATS_RX_BYTES_INC`(dev_)

`SPI_STATS_TX_BYTES_INC`(dev_)

`SPI_STATS_TRANSFER_ERROR_INC`(dev_)

`spi_transceive_stats`(dev, error, tx_bufs, rx_bufs)

`SPI_DT_IODEV_DEFINE`(name, node_id, operation_, delay_)

Define an iodev for a given dt node on the bus.

These do not need to be shared globally but doing so will save a small amount of memory.

Parameters

- **name** – Symbolic name to use for defining the iodev
- **node_id** – Devicetree node identifier
- **operation_** – SPI operational mode
- **delay_** – Chip select delay in microseconds

Typedefs

typedef uint16_t **spi_operation_t**

Opaque type to hold the SPI operation flags.

typedef int (***spi_api_io**)(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs)

Callback API for I/O See *spi_transceive()* for argument descriptions.

Callback API for asynchronous I/O See *spi_transceive_signal()* for argument descriptions.

typedef void (***spi_callback_t**)(const struct *device* *dev, int result, void *data)

SPI callback for asynchronous transfer requests.

Param dev
SPI device which is notifying of transfer completion or error

Param result
Result code of the transfer request. 0 is success, -errno for failure.

Param data
Transfer requester supplied data which is passed along to the callback.

typedef int (***spi_api_io_async**)(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs, *spi_callback_t* cb, void *userdata)

typedef int (*`spi_api_release`)(const struct *device* *dev, const struct *spi_config* *config)

Callback API for unlocking SPI device.

See *spi_release()* for argument descriptions

Functions

static inline bool `spi_cs_is_gpio`(const struct *spi_config* *config)

Check if SPI CS is controlled using a GPIO.

Parameters

- `config` – SPI configuration.

Returns
true If CS is controlled using a GPIO.

Returns
false If CS is controlled by hardware or any other means.

static inline bool `spi_cs_is_gpio_dt`(const struct *spi_dt_spec* *spec)

Check if SPI CS in *spi_dt_spec* is controlled using a GPIO.

Parameters

- `spec` – SPI specification from devicetree.

Returns
true If CS is controlled using a GPIO.

Returns
false If CS is controlled by hardware or any other means.

static inline bool `spi_is_ready_dt`(const struct *spi_dt_spec* *spec)

Validate that SPI bus (and CS gpio if defined) is ready.

Parameters

- `spec` – SPI specification from devicetree

Return values

- `true` – if the SPI bus is ready for use.
- `false` – if the SPI bus (or the CS gpio defined) is not ready for use.

int `spi_transceive`(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs)

Read/write the specified amount of data from the SPI driver.

> **Note**
>
> This function is synchronous.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `config` – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- `tx_bufs` – Buffer array where data to be sent originates from, or NULL if none.

- `rx_bufs` – Buffer array where data to be read will be written to, or NULL if none.

Return values

- `frames` – Positive number of frames received in slave mode.
- `0` – If successful in master mode.
- `-errno` – Negative errno code on failure.

static inline int **spi_transceive_dt**(const struct *spi_dt_spec* *spec, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs)

Read/write data from an SPI bus specified in *spi_dt_spec*.

This is equivalent to:

```
spi_transceive(spec->bus, &spec->config, tx_bufs, rx_bufs);
```

Parameters

- `spec` – SPI specification from devicetree
- `tx_bufs` – Buffer array where data to be sent originates from, or NULL if none.
- `rx_bufs` – Buffer array where data to be read will be written to, or NULL if none.

Returns

a value from *spi_transceive()*.

static inline int **spi_read**(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *rx_bufs)

Read the specified amount of data from the SPI driver.

Note

This function is synchronous.

Note

This function is a helper function calling spi_transceive.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `config` – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- `rx_bufs` – Buffer array where data to be read will be written to.

Return values

- `frames` – Positive number of frames received in slave mode.
- `0` – If successful.
- `-errno` – Negative errno code on failure.

static inline int **spi_read_dt**(const struct *spi_dt_spec* *spec, const struct *spi_buf_set* *rx_bufs)

Read data from a SPI bus specified in *spi_dt_spec*.

This is equivalent to:

```
spi_read(spec->bus, &spec->config, rx_bufs);
```

Parameters

- **spec** – SPI specification from devicetree
- **rx_bufs** – Buffer array where data to be read will be written to.

Returns
a value from *spi_read()*.

static inline int **spi_write**(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs)

Write the specified amount of data from the SPI driver.

Note

This function is synchronous.

Note

This function is a helper function calling spi_transceive.

Parameters

- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **tx_bufs** – Buffer array where data to be sent originates from.

Return values

- **0** – If successful.
- **-errno** – Negative errno code on failure.

static inline int **spi_write_dt**(const struct *spi_dt_spec* *spec, const struct *spi_buf_set* *tx_bufs)

Write data to a SPI bus specified in *spi_dt_spec*.

This is equivalent to:

```
spi_write(spec->bus, &spec->config, tx_bufs);
```

Parameters

- **spec** – SPI specification from devicetree
- **tx_bufs** – Buffer array where data to be sent originates from.

Returns
a value from *spi_write()*.

static inline int **spi_transceive_cb**(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs, *spi_callback_t* callback, void *userdata)

Read/write the specified amount of data from the SPI driver.

Note

This function is asynchronous.

Note

This function is available only if `CONFIG_SPI_ASYNC` is selected.

Parameters

- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **tx_bufs** – Buffer array where data to be sent originates from, or NULL if none.
- **rx_bufs** – Buffer array where data to be read will be written to, or NULL if none.
- **callback** – Function pointer to completion callback. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).
- **userdata** – Userdata passed to callback

Return values

- **frames** – Positive number of frames received in slave mode.
- **0** – If successful in master mode.
- **-errno** – Negative errno code on failure.

static inline int **spi_transceive_signal**(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs, struct *k_poll_signal* *sig)

Read/write the specified amount of data from the SPI driver.

Note

This function is asynchronous.

Note

This function is available only if `CONFIG_SPI_ASYNC` and `CONFIG_POLL` are selected.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `config` – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- `tx_bufs` – Buffer array where data to be sent originates from, or NULL if none.
- `rx_bufs` – Buffer array where data to be read will be written to, or NULL if none.
- `sig` – A pointer to a valid and ready to be signaled struct *k_poll_signal*. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

Return values

- `frames` – Positive number of frames received in slave mode.
- `0` – If successful in master mode.
- `-errno` – Negative errno code on failure.

static inline int **spi_read_signal**(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *rx_bufs, struct *k_poll_signal* *sig)

Read the specified amount of data from the SPI driver.

> **Note**
>
> This function is asynchronous.

> **Note**
>
> This function is a helper function calling spi_transceive_signal.

> **Note**
>
> This function is available only if `CONFIG_SPI_ASYNC` and `CONFIG_POLL` are selected.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `config` – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- `rx_bufs` – Buffer array where data to be read will be written to.
- `sig` – A pointer to a valid and ready to be signaled struct *k_poll_signal*. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

Return values

- `frames` – Positive number of frames received in slave mode.
- `0` – If successful
- `-errno` – Negative errno code on failure.

static inline int **spi_write_signal**(const struct *device* *dev, const struct *spi_config* *config, const struct *spi_buf_set* *tx_bufs, struct *k_poll_signal* *sig)

Write the specified amount of data from the SPI driver.

> **Note**
>
> This function is asynchronous.

> **Note**
>
> This function is a helper function calling spi_transceive_signal.

> **Note**
>
> This function is available only if `CONFIG_SPI_ASYNC` and `CONFIG_POLL` are selected.

Parameters

- **dev** – Pointer to the device structure for the driver instance
- **config** – Pointer to a valid *spi_config* structure instance. Pointer-comparison may be used to detect changes from previous operations.
- **tx_bufs** – Buffer array where data to be sent originates from.
- **sig** – A pointer to a valid and ready to be signaled struct *k_poll_signal*. (Note: if NULL this function will not notify the end of the transaction, and whether it went successfully or not).

Return values

- **0** – If successful.
- **-errno** – Negative errno code on failure.

static inline void **spi_iodev_submit**(struct *rtio_iodev_sqe* *iodev_sqe)

Submit a SPI device with a request.

Parameters

- **iodev_sqe** – Prepared submissions queue entry connected to an iodev defined by SPI_IODEV_DEFINE. Must live as long as the request is in flight.

static inline bool **spi_is_ready_iodev**(const struct *rtio_iodev* *spi_iodev)

Validate that SPI bus (and CS gpio if defined) is ready.

Parameters

- **spi_iodev** – SPI iodev defined with SPI_DT_IODEV_DEFINE

Return values

- **true** – if the SPI bus is ready for use.
- **false** – if the SPI bus (or the CS gpio defined) is not ready for use.

static inline int **spi_rtio_copy**(struct *rtio* *r, struct *rtio_iodev* *iodev, const struct *spi_buf_set* *tx_bufs, const struct *spi_buf_set* *rx_bufs, struct *rtio_sqe* **last_sqe)

Copy the tx_bufs and rx_bufs into a set of RTIO requests.

Parameters

- `r` – **[in]** rtio context
- `iodev` – **[in]** iodev to transceive with
- `tx_bufs` – **[in]** transmit buffer set
- `rx_bufs` – **[in]** receive buffer set
- `last_sqe` – **[out]** last sqe submitted, NULL if not enough memory

Return values

- `Number` – of submission queue entries
- `-ENOMEM` – out of memory

int **spi_release**(const struct *device* *dev, const struct *spi_config* *config)

Release the SPI device locked on and/or the CS by the current config.

Note: This synchronous function is used to release either the lock on the SPI device and/or the CS line that was kept if, and if only, given config parameter was the last one to be used (in any of the above functions) and if it has the SPI_LOCK_ON bit set and/or the SPI_HOLD_ON_CS bit set into its operation bits field. This can be used if the caller needs to keep its hand on the SPI device for consecutive transactions and/or if it needs the device to stay selected. Usually both bits will be used along each other, so the the device is locked and stays on until another operation is necessary or until it gets released with the present function.

Parameters

- `dev` – Pointer to the device structure for the driver instance
- `config` – Pointer to a valid *spi_config* structure instance.

Return values

- `0` – If successful.
- `-errno` – Negative errno code on failure.

static inline int **spi_release_dt**(const struct *spi_dt_spec* *spec)

Release the SPI device specified in *spi_dt_spec*.

This is equivalent to:

```
spi_release(spec->bus, &spec->config);
```

Parameters

- `spec` – SPI specification from devicetree

Returns

a value from *spi_release()*.

Variables

const struct *rtio_iodev_api* **spi_iodev_api**

struct **spi_cs_control**

#include <*spi.h*> SPI Chip Select control structure.

This can be used to control a CS line via a GPIO line, instead of using the controller inner CS logic.

Public Members

struct *gpio_dt_spec* **gpio**

GPIO devicetree specification of CS GPIO.

The device pointer can be set to NULL to fully inhibit CS control if necessary. The GPIO flags GPIO_ACTIVE_LOW/GPIO_ACTIVE_HIGH should be equivalent to SPI_CS_ACTIVE_HIGH/SPI_CS_ACTIVE_LOW options in struct *spi_config*.

uint32_t **delay**

Delay in microseconds to wait before starting the transmission and before releasing the CS line.

struct **spi_config**

#include <*spi.h*> SPI controller configuration structure.

Public Members

uint32_t **frequency**

Bus frequency in Hertz.

spi_operation_t **operation**

Operation flags.

It is a bit field with the following parts:

- 0: Master or slave.
- 1..3: Polarity, phase and loop mode.
- 4: LSB or MSB first.
- 5..10: Size of a data frame in bits.
- 11: Full/half duplex.
- 12: Hold on the CS line if possible.
- 13: Keep resource locked for the caller.
- 14: Active high CS logic.
- 15: Motorola or TI frame format (optional).

If `CONFIG_SPI_EXTENDED_MODES` is enabled:

- 16..17: MISO lines (Single/Dual/Quad/Octal).
- 18..31: Reserved for future use.

uint16_t **slave**

Slave number from 0 to host controller slave limit.

struct *spi_cs_control* **cs**

GPIO chip-select line (optional, must be initialized to zero if not used).

struct **spi_dt_spec**

#include <*spi.h*> Complete SPI DT information.

Public Members

const struct *device* *bus
SPI bus.

struct *spi_config* config
Slave specific configuration.

struct spi_buf
#include <*spi.h*> SPI buffer structure.

Public Members

void *buf
Valid pointer to a data buffer, or NULL otherwise.

size_t len
Length of the buffer *buf*.

If *buf* is NULL, length which as to be sent as dummy bytes (as TX buffer) or the length of bytes that should be skipped (as RX buffer).

struct spi_buf_set
#include <*spi.h*> SPI buffer array structure.

Public Members

const struct *spi_buf* *buffers
Pointer to an array of *spi_buf*, or NULL.

size_t count
Length of the array pointed by *buffers*.

struct spi_driver_api
#include <*spi.h*> SPI driver API This is the mandatory API any SPI driver needs to expose.

7.6.46 System Management Bus (SMBus)

- *Overview*
- *SMBus Controller API*
- *Configuration Options*
- *API Reference*

Overview

System Management Bus (SMBus) is derived from I2C for communication with devices on the motherboard. A system may use SMBus to communicate with the peripherals on the motherboard without using dedicated control lines. SMBus peripherals can provide various manufacturer information, report errors, accept control parameters, etc.

Devices on the bus can operate in three roles: as a Controller that initiates transactions and controls the clock, a Peripheral that responds to transaction commands, or a Host, which is a specialized Controller, that provides the main interface to the system's CPU. Zephyr has API for the Controller role.

SMBus peripheral devices can initiate communication with Controller with two methods:

- **Host Notify protocol**: Peripheral device that supports the Host Notify protocol behaves as a Controller to perform the notification. It writes a three-bytes message to a special address "SMBus Host (0x08)" with own address and two bytes of relevant data.
- **SMBALERT# signal**: Peripheral device uses special signal SMBALERT# to request attention from the Controller. The Controller needs to read one byte from the special "SMBus Alert Response Address (ARA) (0x0c)". The peripheral device responds with a data byte containing its own address.

Currently, the API is based on SMBus Specification version 2.0

Note

See *Rule A.2: Inclusive Language* for information about the terminology used in this API.

SMBus Controller API

Zephyr's SMBus controller API is used when an SMBus device controls the bus, particularly the start and stop conditions and the clock. This is the most common mode used to interact with SMBus peripherals.

Configuration Options

Related configuration options:

- `CONFIG_SMBUS`

API Reference

Related code samples

SMBus shell
Interact with SMBus peripherals using shell commands.

group `smbus_interface`

SMBus Interface.

Since
3.4

Version
0.1.0

SMBus read / write direction

enum `smbus_direction`

SMBus read / write direction.

Values:

enumerator `SMBUS_MSG_WRITE` = 0

Write a message to SMBus peripheral.

enumerator `SMBUS_MSG_READ` = 1

Read a message from SMBus peripheral.

SMBus Protocol commands

SMBus Specification defines the following SMBus protocols operations

`SMBUS_CMD_QUICK`

SMBus Quick protocol is a very simple command with no data sent or received.

Peripheral may denote only R/W bit, which can still be used for the peripheral management, for example to switch peripheral On/Off. Quick protocol can also be used for peripheral devices scanning.

```
0                   1
0 1 2 3 4 5 6 7 8 9 0
+-+-+-+-+-+-+-+-+-+-+
|S| Periph Addr |D|A|P|
+-+-+-+-+-+-+-+-+-+-+
```

`SMBUS_CMD_BYTE`

SMBus Byte protocol can send or receive one byte of data.

```
Byte Write

0                   1                   2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|S| Periph Addr |W|A| Command code  |A|P|
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+

Byte Read

0                   1                   2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|S| Periph Addr |R|A| Byte received |N|P|
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

`SMBUS_CMD_BYTE_DATA`

SMBus Byte Data protocol sends the first byte (command) followed by read or write one byte.

```
Byte Data Write

0                   1                   2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

`SMBUS_CMD_PROC_CALL`

SMBus Process Call protocol is Write Word followed by Read Word.

It is named so because the command sends data and waits for the peripheral to return a reply.

```
0                   1                   2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
|S| Periph Addr |W|A|  Command code |A| Data Write Low|A|

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| Data Read Hi  |N|P|
+-+-+-+-+-+-+-+-+-+
```

`SMBUS_CMD_BLOCK`

SMBus Block protocol reads or writes a block of data up to 32 bytes.

The Count byte specifies the amount of data.

```
SMBus Block Write

0                   1                   2
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7

+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

SMBus device functionality

The following parameters describe the functionality of the SMBus device

`SMBUS_MODE_CONTROLLER`

Peripheral to act as Controller.

`SMBUS_MODE_PEC`

Support Packet Error Code (PEC) checking.

`SMBUS_MODE_HOST_NOTIFY`

Support Host Notify functionality.

`SMBUS_MODE_SMBALERT`

Support SMBALERT signal functionality.

SMBus special reserved addresses

The following addresses are reserved by SMBus specification

`SMBUS_ADDRESS_ARA`

Alert Response Address (ARA)

A broadcast address used by the system host as part of the Alert Response Protocol.

Defines

`SMBUS_BLOCK_BYTES_MAX`

Maximum number of bytes in SMBus Block protocol.

`SMBUS_DT_SPEC_GET`(node_id)

Structure initializer for *smbus_dt_spec* from devicetree.

This helper macro expands to a static initializer for a `struct` *smbus_dt_spec* by reading the relevant bus and address data from the devicetree.

Parameters

- **node_id** – Devicetree node identifier for the SMBus device whose struct *smbus_dt_spec* to create an initializer for

`SMBUS_DT_SPEC_INST_GET`(inst)

Structure initializer for *smbus_dt_spec* from devicetree instance.

This is equivalent to *SMBUS_DT_SPEC_GET(DT_DRV_INST(inst))*.

Parameters

- **inst** – Devicetree instance number

`SMBUS_DEVICE_DT_DEFINE`(node_id, init_fn, pm_device, data_ptr, cfg_ptr, level, prio, api_ptr, ...)

Like *DEVICE_DT_DEFINE()* with SMBus specifics.

Defines a device which implements the SMBus API. May generate a custom *device_state* container struct and init_fn wrapper when needed depending on SMBus `CONFIG_SMBUS_STATS`.

Parameters

- **node_id** – The devicetree node identifier.
- **init_fn** – Name of the init function of the driver.
- **pm_device** – PM device resources reference (NULL if device does not use PM).
- **data_ptr** – Pointer to the device's private data.
- **cfg_ptr** – The address to the structure containing the configuration information for this instance of the driver.
- **level** – The initialization level. See SYS_INIT() for details.
- **prio** – Priority within the selected initialization level. See SYS_INIT() for details.
- **api_ptr** – Provides an initial pointer to the API function struct used by the driver. Can be NULL.

SMBUS_DEVICE_DT_INST_DEFINE(inst, ...)

Like *SMBUS_DEVICE_DT_DEFINE()* for an instance of a DT_DRV_COMPAT compatible.

Parameters

- **inst** – instance number. This is replaced by DT_DRV_COMPAT(inst) in the call to *SMBUS_DEVICE_DT_DEFINE()*.
- ... – other parameters as expected by *SMBUS_DEVICE_DT_DEFINE()*.

Typedefs

typedef void (***smbus_callback_handler_t**)(const struct *device* *dev, struct *smbus_callback* *cb, uint8_t addr)

Define SMBus callback handler function signature.

Param dev
Pointer to the device structure for the SMBus driver instance.

Param cb
Structure *smbus_callback* owning this handler.

Param addr
Address of the SMBus peripheral device.

Functions

static inline void **smbus_xfer_stats**(const struct *device* *dev, uint8_t sent, uint8_t recv)

Updates the SMBus stats.

Parameters

- **dev** – Pointer to the device structure for the SMBus driver instance to update stats for.
- **sent** – Number of bytes sent
- **recv** – Number of bytes received

int **smbus_configure**(const struct *device* *dev, uint32_t dev_config)

Configure operation of a SMBus host controller.

Parameters

- **dev** – Pointer to the device structure for the SMBus driver instance.
- **dev_config** – Bit-packed 32-bit value to the device runtime configuration for the SMBus controller.

Return values

- **0** – If successful.
- **-EIO** – General input / output error.

int **smbus_get_config**(const struct *device* *dev, uint32_t *dev_config)

Get configuration of a SMBus host controller.

This routine provides a way to get current configuration. It is allowed to call the function before smbus_configure, because some SMBus ports can be configured during init process. However, if the SMBus port is not configured, smbus_get_config returns an error.

smbus_get_config can return cached config or probe hardware, but it has to be up to date with current configuration.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `dev_config` – Pointer to return bit-packed 32-bit value of the SMBus controller configuration.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_get_config()* is not implemented by the driver.

static inline int **smbus_smbalert_set_cb**(const struct *device* *dev, struct *smbus_callback* *cb)

Add SMBUSALERT callback for a SMBus host controller.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_smbalert_set_cb()* is not implemented by the driver.

int **smbus_smbalert_remove_cb**(const struct *device* *dev, struct *smbus_callback* *cb)

Remove SMBUSALERT callback from a SMBus host controller.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_smbalert_remove_cb()* is not implemented by the driver.

static inline int **smbus_host_notify_set_cb**(const struct *device* *dev, struct *smbus_callback* *cb)

Add Host Notify callback for a SMBus host controller.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_host_notify_set_cb()* is not implemented by the driver.

int `smbus_host_notify_remove_cb`(const struct *device* *dev, struct *smbus_callback* *cb)

Remove Host Notify callback from a SMBus host controller.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `cb` – Pointer to a callback structure.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_host_notify_remove_cb()* is not implemented by the driver.

int `smbus_quick`(const struct *device* *dev, uint16_t addr, enum *smbus_direction* direction)

Perform SMBus Quick operation.

This routine provides a generic interface to perform SMBus Quick operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance. driver configured in controller mode.
- `addr` – Address of the SMBus peripheral device.
- `direction` – Direction Read or Write.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_quick()* is not implemented by the driver.

int `smbus_byte_write`(const struct *device* *dev, uint16_t addr, uint8_t byte)

Perform SMBus Byte Write operation.

This routine provides a generic interface to perform SMBus Byte Write operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `byte` – Byte to be sent to the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_byte_write()* is not implemented by the driver.

int `smbus_byte_read`(const struct *device* *dev, uint16_t addr, uint8_t *byte)

Perform SMBus Byte Read operation.

This routine provides a generic interface to perform SMBus Byte Read operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `byte` – Byte received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_byte_read()* is not implemented by the driver.

int `smbus_byte_data_write`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint8_t byte)

Perform SMBus Byte Data Write operation.

This routine provides a generic interface to perform SMBus Byte Data Write operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `byte` – Byte to be sent to the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_byte_data_write()* is not implemented by the driver.

int `smbus_byte_data_read`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint8_t *byte)

Perform SMBus Byte Data Read operation.

This routine provides a generic interface to perform SMBus Byte Data Read operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `byte` – Byte received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_byte_data_read()* is not implemented by the driver.

int `smbus_word_data_write`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint16_t word)

Perform SMBus Word Data Write operation.

This routine provides a generic interface to perform SMBus Word Data Write operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.

- `word` – Word (16-bit) to be sent to the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_word_data_write()* is not implemented by the driver.

int `smbus_word_data_read`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint16_t *word)

Perform SMBus Word Data Read operation.

This routine provides a generic interface to perform SMBus Word Data Read operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `word` – Word (16-bit) received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_word_data_read()* is not implemented by the driver.

int `smbus_pcall`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint16_t send_word, uint16_t *recv_word)

Perform SMBus Process Call operation.

This routine provides a generic interface to perform SMBus Process Call operation, which means Write 2 bytes following by Read 2 bytes.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `send_word` – Word (16-bit) to be sent to the peripheral device.
- `recv_word` – Word (16-bit) received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_pcall()* is not implemented by the driver.

int `smbus_block_write`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint8_t count, uint8_t *buf)

Perform SMBus Block Write operation.

This routine provides a generic interface to perform SMBus Block Write operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.

- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `count` – Size of the data block buffer. Maximum 32 bytes.
- `buf` – Data block buffer to be sent to the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_block_write()* is not implemented by the driver.

int `smbus_block_read`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint8_t *count, uint8_t *buf)

Perform SMBus Block Read operation.

This routine provides a generic interface to perform SMBus Block Read operation.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `count` – Size of the data peripheral sent. Maximum 32 bytes.
- `buf` – Data block buffer received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.
- `-ENOSYS` – If function *smbus_block_read()* is not implemented by the driver.

int `smbus_block_pcall`(const struct *device* *dev, uint16_t addr, uint8_t cmd, uint8_t snd_count, uint8_t *snd_buf, uint8_t *rcv_count, uint8_t *rcv_buf)

Perform SMBus Block Process Call operation.

This routine provides a generic interface to perform SMBus Block Process Call operation. This operation is basically Block Write followed by Block Read.

Parameters

- `dev` – Pointer to the device structure for the SMBus driver instance.
- `addr` – Address of the SMBus peripheral device.
- `cmd` – Command byte which is sent to peripheral device first.
- `snd_count` – Size of the data block buffer to send.
- `snd_buf` – Data block buffer send to the peripheral device.
- `rcv_count` – Size of the data peripheral sent.
- `rcv_buf` – Data block buffer received from the peripheral device.

Return values

- `0` – If successful.
- `-EIO` – General input / output error.

- `-ENOSYS` – If function *smbus_block_pcall()* is not implemented by the driver.

struct `smbus_callback`

#include <*smbus.h*> SMBus callback structure.

Used to register a callback in the driver instance callback list. As many callbacks as needed can be added as long as each of them is a unique pointer of struct *smbus_callback*.

Note: Such struct should not be allocated on stack.

Public Members

sys_snode_t `node`

This should be used in driver for a callback list management.

smbus_callback_handler_t `handler`

Actual callback function being called when relevant.

uint8_t `addr`

Peripheral device address.

struct `smbus_dt_spec`

#include <*smbus.h*> Complete SMBus DT information.

Public Members

const struct *device* *`bus`

SMBus bus.

uint16_t `addr`

Address of the SMBus peripheral device.

7.6.47 Universal Asynchronous Receiver-Transmitter (UART)

Overview

Zephyr provides three different ways to access the UART peripheral. Depending on the method, different API functions are used according to below sections:

1. *Polling API*
2. *Interrupt-driven API*
3. *Asynchronous API* using *Direct Memory Access (DMA)*

Polling is the most basic method to access the UART peripheral. The reading function, *uart_poll_in*, is a non-blocking function and returns a character or *-1* when no valid data is available. The writing function, *uart_poll_out*, is a blocking function and the thread waits until the given character is sent.

With the Interrupt-driven API, possibly slow communication can happen in the background while the thread continues with other tasks. The Kernel's *Data Passing* features can be used to communicate between the thread and the UART driver.

The Asynchronous API allows to read and write data in the background using DMA without interrupting the MCU at all. However, the setup is more complex than the other methods.

Warning

Interrupt-driven API and the Asynchronous API should NOT be used at the same time for the same hardware peripheral, since both APIs require hardware interrupts to function properly. Using the callbacks for both APIs would result in interference between each other. `CONFIG_UART_EXCLUSIVE_API_CALLBACKS` is enabled by default so that only the callbacks associated with one API is active at a time.

Configuration Options

Most importantly, the Kconfig options define whether the polling API (default), the interrupt-driven API or the asynchronous API can be used. Only enable the features you need in order to minimize memory footprint.

Related configuration options:

- `CONFIG_SERIAL`
- `CONFIG_UART_INTERRUPT_DRIVEN`
- `CONFIG_UART_ASYNC_API`
- `CONFIG_UART_WIDE_DATA`
- `CONFIG_UART_USE_RUNTIME_CONFIGURE`
- `CONFIG_UART_LINE_CTRL`
- `CONFIG_UART_DRV_CMD`

Enums

enum `uart_line_ctrl`

Line control signals.

Values:

enumerator `UART_LINE_CTRL_BAUD_RATE` = *BIT*(0)

Baud rate.

enumerator `UART_LINE_CTRL_RTS` = *BIT*(1)

Request To Send (RTS)

enumerator `UART_LINE_CTRL_DTR` = *BIT*(2)

Data Terminal Ready (DTR)

enumerator `UART_LINE_CTRL_DCD` = *BIT*(3)

Data Carrier Detect (DCD)

enumerator `UART_LINE_CTRL_DSR` = *BIT*(4)

Data Set Ready (DSR)

enum `uart_rx_stop_reason`

Reception stop reasons.

Values that correspond to events or errors responsible for stopping receiving.

Values:

enumerator `UART_ERROR_OVERRUN` = (1 « 0)

Overrun error.

enumerator `UART_ERROR_PARITY` = (1 « 1)

Parity error.

enumerator `UART_ERROR_FRAMING` = (1 « 2)

Framing error.

enumerator `UART_BREAK` = (1 « 3)

Break interrupt.

A break interrupt was received. This happens when the serial input is held at a logic '0' state for longer than the sum of start time + data bits + parity + stop bits.

enumerator UART_ERROR_COLLISION = (1 « 4)

Collision error.

This error is raised when transmitted data does not match received data. Typically this is useful in scenarios where the TX and RX lines maybe connected together such as RS-485 half-duplex. This error is only valid on UARTs that support collision checking.

enumerator UART_ERROR_NOISE = (1 « 5)

Noise error.

enum uart_config_parity

Parity modes.

Values:

enumerator UART_CFG_PARITY_NONE

No parity.

enumerator UART_CFG_PARITY_ODD

Odd parity.

enumerator UART_CFG_PARITY_EVEN

Even parity.

enumerator UART_CFG_PARITY_MARK

Mark parity.

enumerator UART_CFG_PARITY_SPACE

Space parity.

enum uart_config_stop_bits

Number of stop bits.

Values:

enumerator UART_CFG_STOP_BITS_0_5

0.5 stop bit

enumerator UART_CFG_STOP_BITS_1

1 stop bit

enumerator UART_CFG_STOP_BITS_1_5

1.5 stop bits

enumerator UART_CFG_STOP_BITS_2

2 stop bits

enum uart_config_data_bits

Number of data bits.

Values:

enumerator UART_CFG_DATA_BITS_5
5 data bits

enumerator UART_CFG_DATA_BITS_6
6 data bits

enumerator UART_CFG_DATA_BITS_7
7 data bits

enumerator UART_CFG_DATA_BITS_8
8 data bits

enumerator UART_CFG_DATA_BITS_9
9 data bits

enum uart_config_flow_control
Hardware flow control options.

With flow control set to none, any operations related to flow control signals can be managed by user with uart_line_ctrl functions. In other cases, flow control is managed by hardware/driver.

Values:

enumerator UART_CFG_FLOW_CTRL_NONE
No flow control.

enumerator UART_CFG_FLOW_CTRL_RTS_CTS
RTS/CTS flow control.

enumerator UART_CFG_FLOW_CTRL_DTR_DSR
DTR/DSR flow control.

enumerator UART_CFG_FLOW_CTRL_RS485
RS485 flow control.

Functions

int uart_err_check(const struct *device* *dev)
Check whether an error was detected.

Parameters

- dev – UART device instance.

Return values

- 0 – If no error was detected.
- err – Error flags as defined in *uart_rx_stop_reason*
- -ENOSYS – If not implemented.

int `uart_configure`(const struct *device* *dev, const struct *uart_config* *cfg)

Set UART configuration.

Sets UART configuration using data from *cfg.

Parameters

- `dev` – UART device instance.
- `cfg` – UART configuration structure.

Return values

- `0` – If successful.
- `-errno` – Negative errno code in case of failure.
- `-ENOSYS` – If configuration is not supported by device or driver does not support setting configuration in runtime.
- `-ENOTSUP` – If API is not enabled.

int `uart_config_get`(const struct *device* *dev, struct *uart_config* *cfg)

Get UART configuration.

Stores current UART configuration to *cfg, can be used to retrieve initial configuration after device was initialized using data from DTS.

Parameters

- `dev` – UART device instance.
- `cfg` – UART configuration structure.

Return values

- `0` – If successful.
- `-errno` – Negative errno code in case of failure.
- `-ENOSYS` – If driver does not support getting current configuration.
- `-ENOTSUP` – If API is not enabled.

int `uart_line_ctrl_set`(const struct *device* *dev, uint32_t ctrl, uint32_t val)

Manipulate line control for UART.

Parameters

- `dev` – UART device instance.
- `ctrl` – The line control to manipulate (see enum uart_line_ctrl).
- `val` – Value to set to the line control.

Return values

- `0` – If successful.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.
- `-errno` – Other negative errno value in case of failure.

int `uart_line_ctrl_get`(const struct *device* *dev, uint32_t ctrl, uint32_t *val)

Retrieve line control for UART.

Parameters

- `dev` – UART device instance.
- `ctrl` – The line control to retrieve (see enum uart_line_ctrl).

- `val` – Pointer to variable where to store the line control value.

Return values

- `0` – If successful.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.
- `-errno` – Other negative errno value in case of failure.

int `uart_drv_cmd`(const struct *device* *dev, uint32_t cmd, uint32_t p)

Send extra command to driver.

Implementation and accepted commands are driver specific. Refer to the drivers for more information.

Parameters

- `dev` – UART device instance.
- `cmd` – Command to driver.
- `p` – Parameter to the command.

Return values

- `0` – If successful.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.
- `-errno` – Other negative errno value in case of failure.

struct `uart_config`

#include <*uart.h*> UART controller configuration structure.

Public Members

uint32_t `baudrate`

Baudrate setting in bps.

uint8_t `parity`

Parity bit, use *uart_config_parity*.

uint8_t `stop_bits`

Stop bits, use *uart_config_stop_bits*.

uint8_t `data_bits`

Data bits, use *uart_config_data_bits*.

uint8_t `flow_ctrl`

Flow control setting, use *uart_config_flow_control*.

Polling API

group `uart_polling`

Functions

int `uart_poll_in`(const struct *device* *dev, unsigned char *p_char)

Read a character from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it reads a character from the device, stores to the location pointed to by p_char, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

Parameters

- `dev` – UART device instance.
- `p_char` – Pointer to character.

Return values

- `0` – If a character arrived.
- `-1` – If no character was available to read (i.e. the UART input buffer was empty).
- `-ENOSYS` – If the operation is not implemented.
- `-EBUSY` – If async reception was enabled using *uart_rx_enable*

int `uart_poll_in_u16`(const struct *device* *dev, uint16_t *p_u16)

Read a 16-bit datum from the device for input.

This routine checks if the receiver has valid data. When the receiver has valid data, it reads a 16-bit datum from the device, stores to the location pointed to by p_u16, and returns 0 to the calling thread. It returns -1, otherwise. This function is a non-blocking call.

Parameters

- `dev` – UART device instance.
- `p_u16` – Pointer to 16-bit data.

Return values

- `0` – If data arrived.
- `-1` – If no data was available to read (i.e., the UART input buffer was empty).
- `-ENOTSUP` – If API is not enabled.
- `-ENOSYS` – If the function is not implemented.
- `-EBUSY` – If async reception was enabled using *uart_rx_enable*

void `uart_poll_out`(const struct *device* *dev, unsigned char out_char)

Write a character to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes a character to the data register. It waits and blocks the calling thread, otherwise. This function is a blocking call.

To send a character when hardware flow control is enabled, the handshake signal CTS must be asserted.

Parameters

- `dev` – UART device instance.
- `out_char` – Character to send.

void `uart_poll_out_u16`(const struct *device* *dev, uint16_t out_u16)

Write a 16-bit datum to the device for output.

This routine checks if the transmitter is full. When the transmitter is not full, it writes a 16-bit datum to the data register. It waits and blocks the calling thread, otherwise. This function is a blocking call.

To send a datum when hardware flow control is enabled, the handshake signal CTS must be asserted.

Parameters

- `dev` – UART device instance.
- `out_u16` – Wide data to send.

Interrupt-driven API

group `uart_interrupt`

Typedefs

typedef void (*`uart_irq_callback_user_data_t`)(const struct *device* *dev, void *user_data)

Define the application callback function signature for *uart_irq_callback_user_data_set()* function.

Param dev
UART device instance.

Param user_data
Arbitrary user data.

typedef void (*`uart_irq_config_func_t`)(const struct *device* *dev)

For configuring IRQ on each individual UART device.

Param dev
UART device instance.

Functions

static inline int `uart_fifo_fill`(const struct *device* *dev, const uint8_t *tx_data, int size)

Fill FIFO with data.

This function is expected to be called from UART interrupt handler (ISR), if *uart_irq_tx_ready()* returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, *not* calling this function from an ISR if *uart_irq_tx_ready()* returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

Parameters

- `dev` – UART device instance.
- `tx_data` – Data to transmit.
- `size` – Number of bytes to send.

Return values

- `-ENOSYS` – if this function is not supported
- `-ENOTSUP` – If API is not enabled.

Returns
Number of bytes sent.

static inline int `uart_fifo_fill_u16`(const struct *device* *dev, const uint16_t *tx_data, int size)

Fill FIFO with wide data.

This function is expected to be called from UART interrupt handler (ISR), if *uart_irq_tx_ready()* returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). Likewise, *not* calling this function from an ISR if *uart_irq_tx_ready()* returns true may lead to undefined behavior, e.g. infinite interrupt loops. It's mandatory to test return value of this function, as different hardware has different FIFO depth (oftentimes just 1).

Parameters

- `dev` – UART device instance.
- `tx_data` – Wide data to transmit.
- `size` – Number of datum to send.

Return values

- `-ENOSYS` – If this function is not implemented
- `-ENOTSUP` – If API is not enabled.

Returns
Number of datum sent.

static inline int `uart_fifo_read`(const struct *device* *dev, uint8_t *rx_data, const int size)

Read data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if *uart_irq_rx_ready()* returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It's unspecified whether "RX ready" condition as returned by *uart_irq_rx_ready()* is level- or edge- triggered. That means that once *uart_irq_rx_ready()* is detected, *uart_fifo_read()* must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

Parameters

- `dev` – UART device instance.
- `rx_data` – Data container.
- `size` – Container size.

Return values

- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

Returns
Number of bytes read.

static inline int `uart_fifo_read_u16`(const struct *device* *dev, uint16_t *rx_data, const int size)

Read wide data from FIFO.

This function is expected to be called from UART interrupt handler (ISR), if *uart_irq_rx_ready()* returns true. Result of calling this function not from an ISR is undefined (hardware-dependent). It's unspecified whether "RX ready" condition as

returned by *uart_irq_rx_ready()* is level- or edge- triggered. That means that once *uart_irq_rx_ready()* is detected, *uart_fifo_read()* must be called until it reads all available data in the FIFO (i.e. until it returns less data than was requested).

Parameters

- `dev` – UART device instance.
- `rx_data` – Wide data container.
- `size` – Container size.

Return values

- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

Returns
Number of datum read.

void `uart_irq_tx_enable`(const struct *device* *dev)

Enable TX interrupt in IER.

Parameters

- `dev` – UART device instance.

void `uart_irq_tx_disable`(const struct *device* *dev)

Disable TX interrupt in IER.

Parameters

- `dev` – UART device instance.

static inline int `uart_irq_tx_ready`(const struct *device* *dev)

Check if UART TX buffer can accept a new char.

Check if UART TX buffer can accept at least one character for transmission (i.e. *uart_fifo_fill()* will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, *uart_irq_update()* must be called once per the handler invocation.

Parameters

- `dev` – UART device instance.

Return values

- `1` – If TX interrupt is enabled and at least one char can be written to UART.
- `0` – If device is not ready to write a new byte.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

void `uart_irq_rx_enable`(const struct *device* *dev)

Enable RX interrupt.

Parameters

- `dev` – UART device instance.

void `uart_irq_rx_disable`(const struct *device* *dev)

Disable RX interrupt.

Parameters

- `dev` – UART device instance.

static inline int **uart_irq_tx_complete**(const struct *device* *dev)

Check if UART TX block finished transmission.

Check if any outgoing data buffered in UART TX block was fully transmitted and TX block is idle. When this condition is true, UART device (or whole system) can be power off. Note that this function is *not* useful to check if UART TX can accept more data, use *uart_irq_tx_ready()* for that. This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, *uart_irq_update()* must be called once per the handler invocation.

Parameters

- **dev** – UART device instance.

Return values

- **1** – If nothing remains to be transmitted.
- **0** – If transmission is not completed.
- **-ENOSYS** – If this function is not implemented.
- **-ENOTSUP** – If API is not enabled.

static inline int **uart_irq_rx_ready**(const struct *device* *dev)

Check if UART RX buffer has a received char.

Check if UART RX buffer has at least one pending character (i.e. *uart_fifo_read()* will succeed and return non-zero). This function must be called in a UART interrupt handler, or its result is undefined. Before calling this function in the interrupt handler, *uart_irq_update()* must be called once per the handler invocation. It's unspecified whether condition as returned by this function is level- or edge- triggered (i.e. if this function returns true when RX FIFO is non-empty, or when a new char was received since last call to it). See description of *uart_fifo_read()* for implication of this.

Parameters

- **dev** – UART device instance.

Return values

- **1** – If a received char is ready.
- **0** – If a received char is not ready.
- **-ENOSYS** – If this function is not implemented.
- **-ENOTSUP** – If API is not enabled.

void **uart_irq_err_enable**(const struct *device* *dev)

Enable error interrupt.

Parameters

- **dev** – UART device instance.

void **uart_irq_err_disable**(const struct *device* *dev)

Disable error interrupt.

Parameters

- **dev** – UART device instance.

int **uart_irq_is_pending**(const struct *device* *dev)

Check if any IRQs is pending.

Parameters

- **dev** – UART device instance.

Return values

- `1` – If an IRQ is pending.
- `0` – If an IRQ is not pending.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

int `uart_irq_update`(const struct *device* *dev)

Start processing interrupts in ISR.

This function should be called the first thing in the ISR. Calling *uart_irq_rx_ready()*, *uart_irq_tx_ready()*, *uart_irq_tx_complete()* allowed only after this.

The purpose of this function is:

- For devices with auto-acknowledge of interrupt status on register read to cache the value of this register (rx_ready, etc. then use this case).
- For devices with explicit acknowledgment of interrupts, to ack any pending interrupts and likewise to cache the original value.
- For devices with implicit acknowledgment, this function will be empty. But the ISR must perform the actions needs to ack the interrupts (usually, call *uart_fifo_read()* on rx_ready, and *uart_fifo_fill()* on tx_ready).

Parameters

- `dev` – UART device instance.

Return values

- `1` – On success.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

static inline int `uart_irq_callback_user_data_set`(const struct *device* *dev, *uart_irq_callback_user_data_t* cb, void *user_data)

Set the IRQ callback function pointer.

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with specified user data. See description of *uart_irq_update()* for the requirements on ISR.

Parameters

- `dev` – UART device instance.
- `cb` – Pointer to the callback function.
- `user_data` – Data to pass to callback function.

Return values

- `0` – On success.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

static inline int **uart_irq_callback_set**(const struct *device* *dev,
uart_irq_callback_user_data_t cb)

Set the IRQ callback function pointer (legacy).

This sets up the callback for IRQ. When an IRQ is triggered, the specified function will be called with the device pointer.

Parameters

- `dev` – UART device instance.
- `cb` – Pointer to the callback function.

Return values

- `0` – On success.
- `-ENOSYS` – If this function is not implemented.
- `-ENOTSUP` – If API is not enabled.

Asynchronous API

group `uart_async`

Since
1.14

Version
0.8.0

Typedefs

typedef void (***uart_callback_t**)(const struct *device* *dev, struct *uart_event* *evt, void *user_data)

Define the application callback function signature for *uart_callback_set()* function.

Param dev
UART device instance.

Param evt
Pointer to *uart_event* instance.

Param user_data
Pointer to data specified by user.

Enums

enum **uart_event_type**

Types of events passed to callback in UART_ASYNC_API.

Receiving:

a. To start receiving, uart_rx_enable has to be called with first buffer

b. When receiving starts to current buffer, *UART_RX_BUF_REQUEST* will be generated, in response to that user can either:

- Provide second buffer using uart_rx_buf_rsp, when first buffer is filled, receiving will automatically start to second buffer.

- Ignore the event, this way when current buffer is filled *UART_RX_RDY* event will be generated and receiving will be stopped.

c. If some data was received and timeout occurred *UART_RX_RDY* event will be generated. It can happen multiples times for the same buffer. RX timeout is counted from last byte received i.e. if no data was received, there won't be any timeout event.

d. *UART_RX_BUF_RELEASED* event will be generated when the current buffer is no longer used by the driver. It will immediately follow *UART_RX_RDY* event. Depending on the implementation buffer may be released when it is completely or partially filled.

e. If there was second buffer provided, it will become current buffer and we start again at point 2. If no second buffer was specified receiving is stopped and *UART_RX_DISABLED* event is generated. After that whole process can be repeated.

Any time during reception *UART_RX_STOPPED* event can occur. if there is any data received, *UART_RX_RDY* event will be generated. It will be followed by *UART_RX_BUF_RELEASED* event for every buffer currently passed to driver and finally by *UART_RX_DISABLED* event.

Receiving can be disabled using uart_rx_disable, after calling that function, if there is any data received, *UART_RX_RDY* event will be generated. *UART_RX_BUF_RELEASED* event will be generated for every buffer currently passed to driver and finally *UART_RX_DISABLED* event will occur.

Transmitting:

a. Transmitting starts by uart_tx function.

b. If whole buffer was transmitted *UART_TX_DONE* is generated. If timeout occurred *UART_TX_ABORTED* will be generated.

Transmitting can be aborted using *uart_tx_abort*, after calling that function *UART_TX_ABORTED* event will be generated.

Values:

enumerator `UART_TX_DONE`

Whole TX buffer was transmitted.

enumerator `UART_TX_ABORTED`

Transmitting aborted due to timeout or uart_tx_abort call.

When flow control is enabled, there is a possibility that TX transfer won't finish in the allotted time. Some data may have been transferred, information about it can be found in event data.

enumerator `UART_RX_RDY`

Received data is ready for processing.

This event is generated in the following cases:
- When RX timeout occurred, and data was stored in provided buffer. This can happen multiple times in the same buffer.
- When provided buffer is full.
- After *uart_rx_disable()*.
- After stopping due to external event (*UART_RX_STOPPED*).

enumerator `UART_RX_BUF_REQUEST`

Driver requests next buffer for continuous reception.

This event is triggered when receiving has started for a new buffer, i.e. it's time to provide a next buffer for a seamless switchover to it. For continuous reliable receiving, user should provide another RX buffer in response to this event, using uart_rx_buf_rsp function

If uart_rx_buf_rsp is not called before current buffer is filled up, receiving will stop.

enumerator `UART_RX_BUF_RELEASED`

Buffer is no longer used by UART driver.

enumerator `UART_RX_DISABLED`

RX has been disabled and can be reenabled.

This event is generated whenever receiver has been stopped, disabled or finished its operation and can be enabled again using uart_rx_enable

enumerator `UART_RX_STOPPED`

RX has stopped due to external event.

Reason is one of uart_rx_stop_reason.

Functions

static inline int **uart_callback_set**(const struct *device* *dev, *uart_callback_t* callback, void *user_data)

Set event handler function.

Since it is mandatory to set callback to use other asynchronous functions, it can be used to detect if the device supports asynchronous API. Remaining API does not have that detection.

Parameters

- `dev` – UART device instance.
- `callback` – Event handler.
- `user_data` – Data to pass to event handler function.

Return values

- `0` – If successful.
- `-ENOSYS` – If not supported by the device.
- `-ENOTSUP` – If API not enabled.

int **uart_tx**(const struct *device* *dev, const uint8_t *buf, size_t len, int32_t timeout)

Send given number of bytes from buffer through UART.

Function returns immediately and event handler, set using *uart_callback_set*, is called after transfer is finished.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to transmit buffer.
- `len` – Length of transmit buffer.
- `timeout` – Timeout in microseconds. Valid only if flow control is enabled. SYS_FOREVER_US disables timeout.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – If There is already an ongoing transfer.
- `-errno` – Other negative errno value in case of failure.

int `uart_tx_u16`(const struct *device* *dev, const uint16_t *buf, size_t len, int32_t timeout)

Send given number of datum from buffer through UART.

Function returns immediately and event handler, set using *uart_callback_set*, is called after transfer is finished.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to wide data transmit buffer.
- `len` – Length of wide data transmit buffer.
- `timeout` – Timeout in milliseconds. Valid only if flow control is enabled. SYS_FOREVER_MS disables timeout.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – If there is already an ongoing transfer.
- `-errno` – Other negative errno value in case of failure.

int `uart_tx_abort`(const struct *device* *dev)

Abort current TX transmission.

UART_TX_DONE event will be generated with amount of data sent.

Parameters

- `dev` – UART device instance.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EFAULT` – There is no active transmission.
- `-errno` – Other negative errno value in case of failure.

int `uart_rx_enable`(const struct *device* *dev, uint8_t *buf, size_t len, int32_t timeout)

Start receiving data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using *uart_callback_set*, is called with *UART_RX_RDY* or *UART_RX_BUF_REQUEST* events.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to receive buffer.
- `len` – Buffer length.
- `timeout` – Inactivity period after receiving at least a byte which triggers *UART_RX_RDY* event. Given in microseconds. SYS_FOREVER_US disables timeout. See *uart_event_type* for details.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – RX already in progress.
- `-errno` – Other negative errno value in case of failure.

int `uart_rx_enable_u16`(const struct *device* *dev, uint16_t *buf, size_t len, int32_t timeout)

Start receiving wide data through UART.

Function sets given buffer as first buffer for receiving and returns immediately. After that event handler, set using *uart_callback_set*, is called with *UART_RX_RDY* or *UART_RX_BUF_REQUEST* events.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to wide data receive buffer.
- `len` – Buffer length.
- `timeout` – Inactivity period after receiving at least a byte which triggers *UART_RX_RDY* event. Given in milliseconds. SYS_FOREVER_MS disables timeout. See *uart_event_type* for details.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – RX already in progress.
- `-errno` – Other negative errno value in case of failure.

static inline int `uart_rx_buf_rsp`(const struct *device* *dev, uint8_t *buf, size_t len)

Provide receive buffer in response to *UART_RX_BUF_REQUEST* event.

Provide pointer to RX buffer, which will be used when current buffer is filled.

Note

Providing buffer that is already in usage by driver leads to undefined behavior. Buffer can be reused when it has been released by driver.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to receive buffer.
- `len` – Buffer length.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EBUSY` – Next buffer already set.
- `-EACCES` – Receiver is already disabled (function called too late?).
- `-errno` – Other negative errno value in case of failure.

static inline int **uart_rx_buf_rsp_u16**(const struct *device* *dev, uint16_t *buf, size_t len)

Provide wide data receive buffer in response to *UART_RX_BUF_REQUEST* event.

Provide pointer to RX buffer, which will be used when current buffer is filled.

> **Note**
>
> Providing buffer that is already in usage by driver leads to undefined behavior. Buffer can be reused when it has been released by driver.

Parameters

- `dev` – UART device instance.
- `buf` – Pointer to wide data receive buffer.
- `len` – Buffer length.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled
- `-EBUSY` – Next buffer already set.
- `-EACCES` – Receiver is already disabled (function called too late?).
- `-errno` – Other negative errno value in case of failure.

int **uart_rx_disable**(const struct *device* *dev)

Disable RX.

UART_RX_BUF_RELEASED event will be generated for every buffer scheduled, after that *UART_RX_DISABLED* event will be generated. Additionally, if there is any pending received data, the *UART_RX_RDY* event for that data will be generated before the *UART_RX_BUF_RELEASED* events.

Parameters

- `dev` – UART device instance.

Return values

- `0` – If successful.
- `-ENOTSUP` – If API is not enabled.
- `-EFAULT` – There is no active reception.
- `-errno` – Other negative errno value in case of failure.

struct **uart_event_tx**

#include <uart.h> UART TX event data.

Public Members

const uint8_t ***buf**

Pointer to current buffer.

size_t **len**

Number of bytes sent.

struct `uart_event_rx`

#include <*uart.h*> UART RX event data.

The data represented by the event is stored in rx.buf[rx.offset] to rx.buf[rx.offset+rx.len]. That is, the length is relative to the offset.

Public Members

uint8_t *`buf`

Pointer to current buffer.

size_t `offset`

Currently received data offset in bytes.

size_t `len`

Number of new bytes received.

struct `uart_event_rx_buf`

#include <*uart.h*> UART RX buffer released event data.

Public Members

uint8_t *`buf`

Pointer to buffer that is no longer in use.

struct `uart_event_rx_stop`

#include <*uart.h*> UART RX stopped data.

Public Members

enum *uart_rx_stop_reason* `reason`

Reason why receiving stopped.

struct *uart_event_rx* `data`

Last received data.

struct `uart_event`

#include <*uart.h*> Structure containing information about current event.

Public Members

enum *uart_event_type* `type`

Type of event.

union `uart_event_data`

#include <*uart.h*> Event data.

Public Members

struct *uart_event_tx* **tx**
UART_TX_DONE and *UART_TX_ABORTED* events data.

struct *uart_event_rx* **rx**
UART_RX_RDY event data.

struct *uart_event_rx_buf* **rx_buf**
UART_RX_BUF_RELEASED event data.

struct *uart_event_rx_stop* **rx_stop**
UART_RX_STOPPED event data.

7.6.48 USB-C VBUS

Overview

USB-C VBUS is the line in a USB Type-C connection that delivers power from a Source to a Sink device.

USB-C VBUS API The USB-C VBUS device driver presents an API that's used to control and measure VBUS.

Configuration Options

Related configuration options:

- `CONFIG_USBC_VBUS_DRIVER`

API Reference

group **usbc_vbus_api**
USB-C VBUS API.

Since
3.3

Version
0.1.0

Functions

static inline bool **usbc_vbus_check_level**(const struct *device* *dev, enum *tc_vbus_level* level)
Checks if VBUS is at a particular level.

Parameters

- `dev` – Runtime device structure
- `level` – The level voltage to check against

Return values

- `true` – if VBUS is at the level voltage
- `false` – if VBUS is not at that level voltage

static inline int `usbc_vbus_measure`(const struct *device* *dev, int *meas)

Reads and returns VBUS measured in mV.

Parameters

- `dev` – Runtime device structure
- `meas` – pointer where the measured VBUS voltage is stored

Return values

- `0` – on success
- `-EIO` – on failure

static inline int `usbc_vbus_discharge`(const struct *device* *dev, bool enable)

Controls a pin that discharges VBUS.

Parameters

- `dev` – Runtime device structure
- `enable` – Discharge VBUS when true

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOENT` – if discharge pin isn't defined

static inline int `usbc_vbus_enable`(const struct *device* *dev, bool enable)

Controls a pin that enables VBUS measurements.

Parameters

- `dev` – Runtime device structure
- `enable` – enable VBUS measurements when true

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOENT` – if enable pin isn't defined

struct `usbc_vbus_driver_api`

#include <usbc_vbus.h>

7.6.49 USB Type-C Port Controller (TCPC)

Overview

TCPC (USB Type-C Port Controller) The TCPC is a device used to simplify the implementation of a USB-C system by providing the following three function:

- VBUS and VCONN control USB Type-C: The TCPC may provide a Source device, the mechanism to control VBUS sourcing, and a Sink device, the mechanism to control VBUS sinking. A similar mechanism is provided for the control of VCONN.
- CC control and sensing: The TCPC implements logic for controlling the CC pin pull-up and pull-down resistors. It also provides a way to sense and report what resistors are present on the CC pin.
- Power Delivery message reception and transmission USB Power Delivery: The TCPC sends and receives messages constructed in the TCPM and places them on the CC lines.

TCPC API The TCPC device driver functions as the liaison between the TCPC device and the application software; this is accomplished by the Zephyr's API provided by the device driver that's used to communicate with and control the TCPC device.

Configuration Options

Related configuration options:

- `CONFIG_USBC_TCPC_DRIVER`

API Reference

group `usb_type_c`

USB Type-C.

Defines

`TC_V_SINK_DISCONNECT_MIN_MV`

VBUS minimum for a sink disconnect detection.

See Table 4-3 VBUS Sink Characteristics

`TC_V_SINK_DISCONNECT_MAX_MV`

VBUS maximum for a sink disconnect detection.

See Table 4-3 VBUS Sink Characteristics

`TC_T_VBUS_ON_MAX_MS`

From entry to Attached.SRC until VBUS reaches the minimum vSafe5V threshold as measured at the source's receptacle See Table 4-29 VBUS and VCONN Timing Parameters.

`TC_T_VBUS_OFF_MAX_MS`

From the time the Sink is detached until the Source removes VBUS and reaches vSafe0V (See USB PD).

See Table 4-29 VBUS and VCONN Timing Parameters

`TC_T_VCONN_ON_MAX_MS`

From the time the Source supplied VBUS in the Attached.SRC state.

See Table 4-29 VBUS and VCONN Timing Parameters

`TC_T_VCONN_ON_PA_MAX_MS`

From the time a Sink with accessory support enters the PoweredAccessory state until the Sink sources minimum VCONN voltage (see Table 4-5) See Table 4-29 VBUS and VCONN Timing Parameters.

`TC_T_VCONN_OFF_MAX_MS`

From the time that a Sink is detached or as directed until the VCONN supply is disconnected.

See Table 4-29 VBUS and VCONN Timing Parameters

`TC_T_SINK_ADJ_MAX_MS`

Response time for a Sink to adjust its current consumption to be in the specified range due to a change in USB Type-C Current advertisement See Table 4-29 VBUS and VCONN Timing Parameters.

`TC_T_DRP_MIN_MS`

The minimum period a DRP shall complete a Source to Sink and back advertisement See Table 4-30 DRP Timing Parameters.

`TC_T_DRP_MAX_MS`

The maximum period a DRP shall complete a Source to Sink and back advertisement See Table 4-30 DRP Timing Parameters.

`TC_T_DRP_TRANSITION_MIN_MS`

The minimum time a DRP shall complete transitions between Source and Sink roles during role resolution See Table 4-30 DRP Timing Parameters.

`TC_T_DRP_TRANSITION_MAX_MS`

The maximum time a DRP shall complete transitions between Source and Sink roles during role resolution See Table 4-30 DRP Timing Parameters.

`TC_T_DRP_TRY_MIN_MS`

Minimum wait time associated with the Try.SRC state.

See Table 4-30 DRP Timing Parameters

`TC_T_DRP_TRY_MAX_MS`

Maximum wait time associated with the Try.SRC state.

See Table 4-30 DRP Timing Parameters

`TC_T_DRP_TRY_WAIT_MIN_MS`

Minimum wait time associated with the Try.SNK state.

See Table 4-30 DRP Timing Parameters

`TC_T_DRP_TRY_WAIT_MAX_MS`

Maximum wait time associated with the Try.SNK state.

See Table 4-30 DRP Timing Parameters

`TC_T_TRY_TIMEOUT_MIN_MS`

Minimum timeout for transition from Try.SRC to TryWait.SNK.

See Table 4-30 DRP Timing Parameters

`TC_T_TRY_TIMEOUT_MAX_MS`

Maximum timeout for transition from Try.SRC to TryWait.SNK.

See Table 4-30 DRP Timing Parameters

`TC_T_VPD_DETACH_MIN_MS`

Minimum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed.

See Table 4-30 DRP Timing Parameters

`TC_T_VPD_DETACH_MAX_MS`

Maximum Time for a DRP to detect that the connected Charge-Through VCONNPowered USB Device has been detached, after VBUS has been removed.

See Table 4-30 DRP Timing Parameters

`TC_T_CC_DEBOUNCE_MIN_MS`

Minimum time a port shall wait before it can determine it is attached See Table 4-31 CC Timing.

`TC_T_CC_DEBOUNCE_MAX_MS`

Maximum time a port shall wait before it can determine it is attached See Table 4-31 CC Timing.

`TC_T_PD_DEBOUNCE_MIN_MS`

Minimum time a Sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions.

See Table 4-31 CC Timing

`TC_T_PD_DEBOUNCE_MAX_MS`

Maximum time a Sink port shall wait before it can determine it is detached due to the potential for USB PD signaling on CC as described in the state definitions.

See Table 4-31 CC Timing

`TC_T_TRY_CC_DEBOUNCE_MIN_MS`

Minimum Time a port shall wait before it can determine it is re-attached during the try-wait process.

See Table 4-31 CC Timing

`TC_T_TRY_CC_DEBOUNCE_MAX_MS`

Maximum Time a port shall wait before it can determine it is re-attached during the try-wait process.

See Table 4-31 CC Timing

TC_T_ERROR_RECOVERY_SELF_POWERED_MIN_MS

Minimum time a self-powered port shall remain in the ErrorRecovery state.

See Table 4-31 CC Timing

TC_T_ERROR_RECOVERY_SOURCE_MIN_MS

Minimum time a source shall remain in the ErrorRecovery state if it was sourcing VCONN in the previous state.

See Table 4-31 CC Timing

TC_T_RP_VALUE_CHANGE_MIN_MS

Minimum time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle.

See Table 4-31 CC Timing

TC_T_RP_VALUE_CHANGE_MAX_MS

Maximum time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle.

See Table 4-31 CC Timing

TC_T_SRC_DISCONNECT_MIN_MS

Minimum time a Source shall detect the SRC.Open state.

The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing

TC_T_SRC_DISCONNECT_MAX_MS

Maximum time a Source shall detect the SRC.Open state.

The Source should detect the SRC.Open state as quickly as practical. See Table 4-31 CC Timing

TC_T_NO_TOGGLE_CONNECT_MIN_MS

Minimum time to detect connection when neither Port Partner is toggling.

See Table 4-31 CC Timing

TC_T_NO_TOGGLE_CONNECT_MAX_MS

Maximum time to detect connection when neither Port Partner is toggling.

See Table 4-31 CC Timing

TC_T_ONE_PORT_TOGGLE_CONNECT_MIN_MS

Minimum time to detect connection when one Port Partner is toggling 0ms ... dcSRC.DRP max * tDRP max + 2 * tNoToggleConnect).

See Table 4-31 CC Timing

TC_T_ONE_PORT_TOGGLE_CONNECT_MAX_MS

Maximum time to detect connection when one Port Partner is toggling 0ms ... dcSRC.DRP max * tDRP max + 2 * tNoToggleConnect).

See Table 4-31 CC Timing

TC_T_TWO_PORT_TOGGLE_CONNECT_MIN_MS

Minimum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect).

See Table 4-31 CC Timing

TC_T_TWO_PORT_TOGGLE_CONNECT_MAX_MS

Maximum time to detect connection when both Port Partners are toggling (0ms ... 5 * tDRP max + 2 * tNoToggleConnect).

See Table 4-31 CC Timing

TC_T_VPDCTDD_MIN_US

Minimum time for a Charge-Through VCONN-Powered USB Device to detect that the Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTUnattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC.

See Table 4-31 CC Timing

TC_T_VPDCTDD_MAX_MS

Maximum time for a Charge-Through VCONN-Powered USB Device to detect that the Charge-Through source has disconnected from CC after VBUS has been removed, transition to CTUnattached.VPD, and re-apply its Rp termination advertising 3.0 A on the host port CC.

See Table 4-31 CC Timing

TC_T_VPDDISABLE_MIN_MS

Minimum time for a Charge-Through VCONN-Powered USB Device shall remain in CTDisabled.VPD state.

See Table 4-31 CC Timing

Enums

enum tc_cc_voltage_state

CC Voltage status.

Values:

enumerator TC_CC_VOLT_OPEN = 0

No port partner connection.

enumerator TC_CC_VOLT_RA = 1

Port partner is applying Ra.

enumerator TC_CC_VOLT_RD = 2

Port partner is applying Rd.

enumerator TC_CC_VOLT_RP_DEF = 5

Port partner is applying Rp (0.5A)

enumerator TC_CC_VOLT_RP_1A5 = 6

enumerator TC_CC_VOLT_RP_3A0 = 7
Port partner is applying Rp (3.0A)

enum tc_vbus_level
VBUS level voltages.
Values:

enumerator TC_VBUS_SAFE0V = 0
VBUS is less than vSafe0V max.

enumerator TC_VBUS_PRESENT = 1
VBUS is at least vSafe5V min.

enumerator TC_VBUS_REMOVED = 2
VBUS is less than vSinkDisconnect max.

enum tc_rp_value
Pull-Up resistor values.
Values:

enumerator TC_RP_USB = 0
Pull-Up resistor for a current of 900mA.

enumerator TC_RP_1A5 = 1
Pull-Up resistor for a current of 1.5A.

enumerator TC_RP_3A0 = 2
Pull-Up resistor for a current of 3.0A.

enumerator TC_RP_RESERVED = 3
No Pull-Up resistor is applied.

enum tc_cc_pull
CC pull resistors.
Values:

enumerator TC_CC_RA = 0
Ra Pull-Down resistor.

enumerator TC_CC_RP = 1
Rp Pull-Up resistor.

enumerator TC_CC_RD = 2
Rd Pull-Down resistor.

enumerator TC_CC_OPEN = 3

No CC resistor.

enumerator TC_RA_RD = 4

Ra and Rd Pull-Down resistor.

enum tc_cable_plug

Cable plug.

See 6.2.1.1.7 Cable Plug. Only applies to SOP' and SOP". Replaced by pd_power_role for SOP packets.

Values:

enumerator PD_PLUG_FROM_DFP_UFP = 0

enumerator PD_PLUG_FROM_CABLE_VPD = 1

enum tc_power_role

Power Delivery Power Role.

Values:

enumerator TC_ROLE_SINK = 0

Power role is a sink.

enumerator TC_ROLE_SOURCE = 1

Power role is a source.

enum tc_data_role

Power Delivery Data Role.

Values:

enumerator TC_ROLE_UFP = 0

Data role is an Upstream Facing Port.

enumerator TC_ROLE_DFP = 1

Data role is a Downstream Facing Port.

enumerator TC_ROLE_DISCONNECTED = 2

Port is disconnected.

enum tc_cc_polarity

Polarity of the CC lines.

Values:

enumerator TC_POLARITY_CC1 = 0

Use CC1 IO for Power Delivery communication.

enumerator TC_POLARITY_CC2 = 1
Use CC2 IO for Power Delivery communication.

enum tc_cc_states
Possible port partner connections based on CC line states.
Values:

enumerator TC_CC_NONE = 0
No port partner attached.

enumerator TC_CC_UFP_NONE = 1
From DFP perspective.
No UFP accessory connected

enumerator TC_CC_UFP_AUDIO_ACC = 2
UFP Audio accessory connected.

enumerator TC_CC_UFP_DEBUG_ACC = 3
UFP Debug accessory connected.

enumerator TC_CC_UFP_ATTACHED = 4
Plain UFP attached.

enumerator TC_CC_DFP_ATTACHED = 5
From UFP perspective.
Plain DFP attached

enumerator TC_CC_DFP_DEBUG_ACC = 6
DFP debug accessory connected.

group usb_type_c_port_controller_api
USB Type-C Port Controller API.

0.1.0

Typedefs

typedef int (*tcpc_vconn_control_cb_t)(const struct *device* *dev, enum *tc_cc_polarity* pol, bool enable)

typedef int (*tcpc_vconn_discharge_cb_t)(const struct *device* *dev, enum *tc_cc_polarity* pol, bool enable)

typedef void (*`tcpc_alert_handler_cb_t`)(const struct *device* *dev, void *data, enum *tcpc_alert* alert)

Enums

enum `tcpc_alert`

TCPC Alert bits.

Values:

enumerator `TCPC_ALERT_CC_STATUS`

CC status changed.

enumerator `TCPC_ALERT_POWER_STATUS`

Power status changed.

enumerator `TCPC_ALERT_MSG_STATUS`

Receive Buffer register changed.

enumerator `TCPC_ALERT_HARD_RESET_RECEIVED`

Received Hard Reset message.

enumerator `TCPC_ALERT_TRANSMIT_MSG_FAILED`

SOP* message transmission not successful.

enumerator `TCPC_ALERT_TRANSMIT_MSG_DISCARDED`

Reset or SOP* message transmission not sent due to an incoming receive message.

enumerator `TCPC_ALERT_TRANSMIT_MSG_SUCCESS`

Reset or SOP* message transmission successful.

enumerator `TCPC_ALERT_VBUS_ALARM_HI`

A high-voltage alarm has occurred.

enumerator `TCPC_ALERT_VBUS_ALARM_LO`

A low-voltage alarm has occurred.

enumerator `TCPC_ALERT_FAULT_STATUS`

A fault has occurred.

Read the FAULT_STATUS register

enumerator `TCPC_ALERT_RX_BUFFER_OVERFLOW`

TCPC RX buffer has overflowed.

enumerator `TCPC_ALERT_VBUS_SNK_DISCONNECT`

The TCPC in Attached.SNK state has detected a sink disconnect.

enumerator TCPC_ALERT_BEGINNING_MSG_STATUS
Receive buffer register changed.

enumerator TCPC_ALERT_EXTENDED_STATUS
Extended status changed.

enumerator TCPC_ALERT_EXTENDED
An extended interrupt event has occurred.
Read the alert_extended register

enumerator TCPC_ALERT_VENDOR_DEFINED
A vendor defined alert has been detected.

enum **tcpc_status_reg**
TCPC Status register.
Values:

enumerator TCPC_CC_STATUS
The CC Status register.

enumerator TCPC_POWER_STATUS
The Power Status register.

enumerator TCPC_FAULT_STATUS
The Fault Status register.

enumerator TCPC_EXTENDED_STATUS
The Extended Status register.

enumerator TCPC_EXTENDED_ALERT_STATUS
The Extended Alert Status register.

enumerator TCPC_VENDOR_DEFINED_STATUS
The Vendor Defined Status register.

Functions

static inline int **tcpc_is_cc_rp**(enum *tc_cc_voltage_state* cc)
Returns whether the sink has detected a Rp resistor on the other side.

static inline int **tcpc_is_cc_open**(enum *tc_cc_voltage_state* cc1, enum *tc_cc_voltage_state* cc2)
Returns true if both CC lines are completely open.

static inline int **tcpc_is_cc_snk_dbg_acc**(enum *tc_cc_voltage_state* cc1, enum *tc_cc_voltage_state* cc2)
Returns true if we detect the port partner is a snk debug accessory.

static inline int **tcpc_is_cc_src_dbg_acc**(enum *tc_cc_voltage_state* cc1, enum *tc_cc_voltage_state* cc2)

Returns true if we detect the port partner is a src debug accessory.

static inline int **tcpc_is_cc_audio_acc**(enum *tc_cc_voltage_state* cc1, enum *tc_cc_voltage_state* cc2)

Returns true if the port partner is an audio accessory.

static inline int **tcpc_is_cc_at_least_one_rd**(enum *tc_cc_voltage_state* cc1, enum *tc_cc_voltage_state* cc2)

Returns true if the port partner is presenting at least one Rd.

static inline int **tcpc_is_cc_only_one_rd**(enum *tc_cc_voltage_state* cc1, enum *tc_cc_voltage_state* cc2)

Returns true if the port partner is presenting Rd on only one CC line.

static inline int **tcpc_init**(const struct *device* *dev)

Initializes the TCPC.

Parameters

- `dev` – Runtime device structure

Return values

- `0` – on success
- `-EIO` – on failure
- `-EAGAIN` – if initialization should be postponed

static inline int **tcpc_get_cc**(const struct *device* *dev, enum *tc_cc_voltage_state* *cc1, enum *tc_cc_voltage_state* *cc2)

Reads the status of the CC lines.

Parameters

- `dev` – Runtime device structure
- `cc1` – A pointer where the CC1 status is written
- `cc2` – A pointer where the CC2 status is written

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_select_rp_value**(const struct *device* *dev, enum *tc_rp_value* rp)

Sets the value of CC pull up resistor used when operating as a Source.

Parameters

- `dev` – Runtime device structure
- `rp` – Value of the Pull-Up Resistor.

Return values

- `0` – on success
- `-ENOSYS` –
- `-EIO` – on failure

static inline int **tcpc_get_rp_value**(const struct *device* *dev, enum *tc_rp_value* *rp)

Gets the value of the CC pull up resistor used when operating as a Source.

Parameters

- `dev` – Runtime device structure
- `rp` – pointer where the value of the Pull-Up Resistor is stored

Return values

- `0` – on success
- `-ENOSYS` –
- `-EIO` – on failure

static inline int **tcpc_set_cc**(const struct *device* *dev, enum *tc_cc_pull* pull)

Sets the CC pull resistor and sets the role as either Source or Sink.

Parameters

- `dev` – Runtime device structure
- `pull` – The pull resistor to set

Return values

- `0` – on success
- `-EIO` – on failure

static inline void **tcpc_set_vconn_cb**(const struct *device* *dev, *tcpc_vconn_control_cb_t* vconn_cb)

Sets a callback that can enable or disable VCONN if the TCPC is unable to or the system is configured in a way that does not use the VCONN control capabilities of the TCPC.

The callback is called in the tcpc_set_vconn function if vconn_cb isn't NULL

Parameters

- `dev` – Runtime device structure
- `vconn_cb` – pointer to the callback function that controls vconn

static inline void **tcpc_set_vconn_discharge_cb**(const struct *device* *dev, *tcpc_vconn_discharge_cb_t* cb)

Sets a callback that can enable or discharge VCONN if the TCPC is unable to or the system is configured in a way that does not use the VCONN control capabilities of the TCPC.

The callback is called in the tcpc_vconn_discharge function if cb isn't NULL

Parameters

- `dev` – Runtime device structure
- `cb` – pointer to the callback function that discharges vconn

static inline int **tcpc_vconn_discharge**(const struct *device* *dev, bool enable)

Discharges VCONN.

This function uses the TCPC to discharge VCONN if possible or calls the callback function set by tcpc_set_vconn_cb

Parameters

- `dev` – Runtime device structure
- `enable` – VCONN discharge is enabled when true, it's disabled

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_vconn**(const struct *device* *dev, bool enable)

Enables or disables VCONN.

This function uses the TCPC to measure VCONN if possible or calls the callback function set by tcpc_set_vconn_cb

Parameters

- `dev` – Runtime device structure
- `enable` – VCONN is enabled when true, it's disabled

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_roles**(const struct *device* *dev, enum *tc_power_role* power_role, enum *tc_data_role* data_role)

Sets the Power and Data Role of the PD message header.

This function only needs to be called once per data / power role change

Parameters

- `dev` – Runtime device structure
- `power_role` – current power role
- `data_role` – current data role

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_get_rx_pending_msg**(const struct *device* *dev, struct *pd_msg* *buf)

Retrieves the Power Delivery message from the TCPC.

If buf is NULL, then only the status is returned, where 0 means there is a message pending and -ENODATA means there is no pending message.

Parameters

- `dev` – Runtime device structure
- `buf` – pointer where the pd_buf pointer is written, NULL if only checking the status

Return values

- `Greater` – or equal to 0 is the number of bytes received if buf parameter is provided
- `0` – if there is a message pending and buf parameter is NULL
- `-EIO` – on failure
- `-ENODATA` – if no message is pending

static inline int **tcpc_set_rx_enable**(const struct *device* *dev, bool enable)

Enables the reception of SOP* message types.

Parameters

- `dev` – Runtime device structure
- `enable` – Enable Power Delivery when true, else it's disabled

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_cc_polarity**(const struct *device* *dev, enum *tc_cc_polarity* polarity)

Sets the polarity of the CC lines.

Parameters

- `dev` – Runtime device structure
- `polarity` – Polarity of the cc line

Return values

- `0` – on success
- `-EIO` – on failure

static inline int **tcpc_transmit_data**(const struct *device* *dev, struct *pd_msg* *msg)

Transmits a Power Delivery message.

Parameters

- `dev` – Runtime device structure
- `msg` – Power Delivery message to transmit

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_dump_std_reg**(const struct *device* *dev)

Dump a set of TCPC registers.

Parameters

- `dev` – Runtime device structure

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_alert_handler_cb**(const struct *device* *dev, *tcpc_alert_handler_cb_t* handler, void *data)

Sets the alert function that's called when an interrupt is triggered due to an alert bit.

Calling this function enables the particular alert bit

Parameters

- `dev` – Runtime device structure
- `handler` – The callback function called when the bit is set
- `data` – user data passed to the callback

Return values

- `0` – on success
- `-EINVAL` – on failure

static inline int **tcpc_get_status_register**(const struct *device* *dev, enum *tcpc_status_reg* reg, int32_t *status)

Gets a status register.

Parameters

- `dev` – Runtime device structure
- `reg` – The status register to read
- `status` – Pointer where the status is stored

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_clear_status_register**(const struct *device* *dev, enum *tcpc_status_reg* reg, uint32_t mask)

Clears a TCPC status register.

Parameters

- `dev` – Runtime device structure
- `reg` – The status register to read
- `mask` – A bit mask of the status register to clear. A status bit is cleared when it's set to 1.

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_mask_status_register**(const struct *device* *dev, enum *tcpc_status_reg* reg, uint32_t mask)

Sets the mask of a TCPC status register.

Parameters

- `dev` – Runtime device structure
- `reg` – The status register to read
- `mask` – A bit mask of the status register to mask. The status bit is masked if it's 0, else it's unmasked.

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_debug_accessory**(const struct *device* *dev, bool enable)
Manual control of TCPC DebugAccessory control.

Parameters

- `dev` – Runtime device structure
- `enable` – Enable Debug Accessory when true, else it's disabled

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_debug_detach**(const struct *device* *dev)
Detach from a debug connection.

Parameters

- `dev` – Runtime device structure

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_drp_toggle**(const struct *device* *dev, bool enable)
Enable TCPC auto dual role toggle.

Parameters

- `dev` – Runtime device structure
- `enable` – Auto dual role toggle is active when true, else it's disabled

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_get_snk_ctrl**(const struct *device* *dev)
Queries the current sinking state of the TCPC.

Parameters

- `dev` – Runtime device structure

Return values

- `true` – if sinking power
- `false` – if not sinking power
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_snk_ctrl**(const struct *device* *dev, bool enable)
Set the VBUS sinking state of the TCPC.

Parameters

- `dev` – Runtime device structure
- `enable` – True if sinking should be enabled, false if disabled

Return values

- `0` – on success
- `-ENOSYS` – if not implemented

static inline int **tcpc_get_src_ctrl**(const struct *device* *dev)

Queries the current sourcing state of the TCPC.

Parameters

- `dev` – Runtime device structure

Return values

- `true` – if sourcing power
- `false` – if not sourcing power
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_src_ctrl**(const struct *device* *dev, bool enable)

Set the VBUS sourcing state of the TCPC.

Parameters

- `dev` – Runtime device structure
- `enable` – True if sourcing should be enabled, false if disabled

Return values

- `0` – on success
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_bist_test_mode**(const struct *device* *dev, bool enable)

Controls the BIST Mode of the TCPC.

It disables RX alerts while the mode is active.

Parameters

- `dev` – Runtime device structure
- `enable` – The TCPC enters BIST TEST Mode when true

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_get_chip_info**(const struct *device* *dev, struct *tcpc_chip_info* *chip_info)

Gets the TCPC firmware version.

Parameters

- `dev` – Runtime device structure
- `chip_info` – Pointer to TCPC chip info where the version is stored

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_set_low_power_mode**(const struct *device* *dev, bool enable)
Instructs the TCPC to enter or exit low power mode.

Parameters

- `dev` – Runtime device structure
- `enable` – The TCPC enters low power mode when true, else it exits it

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

static inline int **tcpc_sop_prime_enable**(const struct *device* *dev, bool enable)
Enables the reception of SOP Prime messages.

Parameters

- `dev` – Runtime device structure
- `enable` – Can receive SOP Prime messages when true, else it can not

Return values

- `0` – on success
- `-EIO` – on failure
- `-ENOSYS` – if not implemented

struct **tcpc_chip_info**
#include <usbc_tcpc.h> TCPC Chip Information.

Public Members

uint16_t **vendor_id**
Vendor Id.

uint16_t **product_id**
Product Id.

uint16_t **device_id**
Device Id.

uint64_t **fw_version_number**
Firmware version number.

uint8_t **min_req_fw_version_string**[8]
Minimum Required firmware version string.

uint64_t **min_req_fw_version_number**
Minimum Required firmware version number.

struct **tcpc_driver_api**
#include <usbc_tcpc.h>

group usb_power_delivery

USB Power Delivery.

USB PD 3.1 Rev 1.6, Table 6-70 Counter Parameters

PD_N_CAPS_COUNT

The CapsCounter is used to count the number of Source_Capabilities Messages which have been sent by a Source at power up or after a Hard Reset.

Parameter Name: nCapsCounter

PD_N_HARD_RESET_COUNT

The HardResetCounter is used to retry the Hard Reset whenever there is no response from the remote device (see Section 6.6.6) Parameter Name: nHardResetCounter.

USB PD 3.1 Rev 1.6, Table 6-68 Time Values

PD_T_NO_RESPONSE_MIN_MS

The NoResponseTimer is used by the Policy Engine in a Source to determine that its Port Partner is not responding after a Hard Reset.

Parameter Name: tNoResponseTimer

PD_T_NO_RESPONSE_MAX_MS

The NoResponseTimer is used by the Policy Engine in a Source to determine that its Port Partner is not responding after a Hard Reset.

Parameter Name: tNoResponseTimer

PD_T_PS_HARD_RESET_MIN_MS

Min time the Source waits to ensure that the Sink has had sufficient time to process Hard Reset Signaling before turning off its power supply to VBUS Parameter Name: tPSHardReset.

PD_T_PS_HARD_RESET_MAX_MS

Max time the Source waits to ensure that the Sink has had sufficient time to process Hard Reset Signaling before turning off its power supply to VBUS Parameter Name: tPSHardReset.

PD_T_SINK_TX_MIN_MS

Minimum time a Source waits after changing Rp from SinkTxOk to SinkTxNG before initiating an AMS by sending a Message.

Parameter Name: tSinkTx

PD_T_SINK_TX_MAX_MS

Maximum time a Source waits after changing Rp from SinkTxOk to SinkTxNG before initiating an AMS by sending a Message.

Parameter Name: tSinkTx

PD_T_TYPEC_SEND_SOURCE_CAP_MIN_MS

Minimum time a source shall wait before sending a Source_Capabilities message while the following is true: 1) The Port is Attached.

2) The Source is not in an active connection with a PD Sink Port. Parameter Name: tTypeCSendSourceCap

PD_T_TYPEC_SEND_SOURCE_CAP_MAX_MS

Maximum time a source shall wait before sending a Source_Capabilities message while the following is true: 1) The Port is Attached.

2) The Source is not in an active connection with a PD Sink Port. Parameter Name: tTypeCSendSourceCap

Defines

PD_MAX_EXTENDED_MSG_LEGACY_LEN

Maximum length of a non-Extended Message in bytes.

See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLegacyLen

PD_MAX_EXTENDED_MSG_LEN

Maximum length of an Extended Message in bytes.

See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgLen

PD_MAX_EXTENDED_MSG_CHUNK_LEN

Maximum length of a Chunked Message in bytes.

When one of both Port Partners do not support Extended Messages of Data Size greater than PD_MAX_EXTENDED_MSG_LEGACY_LEN then the Protocol Layer supports a Chunking mechanism to break larger Messages into smaller Chunks of size PD_MAX_EXTENDED_MSG_CHUNK_LEN. See Table 6-75 Value Parameters Parameter Name: MaxExtendedMsgChunkLen

PD_T_TYPEC_SINK_WAIT_CAP_MIN_MS

Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

PD_T_TYPEC_SINK_WAIT_CAP_MAX_MS

Minimum time a sink shall wait for a Source_Capabilities message before sending a Hard Reset See Table 6-61 Time Values Parameter Name: tTypeCSinkWaitCap.

PD_V_SAFE_0V_MAX_MV

VBUS maximum safe operating voltage at “zero volts”.

See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe0V

PD_V_SAFE_5V_MIN_MV

VBUS minimum safe operating voltage at 5V.

See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: vSafe5V

PD_T_SAFE_0V_MAX_MS
: Time to reach PD_V_SAFE_0V_MV max in milliseconds.

  See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe0V

PD_T_SAFE_5V_MAX_MS
: Time to reach PD_V_SAFE_5V_MV max in milliseconds.

  See Table 7-24 Common Source/Sink Electrical Parameters Parameter Name: tSafe5V

PD_T_TX_TIMEOUT_MS
: Time to wait for TCPC to complete transmit.

PD_T_HARD_RESET_COMPLETE_MIN_MS
: Minimum time a Hard Reset must complete.

  See Table 6-68 Time Values

PD_T_HARD_RESET_COMPLETE_MAX_MS
: Maximum time a Hard Reset must complete.

  See Table 6-68 Time Values

PD_T_SENDER_RESPONSE_MIN_MS
: Minimum time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_NOM_MS
: Nomiminal time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SENDER_RESPONSE_MAX_MS
: Maximum time a response must be sent from a Port Partner See Table 6-68 Time Values.

PD_T_SPR_PS_TRANSITION_MIN_MS
: Minimum SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_SPR_PS_TRANSITION_NOM_MS
: Nominal SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_SPR_PS_TRANSITION_MAX_MS
: Maximum SPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_EPR_PS_TRANSITION_MIN_MS
: Minimum EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_EPR_PS_TRANSITION_NOM_MS
: Nominal EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_EPR_PS_TRANSITION_MAX_MS

Maximum EPR Mode time for a power supply to transition to a new level See Table 6-68 Time Values.

PD_T_SINK_REQUEST_MIN_MS

Minimum time to wait before sending another request after receiving a Wait message See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_MIN_MS

Minimum time to wait before sending a Not_Supported message after receiving a Chunked message See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_NOM_MS

Nominal time to wait before sending a Not_Supported message after receiving a Chunked message See Table 6-68 Time Values.

PD_T_CHUNKING_NOT_SUPPORTED_MAX_MS

Maximum time to wait before sending a Not_Supported message after receiving a Chunked message See Table 6-68 Time Values.

PD_CONVERT_BYTES_TO_PD_HEADER_COUNT(c)

Convert bytes to PD Header data object count, where a data object is 4-bytes.

Parameters

- **c** – number of bytes to convert

PD_CONVERT_PD_HEADER_COUNT_TO_BYTES(c)

Convert PD Header data object count to bytes.

Parameters

- **c** – number of PD Header data objects

SINK_TX_OK

Collision avoidance Rp values in REV 3.0 Sink Transmit “OK”.

SINK_TX_NG

Collision avoidance Rp values in REV 3.0 Sink Transmit “NO GO”.

PD_GET_EXT_HEADER(c)

Used to get extended header from the first 32-bit word of the message.

Parameters

- **c** – first 32-bit word of the message

PDO_MAX_DATA_OBJECTS

PDO - Power Data Object RDO - Request Data Object.

Maximum number of 32-bit data objects sent in a single request

PD_CONVERT_MA_TO_FIXED_PDO_CURRENT(c)

Convert milliamps to Fixed PDO Current in 10mA units.

Parameters

- **c** – Current in milliamps

PD_CONVERT_MV_TO_FIXED_PDO_VOLTAGE(v)

Convert millivolts to Fixed PDO Voltage in 50mV units.

Parameters

- v – Voltage in millivolts

PD_CONVERT_FIXED_PDO_CURRENT_TO_MA(c)

Convert a Fixed PDO Current from 10mA units to milliamps.

Parameters

- c – Fixed PDO current in 10mA units.

PD_CONVERT_FIXED_PDO_VOLTAGE_TO_MV(v)

Convert a Fixed PDO Voltage from 50mV units to millivolts.

Used for converting *pd_fixed_supply_pdo_source.voltage* and *pd_fixed_supply_pdo_sink.voltage*

Parameters

- v – Fixed PDO voltage in 50mV units.

PD_CONVERT_MA_TO_VARIABLE_PDO_CURRENT(c)

Convert milliamps to Variable PDO Current in 10ma units.

Parameters

- c – Current in milliamps

PD_CONVERT_MV_TO_VARIABLE_PDO_VOLTAGE(v)

Convert millivolts to Variable PDO Voltage in 50mV units.

Parameters

- v – Voltage in millivolts

PD_CONVERT_VARIABLE_PDO_CURRENT_TO_MA(c)

Convert a Variable PDO Current from 10mA units to milliamps.

Parameters

- c – Variable PDO current in 10mA units.

PD_CONVERT_VARIABLE_PDO_VOLTAGE_TO_MV(v)

Convert a Variable PDO Voltage from 50mV units to millivolts.

Parameters

- v – Variable PDO voltage in 50mV units.

PD_CONVERT_MW_TO_BATTERY_PDO_POWER(c)

Convert milliwatts to Battery PDO Power in 250mW units.

Parameters

- c – Power in milliwatts

PD_CONVERT_MV_TO_BATTERY_PDO_VOLTAGE(v)

Convert milliwatts to Battery PDO Voltage in 50mV units.

Parameters

- v – Voltage in millivolts

PD_CONVERT_BATTERY_PDO_POWER_TO_MW(c)

Convert a Battery PDO Power from 250mW units to milliwatts.

Parameters

- c – Power in 250mW units.

PD_CONVERT_BATTERY_PDO_VOLTAGE_TO_MV(v)

Convert a Battery PDO Voltage from 50mV units to millivolts.

Parameters

- v – Voltage in 50mV units.

PD_CONVERT_MA_TO_AUGMENTED_PDO_CURRENT(c)

Convert milliamps to Augmented PDO Current in 50mA units.

Parameters

- c – Current in milliamps

PD_CONVERT_MV_TO_AUGMENTED_PDO_VOLTAGE(v)

Convert millivolts to Augmented PDO Voltage in 100mV units.

Parameters

- v – Voltage in millivolts

PD_CONVERT_AUGMENTED_PDO_CURRENT_TO_MA(c)

Convert an Augmented PDO Current from 50mA units to milliamps.

Parameters

- c – Augmented PDO current in 50mA units.

PD_CONVERT_AUGMENTED_PDO_VOLTAGE_TO_MV(v)

Convert an Augmented PDO Voltage from 100mV units to millivolts.

Parameters

- v – Augmented PDO voltage in 100mV units.

NUM_SOP_STAR_TYPES

Number of valid Transmit Types.

Enums

enum pdo_type

Power Data Object Type Table 6-7 Power Data Object.

Values:

enumerator PDO_FIXED = 0

Fixed supply (Vmin = Vmax)

enumerator PDO_BATTERY = 1

Battery.

enumerator PDO_VARIABLE = 2

Variable Supply (non-Battery)

enumerator PDO_AUGMENTED = 3
Augmented Power Data Object (APDO)

enum pd_frs_type
Fast Role Swap Required for USB Type-C current.
Values:

enumerator FRS_NOT_SUPPORTED
Fast Swap not supported.

enumerator FRS_DEFAULT_USB_POWER
Default USB Power.

enumerator FRS_1P5A_5V
1.5A @ 5V

enumerator FRS_3P0A_5V
3.0A @ 5V

enum pd_rev_type
Protocol revision.
Values:

enumerator PD_REV10 = 0
PD revision 1.0.

enumerator PD_REV20 = 1
PD revision 2.0.

enumerator PD_REV30 = 2
PD revision 3.0.

enum pd_packet_type
Power Delivery packet type See USB Type-C Port Controller Interface Specification, Revision 2.0, Version 1.2, Table 4-38 TRANSMIT Register Definition.
Values:

enumerator PD_PACKET_SOP = 0
Port Partner message.

enumerator PD_PACKET_SOP_PRIME = 1
Cable Plug message.

enumerator PD_PACKET_PRIME_PRIME = 2
Cable Plug message far end.

enumerator PD_PACKET_DEBUG_PRIME = 3
Currently undefined in the PD specification.

enumerator PD_PACKET_DEBUG_PRIME_PRIME = 4
Currently undefined in the PD specification.

enumerator PD_PACKET_TX_HARD_RESET = 5
Hard Reset message to the Port Partner.

enumerator PD_PACKET_CABLE_RESET = 6
Cable Reset message to the Cable.

enumerator PD_PACKET_TX_BIST_MODE_2 = 7
BIST_MODE_2 message to the Port Partner.

enumerator PD_PACKET_MSG_INVALID = 0xf
USED ONLY FOR RECEPTION OF UNKNOWN MSG TYPES.

enum pd_ctrl_msg_type
Control Message type See Table 6-5 Control Message Types.
Values:

enumerator PD_CTRL_GOOD_CRC = 1
0 Reserved
GoodCRC Message

enumerator PD_CTRL_GOTO_MIN = 2
GotoMin Message.

enumerator PD_CTRL_ACCEPT = 3
Accept Message.

enumerator PD_CTRL_REJECT = 4
Reject Message.

enumerator PD_CTRL_PING = 5
Ping Message.

enumerator PD_CTRL_PS_RDY = 6
PS_RDY Message.

enumerator PD_CTRL_GET_SOURCE_CAP = 7
Get_Source_Cap Message.

enumerator PD_CTRL_GET_SINK_CAP = 8
Get_Sink_Cap Message.

enumerator PD_CTRL_DR_SWAP = 9
DR_Swap Message.

enumerator PD_CTRL_PR_SWAP = 10
PR_Swap Message.

enumerator PD_CTRL_VCONN_SWAP = 11
VCONN_Swap Message.

enumerator PD_CTRL_WAIT = 12
Wait Message.

enumerator PD_CTRL_SOFT_RESET = 13
Soft Reset Message.

enumerator PD_CTRL_DATA_RESET = 14
Used for REV 3.0.
Data_Reset Message

enumerator PD_CTRL_DATA_RESET_COMPLETE = 15
Data_Reset_Complete Message.

enumerator PD_CTRL_NOT_SUPPORTED = 16
Not_Supported Message.

enumerator PD_CTRL_GET_SOURCE_CAP_EXT = 17
Get_Source_Cap_Extended Message.

enumerator PD_CTRL_GET_STATUS = 18
Get_Status Message.

enumerator PD_CTRL_FR_SWAP = 19
FR_Swap Message.

enumerator PD_CTRL_GET_PPS_STATUS = 20
Get_PPS_Status Message.

enumerator PD_CTRL_GET_COUNTRY_CODES = 21
Get_Country_Codes Message.

enumerator PD_CTRL_GET_SINK_CAP_EXT = 22
Get_Sink_Cap_Extended Message.

enum pd_data_msg_type
Data message type See Table 6-6 Data Message Types.
Values:

enumerator PD_DATA_SOURCE_CAP = 1
0 Reserved
Source_Capabilities Message

enumerator PD_DATA_REQUEST = 2
Request Message.

enumerator PD_DATA_BIST = 3
BIST Message.

enumerator PD_DATA_SINK_CAP = 4
Sink Capabilities Message.

enumerator PD_DATA_BATTERY_STATUS = 5
5-14 Reserved for REV 2.0

enumerator PD_DATA_ALERT = 6
Alert Message.

enumerator PD_DATA_GET_COUNTRY_INFO = 7
Get Country Info Message.

enumerator PD_DATA_ENTER_USB = 8
8-14 Reserved for REV 3.0
Enter USB message

enumerator PD_DATA_VENDOR_DEF = 15
Vendor Defined Message.

enum pd_ext_msg_type
Extended message type for REV 3.0 See Table 6-48 Extended Message Types.
Values:

enumerator PD_EXT_SOURCE_CAP = 1
0 Reserved
Source_Capabilities_Extended Message

enumerator PD_EXT_STATUS = 2
Status Message.

enumerator PD_EXT_GET_BATTERY_CAP = 3
Get_Battery_Cap Message.

enumerator PD_EXT_GET_BATTERY_STATUS = 4
Get_Battery_Status Message.

enumerator PD_EXT_BATTERY_CAP = 5
Battery_Capabilities Message.

enumerator PD_EXT_GET_MANUFACTURER_INFO = 6
Get_Manufacturer_Info Message.

enumerator PD_EXT_MANUFACTURER_INFO = 7
Manufacturer_Info Message.

enumerator PD_EXT_SECURITY_REQUEST = 8
Security_Request Message.

enumerator PD_EXT_SECURITY_RESPONSE = 9
Security_Response Message.

enumerator PD_EXT_FIRMWARE_UPDATE_REQUEST = 10
Firmware_Update_Request Message.

enumerator PD_EXT_FIRMWARE_UPDATE_RESPONSE = 11
Firmware_Update_Response Message.

enumerator PD_EXT_PPS_STATUS = 12
PPS_Status Message.

enumerator PD_EXT_COUNTRY_INFO = 13
Country_Codes Message.

enumerator PD_EXT_COUNTRY_CODES = 14
Country_Info Message.

enum usbpd_cc_pin
Active PD CC pin.
Values:

enumerator USBPD_CC_PIN_1 = 0
PD is active on CC1.

enumerator USBPD_CC_PIN_2 = 1
PD is active on CC2.

union pd_header
#include <*usbc_pd.h*> Build a PD message header See Table 6-1 Message Header.

Public Members

uint16_t message_type
Type of message.

uint16_t port_data_role
Port Data role.

uint16_t specification_revision
Specification Revision.

uint16_t **port_power_role**
Port Power Role.

uint16_t **message_id**
Message ID.

uint16_t **number_of_data_objects**
Number of Data Objects.

uint16_t **extended**
Extended Message.

struct pd_header

uint16_t **raw_value**

union **pd_ext_header**
#include <usbc_pd.h> Build an extended message header See Table 6-3 Extended Message Header.

Public Members

uint16_t **data_size**
Number of total bytes in data block.

uint16_t **reserved0**
Reserved.

uint16_t **request_chunk**
1 for a chunked message, else 0

uint16_t **chunk_number**
Chunk number when chkd = 1, else 0.

uint16_t **chunked**
1 for chunked messages

struct pd_ext_header

uint16_t **raw_value**
Raw PD Ext Header value.

union **pd_fixed_supply_pdo_source**
#include <usbc_pd.h> Create a Fixed Supply PDO Source value See Table 6-9 Fixed Supply PDO - Source.

Public Members

uint32_t **max_current**
Maximum Current in 10mA units.

uint32_t **voltage**
Voltage in 50mV units.

uint32_t **peak_current**
Peak Current.

uint32_t **reserved0**
Reserved – Shall be set to zero.

uint32_t **unchunked_ext_msg_supported**
Unchunked Extended Messages Supported.

uint32_t **dual_role_data**
Dual-Role Data.

uint32_t **usb_comms_capable**
USB Communications Capable.

uint32_t **unconstrained_power**
Unconstrained Power.

uint32_t **usb_suspend_supported**
USB Suspend Supported.

uint32_t **dual_role_power**
Dual-Role Power.

enum *pdo_type* **type**
Fixed supply.
SET TO PDO_FIXED

struct pd_fixed_supply_pdo_source

uint32_t **raw_value**
Raw PDO value.

union **pd_fixed_supply_pdo_sink**
#include <usbc_pd.h> Create a Fixed Supply PDO Sink value See Table 6-14 Fixed Supply PDO - Sink.

Public Members

uint32_t **operational_current**
Operational Current in 10mA units.

uint32_t **voltage**
Voltage in 50mV units.

uint32_t **reserved0**
Reserved – Shall be set to zero.

enum *pd_frs_type* **frs_required**
Fast Role Swap required USB Type-C Current.

uint32_t **dual_role_data**
Dual-Role Data.

uint32_t **usb_comms_capable**
USB Communications Capable.

uint32_t **unconstrained_power**
Unconstrained Power.

uint32_t **higher_capability**
Higher Capability.

uint32_t **dual_role_power**
Dual-Role Power.

enum *pdo_type* **type**
Fixed supply.
SET TO PDO_FIXED

struct pd_fixed_supply_pdo_sink

uint32_t **raw_value**
Raw PDO value.

union **pd_variable_supply_pdo_source**
#include <usbc_pd.h> Create a Variable Supply PDO Source value See Table 6-11 Variable Supply (non-Battery) PDO - Source.

Public Members

uint32_t **max_current**
Maximum Current in 10mA units.

uint32_t **min_voltage**
Minimum Voltage in 50mV units.

uint32_t **max_voltage**

Maximum Voltage in 50mV units.

enum *pdo_type* **type**

Variable supply.

SET TO PDO_VARIABLE

struct pd_variable_supply_pdo_source

uint32_t **raw_value**

Raw PDO value.

union **pd_variable_supply_pdo_sink**

#include <usbc_pd.h> Create a Variable Supply PDO Sink value See Table 6-15 Variable Supply (non-Battery) PDO - Sink.

Public Members

uint32_t **operational_current**

operational Current in 10mA units

uint32_t **min_voltage**

Minimum Voltage in 50mV units.

uint32_t **max_voltage**

Maximum Voltage in 50mV units.

enum *pdo_type* **type**

Variable supply.

SET TO PDO_VARIABLE

struct pd_variable_supply_pdo_sink

uint32_t **raw_value**

Raw PDO value.

union **pd_battery_supply_pdo_source**

#include <usbc_pd.h> Create a Battery Supply PDO Source value See Table 6-12 Battery Supply PDO - Source.

Public Members

uint32_t **max_power**

Maximum Allowable Power in 250mW units.

uint32_t **min_voltage**

Minimum Voltage in 50mV units.

uint32_t **max_voltage**

Maximum Voltage in 50mV units.

enum *pdo_type* **type**

Battery supply.

SET TO PDO_BATTERY

struct pd_battery_supply_pdo_source

uint32_t **raw_value**

Raw PDO value.

union **pd_battery_supply_pdo_sink**

#include <usbc_pd.h> Create a Battery Supply PDO Sink value See Table 6-16 Battery Supply PDO - Sink.

Public Members

uint32_t **operational_power**

Operational Power in 250mW units.

uint32_t **min_voltage**

Minimum Voltage in 50mV units.

uint32_t **max_voltage**

Maximum Voltage in 50mV units.

enum *pdo_type* **type**

Battery supply.

SET TO PDO_BATTERY

struct pd_battery_supply_pdo_sink

uint32_t **raw_value**

Raw PDO value.

union **pd_augmented_supply_pdo_source**

#include <usbc_pd.h> Create Augmented Supply PDO Source value See Table 6-13 Programmable Power Supply APDO - Source.

Public Members

uint32_t **max_current**
: Maximum Current in 50mA increments.

uint32_t **reserved0**
: Reserved – Shall be set to zero.

uint32_t **min_voltage**
: Minimum Voltage in 100mV increments.

uint32_t **reserved1**
: Reserved – Shall be set to zero.

uint32_t **max_voltage**
: Maximum Voltage in 100mV increments.

uint32_t **reserved2**
: Reserved – Shall be set to zero.

uint32_t **pps_power_limited**
: PPS Power Limited.

uint32_t **reserved3**
: 00b – Programmable Power Supply 01b…11b - Reserved, Shall Not be used Setting as reserved because it defaults to 0 when not set.

enum *pdo_type* **type**
: Augmented Power Data Object (APDO).

  SET TO PDO_AUGMENTED

struct pd_augmented_supply_pdo_source

uint32_t **raw_value**
: Raw PDO value.

union **pd_augmented_supply_pdo_sink**
: *#include <usbc_pd.h>* Create Augmented Supply PDO Sink value See Table 6-17 Programmable Power Supply APDO - Sink.

Public Members

uint32_t **max_current**
: Maximum Current in 50mA increments.

uint32_t **reserved0**
: Reserved – Shall be set to zero.

uint32_t **min_voltage**
: Minimum Voltage in 100mV increments.

uint32_t **reserved1**

Reserved – Shall be set to zero.

uint32_t **max_voltage**

Maximum Voltage in 100mV increments.

uint32_t **reserved2**

Reserved – Shall be set to zero.

uint32_t **reserved3**

00b – Programmable Power Supply 01b…11b - Reserved, Shall Not be used Setting as reserved because it defaults to 0 when not set.

enum *pdo_type* **type**

Augmented Power Data Object (APDO).

SET TO PDO_AUGMENTED

struct pd_augmented_supply_pdo_sink

uint32_t **raw_value**

Raw PDO value.

union **pd_rdo**

#include <usbc_pd.h> The Request Data Object (RDO) Shall be returned by the Sink making a request for power.

See Section 6.4.2 Request Message

Public Members

uint32_t **min_or_max_operating_current**

Operating Current 10mA units NOTE: If Give Back Flag is zero, this field is the Maximum Operating Current.

If Give Back Flag is one, this field is the Minimum Operating Current.

uint32_t **operating_current**

Operating current in 10mA units.

Operating Current 50mA units.

uint32_t **reserved0**

Reserved - Shall be set to zero.

uint32_t **unchunked_ext_msg_supported**

Unchunked Extended Messages Supported.

uint32_t **no_usb_suspend**

No USB Suspend.

uint32_t **usb_comm_capable**
: USB Communications Capable.

uint32_t **cap_mismatch**
: Capability Mismatch.

uint32_t **giveback**
: Give Back Flag.

uint32_t **object_pos**
: Object Position (000b is Reserved and Shall Not be used)

uint32_t **reserved1**
: Reserved - Shall be set to zero.

struct *pd_rdo* **fixed**
: Create a Fixed RDO value See Table 6-19 Fixed and Variable Request Data Object.

struct *pd_rdo* **variable**
: Create a Variable RDO value See Table 6-19 Fixed and Variable Request Data Object.

uint32_t **min_operating_power**
: Minimum Operating Power in 250mW units.

uint32_t **operating_power**
: Operating power in 250mW units.

struct *pd_rdo* **battery**
: Create a Battery RDO value See Table 6-20 Battery Request Data Object.

uint32_t **output_voltage**
: Output Voltage in 20mV units.

uint32_t **reserved2**
: Reserved - Shall be set to zero.

uint32_t **reserved3**
: Reserved - Shall be set to zero.

struct *pd_rdo* **augmented**
: Create an Augmented RDO value See Table 6-22 Programmable Request Data Object.

uint32_t **raw_value**
: Raw RDO value.

struct **pd_msg**
: *#include <usbc_pd.h>* Power Delivery message.

Public Members

enum *pd_packet_type* **type**
Type of this packet.

union *pd_header* **header**
Header of this message.

uint32_t **len**
Length of bytes in data.

uint8_t **data**[260]
Message data.

7.6.50 Time-aware General-Purpose Input/Output (TGPIO)

Overview

Configuration Options

Related configuration options:

- CONFIG_TIMEAWARE_GPIO

API Reference

Related code samples

Time-aware GPIO
Synchronize clocks.

group **tgpio_interface**
Time-aware GPIO Interface.

Since
3.5

Version
0.1.0

Enums

enum **tgpio_pin_polarity**
Event polarity.

Values:

enumerator **TGPIO_RISING_EDGE** = 0

enumerator TGPIO_FALLING_EDGE

enumerator TGPIO_TOGGLE_EDGE

Functions

int tgpio_port_get_time(const struct *device* *dev, uint64_t *current_time)

Get time from ART timer.

Parameters

- dev – TGPIO device
- current_time – Pointer to store timer value in cycles

Returns
0 if successful

Returns
negative errno code on failure.

int tgpio_port_get_cycles_per_second(const struct *device* *dev, uint32_t *cycles)

Get current running rate.

Parameters

- dev – TGPIO device
- cycles – pointer to store current running frequency

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_disable(const struct *device* *dev, uint32_t pin)

Disable operation on pin.

Parameters

- dev – TGPIO device
- pin – TGPIO pin

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_config_ext_timestamp(const struct *device* *dev, uint32_t pin, uint32_t event_polarity)

Enable/Continue operation on pin.

Parameters

- dev – TGPIO device
- pin – TGPIO pin
- event_polarity – TGPIO pin event polarity

Returns
0 if successful, negative errno code on failure.

int tgpio_pin_periodic_output(const struct *device* *dev, uint32_t pin, uint64_t start_time, uint64_t repeat_interval, bool periodic_enable)

Enable periodic pulse generation on a pin.

Parameters

- `dev` – TGPIO device
- `pin` – TGPIO pin
- `start_time` – start_time of first pulse in hw cycles
- `repeat_interval` – repeat interval between two pulses in hw cycles
- `periodic_enable` – enables periodic mode if 'true' is passed.

Returns
0 if successful, negative errno code on failure.

int `tgpio_pin_read_ts_ec`(const struct *device* *dev, uint32_t pin, uint64_t *timestamp, uint64_t *event_count)

Read timestamp and event counter from TGPIO.

Parameters

- `dev` – TGPIO device
- `pin` – TGPIO pin
- `timestamp` – timestamp of the last pulse received
- `event_count` – number of pulses received since the pin is enabled

Returns
0 if successful, negative errno code on failure.

7.6.51 Video

The video driver API offers a generic interface to video devices.

Basic Operation

Video Device A video device is the abstraction of a hardware or software video function, which can produce, process, consume or transform video data. The video API is designed to offer flexible way to create, handle and combine various video devices.

Endpoint Each video device can have one or more endpoints. Output endpoints configure video output function and generate data. Input endpoints configure video input function and consume data.

Video Buffer A video buffer provides the transport mechanism for the data. There is no particular requirement on the content. The requirement for the content is defined by the endpoint format. A video buffer can be queued to a device endpoint for filling (input ep) or consuming (output ep) operation, once the operation is achieved, buffer can be dequeued for post-processing, release or reuse.

Controls A video control is accessed and identified by a CID (control identifier). It represents a video control property. Different devices will have different controls available which can be generic, related to a device class or vendor specific. The set/get control functions provide a generic scalable interface to handle and create controls.

Defines

`video_fourcc`(a, b, c, d)

Typedefs

typedef int (*`video_api_set_format_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_format* *fmt)

Set video format.

See *video_set_format()* for argument descriptions.

typedef int (*`video_api_get_format_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_format* *fmt)

Get current video format.

See *video_get_format()* for argument descriptions.

typedef int (*`video_api_enqueue_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_buffer* *buf)

Enqueue a buffer in the driver's incoming queue.

See *video_enqueue()* for argument descriptions.

typedef int (*`video_api_dequeue_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_buffer* **buf, *k_timeout_t* timeout)

Dequeue a buffer from the driver's outgoing queue.

See *video_dequeue()* for argument descriptions.

typedef int (*`video_api_flush_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, bool cancel)

Flush endpoint buffers, buffer are moved from incoming queue to outgoing queue.

See *video_flush()* for argument descriptions.

typedef int (*`video_api_stream_start_t`)(const struct *device* *dev)

Start the capture or output process.

See *video_stream_start()* for argument descriptions.

typedef int (*`video_api_stream_stop_t`)(const struct *device* *dev)

Stop the capture or output process.

See *video_stream_stop()* for argument descriptions.

typedef int (*`video_api_set_ctrl_t`)(const struct *device* *dev, unsigned int cid, void *value)

Set a video control value.

See *video_set_ctrl()* for argument descriptions.

typedef int (*`video_api_get_ctrl_t`)(const struct *device* *dev, unsigned int cid, void *value)

Get a video control value.

See *video_get_ctrl()* for argument descriptions.

typedef int (*`video_api_get_caps_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_caps* *caps)

Get capabilities of a video endpoint.

See *video_get_caps()* for argument descriptions.

typedef int (*`video_api_set_signal_t`)(const struct *device* *dev, enum *video_endpoint_id* ep, struct *k_poll_signal* *signal)

Register/Unregister poll signal for buffer events.

See *video_set_signal()* for argument descriptions.

Enums

enum `video_endpoint_id`

video_endpoint_id enum

Identify the video device endpoint.

Values:

enumerator `VIDEO_EP_NONE`

enumerator VIDEO_EP_ANY

enumerator VIDEO_EP_IN

enumerator VIDEO_EP_OUT

enum video_signal_result

video_event enum

Identify video event.

Values:

enumerator VIDEO_BUF_DONE

enumerator VIDEO_BUF_ABORTED

enumerator VIDEO_BUF_ERROR

Functions

static inline int **video_set_format**(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_format* *fmt)

Set video format.

Configure video device with a specific format.

Parameters

- dev – Pointer to the device structure for the driver instance.
- ep – Endpoint ID.
- fmt – Pointer to a video format struct.

Return values

- 0 – Is successful.
- -EINVAL – If parameters are invalid.
- -ENOTSUP – If format is not supported.
- -EIO – General input / output error.

static inline int **video_get_format**(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_format* *fmt)

Get video format.

Get video device current video format.

Parameters

- dev – Pointer to the device structure for the driver instance.
- ep – Endpoint ID.
- fmt – Pointer to video format struct.

Return values

pointer – to video format

static inline int `video_enqueue`(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_buffer* *buf)

Enqueue a video buffer.

Enqueue an empty (capturing) or filled (output) video buffer in the driver's endpoint incoming queue.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `buf` – Pointer to the video buffer.

Return values

- `0` – Is successful.
- `-EINVAL` – If parameters are invalid.
- `-EIO` – General input / output error.

static inline int `video_dequeue`(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_buffer* **buf, *k_timeout_t* timeout)

Dequeue a video buffer.

Dequeue a filled (capturing) or displayed (output) buffer from the driver's endpoint outgoing queue.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `buf` – Pointer a video buffer pointer.
- `timeout` – Timeout

Return values

- `0` – Is successful.
- `-EINVAL` – If parameters are invalid.
- `-EIO` – General input / output error.

static inline int `video_flush`(const struct *device* *dev, enum *video_endpoint_id* ep, bool cancel)

Flush endpoint buffers.

A call to flush finishes when all endpoint buffers have been moved from incoming queue to outgoing queue. Either because canceled or fully processed through the video function.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `cancel` – If true, cancel buffer processing instead of waiting for completion.

Return values

`0` – Is successful, -ERRNO code otherwise.

static inline int **video_stream_start**(const struct *device* *dev)

Start the video device function.

video_stream_start is called to enter 'streaming' state (capture, output...). The driver may receive buffers with *video_enqueue()* before video_stream_start is called. If driver/device needs a minimum number of buffers before being able to start streaming, then driver set the min_vbuf_count to the related endpoint capabilities.

Return values

- `0` – Is successful.
- `-EIO` – General input / output error.

static inline int **video_stream_stop**(const struct *device* *dev)

Stop the video device function.

On video_stream_stop, driver must stop any transactions or wait until they finish.

Return values

- `0` – Is successful.
- `-EIO` – General input / output error.

static inline int **video_get_caps**(const struct *device* *dev, enum *video_endpoint_id* ep, struct *video_caps* *caps)

Get the capabilities of a video endpoint.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `caps` – Pointer to the *video_caps* struct to fill.

Return values

`0` – Is successful, -ERRNO code otherwise.

static inline int **video_set_ctrl**(const struct *device* *dev, unsigned int cid, void *value)

Set the value of a control.

This set the value of a video control, value type depends on control ID, and must be interpreted accordingly.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cid` – Control ID.
- `value` – Pointer to the control value.

Return values

- `0` – Is successful.
- `-EINVAL` – If parameters are invalid.
- `-ENOTSUP` – If format is not supported.
- `-EIO` – General input / output error.

static inline int **video_get_ctrl**(const struct *device* *dev, unsigned int cid, void *value)

Get the current value of a control.

This retrieve the value of a video control, value type depends on control ID, and must be interpreted accordingly.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `cid` – Control ID.
- `value` – Pointer to the control value.

Return values

- `0` – Is successful.
- `-EINVAL` – If parameters are invalid.
- `-ENOTSUP` – If format is not supported.
- `-EIO` – General input / output error.

static inline int `video_set_signal`(const struct *device* *dev, enum *video_endpoint_id* ep, struct *k_poll_signal* *signal)

Register/Unregister k_poll signal for a video endpoint.

Register a poll signal to the endpoint, which will be signaled on frame completion (done, aborted, error). Registering a NULL poll signal unregisters any previously registered signal.

Parameters

- `dev` – Pointer to the device structure for the driver instance.
- `ep` – Endpoint ID.
- `signal` – Pointer to *k_poll_signal*

Return values

`0` – Is successful, -ERRNO code otherwise.

struct *video_buffer* *`video_buffer_aligned_alloc`(size_t size, size_t align)

Allocate aligned video buffer.

Parameters

- `size` – Size of the video buffer (in bytes).
- `align` – Alignment of the requested memory, must be a power of two.

Return values

`pointer` – to allocated video buffer

struct *video_buffer* *`video_buffer_alloc`(size_t size)

Allocate video buffer.

Parameters

- `size` – Size of the video buffer (in bytes).

Return values

`pointer` – to allocated video buffer

void `video_buffer_release`(struct *video_buffer* *buf)

Release a video buffer.

Parameters

- `buf` – Pointer to the video buffer to release.

struct `video_format`

#include <*video.h*> Video format structure.

Used to configure frame format.

Public Members

uint32_t **pixelformat**
FourCC pixel format value (Video pixel formats)

uint32_t **width**
frame width in pixels.

uint32_t **height**
frame height in pixels.

uint32_t **pitch**
line stride.

This is the number of bytes that needs to be added to the address in the first pixel of a row in order to go to the address of the first pixel of the next row (>=width).

struct **video_format_cap**
#include <*video.h*> Video format capability.

Used to describe a video endpoint format capability.

Public Members

uint32_t **pixelformat**
FourCC pixel format value (Video pixel formats).

uint32_t **width_min**
minimum supported frame width in pixels.

uint32_t **width_max**
maximum supported frame width in pixels.

uint32_t **height_min**
minimum supported frame height in pixels.

uint32_t **height_max**
maximum supported frame height in pixels.

uint16_t **width_step**
width step size in pixels.

uint16_t **height_step**
height step size in pixels.

struct **video_caps**
#include <*video.h*> Video format capabilities.

Used to describe video endpoint capabilities.

Public Members

const struct *video_format_cap* ***format_caps**
: list of video format capabilities (zero terminated).

uint8_t **min_vbuf_count**
: minimal count of video buffers to enqueue before being able to start the stream.

struct **video_buffer**
: *#include* <*video.h*> Video buffer structure.

Represent a video frame.

Public Members

void ***driver_data**
: pointer to driver specific data.

uint8_t ***buffer**
: pointer to the start of the buffer.

uint32_t **size**
: size of the buffer in bytes.

uint32_t **bytesused**
: number of bytes occupied by the valid data in the buffer.

uint32_t **timestamp**
: time reference in milliseconds at which the last data byte was actually received for input endpoints or to be consumed for output endpoints.

struct **video_driver_api**
: *#include* <*video.h*>

group **video_controls**
: Video controls.

Control classes

VIDEO_CTRL_CLASS_GENERIC
: Generic class controls.

VIDEO_CTRL_CLASS_CAMERA
: Camera class controls.

VIDEO_CTRL_CLASS_MPEG
: MPEG-compression controls.

`VIDEO_CTRL_CLASS_JPEG`
: JPEG-compression controls.

`VIDEO_CTRL_CLASS_VENDOR`
: Vendor-specific class controls.

Generic class control IDs

`VIDEO_CID_HFLIP`
: Mirror the picture horizontally.

`VIDEO_CID_VFLIP`
: Mirror the picture vertically.

Camera class control IDs

`VIDEO_CID_CAMERA_EXPOSURE`

`VIDEO_CID_CAMERA_GAIN`

`VIDEO_CID_CAMERA_ZOOM`

`VIDEO_CID_CAMERA_BRIGHTNESS`

`VIDEO_CID_CAMERA_SATURATION`

`VIDEO_CID_CAMERA_WHITE_BAL`

`VIDEO_CID_CAMERA_CONTRAST`

`VIDEO_CID_CAMERA_COLORBAR`

`VIDEO_CID_CAMERA_QUALITY`

7.6.52 Watchdog

Overview

API Reference

Related code samples

Watchdog
: Use the watchdog driver API to reset the board when it gets stuck in an infinite loop.

group `watchdog_interface`

Watchdog Interface.

Since
1.0

Version
1.0.0

Watchdog options

`WDT_OPT_PAUSE_IN_SLEEP`

Pause watchdog timer when CPU is in sleep state.

`WDT_OPT_PAUSE_HALTED_BY_DBG`

Pause watchdog timer when CPU is halted by the debugger.

Watchdog behavior flags

`WDT_FLAG_RESET_NONE`

Reset: none.

`WDT_FLAG_RESET_CPU_CORE`

Reset: CPU core.

`WDT_FLAG_RESET_SOC`

Reset: SoC.

Typedefs

typedef void (***wdt_callback_t**)(const struct *device* *dev, int channel_id)

Watchdog callback.

Param dev
Watchdog device instance.

Param channel_id
Channel identifier.

Functions

int **wdt_setup**(const struct *device* *dev, uint8_t options)

Set up watchdog instance.

This function is used for configuring global watchdog settings that affect all timeouts. It should be called after installing timeouts. After successful return, all installed timeouts are valid and must be serviced periodically by calling *wdt_feed()*.

Parameters

- **dev** – Watchdog device instance.
- **options** – Configuration options (see *WDT_OPT*).

Return values

- **0** – If successful.
- **-ENOTSUP** – If any of the set options is not supported.
- **-EBUSY** – If watchdog instance has been already setup.
- **-errno** – In case of any other failure.

int **wdt_disable**(const struct *device* *dev)

Disable watchdog instance.

This function disables the watchdog instance and automatically uninstalls all timeouts. To set up a new watchdog, install timeouts and call *wdt_setup()* again. Not all watchdogs can be restarted after they are disabled.

Parameters

- **dev** – Watchdog device instance.

Return values

- **0** – If successful.
- **-EFAULT** – If watchdog instance is not enabled.
- **-EPERM** – If watchdog can not be disabled directly by application code.
- **-errno** – In case of any other failure.

static inline int **wdt_install_timeout**(const struct *device* *dev, const struct *wdt_timeout_cfg* *cfg)

Install a new timeout.

Note

This function must be used before *wdt_setup()*. Changes applied here have no effects until *wdt_setup()* is called.

Parameters

- **dev** – Watchdog device instance.
- **cfg** – **[in]** Timeout configuration.

Return values

- **channel_id** – If successful, a non-negative value indicating the index of the channel to which the timeout was assigned. This value is supposed to be used as the parameter in calls to *wdt_feed()*.
- **-EBUSY** – If timeout can not be installed while watchdog has already been setup.
- **-ENOMEM** – If no more timeouts can be installed.

- `-ENOTSUP` – If any of the set flags is not supported.
- `-EINVAL` – If any of the window timeout value is out of possible range. This value is also returned if watchdog supports only one timeout value for all timeouts and the supplied timeout window differs from windows for alarms installed so far.
- `-errno` – In case of any other failure.

int `wdt_feed`(const struct *device* *dev, int channel_id)

Feed specified watchdog timeout.

Parameters

- `dev` – Watchdog device instance.
- `channel_id` – Channel index.

Return values

- `0` – If successful.
- `-EAGAIN` – If completing the feed operation would stall the caller, for example due to an in-progress watchdog operation such as a previous *wdt_feed()* call.
- `-EINVAL` – If there is no installed timeout for supplied channel.
- `-errno` – In case of any other failure.

struct `wdt_window`

#include <*watchdog.h*> Watchdog timeout window.

Each installed timeout needs feeding within the specified time window, otherwise the watchdog will trigger. If the watchdog instance does not support window timeouts then min value must be equal to 0.

Note

If specified values can not be precisely set they are always rounded up.

Public Members

uint32_t `min`

Lower limit of watchdog feed timeout in milliseconds.

uint32_t `max`

Upper limit of watchdog feed timeout in milliseconds.

struct `wdt_timeout_cfg`

#include <*watchdog.h*> Watchdog timeout configuration.

Public Members

struct *wdt_window* `window`

Timing parameters of watchdog timeout.

wdt_callback_t **callback**

Timeout callback (can be NULL).

struct *wdt_timeout_cfg* ***next**

Pointer to the next timeout configuration.

This field is only available if CONFIG_WDT_MULTISTAGE is enabled (watchdogs with staged timeouts functionality). Value must be NULL for single stage timeout.

uint8_t **flags**

Flags (see *WDT_FLAGS*).

7.7 Pin Control

This is a high-level guide to pin control. See *Pin Control API* for API reference material.

7.7.1 Introduction

The hardware blocks that control pin multiplexing and pin configuration parameters such as pin direction, pull-up/down resistors, etc. are named **pin controllers**. The pin controller's main users are SoC hardware peripherals, since the controller enables exposing peripheral signals, like for example, map I2C0 SDA signal to pin PX0. Not only that, but it usually allows configuring certain pin settings that are necessary for the correct functioning of a peripheral, for example, the slew-rate depending on the operating frequency. The available configuration options are vendor/SoC dependent and can range from simple pull-up/down options to more advanced settings such as debouncing, low-power modes, etc.

The way pin control is implemented in hardware is vendor/SoC specific. It is common to find a *centralized* approach, that is, all pin configuration parameters are controlled by a single hardware block (typically named pinmux), including signal mapping. The figure below illustrates this approach. PX0 can be mapped to UART0_TX, I2C0_SCK or SPI0_MOSI depending on the AF control bits. Other configuration parameters such as pull-up/down are controlled in the same block via CONFIG bits. This model is used by several SoC families, such as many from NXP and STM32.

Other vendors/SoCs use a *distributed* approach. In such case, the pin mapping and configuration are controlled by multiple hardware blocks. The figure below illustrates a distributed approach where pin mapping is controlled by peripherals, such as in Nordic nRF SoCs.

From a user perspective, there is no difference in pin controller usage regardless of the hardware implementation: a user will always apply a state. The only difference lies in the driver implementation. In general, implementing a pin controller driver for a hardware that uses a distributed approach requires more effort, since the driver needs to gather knowledge of peripheral dependent registers.

Pin control vs. GPIO

Some functionality covered by a pin controller driver overlaps with GPIO drivers. For example, pull-up/down resistors can usually be enabled by both the pin control driver and the GPIO driver. In Zephyr context, the pin control driver purpose is to perform peripheral signal multiplexing and configuration of other pin parameters required for the correct operation of that peripheral. Therefore, the main users of the pin control driver are SoC peripherals. In contrast, GPIO drivers are for general purpose control of a pin, that is, when its logic level is read or controlled manually.

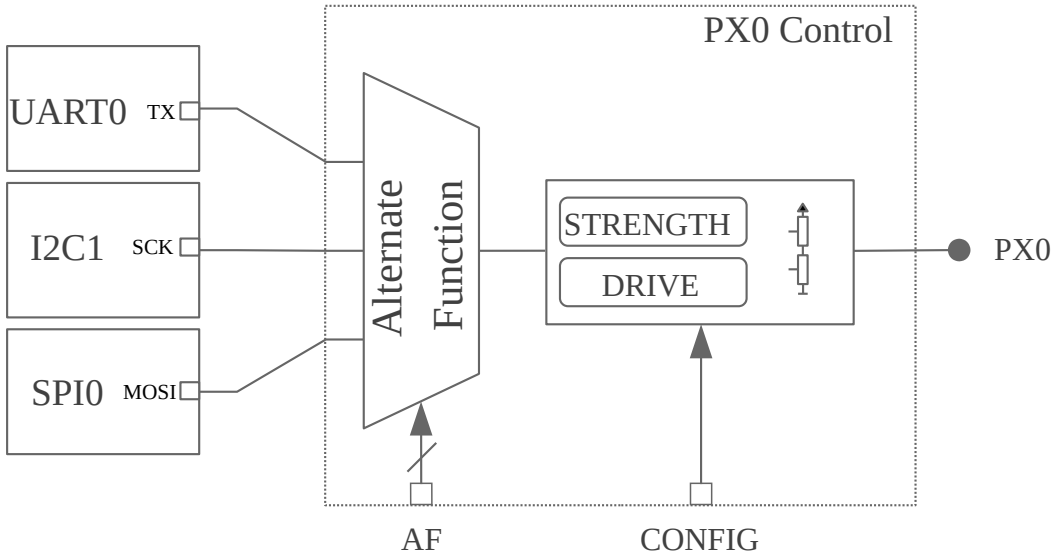

Fig. 3: Example of pin control centralized into a single per-pin block

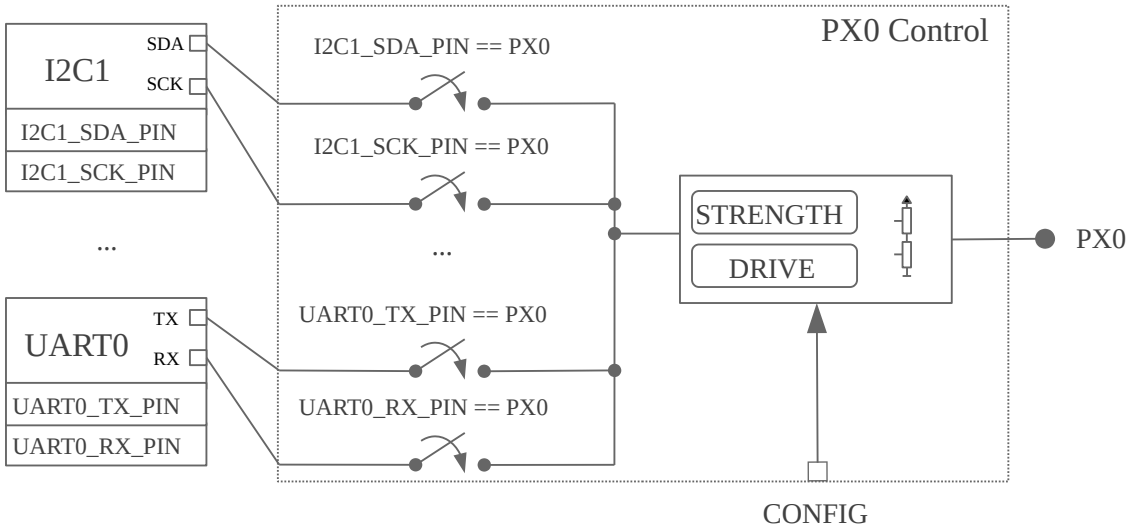

Fig. 4: Example pin control distributed between peripheral registers and per-pin block

7.7.2 State model

For a device driver to operate correctly, a certain pin configuration needs to be applied. Some device drivers require a static configuration, usually set up at initialization time. Others need to change the configuration at runtime depending on the operating conditions, for example, to enable a low-power mode when suspending the device. Such requirements are modeled using **states**, a concept that has been adapted from the one in the Linux kernel. Each device driver owns a set of states. Each state has a unique name and contains a full pin configuration set (see the figure below). This effectively means that states are independent of each other, so they do not need to be applied in any specific order. Another advantage of the state model is that it isolates device drivers from pin configuration.

Table 2: Example pin configuration encoded using the states model

`UART0` peripheral			
`default` state		`sleep` state	
TX	• Pin: PA0 • Pull: NONE • Low Power: NO	TX	• Pin: PA0 • Pull: NONE • Low Power: YES
RX	• Pin: PA1 • Pull: UP • Low Power: NO	RX	• Pin: PA1 • Pull: NONE • Low Power: YES

Standard states

The name assigned to pin control states or the number of them is up to the device driver requirements. In many cases a single state applied at initialization time will be sufficient, but in some other cases more will be required. In order to make things consistent, a naming convention has been established for the most common use cases. The figure below details the standardized states and its purpose.

Table 3: Standardized state names

State	Identifier	Purpose
`default`	*PINCTRL_STATE_DEFAULT*	State of the pins when the device is in operational state
`sleep`	*PINCTRL_STATE_SLEEP*	State of the pins when the device is in low power or sleep modes

Note that other standard states could be introduced in the future.

Custom states

Some device drivers may require using custom states beyond the standard ones. To achieve that, the device driver needs to have in its scope definitions for the custom state identifiers named as `PINCTRL_STATE_{STATE_NAME}`, where `{STATE_NAME}` is the capitalized state name. For example, if `mystate` has to be supported, a definition named `PINCTRL_STATE_MYSTATE` needs to be in the driver's scope.

> **Note**
>
> It is important that custom state identifiers start from *PINCTRL_STATE_PRIV_START*

If custom states need to be accessed from outside the driver, for example to perform dynamic pin control, custom identifiers should be placed in a header that is publicly accessible.

Skipping states

In most situations, the states defined in Devicetree will be the ones used in the compiled firmware. However, there are some cases where certain states will be conditionally used depending on a compilation flag. A typical case is the `sleep` state. This state is only used in practice if `CONFIG_PM` or `CONFIG_PM_DEVICE` is enabled. If a firmware variant without these power management configurations is needed, one should in theory remove the `sleep` state from Devicetree to not waste ROM space storing such unused state.

States can be skipped by the `pinctrl` Devicetree macros if a definition named `PINCTRL_SKIP_{STATE_NAME}` expanding to `1` is present when pin control configuration is defined. In case of the `sleep` state, the `pinctrl` API already provides such definition conditional to the availability of device power management:

```
#if !defined(CONFIG_PM) && !defined(CONFIG_PM_DEVICE)
/** Out of power management configurations, ignore "sleep" state. */
#define PINCTRL_SKIP_SLEEP 1
#endif
```

7.7.3 Dynamic pin control

Dynamic pin control refers to the capability of changing pin configuration at runtime. This feature can be useful in situations where the same firmware needs to run onto slightly different boards, each having a peripheral routed at a different set of pins. This feature can be enabled by setting `CONFIG_PINCTRL_DYNAMIC`.

> **Note**
>
> Dynamic pin control should only be used on devices that have not been initialized. Changing pin configurations while a device is operating may lead to unexpected behavior. Since Zephyr does not support device de-initialization yet, this functionality should only be used during early boot stages.

One of the effects of enabling dynamic pin control is that *pinctrl_dev_config* will be stored in RAM instead of ROM (not states or pin configurations, though). The user can then use *pinctrl_update_states()* to update the states stored in *pinctrl_dev_config* with a new set. This effectively means that the device driver will apply the pin configurations stored in the updated states when it applies a state.

7.7.4 Devicetree representation

Because Devicetree is meant to describe hardware, it is the natural choice when it comes to storing pin control configuration. In the following sections you will find an overview on how states and pin configurations are represented in Devicetree.

States

Given a device, each of its pin control state is represented in Devicetree by `pinctrl-N` properties, being `N` the state index starting from zero. The `pinctrl-names` property is then used to assign a unique identifier for each state property by index, for example, `pinctrl-names` list entry 0 is the name for `pinctrl-0`.

```
periph0: periph@0 {
    ...
    /* state 0 ("default") */
    pinctrl-0 = <...>;
    ...
    /* state N ("mystate") */
    pinctrl-N = <...>;
    /* names for state 0 up to state N */
    pinctrl-names = "default", ..., "mystate";
    ...
};
```

Pin configuration

There are multiple ways to represent the pin configurations in Devicetree. However, all end up encoding the same information: the pin multiplexing and the pin configuration parameters. For example, `UART_RX` is mapped to `PX0` and pull-up is enabled. The representation choice largely depends on each vendor/SoC, so the Devicetree binding files for the pin control drivers are the best place to look for details.

A popular and versatile option is shown in the example below. One of the advantages of this choice is the grouping capability based on shared pin configuration. This allows to reduce the verbosity of the pin control definitions. Another advantage is that the pin configuration parameters for a particular state are enclosed in a single Devicetree node.

```
/* board.dts */
#include "board-pinctrl.dtsi"

&periph0 {
    pinctrl-0 = <&periph0_default>;
    pinctrl-names = "default";
};
```

```
/* vnd-soc-pkgxx.h
 * File with valid mappings for a specific package (may be autogenerated).
 * This file is optional, but recommended.
 */
...
#define PERIPH0_SIGA_PX0 VNDSOC_PIN(X, 0, MUX0)
#define PERIPH0_SIGB_PY7 VNDSOC_PIN(Y, 7, MUX4)
#define PERIPH0_SIGC_PZ1 VNDSOC_PIN(Z, 1, MUX2)
...
```

```
/* board-pinctrl.dtsi */
#include <vnd-soc-pkgxx.h>

&pinctrl {
    /* Node with pin configuration for default state */
    periph0_default: periph0_default {
        group1 {
            /* Mappings: PERIPH0_SIGA -> PX0, PERIPH0_SIGC -> PZ1 */
            pinmux = <PERIPH0_SIGA_PX0>, <PERIPH0_SIGC_PZ1>;
```

(continues on next page)

(continued from previous page)

```
            /* Pins PX0 and PZ1 have pull-up enabled */
            bias-pull-up;
        };
        ...
        groupN {
            /* Mappings: PERIPH0_SIGB -> PY7 */
            pinmux = <PERIPH0_SIGB_PY7>;
        };
    };
};
```

Another popular model is based on having a node for each pin configuration and state. While this model may lead to shorter board pin control files, it also requires to have one node for each pin mapping and state, since in general, nodes can not be re-used for multiple states. This method is discouraged if autogeneration is not an option.

Note

Because all Devicetree information is parsed into a C header, it is important to make sure its size is kept to a minimum. For this reason it is important to prefix pre-generated nodes with `/omit-if-no-ref/`. This prefix makes sure that the node is discarded when not used.

```
/* board.dts */
#include "board-pinctrl.dtsi"

&periph0 {
    pinctrl-0 = <&periph0_siga_px0_default &periph0_sigb_py7_default
                 &periph0_sigc_pz1_default>;
    pinctrl-names = "default";
};
```

```
/* vnd-soc-pkgxx.dtsi
 * File with valid nodes for a specific package (may be autogenerated).
 * This file is optional, but recommended.
 */

&pinctrl {
    /* Mapping for PERIPH0_SIGA -> PX0, to be used for default state */
    /omit-if-no-ref/ periph0_siga_px0_default: periph0_siga_px0_default {
        pinmux = <VNDSOC_PIN(X, 0, MUX0)>;
    };

    /* Mapping for PERIPH0_SIGB -> PY7, to be used for default state */
    /omit-if-no-ref/ periph0_sigb_py7_default: periph0_sigb_py7_default {
        pinmux = <VNDSOC_PIN(Y, 7, MUX4)>;
    };

    /* Mapping for PERIPH0_SIGC -> PZ1, to be used for default state */
    /omit-if-no-ref/ periph0_sigc_pz1_default: periph0_sigc_pz1_default {
        pinmux = <VNDSOC_PIN(Z, 1, MUX2)>;
    };
};
```

```
/* board-pinctrl.dts */
#include <vnd-soc-pkgxx.dtsi>

/* Enable pull-up for PX0 (default state) */
&periph0_siga_px0_default {
```

(continues on next page)

(continued from previous page)

```
    bias-pull-up;
};

/* Enable pull-up for PZ1 (default state) */
&periph0_sigc_pz1_default {
    bias-pull-up;
};
```

Note

It is discouraged to add pin configuration defaults in pre-defined nodes. In general, pin configurations depend on the board design or on the peripheral working conditions, so the decision should be made by the board. For example, enabling a pull-up by default may not always be desired because the board already has one or because its value depends on the operating bus speed. Another downside of defaults is that user may not be aware of them, for example:

```
/* not evident that "periph0_siga_px0_default" also implies "bias-pull-up" */
/omit-if-no-ref/ periph0_siga_px0_default: periph0_siga_px0_default {
    pinmux = <VNDSOC_PIN(X, 0, MUX0)>;
    bias-pull-up;
};
```

7.7.5 Implementation guidelines

Pin control drivers

Pin control drivers need to implement a single function: *pinctrl_configure_pins()*. This function receives an array of pin configurations that need to be applied. Furthermore, if CONFIG_PINCTRL_STORE_REG is set, it also receives the associated device register address for the given pins. This information may be required by some drivers to perform device specific actions.

The pin configuration is stored in an opaque type that is vendor/SoC dependent: pinctrl_soc_pin_t. This type needs to be defined in a header named pinctrl_soc.h file that is in the Zephyr's include path. It can range from a simple integer value to a struct with multiple fields. pinctrl_soc.h also needs to define a macro named Z_PINCTRL_STATE_PINS_INIT that accepts two arguments: a node identifier and a property name (pinctrl-N). With this information the macro needs to define an initializer for all pin configurations contained within the pinctrl-N property of the given node.

Regarding Devicetree pin configuration representation, vendors can decide which option is better for their devices. However, the following guidelines should be followed:

- Use pinctrl-N (N=0, 1, ...) and pinctrl-names properties to define pin control states. These properties are defined in dts/bindings/pinctrl/pinctrl-device.yaml.
- Use standard pin configuration properties as defined in dts/bindings/pinctrl/pincfg-node.yaml.

Representations not following these guidelines may be accepted if they are already used by the same vendor in other operating systems, e.g. Linux.

Device drivers

In this section you will find some tips on how a device driver should use the pinctrl API to successfully configure the pins it needs.

The device compatible needs to be modified in the corresponding binding so that the `pinctrl-device.yaml` is included. For example:

```
include: [base.yaml, pinctrl-device.yaml]
```

This file is needed to add `pinctrl-N` and `pinctrl-names` properties to the device.

From a device driver perspective there are two steps that need to be performed to be able to use the `pinctrl` API. First, the pin control configuration needs to be defined. This includes all states and pins. *PINCTRL_DT_DEFINE* or *PINCTRL_DT_INST_DEFINE* macros should be used for this purpose. Second, a reference to the device instance *pinctrl_dev_config* needs to be stored, since it is required to later use the API. This can be achieved using the *PINCTRL_DT_DEV_CONFIG_GET* and *PINCTRL_DT_INST_DEV_CONFIG_GET* macros.

It is worth to note that the only relationship between a device and its associated pin control configuration is based on variable naming conventions. The way an instance of *pinctrl_dev_config* is named for a corresponding device instance allows to later obtain a reference to it given the device's Devicetree node identifier. This allows to minimize ROM usage, since only devices requiring pin control will own a reference to a pin control configuration.

Once the driver has defined the pin control configuration and kept a reference to it, it is ready to use the API. The most common way to apply a state is by using *pinctrl_apply_state()*. It is also possible to use the lower level function *pinctrl_apply_state_direct()* to skip state lookup if it is cached in advance (e.g. at init time). Since state lookup time is expected to be fast, it is recommended to use *pinctrl_apply_state()*.

The example below contains a complete example of a device driver that uses the `pinctrl` API.

```
/* A driver for the "mydev" compatible device */
#define DT_DRV_COMPAT mydev

...
#include <zephyr/drivers/pinctrl.h>
...

struct mydev_config {
    ...
    /* Reference to mydev pinctrl configuration */
    const struct pinctrl_dev_config *pcfg;
    ...
};

...

static int mydev_init(const struct device *dev)
{
    const struct mydev_config *config = dev->config;
    int ret;
    ...
    /* Select "default" state at initialization time */
    ret = pinctrl_apply_state(config->pcfg, PINCTRL_STATE_DEFAULT);
    if (ret < 0) {
        return ret;
    }
    ...
}

#define MYDEV_DEFINE(i)                                                    \
    /* Define all pinctrl configuration for instance "i" */               \
    PINCTRL_DT_INST_DEFINE(i);                                             \
    ...                                                                    \
    static const struct mydev_config mydev_config_##i = {                 \
        ...                                                                \
```

(continues on next page)

(continued from previous page)

```
        /* Keep a ref. to the pinctrl configuration for instance "i" */    \
        .pcfg = PINCTRL_DT_INST_DEV_CONFIG_GET(i),                         \
        ...                                                                \
    };                                                                     \
    ...                                                                    \
                                                                           \
    DEVICE_DT_INST_DEFINE(i, mydev_init, NULL, &mydev_data##i,             \
                          &mydev_config##i, ...);

DT_INST_FOREACH_STATUS_OKAY(MYDEV_DEFINE)
```

7.7.6 Pin Control API

group `pinctrl_interface`

Pin Controller Interface.

Since
3.0

Version
0.1.0

Pin control states

`PINCTRL_STATE_DEFAULT`

Default state (state used when the device is in operational state).

`PINCTRL_STATE_SLEEP`

Sleep state (state used when the device is in low power mode).

`PINCTRL_STATE_PRIV_START`

This and higher values refer to custom private states.

Defines

`PINCTRL_REG_NONE`

Utility macro to indicate no register is used.

`PINCTRL_DT_DEV_CONFIG_DECLARE`(node_id)

Declare pin control configuration for a given node identifier.

This macro should be used by tests or applications using runtime pin control to declare the pin control configuration for a device. *PINCTRL_DT_DEV_CONFIG_GET* can later be used to obtain a reference to such configuration.

Only available if `CONFIG_PINCTRL_NON_STATIC` is selected.

Parameters

- `node_id` – Node identifier.

PINCTRL_DT_DEFINE(node_id)

Define all pin control information for the given node identifier.

This helper macro should be called together with device definition. It defines and initializes the pin control configuration for the device represented by node_id. Each pin control state (pinctrl-0, ..., pinctrl-N) is also defined and initialized. Note that states marked to be skipped will not be defined (refer to Z_PINCTRL_SKIP_STATE for more details).

Parameters

- `node_id` – Node identifier.

PINCTRL_DT_INST_DEFINE(inst)

Define all pin control information for the given compatible index.

See also

PINCTRL_DT_DEFINE

Parameters

- `inst` – Instance number.

PINCTRL_DT_DEV_CONFIG_GET(node_id)

Obtain a reference to the pin control configuration given a node identifier.

Parameters

- `node_id` – Node identifier.

PINCTRL_DT_INST_DEV_CONFIG_GET(inst)

Obtain a reference to the pin control configuration given current compatible instance number.

See also

PINCTRL_DT_DEV_CONFIG_GET

Parameters

- `inst` – Instance number.

Functions

int pinctrl_lookup_state(const struct *pinctrl_dev_config* *config, uint8_t id, const struct *pinctrl_state* **state)

Find the state configuration for the given state id.

Parameters

- `config` – Pin controller configuration.
- `id` – Pin controller state id (see *PINCTRL_STATES*).
- `state` – Found state.

Return values

- `0` – If state has been found.
- `-ENOENT` – If the state has not been found.

int `pinctrl_configure_pins`(const pinctrl_soc_pin_t *pins, uint8_t pin_cnt, uintptr_t reg)

Configure a set of pins.

This function will configure the necessary hardware blocks to make the configuration immediately effective.

Warning

This function must never be used to configure pins used by an instantiated device driver.

Parameters

- `pins` – List of pins to be configured.
- `pin_cnt` – Number of pins.
- `reg` – Device register (optional, use *PINCTRL_REG_NONE* if not used).

Return values

- `0` – If succeeded
- `-errno` – Negative errno for other failures.

static inline int `pinctrl_apply_state_direct`(const struct *pinctrl_dev_config* *config, const struct *pinctrl_state* *state)

Apply a state directly from the provided state configuration.

Parameters

- `config` – Pin control configuration.
- `state` – State.

Return values

- `0` – If succeeded
- `-errno` – Negative errno for other failures.

static inline int `pinctrl_apply_state`(const struct *pinctrl_dev_config* *config, uint8_t id)

Apply a state from the given device configuration.

Parameters

- `config` – Pin control configuration.
- `id` – Id of the state to be applied (see *PINCTRL_STATES*).

Return values

- `0` – If succeeded.
- `-ENOENT` – If given state id does not exist.
- `-errno` – Negative errno for other failures.

struct `pinctrl_state`

#include <pinctrl.h> Pin control state configuration.

Public Members

const pinctrl_soc_pin_t ***pins**
Pin configurations.

uint8_t **pin_cnt**
Number of pin configurations.

uint8_t **id**
State identifier (see *PINCTRL_STATES*).

struct **pinctrl_dev_config**
#include <*pinctrl.h*> Pin controller configuration for a given device.

Public Members

uintptr_t **reg**
Device address (only available if `CONFIG_PINCTRL_STORE_REG` is enabled).

const struct *pinctrl_state* ***states**
List of state configurations.

uint8_t **state_cnt**
Number of state configurations.

Dynamic pin control

group **pinctrl_interface_dynamic**

Defines

`PINCTRL_DT_STATE_PINS_DEFINE`(node_id, prop)
Helper macro to define the pins of a pin control state from Devicetree.

The name of the defined state pins variable is the same used by `prop`. This macro is expected to be used in conjunction with *PINCTRL_DT_STATE_INIT*.

See also

PINCTRL_DT_STATE_INIT

Parameters

- **node_id** – Node identifier containing `prop`.
- **prop** – Property within `node_id` containing state configuration.

PINCTRL_DT_STATE_INIT(prop, state)

Utility macro to initialize a pin control state.

This macro should be used in conjunction with *PINCTRL_DT_STATE_PINS_DEFINE* when using dynamic pin control to define an alternative state configuration stored in Devicetree.

Example:

```
// board.dts

/{
     zephyr,user {
             // uart0_alt_default node contains alternative pin config
             uart0_alt_default = <&uart0_alt_default>;
     };
};
```

```
// application

PINCTRL_DT_STATE_PINS_DEFINE(DT_PATH(zephyr_user), uart0_alt_default);

static const struct pinctrl_state uart0_alt[] = {
    PINCTRL_DT_STATE_INIT(uart0_alt_default, PINCTRL_STATE_DEFAULT)
};
```

See also

PINCTRL_DT_STATE_PINS_DEFINE

Parameters

- **prop** – Property name in Devicetree containing state configuration.
- **state** – State represented by prop (see *PINCTRL_STATES*).

Functions

int **pinctrl_update_states**(struct *pinctrl_dev_config* *config, const struct *pinctrl_state* *states, uint8_t state_cnt)

Update states with a new set.

Note

In order to guarantee device drivers correct operation the same states have to be provided. For example, if default and sleep are in the current list of states, it is expected that the new array of states also contains both.

Parameters

- **config** – Pin control configuration.
- **states** – New states to be set.
- **state_cnt** – Number of new states to be set.

Return values

- `-EINVAL` – If the new configuration does not contain the same states as the current active configuration.
- `-ENOSYS` – If the functionality is not available.
- `0` – On success.

7.8 Porting

These pages document how to port Zephyr to new hardware.

7.8.1 Architecture Porting Guide

An architecture port is needed to enable Zephyr to run on an ISA (instruction set architecture) or an ABI (Application Binary Interface) that is not currently supported.

The following are examples of ISAs and ABIs that Zephyr supports:

- x86_32 ISA with System V ABI
- ARMv7-M ISA with Thumb2 instruction set and ARM Embedded ABI (aeabi)
- ARCv2 ISA

For information on Kconfig configuration, see *Setting Kconfig configuration values*. Architectures use a Kconfig configuration scheme similar to boards.

An architecture port can be divided in several parts; most are required and some are optional:

- **The early boot sequence**: each architecture has different steps it must take when the CPU comes out of reset (required).
- **Interrupt and exception handling**: each architecture handles asynchronous and unrequested events in a specific manner (required).
- **Thread context switching**: the Zephyr context switch is dependent on the ABI and each ISA has a different set of registers to save (required).
- **Thread creation and termination**: A thread's initial stack frame is ABI and architecture-dependent, and thread abortion possibly as well (required).
- **Device drivers**: most often, the system clock timer and the interrupt controller are tied to the architecture (some required, some optional).
- **Utility libraries**: some common kernel APIs rely on a architecture-specific implementation for performance reasons (required).
- **CPU idling/power management**: most architectures implement instructions for putting the CPU to sleep (partly optional, most likely very desired).
- **Fault management**: for implementing architecture-specific debug help and handling of fatal error in threads (partly optional).
- **Linker scripts and toolchains**: architecture-specific details will most likely be needed in the build system and when linking the image (required).
- **Memory Management and Memory Mapping**: for architecture-specific details on supporting memory management and memory mapping.

- **Stack Objects**: for architecture-specific details on memory protection hardware regarding stack objects.
- **User Mode Threads**: for supporting threads in user mode.
- **GDB Stub**: for supporting GDB stub to enable remote debugging.

Early Boot Sequence

The goal of the early boot sequence is to take the system from the state it is after reset to a state where is can run C code and thus the common kernel initialization sequence. Most of the time, very few steps are needed, while some architectures require a bit more work to be performed.

Common steps for all architectures:

- Setup an initial stack.
- If running an XIP (eXecute-In-Place) kernel, copy initialized data from ROM to RAM.
- If not using an ELF loader, zero the BSS section.
- Jump to `z_cstart()`, the early kernel initialization
  - `z_cstart()` is responsible for context switching out of the fake context running at startup into the main thread.

Some examples of architecture-specific steps that have to be taken:

- If given control in real mode on x86_32, switch to 32-bit protected mode.
- Setup the segment registers on x86_32 to handle boot loaders that leave them in an unknown or broken state.
- Initialize a board-specific watchdog on Cortex-M3/4.
- Switch stacks from MSP to PSP on Cortex-M.
- Use a different approach than calling into _Swap() on Cortex-M to prevent race conditions.
- Setup FIRQ and regular IRQ handling on ARCv2.

Interrupt and Exception Handling

Each architecture defines interrupt and exception handling differently.

When a device wants to signal the processor that there is some work to be done on its behalf, it raises an interrupt. When a thread does an operation that is not handled by the serial flow of the software itself, it raises an exception. Both, interrupts and exceptions, pass control to a handler. The handler is known as an ISR (Interrupt Service Routine) in the case of interrupts. The handler performs the work required by the exception or the interrupt. For interrupts, that work is device-specific. For exceptions, it depends on the exception, but most often the core kernel itself is responsible for providing the handler.

The kernel has to perform some work in addition to the work the handler itself performs. For example:

- Prior to handing control to the handler:
  - Save the currently executing context.
  - Possibly getting out of power saving mode, which includes waking up devices.
  - Updating the kernel uptime if getting out of tickless idle mode.
- After getting control back from the handler:
  - Decide whether to perform a context switch.

  - When performing a context switch, restore the context being context switched in.

This work is conceptually the same across architectures, but the details are completely different:

- The registers to save and restore.
- The processor instructions to perform the work.
- The numbering of the exceptions.
- etc.

It thus needs an architecture-specific implementation, called the interrupt/exception stub.

Another issue is that the kernel defines the signature of ISRs as:

```
void (*isr)(void *parameter)
```

Architectures do not have a consistent or native way of handling parameters to an ISR. As such there are two commonly used methods for handling the parameter.

- Using some architecture defined mechanism, the parameter value is forced in the stub. This is commonly found in X86-based architectures.
- The parameters to the ISR are inserted and tracked via a separate table requiring the architecture to discover at runtime which interrupt is executing. A common interrupt handler demuxer is installed for all entries of the real interrupt vector table, which then fetches the device's ISR and parameter from the separate table. This approach is commonly used in the ARC and ARM architectures via the `CONFIG_GEN_ISR_TABLES` implementation. You can find examples of the stubs by looking at `_interrupt_enter()` in x86, `_IntExit()` in ARM, `_isr_wrapper()` in ARM, or the full implementation description for ARC in arch/arc/core/isr_wrapper.S.

Each architecture also has to implement primitives for interrupt control:

- locking interrupts: *irq_lock()*, *irq_unlock()*.
- registering interrupts: *IRQ_CONNECT()*.
- programming the priority if possible `irq_priority_set()`.
- enabling/disabling interrupts: *irq_enable()*, *irq_disable()*.

Note

IRQ_CONNECT is a macro that uses assembler and/or linker script tricks to connect interrupts at build time, saving boot time and text size.

The vector table should contain a handler for each interrupt and exception that can possibly occur. The handler can be as simple as a spinning loop. However, we strongly suggest that handlers at least print some debug information. The information helps figuring out what went wrong when hitting an exception that is a fault, like divide-by-zero or invalid memory access, or an interrupt that is not expected (*spurious interrupt*). See the ARM implementation in arch/arm/core/cortex_m/fault.c for an example.

Thread Context Switching

Multi-threading is the basic purpose to have a kernel at all. Zephyr supports two types of threads: preemptible and cooperative.

Two crucial concepts when writing an architecture port are the following:

- Cooperative threads run at a higher priority than preemptible ones, and always preempt them.

- After handling an interrupt, if a cooperative thread was interrupted, the kernel always goes back to running that thread, since it is not preemptible.

A context switch can happen in several circumstances:

- When a thread executes a blocking operation, such as taking a semaphore that is currently unavailable.
- When a preemptible thread unblocks a thread of higher priority by releasing the object on which it was blocked.
- When an interrupt unblocks a thread of higher priority than the one currently executing, if the currently executing thread is preemptible.
- When a thread runs to completion.
- When a thread causes a fatal exception and is removed from the running threads. For example, referencing invalid memory,

Therefore, the context switching must thus be able to handle all these cases.

The kernel keeps the next thread to run in a "cache", and thus the context switching code only has to fetch from that cache to select which thread to run.

There are two types of context switches: *cooperative* and *preemptive*.

- A *cooperative* context switch happens when a thread willfully gives the control to another thread. There are two cases where this happens
  - When a thread explicitly yields.
  - When a thread tries to take an object that is currently unavailable and is willing to wait until the object becomes available.
- A *preemptive* context switch happens either because an ISR or a thread causes an operation that schedules a thread of higher priority than the one currently running, if the currently running thread is preemptible. An example of such an operation is releasing an object on which the thread of higher priority was waiting.

Note

Control is never taken from cooperative thread when one of them is the running thread.

A cooperative context switch is always done by having a thread call the `_Swap()` kernel internal symbol. When `_Swap` is called, the kernel logic knows that a context switch has to happen: `_Swap` does not check to see if a context switch must happen. Rather, `_Swap` decides what thread to context switch in. `_Swap` is called by the kernel logic when an object being operated on is unavailable, and some thread yielding/sleeping primitives.

Note

On x86 and Nios2, `_Swap` is generic enough and the architecture flexible enough that `_Swap` can be called when exiting an interrupt to provoke the context switch. This should not be taken as a rule, since neither the ARM Cortex-M or ARCv2 port do this.

Since `_Swap` is cooperative, the caller-saved registers from the ABI are already on the stack. There is no need to save them in the k_thread structure.

A context switch can also be performed preemptively. This happens upon exiting an ISR, in the kernel interrupt exit stub:

- `_interrupt_enter` on x86 after the handler is called.
- `_IntExit` on ARM.

- `_firq_exit` and `_rirq_exit` on ARCv2.

In this case, the context switch must only be invoked when the interrupted thread was preemptible, not when it was a cooperative one, and only when the current interrupt is not nested.

The kernel also has the concept of "locking the scheduler". This is a concept similar to locking the interrupts, but lighter-weight since interrupts can still occur. If a thread has locked the scheduler, is it temporarily non-preemptible.

So, the decision logic to invoke the context switch when exiting an interrupt is simple:

- If the interrupted thread is not preemptible, do not invoke it.
- Else, fetch the cached thread from the ready queue, and:
  - If the cached thread is not the current thread, invoke the context switch.
  - Else, do not invoke it.

This is simple, but crucial: if this is not implemented correctly, the kernel will not function as intended and will experience bizarre crashes, mostly due to stack corruption.

Note

If running a coop-only system, i.e. if `CONFIG_NUM_PREEMPT_PRIORITIES` is 0, no preemptive context switch ever happens. The interrupt code can be optimized to not take any scheduling decision when this is the case.

Thread Creation and Termination

To start a new thread, a stack frame must be constructed so that the context switch can pop it the same way it would pop one from a thread that had been context switched out. This is to be implemented in an architecture-specific `_new_thread` internal routine.

The thread entry point is also not to be called directly, i.e. it should not be set as the PC (program counter) for the new thread. Rather it must be wrapped in `_thread_entry`. This means that the PC in the stack frame shall be set to `_thread_entry`, and the thread entry point shall be passed as the first parameter to `_thread_entry`. The specifics of this depend on the ABI.

The need for an architecture-specific thread termination implementation depends on the architecture. There is a generic implementation, but it might not work for a given architecture.

One reason that has been encountered for having an architecture-specific implementation of thread termination is that aborting a thread might be different if aborting because of a graceful exit or because of an exception. This is the case for ARM Cortex-M, where the CPU has to be taken out of handler mode if the thread triggered a fatal exception, but not if the thread gracefully exits its entry point function.

This means implementing an architecture-specific version of *`k_thread_abort()`*, and setting the Kconfig option `CONFIG_ARCH_HAS_THREAD_ABORT` as needed for the architecture (e.g. see arch/arm/core/cortex_m/Kconfig).

Thread Local Storage

To enable thread local storage on a new architecture:

1. Implement *`arch_tls_stack_setup()`* to setup the TLS storage area in stack. Refer to the toolchain documentation on how the storage area needs to be structured. Some helper functions can be used:
   - Function `z_tls_data_size()` returns the size needed for thread local variables (excluding any extra data required by toolchain and architecture).

- Function `z_tls_copy()` prepares the TLS storage area for thread local variables. This only copies the variable themselves and does not do architecture and/or toolchain specific data.

2. In the context switching, grab the `tls` field inside the new thread's `struct k_thread` and put it into an appropriate register (or some other variable) for access to the TLS storage area. Refer to toolchain and architecture documentation on which registers to use.
3. In kconfig, add `select CONFIG_ARCH_HAS_THREAD_LOCAL_STORAGE` to kconfig related to the new architecture.
4. Run the `tests/kernel/threads/tls` to make sure the new code works.

Device Drivers

The kernel requires very few hardware devices to function. In theory, the only required device is the interrupt controller, since the kernel can run without a system clock. In practice, to get access to most, if not all, of the sanity check test suite, a system clock is needed as well. Since these two are usually tied to the architecture, they are part of the architecture port.

Interrupt Controllers There can be significant differences between the interrupt controllers and the interrupt concepts across architectures.

For example, x86 has the concept of an IDT and different interrupt controllers. The position of an interrupt in the IDT determines its priority.

On the other hand, the ARM Cortex-M has the NVIC (Nested Vectored Interrupt Controller) as part of the architecture definition. There is no need for an IDT-like table that is separate from the NVIC vector table. The position in the table has nothing to do with priority of an IRQ: priorities are programmable per-entry.

The ARCv2 has its interrupt unit as part of the architecture definition, which is somewhat similar to the NVIC. However, where ARC defines interrupts as having a one-to-one mapping between exception and interrupt numbers (i.e. exception 1 is IRQ1, and device IRQs start at 16), ARM has IRQ0 being equivalent to exception 16 (and weirdly enough, exception 1 can be seen as IRQ-15).

All these differences mean that very little, if anything, can be shared between architectures with regards to interrupt controllers.

System Clock x86 has APIC timers and the HPET as part of its architecture definition. ARM Cortex-M has the SYSTICK exception. Finally, ARCv2 has the timer0/1 device.

Kernel timeouts are handled in the context of the system clock timer driver's interrupt handler.

Console Over Serial Line There is one other device that is almost a requirement for an architecture port, since it is so useful for debugging. It is a simple polling, output-only, serial port driver on which to send the console (`printk`, `printf`) output.

It is not required, and a RAM console (`CONFIG_RAM_CONSOLE`) can be used to send all output to a circular buffer that can be read by a debugger instead.

Utility Libraries

The kernel depends on a few functions that can be implemented with very few instructions or in a lock-less manner in modern processors. Those are thus expected to be implemented as part of an architecture port.

- Atomic operators.

  - If instructions do exist for a given architecture, the implementation is configured using the `CONFIG_ATOMIC_OPERATIONS_ARCH` Kconfig option.
  - If instructions do not exist for a given architecture, a generic version that wraps *irq_lock()* or *irq_unlock()* around non-atomic operations exists. It is configured using the `CONFIG_ATOMIC_OPERATIONS_C` Kconfig option.
- Find-least-significant-bit-set and find-most-significant-bit-set.
  - If instructions do not exist for a given architecture, it is always possible to implement these functions as generic C functions.

It is possible to use compiler built-ins to implement these, but be careful they use the required compiler barriers.

CPU Idling/Power Management

The kernel provides support for CPU power management with two functions: *arch_cpu_idle()* and *arch_cpu_atomic_idle()*.

arch_cpu_idle() can be as simple as calling the power saving instruction for the architecture with interrupts unlocked, for example `hlt` on x86, `wfi` or `wfe` on ARM, `sleep` on ARC. This function can be called in a loop within a context that does not care if it get interrupted or not by an interrupt before going to sleep. There are basically two scenarios when it is correct to use this function:

- In a single-threaded system, in the only thread when the thread is not used for doing real work after initialization, i.e. it is sitting in a loop doing nothing for the duration of the application.
- In the idle thread.

arch_cpu_atomic_idle(), on the other hand, must be able to atomically re-enable interrupts and invoke the power saving instruction. It can thus be used in real application code, again in single-threaded systems.

Normally, idling the CPU should be left to the idle thread, but in some very special scenarios, these APIs can be used by applications.

Both functions must exist for a given architecture. However, the implementation can be simply the following steps, if desired:

1. unlock interrupts
2. NOP

However, a real implementation is strongly recommended.

Fault Management

In the event of an unhandled CPU exception, the architecture code must call into `z_fatal_error()`. This function dumps out architecture-agnostic information and makes a policy decision on what to do next by invoking `k_sys_fatal_error()`. This function can be overridden to implement application-specific policies that could include locking interrupts and spinning forever (the default implementation) or even powering off the system (if supported).

Toolchain and Linking

Toolchain support has to be added to the build system.

Some architecture-specific definitions are needed in include/zephyr/toolchain/gcc.h. See what exists in that file for currently supported architectures.

Each architecture also needs its own linker script, even if most sections can be derived from the linker scripts of other architectures. Some sections might be specific to the new architecture, for example the SCB section on ARM and the IDT section on x86.

Memory Management and Memory Mapping

If the target platform enables paging and requires drivers to memory-map their I/O regions, CONFIG_MMU needs to be enabled and the following API implemented:

- *arch_mem_map()*
- *arch_mem_unmap()*
- *arch_page_phys_get()*

Stack Objects

The presence of memory protection hardware affects how stack objects are created. All architecture ports must specify the required alignment of the stack pointer, which is some combination of CPU and ABI requirements. This is defined in architecture headers with ARCH_STACK_PTR_ALIGN and is typically something small like 4, 8, or 16 bytes.

Two types of thread stacks exist:

- "kernel" stacks defined with *K_KERNEL_STACK_DEFINE()* and related APIs, which can host kernel threads running in supervisor mode or used as the stack for interrupt/exception handling. These have significantly relaxed alignment requirements and use less reserved data. No memory is reserved for privilege elevation stacks.
- "thread" stacks which typically use more memory, but are capable of hosting thread running in user mode, as well as any use-cases for kernel stacks.

If CONFIG_USERSPACE is not enabled, "thread" and "kernel" stacks are equivalent.

Additional macros may be defined in the architecture layer to specify the alignment of the base of stack objects, any reserved data inside the stack object not used for the thread's stack buffer, and how to round up stack sizes to support user mode threads. In the absence of definitions some defaults are assumed:

- ARCH_KERNEL_STACK_RESERVED: default no reserved space
- ARCH_THREAD_STACK_RESERVED: default no reserved space
- ARCH_KERNEL_STACK_OBJ_ALIGN: default align to ARCH_STACK_PTR_ALIGN
- ARCH_THREAD_STACK_OBJ_ALIGN: default align to ARCH_STACK_PTR_ALIGN
- ARCH_THREAD_STACK_SIZE_ALIGN: default round up to ARCH_STACK_PTR_ALIGN

All stack creation macros are defined in terms of these.

Stack objects all have the following layout, with some regions potentially zero-sized depending on configuration. There are always two main parts: reserved memory at the beginning, and then the stack buffer itself. The bounds of some areas can only be determined at runtime in the context of its associated thread object. Other areas are entirely computable at build time.

Some architectures may need to carve-out reserved memory at runtime from the stack buffer, instead of unconditionally reserving it at build time, or to supplement an existing reserved area (as is the case with the ARM FPU). Such carve-outs will always be tracked in `thread.stack_info.start`. The region specified by `thread.stack_info.start` and `thread.stack_info.size` is always fully accessible by a user mode thread. `thread.stack_info.delta` denotes an offset which can be used to compute the initial stack pointer from the very end of the stack object, taking into account storage for TLS and ASLR random offsets.

```
+---------------------+ <- thread.stack_obj
| Reserved Memory     | } K_(THREAD|KERNEL)_STACK_RESERVED
+---------------------+
| Carved-out memory   |
|.....................| <- thread.stack_info.start
| Unused stack buffer |
|                     |
|.....................| <- thread's current stack pointer
| Used stack buffer   |
|                     |
|.....................| <- Initial stack pointer. Computable
| ASLR Random offset  |      with thread.stack_info.delta
+---------------------| <- thread.userspace_local_data
| Thread-local data   |
+---------------------+ <- thread.stack_info.start + thread.stack_info.size
```

At present, Zephyr does not support stacks that grow upward.

No Memory Protection If no memory protection is in use, then the defaults are sufficient.

HW-based stack overflow detection This option uses hardware features to generate a fatal error if a thread in supervisor mode overflows its stack. This is useful for debugging, although for a couple reasons, you can't reliably make any assertions about the state of the system after this happens:

- The kernel could have been inside a critical section when the overflow occurs, leaving important global data structures in a corrupted state.
- For systems that implement stack protection using a guard memory region, it's possible to overshoot the guard and corrupt adjacent data structures before the hardware detects this situation.

To enable the `CONFIG_HW_STACK_PROTECTION` feature, the system must provide some kind of hardware-based stack overflow protection, and enable the `CONFIG_ARCH_HAS_STACK_PROTECTION` option.

Two forms of HW-based stack overflow detection are supported: dedicated CPU features for this purpose, or special read-only guard regions immediately preceding stack buffers.

`CONFIG_HW_STACK_PROTECTION` only catches stack overflows for supervisor threads. This is not required to catch stack overflow from user threads; `CONFIG_USERSPACE` is orthogonal.

This feature only detects supervisor mode stack overflows, including stack overflows when handling system calls. It doesn't guarantee that the kernel has not been corrupted. Any stack overflow in supervisor mode should be treated as a fatal error, with no assertions about the integrity of the overall system possible.

Stack overflows in user mode are recoverable (from the kernel's perspective) and require no special configuration; `CONFIG_HW_STACK_PROTECTION` only applies to catching overflows when the CPU is in supervisor mode.

CPU-based stack overflow detection If we are detecting stack overflows in supervisor mode via special CPU registers (like ARM's SPLIM), then the defaults are sufficient.

Guard-based stack overflow detection We are detecting supervisor mode stack overflows via special memory protection region located immediately before the stack buffer that generates an exception on write. Reserved memory will be used for the guard region.

ARCH_KERNEL_STACK_RESERVED should be defined to the minimum size of a memory protection region. On most ARM CPUs this is 32 bytes. ARCH_KERNEL_STACK_OBJ_ALIGN should also be set to the required alignment for this region.

MMU-based systems should not reserve RAM for the guard region and instead simply leave an non-present virtual page below every stack when it is mapped into the address space. The stack object will still need to be properly aligned and sized to page granularity.

```
+----------------------------+ <- thread.stack_obj
| Guard reserved memory      | } K_KERNEL_STACK_RESERVED
+----------------------------+
| Guard carve-out            |
|............................| <- thread.stack_info.start
| Stack buffer               |
.                            .
```

Guard carve-outs for kernel stacks are uncommon and should be avoided if possible. They tend to be needed for two situations:

- The same stack may be re-purposed to host a user thread, in which case the guard is unnecessary and shouldn't be unconditionally reserved. This is the case when privilege elevation stacks are not inside the stack object.
- The required guard size is variable and depends on context. For example, some ARM CPUs have lazy floating point stacking during exceptions and may decrement the stack pointer by a large value without writing anything, completely overshooting a minimally-sized guard and corrupting adjacent memory. Rather than unconditionally reserving a larger guard, the extra memory is carved out if the thread uses floating point.

User mode enabled Enabling user mode activates two new requirements:

- A separate fixed-sized privilege mode stack, specified by CONFIG_PRIVILEGED_STACK_SIZE, must be allocated that the user thread cannot access. It is used as the stack by the kernel when handling system calls. If stack guards are implemented, a stack guard region must be able to be placed before it, with support for carve-outs if necessary.
- The memory protection hardware must be able to program a region that exactly covers the thread's stack buffer, tracked in thread.stack_info. This implies that ARCH_THREAD_STACK_SIZE_ADJUST() will need to round up the requested stack size so that a region may cover it, and that ARCH_THREAD_STACK_OBJ_ALIGN() is also specified per the granularity of the memory protection hardware.

This becomes more complicated if the memory protection hardware requires that all memory regions be sized to a power of two, and aligned to their own size. This is common on older MPUs and is known with CONFIG_MPU_REQUIRES_POWER_OF_TWO_ALIGNMENT.

thread.stack_info always tracks the user-accessible part of the stack object, it must always be correct to program a memory protection region with user access using the range stored within.

Non power-of-two memory region requirements On systems without power-of-two region requirements, the reserved memory area for threads stacks defined by K_THREAD_STACK_RESERVED may be used to contain the privilege mode stack. The layout could be something like:

```
+----------------------------+ <- thread.stack_obj
| Other platform data        |
+----------------------------+
| Guard region (if enabled)  |
+----------------------------+
| Guard carve-out (if needed)  |
|............................|
```

(continues on next page)

(continued from previous page)

```
| Privilege elevation stack    |
+------------------------------| <- thread.stack_obj +
| Stack buffer                 |      K_THREAD_STACK_RESERVED =
.                              .      thread.stack_info.start
```

The guard region, and any carve-out (if needed) would be configured as a read-only region when the thread is created.

- If the thread is a supervisor thread, the privilege elevation region is just extra stack memory. An overflow will eventually crash into the guard region.
- If the thread is running in user mode, a memory protection region will be configured to allow user threads access to the stack buffer, but nothing before or after it. An overflow in user mode will crash into the privilege elevation stack, which the user thread has no access to. An overflow when handling a system call will crash into the guard region.

On an MMU system there should be no physical guards; the privilege mode stack will be mapped into kernel memory, and the stack buffer in the user part of memory, each with non-present virtual guard pages below them to catch runtime stack overflows.

Other platform data may be stored before the guard region, but this is highly discouraged if such data could be stored in `thread.arch` somewhere.

`ARCH_THREAD_STACK_RESERVED` will need to be defined to capture the size of the reserved region containing platform data, privilege elevation stacks, and guards. It must be appropriately sized such that an MPU region to grant user mode access to the stack buffer can be placed immediately after it.

Power-of-two memory region requirements Thread stack objects must be sized and aligned to the same power of two, without any reserved memory to allow efficient packing in memory. Thus, any guards in the thread stack must be completely carved out, and the privilege elevation stack must be allocated elsewhere.

`ARCH_THREAD_STACK_SIZE_ADJUST()` and `ARCH_THREAD_STACK_OBJ_ALIGN()` should both be defined to `Z_POW2_CEIL()`. `K_THREAD_STACK_RESERVED` must be 0.

For the privilege stacks, the `CONFIG_GEN_PRIV_STACKS` must be, enabled. For every thread stack found in the system, a corresponding fixed- size kernel stack used for handling system calls is generated. The address of the privilege stacks can be looked up quickly at runtime based on the thread stack address using `z_priv_stack_find()`. These stacks are laid out the same way as other kernel-only stacks.

```
+------------------------------+ <- z_priv_stack_find(thread.stack_obj)
| Reserved memory              | } K_KERNEL_STACK_RESERVED
+------------------------------+
| Guard carve-out (if needed) |
|.............................|
| Privilege elevation stack   |
|                             |
+------------------------------+ <- z_priv_stack_find(thread.stack_obj) +
                                     K_KERNEL_STACK_RESERVED +
                                     CONFIG_PRIVILEGED_STACK_SIZE

+------------------------------+ <- thread.stack_obj
| MPU guard carve-out          |
| (supervisor mode only)       |
|..............................| <- thread.stack_info.start
| Stack buffer                 |
.                              .
```

The guard carve-out in the thread stack object is only used if the thread is running in supervisor mode. If the thread drops to user mode, there is no guard and the entire object is used as the

stack buffer, with full access to the associated user mode thread and `thread.stack_info` updated appropriately.

User Mode Threads

To support user mode threads, several kernel-to-arch APIs need to be implemented, and the system must enable the `CONFIG_ARCH_HAS_USERSPACE` option. Please see the documentation for each of these functions for more details:

- *arch_buffer_validate()* to test whether the current thread has access permissions to a particular memory region
- *arch_user_mode_enter()* which will irreversibly drop a supervisor thread to user mode privileges. The stack must be wiped.
- *arch_syscall_oops()* which generates a kernel oops when system call parameters can't be validated, in such a way that the oops appears to be generated from where the system call was invoked in the user thread
- *arch_syscall_invoke0()* through *arch_syscall_invoke6()* invoke a system call with the appropriate number of arguments which must all be passed in during the privilege elevation via registers.
- *arch_is_user_context()* return nonzero if the CPU is currently running in user mode
- *arch_mem_domain_max_partitions_get()* which indicates the max number of regions for a memory domain. MMU systems have an unlimited amount, MPU systems have constraints on this.

Some architectures may need to update software memory management structures or modify hardware registers on another CPU when memory domain APIs are invoked. If so, `CONFIG_ARCH_MEM_DOMAIN_SYNCHRONOUS_API` must be selected by the architecture and some additional APIs must be implemented. This is common on MMU systems and uncommon on MPU systems:

- `arch_mem_domain_thread_add()`
- `arch_mem_domain_thread_remove()`
- `arch_mem_domain_partition_add()`
- `arch_mem_domain_partition_remove()`

Please see the doxygen documentation of these APIs for details.

In addition to implementing these APIs, there are some other tasks as well:

- `_new_thread()` needs to spawn threads with *K_USER* in user mode
- On context switch, the outgoing thread's stack memory should be marked inaccessible to user mode by making the appropriate configuration changes in the memory management hardware.. The incoming thread's stack memory should likewise be marked as accessible. This ensures that threads can't mess with other thread stacks.
- On context switch, the system needs to switch between memory domains for the incoming and outgoing threads.
- Thread stack areas must include a kernel stack region. This should be inaccessible to user threads at all times. This stack will be used when system calls are made. This should be fixed size for all threads, and must be large enough to handle any system call.
- A software interrupt or some kind of privilege elevation mechanism needs to be established. This is closely tied to how the _arch_syscall_invoke macros are implemented. On system call, the appropriate handler function needs to be looked up in _k_syscall_table. Bad system call IDs should jump to the `K_SYSCALL_BAD` handler. Upon completion of the system call, care must be taken not to leak any register state back to user mode.

GDB Stub

To enable GDB stub for remote debugging on a new architecture:

1. Create a new `gdbstub.h` header file under appropriate architecture include directory (`include/arch/<arch>/gdbstub.h`).
   - Create a new struct `struct gdb_ctx` as the GDB context.
     - Must define a member named `exception` of type `unsigned int` to store the GDB exception reason. This value needs to be set before entering `z_gdb_main_loop()`.
     - Architecture can define as many members as needed for GDB stub to function.
     - Pointer to this struct needs to be passed to `z_gdb_main_loop()`, where this pointer will be passed to other GDB stub functions.
2. Functions for entering and exiting GDB stub main loop.
   - If the architecture relies on interrupts to service breakpoints, interrupt service routines (ISR) need to be implemented, which will serve as the entry point to GDB stub main loop.
   - These functions need to save and restore context so code execution can continue as if no breakpoints have been encountered.
   - These functions need to call `z_gdb_main_loop()` after saving execution context to go into the GDB stub main loop to receive commands from GDB.
   - Before calling `z_gdb_main_loop()`, `gdb_ctx.exception` must be set to specify the exception reason.
3. Implement necessary functions to support GDB stub functionality:
   - *`arch_gdb_init()`*
     - This needs to initialize necessary bits to support GDB stub functionality, for example, setting up the GDB context and connecting debug interrupts.
     - This must stop code execution via architecture specific method (e.g. raising debug interrupts). This allows GDB to connect during boot.
   - *`arch_gdb_continue()`*
     - This function is called when GDB sends a `c` or `continue` command to continue code execution.
   - *`arch_gdb_step()`*
     - This function is called when GDB sends a `si` or `stepi` command to execute one machine instruction, before returning to GDB prompt.
   - Hardware register read/write functions:
     - Since the GDB stub is running on the target, manipulation of hardware registers need to cached to avoid affecting the execution of GDB stub. Think of it as context switching, where the execution context is changed to the GDB stub. So that the register values of the running thread before context switch need to be stored. Manipulation of register values must only be done to this cached copy. The updated values will then be written to hardware registers before switching back to the previous running thread.
     - *`arch_gdb_reg_readall()`*
       * This collects all hardware register values that would appear in a `g`/`G` packets which will be sent back to GDB. The format of the G-packet is architecture specific. Consult GDB on what is expected.

        * Note that, for most architectures, a valid G-packet must be returned and sent to GDB. If a packet without incorrect length is sent to GDB, GDB will abort the debugging session.
      - *arch_gdb_reg_writeall()*
        * This takes a G-packet sent by GDB and populates the hardware registers with values from the G-packet.
      - *arch_gdb_reg_readone()*
        * This reads the value of one hardware register and sends the result to GDB.
      - *arch_gdb_reg_writeone()*
        * This writes the value of one hardware register received from GDB.
    - Breakpoints:
      - *arch_gdb_add_breakpoint()* and *arch_gdb_remove_breakpoint()*
      - GDB may decide to use software breakpoints which modifies the memory at the breakpoint locations to replace the instruction with software breakpoint or trap instructions. GDB will then restore the memory content once execution reaches the breakpoints. GDB supports this by default and there is usually no need to handle software breakpoints in the architecture code (where breakpoint type is `0`).
      - Hardware breakpoints (type `1`) are required if the code is in ROM or flash that cannot be modified at runtime. Consult the architecture datasheet on how to enable hardware breakpoints.
      - If hardware breakpoints are not supported by the architecture, there is no need to implement these in architecture code. GDB will then rely on software breakpoints.
4. For architecture where certain memory regions are not accessible, an array named `gdb_mem_region_array` of type `gdb_mem_region` needs to be defined to specify regions that are accessible. For each array item:
    - `gdb_mem_region.start` specifies the start of a memory region.
    - `gdb_mem_region.end` specifies the end of a memory region.
    - `gdb_mem_region.attributes` specifies the permission of a memory region.
      - `GDB_MEM_REGION_RO`: region is read-only.
      - `GDB_MEM_REGION_RW`: region is read-write.
    - `gdb_mem_region.alignment` specifies read/write alignment of a memory region. Use `0` if there is no alignment requirement and read/write can be done byte-by-byte.

API Reference

Timing

group `arch-timing`

Functions

void **arch_busy_wait**(uint32_t usec_to_wait)

Architecture-specific implementation of busy-waiting.

Parameters

- **usec_to_wait** – Wait period, in microseconds

static inline uint32_t **arch_k_cycle_get_32**(void)

Obtain the current cycle count, in units specified by CONFIG_SYS_CLOCK_HW_CYCLES_PER_SEC.

While this is historically specified as part of the architecture API, in practice virtually all platforms forward it to the sys_clock_cycle_get_32() API provided by the timer driver.

See also

k_cycle_get_32()

Returns

The current cycle time. This should count up monotonically through the full 32 bit space, wrapping at 0xffffffff. Hardware with fewer bits of precision in the timer is expected to synthesize a 32 bit count.

static inline uint64_t **arch_k_cycle_get_64**(void)

As for *arch_k_cycle_get_32()*, but with a 64 bit return value.

Not all timer hardware has a 64 bit timer, this needs to be implemented only if CONFIG_TIMER_HAS_64BIT_CYCLE_COUNTER is set.

See also

arch_k_cycle_get_32()

Returns

The current cycle time. This should count up monotonically through the full 64 bit space, wrapping at 2^64-1. Hardware with fewer bits of precision in the timer is generally not expected to implement this API.

Threads

group **arch-threads**

Functions

void **arch_new_thread**(struct *k_thread* *thread, k_thread_stack_t *stack, char *stack_ptr, k_thread_entry_t entry, void *p1, void *p2, void *p3)

Handle arch-specific logic for setting up new threads.

The stack and arch-specific thread state variables must be set up such that a later attempt to switch to this thread will succeed and we will enter z_thread_entry with the requested thread and arguments as its parameters.

At some point in this function's implementation, z_setup_new_thread() must be called with the true bounds of the available stack buffer within the thread's stack object.

The provided stack pointer is guaranteed to be properly aligned with respect to the CPU and ABI requirements. There may be space reserved between the stack pointer and

the bounds of the stack buffer for initial stack pointer randomization and thread-local storage.

Fields in thread->base will be initialized when this is called.

Parameters

- `thread` – Pointer to uninitialized struct *k_thread*
- `stack` – Pointer to the stack object
- `stack_ptr` – Aligned initial stack pointer
- `entry` – Thread entry function
- `p1` – 1st entry point parameter
- `p2` – 2nd entry point parameter
- `p3` – 3rd entry point parameter

static inline void **arch_switch**(void *switch_to, void **switched_from)

Cooperative context switch primitive.

The action of *arch_switch()* should be to switch to a new context passed in the first argument, and save a pointer to the current context into the address passed in the second argument.

The actual type and interpretation of the switch handle is specified by the architecture. It is the same data structure stored in the "switch_handle" field of a newly-created thread in *arch_new_thread()*, and passed to the kernel as the "interrupted" argument to z_get_next_switch_handle().

Note that on SMP systems, the kernel uses the store through the second pointer as a synchronization point to detect when a thread context is completely saved (so another CPU can know when it is safe to switch). This store must be done AFTER all relevant state is saved, and must include whatever memory barriers or cache management code is required to be sure another CPU will see the result correctly.

The simplest implementation of *arch_switch()* is generally to push state onto the thread stack and use the resulting stack pointer as the switch handle. Some architectures may instead decide to use a pointer into the thread struct as the "switch handle" type. These can legally assume that the second argument to *arch_switch()* is the address of the switch_handle field of struct thread_base and can use an offset on this value to find other parts of the thread struct. For example a (C pseudocode) implementation of *arch_switch()* might look like:

void *arch_switch(void *switch_to, void **switched_from)* { struct *k_thread* *new = switch_to; struct *k_thread* *old = *CONTAINER_OF(switched_from, struct k_thread,switch_handle)*;

// save old context... *switched_from = old; // restore new context... }

Note that the kernel manages the switch_handle field for synchronization as described above. So it is not legal for architecture code to assume that it has any particular value at any other time. In particular it is not legal to read the field from the address passed in the second argument.

Parameters

- `switch_to` – Incoming thread's switch handle
- `switched_from` – Pointer to outgoing thread's switch handle storage location, which must be updated.

void **arch_switch_to_main_thread**(struct *k_thread* *main_thread, char *stack_ptr, k_thread_entry_t _main)

Custom logic for entering main thread context at early boot.

Used by architectures where the typical trick of setting up a dummy thread in early boot context to "switch out" of isn't workable.

Parameters

- `main_thread` – main thread object
- `stack_ptr` – Initial stack pointer
- `_main` – Entry point for application main function.

int `arch_float_disable`(struct *k_thread* *thread)

Disable floating point context preservation.

The function is used to disable the preservation of floating point context information for a particular thread.

> **Note**
>
> For ARM architecture, disabling floating point preservation may only be requested for the current thread and cannot be requested in ISRs.

Return values

- `0` – On success.
- `-EINVAL` – If the floating point disabling could not be performed.
- `-ENOTSUP` – If the operation is not supported

int `arch_float_enable`(struct *k_thread* *thread, unsigned int options)

Enable floating point context preservation.

The function is used to enable the preservation of floating point context information for a particular thread. This API depends on each architecture implementation. If the architecture does not support enabling, this API will always be failed.

The *options* parameter indicates which floating point register sets will be used by the specified thread. Currently it is used by x86 only.

Parameters

- `thread` – ID of thread.
- `options` – architecture dependent options

Return values

- `0` – On success.
- `-EINVAL` – If the floating point enabling could not be performed.
- `-ENOTSUP` – If the operation is not supported

group `arch-tls`

Functions

size_t **arch_tls_stack_setup**(struct *k_thread* *new_thread, char *stack_ptr)

Setup Architecture-specific TLS area in stack.

This sets up the stack area for thread local storage. The structure inside TLS area is architecture specific.

Parameters

- **new_thread** – New thread object
- **stack_ptr** – Stack pointer

Returns

Number of bytes taken by the TLS area

Power Management

group **arch-pm**

Functions

FUNC_NORETURN void **arch_system_halt**(unsigned int reason)

Halt the system, optionally propagating a reason code.

void **arch_cpu_idle**(void)

Power save idle routine.

This function will be called by the kernel idle loop or possibly within an implementation of z_pm_save_idle in the kernel when the '_pm_save_flag' variable is non-zero.

Architectures that do not implement power management instructions may immediately return, otherwise a power-saving instruction should be issued to wait for an interrupt.

See also

k_cpu_idle()

Note

The function is expected to return after the interrupt that has caused the CPU to exit power-saving mode has been serviced, although this is not a firm requirement.

void **arch_cpu_atomic_idle**(unsigned int key)

Atomically re-enable interrupts and enter low power mode.

The requirements for *arch_cpu_atomic_idle()* are as follows:

a. Enabling interrupts and entering a low-power mode needs to be atomic, i.e. there should be no period of time where interrupts are enabled before the processor enters a low-power mode. See the comments in *k_lifo_get()*, for example, of the race condition that occurs if this requirement is not met.

b. After waking up from the low-power mode, the interrupt lockout state must be restored as indicated in the 'key' input parameter.

See also

k_cpu_atomic_idle()

Parameters

- `key` – Lockout key returned by previous invocation of *arch_irq_lock()*

Symmetric Multi-Processing

group `arch-smp`

Typedefs

typedef void (*`arch_cpustart_t`)(void *data)

Per-cpu entry function.

Param data
context parameter, implementation specific

Functions

void `arch_cpu_start`(int cpu_num, k_thread_stack_t *stack, int sz, *arch_cpustart_t* fn, void *arg)

Start a numbered CPU on a MP-capable system.

This starts and initializes a specific CPU. The main thread on startup is running on CPU zero, other processors are numbered sequentially. On return from this function, the CPU is known to have begun operating and will enter the provided function. Its interrupts will be initialized but disabled such that *irq_unlock()* with the provided key will work to enable them.

Normally, in SMP mode this function will be called by the kernel initialization and should not be used as a user API. But it is defined here for special-purpose apps which want Zephyr running on one core and to use others for design-specific processing.

Parameters

- `cpu_num` – Integer number of the CPU
- `stack` – Stack memory for the CPU
- `sz` – Stack buffer size, in bytes
- `fn` – Function to begin running on the CPU.
- `arg` – Untyped argument to be passed to “fn”

bool `arch_cpu_active`(int cpu_num)

Return CPU power status.

Parameters

- `cpu_num` – Integer number of the CPU

static inline struct _cpu *arch_curr_cpu(void)

Return the CPU struct for the currently executing CPU.

static inline uint32_t arch_proc_id(void)

Processor hardware ID.

Most multiprocessor architectures have a low-level unique ID value associated with the current CPU that can be retrieved rapidly and efficiently in kernel context. Note that while the numbering of the CPUs is guaranteed to be unique, the values are platform-defined. In particular, they are not guaranteed to match Zephyr's own sequential CPU IDs (even though on some platforms they do).

Note

There is an inherent race with this API: the system may preempt the current thread and migrate it to another CPU before the value is used. Safe usage requires knowing the migration is impossible (e.g. because the code is in interrupt context, holds a spinlock, or cannot migrate due to k_cpu_mask state).

Returns

Unique ID for currently-executing CPU

void arch_sched_broadcast_ipi(void)

Broadcast an interrupt to all CPUs.

This will invoke z_sched_ipi() on all other CPUs in the system.

void arch_sched_directed_ipi(uint32_t cpu_bitmap)

Direct IPIs to the specified CPUs.

This will invoke z_sched_ipi() on the CPUs identified by *cpu_bitmap*.

Parameters

- cpu_bitmap – A bitmap indicating which CPUs need the IPI

int arch_smp_init(void)

static inline unsigned int arch_num_cpus(void)

Returns the number of CPUs.

For most systems this will be the same as CONFIG_MP_MAX_NUM_CPUS, however some systems may determine this at runtime instead.

Returns

the number of CPUs

Interrupts

group arch-irq

Functions

static inline bool arch_is_in_isr(void)

Test if the current context is in interrupt context.

XXX: This is inconsistently handled among arches wrt exception context See: #17656

Returns

true if we are in interrupt context

static inline unsigned int **arch_irq_lock**(void)
Lock interrupts on the current CPU.

See also

irq_lock()

static inline void **arch_irq_unlock**(unsigned int key)
Unlock interrupts on the current CPU.

See also

irq_unlock()

static inline bool **arch_irq_unlocked**(unsigned int key)
Test if calling *arch_irq_unlock()* with this key would unlock irqs.

Parameters

- **key** – value returned by *arch_irq_lock()*

Returns
true if interrupts were unlocked prior to the *arch_irq_lock()* call that produced the key argument.

void **arch_irq_disable**(unsigned int irq)
Disable the specified interrupt line.

See also

irq_disable()

Note

: The behavior of interrupts that arrive after this call returns and before the corresponding call to arch_irq_enable() is undefined. The hardware is not required to latch and deliver such an interrupt, though on some architectures that may work. Other architectures will simply lose such an interrupt and never deliver it. Many drivers and subsystems are not tolerant of such dropped interrupts and it is the job of the application layer to ensure that behavior remains correct.

void **arch_irq_enable**(unsigned int irq)
Enable the specified interrupt line.

See also

irq_enable()

int **arch_irq_is_enabled**(unsigned int irq)

Test if an interrupt line is enabled.

See also

irq_is_enabled()

int **arch_irq_connect_dynamic**(unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)

Arch-specific hook to install a dynamic interrupt.

Parameters

- **irq** – IRQ line number
- **priority** – Interrupt priority
- **routine** – Interrupt service routine
- **parameter** – ISR parameter
- **flags** – Arch-specific IRQ configuration flag

Returns

The vector assigned to this interrupt

int **arch_irq_disconnect_dynamic**(unsigned int irq, unsigned int priority, void (*routine)(const void *parameter), const void *parameter, uint32_t flags)

Arch-specific hook to dynamically uninstall a shared interrupt.

If the interrupt is not being shared, then the associated _sw_isr_table entry will be replaced by (NULL, z_irq_spurious) (default entry).

Parameters

- **irq** – IRQ line number
- **priority** – Interrupt priority
- **routine** – Interrupt service routine
- **parameter** – ISR parameter
- **flags** – Arch-specific IRQ configuration flag

Returns

0 in case of success, negative value otherwise

unsigned int **arch_irq_allocate**(void)

Arch-specific hook for allocating IRQs.

Note: disable/enable IRQ relevantly inside the implementation of such function to avoid concurrency issues. Also, an allocated IRQ is assumed to be used thus a following

See also

arch_irq_is_used() should return true.

Returns

The newly allocated IRQ or UINT_MAX on error.

void `arch_irq_set_used`(unsigned int irq)

Arch-specific hook for declaring an IRQ being used.

Note: disable/enable IRQ relevantly inside the implementation of such function to avoid concurrency issues.

Parameters

- `irq` – the IRQ to declare being used

bool `arch_irq_is_used`(unsigned int irq)

Arch-specific hook for checking if an IRQ is being used already.

Parameters

- `irq` – the IRQ to check

Returns

true if being, false otherwise

Userspace

group `arch-userspace`

Functions

static inline uintptr_t `arch_syscall_invoke0`(uintptr_t call_id)

Invoke a system call with 0 arguments.

No general-purpose register state other than return value may be preserved when transitioning from supervisor mode back down to user mode for security reasons.

It is required that all arguments be stored in registers when elevating privileges from user to supervisor mode.

Processing of the syscall takes place on a separate kernel stack. Interrupts should be enabled when invoking the system call marshallers from the dispatch table. Thread preemption may occur when handling system calls.

Call IDs are untrusted and must be bounds-checked, as the value is used to index the system call dispatch table, containing function pointers to the specific system call code.

Parameters

- `call_id` – System call ID

Returns

Return value of the system call. Void system calls return 0 here.

static inline uintptr_t `arch_syscall_invoke1`(uintptr_t arg1, uintptr_t call_id)

Invoke a system call with 1 argument.

See also

arch_syscall_invoke0()

Parameters

- `arg1` – First argument to the system call.

- `call_id` – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t **arch_syscall_invoke2**(uintptr_t arg1, uintptr_t arg2, uintptr_t call_id)

Invoke a system call with 2 arguments.

See also

arch_syscall_invoke0()

Parameters

- `arg1` – First argument to the system call.
- `arg2` – Second argument to the system call.
- `call_id` – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t **arch_syscall_invoke3**(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t call_id)

Invoke a system call with 3 arguments.

See also

arch_syscall_invoke0()

Parameters

- `arg1` – First argument to the system call.
- `arg2` – Second argument to the system call.
- `arg3` – Third argument to the system call.
- `call_id` – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline uintptr_t **arch_syscall_invoke4**(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t call_id)

Invoke a system call with 4 arguments.

See also

arch_syscall_invoke0()

Parameters

- `arg1` – First argument to the system call.
- `arg2` – Second argument to the system call.
- `arg3` – Third argument to the system call.
- `arg4` – Fourth argument to the system call.
- `call_id` – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns

Return value of the system call. Void system calls return 0 here.

static inline uintptr_t **arch_syscall_invoke5**(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t arg5, uintptr_t call_id)

Invoke a system call with 5 arguments.

See also

arch_syscall_invoke0()

Parameters

- `arg1` – First argument to the system call.
- `arg2` – Second argument to the system call.
- `arg3` – Third argument to the system call.
- `arg4` – Fourth argument to the system call.
- `arg5` – Fifth argument to the system call.
- `call_id` – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns

Return value of the system call. Void system calls return 0 here.

static inline uintptr_t **arch_syscall_invoke6**(uintptr_t arg1, uintptr_t arg2, uintptr_t arg3, uintptr_t arg4, uintptr_t arg5, uintptr_t arg6, uintptr_t call_id)

Invoke a system call with 6 arguments.

See also

arch_syscall_invoke0()

Parameters

- `arg1` – First argument to the system call.
- `arg2` – Second argument to the system call.
- `arg3` – Third argument to the system call.
- `arg4` – Fourth argument to the system call.
- `arg5` – Fifth argument to the system call.
- `arg6` – Sixth argument to the system call.
- `call_id` – System call ID, will be bounds-checked and used to reference kernel-side dispatch table

Returns
Return value of the system call. Void system calls return 0 here.

static inline bool `arch_is_user_context`(void)

Indicate whether we are currently running in user mode.

Returns
True if the CPU is currently running with user permissions

int `arch_mem_domain_max_partitions_get`(void)

Get the maximum number of partitions for a memory domain.

Returns
Max number of partitions, or -1 if there is no limit

int `arch_buffer_validate`(const void *addr, size_t size, int write)

Check memory region permissions.

Given a memory region, return whether the current memory management hardware configuration would allow a user thread to read/write that region. Used by system calls to validate buffers coming in from userspace.

Notes: The function is guaranteed to never return validation success, if the entire buffer area is not user accessible.

The function is guaranteed to correctly validate the permissions of the supplied buffer, if the user access permissions of the entire buffer are enforced by a single, enabled memory management region.

In some architectures the validation will always return failure if the supplied memory buffer spans multiple enabled memory management regions (even if all such regions permit user access).

Warning

Buffer of size zero (0) has undefined behavior.

Parameters

- `addr` – start address of the buffer
- `size` – the size of the buffer
- `write` – If non-zero, additionally check if the area is writable. Otherwise, just check if the memory can be read.

Returns
nonzero if the permissions don't match.

size_t **arch_virt_region_align**(uintptr_t phys, size_t size)

Get the optimal virtual region alignment to optimize the MMU table layout.

Some MMU HW requires some region to be aligned to some of the intermediate block alignment in order to reduce table usage. This call returns the optimal virtual address alignment in order to permit such optimization in the following MMU mapping call.

Parameters

- **phys** – **[in]** Physical address of region to be mapped, aligned to CONFIG_MMU_PAGE_SIZE
- **size** – **[in]** Size of region to be mapped, aligned to CONFIG_MMU_PAGE_SIZE

Returns

Alignment to apply on the virtual address of this region

FUNC_NORETURN void **arch_user_mode_enter**(k_thread_entry_t user_entry, void *p1, void *p2, void *p3)

Perform a one-way transition from supervisor to user mode.

Implementations of this function must do the following:

- Reset the thread's stack pointer to a suitable initial value. We do not need any prior context since this is a one-way operation.
- Set up any kernel stack region for the CPU to use during privilege elevation
- Put the CPU in whatever its equivalent of user mode is
- Transfer execution to *arch_new_thread()* passing along all the supplied arguments, in user mode.

Parameters

- **user_entry** – Entry point to start executing as a user thread
- **p1** – 1st parameter to user thread
- **p2** – 2nd parameter to user thread
- **p3** – 3rd parameter to user thread

FUNC_NORETURN void **arch_syscall_oops**(void *ssf)

Induce a kernel oops that appears to come from a specific location.

Normally, k_oops() generates an exception that appears to come from the call site of the k_oops() itself.

However, when validating arguments to a system call, if there are problems we want the oops to appear to come from where the system call was invoked and not inside the validation function.

Parameters

- **ssf** – System call stack frame pointer. This gets passed as an argument to _k_syscall_handler_t functions and its contents are completely architecture specific.

size_t **arch_user_string_nlen**(const char *s, size_t maxsize, int *err)

Safely take the length of a potentially bad string.

This must not fault, instead the err parameter must have -1 written to it. This function otherwise should work exactly like libc strnlen(). On success err should be set to 0.

Parameters

- `s` – String to measure
- `maxsize` – Max length of the string
- `err` – Error value to write

Returns
Length of the string, not counting NULL byte, up to maxsize

static inline bool `arch_mem_coherent`(void *ptr)

Detect memory coherence type.

Required when ARCH_HAS_COHERENCE is true. This function returns true if the byte pointed to lies within an architecture-defined "coherence region" (typically implemented with uncached memory) and can safely be used in multiprocessor code without explicit flush or invalidate operations.

Note

The result is for only the single byte at the specified address, this API is not required to check region boundaries or to expect aligned pointers. The expectation is that the code above will have queried the appropriate address(es).

static inline void `arch_cohere_stacks`(struct *k_thread* *old_thread, void *old_switch_handle, struct *k_thread* *new_thread)

Ensure cache coherence prior to context switch.

Required when ARCH_HAS_COHERENCE is true. On cache-incoherent multiprocessor architectures, thread stacks are cached by default for performance reasons. They must therefore be flushed appropriately on context switch. The rules are:

a. The region containing live data in the old stack (generally the bytes between the current stack pointer and the top of the stack memory) must be flushed to underlying storage so a new CPU that runs the same thread sees the correct data. This must happen before the assignment of the switch_handle field in the thread struct which signals the completion of context switch.

b. Any data areas to be read from the new stack (generally the same as the live region when it was saved) should be invalidated (and NOT flushed!) in the data cache. This is because another CPU may have run or re-initialized the thread since this CPU suspended it, and any data present in cache will be stale.

Note

The kernel will call this function during interrupt exit when a new thread has been chosen to run, and also immediately before entering *arch_switch()* to effect a code-driven context switch. In the latter case, it is very likely that more data will be written to the old_thread stack region after this function returns but before the completion of the switch. Simply flushing naively here is not sufficient on many architectures and coordination with the *arch_switch()* implementation is likely required.

Parameters

- `old_thread` – The old thread to be flushed before being allowed to run on other CPUs.
- `old_switch_handle` – The switch handle to be stored into old_thread (it will not be valid until the cache is flushed so is not present yet). This will

be NULL if inside z_swap() (because the *arch_switch()* has not saved it yet).

- `new_thread` – The new thread to be invalidated before it runs locally.

Memory Management

group `arch-mmu`

Defines

`ARCH_DATA_PAGE_ACCESSED`

Bit indicating the data page was accessed since the value was last cleared.

Used by marking eviction algorithms. Safe to set this if uncertain.

This bit is undefined if ARCH_DATA_PAGE_LOADED is not set.

`ARCH_DATA_PAGE_DIRTY`

Bit indicating the data page, if evicted, will need to be paged out.

Set if the data page was modified since it was last paged out, or if it has never been paged out before. Safe to set this if uncertain.

This bit is undefined if ARCH_DATA_PAGE_LOADED is not set.

`ARCH_DATA_PAGE_LOADED`

Bit indicating that the data page is loaded into a physical page frame.

If un-set, the data page is paged out or not mapped.

`ARCH_DATA_PAGE_NOT_MAPPED`

If ARCH_DATA_PAGE_LOADED is un-set, this will indicate that the page is not mapped at all.

This bit is undefined if ARCH_DATA_PAGE_LOADED is set.

Enums

enum `arch_page_location`

Status of a particular page location.

Values:

enumerator `ARCH_PAGE_LOCATION_PAGED_OUT`

The page has been evicted to the backing store.

enumerator `ARCH_PAGE_LOCATION_PAGED_IN`

The page is resident in memory.

enumerator `ARCH_PAGE_LOCATION_BAD`

The page is not mapped.

Functions

void `arch_mem_map`(void *virt, uintptr_t phys, size_t size, uint32_t flags)

Map physical memory into the virtual address space.

This is a low-level interface to mapping pages into the address space. Behavior when providing unaligned addresses/sizes is undefined, these are assumed to be aligned to CONFIG_MMU_PAGE_SIZE.

The core kernel handles all management of the virtual address space; by the time we invoke this function, we know exactly where this mapping will be established. If the page tables already had mappings installed for the virtual memory region, these will be overwritten.

If the target architecture supports multiple page sizes, currently only the smallest page size will be used.

The memory range itself is never accessed by this operation.

This API must be safe to call in ISRs or exception handlers. Calls to this API are assumed to be serialized, and indeed all usage will originate from kernel/mm.c which handles virtual memory management.

Architectures are expected to pre-allocate page tables for the entire address space, as defined by CONFIG_KERNEL_VM_BASE and CONFIG_KERNEL_VM_SIZE. This operation should never require any kind of allocation for paging structures.

Validation of arguments should be done via assertions.

This API is part of infrastructure still under development and may change.

Parameters

- `virt` – Page-aligned Destination virtual address to map
- `phys` – Page-aligned Source physical address to map
- `size` – Page-aligned size of the mapped memory region in bytes
- `flags` – Caching, access and control flags, see K_MAP_* macros

void `arch_mem_unmap`(void *addr, size_t size)

Remove mappings for a provided virtual address range.

This is a low-level interface for un-mapping pages from the address space. When this completes, the relevant page table entries will be updated as if no mapping was ever made for that memory range. No previous context needs to be preserved. This function must update mappings in all active page tables.

Behavior when providing unaligned addresses/sizes is undefined, these are assumed to be aligned to CONFIG_MMU_PAGE_SIZE.

Behavior when providing an address range that is not already mapped is undefined.

This function should never require memory allocations for paging structures, and it is not necessary to free any paging structures. Empty page tables due to all contained entries being un-mapped may remain in place.

Implementations must invalidate TLBs as necessary.

This API is part of infrastructure still under development and may change.

Parameters

- `addr` – Page-aligned base virtual address to un-map
- `size` – Page-aligned region size

int `arch_page_phys_get`(void *virt, uintptr_t *phys)

Get the mapped physical memory address from virtual address.

The function only needs to query the current set of page tables as the information it reports must be common to all of them if multiple page tables are in use. If multiple page tables are active it is unnecessary to iterate over all of them.

Unless otherwise specified, virtual pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior. Just check the currently installed page tables and return the information in that.

Parameters

- `virt` – Page-aligned virtual address
- `phys` – **[out]** Mapped physical address (can be NULL if only checking if virtual address is mapped)

Return values

- `0` – if mapping is found and valid
- `-EFAULT` – if virtual address is not mapped

void `arch_reserved_pages_update`(void)

Update page frame database with reserved pages.

Some page frames within system RAM may not be available for use. A good example of this is reserved regions in the first megabyte on PC-like systems.

Implementations of this function should mark all relevant entries in k_mem_page_frames with K_PAGE_FRAME_RESERVED. This function is called at early system initialization with mm_lock held.

void `arch_mem_page_out`(void *addr, uintptr_t location)

Update all page tables for a paged-out data page.

This function:

- Sets the data page virtual address to trigger a fault if accessed that can be distinguished from access violations or un-mapped pages.
- Saves the provided location value so that it can retrieved for that data page in the page fault handler.
- The location value semantics are undefined here but the value will be always be page-aligned. It could be 0.

If multiple page tables are in use, this must update all page tables. This function is called with interrupts locked.

Calling this function on data pages which are already paged out is undefined behavior.

This API is part of infrastructure still under development and may change.

void `arch_mem_page_in`(void *addr, uintptr_t phys)

Update all page tables for a paged-in data page.

This function:

- Maps the specified virtual data page address to the provided physical page frame address, such that future memory accesses will function as expected. Access and caching attributes are undisturbed.
- Clears any accounting for “accessed” and “dirty” states.

If multiple page tables are in use, this must update all page tables. This function is called with interrupts locked.

Calling this function on data pages which are already paged in is undefined behavior.

This API is part of infrastructure still under development and may change.

void **arch_mem_scratch**(uintptr_t phys)

Update current page tables for a temporary mapping.

Map a physical page frame address to a special virtual address K_MEM_SCRATCH_PAGE, with read/write access to supervisor mode, such that when this function returns, the calling context can read/write the page frame's contents from the K_MEM_SCRATCH_PAGE address.

This mapping only needs to be done on the current set of page tables, as it is only used for a short period of time exclusively by the caller. This function is called with interrupts locked.

This API is part of infrastructure still under development and may change.

enum *arch_page_location* **arch_page_location_get**(void *addr, uintptr_t *location)

Fetch location information about a page at a particular address.

The function only needs to query the current set of page tables as the information it reports must be common to all of them if multiple page tables are in use. If multiple page tables are active it is unnecessary to iterate over all of them. This may allow certain types of optimizations (such as reverse page table mapping on x86).

This function is called with interrupts locked, so that the reported information can't become stale while decisions are being made based on it.

Unless otherwise specified, virtual data pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior. Just check the currently installed page tables and return the information in that.

Parameters

- **addr** – Virtual data page address that took the page fault
- **location** – **[out]** In the case of ARCH_PAGE_LOCATION_PAGED_OUT, the backing store location value used to retrieve the data page. In the case of ARCH_PAGE_LOCATION_PAGED_IN, the physical address the page is mapped to.

Return values

- **ARCH_PAGE_LOCATION_PAGED_OUT** – The page was evicted to the backing store.
- **ARCH_PAGE_LOCATION_PAGED_IN** – The data page is resident in memory.
- **ARCH_PAGE_LOCATION_BAD** – The page is un-mapped or otherwise has had invalid access

uintptr_t **arch_page_info_get**(void *addr, uintptr_t *location, bool clear_accessed)

Retrieve page characteristics from the page table(s)

The architecture is responsible for maintaining "accessed" and "dirty" states of data pages to support marking eviction algorithms. This can either be directly supported by hardware or emulated by modifying protection policy to generate faults on reads or writes. In all cases the architecture must maintain this information in some way.

For the provided virtual address, report the logical OR of the accessed and dirty states for the relevant entries in all active page tables in the system if the page is mapped and not paged out.

If clear_accessed is true, the ARCH_DATA_PAGE_ACCESSED flag will be reset. This function will report its prior state. If multiple page tables are in use, this function clears accessed state in all of them.

This function is called with interrupts locked, so that the reported information can't become stale while decisions are being made based on it.

The return value may have other bits set which the caller must ignore.

Clearing accessed state for data pages that are not ARCH_DATA_PAGE_LOADED is undefined behavior.

ARCH_DATA_PAGE_DIRTY and ARCH_DATA_PAGE_ACCESSED bits in the return value are only significant if ARCH_DATA_PAGE_LOADED is set, otherwise ignore them.

ARCH_DATA_PAGE_NOT_MAPPED bit in the return value is only significant if ARCH_DATA_PAGE_LOADED is un-set, otherwise ignore it.

Unless otherwise specified, virtual data pages have the same mappings across all page tables. Calling this function on data pages that are exceptions to this rule (such as the scratch page) is undefined behavior.

This API is part of infrastructure still under development and may change.

Parameters

- `addr` – Virtual address to look up in page tables
- `location` – **[out]** If non-NULL, updated with either physical page frame address or backing store location depending on ARCH_DATA_PAGE_LOADED state. This is not touched if ARCH_DATA_PAGE_NOT_MAPPED.
- `clear_accessed` – Whether to clear ARCH_DATA_PAGE_ACCESSED state

Return values

`Value` – with ARCH_DATA_PAGE_* bits set reflecting the data page configuration

Miscellaneous Architecture APIs

group `arch-misc`

Functions

int `arch_printk_char_out`(int c)

Early boot console output hook.

Definition of this function is optional. If implemented, any invocation of printk() (or logging calls with CONFIG_LOG_MODE_MINIMAL which are backed by printk) will default to sending characters to this function. It is useful for early boot debugging before main serial or console drivers come up.

This can be overridden at runtime with __printk_hook_install().

The default __weak implementation of this does nothing.

Parameters

- `c` – Character to print

Returns

The character printed

static inline void **arch_kernel_init**(void)

Architecture-specific kernel initialization hook.

This function is invoked near the top of z_cstart, for additional architecture-specific setup before the rest of the kernel is brought up.

static inline void **arch_nop**(void)

Do nothing and return.

Yawn.

GDB Stub APIs

group **arch-gdbstub**

Functions

void **arch_gdb_init**(void)

Architecture layer debug start.

This function is called by `gdb_init()`

void **arch_gdb_continue**(void)

Continue running program.

Continue software execution.

void **arch_gdb_step**(void)

Continue with one step.

Continue software execution until reaches the next statement.

size_t **arch_gdb_reg_readall**(struct gdb_ctx *ctx, uint8_t *buf, size_t buflen)

Read all registers, and outputs as hexadecimal string.

This reads all CPU registers and outputs as hexadecimal string. The output string must be parsable by GDB.

Parameters

- **ctx** – GDB context
- **buf** – Buffer to output hexadecimal string.
- **buflen** – Length of buffer.

Returns

Length of hexadecimal string written. Return 0 if error or not supported.

size_t **arch_gdb_reg_writeall**(struct gdb_ctx *ctx, uint8_t *hex, size_t hexlen)

Take a hexadecimal string and update all registers.

This takes in a hexadecimal string as presented from GDB, and updates all CPU registers with new values.

Parameters

- **ctx** – GDB context
- **hex** – Input hexadecimal string.
- **hexlen** – Length of hexadecimal string.

Returns

Length of hexadecimal string parsed. Return 0 if error or not supported.

size_t `arch_gdb_reg_readone`(struct gdb_ctx *ctx, uint8_t *buf, size_t buflen, uint32_t regno)

Read one register, and outputs as hexadecimal string.

This reads one CPU register and outputs as hexadecimal string. The output string must be parsable by GDB.

Parameters

- `ctx` – GDB context
- `buf` – Buffer to output hexadecimal string.
- `buflen` – Length of buffer.
- `regno` – Register number

Returns

Length of hexadecimal string written. Return 0 if error or not supported.

size_t `arch_gdb_reg_writeone`(struct gdb_ctx *ctx, uint8_t *hex, size_t hexlen, uint32_t regno)

Take a hexadecimal string and update one register.

This takes in a hexadecimal string as presented from GDB, and updates one CPU registers with new value.

Parameters

- `ctx` – GDB context
- `hex` – Input hexadecimal string.
- `hexlen` – Length of hexadecimal string.
- `regno` – Register number

Returns

Length of hexadecimal string parsed. Return 0 if error or not supported.

int `arch_gdb_add_breakpoint`(struct gdb_ctx *ctx, uint8_t type, uintptr_t addr, uint32_t kind)

Add breakpoint or watchpoint.

Parameters

- `ctx` – GDB context
- `type` – Breakpoint or watchpoint type
- `addr` – Address of breakpoint or watchpoint
- `kind` – Size of breakpoint/watchpoint in bytes

Return values

- `0` – Operation successful
- `-1` – Error encountered
- `-2` – Not supported

int `arch_gdb_remove_breakpoint`(struct gdb_ctx *ctx, uint8_t type, uintptr_t addr, uint32_t kind)

Remove breakpoint or watchpoint.

Parameters

- `ctx` – GDB context
- `type` – Breakpoint or watchpoint type

- `addr` – Address of breakpoint or watchpoint
- `kind` – Size of breakpoint/watchpoint in bytes

Return values

- `0` – Operation successful
- `-1` – Error encountered
- `-2` – Not supported

7.8.2 SoC Porting Guide

This page describes how to add support for a new *SoC* in Zephyr, be it in the upstream Zephyr project or locally in your own repository.

SoC Definitions

It is expected that you are familiar with the board concept in Zephyr. A high level overview of the hardware support hierarchy and terms used in the Zephyr documentation can be seen in *Hardware support hierarchy*.

For SoC porting, the most important terms are:

- SoC: the exact system on a chip the board's CPU is part of.
- SoC series: a group of tightly related SoCs.
- SoC family: a wider group of SoCs with similar characteristics.
- CPU Cluster: a cluster of one or more CPU cores.
- CPU core: a particular CPU instance of a given architecture.
- Architecture: an instruction set architecture.

Architecture See *Architecture Porting Guide*.

Create your SoC directory

Each SoC must have a unique name. Use the official name given by the SoC vendor and check that it's not already in use. In some cases someone else may have contributed a SoC with identical name. If the SoC name is already in use, then you should probably improve the existing SoC instead of creating a new one. The script `list_hardware` can be used to retrieve a list of all SoCs known in Zephyr, for example `./scripts/list_hardware.py --soc-root=. --socs` from the Zephyr base directory for a list of names that are already in use.

Start by creating the directory `zephyr/soc/<VENDOR>/soc1`, where `<VENDOR>` is your vendor subdirectory.

Note

A `<VENDOR>` subdirectory is mandatory if contributing your SoC to Zephyr, but if your SoC is placed in a local repo, then any folder structure under `<your-repo>/soc` is permitted. The `<VENDOR>` subdirectory must match a vendor defined in the list in dts/bindings/vendor-prefixes.txt. If the SoC vendor does not have a prefix in that list, then one must be created.

Note

The SoC directory name does not need to match the name of the SoC. Multiple SoCs can even be defined in one directory. In Zephyr, SoCs are often organized in sub-folders in a common SoC Family or SoC Series tree.

Your SoC directory should look like this:

```
soc/<VENDOR>/<soc-name>
├── soc.yml
├── soc.h
├── CMakeLists.txt
├── Kconfig
├── Kconfig.soc
└── Kconfig.defconfig
```

Replace `<soc-name>` with your SoC's name.

The mandatory files are:

1. `soc.yml`: a YAML file describing the high-level meta data of the SoC such as: - SoC name: the name of the SoC - CPU clusters: CPU clusters if the SoC contains one or more clusters - SoC series: the SoC series to which the SoC belong - SoC family: the SoC family to which the series belong
2. `soc.h`: a header file which can be used to describe or provide configuration macros for the SoC. The `soc.h` will often be included in drivers, sub-systems, boards, and other source code found in Zephyr.
3. `Kconfig.soc`: the base SoC configuration which defines a Kconfig SoC symbol in the form of `config SOC_<soc-name>` and provides the SoC name to the Kconfig `SOC` setting. If the `soc.yml` describes a SoC family and series, then those must also be defined in this file. Kconfig settings outside of the SoC tree must not be selected. To select general Zephyr Kconfig settings the `Kconfig` file must be used.
4. `CMakeLists.txt`: CMake file loaded by the Zephyr build system. This CMake file can define additional include paths and/or source files to be used when a build targets the SoC. Also the base line linker script to use must be defined.

The optional files are:

- `Kconfig`, `Kconfig.defconfig` software configuration in *Configuration System (Kconfig)* format. These select the architecture and peripherals available.

Write your SoC YAML

The SoC YAML file describes the SoC family, SoC series, and SoC at a high level.

Detailed configurations, such as hardware description and configuration are done in devicetree and Kconfig.

The skeleton of a simple SoC YAML file containing just one SoC is:

```
socs:
- name: <soc1>
```

It is possible to have multiple SoC located in the SoC folder. For example if they belong to a common family or series it is recommended to locate such SoC in a common tree. Multiple SoCs and SoC series in a common folder can be described in the `soc.yml` file as:

```
family:
  name: <family-name>
  series:
    - name: <series-1-name>
      socs:
        - name: <soc1>
          cpucluster:
            - name: <coreA>
            - name: <coreB>
              ...
        - name: <soc2>
    - name: <series-2-name>
      ...
```

Write your SoC devicetree

SoC devicetree include files are located in the `<zephyr-repo>/dts` folder under a corresponding `<ARCH>/<VENDOR>`.

The SoC `dts/<ARCH>/<VENDOR>/<soc>.dtsi` describes your SoC hardware in the Devicetree Source (DTS) format and must be included by any boards which use the SoC.

If a highlevel `<arch>.dtsi` file exists, then a good starting point is to include this file in your `<soc>.dtsi`.

In general, `<soc>.dtsi` should look like this:

```
#include <arch>/<arch>.dtsi

/ {
        chosen {
                /* common chosen settings for your SoC */
        };

        cpus {
                #address-cells = <m>;
                #size-cells = <n>;

                cpu@0 {
                device_type = "cpu";
                compatible = "<compatibles>";
                /* ... your CPU definitions ... */
        };

        soc {
                /* Your SoC definitions and peripherals */
                /* such as ram, clock, buses, peripherals. */
        };
};
```

Hint

It is possible to structure multiple `<VENDOR>/<soc>.dtsi` files in sub-directories for a cleaner file system structure. For example organized pre SoC series, like this: `<VENDOR>/<SERIES>/<soc>.dtsi`.

Multiple CPU clusters Devicetree reflects the hardware. The memory space and peripherals available to one CPU cluster can be very different from another CPU cluster, therefore each CPU

cluster will often have its own `.dtsi` file.

CPU cluster `.dtsi` files should follow the naming scheme `<soc>_<cluster>.dtsi`. A `<soc>_<cluster>.dtsi` file will look similar to a SoC `.dtsi` without CPU clusters.

Write Kconfig files

Zephyr uses the Kconfig language to configure software features. Your SoC needs to provide some Kconfig settings before you can compile a Zephyr application for it.

Setting Kconfig configuration values is documented in detail in *Setting Kconfig configuration values*.

There is one mandatory Kconfig file in the SoC directory, and two optional files for a SoC:

```
soc/<vendor>/<your soc>
├── Kconfig.soc
├── Kconfig
└── Kconfig.defconfig
```

`Kconfig.soc`
: A shared Kconfig file which can be sourced both in Zephyr Kconfig and sysbuild Kconfig trees.

  This file selects the SoC family and series in the Kconfig tree and potential other SoC related Kconfig settings. In some cases a SOC_PART_NUMBER. This file must not select anything outside the re-usable Kconfig SoC tree.

  A `Kconfig.soc` may look like this:

```
config SOC_<series name>
        bool

config SOC_<SOC_NAME>
        bool
        select SOC_SERIES_<series name>

config SOC
        default "SoC name" if SOC_<SOC_NAME>
```

  Notice that `SOC_NAME` is a pure upper case version of the SoC name.

  The Kconfig `SOC` setting is globally defined as a string and therefore the `Kconfig.soc` file shall only define the default string value and not the type. Notice that the string value must match the SoC name used in the `soc.yml` file.

`Kconfig`
: Included by soc/Kconfig.

  This file can add Kconfig settings which are specific to the current SoC.

  The `Kconfig` will often indicate given hardware support using a setting of the form `HAS_<support>`.

```
config SOC_<SOC_NAME>
        select ARM
        select CPU_HAS_FPU
```

  If the setting name is identical to an existing Kconfig setting in Zephyr and only modifies the default value of said setting, then `Kconfig.defconfig` should be used instead.

`Kconfig.defconfig`
: SoC specific default values for Kconfig options.

  Not all SoCs have a `Kconfig.defconfig` file.

The entire file should be inside a pair of `if SOC_<SOC_NAME>` / `endif` or `if SOC_SERIES_<SERIES_NAME>` / `endif`, like this:

```
if SOC_<SOC_NAME>

config NUM_IRQS
        default 32

endif # SOC_<SOC_NAME>
```

Multiple CPU clusters CPU clusters must provide additional Kconfig settings in the `Kconfig.soc` file. This will usually be in the form of `SOC_<SOC_NAME>_<CLUSTER>` so for a given `soc1` with two clusters `clusterA` and `clusterB`, then this will look like:

SoC's When a SoC defines CPU cluster

```
config SOC_SOC1_CLUSTERA
        bool
        select SOC_SOC1

config SOC_SOC1_CLUSTERB
        bool
        select SOC_SOC1
```

7.8.3 Board Porting Guide

To add Zephyr support for a new *board*, you at least need a *board directory* with various files in it. Files in the board directory inherit support for at least one SoC and all of its features. Therefore, Zephyr must support your *SoC* as well.

Transition to the current hardware model

Shortly after Zephyr 3.6.0 was released, a new hardware model was introduced to Zephyr. This new model overhauls the way both SoCs and boards are named and defined, and adds support for features that had been identified as important over the years. Among them:

- Support for multi-core, multi-arch AMP (Asymmetrical Multi Processing) SoCs
- Support for multi-SoC boards
- Support for reusing the SoC and board Kconfig trees outside of the Zephyr build system
- Support for advanced use cases with *Sysbuild (System build)*
- Removal of all existing arbitrary and inconsistent uses of Kconfig and folder names

All the documentation in this page refers to the current hardware model. Please refer to the documentation in Zephyr v3.6.0 (or earlier) for information on the previous, now obsolete, hardware model.

More information about the rationale, development and concepts behind the new model can be found in the original issue, the original Pull Request and, for a complete set of changes introduced, the hardware model v2 commit.

Some non-critical features, enhancements and improvements of the new hardware model are still in development. Check the hardware model v2 enhancements issue for a complete list.

The transition from the previous hardware model to the current one (commonly referred to as "hardware model v2") requires modifications to all existing board and SoC definitions. A decision was made not to provide direct backwards compatibility for the previous model, which

leaves users transitioning from a previous version of Zephyr to one including the new model (v3.7.0 and onwards) with two options if they have an out-of-tree board (or SoC):

1. Convert the out-of-tree board to the current hardware model (recommended)
2. Take the SoC definition from Zephyr v3.6.0 and copy it to your downstream repository (ensuring that the build system can find it via a *zephyr module* or `SOC_ROOT`). This will allow your board, defined in the previous hardware model, to continue to work

When converting your board from the previous to the current hardware model, we recommend first reading through this page to understand the model in detail. You can then use the example-application conversion Pull Request as an example on how to port a simple board. Additionally, a conversion script is available and works reliably in many cases (though multi-core SoCs may not be handled entirely). Finally, the hardware model v2 commit contains the full conversion of all existing boards from the old to the current model, so you can use it as a complete conversion reference.

Hardware support hierarchy

Zephyr's hardware support is based on a series of hierarchical abstractions. Primarily, each *board* has one or more *SoC*. Each SoC can be optionally classed into an *SoC series*, which in turn may optionally belong to an *SoC family*. Each SoC has one or more *CPU cluster*, each containing one or more *CPU core* of a particular *architecture*.

You can visualize the hierarchy in the diagram below:

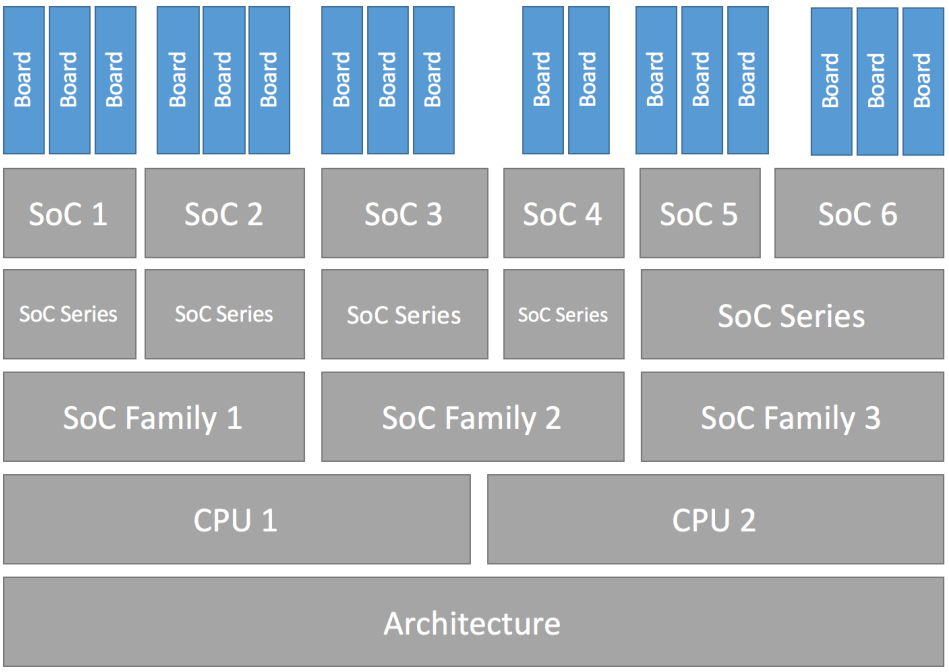

Fig. 5: Hardware support Hierarchy

Below are some examples of the hierarchy described in this section, in the form of a *board* per row with its corresponding hierarchy entries. Notice how the *SoC series* and *SoC family* levels are not always used.

board name	board qualifiers	SoC	SoC Series	SoC family	CPU core	architecture
nrf52dk	nrf52832	nRF52832	nRF52	Nordic nRF	Arm Cortex-M4	ARMv7-M
frdm_k64f	mk64f12	MK64F12	Kinetis K6x	NXP Kinetis	Arm Cortex-M4	ARMv7-M
rv32m1_vega	openisa_rv32m1/r	RV32M1	(Not used)	(Not used)	RI5CY	RISC-V RV32
nrf5340dk	nrf5340/cpuapp	nRF5340	nRF53	Nordic nRF	Arm Cortex-M33	ARMv8-M
	nrf5340/cpunet	nRF5340	nRF53	Nordic nRF	Arm Cortex-M33	ARMv8-M
mimx8mp_e	mimx8ml8/a53	i.MX8M Plus	i.MX8M	NXP i.MX	Arm Cortex-A53	ARMv8-A
	mimx8ml8/m7	i.MX8M Plus	i.MX8M	NXP i.MX	Arm Cortex-M7	ARMv7-M
	mimx8ml8/adsp	i.MX8M Plus	i.MX8M	NXP i.MX	Cadence HIFI4	Xtensa LX6

Additional details about terminology can be found in the next section.

Board terminology

The previous section introduced the hierarchical manner in which Zephyr classifies and implements hardware support. This section focuses on the terminology used around hardware support, and in particular when defining and working with boards and SoCs.

The overall set of terms used around the concept of board in Zephyr is depicted in the image below, which uses the bl5340_dvk board as reference.

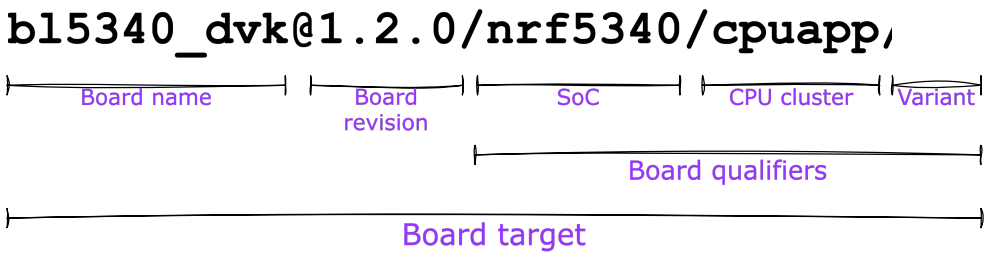

Fig. 6: Board terminology diagram

The diagram shows the different terms that are used to describe boards:

- The *board name*: `bl5340_dvk`
- The optional *board revision*: `1.2.0`
- The *board qualifiers*, that optionally describe the *SoC*, *CPU cluster* and *variant*: `nrf5340/cpuapp/ns`
- The *board target*, which uniquely identifies a combination of the above and can be used to specify the hardware to build for when using the tooling provided by Zephyr: `bl5340_dvk@1.2.0/nrf5340/cpuapp/ns`

Formally this can also be seen as *board name*`[@`*revision*`][/`*board qualifiers*`]`, which can be extended to *board name*`[@`*revision*`][/`*SoC*`[/`*CPU cluster*`][/`*variant*`]]`.

If a board contains only one single-core SoC, then the SoC can be omitted from the board target. This implies that if the board does not define any board qualifiers, the board name can be used as a board target. Conversely, if board qualifiers are part of the board definition, then the SoC can be omitted by leaving it out but including the corresponding forward-slashes: `//`.

Continuing with the example above, The board bl5340_dvk is a single SoC board where the SoC defines two CPU clusters: `cpuapp` and `cpunet`. One of the CPU clusters, `cpuapp`, additionally defines a non-secure board variant, `ns`.

The board qualifiers `nrf5340/cpuapp/ns` can be read as:

- `nrf5340`: The SoC, which is a Nordic nRF5340 dual-core SoC
- `cpuapp`: The CPU cluster `cpuapp`, which consists of a single Cortex-M33 CPU core. The number of cores in a CPU cluster cannot be determined from the board qualifiers.
- `ns`: a variant, in this case `ns` is a common variant name is Zephyr denoting a non-secure build for boards supporting *Trusted Firmware-M*.

Not all SoCs define CPU clusters or variants. For example a simple board like the thingy52_nrf52832 contains a single SoC with no CPU clusters and no variants. For `thingy52` the board target `thingy52/nrf52832` can be read as:

- `thingy52`: board name.
- `nrf52832`: The board qualifiers, in this case identical to the SoC, which is a Nordic nRF52832.

Make sure your SoC is supported

Start by making sure your SoC is supported by Zephyr. If it is, it's time to *Create your board directory*. If you don't know, try:

- checking boards for names that look relevant, and reading individual board documentation to find out for sure.
- asking your SoC vendor

If you need to add a SoC, CPU cluster, or even architecture support, this is the wrong page, but here is some general advice.

Architecture See *Architecture Porting Guide*.

CPU Core CPU core support files go in `core` subdirectories under arch, e.g. arch/x86/core.

See *Install a Toolchain* for information about toolchains (compiler, linker, etc.) supported by Zephyr. If you need to support a new toolchain, *Build and Configuration Systems* is a good place to start learning about the build system. Please reach out to the community if you are looking for advice or want to collaborate on toolchain support.

SoC Zephyr SoC support files are in architecture-specific subdirectories of soc. They are generally grouped by SoC family.

When adding a new SoC family or series for a vendor that already has SoC support within Zephyr, please try to extract common functionality into shared files to avoid duplication. If there is no support for your vendor yet, you can add it in a new directory `zephyr/soc/<VENDOR>/<YOUR-SOC>`; please use self-explanatory directory names.

Create your board directory

Once you've found an existing board that uses your SoC, you can usually start by copy/pasting its board directory and changing its contents for your hardware.

You need to give your board a unique name. Run `west boards` for a list of names that are already taken, and pick something new. Let's say your board is called `plank` (please don't actually use that name).

Start by creating the board directory `zephyr/boards/<VENDOR>/plank`, where `<VENDOR>` is your vendor subdirectory. (You don't have to put your board directory in the zephyr repository, but it's the easiest way to get started. See *Custom Board, Devicetree and SOC Definitions* for documentation on moving your board directory to a separate repository once it's working.)

Note

A `<VENDOR>` subdirectory is mandatory if contributing your board to Zephyr, but if your board is placed in a local repo, then any folder structure under `<your-repo>/boards` is permitted. If the vendor is defined in the list in dts/bindings/vendor-prefixes.txt then you must use that vendor prefix as `<VENDOR>`. `others` may be used as vendor prefix if the vendor is not defined.

Note

The board directory name does not need to match the name of the board. Multiple boards can even defined be in one directory.

Your board directory should look like this:

```
boards/<VENDOR>/plank
├── board.yml
├── board.cmake
├── CMakeLists.txt
├── doc
│   ├── plank.png
│   └── index.rst
├── Kconfig.plank
├── Kconfig.defconfig
├── plank_defconfig
├── plank_<qualifiers>_defconfig
├── plank.dts
├── plank_<qualifiers>.dts
└── plank.yaml
```

Replace `plank` with your board's name, of course.

The mandatory files are:

1. `board.yml`: a YAML file describing the high-level meta data of the boards such as the boards names, their SoCs, and variants. CPU clusters for multi-core SoCs are not described in this file as they are inherited from the SoC's YAML description.
2. `plank.dts` or `plank_<qualifiers>.dts`: a hardware description in *devicetree* format. This declares your SoC, connectors, and any other hardware components such as LEDs, buttons, sensors, or communication peripherals (USB, BLE controller, etc).
3. `Kconfig.plank`: the base software configuration for selecting SoC and other board and SoC related settings. Kconfig settings outside of the board and SoC tree must not be selected. To select general Zephyr Kconfig settings the `Kconfig` file must be used.

The optional files are:

- `Kconfig`, `Kconfig.defconfig` software configuration in *Configuration System (Kconfig)* formats. This provides default settings for software features and peripheral drivers.
- `plank_defconfig` and `plank_<qualifiers>_defconfig`: software configuration in Kconfig `.conf` format.
- `board.cmake`: used for *Flash and debug support*
- `CMakeLists.txt`: if you need to add additional source files to your build.
- `doc/index.rst`, `doc/plank.png`: documentation for and a picture of your board. You only need this if you're *Contributing your board* to Zephyr.
- `plank.yaml`: a YAML file with miscellaneous metadata used by the *Test Runner (Twister)*.

Board qualifiers of the form `<soc>/<cpucluster>/<variant>` are normalized so that `/` is replaced with `_` when used for filenames, for example: `soc1/foo` becomes `soc1_foo` when used in filenames.

Write your board YAML

The board YAML file describes the board at a high level. This includes the SoC, board variants, and board revisions.

Detailed configurations, such as hardware description and configuration are done in devicetree and Kconfig.

The skeleton of the board YAML file is:

```
board:
  name: <board-name>
  vendor: <board-vendor>
  revision:
    format: <major.minor.patch|letter|number|custom>
    default: <default-revision-value>
    exact: <true|false>
    revisions:
    - name: <revA>
    - name: <revB>
      ...
  socs:
  - name: <soc-1>
    variants:
    - name: <variant-1>
    - name: <variant-2>
      variants:
      - name: <sub-variant-2-1>
        ...
  - name: <soc-2>
    ...
```

It is possible to have multiple boards located in the board folder. If multiple boards are placed in the same board folder, then the file `board.yml` must describe those in a list as:

```
boards:
- name: <board-name-1>
  vendor: <board-vendor>
  ...
- name: <board-name-2>
  vendor: <board-vendor>
  ...
...
```

Write your devicetree

The devicetree file boards/<vendor>/plank/plank.dts or boards/<vendor>/plank/plank_<qualifiers>.dts describes your board hardware in the Devicetree Source (DTS) format (as usual, change plank to your board's name). If you're new to devicetree, see *Introduction to devicetree*.

In general, plank.dts should look like this:

```
/dts-v1/;
#include <your_soc_vendor/your_soc.dtsi>

/ {
        model = "A human readable name";
        compatible = "yourcompany,plank";

        chosen {
                zephyr,console = &your_uart_console;
                zephyr,sram = &your_memory_node;
                /* other chosen settings  for your hardware */
        };

        /*
         * Your board-specific hardware: buttons, LEDs, sensors, etc.
         */

        leds {
                compatible = "gpio-leds";
                led0: led_0 {
                        gpios = < /* GPIO your LED is hooked up to */ >;
                        label = "LED 0";
                };
                /* ... other LEDs ... */
        };

        buttons {
                compatible = "gpio-keys";
                /* ... your button definitions ... */
        };

        /* These aliases are provided for compatibility with samples */
        aliases {
                led0 = &led0; /* now you support the blinky sample! */
                /* other aliases go here */
        };
};

&some_peripheral_you_want_to_enable { /* like a GPIO or SPI controller */
        status = "okay";
};

&another_peripheral_you_want {
        status = "okay";
};
```

Only one .dts file will be used, and the most specific file which exists will be used.

This means that if both plank.dts and plank_soc1_foo.dts exist, then when building for plank / plank/soc1, then plank.dts is used. When building for plank//foo / plank/soc1/foo the plank_soc1_foo.dts is used.

This allows board maintainers to write a base devicetree file for the board or write specific devicetree files for a given board's SoC or variant.

If you're in a hurry, simple hardware can usually be supported by copy/paste followed by trial and error. If you want to understand details, you will need to read the rest of the devicetree documentation and the devicetree specification.

Example: FRDM-K64F and Hexiwear K64 This section contains concrete examples related to writing your board's devicetree.

The FRDM-K64F and Hexiwear K64 board devicetrees are defined in frdm_k64fs.dts and hexiwear_k64.dts respectively. Both boards have NXP SoCs from the same Kinetis SoC family, the K6X.

Common devicetree definitions for K6X are stored in nxp_k6x.dtsi, which is included by both board `.dts` files. nxp_k6x.dtsi in turn includes armv7-m.dtsi, which has common definitions for Arm v7-M cores.

Since nxp_k6x.dtsi is meant to be generic across K6X-based boards, it leaves many devices disabled by default using `status` properties. For example, there is a CAN controller defined as follows (with unimportant parts skipped):

```
can0: can@40024000 {
     ...
     status = "disabled";
     ...
};
```

It is up to the board `.dts` or application overlay files to enable these devices as desired, by setting `status = "okay"`. The board `.dts` files are also responsible for any board-specific configuration of the device, such as adding nodes for on-board sensors, LEDs, buttons, etc.

For example, FRDM-K64 (but not Hexiwear K64) `.dts` enables the CAN controller and sets the bus speed:

```
&can0 {
     status = "okay";
};
```

The `&can0 { ... };` syntax adds/overrides properties on the node with label `can0`, i.e. the `can@4002400` node defined in the `.dtsi` file.

Other examples of board-specific customization is pointing properties in `aliases` and `chosen` to the right nodes (see *Aliases and chosen nodes*), and making GPIO/pinmux assignments.

Write Kconfig files

Zephyr uses the Kconfig language to configure software features. Your board needs to provide some Kconfig settings before you can compile a Zephyr application for it.

Setting Kconfig configuration values is documented in detail in *Setting Kconfig configuration values*.

There is one mandatory Kconfig file in the board directory, and several optional files for a board named `plank`:

```
boards/<vendor>/plank
├── Kconfig
├── Kconfig.plank
├── Kconfig.defconfig
├── plank_defconfig
└── plank_<qualifiers>_defconfig
```

`Kconfig.plank`
: A shared Kconfig file which can be sourced both in Zephyr Kconfig and sysbuild Kconfig trees.

  This file selects the SoC in the Kconfig tree and potential other SoC related Kconfig settings. This file must not select anything outside the re-usable Kconfig board and SoC trees.

  A `Kconfig.plank` may look like this:

```
config BOARD_PLANK
        select SOC_SOC1
```

  The Kconfig symbols `BOARD_`*board* and `BOARD_`*normalized_board_target* are constructed by the build system, therefore no type shall be defined in above code snippet.

`Kconfig`
: Included by boards/Kconfig.

  This file can add Kconfig settings which are specific to the current board.

  Not all boards have a `Kconfig` file.

  A board specific setting should be defining a custom setting and usually with a prompt, like this:

```
config BOARD_FEATURE
        bool "Board specific feature"
```

  If the setting name is identical to an existing Kconfig setting in Zephyr and only modifies the default value of said setting, then `Kconfig.defconfig` should be used instead.

`Kconfig.defconfig`
: Board-specific default values for Kconfig options.

  Not all boards have a `Kconfig.defconfig` file.

  The entire file should be inside an `if BOARD_PLANK` / `endif` pair of lines, like this:

```
if BOARD_PLANK

config FOO
        default y

if NETWORKING
config SOC_ETHERNET_DRIVER
        default y
endif # NETWORKING

endif # BOARD_PLANK
```

`plank_defconfig` / `plank_<qualifiers>_defconfig`
: A Kconfig fragment that is merged as-is into the final build directory `.config` whenever an application is compiled for your board.

  If both the common `plank_defconfig` file and one or more board qualifiers specific `plank_<qualifiers>_defconfig` files exist, then all matching files will be used. This allows you to place configuration which is common for all board SoCs, CPU clusters, and board variants in the base `plank_defconfig` and only place the adjustments specific for a given SoC or board variant in the `plank_<qualifiers>_defconfig`.

  The `_defconfig` should contain mandatory settings for your system clock, console, etc. The results are architecture-specific, but typically look something like this:

```
CONFIG_SYS_CLOCK_HW_CYCLES_PER_SEC=120000000  # set up your clock, etc
CONFIG_SERIAL=y
```

`plank_x_y_z_defconfig` / `plank_<qualifiers>_x_y_z_defconfig`
: A Kconfig fragment that is merged as-is into the final build directory `.config` whenever an application is compiled for your board revision `x.y.z`.

Build, test, and fix

Now it's time to build and test the application(s) you want to run on your board until you're satisfied.

For example:

```
west build -b plank samples/hello_world
west flash
```

For `west flash` to work, see *Flash and debug support* below. You can also just flash `build/zephyr/zephyr.elf`, `zephyr.hex`, or `zephyr.bin` with any other tools you prefer.

General recommendations

For consistency and to make it easier for users to build generic applications that are not board specific for your board, please follow these guidelines while porting.

- Unless explicitly recommended otherwise by this section, leave peripherals and their drivers disabled by default.
- Configure and enable a system clock, along with a tick source.
- Provide pin and driver configuration that matches the board's valuable components such as sensors, buttons or LEDs, and communication interfaces such as USB, Ethernet connector, or Bluetooth/Wi-Fi chip.
- If your board uses a well-known connector standard (like Arduino, Mikrobus, Grove, or 96Boards connectors), add connector nodes to your DTS and configure pin muxes accordingly.
- Configure components that enable the use of these pins, such as configuring an SPI instance to use the usual Arduino SPI pins.
- If available, configure and enable a serial output for the console using the `zephyr,console` chosen node in the devicetree.
- If your board supports networking, configure a default interface.
- Enable all GPIO ports connected to peripherals or expansion connectors.
- If available, enable pinmux and interrupt controller drivers.
- It is recommended to enable the MPU by default, if there is support for it in hardware. For boards with limited memory resources it is acceptable to disable it. When the MPU is enabled, it is recommended to also enable hardware stack protection (CONFIG_HW_STACK_PROTECTION=y) and, thus, allow the kernel to detect stack overflows when the system is running in privileged mode.

Flash and debug support

Zephyr supports *Building, Flashing and Debugging* via west extension commands.

To add `west flash` and `west debug` support for your board, you need to create a `board.cmake` file in your board directory. This file's job is to configure a "runner" for your board. (There's nothing special you need to do to get `west build` support for your board.)

"Runners" are Zephyr-specific Python classes that wrap *flash and debug host tools* and integrate with west and the zephyr build system to support `west flash` and related commands. Each runner supports flashing, debugging, or both. You need to configure the arguments to these Python scripts in your `board.cmake` to support those commands like this example `board.cmake`:

```
board_runner_args(jlink "--device=nrf52" "--speed=4000")
board_runner_args(pyocd "--target=nrf52" "--frequency=4000000")

include(${ZEPHYR_BASE}/boards/common/nrfjprog.board.cmake)
include(${ZEPHYR_BASE}/boards/common/jlink.board.cmake)
include(${ZEPHYR_BASE}/boards/common/pyocd.board.cmake)
```

This example configures the `nrfjprog`, `jlink`, and `pyocd` runners.

Warning

Runners usually have names which match the tools they wrap, so the `jlink` runner wraps Segger's J-Link tools, and so on. But the runner command line options like `--speed` etc. are specific to the Python scripts.

Note

Runners and board configuration should be created without being targeted to a single operating system if the tool supports multiple operating systems, nor should it rely upon special system setup/configuration. For example; do not assume that a user will have prior knowledge/configuration or (if using Linux) special udev rules installed, do not assume one specific `/dev/X` device for all platforms as this will not be compatible with Windows or macOS, and allow for overriding of the selected device so that multiple boards can be connected to a single system and flashed/debugged at the choice of the user.

For more details:

- Run `west flash --context` to see a list of available runners which support flashing, and `west flash --context -r <RUNNER>` to view the specific options available for an individual runner.
- Run `west debug --context` and `west debug --context <RUNNER>` to get the same output for runners which support debugging.
- Run `west flash --help` and `west debug --help` for top-level options for flashing and debugging.
- See *Flash and debug runners* for Python APIs.
- Look for `board.cmake` files for other boards similar to your own for more examples.

To see what a `west flash` or `west debug` command is doing exactly, run it in verbose mode:

```
west --verbose flash
west --verbose debug
```

Verbose mode prints any host tool commands the runner uses.

The order of the `include()` calls in your `board.cmake` matters. The first `include` sets the default runner if it's not already set. For example, including `nrfjprog.board.cmake` first means that `nrfjprog` is the default flash runner for this board. Since `nrfjprog` does not support debugging, `jlink` is the default debug runner.

Multiple board revisions

See *Building for a board revision* for basics on this feature from the user perspective.

Board revisions are described in the `revision` entry of the `board.yml`.

```
board:
  revision:
    format: <major.minor.patch|letter|number|custom>
    default: <default-revision-value>
    exact: <true|false>
    revisions:
    - name: <revA>
    - name: <revB>
```

Zephyr natively supports the following revision formats:

- `major.minor.patch`: match a three digit revision, such as `1.2.3`.
- `number`: matches integer revisions
- `letter`: matches single letter revisions from `A` to `Z` only

Fuzzy revision matching Fuzzy revision matching is enabled per default.

If the user selects a revision between those available, the closest revision number that is not larger than the user's choice is used. For example, if the board `plank` defines revisions `0.5.0`, and `1.5.0` and the user builds for `plank@0.7.0`, the build system will target revision `0.5.0`.

The build system will print this at CMake configuration time:

```
-- Board: plank, Revision: 0.7.0 (Active: 0.5.0)
```

This allows you to only create revision configuration files for board revision numbers that introduce incompatible changes.

Similar for `letter` where revision `A`, `D`, and `F` could be defined and the user builds for `plank@E`, the build system will target revision `D` .

Exact revision matching Exact revision matching is enabled when `exact: true` is specified in the revision section in `board.yml`.

When exact is defined then building for `plank@0.7.0` in the above example will result in the following error message:

```
Board revision `0.7.0` not found.  Please specify a valid board revision.
```

Board revision configuration adjustment When the user builds for board `plank@<revision>` it is possible to make adjustments to the board's normal configuration.

As described in the *Write your devicetree* and *Write Kconfig files* sections the board default configuration is created from the files `<board>.dts` / `<board>_<qualifiers>.dts` and `<board>_defconfig` / `<board>_<qualifiers>_defconfig`. When building for a specific board revision, the above files are used as a starting point and the following board files will be used in addition:

- `<board>_<qualifiers>_<revision>_defconfig`: a specific revision defconfig which is only used for the board and SOC / variants identified by `<board>_<qualifiers>`.
- `<board>_<revision>_defconfig`: a specific revision defconfig which is used for the board regardless of the SOC / variants.

- <board>_<qualifiers>_<revision>.overlay: a specific revision dts overlay which is only used for the board and SOC / variants identified by <board>_<qualifiers>.
- <board>_<revision>.overlay: a specific revision dts overlay which is used for the board regardless of the SOC / variants.

This split allows boards with multiple SoCs, multi-core SoCs, or variants to place common revision adjustments which apply to all SoCs and variants in a single file, while still providing the ability to place SoC or variant specific adjustments in a dedicated revision file.

Using the plank board from previous sections, then we could have the following revision adjustments:

```
boards/zephyr/plank
├── plank_0_5_0_defconfig          # Kconfig adjustment for all plank board qualifiers on␣
↪revision 0.5.0
├── plank_0_5_0.overlay            # DTS overlay for all plank board qualifiers on revision␣
↪0.5.0
└── plank_soc1_foo_1_5_0_defconfig # Kconfig adjustment for plank board when building for␣
↪soc1 variant foo on revision 1.5.0
```

Custom revision.cmake files

Some boards may not use board revisions supported natively by Zephyr. For example string revisions.

One reason why Zephyr doesn't support string revisions is that strings can take many forms and it's not always clear if the given strings are just strings, such as blue, green, red, etc. or if they provide an order which can be matched against higher or lower revisions, such as alpha, beta', gamma.

Due to the sheer number of possibilities with strings, including the possibility of doing regex matches internally, then string revisions must be done using custom revision type.

To indicate to the build system that custom revisions are used, the format field in the revision section of the board.yml must be written as:

```
board:
  revision:
    format: custom
```

When using custom revisions then a revision.cmake must be created in the board directory.

The revision.cmake will be included by the build system when building for the board and it is the responsibility of the file to validate the revision specified by the user.

The BOARD_REVISION variable holds the revision value specified by the user.

To signal to the build system that it should use a different revision than the one specified by the user, revision.cmake can set the variable ACTIVE_BOARD_REVISION to the revision to use instead. The corresponding Kconfig files and devicetree overlays must be named <board>_<ACTIVE_BOARD_REVISION>_defconfig and <board>_<ACTIVE_BOARD_REVISION>.overlay.

Contributing your board

If you want to contribute your board to Zephyr, first – thanks!

There are some extra things you'll need to do:

1. Make sure you've followed all the *General recommendations*. They are requirements for boards included with Zephyr.

2. Add documentation for your board using the template file doc/templates/board.tmpl. See *Documentation Generation* for information on how to build your documentation before submitting your pull request.
3. Prepare a pull request adding your board which follows the *Contribution Guidelines*.

Board extensions

Boards already supported by Zephyr can be extended by downstream users, such as `example-application` or vendor SDKs. In some situations, certain hardware description or *choices* can not be added in the upstream Zephyr repository, but they can be in a downstream project, where custom bindings or driver classes can also be created. This feature may also be useful in development phases, when the board skeleton lives upstream, but other features are developed in a downstream module.

Board extensions are board fragments that can be present in an out-of-tree board root folder, under `${BOARD_ROOT}/boards/extensions`. Here is an example structure of an extension for the `plank` board and its revisions:

```
boards/extensions/plank
├── plank.conf                # optional
├── plank_<revision>.conf     # optional
├── plank.overlay             # optional
└── plank_<revision>.overlay  # optional
```

A board extension directory must follow the naming structure of the original board it extends. It may contain Kconfig fragments and/or devicetree overlays. Extensions are, by default, automatically loaded and applied on top of board files, before anything else. There is no guarantee on which order extensions are applied, in case multiple exist. This feature can be disabled by passing `-DBOARD_EXTENSIONS=OFF` when building.

Note that board extensions need to follow the *same guidelines* as regular boards. For example, it is wrong to enable extra peripherals or subsystems in a board extension.

Warning

Board extensions are not allowed in any module referenced in Zephyr's `west.yml` manifest file. Any board changes are required to be submitted to the main Zephyr repository.

7.8.4 Shields

Shields, also known as "add-on" or "daughter boards", attach to a board to extend its features and services for easier and modularized prototyping. In Zephyr, the shield feature provides Zephyr-formatted shield descriptions for easier compatibility with applications.

Shield porting and configuration

Shield configuration files are available in the board directory under /boards/shields:

```
boards/shields/<shield>
├── <shield>.overlay
├── Kconfig.shield
└── Kconfig.defconfig
```

These files provides shield configuration as follows:

- **<shield>.overlay**: This file provides a shield description in devicetree format that is merged with the board's *devicetree* before compilation.
- **Kconfig.shield**: This file defines shield Kconfig symbols that will be used for default shield configuration. To ease use with applications, the default shield configuration here should be consistent with those in the *Write your devicetree*.
- **Kconfig.defconfig**: This file defines the default shield configuration. It is made to be consistent with the *Write your devicetree*. Hence, shield configuration should be done by keeping in mind that features activation is application responsibility.

Besides, in order to avoid name conflicts with devices that may be defined at board level, it is advised, specifically for shields devicetree descriptions, to provide a device nodelabel is the form <device>_<shield>, for instance:

```
sdhc_myshield: sdhc@1 {
        reg = <1>;
        ...
};
```

Board compatibility

Hardware shield-to-board compatibility depends on the use of well-known connectors used on popular boards (such as Arduino and 96boards). For software compatibility, boards must also provide a configuration matching their supported connectors.

This should be done at two different level:

- Pinmux: Connector pins should be correctly configured to match shield pins
- Devicetree: A board *devicetree* file, `BOARD.dts` should define an alternate nodelabel for each connector interface. For example, for Arduino I2C:

```
arduino_i2c: &i2c1 {};
```

Board specific shield configuration If modifications are needed to fit a shield to a particular board or board revision, you can override a shield description for a specific board by adding board or board revision overriding files to a shield, as follows:

```
boards/shields/<shield>
└── boards
    ├── <board>_<revision>.overlay
    ├── <board>.overlay
    ├── <board>.defconfig
    ├── <board>_<revision>.conf
    └── <board>.conf
```

Shield activation

Activate support for one or more shields by adding the matching `--shield` arguments to the west command:

```
# From the root of the zephyr repository
west build -b None --shield x_nucleo_idb05a1 --shield x_nucleo_iks01a1 your_app
```

Alternatively, it could be set by default in a project's CMakeLists.txt:

```
set(SHIELD x_nucleo_iks01a1)
```

Shield variants

Some shields may support several variants or revisions. In that case, it is possible to provide multiple version of the shields description:

```
boards/shields/<shield>
├── <shield_v1>.overlay
├── <shield_v1>.defconfig
├── <shield_v2>.overlay
└── <shield_v2>.defconfig
```

In this case, a shield-particular revision name can be used:

```
# From the root of the zephyr repository
west build -b None --shield shield_v2 your_app
```

You can also provide a board-specific configuration to a specific shield revision:

```
boards/shields/<shield>
├── <shield_v1>.overlay
├── <shield_v1>.defconfig
├── <shield_v2>.overlay
├── <shield_v2>.defconfig
└── boards
    └── <shield_v2>
        ├── <board>.overlay
        └── <board>.defconfig
```

GPIO nexus nodes

GPIOs accessed by the shield peripherals must be identified using the shield GPIO abstraction, for example from the `arduino-header-r3` compatible. Boards that provide the header must map the header pins to SOC-specific pins. This is accomplished by including a nexus node that looks like the following into the board devicetree file:

```
arduino_header: connector {
        compatible = "arduino-header-r3";
        #gpio-cells = <2>;
        gpio-map-mask = <0xffffffff 0xffffffc0>;
        gpio-map-pass-thru = <0 0x3f>;
        gpio-map = <0 0 &gpioa 0 0>,    /* A0 */
                   <1 0 &gpioa 1 0>,    /* A1 */
                   <2 0 &gpioa 4 0>,    /* A2 */
                   <3 0 &gpiob 0 0>,    /* A3 */
                   <4 0 &gpioc 1 0>,    /* A4 */
                   <5 0 &gpioc 0 0>,    /* A5 */
                   <6 0 &gpioa 3 0>,    /* D0 */
                   <7 0 &gpioa 2 0>,    /* D1 */
                   <8 0 &gpioa 10 0>,   /* D2 */
                   <9 0 &gpiob 3 0>,    /* D3 */
                   <10 0 &gpiob 5 0>,   /* D4 */
                   <11 0 &gpiob 4 0>,   /* D5 */
                   <12 0 &gpiob 10 0>,  /* D6 */
                   <13 0 &gpioa 8 0>,   /* D7 */
                   <14 0 &gpioa 9 0>,   /* D8 */
                   <15 0 &gpioc 7 0>,   /* D9 */
                   <16 0 &gpiob 6 0>,   /* D10 */
                   <17 0 &gpioa 7 0>,   /* D11 */
                   <18 0 &gpioa 6 0>,   /* D12 */
                   <19 0 &gpioa 5 0>,   /* D13 */
```

(continues on next page)

(continued from previous page)

```
                    <20 0 &gpiob 9 0>,   /* D14 */
                    <21 0 &gpiob 8 0>;   /* D15 */
};
```

This specifies how Arduino pin references like `<&arduino_header 11 0>` are converted to SOC gpio pin references like `<&gpiob 4 0>`.

In Zephyr GPIO specifiers generally have two parameters (indicated by `#gpio-cells = <2>`): the pin number and a set of flags. The low 6 bits of the flags correspond to features that can be configured in devicetree. In some cases it's necessary to use a non-zero flag value to tell the driver how a particular pin behaves, as with:

```
drdy-gpios = <&arduino_header 11 GPIO_ACTIVE_LOW>;
```

After preprocessing this becomes `<&arduino_header 11 1>`. Normally the presence of such a flag would cause the map lookup to fail, because there is no map entry with a non-zero flags value. The `gpio-map-mask` property specifies that, for lookup, all bits of the pin and all but the low 6 bits of the flags are used to identify the specifier. Then the `gpio-map-pass-thru` specifies that the low 6 bits of the flags are copied over, so the SOC GPIO reference becomes `<&gpiob 4 1>` as intended.

See nexus node for more information about this capability.

Chapter 8

Contributing to Zephyr

Contributions from the community are the backbone of the project. Whether it is by submitting code, improving documentation, or proposing new features, your efforts are highly appreciated. This page lists useful resources and guidelines to help you in your contribution journey.

8.1 General Guidelines

8.1.1 Contribution Guidelines

As an open-source project, we welcome and encourage the community to submit patches directly to the project. In our collaborative open source environment, standards and methods for submitting changes help reduce the chaos that can result from an active development community.

This document explains how to participate in project conversations, log bugs and enhancement requests, and submit patches to the project so your patch will be accepted quickly in the codebase.

Licensing

Licensing is very important to open source projects. It helps ensure the software continues to be available under the terms that the author desired.

Zephyr uses the Apache 2.0 license (as found in the LICENSE file in the project's GitHub repo) to strike a balance between open contribution and allowing you to use the software however you would like to. The Apache 2.0 license is a permissive open source license that allows you to freely use, modify, distribute and sell your own products that include Apache 2.0 licensed software. (For more information about this, check out articles such as Why choose Apache 2.0 licensing and Top 10 Apache License Questions Answered).

A license tells you what rights you have as a developer, as provided by the copyright holder. It is important that the contributor fully understands the licensing rights and agrees to them. Sometimes the copyright holder isn't the contributor, such as when the contributor is doing work on behalf of a company.

Components using other Licenses There are some imported or reused components of the Zephyr project that use other licensing, as described in *Licensing of Zephyr Project components*.

Importing code into the Zephyr OS from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board.

By carefully reviewing potential contributions and also enforcing a *Developer Certification of Origin (DCO)* for contributed code, we can ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

See *Contributing External Components* for more information about this contributing and review process for imported components.

Licensing of Zephyr Project components The Zephyr kernel tree imports or reuses packages, scripts and other files that are not covered by the Apache 2.0 License. In some places there is no LICENSE file or way to put a LICENSE file there, so we describe the licensing in this document.

Developer Certification of Origin (DCO)

To make a good faith effort to ensure licensing criteria are met, the Zephyr project requires the Developer Certificate of Origin (DCO) process to be followed.

The DCO is an attestation attached to every contribution made by every developer. In the commit message of the contribution, (described more fully later in this document), the developer simply adds a `Signed-off-by` statement and thereby agrees to the DCO.

When a developer submits a patch, it is a commitment that the contributor has the right to submit the patch per the license. The DCO agreement is shown below and at http://developercertificate.org/.

```
Developer's Certificate of Origin 1.1

By making a contribution to this project, I certify that:

(a) The contribution was created in whole or in part by me and I
    have the right to submit it under the open source license
    indicated in the file; or

(b) The contribution is based upon previous work that, to the
    best of my knowledge, is covered under an appropriate open
    source license and I have the right under that license to
    submit that work with modifications, whether created in whole
    or in part by me, under the same open source license (unless
    I am permitted to submit under a different license), as
    Indicated in the file; or
```

(continues on next page)

(continued from previous page)

```
(c) The contribution was provided directly to me by some other
    person who certified (a), (b) or (c) and I have not modified
    it.

(d) I understand and agree that this project and the contribution
    are public and that a record of the contribution (including
    all personal information I submit with it, including my
    sign-off) is maintained indefinitely and may be redistributed
    consistent with this project or the open source license(s)
    involved.
```

DCO Sign-Off The "sign-off" in the DCO is a "Signed-off-by:" line in each commit's log message. The Signed-off-by: line must be in the following format:

```
Signed-off-by: Your Name <your.email@example.com>
```

For your commits, replace:

- `Your Name` with your legal name (pseudonyms, hacker handles, and the names of groups are not allowed)
- `your.email@example.com` with the same email address you are using to author the commit (CI will fail if there is no match)

You can automatically add the Signed-off-by: line to your commit body using `git commit -s`. Use other commits in the zephyr git history as examples. See *Git Setup* for instructions on configuring user and email settings in Git.

Additional requirements:

- If you are altering an existing commit created by someone else, you must add your Signed-off-by: line without removing the existing one.
- If you forget to add the Signed-off-by: line, you can add it to your previous commit by running `git commit --amend -s`.
- If you've pushed your changes to GitHub already you'll need to force push your branch after this with `git push -f`.

Notes Any contributions made as part of submitted pull requests are considered free for the Project to use. Developers are permitted to cherry-pick patches that are included in pull requests submitted by other contributors. It is expected that

- the content of the patches will not be substantially modified,
- the cherry-picked commits or portions of a commit shall preserve the original sign-off messages and the author identity.

Modifying Contributions made by other developers describes additional recommended policies around working with contributions submitted by other developers.

Prerequisites

As a contributor, you'll want to be familiar with the Zephyr project, how to configure, install, and use it as explained in the Zephyr Project website and how to set up your development environment as introduced in the Zephyr *Getting Started Guide*.

You should be familiar with common developer tools such as Git and CMake, and platforms such as GitHub.

If you haven't already done so, you'll need to create a (free) GitHub account on https://github.com and have Git tools available on your development system.

Note

The Zephyr development workflow supports all 3 major operating systems (Linux, macOS, and Windows) but some of the tools used in the sections below are only available on Linux and macOS. On Windows, instead of running these tools yourself, you will need to rely on the Continuous Integration (CI) service using Github Actions, which runs automatically on GitHub when you submit your Pull Request (PR). You can see any failure results in the workflow details link near the end of the PR conversation list. See *Continuous Integration* for more information

Source Tree Structure

To clone the main Zephyr Project repository use the instructions in *Get Zephyr and install Python dependencies*.

This section describes the main repository's source tree. In addition to the Zephyr kernel itself, you'll also find the sources for technical documentation, sample code, supported board configurations, and a collection of subsystem tests. All of these are available for developers to contribute to and enhance.

Understanding the Zephyr source tree can help locate the code associated with a particular Zephyr feature.

At the top of the tree, several files are of importance:

`CMakeLists.txt`
: The top-level file for the CMake build system, containing a lot of the logic required to build Zephyr.

`Kconfig`
: The top-level Kconfig file, which refers to the file `Kconfig.zephyr` also found in the top-level directory.

  See *the Kconfig section of the manual* for detailed Kconfig documentation.

`west.yml`
: The *West (Zephyr's meta-tool)* manifest, listing the external repositories managed by the west command-line tool.

The Zephyr source tree also contains the following top-level directories, each of which may have one or more additional levels of subdirectories not described here.

`arch`
: Architecture-specific kernel and system-on-chip (SoC) code. Each supported architecture (for example, x86 and ARM) has its own subdirectory, which contains additional subdirectories for the following areas:

  - architecture-specific kernel source files
  - architecture-specific kernel include files for private APIs

`soc`
: SoC related code and configuration files.

`boards`
: Board related code and configuration files.

`doc`
: Zephyr technical documentation source files and tools used to generate the https://docs.zephyrproject.org web content.

`drivers`
: Device driver code.

`dts`
: *devicetree* source files used to describe non-discoverable board-specific hardware details.

`include`
: Include files for all public APIs, except those defined under `lib`.

`kernel`
: Architecture-independent kernel code.

`lib`
: Library code, including the minimal standard C library.

`misc`
: Miscellaneous code that doesn't belong to any of the other top-level directories.

`samples`
: Sample applications that demonstrate the use of Zephyr features.

`scripts`
: Various programs and other files used to build and test Zephyr applications.

`cmake`
: Additional build scripts needed to build Zephyr.

`subsys`
: Subsystems of Zephyr, including:

  - USB device stack code
  - Networking code, including the Bluetooth stack and networking stacks
  - File system code
  - Bluetooth host and controller

`tests`
: Test code and benchmarks for Zephyr features.

`share`
: Additional architecture independent data. It currently contains Zephyr's CMake package.

Pull Requests and Issues

Before starting on a patch, first check in our issues Zephyr Project Issues system to see what's been reported on the issue you'd like to address. Have a conversation on the Zephyr devel mailing list (or the Zephyr Discord Server) to see what others think of your issue (and proposed solution). You may find others that have encountered the issue you're finding, or that have similar ideas for changes or additions. Send a message to the Zephyr devel mailing list to introduce and discuss your idea with the development community.

It's always a good practice to search for existing or related issues before submitting your own. When you submit an issue (bug or feature request), the triage team will review and comment on the submission, typically within a few business days.

You can find all open pull requests on GitHub and open Zephyr Project Issues in Github issues.

Git Setup

We need to know who you are, and how to contact you. To add this information to your Git installation, set the Git configuration variables `user.name` to your full name, and `user.email` to your email address.

For example, if your name is `Zephyr Developer` and your email address is `z.developer@example.com`:

```
git config --global user.name "Zephyr Developer"
git config --global user.email "z.developer@example.com"
```

Pull Request Guidelines

When opening a new Pull Request, adhere to the following guidelines to ensure compliance with Zephyr standards and facilitate the review process.

If in doubt, it's advisible to explore existing Pull Requests within the Zephyr repository. Use the search filters and labels to locate PRs related to changes similar to the ones you are proposing.

Commit Message Guidelines Changes are submitted as Git commits. Each commit has a *commit message* describing the change. Acceptable commit messages look like this:

```
[area]: [summary of change]

[Commit message body (must be non-empty)]

Signed-off-by: [Your Full Name] <[your.email@address]>
```

You need to change text in square brackets (`[like this]`) above to fit your commit.

Examples and more details follow.

Example Here is an example of a good commit message.

```
drivers: sensor: abcd1234: fix bus I/O error handling

The abcd1234 sensor driver is failing to check the flags field in
the response packet from the device which signals that an error
occurred. This can lead to reading invalid data from the response
buffer. Fix it by checking the flag and adding an error path.

Signed-off-by: Zephyr Developer <z.developer@example.com>
```

[area]: [summary of change] This line is called the commit's *title*. Titles must be:

- one line
- less than 72 characters long
- followed by a completely blank line

[area]
: The `[area]` prefix usually identifies the area of code being changed. It can also identify the change's wider context if multiple areas are affected.

  Here are some examples:

  - `doc: ...` for documentation changes
  - `drivers: foo:` for `foo` driver changes
  - `Bluetooth: Shell:` for changes to the Bluetooth shell
  - `net: ethernet:` for Ethernet-related networking changes
  - `dts:` for treewide devicetree changes

- `style:` for code style changes

If you're not sure what to use, try running `git log FILE`, where `FILE` is a file you are changing, and using previous commits that changed the same file as inspiration.

[summary of change]
The `[summary of change]` part should be a quick description of what you've done. Here are some examples:

- `doc: update wiki references to new site`
- `drivers: sensor: sensor_shell: fix channel name collision`

Warning

An empty commit message body is not permitted. Even for trivial changes, please include a descriptive commit message body. Your pull request will fail CI checks if you do not.

Commit Message Body This part of the commit should explain what your change does, and why it's needed. Be specific. A body that says `"Fixes stuff"` will be rejected. Be sure to include the following as relevant:

- **what** the change does,
- **why** you chose that approach,
- **what** assumptions were made, and
- **how** you know it works – for example, which tests you ran.

Each line in your commit message should usually be 75 characters or less. Use newlines to wrap longer lines. Exceptions include lines with long URLs, email addresses, etc.

For examples of accepted commit messages, you can refer to the Zephyr GitHub changelog.

Tip

You should have set your *Git Setup* already. Create your commit with `git commit -s` to add the Signed-off-by: line automatically using this information.

Signed-off-by: ... For open source licensing reasons, your commit must include a Signed-off-by: line that looks like this:

```
Signed-off-by: [Your Full Name] <[your.email@address]>
```

For example, if your full name is `Zephyr Developer` and your email address is `z.developer@example.com`:

```
Signed-off-by: Zephyr Developer <z.developer@example.com>
```

This means that you have personally made sure your change complies with the *Developer Certification of Origin (DCO)*. For this reason, you must use your legal name. Pseudonyms or "hacker aliases" are not permitted.

Your name and the email address you use must match the name and email in the Git commit's `Author:` field.

See the *Contributor Expectations* for a more complete discussion of contributor and reviewer expectations.

Adding links Do not include GitHub references in the commit message directly, as it can lose meaning in case the repository is forked, for example. Instead, if the change addresses a specific GitHub issue, include in the Pull Request message a line of the form:

```
Fixes #[issue number]
```

Where `[issue number]` is the relevant GitHub issue's number. For example:

```
Fixes: #1234
```

You can point to other relevant information that can be found on the web using `Link:` tags. This includes, for example: GitHub issues, datasheets, reference manuals, etc.

```
Link: https://github.com/zephyrproject-rtos/zephyr/issues/<issue number>
```

Coding Style In general, follow the Linux kernel coding style, with the following exceptions:

- The line length is 100 columns or fewer. In the documentation, longer lines for URL references are an allowed exception.
- Add braces to every `if`, `else`, `do`, `while`, `for` and `switch` body, even for single-line code blocks. Use the `--ignore BRACES` flag to make *checkpatch* stop complaining.
- Use spaces instead of tabs to align comments after declarations, as needed.
- Use C89-style single line comments, `/* */`. The C99-style single line comment, `//`, is not allowed.
- Use `/** */` for doxygen comments that need to appear in the documentation.
- Avoid using binary literals (constants starting with `0b`).
- Avoid using non-ASCII symbols in code, unless it significantly improves clarity, avoid emojis in any case.

Use these coding guidelines to ensure that your development complies with the project's style and naming conventions.

The Linux kernel GPL-licensed tool `checkpatch` is used to check coding style conformity.

> **Note**
>
> checkpatch does not currently run on Windows.

Checkpatch is available in the scripts directory. To invoke it when committing code, make the file *$ZEPHYR_BASE/.git/hooks/pre-commit* executable and edit it to contain:

```
#!/bin/sh
set -e exec
exec git diff --cached | ${ZEPHYR_BASE}/scripts/checkpatch.pl -
```

Instead of running checkpatch at each commit, you may prefer to run it only before pushing on zephyr repo. To do this, make the file *$ZEPHYR_BASE/.git/hooks/pre-push* executable and edit it to contain:

```
#!/bin/sh
remote="$1"
url="$2"

z40=0000000000000000000000000000000000000000

echo "Run push hook"
```

(continues on next page)

(continued from previous page)

```
while read local_ref local_sha remote_ref remote_sha
do
    args="$remote $url $local_ref $local_sha $remote_ref $remote_sha"
    exec ${ZEPHYR_BASE}/scripts/series-push-hook.sh $args
done

exit 0
```

If you want to override checkpatch verdict and push you branch despite reported issues, you can add option –no-verify to the git push command.

A more complete alternative to this is using *check_compliance.py* script.

clang-format The clang-format tool can be helpful to quickly reformat large amounts of new source code to our *Coding Style* standards together with the `.clang-format` configuration file provided in the repository. `clang-format` is well integrated into most editors, but you can also run it manually like this:

```
clang-format -i my_source_file.c
```

`clang-format` is part of LLVM, which can be downloaded from the project releases page. Note that if you are a Linux user, `clang-format` will likely be available as a package in your distribution repositories.

When there are differences between the *Coding Style* guidelines and the formatting generated by code formatting tools, the *Coding Style* guidelines take precedence. If there is ambiguity between formatting tools and the guidelines, maintainers may decide which style should be adopted.

Continuous Integration (CI) The Zephyr Project operates a Continuous Integration (CI) system that runs on every Pull Request (PR) in order to verify several aspects of the PR:

- Git commit formatting
- Coding Style
- Twister builds for multiple architectures and boards
- Documentation build to verify any doc changes

CI is run on Github Actions and it uses the same tools described in the *CI Tests* section. The CI results must be green indicating “All checks have passed” before the Pull Request can be merged. CI is run when the PR is created, and again every time the PR is modified with a commit.

The current status of the CI run can always be found at the bottom of the GitHub PR page, below the review status. Depending on the success or failure of the run you will see:

- “All checks have passed”
- “All checks have failed”

In case of failure you can click on the “Details” link presented below the failure message in order to navigate to `Github Actions` and inspect the results. Once you click on the link you will be taken to the `Github actions` summary results page where a table with all the different builds will be shown. To see what build or test failed click on the row that contains the failed (i.e. non-green) build.

Running CI Tests Locally

check_compliance.py The `check_compliance.py` script serves as a valuable tool for assessing code compliance with Zephyr's established guidelines and best practices. The script acts as wrapper for a suite of tools that performs various checks, including linters and formatters.

Developers are encouraged to run the script locally to validate their changes before opening a new Pull Request:

```
./scripts/ci/check_compliance.py -c upstream/main..
```

> **Note**
>
> twister is only fully supported on Linux; on Windows and MacOS the execution of tests is not supported, only building.

twister If you think your change may break some test, you can submit your PR as a draft and let the project CI automatically run the *Test Runner (Twister)* for you.

If a test fails, you can check from the CI run logs how to rerun it locally, for example:

```
west twister -p native_sim -s tests/drivers/build_all/sensor/sensors.generic_test
```

Static Code Analysis

Coverity Scan is a free service for static code analysis of Open Source projects. It is based on Coverity's commercial product and is able to analyze C, C++ and Java code.

Coverity's static code analysis doesn't run the code. Instead of that it uses abstract interpretation to gain information about the code's control flow and data flow. It's able to follow all possible code paths that a program may take. For example the analyzer understands that malloc() returns a memory that must be freed with free() later. It follows all branches and function calls to see if all possible combinations free the memory. The analyzer is able to detect all sorts of issues like resource leaks (memory, file descriptors), NULL dereferencing, use after free, unchecked return values, dead code, buffer overflows, integer overflows, uninitialized variables, and many more.

The results are available on the Coverity Scan website. In order to access the results you have to create an account yourself. From the Zephyr project page, you may select "Add me to project" to be added to the project. New members must be approved by an admin.

Static analysis of the Zephyr codebase is conducted on a bi-weekly basis. GitHub issues are automatically created for any issues detected by static analysis tools. These issues will have the same (or equivalent) priority initially defined by the tool.

To ensure accountability and efficient issue resolution, they are assigned to the respective maintainer who is responsible for the affected code.

A dedicated team comprising members with expertise in static analysis, code quality, and software security ensures the effectiveness of the static analysis process and verifies that identified issues are properly triaged and resolved in a timely manner.

Workflow If after analyzing the Coverity report it is concluded that it is a false positive please set the classification to either "False positive" or "Intentional", the action to "Ignore", owner to your own account and add a comment why the issue is considered false positive or intentional.

Update the related Github issue in the zephyr project with the details, and only close it after completing the steps above on scan service website. Any issues closed without a fix or without ignoring the entry in the scan service will be automatically reopened if the issue continues to be present in the code.

Contribution Workflow

One general practice we encourage, is to make small, controlled changes. This practice simplifies review, makes merging and rebasing easier, and keeps the change history clear and clean.

When contributing to the Zephyr Project, it is also important you provide as much information as you can about your change, update appropriate documentation, and test your changes thoroughly before submitting.

The general GitHub workflow used by Zephyr developers uses a combination of command line Git commands and browser interaction with GitHub. As it is with Git, there are multiple ways of getting a task done. We'll describe a typical workflow here:

1. Create a Fork of Zephyr to your personal account on GitHub. (Click on the fork button in the top right corner of the Zephyr project repo page in GitHub.)
2. On your development computer, change into the `zephyr` folder that was created when you *obtained the code*:

   ```
   cd zephyrproject/zephyr
   ```

   Rename the default remote pointing to the upstream repository from `origin` to `upstream`:

   ```
   git remote rename origin upstream
   ```

   Let Git know about the fork you just created, naming it `origin`:

   ```
   git remote add origin https://github.com/<your github id>/zephyr
   ```

   and verify the remote repos:

   ```
   git remote -v
   ```

   The output should look similar to:

   ```
   origin   https://github.com/<your github id>/zephyr (fetch)
   origin   https://github.com/<your github id>/zephyr (push)
   upstream https://github.com/zephyrproject-rtos/zephyr (fetch)
   upstream https://github.com/zephyrproject-rtos/zephyr (push)
   ```

3. Create a topic branch (off of `main`) for your work (if you're addressing an issue, we suggest including the issue number in the branch name):

   ```
   git checkout main
   git checkout -b fix_comment_typo
   ```

   Some Zephyr subsystems do development work on a separate branch from `main` so you may need to indicate this in your checkout:

   ```
   git checkout -b fix_out_of_date_patch origin/net
   ```

4. Make changes, test locally, change, test, test again, ... (Check out the prior chapter on *twister* as well).
5. When things look good, start the pull request process by adding your changed files:

   ```
   git add [file(s) that changed, add -p if you want to be more specific]
   ```

   You can see files that are not yet staged using:

   ```
   git status
   ```

6. Verify changes to be committed look as you expected:

```
git diff --cached
```

7. Commit your changes to your local repo:

   ```
   git commit -s
   ```

   The `-s` option automatically adds your `Signed-off-by:` to your commit message. Your commit will be rejected without this line that indicates your agreement with the *Developer Certification of Origin (DCO)*. See the *Commit Message Guidelines* section for specific guidelines for writing your commit messages.

8. Push your topic branch with your changes to your fork in your personal GitHub account:

   ```
   git push origin fix_comment_typo
   ```

9. In your web browser, go to your forked repo and click on the `Compare & pull request` button for the branch you just worked on and you want to open a pull request with.

10. Review the pull request changes, and verify that you are opening a pull request for the `main` branch. The title and message from your commit message should appear as well.

11. A bot will assign one or more suggested reviewers (based on the MAINTAINERS file in the repo). If you are a project member, you can select additional reviewers now too.

12. Click on the submit button and your pull request is sent and awaits review. Email will be sent as review comments are made, or you can check on your pull request at https://github.com/zephyrproject-rtos/zephyr/pulls.

    Note

    As more commits are merged upstream, the GitHub PR page will show a `This branch is out-of-date with the base branch` message and a `Update branch` button on the PR page. That message should be ignored, as the commits will be rebased as part of merging anyway, and triggering a branch update from the GitHub UI will cause the PR approvals to be dropped.

13. While you're waiting for your pull request to be accepted and merged, you can create another branch to work on another issue. (Be sure to make your new branch off of `main` and not the previous branch.):

    ```
    git checkout main
    git checkout -b fix_another_issue
    ```

    and use the same process described above to work on this new topic branch.

14. If reviewers do request changes to your patch, you can interactively rebase commit(s) to fix review issues. In your development repo:

    ```
    git rebase -i <offending-commit-id>^
    ```

    In the interactive rebase editor, replace `pick` with `edit` to select a specific commit (if there's more than one in your pull request), or remove the line to delete a commit entirely. Then edit files to fix the issues in the review.

    As before, inspect and test your changes. When ready, continue the patch submission:

    ```
    git add [file(s)]
    git rebase --continue
    ```

    Update commit comment if needed, and continue:

```
git push --force origin fix_comment_typo
```

By force pushing your update, your original pull request will be updated with your changes so you won't need to resubmit the pull request.

15. After pushing the requested change, check on the PR page if there is a merge conflict. If so, rebase your local branch:

```
git fetch --all
git rebase --ignore-whitespace upstream/main
```

The `--ignore-whitespace` option stops `git apply` (called by rebase) from changing any whitespace. Resolve the conflicts and push again:

```
git push --force origin fix_comment_typo
```

> **Note**
>
> While amending commits and force pushing is a common review model outside GitHub, and the one recommended by Zephyr, it's not the main model supported by GitHub. Forced pushes can cause unexpected behavior, such as not being able to use "View Changes" buttons except for the last one - GitHub complains it can't find older commits. You're also not always able to compare the latest reviewed version with the latest submitted version. When rewriting history GitHub only guarantees access to the latest version.

16. If the CI run fails, you will need to make changes to your code in order to fix the issues and amend your commits by rebasing as described above. Additional information about the CI system can be found in *Continuous Integration*.

Contribution Tips The following is a list of tips to improve and accelerate the review process of Pull Requests. If you follow them, chances are your pull request will get the attention needed and it will be ready for merge sooner than later:

1. When pushing follow-up changes, use the `--keep-base` option of git-rebase
2. On the PR page, check if the change can still be merged with no merge conflicts
3. Make sure title of PR explains what is being fixed or added
4. Make sure your PR has a body with more details about the content of your submission
5. Make sure you reference the issue you are fixing in the body of the PR
6. Watch early CI results immediately after submissions and fix issues as they are discovered
7. Revisit PR after 1-2 hours to see the status of all CI checks, make sure all is green
8. If you get request for changes and submit a change to address them, make sure you click the "Re-request review" button on the GitHub UI to notify those who asked for the changes

Submitting Proposals You can request a new feature or submit a proposal by submitting an issue to our GitHub Repository. If you would like to implement a new feature, please submit an issue with a proposal (RFC) for your work first, to be sure that we can use it. Please consider what kind of change it is:

- For a Major Feature, first open an issue and outline your proposal so that it can be discussed. This will also allow us to better coordinate our efforts, prevent duplication of work, and help you to craft the change so that it is successfully accepted into the project. Providing the following information will increase the chances of your issue being dealt with quickly:

  - Overview of the Proposal
  - Motivation for or Use Case
  - Design Details
  - Alternatives
  - Test Strategy
- Small Features can be crafted and directly submitted as a Pull Request.

Identifying Contribution Origin When adding a new file to the tree, it is important to detail the source of origin on the file, provide attributions, and detail the intended usage. In cases where the file is an original to Zephyr, the commit message should include the following ("Original" is the assumption if no Origin tag is present):

```
Origin: Original
```

In cases where the file is *imported from an external project*, the commit message shall contain details regarding the original project, the location of the project, the SHA-id of the origin commit for the file and the intended purpose.

For example, a copy of a locally maintained import:

```
Origin: Contiki OS
License: BSD 3-Clause
URL: http://www.contiki-os.org/
commit: 853207acfdc6549b10eb3e44504b1a75ae1ad63a
Purpose: Introduction of networking stack.
```

For example, a copy of an externally maintained import in a module repository:

```
Origin: Tiny Crypt
License: BSD 3-Clause
URL: https://github.com/01org/tinycrypt
commit: 08ded7f21529c39e5133688ffb93a9d0c94e5c6e
Purpose: Introduction of TinyCrypt
```

Contributions to External Modules

Follow the guidelines in the *Modules (External projects)* section for contributing *new modules* and submitting changes to *existing modules*.

Treewide Changes

This section describes contributions that are treewide changes and some additional associated requirements that apply to them. These requirements exist to try to give such changes increased review and user visibility due to their large impact.

Definition and Decision Making A *treewide change* is defined as any change to Zephyr APIs, coding practices, or other development requirements that either implies required changes throughout the zephyr source code repository or can reasonably be expected to do so for a wide class of external Zephyr-based source code.

This definition is informal by necessity. This is because the decision on whether any particular change is treewide can be subjective and may depend on additional context.

Project maintainers should use good judgement and prioritize the Zephyr developer experience when deciding when a proposed change is treewide. Protracted disagreements can be resolved by the Zephyr Project's Technical Steering Committee (TSC), but please avoid premature escalation to the TSC.

Requirements for Treewide Changes

- The zephyr repository must apply the 'treewide' GitHub label to any issues or pull requests that are treewide changes
- The person proposing a treewide change must create an RFC issue describing the change, its rationale and impact, etc. before any pull requests related to the change can be merged
- The project's Architecture Working Group (WG) must include the issue on the agenda and discuss whether the project will accept or reject the change before any pull requests related to the change can be merged (with escalation to the TSC if consensus is not reached at the WG)
- The Architecture WG must specify the procedure for merging any PRs associated with each individual treewide change, including any required approvals for pull requests affecting specific subsystems or extra review time requirements
- The person proposing a treewide change must email devel@lists.zephyrproject.org about the RFC if it is accepted by the Architecture WG before any pull requests related to the change can be merged

Examples Some example past treewide changes are:

- the deprecation of version 1 of the *Logging API* in favor of version 2 (see commit 262cc55609)
- the removal of support for a legacy *Devicetree bindings* syntax (6bf761fc0a)

Note that adding a new version of a widely used API while maintaining support for the old one is not a treewide change. Deprecation and removal of such APIs, however, are treewide changes.

Specialized driver requirements

Drivers for standalone devices should use the Zephyr bus APIs (SPI, I2C...) whenever possible so that the device can be used with any SoC from any vendor implementing a compatible bus.

If it is not technically possible to achieve full performance using the Zephyr APIs due to specialized accelerators in a particular SoC family, one could extend the support for an external device by providing a specialized path for that SoC family. However, the driver must still provide a regular path (via Zephyr APIs) for all other SoCs. Every exception must be approved by the Architecture WG in order to be validated and potentially to be learned/improved from.

8.1.2 Coding Guidelines

The project TSC and the Safety Committee of the project agreed to implement a staged and incremental approach for complying with a set of coding rules (AKA Coding Guidelines) to improve quality and consistency of the code base. Below are the agreed upon stages:

Stage I (COMPLETED)
: Coding guideline rules are available to be followed and referenced, but not enforced. Rules are not yet enforced in CI and pull-requests cannot be blocked by reviewers/approvers due to violations.

Stage II
: Begin enforcement on a limited scope of the code base. Initially, this would be the safety certification scope. For rules easily applied across codebase, we should not limit compliance to initial scope. This step requires tooling, CI setup and an enforcement strategy.

Stage III
: Revisit the coding guideline rules and based on experience from previous stages, refine/iterate on selected rules.

Stage IV
: Expand enforcement to the wider codebase. Exceptions may be granted on some areas of the codebase with a proper justification. Exception would require TSC approval.

Note

Coding guideline rules may be removed/changed at any time by filing a GH issue/RFC.

Important

Current stage: The prerequisites for entering **Stage II** are currently being looked at: The tooling is in evaluation, CI setup and enforcement strategy is being worked on.

Main rules

The coding guideline rules are based on MISRA-C 2012 and are a subset of MISRA-C. The subset is listed in the table below with a summary of the rules, its severity and the equivalent rules from other standards for reference.

Note

For existing Zephyr maintainers and collaborators, if you are unable to obtain a copy through your employer, a limited number of copies will be made available through the project. If you need a copy of MISRA-C 2012, please send email to safety@lists.zephyrproject.org and provide details on reason why you can't obtain one through other options and expected contributions once you have one. The safety committee will review all requests.

Table 1: Main rules

MISRA C 2012	Severity	Description	CERT C	Example
Dir 1.1	Required	Any implementation-defined behaviour on which the output of the program depends shall be documented and understood	MSC09-C	Dir 1.1
Dir 2.1	Required	All source files shall compile without any compilation errors	N/A	Dir 2.1
Dir 3.1	Required	All code shall be traceable to documented requirements	N/A	Dir 3.1
Dir 4.1	Required	Run-time failures shall be minimized	N/A	Dir 4.1
Dir 4.2	Advisory	All usage of assembly language should be documented	N/A	Dir 4.2

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Dir 4.4	Advisory	Sections of code should not be "commented out"	MSC04-C	Dir 4.4
Dir 4.5	Advisory	Identifiers in the same name space with overlapping visibility should be typographically unambiguous	DCL02-C	Dir 4.5
Dir 4.6	Advisory	typedefs that indicate size and signedness should be used in place of the basic numerical types	N/A	Dir 4.6
Dir 4.7	Required	If a function returns error information, then that error information shall be tested	N/A	Dir 4.7
Dir 4.8	Advisory	If a pointer to a structure or union is never dereferenced within a translation unit, then the implementation of the object should be hidden	DCL12-C	Dir 4.8 example 1 Dir 4.8 example 2
Dir 4.9	Advisory	A function should be used in preference to a function-like macro where they are interchangeable	PRE00-C	Dir 4.9
Dir 4.10	Required	Precautions shall be taken in order to prevent the contents of a header file being included more than once	PRE06-C	Dir 4.10
Dir 4.11	Required	The validity of values passed to library functions shall be checked	N/A	Dir 4.11
Dir 4.12	Required	Dynamic memory allocation shall not be used	STR01-C	Dir 4.12
Dir 4.13	Advisory	Functions which are designed to provide operations on a resource should be called in an appropriate sequence	N/A	Dir 4.13
Dir 4.14	Required	The validity of values received from external sources shall be checked	N/A	Dir 4.14
Rule 1.2	Advisory	Language extensions should not be used	MSC04-C	Rule 1.2
Rule 1.3	Required	There shall be no occurrence of undefined or critical unspecified behaviour	N/A	Rule 1.3
Rule 2.1	Required	A project shall not contain unreachable code	MSC07-C	Rule 2.1 example 1 Rule 2.1 example 2
Rule 2.2	Required	There shall be no dead code	MSC12-C	Rule 2.2
Rule 2.3	Advisory	A project should not contain unused type declarations	N/A	Rule 2.3
Rule 2.6	Advisory	A function should not contain unused label declarations	N/A	Rule 2.6
Rule 2.7	Advisory	There should be no unused parameters in functions	N/A	Rule 2.7

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 3.1	Required	The character sequences /* and // shall not be used within a comment	MSC04-C	Rule 3.1
Rule 3.2	Required	Line-splicing shall not be used in // comments	N/A	Rule 3.2
Rule 4.1	Required	Octal and hexadecimal escape sequences shall be terminated	MSC09-C	Rule 4.1
Rule 4.2	Advisory	Trigraphs should not be used	PRE07-C	Rule 4.2
Rule 5.1	Required	External identifiers shall be distinct	DCL23-C	Rule 5.1 example 1 Rule 5.1 example 2
Rule 5.2	Required	Identifiers declared in the same scope and name space shall be distinct	DCL23-C	Rule 5.2
Rule 5.3	Required	An identifier declared in an inner scope shall not hide an identifier declared in an outer scope	DCL23-C	Rule 5.3
Rule 5.4	Required	Macro identifiers shall be distinct	DCL23-C	Rule 5.4
Rule 5.5	Required	Identifiers shall be distinct from macro names	DCL23-C	Rule 5.5
Rule 5.6	Required	A typedef name shall be a unique identifier	N/A	Rule 5.6
Rule 5.7	Required	A tag name shall be a unique identifier	N/A	Rule 5.7
Rule 5.8	Required	Identifiers that define objects or functions with external linkage shall be unique	N/A	Rule 5.8 example 1 Rule 5.8 example 2
Rule 5.9	Advisory	Identifiers that define objects or functions with internal linkage should be unique	N/A	Rule 5.9 example 1 Rule 5.9 example 2
Rule 6.1	Required	Bit-fields shall only be declared with an appropriate type	INT14-C	Rule 6.1
Rule 6.2	Required	Single-bit named bit fields shall not be of a signed type	INT14-C	Rule 6.2
Rule 7.1	Required	Octal constants shall not be used	DCL18-C	Rule 7.1
Rule 7.2	Required	A u or U suffix shall be applied to all integer constants that are represented in an unsigned type	N/A	Rule 7.2

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 7.3	Required	The lowercase character l shall not be used in a literal suffix	DCL16-C	Rule 7.3
Rule 7.4	Required	A string literal shall not be assigned to an object unless the objects type is pointer to const-qualified char	N/A	Rule 7.4
Rule 8.1	Required	Types shall be explicitly specified	N/A	Rule 8.1
Rule 8.2	Required	Function types shall be in prototype form with named parameters	DCL20-C	Rule 8.2
Rule 8.3	Required	All declarations of an object or function shall use the same names and type qualifiers	N/A	Rule 8.3
Rule 8.4	Required	A compatible declaration shall be visible when an object or function with external linkage is defined	N/A	Rule 8.4
Rule 8.5	Required	An external object or function shall be declared once in one and only one file	N/A	Rule 8.5 example 1 Rule 8.5 example 2
Rule 8.6	Required	An identifier with external linkage shall have exactly one external definition	N/A	Rule 8.6 example 1 Rule 8.6 example 2
Rule 8.8	Required	The static storage class specifier shall be used in all declarations of objects and functions that have internal linkage	DCL15-C	Rule 8.8
Rule 8.9	Advisory	An object should be defined at block scope if its identifier only appears in a single function	DCL19-C	Rule 8.9
Rule 8.10	Required	An inline function shall be declared with the static storage class	N/A	Rule 8.10
Rule 8.12	Required	Within an enumerator list, the value of an implicitly-specified enumeration constant shall be unique	INT09-C	Rule 8.12
Rule 8.14	Required	The restrict type qualifier shall not be used	N/A	Rule 8.14
Rule 9.1	Mandatory	The value of an object with automatic storage duration shall not be read before it has been set	N/A	Rule 9.1
Rule 9.2	Required	The initializer for an aggregate or union shall be enclosed in braces	N/A	Rule 9.2
Rule 9.3	Required	Arrays shall not be partially initialized	N/A	Rule 9.3
Rule 9.4	Required	An element of an object shall not be initialized more than once	N/A	Rule 9.4

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 9.5	Required	Where designated initializers are used to initialize an array object the size of the array shall be specified explicitly	N/A	Rule 9.5
Rule 10.1	Required	Operands shall not be of an inappropriate essential type	STR04-C	Rule 10.1
Rule 10.2	Required	Expressions of essentially character type shall not be used inappropriately in addition and subtraction operations	STR04-C	Rule 10.2
Rule 10.3	Required	The value of an expression shall not be assigned to an object with a narrower essential type or of a different essential type category	STR04-C	Rule 10.3
Rule 10.4	Required	Both operands of an operator in which the usual arithmetic conversions are performed shall have the same essential type category	STR04-C	Rule 10.4
Rule 10.5	Advisory	The value of an expression should not be cast to an inappropriate essential type	N/A	Rule 10.5
Rule 10.6	Required	The value of a composite expression shall not be assigned to an object with wider essential type	INT02-C	Rule 10.6
Rule 10.7	Required	If a composite expression is used as one operand of an operator in which the usual arithmetic conversions are performed then the other operand shall not have wider essential type	INT02-C	Rule 10.7
Rule 10.8	Required	The value of a composite expression shall not be cast to a different essential type category or a wider essential type	INT02-C	Rule 10.8
Rule 11.2	Required	Conversions shall not be performed between a pointer to an incomplete type and any other type	N/A	Rule 11.2
Rule 11.6	Required	A cast shall not be performed between pointer to void and an arithmetic type	N/A	Rule 11.6
Rule 11.7	Required	A cast shall not be performed between pointer to object and a noninteger arithmetic type	N/A	Rule 11.7
Rule 11.8	Required	A cast shall not remove any const or volatile qualification from the type pointed to by a pointer	EXP05-C	Rule 11.8
Rule 11.9	Required	The macro NULL shall be the only permitted form of integer null pointer constant	N/A	Rule 11.9
Rule 12.1	Advisory	The precedence of operators within expressions should be made explicit	EXP00-C	Rule 12.1
Rule 12.2	Required	The right hand operand of a shift operator shall lie in the range zero to one less than the width in bits of the essential type of the left hand operand	N/A	Rule 12.2
Rule 12.4	Advisory	Evaluation of constant expressions should not lead to unsigned integer wrap-around	N/A	Rule 12.4

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 12.5	Mandatory	The sizeof operator shall not have an operand which is a function parameter declared as “array of type”	N/A	Rule 12.5
Rule 13.1	Required	Initializer lists shall not contain persistent side effects	N/A	Rule 13.1 example 1 Rule 13.1 example 2
Rule 13.2	Required	The value of an expression and its persistent side effects shall be the same under all permitted evaluation orders	N/A	Rule 13.2
Rule 13.3	Advisory	A full expression containing an increment (++) or decrement (–) operator should have no other potential side effects other than that caused by the increment or decrement operator	N/A	Rule 13.3
Rule 13.4	Advisory	The result of an assignment operator should not be used	N/A	Rule 13.4
Rule 13.5	Required	The right hand operand of a logical && or || operator shall not contain persistent side effects	EXP10-C	Rule 13.5 example 1 Rule 13.5 example 2
Rule 13.6	Mandatory	The operand of the sizeof operator shall not contain any expression which has potential side effects	N/A	Rule 13.6
Rule 14.1	Required	A loop counter shall not have essentially floating type	N/A	Rule 14.1
Rule 14.2	Required	A for loop shall be well-formed	N/A	Rule 14.2
Rule 14.3	Required	Controlling expressions shall not be invariant	N/A	Rule 14.3
Rule 14.4	Required	The controlling expression of an if statement and the controlling expression of an iteration-statement shall have essentially Boolean type	N/A	Rule 14.4
Rule 15.2	Required	The goto statement shall jump to a label declared later in the same function	N/A	Rule 15.2
Rule 15.3	Required	Any label referenced by a goto statement shall be declared in the same block, or in any block enclosing the goto statement	N/A	Rule 15.3
Rule 15.6	Required	The body of an iteration-statement or a selection-statement shall be a compound-statement	EXP19-C	Rule 15.6
Rule 15.7	Required	All if else if constructs shall be terminated with an else statement	N/A	Rule 15.7

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 16.1	Required	All switch statements shall be well-formed	N/A	Rule 16.1
Rule 16.2	Required	A switch label shall only be used when the most closely-enclosing compound statement is the body of a switch statement	MSC20-C	Rule 16.2
Rule 16.3	Required	An unconditional break statement shall terminate every switch-clause	N/A	Rule 16.3
Rule 16.4	Required	Every switch statement shall have a default label	N/A	Rule 16.4
Rule 16.5	Required	A default label shall appear as either the first or the last switch label of a switch statement	N/A	Rule 16.5
Rule 16.6	Required	Every switch statement shall have at least two switch-clauses	N/A	Rule 16.6
Rule 16.7	Required	A switch-expression shall not have essentially Boolean type	N/A	Rule 16.7
Rule 17.1	Required	The features of <stdarg.h> shall not be used	ERR00-C	Rule 17.1
Rule 17.2	Required	Functions shall not call themselves, either directly or indirectly	MEM05-C	Rule 17.2
Rule 17.3	Mandatory	A function shall not be declared implicitly	N/A	Rule 17.3
Rule 17.4	Mandatory	All exit paths from a function with non-void return type shall have an explicit return statement with an expression	N/A	Rule 17.4
Rule 17.5	Advisory	The function argument corresponding to a parameter declared to have an array type shall have an appropriate number of elements	N/A	Rule 17.5
Rule 17.6	Mandatory	The declaration of an array parameter shall not contain the static keyword between the [ ]	N/A	Rule 17.6
Rule 17.7	Required	The value returned by a function having non-void return type shall be used	N/A	Rule 17.7
Rule 18.1	Required	A pointer resulting from arithmetic on a pointer operand shall address an element of the same array as that pointer operand	EXP08-C	Rule 18.1
Rule 18.2	Required	Subtraction between pointers shall only be applied to pointers that address elements of the same array	EXP08-C	Rule 18.2
Rule 18.3	Required	The relational operators >, >=, < and <= shall not be applied to objects of pointer type except where they point into the same object	EXP08-C	Rule 18.3
Rule 18.5	Advisory	Declarations should contain no more than two levels of pointer nesting	N/A	Rule 18.5

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 18.6	Required	The address of an object with automatic storage shall not be copied to another object that persists after the first object has ceased to exist	N/A	Rule 18.6 example 1 Rule 18.6 example 2
Rule 18.8	Required	Variable-length array types shall not be used	N/A	Rule 18.8
Rule 19.1	Mandatory	An object shall not be assigned or copied to an overlapping object	N/A	Rule 19.1
Rule 20.2	Required	The ‘, or characters and the /* or // character sequences shall not occur in a header file name”	N/A	Rule 20.2
Rule 20.3	Required	The #include directive shall be followed by either a <filename> or “filename” sequence	N/A	Rule 20.3
Rule 20.4	Required	A macro shall not be defined with the same name as a keyword	N/A	Rule 20.4
Rule 20.7	Required	Expressions resulting from the expansion of macro parameters shall be enclosed in parentheses	PRE01-C	Rule 20.7
Rule 20.8	Required	The controlling expression of a #if or #elif preprocessing directive shall evaluate to 0 or 1	N/A	Rule 20.8
Rule 20.9	Required	All identifiers used in the controlling expression of #if or #elif preprocessing directives shall be #defined before evaluation	N/A	Rule 20.9
Rule 20.11	Required	A macro parameter immediately following a # operator shall not immediately be followed by a ## operator	N/A	Rule 20.11
Rule 20.12	Required	A macro parameter used as an operand to the # or ## operators, which is itself subject to further macro replacement, shall only be used as an operand to these operators	N/A	Rule 20.12
Rule 20.13	Required	A line whose first token is # shall be a valid preprocessing directive	N/A	Rule 20.13
Rule 20.14	Required	All #else, #elif and #endif preprocessor directives shall reside in the same file as the #if, #ifdef or #ifndef directive to which they are related	N/A	Rule 20.14
Rule 21.1	Required	#define and #undef shall not be used on a reserved identifier or reserved macro name	N/A	Rule 21.1
Rule 21.2	Required	A reserved identifier or macro name shall not be declared	N/A	Rule 21.2
Rule 21.3	Required	The memory allocation and deallocation functions of <stdlib.h> shall not be used	MSC24-C	Rule 21.3
Rule 21.4	Required	The standard header file <setjmp.h> shall not be used	N/A	Rule 21.4

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 21.6	Required	The Standard Library input/output functions shall not be used	N/A	Rule 21.6
Rule 21.7	Required	The atof, atoi, atol and atoll functions of <stdlib.h> shall not be used	N/A	Rule 21.7
Rule 21.9	Required	The library functions bsearch and qsort of <stdlib.h> shall not be used	N/A	Rule 21.9
Rule 21.11	Required	The standard header file <tgmath.h> shall not be used	N/A	Rule 21.11
Rule 21.12	Advisory	The exception handling features of <fenv.h> should not be used	N/A	Rule 21.12
Rule 21.13	Mandatory	Any value passed to a function in <ctype.h> shall be representable as an unsigned char or be the value EO	N/A	Rule 21.13
Rule 21.14	Required	The Standard Library function memcmp shall not be used to compare null terminated strings	N/A	Rule 21.14
Rule 21.15	Required	The pointer arguments to the Standard Library functions memcpy, memmove and memcmp shall be pointers to qualified or unqualified versions of compatible types	N/A	Rule 21.15
Rule 21.16	Required	The pointer arguments to the Standard Library function memcmp shall point to either a pointer type, an essentially signed type, an essentially unsigned type, an essentially Boolean type or an essentially enum type	N/A	Rule 21.16
Rule 21.17	Mandatory	Use of the string handling functions from <string.h> shall not result in accesses beyond the bounds of the objects referenced by their pointer parameters	N/A	Rule 21.17
Rule 21.18	Mandatory	The size_t argument passed to any function in <string.h> shall have an appropriate value	N/A	Rule 21.18
Rule 21.19	Mandatory	The pointers returned by the Standard Library functions localeconv, getenv, setlocale or, strerror shall only be used as if they have pointer to const-qualified type	N/A	Rule 21.19
Rule 21.20	Mandatory	The pointer returned by the Standard Library functions asctime, ctime, gmtime, localtime, localeconv, getenv, setlocale or strerror shall not be used following a subsequent call to the same function	N/A	Rule 21.20
Rule 22.1	Required	All resources obtained dynamically by means of Standard Library functions shall be explicitly released	N/A	Rule 22.1
Rule 22.2	Mandatory	A block of memory shall only be freed if it was allocated by means of a Standard Library function	N/A	Rule 22.2

continues on next page

Table 1 – continued from previous page

MISRA C 2012	Severity	Description	CERT C	Example
Rule 22.3	Required	The same file shall not be open for read and write access at the same time on different streams	N/A	Rule 22.3
Rule 22.4	Mandatory	There shall be no attempt to write to a stream which has been opened as read-only	N/A	Rule 22.4
Rule 22.5	Mandatory	A pointer to a FILE object shall not be dereferenced	N/A	Rule 22.5
Rule 22.6	Mandatory	The value of a pointer to a FILE shall not be used after the associated stream has been closed	N/A	Rule 22.6
Rule 22.7	Required	The macro EOF shall only be compared with the unmodified return value from any Standard Library function capable of returning EOF	N/A	Rule 22.7
Rule 22.8	Required	The value of errno shall be set to zero prior to a call to an errno-setting-function	N/A	Rule 22.8
Rule 22.9	Required	The value of errno shall be tested against zero after calling an errno-setting-function	N/A	Rule 22.9
Rule 22.10	Required	The value of errno shall only be tested when the last function to be called was an errno-setting-function	N/A	Rule 22.10

Additional rules

Rule A.1: Conditional Compilation

Severity Required

Description Do not conditionally compile function declarations in header files. Do not conditionally compile structure declarations in header files. You may conditionally exclude fields within structure definitions to avoid wasting memory when the feature they support is not enabled.

Rationale Excluding declarations from the header based on compile-time options may prevent their documentation from being generated. Their absence also prevents use of `if (IS_ENABLED(CONFIG_FOO)) {}` as an alternative to preprocessor conditionals when the code path should change based on the selected options.

Rule A.2: Inclusive Language

Severity Required

Description Do not introduce new usage of offensive terms listed below. This rule applies but is not limited to source code, comments, documentation, and branch names. Replacement terms may vary by area or subsystem, but should aim to follow updated industry standards when possible.

Exceptions are allowed for maintaining existing implementations or adding new implementations of industry standard specifications governed externally to the Zephyr Project.

Existing usage is recommended to change as soon as updated industry standard specifications become available or new terms are publicly announced by the governing body, or immediately if no specifications apply.

Offensive Terms	Recommended Replacements
`{master,leader} / slave`	• `{primary,main} / {secondary, replica}` • `{initiator,requester} / {target, responder}` • `{controller,host} / {device,worker, proxy,target}` • `director / performer` • `central / peripheral`
`blacklist / whitelist`	• `denylist / allowlist` • `blocklist / allowlist` • `rejectlist / acceptlist`
`grandfather policy`	• `legacy`
`sanity`	• `coherence` • `confidence`

Rationale Offensive terms do not create an inclusive community environment and therefore violate the Zephyr Project Code of Conduct. This coding rule was inspired by a similar rule in Linux.

Status Related GitHub Issues and Pull Requests are tagged with the Inclusive Language Label.

Area	Selected Replacements	Status
API	See Bluetooth Appropriate Language Mapping Tables	
CAN	This CAN in Automation Inclusive Language news post has a list of general recommendations. See CAN in Automation Inclusive Language for terms to be used in specification document updates.	
eSPI	• `master / slave` => `controller / target`	Refer to eSPI Specification for new terminology
gPTP	• `master / slave` => TBD	
Inter-Integrated Circuit (I2C) Bus	• `master / slave` => TBD	NXP publishes the I2C Specification and has selected `controller / target` as replacement terms, but the timing to publish an announcement or new specification is TBD. Zephyr will update I2C when replacement terminology is confirmed by a public announcement or updated specification. See Zephyr issue 27033.
Inter-IC Sound (I2S) Bus	• `master / slave` => TBD	
SMP/AMP	• `master / slave` => TBD	
Serial Peripheral Interface (SPI) Bus	• `master / slave` => `controller / peripheral` • `MOSI / MISO / SS` => `SDO / SDI / CS`	The Open Source Hardware Association has selected these replacement terms. See OSHWA Resolution to Redefine SPI Signal Names
Test Runner (Twister)	• `platform_whitelist` => `platform_allow` • `sanitycheck` => `twister`	

Rule A.3: Macro name collisions

Severity Required

Description Macros with commonly used names such as `MIN`, `MAX`, `ARRAY_SIZE`, must not be modified or protected to avoid name collisions with other implementations. In particular, they must not be prefixed to place them in a Zephyr-specific namespace, re-defined using `#undef`, or conditionally excluded from compilation using `#ifndef`. Instead, if a conflict arises with an

existing definition originating from a *module*, the module's code itself needs to be modified (ideally upstream, alternatively via a change in Zephyr's own fork). This rule applies to Zephyr as a project in general, regardless of the time of introduction of the macro or its current name in the tree. If a macro name is commonly used in several other well-known open source projects then the implementation in Zephyr should use that name. While there is a subjective and non-measurable component to what "commonly used" means, the ultimate goal is to offer users familiar macros. Finally, this rule applies to inter-module name collisions as well: in that case both modules, prior to their inclusion, should be modified to use module-specific versions of the macro name that collides.

Rationale Zephyr is an RTOS that comes with additional functionality and dependencies in the form of modules. Those modules are typically independent projects that may use macro names that can conflict with other modules or with Zephyr itself. Since, in the context of this documentation, Zephyr is considered the central or main project, it should implement the non-namespaced versions of the macros. Given that Zephyr uses a fork of the corresponding upstream for each module, it is always possible to patch the macro implementation in each module to avoid collisions.

Rule A.4: C Standard Library Usage Restrictions in Zephyr Kernel

Severity Required

Description The use of the C standard library functions and macros in the Zephyr kernel shall be limited to the following functions and macros from the ISO/IEC 9899:2011 standard, also known as C11, and their extensions:

Table 2: List of allowed libc functions and macros in the Zephyr kernel

Function	Source
abort()	ISO/IEC 9899:2011
abs()	ISO/IEC 9899:2011
aligned_alloc()	ISO/IEC 9899:2011
assert()	ISO/IEC 9899:2011
atoi()	ISO/IEC 9899:2011
bsearch()	ISO/IEC 9899:2011
calloc()	ISO/IEC 9899:2011
exit()	ISO/IEC 9899:2011
fprintf()	ISO/IEC 9899:2011
fputc()	ISO/IEC 9899:2011

All of the functions listed above must be implemented by the *minimal libc* to ensure that the Zephyr kernel can build with the minimal libc.

In addition, any functions from the above list that are not part of the ISO/IEC 9899:2011 standard must be implemented by the *common libc* to ensure their availability across multiple C standard libraries.

Introducing new C standard library functions to the Zephyr kernel is allowed with justification given that the above requirements are satisfied.

Note that the use of the functions listed above are subject to secure and safe coding practices and it should not be assumed that their use in the Zephyr kernel is unconditionally permitted by being listed in this rule.

The "Zephyr kernel" in this context consists of the following components:

- Kernel (`kernel`)
- OS Library (`lib/os`)
- Architecture Port (`arch`)
- Logging Subsystem (`subsys/logging`)

Rationale Zephyr kernel must be able to build with the *minimal libc*, a limited C standard library implementation that is part of the Zephyr RTOS and maintained by the Zephyr Project, to allow self-contained testing and verification of the kernel and core OS services.

In order to ensure that the Zephyr kernel can build with the minimal libc, it is necessary to restrict the use of the C standard library functions and macros in the Zephyr kernel to the functions and macros that are available as part of the minimal libc.

Rule A.5: C Standard Library Usage Restrictions in Zephyr Codebase

Severity Required

Description The use of the C standard library functions and macros in the Zephyr codebase shall be limited to the functions, excluding the Annex K "Bounds-checking interfaces", from the ISO/IEC 9899:2011 standard, also known as C11, unless exempted by this rule.

The "Zephyr codebase" in this context refers to all embedded source code files committed to the main Zephyr repository, except the Zephyr kernel as defined by the *Rule A.4: C Standard Library Usage Restrictions in Zephyr Kernel*. With embedded source code we refer to code which is meant to be executed in embedded targets, and therefore excludes host tooling, and code specific for the native test targets.

The following non-ISO 9899:2011, hereinafter referred to as non-standard, functions and macros are exempt from this rule and allowed to be used in the Zephyr codebase:

Table 3: List of allowed non-standard libc functions

Function	Source
gmtime_r()	POSIX.1-2001
strnlen()	POSIX.1-2008
strtok_r()	POSIX.1-2001

All non-standard functions and macros listed above must be implemented by the *common libc* in order to make sure that these functions can be made available when using a C standard library that does not implement these functions.

Adding a new non-standard function from common C standard libraries to the above list is allowed with justification, given that the above requirement is satisfied. However, when there exists a standard function that is functionally equivalent, the standard function shall be used.

Rationale Some C standard libraries, such as Newlib and Picolibc, include additional functions and macros that are defined by the standards and de-facto standards that extend the ISO C standard (e.g. POSIX, Linux).

The ISO/IEC 9899:2011 standard does not require C compiler toolchains to include the support for these non-standard functions, and therefore using these functions can lead to compatibility issues with the third-party toolchains that come with their own C standard libraries.

8.1.3 Proposals and RFCs

Many changes, including bug fixes and documentation improvements can be implemented and reviewed via the normal GitHub pull request workflow.

Many changes however are "substantial" and need to go through a design process and produce a consensus among the project stakeholders.

The "RFC" (request for comments) process is intended to provide a consistent and controlled path for new features to enter the project.

Contributors and project stakeholders should consider using this process if they intend to make "substantial" changes to Zephyr or its documentation. Some examples that would benefit from an RFC are:

- A new feature that creates new API surface area, and would require a feature flag if introduced.
- The modification of an existing stable API.
- The removal of features that already shipped as part of Zephyr.
- The introduction of new idiomatic usage or conventions, even if they do not include code changes to Zephyr itself.

The RFC process is a great opportunity to get more eyeballs on proposals coming from contributors before it becomes a part of Zephyr. Quite often, even proposals that seem "obvious" can be significantly improved once a wider group of interested people have a chance to weigh in.

The RFC process can also be helpful to encourage discussions about a proposed feature as it is being designed, and incorporate important constraints into the design while it's easier to change, before the design has been fully implemented.

Some changes do not require an RFC:

- Rephrasing, reorganizing or refactoring
- Addition or removal of warnings
- Addition of new boards, SoCs or drivers to existing subsystems
- ...

The process in itself consists in creating a GitHub issue with the *RFC label* that documents the proposal thoroughly. There is an RFC template included in the main Zephyr GitHub repository that serves as a guideline to write a new RFC.

As with Pull Requests, RFCs might require discussion in the context of one of the Zephyr meetings in order to move it forward in cases where there is either disagreement or not enough voiced opinions in order to proceed. Make sure to either label it appropriately or include it in the corresponding GitHub project in order for it to be examined during the next meeting.

8.1.4 Contributor Expectations

The Zephyr project encourages *contributors* to submit changes as smaller pull requests. Smaller pull requests (PRs) have the following benefits:

- Reviewed more quickly and reviewed more thoroughly. It's easier for reviewers to set aside a few minutes to review smaller changes several times than it is to allocate large blocks of time to review a large PR.
- Less wasted work if reviewers or maintainers reject the direction of the change.
- Easier to rebase and merge. Smaller PRs are less likely to conflict with other changes in the tree.
- Easier to revert if the PR breaks functionality.

Note

This page does not apply to draft PRs which can have any size, any number of commits and any combination of smaller PRs for testing and preview purposes. Draft PRs have no review expectation and PRs created as drafts from the start do not notify anyone by default.

Defining Smaller PRs

- Smaller PRs should encompass one self-contained logical change.
- When adding a new large feature or API, the PR should address only one part of the feature. In this case create an *RFC proposal* to describe the additional parts of the feature for reviewers.
- PRs should include tests or samples under the following conditions:
  - Adding new features or functionality.
  - Modifying a feature, especially for API behavior contract changes.
  - Fixing a hardware agnostic bug. The test should fail without the bug fixed and pass with the fix applied.
- PRs must update any documentation affected by a functional code change.
- If introducing a new API, the PR must include an example usage of the API. This provides context to the reviewer and prevents submitting PRs with unused APIs.

Multiple Commits on a Single PR

Contributors are further encouraged to break up PRs into multiple commits. Keep in mind each commit in the PR must still build cleanly and pass all the CI tests.

For example, when introducing an extension to an API, contributors can break up the PR into multiple commits targeting these specific changes:

1. Introduce the new APIs, including shared devicetree bindings
2. Update driver implementation X, with driver specific devicetree bindings
3. Update driver implementation Y
4. Add tests for the new API
5. Add a sample using the API
6. Update the documentation

Large Changes

Large changes to the Zephyr project must submit an *RFC proposal* describing the full scope of change and future work. The RFC proposal provides the required context to reviewers, but allows for smaller, incremental, PRs to get reviewed and merged into the project. The RFC should also define the minimum viable implementation.

Changes which require an RFC proposal include:

- Submitting a new feature.
- Submitting a new API.
- *Treewide Changes*.
- Other large changes that can benefit from the RFC proposal process.

Maintainers have the discretion to request that contributors create an RFC for PRs that are too large or complicated.

PR Requirements

- Each commit in the PR must provide a commit message following the *Commit Message Guidelines*.
- The PR description must include a summary of the changes and their rationales.
- All files in the PR must comply with *Licensing Requirements*.
- Follow the Zephyr *Coding Style* and *Coding Guidelines*.
- PRs must pass all CI checks. This is a requirement to merge the PR. Contributors may mark a PR as draft and explicitly request reviewers to provide early feedback, even with failing CI checks.
- When breaking a PR into multiple commits, each commit must build cleanly. The CI system does not enforce this policy, so it is the PR author's responsibility to verify.
- When major new functionality is added, tests for the new functionality shall be added to the automated test suite. All API functions should have test cases and there should be tests for the behavior contracts of the API. Maintainers and reviewers have the discretion to determine if the provided tests are sufficient. The examples below demonstrate best practices on how to test APIs effectively.
  - Kernel timer tests provide around 85% test coverage for the kernel timer , measured by lines of code.
  - Emulators for off-chip peripherals are an effective way to test driver APIs. The fuel gauge tests use the smart battery emulator , providing test coverage for the fuel gauge API and the smart battery driver .
  - Code coverage reports for the Zephyr project are available on Codecov.
- Incompatible changes to APIs must also update the release notes for the next release detailing the change. APIs marked as experimental are excluded from this requirement.
- Changes to APIs must increment the API version number according to the API version rules.
- PRs must also satisfy all *Merge Criteria* before a member of the release engineering team merges the PR into the zephyr tree.

Maintainers may request that contributors break up a PR into smaller PRs and may request that they create an *RFC proposal*.

Workflow Suggestions That Help Reviewers

- Unless they applied the reviewer's recommendation exactly, authors must not resolve and hide comments, they must let the initial reviewer do it. The Zephyr project does not require all comments to be resolved before merge. Leaving some completed discussions open can sometimes be useful to understand the greater picture.
- Respond to comments using the "Start Review" and "Add Review" green buttons in the "Files changed" view. This allows responding to multiple comments and publishing the responses in bulk. This reduces the number of emails sent to reviewers.
- As GitHub does not implement `git range-diff`, try to minimize rebases in the middle of a review. If a rebase is required, push this as a separate update with no other changes since the last push of the PR. When pushing a rebase only, add a comment to the PR indicating which commit is the rebase.

PR Review Escalation The Zephyr community is a diverse group of individuals, with different levels of commitment and priorities. As such, reviewers and maintainers may not get to a PR right away.

The Zephyr Dev Meeting performs a triage of PRs missing reviewer approval, following this process:

1. Identify and update PRs missing an Assignee.
2. Identify PRs without any comments or reviews, ping the PR Assignee to start a review or assign to a different maintainer.
3. For PRs that have otherwise stalled, the Zephyr Dev Meeting pings the Assignee and any reviewers that have left comments on the PR.

Contributors may escalate PRs outside of the Zephyr Dev Meeting triage process as follows:

- After 1 week of inactivity, ping the Assignee or reviewers on the PR by adding a comment to the PR.
- After 2 weeks of inactivity, post a message on the #pr-help channel on Discord linking to the PR.
- After 2 weeks of inactivity, add the dev-review label to the PR. This explicitly adds the PR to the agenda for the next Zephyr Dev Meeting independent of the triage process. Not all contributors have the required privileges to add labels to PRs, in this case the contributor should request help on Discord or send an email to the Zephyr devel mailing list.

Note that for new PRs, contributors should generally wait for at least one Zephyr Dev Meeting before escalating the PR themselves.

PR Technical Escalation In cases where a contributor objects to change requests from reviewers, Zephyr defines the following escalation process for resolving technical disagreements.

Before escalation of technical disagreements, follow the steps below:

- Resolve in the PR among assignee, maintainers and reviewer.
  - Assignee to act as moderator if applicable.
- Optionally resolve in the next Zephyr Dev Meeting meeting with more Maintainers and project stakeholders.
  - The involved parties and the Assignee to be present when the issue is discussed.
- If no progress is made, the assignee (maintainer) has the right to dismiss stale, unrelated or irrelevant change requests by reviewers giving the reviewers a minimum of 1 business day to respond and revisit their initial change requests or start the escalation process.

The assignee has the responsibility to document the reasoning for dismissing any reviews in the PR and should notify the reviewer about their review being dismissed.

To give the reviewers time to respond and escalate, the assignee is expected to block the PR from being merged either by not approving the PR or by setting the *DNM* label.

Escalation can be triggered by any party participating in the review process (assignee, reviewers or the original author of the change) following the steps below:

- Escalate to the Architecture Working Group by adding the *Architecture Review* label on the PR. Beside the weekly meeting where such escalations are processed, the Architecture Working Group shall facilitate an offline review of the escalation if requested, especially if any of the parties can't attend the meeting.
- If all avenues of resolution and escalation have failed, assignees can escalate to the TSC and get a binding resolution in the TSC by adding the *TSC* label on the PR.
- The Assignee is expected to ensure the resolution of the escalation and the outcome is documented in the related pull request or issues on Github.

Reviewer Expectations

- Be respectful when commenting on PRs. Refer to the Zephyr Code of Conduct for more details.
- The Zephyr Project recognizes that reviewers and maintainers have limited bandwidth. As a reviewer, prioritize review requests in the following order:
  1. PRs related to items in the Zephyr Release Plan or those targeting the next release during the stabilization period (after RC1).
  2. PRs where the reviewer has requested blocking changes.
  3. PRs assigned to the reviewer as the area maintainer.
  4. All other PRs.
- Reviewers shall strive to advance the PR to a mergeable state with their feedback and engagement with the PR author.
- Try to provide feedback on the entire PR in one shot. This provides the contributor an opportunity to address all comments in the next PR update.
- Partial reviews are permitted, but the reviewer must add a comment indicating what portion of the PR they reviewed. Examples of useful partial reviews include:
  - Domain specific reviews (e.g. Devicetree).
  - Code style changes that impact the readability of the PR.
  - Reviewing commits separately when the requested changes cascade into the later commits.
- Avoid increasing scope of the PR by requesting new features, especially when there is a corresponding *RFC* associated with the PR. Instead, reviewers should add suggestions as a comment to the *RFC*. This also encourages more collaboration as it is easier for multiple contributors to work on a feature once the minimum implementation has merged.
- When using the "Request Changes" option, mark trivial, non-functional, requests as "Non-blocking" in the comment. Reviewers should approve PRs once only non-blocking changes remain. The PR author has discretion as to whether they address all non-blocking comments. PR authors should acknowledge every review comment in some way, even if it's just with an emoticon.

- Reviewers shall be *clear* and *concise* what changes they are requesting when the "Request Changes" option is used. Requested changes shall be in the scope of the PR in question and following the contribution and style guidelines of the project.
- Reviewers shall not close a PR due to technical or structural disagreement. If requested changes cannot be resolved within the review process, the *PR Technical Escalation* path shall be used for any potential resolution path, which may include closing the PR.

Contribution Guidelines
Learn about the overall process and guidelines for contributing to the Zephyr project.

This page is a mandatory read for first-time contributors as it contains important information on how to ensure your contribution can be considered for inclusion in the project and potentially merged.

Contributor Expectations
This document is another mandatory read that describes the expected behavior of *all* contributors to the project.

Coding Guidelines
Code contributions are expected to follow a set of coding guidelines to ensure consistency and readability across the code base.

This page describes these guidelines and introduces important considerations regarding the use of *inclusive language*.

Proposals and RFCs
Learn when and how to submit RFCs (Request for Comments) for new features and changes to the project.

8.2 Documentation

The Zephyr project thrives on good documentation. Whether it is as part of a code contribution or as a standalone effort, contributing documentation is particularly valuable to the project.

8.2.1 Documentation Guidelines

Note

For instructions on building the documentation, see *Documentation Generation*.

Zephyr Project content is written using the reStructuredText markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted standalone website. Developers can view this content either in its raw form as .rst markup files, or (with Sphinx installed) they can *build the documentation* locally to generate the documentation in HTML or PDF format. The HTML content can then be viewed using a web browser. This same .rst content is served by the Zephyr documentation website.

You can read details about reStructuredText and about Sphinx extensions from their respective websites.

This document provides a quick reference for commonly used reST and Sphinx-defined directives and roles used to create the documentation you're reading.

Headings

While reST allows use of both and overline and matching underline to indicate a heading, we only use an underline indicator for headings.

- Document title (h1) use "#" for the underline character
- First section heading level (h2) use "*"
- Second section heading level (h3) use "="
- Third section heading level (h4) use "-"

The heading underline must be at least as long as the title it's under.

For example:

```
This is a title heading
#######################

some content goes here

First section heading
*********************
```

Content Highlighting

Some common reST inline markup samples:

- one asterisk: `*text*` for emphasis (*italics*),
- two asterisks: `**text**` for strong emphasis (**boldface**), and
- two backquotes: ``` ``text`` ``` for `inline code` samples.

If asterisks or backquotes appear in running text and could be confused with inline markup delimiters, you can eliminate the confusion by adding a backslash (\) before it.

Lists

For bullet lists, place an asterisk (*) or hyphen (-) at the start of a paragraph and indent continuation lines with two spaces.

The first item in a list (or sublist) must have a blank line before it and should be indented at the same level as the preceding paragraph (and not indented itself).

For numbered lists start with a 1. or a. for example, and continue with autonumbering by using a # sign. Indent continuation lines with three spaces:

```
* This is a bulleted list.
* It has two items, the second
  item and has more than one line of reST text.  Additional lines
  are indented to the first character of the
  text of the bullet list.

1. This is a new numbered list. If the wasn't a blank line before it,
   it would be a continuation of the previous list (or paragraph).
#. It has two items too.

a. This is a numbered list using alphabetic list headings
#. It has three items (and uses autonumbering for the rest of the list)
#. Here's the third item
```

(continues on next page)

(continued from previous page)

```
#. This is an autonumbered list (default is to use numbers starting
   with 1).

   #. This is a second-level list under the first item (also
      autonumbered).  Notice the indenting.
   #. And a second item in the nested list.
#. And a second item back in the containing list.  No blank line
   needed, but it wouldn't hurt for readability.
```

Definition lists (with a term and its definition) are a convenient way to document a word or phrase with an explanation. For example this reST content:

```
The Makefile has targets that include:

html
   Build the HTML output for the project

clean
   Remove all generated output, restoring the folders to a
   clean state.
```

Would be rendered as:

The Makefile has targets that include:

html
: Build the HTML output for the project

clean
: Remove all generated output, restoring the folders to a clean state.

Multi-column lists

If you have a long bullet list of items, where each item is short, you can indicate the list items should be rendered in multiple columns with a special `.. rst-class:: rst-columns` directive. The directive will apply to the next non-comment element (e.g., paragraph), or to content indented under the directive. For example, this unordered list:

```
.. rst-class:: rst-columns

* A list of
* short items
* that should be
* displayed
* horizontally
* so it doesn't
* use up so much
* space on
* the page
```

would be rendered as:

- A list of
- short items
- that should be
- displayed
- horizontally
- so it doesn't

- use up so much
- space on
- the page

A maximum of three columns will be displayed, and change based on the available width of the display window, reducing to one column on narrow (phone) screens if necessary. We've deprecated use of the `hlist` directive because it misbehaves on smaller screens.

Tables

There are a few ways to create tables, each with their limitations or quirks. Grid tables offer the most capability for defining merged rows and columns, but are hard to maintain:

```
+------------------------+------------+----------+----------+
| Header row, column 1   | Header 2   | Header 3 | Header 4 |
| (header rows optional) |            |          |          |
+========================+============+==========+==========+
| body row 1, column 1   | column 2   | column 3 | column 4 |
+------------------------+------------+----------+----------+
| body row 2             | ...        | ...      | you can  |
+------------------------+------------+----------+ easily   +
| body row 3 with a two column span   | ...      | span     |
+------------------------+------------+----------+ rows     +
| body row 4             | ...        | ...      | too      |
+------------------------+------------+----------+----------+
```

This example would render as:

Header row, column 1 (header rows optional)	Header 2	Header 3	Header 4
body row 1, column 1	column 2	column 3	column 4
body row 2	...	...	you can easily span rows too
body row 3 with a two column span		...	
body row 4	...	...	

List tables are much easier to maintain, but don't support row or column spans:

```
.. list-table:: Table title
   :widths: 15 20 40
   :header-rows: 1

   * - Heading 1
     - Heading 2
     - Heading 3
   * - body row 1, column 1
     - body row 1, column 2
     - body row 1, column 3
   * - body row 2, column 1
     - body row 2, column 2
     - body row 2, column 3
```

This example would render as:

Table 4: Table title

Heading 1	Heading 2	Heading 3
body row 1, column 1	body row 1, column 2	body row 1, column 3
body row 2, column 1	body row 2, column 2	body row 2, column 3

The `:widths:` parameter lets you define relative column widths. The default is equal column widths. If you have a three-column table and you want the first column to be half as wide as the other two equal-width columns, you can specify `:widths: 1 2 2`. If you'd like the browser to set the column widths automatically based on the column contents, you can use `:widths: auto`.

File names and Commands

Sphinx extends reST by supporting additional inline markup elements (called "roles") used to tag text with special meanings and allow style output formatting. (You can refer to the Sphinx Inline Markup documentation for the full list).

For example, there are roles for marking `filenames` (`:file:\`name\``) and command names such as **`make`** (`:command:\`make\``). You can also use the "inline code" markup (double backticks) to indicate a `filename`.

For references to files that are in the Zephyr GitHub tree, a special role can be used that creates a hyperlink to that file. For example a reference to the reST file used to create this document can be generated using `:zephyr_file:\`doc/contribute/documentation/guidelines.rst\`` that will show up as doc/contribute/documentation/guidelines.rst, a link to the "blob" file in the github repo. There's also a `:zephyr_raw:\`doc/contribute/documentation/guidelines.rst\`` role that will link to the "raw" content, doc/contribute/documentation/guidelines.rst. (You can click on these links to see the difference.)

Internal Cross-Reference Linking

Traditional ReST links are only supported within the current file using the notation:

```
Refer to the `internal-linking`_ page
```

which renders as,

> Refer to the *internal-linking* page

Note the use of a trailing underscore to indicate an outbound link. In this example, the label was added immediately before a heading, so the text that's displayed is the heading text itself. You can change the text that's displayed as the link writing this as:

```
Refer to the `show this text instead <internal-linking_>`_ page
```

which renders as,

> Refer to the *show this text instead* page

External Cross-Reference Linking

With Sphinx's help, we can create link-references to any tagged text within the Zephyr Project documentation.

Target locations in a document are defined with a label directive:

```
.. _my label name:

Heading
=======
```

Note the leading underscore indicating an inbound link. The content immediately following this label must be a heading, and is the target for a :ref:`my label name` reference from anywhere within the Zephyr documentation. The heading text is shown when referencing this label. You can also change the text that's displayed for this link, such as:

```
:ref:`some other text <my label name>`
```

To enable easy cross-page linking within the site, each file should have a reference label before its title so it can be referenced from another file. These reference labels must be unique across the whole site, so generic names such as "samples" should be avoided. For example the top of this document's .rst file is:

```
.. _doc_guidelines:

Documentation Guidelines for the Zephyr Project
###############################################
```

Other .rst documents can link to this document using the :ref:`doc_guidelines` tag and it will show up as *Documentation Guidelines*. This type of internal cross reference works across multiple files, and the link text is obtained from the document source so if the title changes, the link text will update as well.

You can also define links to any URL and then reference it in your document. For example, with this label definition in the document:

```
.. _Zephyr Wikipedia Page:
   https://en.wikipedia.org/wiki/Zephyr_(operating_system)
```

you can reference it with:

```
Read the `Zephyr Wikipedia Page`_ for more information about the
project.
```

'any' links

Within the Zephyr project, we've defined the default role to be "any", meaning if you just write a phrase in back-ticks, e.g., `doc_guidelines`, Sphinx will search through all domains looking for something called doc_guidelines to link to. In this case it will find the label at the top of this document, and link to *doc_guidelines*. This can be useful for linking to doxygen-generated links for function names and such, but will cause a warning such as:

```
WARNING: 'any' reference target not found: doc_giudelines
```

if you misspelled `doc_guidelines` as `doc_giudelines`.

Non-ASCII Characters

You can insert non-ASCII characters such as a Trademark symbol (™), by using the notation |trade|. Available replacement names are defined in an include file used during the Sphinx processing of the reST files. The names of these replacement characters are the same as used in HTML entities used to insert characters in HTML, e.g., ™ and are defined in the file sphinx_build/substitutions.txt as listed here:

```
.. |br|     raw:: html        .. force a line break in HTML output (blank lines needed here)

   <br />

.. |p|     raw:: html        .. force a blank line in HTML output (blank lines needed here)

   <p></p>

.. These are replacement strings for non-ASCII characters used within the project
   using the same name as the html entity names (e.g., &copy;) for that character

.. |copy|   unicode:: U+000A9 .. COPYRIGHT SIGN
   :ltrim:
.. |trade|  unicode:: U+02122 .. TRADEMARK SIGN
   :ltrim:
.. |reg|    unicode:: U+000AE .. REGISTERED TRADEMARK SIGN
   :ltrim:
.. |deg|    unicode:: U+000B0 .. DEGREE SIGN
   :ltrim:
.. |plusminus|  unicode:: U+000B1 .. PLUS-MINUS SIGN
   :rtrim:
.. |micro|  unicode:: U+000B5 .. MICRO SIGN
   :rtrim:
.. |sup2|  unicode:: U+00B2 .. SUPERSCRIPT TWO
   :ltrim:
```

We've kept the substitutions list small but others can be added as needed by submitting a change to the `substitutions.txt` file.

Code and Command Examples

Use the reST `code-block` directive to create a highlighted block of fixed-width text, typically used for showing formatted code or console commands and output. Smart syntax highlighting is also supported (using the Pygments package). You can also directly specify the highlighting language. For example:

```
.. code-block:: c

   struct k_object {
      char *name;
      uint8_t perms[CONFIG_MAX_THREAD_BYTES];
      uint8_t type;
      uint8_t flags;
      uint32_t data;
   } __packed;
```

Note the blank line between the `code-block` directive and the first line of the code-block body, and the body content is indented three spaces (to the first non-white space of the directive name).

This would be rendered as:

```
struct k_object {
   char *name;
   uint8_t perms[CONFIG_MAX_THREAD_BYTES];
   uint8_t type;
   uint8_t flags;
   uint32_t data;
} __packed;
```

Other languages are of course supported (see languages supported by Pygments), and in particular, you are encouraged to make use of the following when appropriate:

- `c` for C code
- `cpp` for C++ code
- `python` for Python code
- `console` for console output, i.e. interactive shell sessions where commands are prefixed by a prompt (ex. `$` for Linux, or `uart:~$` for Zephyr's shell), and where the output is also shown. The commands will be highlighted, and the output will not. What's more, copying code block using the "copy" button will automatically copy just the commands, excluding the prompt and the outputs of the commands.
- `shell` or `bash` for shell commands. Both languages get highlighted the same but you may use `bash` for conveying that the commands are bash-specific, and `shell` for generic shell commands.

Note

Do not use `bash` or `shell` if your code block includes a prompt, use `console` instead.

Reciprocally, do not use `console` if your code block does not include a prompt and is not showcasing an interactive session with command(s) and their output.

Table 5: When to use `bash`/`shell` vs. `console`

Use case	code-block snippet	Expected output

One or several commands, no output	`.. code-block:: shell`
	
	`echo "Hello World!"`
		`echo "Hello World!"`

An interactive shell session with command(s) and their output	`.. code-block:: console`
	
	`$ echo "Hello World!"`
	`Hello World!`
		`$ echo "Hello World!"`
		`Hello World!`

An interactive Zephyr shell session, with commands and their outputs	`.. code-block:: console`
	
	`uart:~$ version`
	`Zephyr version 3.5.99`
	`uart:~$ kernel uptime`
	`Uptime: 20970 ms`
		`uart:~$ version`
		`Zephyr version 3.5.99`
		`uart:~$ kernel uptime`
		`Uptime: 20970 ms`

- `bat` for Windows batch files
- `cfg` for config files with "KEY=value" entries (ex. Kconfig `.conf` files)
- `cmake` for CMake
- `devicetree` for Devicetree
- `kconfig` for Kconfig
- `yaml` for YAML
- `rst` for reStructuredText

When no language is specified, the language is set to `none` and the code block is not highlighted. You may also use `none` explicitly to achieve the same result; for example:

```
.. code-block:: none

   This would be a block of text styled with a background
   and box, but with no syntax highlighting.
```

Would display as:

```
This would be a block of text styled with a background
and box, but with no syntax highlighting.
```

There's a shorthand for writing code blocks too: end the introductory paragraph with a double colon (`::`) and indent the code block content that follows it by three spaces. On output, only one colon will be shown. The code block will have no highlighting (i.e. `none`). You may however use the `.. highlight::` directive to customize the default language used in your document (see for example how this is done at the beginning of this very document).

Images

Images are included in documentation by using an image directive:

```
.. image:: ../../../../images/doc-gen-flow.png
   :align: center
   :alt: alt text for the image
```

or if you'd like to add an image caption, use:

```
.. figure:: ../../../../images/doc-gen-flow.png
   :alt: image description

   Caption for the figure
```

The file name specified is relative to the document source file, and we recommend putting images into an `images` folder where the document source is found. The usual image formats handled by a web browser are supported: JPEG, PNG, GIF, and SVG. Keep the image size only as large as needed, generally at least 500 px wide but no more than 1000 px, and no more than 250 KB unless a particularly large image is needed for clarity.

Tabs, spaces, and indenting

Indenting is significant in reST file content, and using spaces is preferred. Extra indenting can (unintentionally) change the way content is rendered too. For lists and directives, indent the content text to the first non-white space in the preceding line. For example:

```
* List item that spans multiple lines of text
  showing where to indent the continuation line.

1. And for numbered list items, the continuation
   line should align with the text of the line above.

.. code-block::

   The text within a directive block should align with the
   first character of the directive name.
```

Refer to the Zephyr *Coding Style* for additional requirements.

zephyr-app-commands Directive

This is a Zephyr directive for generating consistent documentation of the shell commands needed to manage (build, flash, etc.) an application.

For example, to generate commands to build samples/hello_world for qemu_x86 use:

```
.. zephyr-app-commands::
   :zephyr-app: samples/hello_world
   :board: qemu_x86
   :goals: build
```

Directive options:

:tool:
which tool to use. Valid options are currently 'cmake', 'west' and 'all'. The default is 'west'.

:app:
path to the application to build.

:zephyr-app:
path to the application to build, this is an app present in the upstream zephyr repository. Mutually exclusive with :app:.

:cd-into:
if set, build instructions are given from within the :app: folder, instead of outside of it.

:generator:
which build system to generate. Valid options are currently 'ninja' and 'make'. The default is 'ninja'. This option is not case sensitive.

:host-os:
which host OS the instructions are for. Valid options are 'unix', 'win' and 'all'. The default is 'all'.

:board:
if set, the application build will target the given board.

:shield:
if set, the application build will target the given shield. Multiple shields can be provided in a comma separated list.

:conf:
if set, the application build will use the given configuration file. If multiple conf files are provided, enclose the space-separated list of files with quotes, e.g., "a.conf b.conf".

:gen-args:
if set, additional arguments to the CMake invocation

:build-args:
if set, additional arguments to the build invocation

:snippets:
if set, indicates the application should be compiled with the listed snippets. Multiple snippets can be provided in a comma separated list.

:build-dir:
if set, the application build directory will *APPEND* this (relative, Unix-separated) path to the standard build directory. This is mostly useful for distinguishing builds for one application within a single page.

:build-dir-fmt:
if set, assume that "west config build.dir-fmt" has been set to this path. Exclusive with 'build-dir' and depends on 'tool=west'.

:goals:
a whitespace-separated list of what to do with the app (in 'build', 'flash', 'debug', 'debugserver', 'run'). Commands to accomplish these tasks will be generated in the right order.

:maybe-skip-config:
if set, this indicates the reader may have already created a build directory and changed there, and will tweak the text to note that doing so again is not necessary.

:compact:
if set, the generated output is a single code block with no additional comment lines

:west-args:
if set, additional arguments to the west invocation (ignored for CMake)

:flash-args:
if set, additional arguments to the flash invocation

For example, the `.. zephyr-app-commands` listed above would render like this in the generated HTML output:

```
# From the root of the zephyr repository
west build -b qemu_x86 samples/hello_world
```

Alternative Tabbed Content

As introduced in the *Getting Started Guide*, you can provide alternative content to the reader via a tabbed interface. When the reader clicks on a tab, the content for that tab is displayed, for example:

```
.. tabs::

   .. tab:: Apples

      Apples are green, or sometimes red.

   .. tab:: Pears

      Pears are green.

   .. tab:: Oranges

      Oranges are orange.
```

will display as:

Apples

Apples are green, or sometimes red.

Pears

Pears are green.

Oranges

Oranges are orange.

Tabs can also be grouped, so that changing the current tab in one area changes all tabs with the same name throughout the page. For example:

Linux

Linux Line 1

macOS

macOS Line 1

Windows

Windows Line 1

Linux

Linux Line 2

macOS

macOS Line 2

Windows

Windows Line 2

In this latter case, we're using `.. group-tab::` instead of simply `.. tab::`. Under the hood, we're using the sphinx-tabs extension that's included in the Zephyr setup. Within a tab, you can have most any content *other than a heading* (code-blocks, ordered and unordered lists, pictures, paragraphs, and such). You can read more about sphinx-tabs from the link above.

8.2.2 Documentation Generation

These instructions will walk you through generating the Zephyr Project's documentation on your local system using the same documentation sources as we use to create the online documentation found at https://docs.zephyrproject.org

Documentation overview

Zephyr Project content is written using the reStructuredText markup language (.rst file extension) with Sphinx extensions, and processed using Sphinx to create a formatted stand-alone website. Developers can view this content either in its raw form as .rst markup files, or you can generate the HTML content and view it with a web browser directly on your workstation. This same .rst content is also fed into the Zephyr Project's public website documentation area (with a different theme applied).

You can read details about reStructuredText, and Sphinx from their respective websites.

The project's documentation contains the following items:

- ReStructuredText source files used to generate documentation found at the https://docs.zephyrproject.org website. Most of the reStructuredText sources are found in the `/doc` directory, but others are stored within the code source tree near their specific component (such as `/samples` and `/boards`)
- Doxygen-generated material used to create all API-specific documents also found at https://docs.zephyrproject.org
- Script-generated material for kernel configuration options based on Kconfig files found in the source code tree

The reStructuredText files are processed by the Sphinx documentation system, and make use of the breathe extension for including the doxygen-generated API material. Additional tools are required to generate the documentation locally, as described in the following sections.

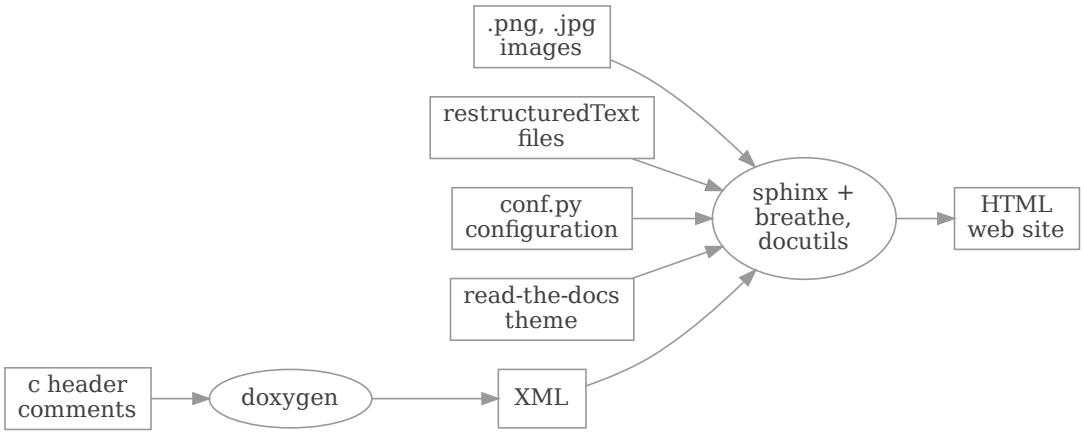

Fig. 1: Schematic of the documentation build process

Installing the documentation processors

Our documentation processing has been tested to run with:

- Doxygen version 1.8.13
- Graphviz 2.43
- Latexmk version 4.56
- All Python dependencies listed in the repository file `doc/requirements.txt`

In order to install the documentation tools, first install Zephyr as described in *Getting Started Guide*. Then install additional tools that are only required to generate the documentation, as described below:

Linux

Common to all Linux installations, install the Python dependencies required to build the documentation:

```
pip install -U -r ~/zephyrproject/zephyr/doc/requirements.txt
```

On Ubuntu Linux:

```
sudo apt-get install --no-install-recommends doxygen graphviz librsvg2-bin \
texlive-latex-base texlive-latex-extra latexmk texlive-fonts-recommended imagemagick
```

On Fedora Linux:

```
sudo dnf install doxygen graphviz texlive-latex latexmk \
texlive-collection-fontsrecommended librsvg2-tools ImageMagick
```

On Clear Linux:

```
sudo swupd bundle-add texlive graphviz ImageMagick
```

On Arch Linux:

```
sudo pacman -S graphviz doxygen librsvg texlive-core texlive-bin \
texlive-latexextra texlive-fontsextra imagemagick
```

macOS

Install the Python dependencies required to build the documentation:

```
pip install -U -r ~/zephyrproject/zephyr/doc/requirements.txt
```

Use `brew` and `tlmgr` to install the tools:

```
brew install doxygen graphviz mactex librsvg imagemagick
tlmgr install latexmk
tlmgr install collection-fontsrecommended
```

Windows

Install the Python dependencies required to build the documentation:

```
pip install -U -r %HOMEPATH$\zephyrproject\zephyr\doc\requirements.txt
```

Open a `cmd.exe` window as **Administrator** and run the following command:

```
choco install doxygen.install graphviz strawberryperl miktex rsvg-convert imagemagick
```

Note

On Windows, the Sphinx executable `sphinx-build.exe` is placed in the `Scripts` folder of your Python installation path. Depending on how you have installed Python, you might need to add this folder to your `PATH` environment variable. Follow the instructions in Windows Python Path to add those if needed.

Documentation presentation theme

Sphinx supports easy customization of the generated documentation appearance through the use of themes. Replace the theme files and do another `make html` and the output layout and style is changed. The `read-the-docs` theme is installed as part of the *Get Zephyr and install Python dependencies* step you took in the getting started guide.

Running the documentation processors

The `/doc` directory in your cloned copy of the Zephyr project git repo has all the .rst source files, extra tools, and Makefile for generating a local copy of the Zephyr project's technical documentation. Assuming the local Zephyr project copy is in a folder `zephyr` in your home folder, here are the commands to generate the html content locally:

```
# On Linux/macOS
cd ~/zephyr/doc
# On Windows
cd %userprofile%\zephyr\doc

# Use cmake to configure a Ninja-based build system:
cmake -GNinja -B_build .

# Enter the build directory
cd _build

# To generate HTML output, run ninja on the generated build system:
ninja html
# If you modify or add .rst files, run ninja again:
ninja html
```

(continues on next page)

(continued from previous page)

```
# To generate PDF output, run ninja on the generated build system:
ninja pdf
```

Warning

The documentation build system creates copies in the build directory of every .rst file used to generate the documentation, along with dependencies referenced by those .rst files.

This means that Sphinx warnings and errors refer to the **copies**, and **not the version-controlled original files in Zephyr**. Be careful to make sure you don't accidentally edit the copy of the file in an error message, as these changes will not be saved.

Depending on your development system, it will take up to 15 minutes to collect and generate the HTML content. When done, you can view the HTML output with your browser started at `doc/_build/html/index.html` and if generated, the PDF file is available at `doc/_build/latex/zephyr.pdf`.

If you want to build the documentation from scratch just delete the contents of the build folder and run `cmake` and then `ninja` again.

Note

If you add or remove a file from the documentation, you need to re-run CMake.

On Unix platforms a convenience doc/Makefile can be used to build the documentation directly from there:

```
cd ~/zephyr/doc

# To generate HTML output
make html

# To generate PDF output
make pdf
```

Filtering expected warnings

There are some known issues with Sphinx/Breathe that generate Sphinx warnings even though the input is valid C code. While these issues are being considered for fixing we have created a Sphinx extension that allows to filter them out based on a set of regular expressions. The extension is named `zephyr.warnings_filter` and it is located at `doc/_extensions/zephyr/warnings_filter.py`. The warnings to be filtered out can be added to the `doc/known-warnings.txt` file.

The most common warning reported by Sphinx/Breathe is related to duplicate C declarations. This warning may be caused by different Sphinx/Breathe issues:

- Multiple declarations of the same object are not supported
- Different objects (e.g. a struct and a function) can not share the same name
- Nested elements (e.g. in a struct or union) can not share the same name

Developer-mode Document Building

When making and testing major changes to the documentation, we provide an option to temporarily stub-out the auto-generated Devicetree bindings documentation so the doc build process runs faster.

To enable this mode, set the following option when invoking cmake:

```
-DDT_TURBO_MODE=1
```

or invoke make with the following target:

```
cd ~/zephyr

# To generate HTML output without detailed Kconfig
make html-fast
```

Viewing generated documentation locally

The generated HTML documentation can be hosted locally with python for viewing with a web browser:

```
$ python3 -m http.server -d _build/html
```

Note

WSL2 users may need to explicitly bind the address to `127.0.0.1` in order to be accessible from the host machine:

```
$ python3 -m http.server -d _build/html --bind 127.0.0.1
```

Linking external Doxygen projects against Zephyr

External projects that build upon Zephyr functionality and wish to refer to Zephyr documentation in Doxygen (through the use of @ref), can utilize the tag file exported at zephyr.tag

Once downloaded, the tag file can be used in a custom `doxyfile.in` as follows:

```
TAGFILES = "/path/to/zephyr.tag=https://docs.zephyrproject.org/latest/doxygen/html/"
```

For additional information refer to Doxygen External Documentation.

Documentation Guidelines
: This page provides some simple guidelines for writing documentation using the reSTructuredText (reST) markup language and Sphinx documentation generator.

Documentation Generation
: As you write documentation, it can be helpful to see how it will look when rendered.

  This page describes how to build the Zephyr documentation locally.

8.3 Dealing with external components

8.3.1 Contributing External Components

In some cases it is desirable to leverage existing, external source code in order to avoid re-implementing basic functionality or features that are readily available in other open source projects.

This section describes the circumstances under which external source code can be imported into Zephyr, and the process that governs the inclusion.

There are three main factors that will be considered during the inclusion process in order to determine whether it will be accepted. These will be described in the following sections.

Note that most of this page deals with external components that end up being compiled and linked into the final image, and programmed into the target hardware. For external tooling that is only used during compilation, code analysis, testing or simulation please refer to the *Contributing External Tooling* section at the end of the page.

Software License

> **Note**
>
> External source code licensed under the Apache-2.0 license is not subject to this section.

Integrating code into the Zephyr Project from other projects that use a license other than the Apache 2.0 license needs to be fully understood in context and approved by the Zephyr governing board, as described in the Zephyr project charter. The board will automatically reject licenses that have not been approved by the Open Source Initiative (OSI). See the *Submission and review process* section for more details.

By carefully reviewing potential contributions and also enforcing a *Developer Certification of Origin (DCO)* for contributed code, we ensure that the Zephyr community can develop products with the Zephyr Project without concerns over patent or copyright issues.

Merit

Just like with any other regular contribution, one that contains external code needs to be evaluated for merit. However, in the particular case of code that comes from an existing project, there are additional questions that must be answered in order to accept the contribution. More specifically, the following will be considered by the Technical Steering Committee and evaluated carefully before the external source code is accepted into the project:

- Is this the most optimal way to introduce the functionality to the project? Both the cost of implementing this internally and the one incurred in maintaining an externally developed codebase need to be evaluated.
- Is the external project being actively maintained? This is particularly important for source code that deals with security or cryptography.
- Have alternatives to the particular implementation proposed been considered? Are there other open source project that implement the same functionality?

Mode of integration

There are two ways of integrating external source code into the Zephyr Project, and careful consideration must be taken to choose the appropriate one for each particular case.

Integration in the main tree The first way to integrate external source code into the project is to simply import the source code files into the main `zephyr` repository. This automatically implies that the imported source code becomes part of the "mainline" codebase, which in turn requires that:

- The code is formatted according to the Zephyr *Coding Style*
- The code adheres to the project's *Coding Guidelines*
- The code is subject to the same checks and verification requirements as the rest of the code in the main tree, including static analysis
- All files contain an SPDX tag if not already present
- If the source is not Apache 2.0 licensed, an entry is added to the *licensing page*.

This mode of integration can be applicable to both small and large external codebases, but it is typically used more commonly with the former.

Integration as a module The second way of integrating external source code into the project is to import the whole or parts of the third-party open source project into a separate repository, and then include it under the form of a *module*. With this approach the code is considered as being developed externally, and thus it is not automatically subject to the requirements of the previous section.

Integration in main manifest file (west.yaml) Integrating external code into the main `west.yml` manifest file is limited to code that is used by a Zephyr subsystem (libraries), by a platform, drivers (HAL) or tooling needed to test or build Zephyr components.

The integration of modules in this group is validated by the Zephyr project CI, and verified to be working with each Zephyr release.

Integrated modules will not be removed from the tree without a detailed migration plan.

Integration as optional modules Standalone or loose integration of modules/projects without any incoming dependencies shall be made optional and shall be kept standalone. Optional projects that provide value to users directly and through a Zephyr subsystem or platform shall be added to an optional manifest file that is filtered by default. (`submanifests/optional.yml`).

Such optional projects might include samples and tests in their own repositories.

There shall not be any direct dependency added in the Zephyr code tree (Git repository) and all sample or test code shall be maintained as part of the module.

> **Note**
>
> This is valid for all new optional modules. Existing optional modules with samples and test code in the Zephyr Git repository will be transitioned out over time.

Integration as external modules Similar to optional modules, but added to the Zephyr project as an entry in the documentation using a pre-defined template. This type of modules exists outside the Zephyr project manifest with documentation instructing users and developers how to integrate the functionality.

Ongoing maintenance

Regardless of the mode of integration, external source code that is integrated in Zephyr requires regular ongoing maintenance. The submitter of the proposal to integrate external source code must therefore commit to maintain the integration of such code for the foreseeable future. This may require adding an entry in the `MAINTAINERS.yml` as part of the process.

Submission and review process

Before external source code can be included in the project, it must be reviewed and accepted by the Technical Steering Committee (TSC) and, in some cases, by the Zephyr governing board.

A request for external source code integration must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the source code and how it integrates into the project.

Follow the steps below to begin the submission process:

1. Make sure to read through the *Contributing External Components* section in detail, so that you are informed of the criteria used by the TSC and board in order to approve or reject a request
2. Use the New External Source Code Issue to open an issue
3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Optionally you can also create a Pull Request that demonstrates the integration of the external source code and link to it from the issue
4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments

If, after consideration by the TSC, the conclusion is that integrating external source code is the best solution, and the external source code is licensed under the Apache-2.0 license, the submission process is complete and the external source code can be integrated.

If, however, the external source code uses a license other than Apache-2.0, then these additional steps must be followed:

1. The TSC chair will forward the link to the GitHub issue created during the early submission process to the Zephyr governing board for further review
2. The Zephyr governing board has two weeks to review and ask questions:
    - If there are no objections, the matter is closed. Approval can be accelerated by unanimous approval of the board before the two weeks are up
    - If a governing board member raises an objection that cannot be resolved via email, the board will meet to discuss whether to override the TSC approval or identify other approaches that can resolve the objections
3. On approval of the Zephyr TSC and governing board the submission process is complete

The flowchart below shows an overview of the process:

Contributing External Tooling

This section deals exclusively with the inclusion of external tooling in the Zephyr project, where tooling is defined as software that assists the compilation, testing or simulation processes but in no case ends up being part of the code compiled and linked into the final image. “Inclusion” in this context means becoming part of the Zephyr default distribution either in the main tree directly under the `scripts/` folder or indirectly as a west project in the main `west.yml` manifest.

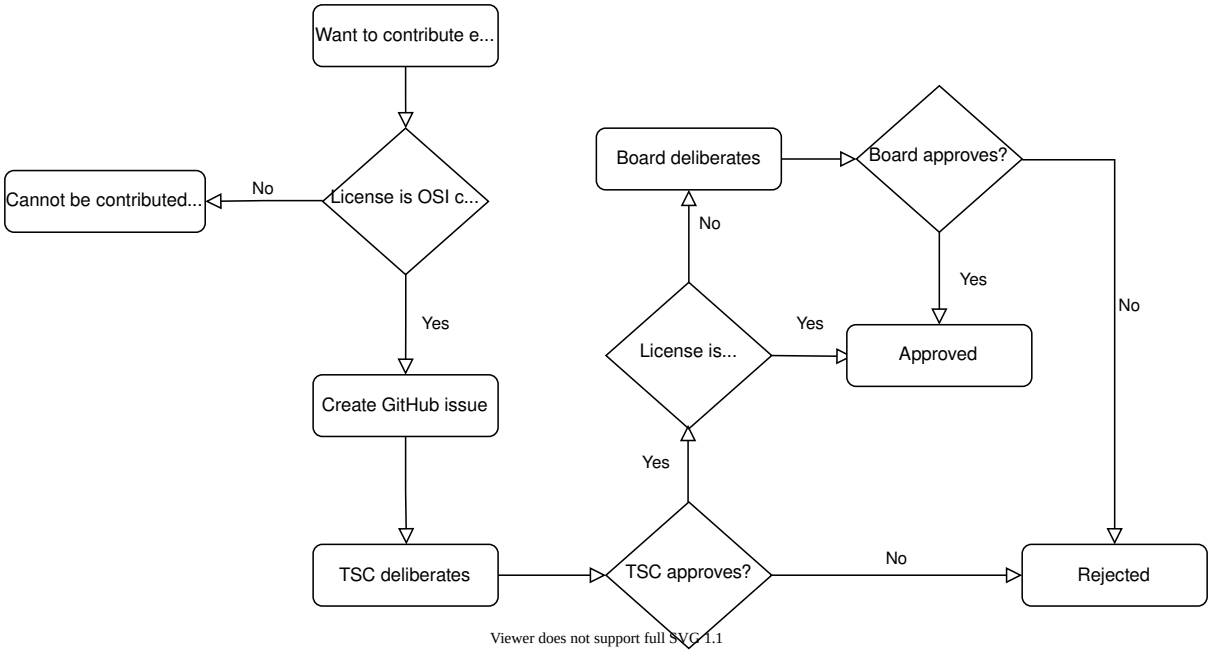

Fig. 2: Submission process

Therefore, this section does not apply to 3rd-party tooling such as toolchains, simulators or others, which may still be referenced by the Zephyr build system or docs without being included in Zephyr.

Tooling components must be released under a license approved by the Open Source Initiative (OSI).

Just like with regular external components, tooling that is imported from another project can be integrated either in the main tree or as a *west project*. Note that in this case the corresponding west project will not be a *module*, because tooling does not make use of the Zephyr build system and does not need to be processed by it. Please see *Modules vs west projects* for additional information on the differences.

If the tool is integrated in the main tree it should be placed under the `scripts/` folder. If the tool is integrated as a west project, then the project repository can be hosted outside the zephyrproject-rtos GitHub organization, provided that the project is made optional via the `group-filter:` field in the main `west.yml` manifest. More info on optional projects can be found in *this section*.

The TSC must approve every Pull Request that introduces a new external tooling component. This will be done on a case-by-case, individual analysis of the proposed addition by the TSC representatives.

Additional considerations about the main manifest

In general, any additions or removals whatsoever to the `projects:` section of the main manifest file requires TSC approval. This includes, but is not limited to:

- Adding and removing groups and group filters
- Adding and removing projects
- Adding and removing `import` statements

8.3.2 Binary Blobs

In the context of an operating system that supports multiple architectures and many different IC families, some functionality may be unavailable without the help of executable code distributed in binary form. Binary blobs (or blobs for short) are files containing proprietary machine code or data in a binary format, e.g. without corresponding source code released under an OSI approved license.

Zephyr supports downloading and using third-party binary blobs via its built-in mechanisms, with some important caveats, described in the following sections. It is important to note that all the information in this section applies only to upstream (vanilla) Zephyr.

There are no limitations whatsoever (except perhaps license compatibility) in the support for binary blobs in forks or third-party distributions of Zephyr. In fact, Zephyr's build system supports arbitrary use cases related to blobs. This includes linking against libraries, flashing images to targets, etc. Users are therefore free to create Zephyr-based downstream software which uses binary blobs if they cannot meet the requirements described in this page.

Software license

Most binary blobs are distributed under proprietary licenses which vary significantly in nature and conditions. It is up to the vendor to specify the license as part of the blob submission process. Blob vendors may impose a click-through or other EULA-like workflow when users fetch and install blobs.

Hosting

Blobs must be hosted on the Internet and managed by third-party infrastructure. Two potential examples are Git repositories and web servers managed by individual hardware vendors.

The Zephyr Project does not host binary blobs in its Git repositories or anywhere else.

Fetching blobs

Blobs are fetched from official third-party sources by the *west blobs* command.

The blobs themselves must be specified in the *module.yml* files included in separate Zephyr *module repositories* maintained by their respective vendors. This means that in order to include a reference to a binary blob to the upstream Zephyr distribution, a module repository must exist first or be created as part of the submission process.

Each blob which may be fetched must be individually identified in the corresponding `module.yml` file. A specification for a blob must contain:

- An abstract description of the blob itself
- Version information
- A reference to vendor-provided documentation
- The blob's *type*, which must be one of the allowed types
- A checksum for the blob, which `west blobs` checks after downloading. This is required for reproducibility and to allow bisecting issues as blobs change using Git and west
- License text applicable to the blob or a reference to such text, in SPDX format

See the *corresponding section* for a more formal definition of the fields.

The *west blobs* command can be used to list metadata of available blobs and to fetch blobs from user-selected modules.

The `west blobs` command only fetches and stores the binary blobs themselves. Any accompanying code, including interface header files for the blobs, must be present in the corresponding module repository.

Tainting

Inclusion of binary blobs will taint the Zephyr build. The definition of tainting originates in the Linux kernel and, in the context of Zephyr, a tainted image will be one that includes binary blobs in it.

Tainting will be communicated to the user in the following manners:

- One or more Kconfig options `TAINT_BLOBS_*` will be set to `y`
- The Zephyr build system, during its configuration phase, will issue a warning. It will be possible to disable the warning using Kconfig
- The `west spdx` command will include the tainted status in its output
- The kernel's default fatal error handler will also explicitly print out the kernel's tainted status

Allowed types

The following binary blob types are acceptable in Zephyr:

- Precompiled libraries: Hardware enablement libraries, distributed in precompiled binary form, typically for SoC peripherals. An example could be an enablement library for a wireless peripheral
- Firmware images: An image containing the executable code for a secondary processor or CPU. This can be full or partial (typically delta or patch data) and is generally copied into RAM or flash memory by the main CPU. An example could be the firmware for the core running a Bluetooth LE Controller
- Miscellaneous binary data files. An example could be pre-trained neural network model data

Hardware agnostic features provided via a proprietary library are not acceptable. For example, a proprietary and hardware agnostic TCP/IP stack distributed as a static archive would be rejected.

Note that just because a blob has an acceptable type does not imply that it will be unconditionally accepted by the project; any blob may be rejected for other reasons on a case by case basis (see library-specific requirements below). In case of disagreement, the TSC is the arbiter of whether a particular blob fits in one of the above types.

Precompiled library-specific requirements

This section contains additional requirements specific to precompiled library blobs.

Any person who wishes to submit a precompiled library must represent that it meets these requirements. The project may remove a blob from the upstream distribution if it is discovered that the blob fails to meet these requirements later on.

Interface header files The precompiled library must be accompanied by one or more header files, distributed under a non-copyleft OSI approved license, that define the interface to the library.

Allowed dependencies This section defines requirements related to external symbols that a library blob requires the build system to provide.

- The blob must not depend on Zephyr APIs directly. In other words, it must have been possible to build the binary without any Zephyr source code present at all. This is required for loose coupling and maintainability, since Zephyr APIs may change and such blobs cannot be modified by all project maintainers
- Instead, if the code in the precompiled library requires functionality provided by Zephyr (or an RTOS in general), an implementation of an OS abstraction layer (aka porting layer) can be provided alongside the library. The implementation of this OS abstraction layer must be in source code form, released under an OSI approved license and documented using Doxygen

Toolchain requirements Precompiled library blobs must be in a data format which is compatible with and can be linked by a toolchain supported by the Zephyr Project. This is required for maintainability and usability. Use of such libraries may require special compiler and/or linker flags, however. For example, a porting layer may require special flags, or a static archive may require use of specific linker flags.

Limited scope Allowing arbitrary library blobs carries a risk of degrading the degree to which the upstream Zephyr software distribution is open source. As an extreme example, a target with a zephyr kernel clock driver that is just a porting layer around a library blob would not be bootable with open source software.

To mitigate this risk, the scope of upstream library blobs is limited. The project maintainers define an open source test suite that an upstream target must be able to pass using only open source software included in the mainline distribution and its modules. The open source test suite currently consists of:

- `samples/philosophers`
- `tests/kernel`

The scope of this test suite may grow over time. The goal is to specify tests for a minimal feature set which must be supported via open source software for any target with upstream Zephyr support.

At the discretion of the release team, the project may remove support for a hardware target if it cannot pass this test suite.

Support and maintenance

The Zephyr Project is not expected to be responsible for the maintenance and support of contributed binary blobs. As a consequence, at the discretion of the Zephyr Project release team, and on a case-by-case basis:

- GitHub issues reported on the zephyr repository tracker that require use of blobs to reproduce may not be treated as bugs
- Such issues may be closed as out of scope of the Zephyr project

This does not imply that issues which require blobs to reproduce will be closed without investigation. For example, the issue may be exposing a bug in a Zephyr code path that is difficult or impossible to trigger without a blob. Project maintainers may accept and attempt to resolve such issues.

However, some flexibility is required because project maintainers may not be able to determine if a given issue is due to a bug in Zephyr or the blob itself, may be unable to reproduce the bug due to lack of hardware, etc.

Blobs must have designated maintainers that must be responsive to issue reports from users and provide updates to the blobs to address issues. At the discretion of the Zephyr Project release team, module revisions referencing blobs may be removed from `zephyr/west.yml` at any time due to lack of responsiveness or support from their maintainers. This is required to maintain project control over bit-rot, security issues, etc.

The submitter of the proposal to integrate a binary blob must commit to maintain the integration of such blob for the foreseeable future.

Regarding Continuous Integration, binary blobs will **not** be fetched in the project's CI infrastructure that builds and optionally executes tests and samples to prevent regressions and issues from entering the codebase. This includes both CI ran when a new GitHub Pull Request is opened as well as any other regularly scheduled execution of the CI infrastructure.

Submission and review process

For references to binary blobs to be included in the project, they must be reviewed and accepted by the Technical Steering Committee (TSC). This process is only required for new binary blobs, updates to binary blobs follow the *module update procedure*.

A request for integration with binary blobs must be made by creating a new issue in the Zephyr project issue tracking system on GitHub with details about the blobs and the functionality they provide to the project.

Follow the steps below to begin the submission process:

1. Make sure to read through the *Binary Blobs* section in detail, so that you are informed of the criteria used by the TSC in order to approve or reject a request
2. Use the New Binary Blobs Issue to open an issue
3. Fill out all required sections, making sure you provide enough detail for the TSC to assess the merit of the request. Additionally you must also create a Pull Request that demonstrates the integration of the binary blobs and then link to it from the issue
4. Wait for feedback from the TSC, respond to any additional questions added as GitHub issue comments

If, after consideration by the TSC, the submission of the binary blob(s) is approved, the submission process is complete and the binary blob(s) can be integrated.

Contributing External Components
: Basic functionality or features that would make useful addition to Zephyr might be readily available in other open source projects, and it is recommended and encouraged to reuse such code. This page describes in more details when and how to import external source code into Zephyr.

Contributing External Tooling
: Similarly, external tooling used during compilation, code analysis, testing or simulation, can be beneficial and is covered in this section.

Binary Blobs
: As some functionality might only be made available with the help of executable code distributed in binary form, this page describes the process and guidelines for *contributing binary blobs* to the project.

8.4 Zephyr Contributor Badge

When your first contribution to the Zephyr project gets merged, you'll become eligible to claim your Zephyr Contributor Badge. This digital badge can be displayed on your website, blog, social

media profile, etc. It will allow you to showcase your involvement in the Zephyr project and help raise its awareness.

You may apply for your Contributor Badge by filling out the Zephyr Contributor Badge form.

8.5 Need help along the way?

If you have questions related to the contribution process, the Zephyr community is here to help. You may join our Discord channel or use the Developer Mailing List.

Chapter 9

Project and Governance

9.1 Technical Steering Committee (TSC)

9.1.1 TSC Member Role

The TSC role and its responsibilities is defined in the Zephyr project charter.

Membership

A TSC member plays a pivotal role in shaping the technical direction of the Zephyr Project. TSC members work collaboratively with other TSC members, contributors, and stakeholders to ensure the project's success and sustainability.

By fulfilling the rights and responsibilities below, TSC members contribute to the overall success and growth of the Zephyr Project, ensuring that it remains a vibrant and thriving open-source community for years to come.

Rights

Decision Making
: Participate in key decisions related to the project's technical direction, including architectural changes, feature additions, and release planning.

Voting
: Exercise voting rights on important matters discussed within the TSC, including feature proposals, code contributions, and community initiatives.

Access
: Gain access to relevant project repositories, documentation, and communication channels to stay informed and contribute effectively.

Leadership
: Take on leadership roles within working groups or subcommittees dedicated to specific technical areas or initiatives.

Representation
: Act as a representative of the broader Zephyr community, advocating for the interests of contributors, users, and stakeholders.

Responsibilities TSC members are expected to fulfill the following responsibilities, though it is not mandatory to fulfill all:

Technical Oversight
: Provide guidance and oversight on technical matters, ensuring alignment with project goals, standards, and best practices through active participation as core members in working groups and committees.

Code Review
: Participate in code reviews to maintain code quality, consistency, and compatibility with project standards.

Community Engagement
: Engage with the community through forums, mailing lists, conferences, and other channels to foster collaboration, address concerns, and gather feedback.

Documentation
: Contribute to the development and maintenance of project documentation, including technical guides, API references, and best practices.

Release Management
: Collaborate with the release manager and other stakeholders to plan and coordinate project releases, ensuring timely delivery and quality assurance.

Contributor Support
: Support and mentor new contributors, helping them navigate the project's codebase, processes, and community norms.

Issue Triage
: Assist in triaging and prioritizing issues reported by users and contributors, facilitating timely resolution and communication.

Compliance and Licensing
: Ensure compliance with project licensing requirements and open-source best practices, addressing any licensing-related issues that may arise.

Conflict Resolution
: Facilitate constructive discussions and resolution of technical disagreements or conflicts within the community, promoting a healthy and inclusive environment.

Continuous Improvement
: Continuously seek opportunities to improve project governance, processes, and infrastructure, driving innovation and sustainability.

Appointed TSC Members

See Zephyr project charter for more details.

- Appointed TSC members have no term limits besides the term of their employment at the organization they represent or their organization's membership in the Zephyr Project.
- Appointed TSC members can select an Alternate from the same organization.

Elected TSC Members

Per the Zephyr project charter, TSC members can nominate representatives from the technical community at the rate of no more than one per quarter.

- Majority vote is required to confirm a candidate.
- Once elected, a TSC member serves for 2 years.
- Elected TSC members do not have the right to appoint an Alternate.

- To ensure continuity of the TSC, at the end of the 2 year term, the TSC is required to reconfirm the membership of elected members. If the elected member declines a new term or if the TSC fails to reconfirm the term, the seat will be open for new nominations.
- If an elected TSC member resigns before the end of the 2 year term, their spot will be open for new members outside of the quarterly nomination limit. The elected member will serve a 2 year term.
- The TSC has the right to terminate elected members who become inactive and are not fulfilling the responsibilities of TSC members as described in this document.
- The number of elected members shall not exceed 20% of the total of appointed members.
- Existing TSC members who were elected before May 2024 shall be re-confirmed after completing the 2 year term since they were first elected.

Suspensions

As noted under Section 8b of the Project Charter, voting rights for a representative who misses three consecutive meetings are subject to suspension and suspended representatives do not count towards the quorum requirement.

A representative's suspension will end and voting rights be restored at the start of the next attended meeting. The TSC enforces the suspension policy for voting members who miss three consecutive TSC weekly meetings.

Multi-day meetings (F2F events) are counted as "one" meeting. The TSC voted on February 16, 2022 to discontinue default enforcement of the suspension policy. The TSC voted on January 18, 2023 to re-enact default enforcement of the suspension policy.

Notice of suspension will be sent to representatives who miss three consecutive meetings, noting that rights will be restored upon next attendance of a TSC meeting.

> **Note**
>
> As per Section 4b of the Project Charter, Platinum and Silver Members may choose to opt out of a voting seat on the TSC.
>
> Members who opt out and then wish to reclaim their seat later will have their voting rights restored at the start of the second consecutive meeting attended following notification to the TSC Chair.

Voting

Voting in the Zephyr Project is defined under Section 8 of the Project Charter.

Additional points of clarity / TSC interpretation have been added below. The Governing Board may opt to update the Charter to include the below refinements. Until then, additional clarifications (if/where needed) will be discussed in the Process Working Group, and approved in the TSC.

- TSC In-Meeting Voting For items requesting an in-meeting vote of the Zephyr Technical Steering Committee (TSC), assuming quorum requirements have been met, the default voting mechanism will be a verbal motion to determine if there is general consensus.
- If there are no objections to a motion being brought forward, general consensus is assumed and the motion passes.
- Should there be any objections raised, the vote will move to email, and be executed using the Voting Guidelines outlined in Section 8 of the Project Charter.

- Should a motion be deemed urgent by the TSC Chair, and assuming quorum requirements have been met, the Chair may call for a roll call vote in-meeting.

Voting Options

- Voting Options are:
  - "Yes",
  - "No" or
  - "Abstain"

Abstention Abstentions do not count in tallying the vote negatively or positively; when members abstain, they are in effect attending only to contribute to a quorum.

Abstentions do not impact the number of votes needed to decide a vote.

Quorum Quorum for TSC meetings shall require 60% of the voting representatives… (ref 8b of the Charter)

Decisions Decisions by vote shall be based on a majority vote, provided that at least sixty percent (60%) of the **TSC** representatives must be either present or participating electronically or by written action in order to conduct a valid vote. (ref 8c of the Charter)

Example A:

> 40 eligible TSC voters. 3 abstain from a vote on a motion. 12 vote Yes. 11 vote No.
>
> Quorum reached: 26 votes cast (quorum = 60% of 40 = 24) Majority vote: 12 Yes vs. 11 No. Yes wins. Motion adopted.

Example B:

> 40 eligible TSC voters. 5 abstain from a vote on a motion. 12 vote Yes. 6 vote No. Quorum reached? 23 votes cast (quorum = 60% of 40 = 24)
>
> Vote is not valid. Quorum not reached.

Example C:

> 40 eligible TSC voters. 21 abstain from a vote on a motion. 2 vote Yes. 1 votes No. Quorum reached? 24 votes cast (quorum = 60% of 40 = 24)
>
> Majority vote: 2 Yes vs. 1 No. Yes wins.

Immutable Votes

Votes are considered immutable once cast. A voter may not change their vote, once cast, between the time a Motion is brought forth and the time at which results are announced.

9.2 TSC Project Roles

9.2.1 Project Roles

TSC projects generally will involve *Maintainers*, *Collaborators*, and *Contributors*:

Maintainer: lead Collaborators on an area identified by the TSC (e.g. Architecture, code subsystems, etc.). Maintainers shall also serve as the area's representative on the TSC as needed. Maintainers may become voting members of the TSC under the guidelines stated in the project Charter.

Collaborator: A highly involved Contributor in one or more areas. May become a Maintainer with approval of existing TSC voting members.

Contributor: anyone in the community that contributes code or documentation to the project. Contributors may become Collaborators by approval of the existing Collaborators and Maintainers of the particular code base areas or subsystems.

Contributor

A *Contributor* is a developer who wishes to contribute to the project, at any level.

Contributors are granted the following rights and responsibilities:

- Right to contribute code, documentation, translations, artwork, etc.
- Right to report defects (bugs) and suggestions for enhancement.
- Right to participate in the process of reviewing contributions by others.
- Right to initiate and participate in discussions in any communication methods.
- Right to approach any member of the community with matters they believe to be important.
- Right to participate in the feature development process.
- Responsibility to abide by decisions, once made. They are welcome to provide new, relevant information to reopen decisions.
- Responsibility for issues and bugs introduced by one's own contributions.
- Responsibility to respect the rules of the community.
- Responsibility to provide constructive advice whenever participating in discussions and in the review of contributions.
- Responsibility to follow the project's code of conduct (https://github.com/zephyrproject-rtos/zephyr/blob/main/CODE_OF_CONDUCT.md)

Contributors are initially only given Read access to the Zephyr GitHub repository. Specifically, at the Read access level, Contributors are not allowed to assign reviewers to their own pull requests. An automated process will assign reviewers. You may also share the pull request on the Zephyr devel mailing list or on the Zephyr Discord Server.

Contributors who show dedication and skill are granted the Triage permission level to the Zephyr GitHub repository.

You may nominate yourself, or another GitHub user, for promotion to the Triage permission level by creating a GitHub issue, using the nomination template.

Contributors granted the Triage permission level are permitted to add reviewers to a pull request and can be added as a reviewer by other GitHub users. Contributor change requests or approval on pull requests are not counted with respect to accepting and merging a pull request. However, Contributors comments and requested changes should still be considered by the pull request author.

Collaborator

A *Collaborator* is a Contributor who is also responsible for the maintenance of Zephyr source code. Their opinions weigh more when decisions are made, in a fully meritocratic fashion.

Collaborators have the following rights and responsibilities, in addition to those listed for Contributors:

- Right to set goals for the short and medium terms for the project being maintained, alongside the Maintainer.
- Responsibility to participate in the feature development process.
- Responsibility to review relevant code changes within reasonable time.
- Responsibility to ensure the quality of the code to expected levels.
- Responsibility to participate in community discussions.
- Responsibility to mentor new contributors when appropriate
- Responsibility to participate in the quality verification and release process, when those happen.

Contributors are promoted to the Collaborator role by adding the GitHub user name to one or more `collaborators` sections of the *MAINTAINERS File* in the Zephyr repository.

Collaborator change requests on pull requests should be addressed by the original submitter. In cases where the changes requested do not follow the *expectations* and the guidelines of the project or in cases of disagreement, it is the responsibility of the assignee to advance the review process and resolve any disagreements.

Collaborator approval of pull requests are counted toward the minimum required approvals needed to merge a PR. Other criteria for merging may apply.

Maintainer

A *Maintainer* is a Collaborator who is also responsible for knowing, directing and anticipating the needs of a given zephyr source code area.

Maintainers have the following rights and responsibilities, in addition to those listed for Contributors and Collaborators:

- Right to set the overall architecture of the relevant subsystems or areas of involvement.
- Right to make decisions in the relevant subsystems or areas of involvement, in conjunction with the collaborators and submitters. See *PR Technical Escalation*.
- Responsibility to convey the direction of the relevant subsystem or areas to the TSC
- Responsibility to ensure all contributions of the project have been reviewed within reasonable time.
- Responsibility to enforce the code of conduct.
- Responsibility to triage static analysis issues in their code area. See *Static Code Analysis*.

Contributors or Collaborators are promoted to the Maintainer role by adding the GitHub user name to one or more `maintainers` sections of the *MAINTAINERS File* in the Zephyr repository.

Maintainer approval of pull requests are counted toward the minimum required approvals needed to merge a PR. Other criteria for merging may apply.

9.2.2 Role Retirement

- Individuals elected to the following Project roles, including, Maintainer, Release Engineering Team member, Release Manager, but are no longer engaged in the project as described by the rights and responsibilities of that role, may be requested by the TSC to retire from the role they are elected.

- Such a request needs to be raised as a motion in the TSC and be approved by the TSC voting members. By approval of the TSC the individual is considered to be retired from the role they have been elected.
- The above applies to elected TSC Project roles that may be defined in addition.

9.2.3 Teams and Supporting Activities

Assignee

An *Assignee* is one of the maintainers of a subsystem or code being changed. Assignees are set either automatically based on the code being changed or set by the other Maintainers, the Release Engineering team can set an assignee when the latter is not possible.

- Responsibility to drive the pull request to a mergeable state
- Right to dismiss stale and unrelated reviews or reviews not following *expectations* from reviewers and seek reviews from additional maintainers, developers and contributors
- Right to block pull requests from being merged until issues or changes requested are addressed
- Responsibility to re-assign a pull request if they are the original submitter of the code
- Solicit approvals from maintainers of the subsystems affected
- Responsibility to drive the *PR Technical Escalation* process

Static Analysis Audit Team

The Static Analysis Audit team works closely with the release engineering team to ensure that static analysis defects opened during a release cycle are properly addressed. The team has the following rights and responsibilities:

- Right to revert any triage in a static analysis tool (e.g: Coverity) that does not follow the project expectations.
- Responsibility to inform code owners about improper classifications.
- Responsibility to alert TSC if any issues are not adequately addressed by the responsible code owners.

Joining the Static Analysis Audit team

- Contributors highly involved in the project with some expertise in static analysis.

Release Engineering Team

A team of active Maintainers involved in multiple areas.

- The members of the Release Engineering team are expected to fill the Release Manager role based on a defined cadence and selection process.
- The cadence and selection process are defined by the Release Engineering team and are approved by the TSC.
- The team reports directly into the TSC.

Release Engineering team has the following rights and responsibilities:

- Right to merge code changes to the zephyr tree following the project rules.
- Right to revert any changes that have broken the code base

- Right to close any stale changes after <N> months of no activity
- Responsibility to take directions from the TSC and follow them.
- Responsibility to coordinate code merges with maintainers.
- Responsibility to merge all contributions regardless of their origin and area if they have been approved by the respective maintainers and follow the merge criteria of a change.
- Responsibility to keep the Zephyr code base in a working and passing state (as per CI)

Joining the Release Engineering team

- Maintainers highly involved in the project may be nominated by a TSC voting member to join the Release Engineering team. Nominees may become members of the team by approval of the existing TSC voting members.
- To ensure a functional Release Engineering team the TSC shall periodically review the team's followed processes, the appropriate size, and the membership composition (ensure, for example, that team members are geographically distributed across multiple locations and time-zones).

Release Manager

A *Maintainer* responsible for driving a specific release to completion following the milestones and the roadmap of the project for this specific release.

- TSC has to approve a release manager.

A Release Manager is a member of the Release Engineering team and has the rights and responsibilities of that team in addition to the following:

- Right to manage and coordinate all code merges after the code freeze milestone (M3, see program management overview.)
- Responsibility to drive and coordinate the triaging process for the release
- Responsibility to create the release notes of the release
- Responsibility to notify all stakeholders of the project, including the community at large about the status of the release in a timely manner.
- Responsibility to coordinate with QA and validation and verify changes either directly or through QA before major changes and major milestones.

Roles / Permissions

Table 1: Project Roles vs GitHub Permissions

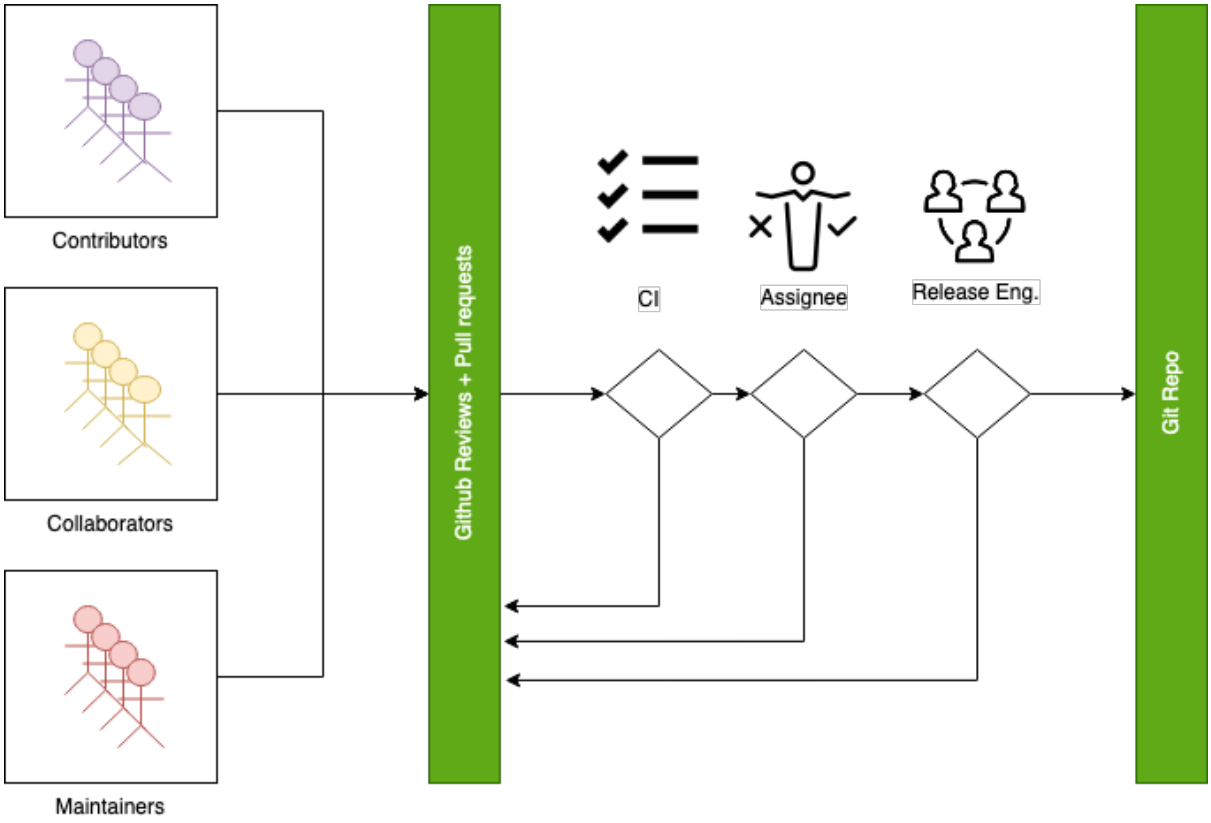
		Admin	**Merge Rights**	Member	Owner	Collaborator
Main Roles	Contributor					x
	Collaborator			x		
	Maintainer			x		
Supportive Roles	QA/Validation			x		x
	DevOps	**x**				
	System Admin	**x**			x	
	Release Engineering	**x**	**x**	x		

9.2.4 MAINTAINERS File

Generic guidelines for deciding and filling in the Maintainers' list

- The MAINTAINERS.yml file shall replace the CODEOWNERS file and will be used for both setting assignees and reviewers.
- We should keep the granularity of code maintainership at a manageable level
- We should be looking for maintainers for areas of code that are orphaned (i.e. without an explicit maintainer)
  - Un-maintained areas should be indicated clearly in the MAINTAINERS file
- All submitted pull requests should have an assignee
- We Introduce an area/subsystem hierarchy to address the above point
  - Parent-area maintainer should be acting as default substitute/fallback assignee for un-maintained sub-areas
  - Area maintainer gets precedence over parent-area maintainer
- Pull requests may be re-assigned if this is needed or more appropriate
  - Re-assigned by original assignee
- In general, updates to the MAINTAINERS file should be in a standalone commit alongside other changes introducing new files and directories to the tree.
- Major changes to the file, including the addition of new areas with new maintainers should come in as standalone pull requests and require TSC review.
- If additional review by the TSC is required, the maintainers of the file should send the requested changes to the TSC and give members of the TSC two (2) days to object to any of the changes to maintainership of areas or the addition of new maintainers or areas.
- Path, collaborator and name changes do not require a review by the TSC.
- Addition of new areas without a maintainer do not require review by the TSC.
- The MAINTAINERS file itself shall have a maintainer
- Architectures, core components, sub-systems, samples, tests
  - Each area shall have an explicit maintainer
- Boards (incl relevant samples, tests), SoCs (incl DTS) * May have a maintainer, shall have a higher-level platform maintainer
- Drivers
  - Shall have a driver-area (and API) maintainer
  - Could have individual driver implementation maintainers but preferably collaborator/contributors
  - In the above case, platform-specific PRs may be re-assigned to respective collaborator/contributor of driver implementation

9.2.5 Release Activity



Merge Criteria

- Minimal of 2 approvals, including an approval by the designated assignee.
- Pull requests should be reviewed by at least a maintainer or collaborator of each affected area; Unless the changes to a given area are considered trivial enough, in which case approvals by other affected subsystems maintainers/collaborators would suffice.
- Four eye principle on the organisation level. We already require at least 2 approvals (basic four eye principle), however, such reviews and approvals might be unintentionally biased in the case where the submitter is from the same organisation as the approvers. To allow for project wide review and approvals, the merge criteria is extended with the guidelines below:
  - Changes or additions to common and shared code shall have approvals from different organisations (at least one approval from an organisation different than the submitters'). Common and shared code is defined as anything that does not fall under soc, `boards` and `drivers/*/*`.
  - Changes or additions to hardware support (driver, SoC, boards) shall at least have the merger be from a different organisation. This applies only to implementation of an API supporting vendor specific hardware and not the APIs.
  - Release engineers may make exceptions for areas with contributions primarily coming from one organisation and where reviews from other organisations are not possible, however, merges shall be completed by a person from a different organisation. In such cases, the minimum review period of at least 2 days shall be strictly followed to allow for additional reviews.
  - Release engineers shall not merge code changes originating and reviewed only by their own organisation. To be able to merge such changes, at least one review shall be from a different organisation.

- A minimum review period of 2 business days, 4 hours for trivial changes (see *Give reviewers time to review before code merge*).
- Hotfixes can be merged at any time after CI has passed and are excluded from most of the conditions listed above.
- All required checks are passing:
  - Codeowners
  - Device Tree
  - Documentation
  - Gitlint
  - Identity/Emails
  - Kconfig
  - License checks
  - Checkpatch (Coding Style)
  - Pylint
  - Integration Tests (Via twister) on emulation/simulation platforms
  - Simulated Bluetooth Tests
- Planned
  - Footprint
  - Code coverage
  - Coding Guidelines
  - Static Analysis (Coverity)
  - Documentation coverage (APIs)

9.3 TSC Working Groups

9.3.1 Overview

The TSC, at its discretion, may establish working groups or subcommittees to serve as focused teams dedicated to specific technical areas, initiatives, or tasks.

9.3.2 Membership

Working Group Membership Eligibility

- Each Working group (WG) shall determine its own membership eligibility, in consultation with the TSC.
- Each working group shall have a team of members who are actively involved in its activities and decision-making processes.
- It is expected that WG membership shall be **open to all Zephyr project :ref:‘Collaborators <collaborator>‘**; however, working groups may impose restrictions such as the number of participants from a single company.
- All TSC members are eligible to join a working group as members, part of the responsibilities being a TSC member.

- The minimal number of members may vary depending on the complexity of the tasks and the breadth of expertise required to address them effectively.
- A working group should aim to have at least five to seven members to ensure diversity of perspectives, collaboration, and continuity.
- The structure of each working group within the Zephyr Project should be designed to ensure effectiveness, productivity, and inclusivity. While the optimal size of a working group can vary depending on the specific context and scope of its activities.
- Participation in WG meetings and discussions is open to all project *contributors*.

Working Group Chair / Co-chair

Each working group may elect a Chair and optionally a Co-Chair who is responsible for leading meetings and representing the working group to the TSC.

Working Group Chair / Co-Chair Elections

- The Chair and Co-Chair shall be elected by the members of the working group
- Any member of the working group has the right to nominate themselves for the chair/co-chair positions.
- The term for the chair/co-chair is one year
- If a chair/co-chair resigns from the position before the end of the term, a vote is to be held to elect a new chair/co-chair.

Working Group Voter Eligibility

- Voting for a Chair or Co-Chair is open to the members of the working group.
- Only 1 working group member from each company may vote in the election.
- The Chair and Co-Chair shall be members of the working group.

Working Group Election Confirmation

- The elected Chair (and/or Co-Chair) is submitted to the TSC for confirmation.
- The TSC decides to accept the outcome or requests a new voting.

9.3.3 Advisory role

- Working Groups are advisory in nature. They provide advice to the projects and to the TSC.
- Working groups operate on a rough consensus basis. If the working group is unable to reach consensus on what advice to offer, the working group Chair shall raise the issue with the TSC or the relevant committee (Safety and Security), where a formal vote can be taken, or advise the project that the working group cannot reach consensus.
- Working groups shall keep track of discussions and record any votes, decisions, or recommendations made and share results with the community and the TSC.
- Working group meetings and offline discussions shall be captured in a standalone document with all supporting details such as attendance, quorum, actions to be taken, and next steps.

- Decisions made within a working group are non-binding and are only considered ratified after communicating decisions and outcomes to the TSC.
- Lacking any objections from the TSC within 1 week after the communication or report of any results, decisions of a working group are considered confirmed and ratified.

9.3.4 TSC Working Group Lifecycle

Creation of a TSC working group

In order to create a TSC working group, a TSC member shall make a proposal to the TSC (via TSC email list) that shall cover at least the following:

- TSC working group name.
- TSC working group purpose
- TSC working group expected deliverables
- TSC working group starting participants with at least one TSC member acting as a sponsor.
- Optionally TSC working group definition of done

Update of a TSC working group

The TSC can modify a TSC working group via a TSC decision. To request such a modification, a request is made to the TSC email list.

Conclusion of a TSC working group

The TSC decides the termination of the TSC working group in accordance with the TSC decision procedure. The submission of a request to terminate the TSC working group should cover:

- TSC working group name
- TSC working group deliveries
- Motivation for termination of the TSC working group

9.4 Release Process

The Zephyr project releases on a time-based cycle, rather than a feature-driven one. Zephyr releases represent an aggregation of the work of many contributors, companies, and individuals from the community.

A time-based release process enables the Zephyr project to provide users with a balance of the latest technologies and features and excellent overall quality. A roughly 4-month release cycle allows the project to coordinate development of the features that have actually been implemented, allowing the project to maintain the quality of the overall release without delays because of one or two features that are not ready yet.

The Zephyr release model was loosely based on the Linux kernel model:

- Release tagging procedure:
  - linear mode on main branch,
  - release branches for maintenance after release tagging.

- Each release period will consist of a development phase followed by a stabilization phase. Release candidates will be tagged during the stabilization phase. During the stabilization phase, only stabilization changes such as bug fixes and documentation will be merged unless granted a special exemption by the Technical Steering Committee.
  - Development phase: all changes are considered and merged, subject to approval from the respective maintainers.
  - Stabilisation phase: the release manager creates a vN-rc1 tag and the tree enters the stabilization phase
  - CI sees the tag, builds and runs tests; Test teams analyse the report from the build and test run and give an ACK/NAK to the build
  - The release owner, with test teams and any other needed input, determines if the release candidate is a go for release
  - If it is a go for a release, the release owner lays a tag release vN at the same point

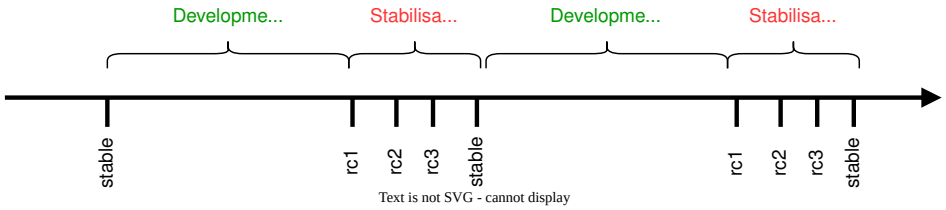


Fig. 1: Release Cycle

Note

The milestones for the current major version can be found on the Official GitHub Wiki. Information on previous releases can be found here.

9.4.1 Development Phase

A relatively straightforward discipline is followed with regard to the merging of patches for each release. At the beginning of each development cycle, the main branch is said to be open for development. At that time, code which is deemed to be sufficiently stable (and which is accepted by the maintainers and the wide community) is merged into the mainline tree. The bulk of changes for a new development cycle (and all of the major changes) will be merged during this time.

The development phase lasts for approximately three months. At the end of this time, the release owner will declare that the development phase is over and releases the first of the release candidates. For the codebase release which is destined to be 3.1.0, for example, the release which happens at the end of the development phase will be called 3.1.0-rc1. The -rc1 release is the signal that the time to merge new features has passed, and that the time to stabilize the next release of the code base has begun.

9.4.2 Stabilization Phase

Over the next weeks and depending on the release milestone, only stabilization, cosmetic changes, tests, bug and doc fixes are allowed (See *table* below).

On occasion, more significant changes and new features will be allowed, but such occasions are rare and require a TSC approval and a justification. As a general rule, if you miss submitting your code during the development phase for a given feature, the best thing to do is to wait for the next

development cycle. (An occasional exception is made for drivers for previously unsupported hardware; if they do not touch any other in-tree code, they cannot cause regressions and should be safe to add at any time).

As fixes make their way into the mainline, the patch rate will slow over time. The mainline release owner releases new -rc drops once or twice a week; a normal series will get up to somewhere between -rc4 and -rc6 before the code base is considered to be sufficiently stable and the release criteria have been achieved at which point the final 3.1.0 release is made.

At that point, the whole process starts over again.

9.4.3 Release Criteria

The main motivation is to clearly have the criteria in place that must be met for a release. This will help define when a release is “done” in terms that most people can understand and in ways that help new people to understand the process and participate in creating successful releases:

- The release criteria documents all the requirements of our target audience for each Zephyr release
- The target audiences for each release can be different, and may overlap
- The criteria at any given time are not set in stone: there may be requirements that have been overlooked, or that are new, and in these cases, the criteria should be expanded to ensure all needs are covered.

Below is the high level criteria to be met for each release:

- No blocker bugs / blocking issues
- All relevant tests shall pass on `Tier 0` platforms
- All relevant tests shall pass on Tier 0 and 1 platforms (at least 1 per architecture/architecture variant/Hardware features)
- All applicable samples/tests shall build on Tiers 0, 1 and 2
- All high and critical static analysis and security issues addressed
- Release Notes are up-to-date.

Blocker Bugs

Blocker bug process kicks in during the release process and is in effect after the feature freeze milestone. An issue labeled as a blocker practically blocks a release from happening. All blocker bugs shall be resolved before a release is created.

A fix for a bug that is granted *blocker* status can be merged to ‘main’ and included in the release all the way until the final release date.

Bugs of moderate severity and higher that have impact on all users are typically the candidates to be promoted to blocker bugs

Contributors and member of the release engineering team shall follow these guidelines for release blocker bugs:

- Only mark bugs as blockers if the software (Zephyr) must not be released with the bug present.
- All collaborators can add or remove blocking labels.
- Evaluate bugs as potential blockers based on their severity and prevalence.
- Provide detailed rationale whenever adding or removing a blocking label.
- Ensure all blockers have the milestone tagged.

- Release managers have final say on blocking status; contact them with any questions.

9.4.4 Release Milestones

Table 2: Release Milestones

Timeline	Checkpoint	Description	Owner
T-5M	Planning	Finalize dates for release, Assign release owner and agree on project wide goals for this release.	TSC
T-7W	Review target milestones	Finalize target milestones for features in flight.	Release Engineering
T-4W	Release Announcement	Release owner announces feature freeze and timeline for release.	Release Manager
T-3W	Feature Freeze (RC1)	No new features after RC1, ONLY stabilization and cosmetic changes, bug and doc fixes are allowed. New tests for existing features are also allowed.	Release Engineering
T-2W	2nd Release Candidate	No new features after RC2, ONLY stabilization and cosmetic changes, bug and doc fixes are allowed.	Release Manager
T-1W	Hard Freeze (RC3)	Only blocker bug fixes after RC3, documentation and changes to release notes are allowed. Release notes need to be complete by this checkpoint. Release Criteria is met.	Release Manager
T-0W	Release		Release Manager

9.4.5 Releases

The following syntax should be used for releases and tags in Git:

- Release [Major].[Minor].[Patch Level]
- Release Candidate [Major].[Minor].[Patch Level]-rc[RC Number]
- Tagging:
  - v[Major].[Minor].[Patch Level]-rc[RC Number]
  - v[Major].[Minor].[Patch Level]
  - v[Major].[Minor].99 - A tag applied to main branch to signify that work on v[Major].[Minor+1] has started. For example, v1.7.99 will be tagged at the start of v1.8 process. The tag corresponds to VERSION_MAJOR/VERSION_MINOR/PATCHLEVEL macros as defined for a work-in-progress main branch version. Presence of this tag allows generation of sensible output for “git describe” on main branch, as typically used for automated builds and CI tools.

Long Term Support (LTS)

Long-term support releases are designed to be supported and maintained for an extended period and is the recommended release for products and the auditable branch used for certification.

An LTS release is defined as:

- **Product focused**

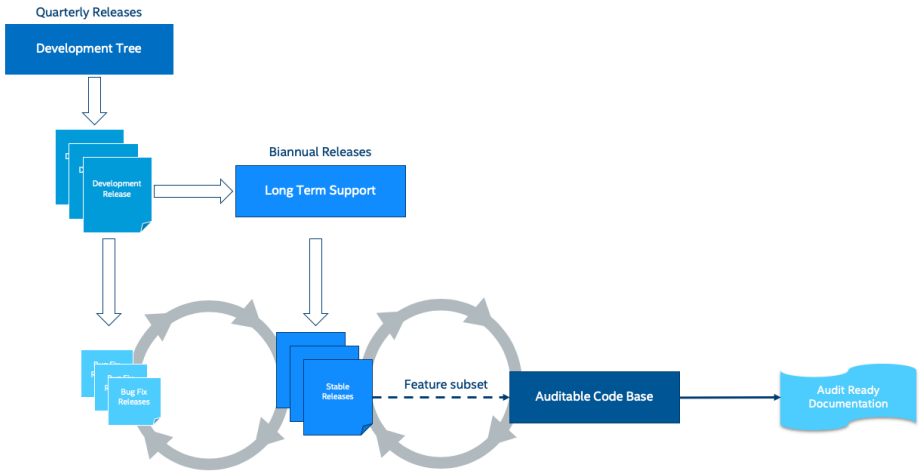

Fig. 2: Zephyr Code and Releases

- **Extended Stabilisation period**: Allow for more testing and bug fixing
- **Stable APIs**
- **Quality Driven Process**
- **Long Term**: Maintained for an extended period of time (at least 2.5 years) overlapping previous LTS release for at least half a year.

Product Focused Zephyr LTS is the recommended release for product makers with an extended support and maintenance which includes general stability and bug fixes, security fixes.

An LTS includes both mature and new features. API and feature maturity is documented and tracked. The footprint and scope of mature and stable APIs expands as we move from one LTS to the next giving users access to bleeding edge features and new hardware while keeping a stable foundation that evolves over time.

Extended Stabilisation Period Zephyr LTS development cycle differs from regular releases and has an extended stabilization period. Feature freeze of regular releases happens 3-4 weeks before the scheduled release date. The stabilization period for LTS is extended by 3 weeks with the feature freeze occurring 6-7 weeks before the anticipated release date. The time between code freeze and release date is extended in this case.

Stable APIs Zephyr LTS provides a stable and long-lived foundation for developing products. To guarantee stability of the APIs and the implementation of such APIs it is required that any release software that makes the core of the OS went through the Zephyr API lifecycle and stabilized over at least 2 releases. This guarantees that we release many of the highlighted and core features with mature and well-established implementations with stable APIs that are supported during the lifetime of the release LTS.

- API Freeze (LTS - 2)
  - All stable APIs need to be frozen 2 releases before an LTS. APIs can be extended with additional features, but the core implementation is not modified. This is valid for the following subsystems for example:
    - Device Drivers (i2c.h, spi.h)...
    - Kernel (k_*):
    - OS services (logging,debugging, ..)

    * DTS: API and bindings stability
    * Kconfig
  - New APIs for experimental features can be added at any time as long as they are standalone and documented as experimental or unstable features/APIs.
- Feature Freeze (LTS - 1) - No new features or overhaul/restructuring of code covering major LTS features.
  - Kernel + Base OS
  - Additional advertised LTS features
  - Auxiliary features on top of and/or extending the base OS and advertised LTS features can be added at any time and should be marked as experimental if applicable

Quality Driven Process The Zephyr project follows industry standards and processes with the goal of providing a quality oriented releases. This is achieved by providing the following products to track progress, integrity and quality of the software components provided by the project:

- Compliance with published coding guidelines, style guides and naming conventions and documentation of deviations.
- Static analysis reports
  - Regular static analysis on the complete tree using available commercial and open-source tools, and documentation of deviations and false positives.
- Documented components and APIS
- Requirements Catalog
- Verification Plans
- Verification Reports
- Coverage Reports
- Requirements Traceability Matrix (RTM)
- SPDX License Reports

Each release is created with the above products to document the quality and the state of the software when it was released.

Long Term Support and Maintenance A Zephyr LTS release is published every 2 years and is branched and maintained independently from the main tree for at least 2.5 years after it was released. Support and maintenance for an LTS release stops at least half a year after the following LTS release is published.

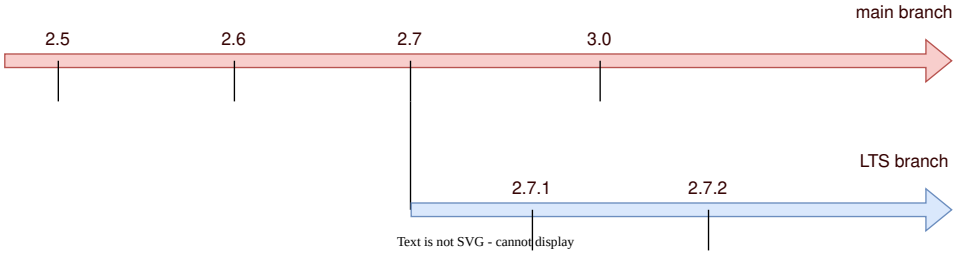

Fig. 3: Long Term Support Release

Changes and fixes flow in both directions. However, changes from main branch to an LTS branch will be limited to fixes that apply to both branches and for existing features only.

All fixes for an LTS branch that apply to the mainline tree shall be submitted to mainline tree as well.

Auditable Code Base

An auditable code base is to be established from a defined subset of Zephyr OS features and will be limited in scope. The LTS, development tree, and the auditable code bases shall be kept in sync after the audit branch is created, but with a more rigorous process in place for adding new features into the audit branch used for certification.

This process will be applied before new features move into the auditable code base.

The initial and subsequent certification targets will be decided by the Zephyr project governing board.

Processes to achieve selected certification will be determined by the Security and Safety Working Groups and coordinated with the TSC.

9.4.6 Hardware Support Tiers

Tier 0: Emulation Platforms

- Tests are both built and run in these platforms in CI, and therefore runtime failures can block Pull Requests.
- Supported by the Zephyr project itself, commitment to fix bugs in releases.
- One Tier 0 platform is required for each new architecture.
- Bugs reported against platforms of this tier are to be evaluated and treated as a general bug in Zephyr and should be dealt with the highest priority.

Tier 1: Supported Platforms

- Commitment from a specific team to run tests using twister device testing for the “Zephyr compatibility test suite” (details TBD) on a regular basis using open-source and publicly available drivers.
- Commitment to fix bugs in time for releases. Not supported by “Zephyr Project” itself.
- General availability for purchase
- Bugs reported against platforms of this tier are to be evaluated and treated as a general bug in Zephyr and should be dealt with medium to high priority.

Tier 2: Community Platforms

- Platform implementation is available in upstream, no commitment to testing, may not be generally available.
- Has a dedicated maintainer who commits to respond to issues / review patches.
- Bugs reported against platforms of this tier are NOT considered as a general bug in Zephyr.

Tier 3: Deprecated and unsupported Platforms

- Platform implementation is available, but no owner or unresponsive owner.
- No commitment to support is available.
- May be removed from upstream if no one works to bring it up to tier 2 or better.
- Bugs reported against platforms of this tier are NOT considered as a general bug in Zephyr.

9.4.7 Release Procedure

This section documents the Release manager responsibilities so that it serves as a knowledge repository for Release managers.

Release Checklist

Each release has a GitHub issue associated with it that contains the full checklist. After a release is complete, a checklist for the next release is created.

Tagging

The final release and each release candidate shall be tagged using the following steps:

> **Note**
>
> Tagging needs to be done via explicit git commands and not via GitHub's release interface. The GitHub release interface does not generate annotated tags (it generates 'lightweight' tags regardless of release or pre-release). You should also upload your gpg public key to your GitHub account, since the instructions below involve creating signed tags. However, if you do not have a gpg public key you can opt to remove the `-s` option from the commands below.

Release Candidate

> **Note**
>
> This section uses tagging 1.11.0-rc1 as an example, replace with the appropriate release candidate version.

1. Update the version variables in the VERSION file located in the root of the Git repository to match the version for this release candidate. The `EXTRAVERSION` variable is used to identify the rc[RC Number] value for this candidate:

   ```
   EXTRAVERSION = rc1
   ```

2. Post a PR with the updated VERSION file using `release: Zephyr 1.11.0-rc1` as the commit subject. Merge the PR after successful CI.

3. Tag and push the version, using an annotated tag:

   ```
   $ git pull
   $ git tag -s -m "Zephyr 1.11.0-rc1" v1.11.0-rc1
   $ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0-rc1
   ```

4. Send an email to the mailing lists (`announce` and `devel`) with a link to the release

Final Release

> **Note**
>
> This section uses tagging 1.11.0 as an example, replace with the appropriate final release version.

When all final release criteria has been met and the final release notes have been approved and merged into the repository, the final release version will be set and repository tagged using the following procedure:

1. Update the version variables in the VERSION file located in the root of the Git repository. Set `EXTRAVERSION` variable to an empty string to indicate final release:

   ```
   EXTRAVERSION =
   ```

2. Post a PR with the updated VERSION file using `release: Zephyr 1.11.0` as the commit subject. Merge the PR after successful CI.

3. Tag and push the version, using two annotated tags:

   ```
   $ git pull
   $ git tag -s -m "Zephyr 1.11.0" v1.11.0
   $ git push git@github.com:zephyrproject-rtos/zephyr.git v1.11.0
   ```

4. Find the new `v1.11.0` tag at the top of the releases page and edit the release with the `Edit tag` button with the following:

   - Copy the overview of `docs/releases/release-notes-1.11.rst` into the release notes textbox and link to the full release notes file on docs.zephyrproject.org.

5. Send an email to the mailing lists (`announce` and `devel`) with a link to the release

9.5 Feature Tracking

For feature tracking we use Github labels to classify new features and enhancements. The following is the description of each category:

Enhancement
: Changes to existing features that are not considered a bug and would not block a release. This is an incremental enhancement to a feature that already exists in Zephyr.

Feature request
: A request for the implementation or inclusion of a new unit of functionality that is not part of any release plans yet, that has not been vetted, and needs further discussion and details.

Feature
: A committed and planned unit of functionality with a detailed design and implementation proposal and an owner. Features must go through an RFC process and must be vetted and discussed in the TSC before a target milestone is set.

Hardware Support
: A request or plan to port an existing feature or enhancement to a particular hardware platform. This ranges from porting Zephyr itself to a new architecture, SoC or board to adding an implementation of a peripheral driver API for an existing hardware platform.

Meta
: A label to group other GitHub issues that are part of a single feature or unit of work.

The following workflow should be used to process features:.

This is the formal way for asking for a new feature in Zephyr and indicating its importance to the project. Often, the requester may have a readiness and willingness to drive implementation of the feature in an upcoming release, and should assign the request to themselves. If not though, an owner will be assigned after evaluation by the TSC. A feature request can also have a companion RFC with more details on the feature and a proposed design or implementation.

- Label new features requests as `feature-request`
- The TSC discusses new `feature-request` items regularly and triages them. Items are examined for similarity with existing features, how they fit with the project goals and other timeline considerations. The priority is determined as follows:
  - High = Next milestone
  - Medium = As soon as possible
  - Low = Best effort
- After the initial discussion and triaging, the label is moved from `feature-request` to `feature` with the target milestone and an assignee.

All items marked as `feature-request` are non-binding and those without an assignee are open for grabs, meaning that they can be picked up and implemented by any project member or the community. You should contact an assigned owner if you'd like to discuss or contribute to that feature's implementation

9.5.1 Roadmap and Release Plans

Project roadmaps and release plans are both important tools for the project, but they have very different purposes and should not be confused. A project roadmap communicates the high-level overview of a project's strategy, while a release plan is a tactical document designed to capture and track the features planned for upcoming releases.

- The project roadmap communicates the why; a release plan details the what
- A release plan spans only a few months; a product roadmap might cover a year or more

Project Roadmap

The project roadmap should serve as a high-level, visual summary of the project's strategic objectives and expectations.

If built properly, the roadmap can be a valuable tool for several reasons. It can help the project present its plan in a compelling way to existing and new stakeholders, to help recruit new members and it can be a helpful resource the team and community can refer to throughout the project's development, to ensure they are still executing according to plan.

As such, the roadmap should contain only strategic-level details, major project themes, epics, and goals.

Release Plans

The release plan comes into play when the project roadmap's high-level strategy is translated into an actionable plan built on specific features, enhancements, and fixes that need to go into a specific release or milestone.

The release plan communicates those features and enhancements slated for your project' next release (or the next few releases). So it acts as more of a project plan, breaking the big ideas down into smaller projects the community and main stakeholders of the project can make progress on.

Items labeled as `features` are short or long term release items that shall have an assignee and a milestone set.

9.6 Code Flow and Branches

9.6.1 Introduction

The zephyr Git repository has three types of branches:

main
: Which contains the latest state of development

collab-*
: Collaboration branches that are used for shared development of new features to be introduced into the main branch when ready. Creating a new collaboration branch requires a justification and TSC approval. Collaboration branches shall be based off the main branch and any changes developed in the collab branch shall target the main development branch. For released versions of Zephyr, the introduction of fixes and new features, if approved by the TSC, shall be done using backport pull requests.

vx.y-branch
: Branches which track maintenance releases based on a major release

Development in collaboration branches before features go to mainline allows teams to work independently on a subsystem or a feature, improves efficiency and turnaround time, and encourages collaboration and streamlines communication between developers.

Changes submitted to a collaboration branch can evolve and improve incrementally in a branch, before they are submitted to the mainline tree for final integration.

By dedicating an isolated branch to complex features, it's possible to initiate in-depth discussions around new additions before integrating them into the official project.

Collaboration branches are ephemeral and shall be removed once the collaboration work has been completed. When a branch is requested, the proposal should include the following:

- Define exit criteria for merging the collaboration branch changes back into the main branch.
- Define a timeline for the expected life cycle of the branch. It is recommended to select a Zephyr release to set the timeline. Extensions to this timeline requires TSC approval.

9.6.2 Roles and Responsibilities

Collaboration branch owners have the following responsibilities:

- Use the infrastructure and tools provided by the project (GitHub, Git)
- All changes to collaboration branches shall come in form of github pull requests.
- Force pushing a collaboration branch is only allowed when rebasing against the main branch.
- Review changes coming from team members and request review from branch owners when submitting changes.
- Keep the branch in sync with upstream and update on a regular basis.
- Push changes frequently to upstream using the following methods:
  - GitHub pull requests: for example, when reviews have not been done in the local branch (one-man branch).

  - Merge requests: When a set of changes has been done in a local branch and has been reviewed and tested in a collaboration branch.

9.7 Modifying Contributions made by other developers

9.7.1 Scenarios

Zephyr contributors and collaborators are encouraged to assist as reviewers in pull requests, so that patches may be approved and merged to Zephyr's main branch as part of the original pull requests. The authors of the pull requests are responsible for amending their original commits following the review process.

There are occasions, however, when a contributor might need to modify patches included in pull requests that are submitted by other Zephyr contributors. For instance, this is the case when:

- a developer cherry-picks commits submitted by other contributors into their own pull requests in order to:
  - integrate useful content which is part of a stale pull request, or
  - get content merged to the project's main branch as part of a larger patch
- a developer pushes to a branch or pull request opened by another contributor in order to:
  - assist in updating pull requests in order to get the patches merged to the project's main branch
  - drive stale pull requests to completion so they can be merged

9.7.2 Accepted policies

A developer who intends to cherry-pick and potentially modify patches sent by another contributor shall:

- clarify in their pull request the reason for cherry-picking the patches, instead of assisting in getting the patches merged in their original pull request, and
- invite the original author of the patches to their pull request review.

A developer who intends to force-push to a branch or pull request of another Zephyr contributor shall clarify in the pull request the reason for pushing and for modifying the existing patches (e.g. stating that it is done to drive the pull request review to completion, when the pull request author is not able to do so).

> **Note**
>
> Developers should try to limit the above practice to pull requests identified as *stale*. Read about how to identify pull requests as stale in *development processes and tools*

If the original patches are substantially modified, the developer can either:

- (preferably) reach out to the original author and request them to acknowledge that the modified patches may be merged while having the original sign-off line and author identity, or
- submit the modified patches as their *own* work (i.e. with their *own* sign-off line and author identity). In this case, the developer shall identify in the commit message(s) the original source the submitted work is based on (mentioning, for example, the original PR number).

Note

Contributors should uncheck the box *"Allow Edits By Maintainers"* to indicate that they do not wish their patches to be amended, inside their original branch or pull request, by other Zephyr developers.

9.8 Development Environment and Tools

9.8.1 Code Review

GitHub is intended to provide a framework for reviewing every commit before it is accepted into the code base. Changes, in the form of Pull Requests (PR) are uploaded to GitHub but don't actually become a part of the project until they've been reviewed, passed a series of checks (CI), and are approved by maintainers. GitHub is used to support the standard open source practice of submitting patches, which are then reviewed by the project members before being applied to the code base.

Pull requests should be appropriately *labeled*, and linked to any relevant *bug or feature tracking issues* .

The Zephyr project uses GitHub for code reviews and Git tree management. When submitting a change or an enhancement to any Zephyr component, a developer should use GitHub. GitHub Actions automatically assigns a responsible reviewer on a component basis, as defined in the MAINTAINERS.yml file stored with the code tree in the Zephyr project repository. A limited set of release managers are allowed to merge a pull request into the main branch once reviews are complete.

Give reviewers time to review before code merge

The Zephyr project is a global project that is not tied to a certain geography or timezone. We have developers and contributors from across the globe. When changes are proposed using pull request, we need to allow for a minimal review time to give developers and contributors the opportunity to review and comment on changes. There are different categories of changes and we know that some changes do require reviews by subject matter experts and owners of the subsystem being changed. Many changes fall under the "trivial" category that can be addressed with general reviews and do not need to be queued for a maintainer or code-owner review. Additionally, some changes might require further discussions and a decision by the TSC or the Security working group. To summarize the above, the diagram below proposes minimal review times for each category:

Workflow

- An author of a change can suggest in his pull-request which category a change should belong to. A project maintainers or TSC member monitoring the inflow of changes can change the label of a pull request by adding a comment justifying why a change should belong to another category.
- The project will use the label system to categorize the pull requests.
- Changes should not be merged before the minimal time has expired.

Categories/Labels

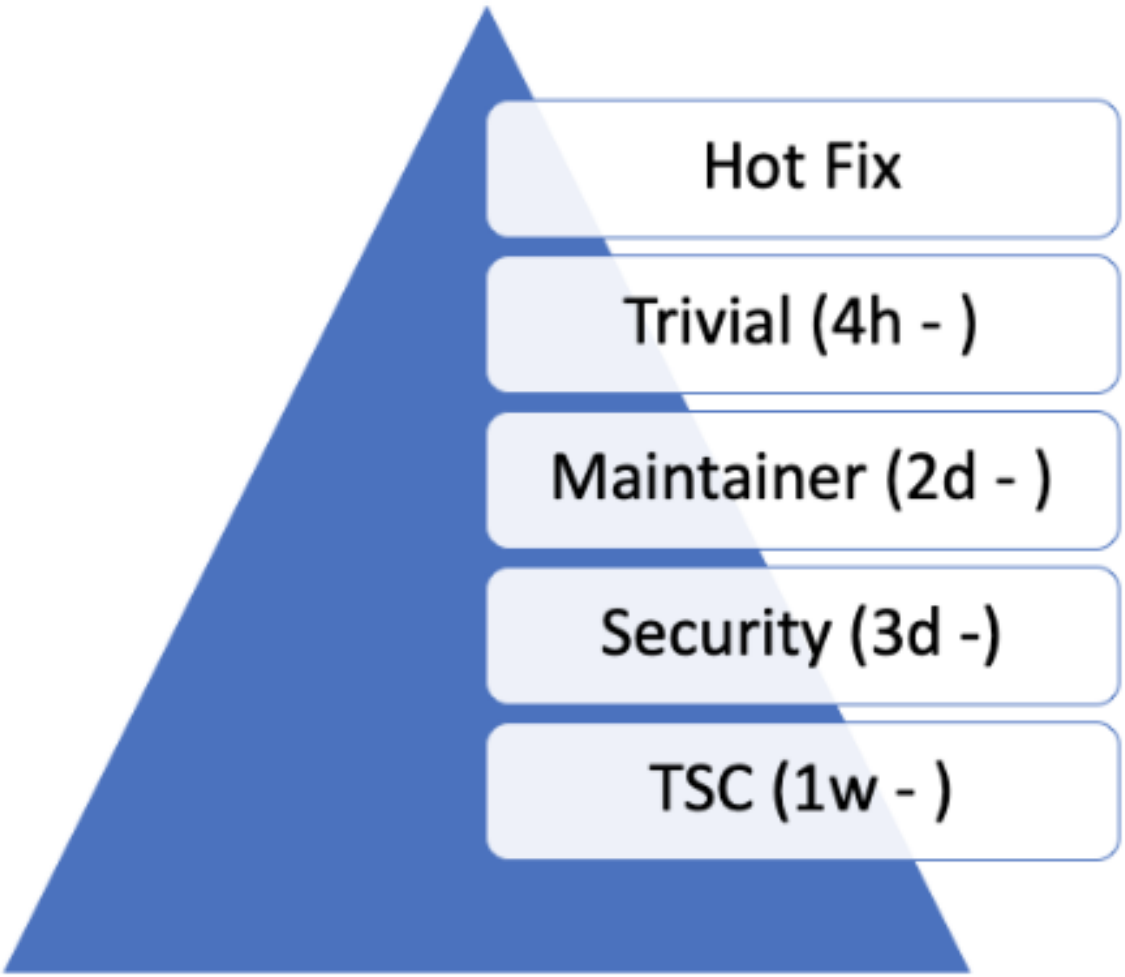

Fig. 4: Pull request classes

Hotfix Any change that is a fix to an issue that blocks developers from doing their daily work, for example CI breakage, Test breakage, Minor documentation fixes that impact the user experience.

Such fixes can be merged at any time after they have passed CI checks. Depending on the fix, severity, and availability of someone to review them (other than the author) they can be merged with justification without review by one of the project owners.

Trivial Trivial changes are those that appear obvious enough and do not require maintainer or code-owner involvement. Such changes should not change the logic or the design of a subsystem or component. For example a trivial change can be:

- Documentation changes
- Configuration changes
- Minor Build System tweaks
- Minor optimization to code logic without changing the logic
- Test changes and fixes
- Sample modifications to support additional configuration or boards etc.

Maintainer Any changes that touch the logic or the original design of a subsystem or component will need to be reviewed by the code owner or the designated subsystem maintainer. If the code changes is initiated by a contributor or developer other than the owner the pull request needs to be assigned to the code owner who will have to drive the pull request to a mergeable state by giving feedback to the author and asking for more reviews from other developers.

Security Changes that appear to have an impact to the overall security of the system need to be reviewed by a security expert from the security working group.

TSC and Working Groups Changes that introduce new features or functionality or change the way the overall system works need to be reviewed by the TSC or the responsible Working Group. For example for *breaking API changes*, the proposal needs to be presented in the Architecture meeting so that the relevant stakeholders are made aware of the change.

A Pull-Request should have an Assignee

- An assignee to a pull request should not be the same as the author of the pull-request
- An assignee to a pull request is responsible for driving the pull request to a mergeable state
- An assignee is responsible for dismissing stale reviews and seeking reviews from additional developers and contributors
- Pull requests should not be merged without an approval by the assignee.

Pull Request should not be merged by author without review

All pull requests need to be reviewed and should not be merged by the author without a review. The following exceptions apply:

- Hot fixes: Fixing CI issues, reverts, and system breakage
- Release related changes: Changing version file, applying tags and release related activities without any code changes.

Developers and contributors should always seek review, however there are cases when reviewers are not available and there is a need to get a code change into the tree as soon as possible.

Reviewers shall not 'Request Changes' without comments or justification

Any change requests (-1) on a pull request have to be justified. A reviewer should avoid blocking a pull-request with no justification. If a reviewer feels that a change should not be merged without their review, then: Request change of the category: for example:

- Trivial -> Maintainer
- Assign Pull Request to yourself, this will mean that a pull request should not be merged without your approval.

Pull Requests should have at least 2 approvals before they are merged

A pull-request shall be merged only with two positive reviews (approval). Beside the person merging the pull-request (merging != approval), two additional approvals are required to be able to merge a pull request. The person merging the request can merge without approving or approve and merge to get to the 2 approvals required.

Reviewers should keep track of pull requests they have provided feedback to

If a reviewer has requested changes in a pull request, he or she should monitor the state of the pull request and/or respond to mention requests to see if his feedback has been addressed. Failing to do so, negative reviews shall be dismissed by the assignee or an owner of the repository. Reviews will be dismissed following the criteria below:

- The feedback or concerns were visibly addressed by the author
- The reviewer did not revisit the pull request after 2 week and multiple pings by the author
- The review is unrelated to the code change or asking for unjustified structural changes such as:
  - Split the PR
  - Can you fix this unrelated code that happens to appear in the diff
  - Can you fix unrelated issues
  - Etc.

Closing Stale Issues and Pull Requests

- The Pull requests and issues sections on Github are NOT discussion forums. They are items that we need to execute and drive to closure. Use the mailing lists for discussions.
- In case of both issues and pull-requests the original poster needs to respond to questions and provide clarifications regarding the issue or the change. After one week without a response to a request, a second attempt to elicit a response from the contributor will be made. After one more week without a response the item may be closed (draft and DNM tagged pull requests are excluded).

9.8.2 Continuous Integration

All changes submitted to GitHub are subject to tests that are run on emulated platforms and architectures to identify breakage and regressions that can be immediately identified. Testing using Twister additionally performs build tests of all boards and platforms. Documentation changes are also verified through review and build testing to verify doc generation will be successful.

Any failures found during the CI test run will result in a negative review assigned automatically by the CI system. Developers are expected to fix issues and rework their patches and submit again.

The CI infrastructure currently runs the following tests:

- Run `checkpatch` for code style issues (can vote -1 on errors; see note)
- Gitlint: Git commit style based on project requirements
- License Check: Check for conflicting licenses
- Run `twister` script
  - Run kernel tests in QEMU (can vote -1 on errors)
  - Build various samples for different boards (can vote -1 on errors)
- Verify documentation builds correctly.

Note

`checkpatch` is a Perl script that uses regular expressions to extract information that requires a C language parser to process accurately. As such it sometimes issues false positives. Known cases include constructs like:

```
static uint8_t __aligned(PAGE_SIZE) page_pool[PAGE_SIZE * POOL_PAGES];
IOPCTL_Type *base = config->base;
```

Both lines produce a diagnostic regarding spaces around the `*` operator: the first is misidentified as a pointer type declaration that would be correct as `PAGE_SIZE *POOL_PAGES` while the second is misidentified as a multiplication expression that would be correct as `IOPCTL_Type * base`.

Maintainers can override the -1 in cases where the CI infrastructure gets the wrong answer.

9.8.3 Labeling issues and pull requests in GitHub

The project uses GitHub issues and pull requests (PRs) to track and manage daily and long-term work and contributions to the Zephyr project. We use GitHub **labels** to classify and organize these issues and PRs by area, type, priority, and more, making it easier to find and report on relevant items.

All GitHub issues or pull requests must be appropriately labeled. Issues and PRs often have multiple labels assigned, to help classify them in the different available categories. When reviewing a PR, if it has missing or incorrect labels, maintainers shall fix it.

This saves us all time when searching, reduces the chances of the PR or issue being forgotten, speeds up reviewing, avoids duplicate issue reports, etc.

These are the labels we currently have, grouped by applicability:

Labels applicable to issues only

Label	Description
priority: {high|medium|l	To classify the impact and importance of a bug or *feature*. Note: Issue priorities are generally set or changed during the bug-triage or TSC meetings.
Regression	Something, which was working, but does not anymore (bug subtype).
Enhancement	Changes/Updates/Additions to existing *features*.
Feature request	A request for a new *feature*.
Feature	A *planned feature* with a milestone.
Hardware Support	Covers porting an existing feature (including Zephyr itself) to new hardware.
Duplicate	This issue is a duplicate of another issue (please specify).
Good first issue	Good for a first time contributor to take.
Release Notes	Issues that need to be mentioned in release notes as known issues with additional information.

Any issue must be classified and labeled as either *Bug*, *Enhancement*, *RFC*, *Feature*, *Feature Request* or *Hardware Support*. More information on how feature requests are handled and become features can be found in *Feature Tracking*.

Labels applicable to pull requests only

The issue or PR describes a change to a stable API.

Label	Description
Hotfix	Fix for an issue blocking development.
Trivial	Simple changes that can have shorter review time and be reviewed by anyone, i.e. typos, straightforward one-liner bug fixes, etc.
Maintainer	Maintainer review required.
Security Review	To be reviewed by a security expert.
DNM	This PR should not be merged (Do Not Merge). For work in progress, GitHub "draft" PRs are preferred.
Needs review	The PR needs attention from the maintainers.
Backport	The PR is a backport or should be backported.
Licensing	The PR has licensing issues which require a licensing expert to review it.

Note

For all labels applicable to PRs: Please note that the label, together with PR complexity, affects how long a merge should be held to ensure proper review. See *review process* for details.

Labels applicable to both pull requests and issues

Label	Description
area: {area-name}	Indicates Zephyr subsystems (e.g, *area: Kernel*, *area: I2C*, *area: Memory Management*), project functions (e.g., *area: Debugging*, *area: Documentation*, *area: Process*), or other categories (e.g., *area: Coding Style*, *area: MISRA-C*) affected by the bug or the pull request. An area maintainer should be able to filter by an area label and find all issues and PRs which relate to that area.
platform: {platfor name}	An issue or PR which affects only a particular platform.
dev-review	The issue is to be discussed in the following dev-review if time permits.
TSC	TSC stands for Technical Steering Committee. The issue is to be discussed in the following TSC meeting if time permits.
Breaking API Change	The issue or PR describes a breaking change to a stable API. See additional information in *Introducing breaking API changes*.
bug	The issue is a bug, or the PR is fixing a bug.
Coverity	A Coverity detected issue or its fix.
Waiting for response	The Zephyr developers are waiting for the submitter to respond to a question, or address an issue.
Blocked	Blocked by another PR or issue.
Stale	An issue or a PR which seems abandoned, and requires attention by the author.
In progres	For PRs: is work in progress and should not be merged yet. For issues: Is being worked on.
RFC	The author would like input from the community. For a PR it should be considered a draft.
LTS	Long term release branch related.
EXT	Related to an external component.

9.9 Bug Reporting

To maintain traceability and relation between proposals, changes, features, and issues, it is recommended to cross-reference source code commits with the relevant GitHub issues and vice versa. Any changes that originate from a tracked feature or issue should contain a reference to the feature by mentioning the corresponding issue or pull-request identifiers.

At any time it should be possible to establish the origin of a change and the reason behind it by following the references in the code.

9.9.1 Reporting a regression issue

It could happen that the issue being reported is identified as a regression, as the use case is known to be working on earlier commit or release. In this case, providing directly the guilty commit when submitting the bug gains a lot of time in the eventual bug fixing.

To identify the commit causing the regression, several methods could be used, but tree bisecting method is an efficient one that doesn't require deep code expertise and can be used by every one.

For this, git bisect is the recommended tool.

Recommendations on the process:

- Run `west update` on each bisection step.
- Once the bisection is over and a culprit identified, verify manually the result.

9.10 Communication and Collaboration

The Zephyr Discord Server is the primary chat forum used by Zephyr developers, contributors, and users.

The Zephyr project mailing lists are used as an additional communication tool by project members, contributors, and the community. There are specialized mailing lists for specific interests. Several lists are public and open. Mailing lists are always available for use in situations where Discord is unavailable or an unsuitable forum.

In general, bug reports and other issues should be reported as GitHub Issues and not broadcasted to the mailing list. The same applies to code reviews.

9.11 Code Documentation

9.11.1 API Documentation

Well documented APIs enhance the experience for developers and are an essential requirement for defining an API's success. Doxygen is a general purpose documentation tool that the zephyr project uses for documenting APIs. It generates either an on-line documentation browser (in HTML) and/or provides input for other tools that is used to generate a reference manual from documented source files. In particular, doxygen's XML output is used as an input when producing the Zephyr project's online documentation.

9.11.2 Reference to Requirements

APIs for the most part document the implementation of requirements or advertised features and can be traced back to features. We use the API documentation as the main interface to trace implementation back to documented features. This is done using custom _doxygen_ tags that reference requirements maintained somewhere else in a requirement catalogue.

9.11.3 Test Documentation

To help understand what each test does and which functionality it tests we also document all test code using the same tools and in the same context and generate documentation for all unit and integration tests maintained in the same environment. Tests are documented using references to the APIs or functionality they validate by creating a link back to the APIs and by adding a reference to the original requirements.

9.11.4 Documentation Guidelines

Test Code

The Zephyr project uses several test methodologies, the most common being the *Ztest framework*. Test documentation should only be done on the entry test functions (usually prefixed with test_) and those that are called directly by the Ztest framework. Those tests are going to appear in test reports and using their name and identifier is the best way to identify them and trace back to them from requirements.

Test documentation should not interfere with the actual API documentation and needs to follow a new structure to avoid confusion. Using a consistent naming scheme and following a well-defined structure we will be able to group this documentation in its own module and identify it uniquely when parsing test data for traceability reports. Here are a few guidelines to be followed:

- All test code documentation should be grouped under the `all_tests` doxygen group
- All test documentation should be under doxygen groups that are prefixed with tests_

The custom doxygen `@verify` directive signifies that a test verifies a requirement:

```
/**
* @brief Tests for the Semaphore kernel object
* @defgroup kernel_semaphore_tests Semaphore
* @ingroup all_tests
* @{
*/

...
/**
* @brief A brief description of the tests
* Some details about the test
* more details
*
* @verify{@req{1111}}
*/
void test_sema_thread2thread(void)
{
...
}
...

/**
* @}
*/
```

To get coverage of how an implementation or a piece of code satisfies a requirements, we use the `satisfy` alias in doxygen:

```
/**
* @brief Give a semaphore.
*
* This routine gives @a sem, unless the semaphore is already at its maximum
* permitted count.
*
* @note Can be called by ISRs.
*
* @param sem Address of the semaphore.
*
* @satisfy{@req{015}}
*/
__syscall void k_sem_give(struct k_sem *sem);
```

To generate the matrix, you will first need to build the documentation, specifically you will need to build the doxygen XML output:

```
$ make doxygen
```

Parse the generated XML data from doxygen to generate the traceability matrix.

The Zephyr project defines a development process workflow using GitHub **Issues** to track feature, enhancement, and bug reports together with GitHub **Pull Requests** (PRs) for submitting and reviewing changes. Zephyr community members work together to review these Issues and PRs, managing feature enhancements and quality improvements of Zephyr through its regular releases, as outlined in the program management overview.

We can only manage the volume of Issues and PRs, by requiring timely reviews, feedback, and responses from the community and contributors, both for initial submissions and for followup questions and clarifications. Read about the project's *development processes and tools* and specifics about *review timelines* to learn about the project's goals and guidelines for our active developer community.

TSC Project Roles describes in detail the Zephyr project roles and associated permissions with respect to the development process workflow.

9.12 Terminology

- mainline: The main tree where the core functionality and core features are being developed.
- subsystem/feature branch: is a branch within the same repository. In our case, we will use the term branch also when referencing branches not in the same repository, which are a copy of a repository sharing the same history.
- upstream: A parent branch the source code is based on. This is the branch you pull from and push to, basically your upstream.
- LTS: Long Term Support

Chapter 10

Security

These documents describe the requirements, processes, and developer guidelines for ensuring security is addressed within the Zephyr project.

10.1 Zephyr Security Overview

10.1.1 Introduction

This document outlines the steps of the Zephyr Security Subcommittee towards a defined security process that helps developers build more secure software while addressing security compliance requirements. It presents the key ideas of the security process and outlines which documents need to be created. After the process is implemented and all supporting documents are created, this document is a top-level overview and entry point.

Overview and Scope

We begin with an overview of the Zephyr development process, which mainly focuses on security functionality.

In subsequent sections, the individual parts of the process are treated in detail. As depicted in Figure 1, these main steps are:

1. **Secure Development:** Defines the system architecture and development process that ensures adherence to relevant coding principles and quality assurance procedures.
2. **Secure Design:** Defines security procedures and implement measures to enforce them. A security architecture of the system and relevant sub-modules is created, threats are identified, and countermeasures designed. Their correct implementation and the validity of the threat models are checked by code reviews. Finally, a process shall be defined for reporting, classifying, and mitigating security issues.
3. **Security Certification:** Defines the certifiable part of the Zephyr RTOS. This includes an evaluation target, its assets, and how these assets are protected. Certification claims shall be determined and backed with appropriate evidence.

Intended Audience

This document is a guideline for the development of a security process by the Zephyr Security Subcommittee and the Zephyr Technical Steering Committee. It provides an overview of the Zephyr security process for (security) engineers and architects.

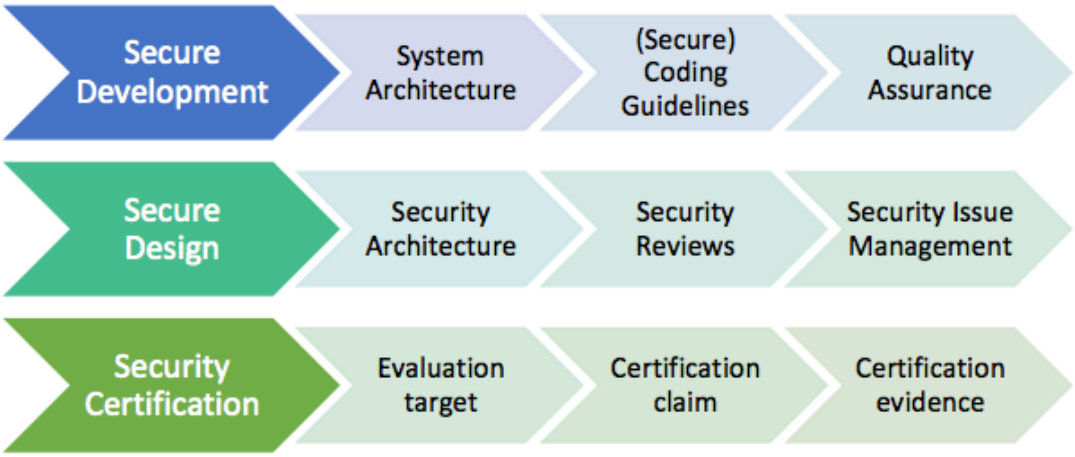

Fig. 1: Figure 1. Security Process Steps

Nomenclature

In this document, the keywords “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” are to be interpreted as described in **[?]**.

These words are used to define absolute requirements (or prohibitions), highly recommended requirements, and truly optional requirements. As noted in RFC-2119, “These terms are frequently used to specify behavior with security implications. The effects on security of not implementing a MUST or SHOULD, or doing something the specification says MUST NOT or SHOULD NOT be done may be very subtle. Document authors should take the time to elaborate the security implications of not following recommendations or requirements as most implementors will not have had the benefit of the experience and discussion that produced the specification.”

Security Document Update

This document is a living document. As new requirements, features, and changes are identified, they will be added to this document through the following process:

1. Changes will be submitted from the interested party(ies) via pull requests to the Zephyr documentation repository.
2. The Zephyr Security Subcommittee will review these changes and provide feedback or acceptance of the changes.
3. Once accepted, these changes will become part of the document.

10.1.2 Current Security Definition

This section recapitulates the current status of secure development within the Zephyr RTOS. Currently, focus is put on functional security and code quality assurance, although additional security features are scoped.

The three major security measures currently implemented are:

- **Security Functionality** with a focus on cryptographic algorithms and protocols. Support for cryptographic hardware is scoped for future releases. The Zephyr runtime architecture

is a monolithic binary and removes the need for dynamic loaders, thereby reducing the exposed attack surface.

- **Quality Assurance** is driven by using a development process that requires all code to be reviewed before being committed to the common repository. Furthermore, the reuse of proven building blocks such as network stacks increases the overall quality level and guarantees stable APIs. Static code analyses provide additional quality checks.
- **Execution Protection** including thread separation, stack and memory protection is currently available in the upstream Zephyr RTOS starting with version 1.9.0 (stack protection). Memory protection and thread separation were added in version 1.10.0 for X86 and in version 1.11.0 for ARM and ARC.

These topics are discussed in more detail in the following subsections.

Security Functionality

The security functionality in Zephyr hinges mainly on the inclusion of cryptographic algorithms, and on its monolithic system design.

The cryptographic features are provided through PSA Crypto, with mbedTLS as the underlying implementation. Applications leverage PSA Crypto APIs, ensuring a standardized and secure approach to cryptographic operations. mbedTLS, as the implementation of PSA Crypto, supports a wide range of cryptographic algorithms, making it suitable for various application requirements.

APIs for vendor specific cryptographic IPs in both hardware and software are planned, including secure key storage in the form of secure access modules (SAMs), Trusted Platform Modules (TPMs), and Trusted Execution Environments (TEEs).

The security architecture is based on a monolithic design where the Zephyr kernel and all applications are compiled into a single static binary. System calls are implemented as function calls without requiring context switches. Static linking eliminates the potential for dynamically loading malicious code.

Additional protection features are available in later releases. Stack protection mechanisms are provided to protect against stack overruns. In addition, applications can take advantage of thread separation features to split the system into privileged and unprivileged execution environments. Memory protection features provide the capability to partition system resources (memory, peripheral address space, etc.) and assign resources to individual threads or groups of threads. Stack, thread execution level, and memory protection constraints are enforced at the time of context switch.

Quality Assurance

The Zephyr project uses an automated quality assurance process. The goal is to have a process including mandatory code reviews, feature and issue management/tracking, and static code analyses.

Code reviews are documented and enforced using a voting system before getting checked into the repository by the responsible subsystem's maintainer. The main goals of the code review are:

- Verifying correct functionality of the implementation
- Increasing the readability and maintainability of the contributed source code
- Ensuring appropriate usage of string and memory functions
- Validation of the user input
- Reviewing the security relevant code for potential issues

The current coding principles focus mostly on coding styles and conventions. Functional correctness is ensured by the build system and the experience of the reviewer. Especially for security relevant code, concrete and detailed guidelines need to be developed and aligned with the developers (see: *Secure Coding*).

Static code analyses are run on the Zephyr code tree on a regular basis, see *Static Code Analysis*.

Bug and issue tracking and management is performed using Github. The term "survivability" was coined to cover pro-active security tasks such as security issue categorization and management. A problem identified as vulnerability is managed within Github security advisories.

Issues determined by static analyses should have more stringent reviews before they are closed as non-issues (at least another person educated in security processes need to agree on non-issue before closing).

A security subcommittee has been formed to develop a security process in more detail; this document is part of that process.

Execution Protection

Execution protection is supported and can be categorized into the following tasks:

- **Memory separation:** Memory will be partitioned into regions and assigned attributes based on the owner of that region of memory. Threads will only have access to regions they control.
- **Stack protection:** Stack guards would provide mechanisms for detecting and trapping stack overruns. Individual threads should only have access to their own stacks.
- **Thread separation:** Individual threads should only have access to their own memory resources. As threads are scheduled, only memory resources owned by that thread will be accessible. Topics such as program flow protection and other measures for tamper resistance are currently not in scope.

System Level Security (Ecosystem, ...)

System level security encompasses a wide variety of categories. Some examples of these would be:

- Secure/trusted boot
- Over the air (OTA) updates
- External Communication
- Device authentication
- Access control of onboard resources
  - Flash updating
  - Secure storage
  - Peripherals
- Root of trust
- Reduction of attack surface

Some of these categories are interconnected and rely on multiple pieces to be in place to produce a full solution for the application.

10.1.3 Secure Development Process

The development of secure code shall adhere to certain criteria. These include coding guidelines and development processes that can be roughly separated into two categories related to software quality and related to software security. Furthermore, a system architecture document shall be created and kept up-to-date with future development.

System Architecture

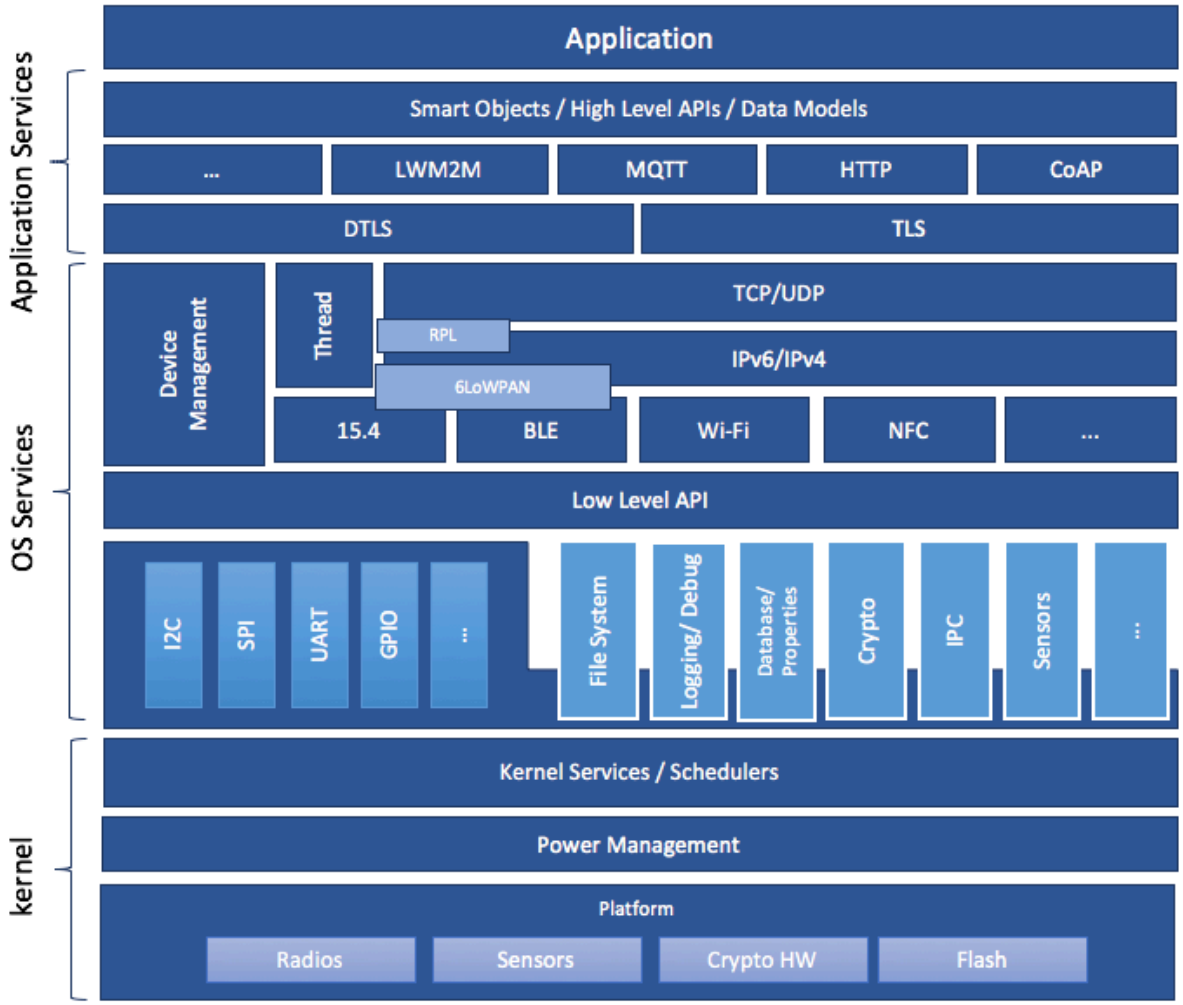

Fig. 2: Figure 2: Zephyr System Architecture

A high-level schematic of the Zephyr system architecture is given in Figure 2. It separates the architecture into an OS part (*kernel* + *OS Services*) and a user-specific part (*Application Services*). The OS part itself contains low-level, platform specific drivers and the generic implementation of I/O APIs, file systems, kernel-specific functions, and the cryptographic library.

A document describing the system architecture and design choices shall be created and kept up to date with future development. This document shall include the base architecture of the Zephyr OS and an overview of important submodules. For each of the modules, a dedicated architecture document shall be created and evaluated against the implementation. These documents shall serve as an entry point to new developers and as a basis for the security architecture. Please refer to the *Zephyr subsystem documentation* for detailed information.

Secure Coding

Designing an open software system such as Zephyr to be secure requires adhering to a defined set of design standards. These standards are included in the Zephyr Project documentation, specifically in its *Secure Coding* section. In [**?**], the following, widely accepted principles for protection mechanisms are defined to prevent security violations and limit their impact:

- **Open design** as a design principle incorporates the maxim that protection mechanisms cannot be kept secret on any system in widespread use. Instead of relying on secret, custom-tailored security measures, publicly accepted cryptographic algorithms and well established cryptographic libraries shall be used.
- **Economy of mechanism** specifies that the underlying design of a system shall be kept as simple and small as possible. In the context of the Zephyr project, this can be realized, e.g., by modular code [**?**] and abstracted APIs.
- **Complete mediation** requires that each access to every object and process needs to be authenticated first. Mechanisms to store access conditions shall be avoided if possible.
- **Fail-safe defaults** defines that access is restricted by default and permitted only in specific conditions defined by the system protection scheme, e.g., after successful authentication. Furthermore, default settings for services shall be chosen in a way to provide maximum security. This corresponds to the "Secure by Default" paradigm [**?**].
- **Separation of privilege** is the principle that two conditions or more need to be satisfied before access is granted. In the context of the Zephyr project, this could encompass split keys [**?**].
- **Least privilege** describes an access model in which each user, program and thread shall have the smallest possible subset of permissions in the system required to perform their task. This positive security model aims to minimize the attack surface of the system.
- **Least common mechanism** specifies that mechanisms common to more than one user or process shall not be shared if not strictly required. The example given in [**?**] is a function that should be implemented as a shared library executed by each user and not as a supervisor procedure shared by all users.
- **Psychological acceptability** requires that security features are easy to use by the developers in order to ensure its usage and the correctness of its application.

In addition to these general principles, the following points are specific to the development of a secure RTOS:

- **Complementary Security/Defense in Depth:** do not rely on a single threat mitigation approach. In case of the complementary security approach, parts of the threat mitigation are performed by the underlying platform. In case such mechanisms are not provided by the platform, or are not trusted, a defense in depth [**?**] paradigm shall be used.
- **Less commonly used services off by default**: to reduce the exposure of the system to potential attacks, features or services shall not be enabled by default if they are only rarely used (a threshold of 80% is given in [**?**]). For the Zephyr project, this can be realized using the configuration management. Each functionality and module shall be represented as a configuration option and needs to be explicitly enabled. Then, all features, protocols, and drivers not required for a particular use case can be disabled. The user shall be notified if low-level options and APIs are enabled but not used by the application.
- **Change management:** to guarantee a traceability of changes to the system, each change shall follow a specified process including a change request, impact analysis, ratification, implementation, and validation phase. In each stage, appropriate documentation shall be provided. All commits shall be related to a bug report or change request in the issue tracker. Commits without a valid reference shall be denied.

Based on these design principles and commonly accepted best practices, a secure development guide shall be developed, published, and implemented into the Zephyr development process.

Further details on this are given in the *Secure Design* section.

Quality Assurance

The quality assurance part encompasses the following criteria:

- **Adherence to the Coding Conventions** with respect to coding style, naming schemes of modules, functions, variables, and so forth. This increases the readability of the Zephyr code base and eases the code review. These coding conventions are enforced by automated scripts prior to check-in.
- **Adherence to Deployment Guidelines** is required to ensure consistent releases with a well-documented feature set and a trackable list of security issues.
- **Code Reviews** ensure the functional correctness of the code base and shall be performed on each proposed code change prior to check-in. Code reviews shall be performed by at least one independent reviewer other than the author(s) of the code change. These reviews shall be performed by the subsystem maintainers and developers on a functional level and are to be distinguished from security reviews as laid out in the *Secure Design* section. Refer to the *Project and Governance* documentation for more information.
- **Static Code Analysis** tools efficiently detect common coding mistakes in large code bases. All code shall be analyzed using an appropriate tool prior to merges into the main repository. This is not per individual commit, but is to be run on some interval on specific branches. It is mandatory to remove all findings or waive potential false-positives before each release. Waivers shall be documented centrally and in the form of a comment inside the source code itself. The documentation shall include the employed tool and its version, the date of the analysis, the branch and parent revision number, the reason for the waiver, the author of the respective code, and the approver(s) of the waiver. This shall as a minimum run on the main release branch and on the security branch. It shall be ensured that each release has zero issues with regard to static code analysis (including waivers). Refer to the *Project and Governance* documentation for more information.
- **Complexity Analyses** shall be performed as part of the development process and metrics such as cyclomatic complexity shall be evaluated. The main goal is to keep the code as simple as possible.
- **Automation:** the review process and checks for coding rule adherence are a mandatory part of the precommit checks. To ensure consistent application, they shall be automated as part of the precommit procedure. Prior to merging large pieces of code in from subsystems, in addition to review process and coding rule adherence, all static code analysis must have been run and issues resolved.

Release and Lifecycle Management

Lifecycle management contains several aspects:

- **Device management** encompasses the possibility to update the operating system and/or security related sub-systems of Zephyr enabled devices in the field.
- **Lifecycle management:** system stages shall be defined and documented along with the transactions between the stages in a system state diagram. For security reasons, this shall include locking of the device in case an attack has been detected, and a termination if the end of life is reached.
- **Release management** describes the process of defining the release cycle, documenting releases, and maintaining a record of known vulnerabilities and mitigations. Especially for certification purposes the integrity of the release needs to be ensured in a way that later manipulation (e.g., inserting of backdoors, etc.) can be easily detected.

- **Rights management and NDAs:** if required by the chosen certification, the confidentiality and integrity of the system needs to be ensured by an appropriate rights management (e.g., separate source code repository) and non-disclosure agreements between the relevant parties. In case of a repository shared between several parties, measures shall be taken that no malicious code is checked in.

These points shall be evaluated with respect to their impact on the development process employed for the Zephyr project.

10.1.4 Secure Design

In order to obtain a certifiable system or product, the security process needs to be clearly defined and its application needs to be monitored and driven. This process includes the development of security related modules in all of its stages and the management of reported security issues. Furthermore, threat models need to be created for currently known and future attack vectors, and their impact on the system needs to be investigated and mitigated. Please refer to the *Secure Coding* outlined in the Zephyr project documentation for detailed information.

The software security process includes:

- **Adherence to the Secure Development Coding** is mandatory to avoid that individual components breach the system security and to minimize the vulnerability of individual modules. While this can be partially achieved by automated tests, it is inevitable to investigate the correct implementation of security features such as countermeasures manually in security-critical modules.
- **Security Reviews** shall be performed by a security architect in preparation of each security-targeted release and each time a security-related module of the Zephyr project is changed. This process includes the validation of the effectiveness of implemented security measures, the adherence to the global security strategy and architecture, and the preparation of audits towards a security certification if required.
- **Security Issue Management** encompasses the evaluation of potential system vulnerabilities and their mitigation as described in *Security Issue Management*.

These criteria and tasks need to be integrated into the development process for secure software and shall be automated wherever possible. On system level, and for each security related module of the secure branch of Zephyr, a directly responsible security architect shall be defined to guide the secure development process.

Security Architecture

The general guidelines above shall be accompanied by an architectural security design on system- and module-level. The high level considerations include

- The identification of **security and compliance requirements**
- **Functional security** such as the use of cryptographic functions whenever applicable
- Design of **countermeasures** against known attack vectors
- Recording of security relevant **auditable events**
- Support for **Trusted Platform Modules (TPM)** and **Trusted Execution Environments (TEE)**
- Mechanisms to allow for **in-the-field updates** of devices using Zephyr
- Task scheduler and separation

The security architecture development is based on assets derived from the structural overview of the overall system architecture. Based on this, the individual steps include:

1. **Identification of assets** such as user data, authentication and encryption keys, key generation data (obtained from RNG), security relevant status information.
2. **Identification of threats** against the assets such as breaches of confidentiality, manipulation of user data, etc.
3. **Definition of requirements** regarding security and protection of the assets, e.g., countermeasures or memory protection schemes.

The security architecture shall be harmonized with the existing system architecture and implementation to determine potential deviations and mitigate existing weaknesses. Newly developed sub-modules that are integrated into the secure branch of the Zephyr project shall provide individual documents describing their security architecture. Additionally, their impact on the system level security shall be considered and documented.

Security Vulnerability Reporting

Please see *Security Vulnerability Reporting* for information on reporting security vulnerabilities.

Threat Modeling and Mitigation

The modeling of security threats against the Zephyr RTOS is required for the development of an accurate security architecture and for most certification schemes. The first step of this process is the definition of assets to be protected by the system. The next step then models how these assets are protected by the system and which threats against them are present. After a threat has been identified, a corresponding threat model is created. This model contains the asset and system vulnerabilities, as well as the description of the potential exploits of these vulnerabilities. Additionally, the impact on the asset, the module it resides in, and the overall system is to be estimated. This threat model is then considered in the module and system security architecture and appropriate countermeasures are defined to mitigate the threat or limit the impact of exploits.

In short, the threat modeling process can be separated into these steps (adapted from **[?]**):

1. Definition of assets
2. Application decomposition and creation of appropriate data flow diagrams (DFDs)
3. Threat identification and categorization using the **[?]** and **[?]** approaches
4. Determination of countermeasures and other mitigation approaches

This procedure shall be carried out during the design phase of modules and before major changes of the module or system architecture. Additionally, new models shall be created, or existing ones shall be updated whenever new vulnerabilities or exploits are discovered. During security reviews, the threat models and the mitigation techniques shall be evaluated by the responsible security architect.

From these threat models and mitigation techniques tests shall be derived that prove the effectiveness of the countermeasures. These tests shall be integrated into the continuous integration workflow to ensure that the security is not impaired by regressions.

Vulnerability Analyses

In order to find weak spots in the software implementation, vulnerability analyses (VA) shall be performed. Of special interest are investigations on cryptographic algorithms, critical OS tasks, and connectivity protocols.

On a pure software level, this encompasses

- **Penetration testing** of the RTOS on a particular hardware platform, which involves testing the respective Zephyr OS configuration and hardware as one system.

- **Side channel attacks** (timing invariance, power invariance, etc.) should be considered. For instance, ensuring **timing invariance** of the cryptographic algorithms and modules is required to reduce the attack surface. This applies to both the software implementations and when using cryptographic hardware.
- **Fuzzing tests** shall be performed on both exposed APIs and protocols.

The list given above serves primarily illustration purposes. For each module and for the complete Zephyr system (in general on a particular hardware platform), a suitable VA plan shall be created and executed. The findings of these analyses shall be considered in the security issue management process, and learnings shall be formulated as guidelines and incorporated into the secure coding guide.

If possible (as in case of fuzzing analyses), these tests shall be integrated into the continuous integration process.

10.1.5 Security Certification

One goal of creating a secure branch of the Zephyr RTOS is to create a certifiable system or certifiable submodules thereof. The certification scope and scheme are yet to be decided. However, many certifications such as Common Criteria [**?**] require evidence that the evaluation claims are indeed fulfilled, so a general certification process is outlined in the following. Based on the final choices for the certification scheme and evaluation level, this process needs to be refined.

Generic Certification Process

In general, the steps towards a certification or precertification (compare [**?**]) are:

1. The **definition of assets** to be protected within the Zephyr RTOS. Potential candidates are confidential information such as cryptographic keys, user data such as communication logs, and potentially IP of the vendor or manufacturer.
2. Developing a **threat model** and **security architecture** to protect the assets against exploits of vulnerabilities of the system. As a complete threat model includes the overall product including the hardware platform, this might be realized by a split model containing a precertified secure branch of Zephyr which the vendor could use to certify their Zephyr-enabled product.
3. Formulating an **evaluation target** that includes the **certification claims** on the security of the assets to be evaluated and certified, as well as assumptions on the operating conditions.
4. Providing **proof** that the claims are fulfilled. This includes consistent documentation of the security development process, etc.

These steps are partially covered in previous sections as well. In contrast to these sections, the certification process only requires to consider those components that shall be covered by the certification. The security architecture, for example, considers assets on system level and might include items not relevant for the certification.

Certification Options

For the security certification as such, the following options can be pursued:

1. **Abstract precertification of Zephyr as a pure software system:** this option requires assumptions on the underlying hardware platform and the final application running on top of Zephyr. If these assumptions are met by the hardware and the application, a full certification can be more easily achieved. This option is the most flexible approach but puts the largest burden on the product vendor.

2. **Certification of Zephyr on specific hardware platform without a specific application in mind:** this scenario describes the enablement of a secure platform running the Zephyr RTOS. The hardware manufacturer certifies the platform under defined assumptions on the application. If these are met, the final product can be certified with little effort.
3. **Certification of an actual product:** in this case, a full product including a specific hardware, the Zephyr RTOS, and an application is certified.

In all three cases, the certification scheme (e.g., FIPS 140-2 [**?**] or Common Criteria [**?**]), the scope of the certification (main-stream Zephyr, security branch, or certain modules), and the certification/assurance level need to be determined.

In case of partial certifications (options 1 and 2), assumptions on hardware and/or software are required for certifications. These can include [**?**]

- **Appropriate physical security** of the hardware platform and its environment.
- **Sufficient protection of storage and timing channels** on the hardware platform itself and all connected devices. (No mentioning of remote connections.)
- Only **trusted/assured applications** running on the device
- The device and its software stack is configured and operated by **properly trained and trusted individuals** with no malicious intent.

These assumptions shall be part of the security claim and evaluation target documents.

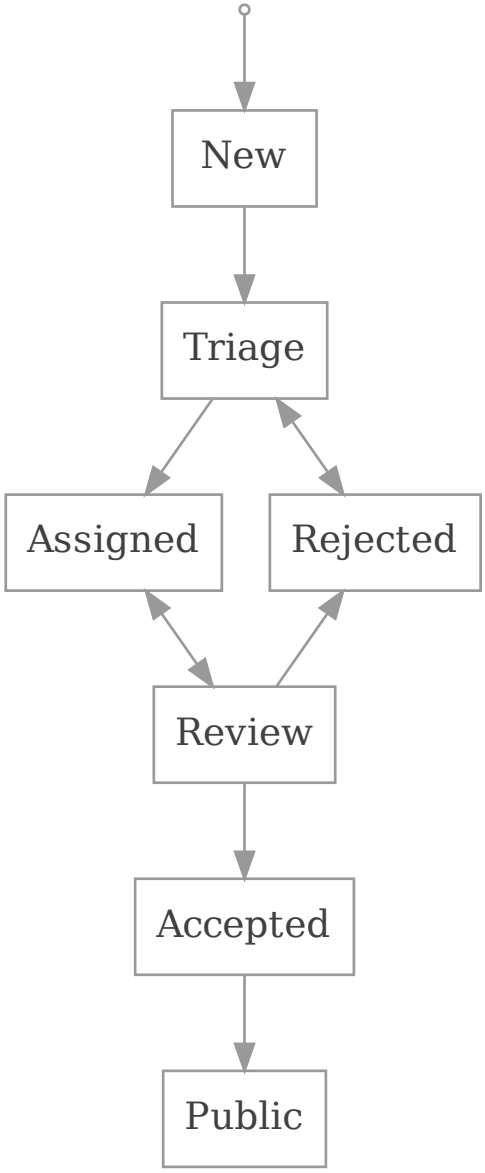
10.2 Security Vulnerability Reporting

10.2.1 Introduction

Vulnerabilities to the Zephyr project may be reported via email to the vulnerabilities@zephyrproject.org mailing list. These reports will be acknowledged and analyzed by the security response team within 1 week. Each vulnerability will be entered into the Zephyr Project security advisory GitHub. The original submitter will be granted permission to view the issues that they have reported.

10.2.2 Security Issue Management

Issues within this bug tracking system will transition through a number of states according to this diagram:



- New: This state represents new reports that have been entered directly by a reporter. When entered by the response team in response to an email, the issue shall be transitioned directly to Triage.
- Triage: This issue is awaiting Triage by the response team. The response team will analyze the issue, determine a responsible entity, assign it to that individual, and move the issue to the Assigned state. Part of triage will be to set the issue's priority.
- Assigned: The issue has been assigned, and is awaiting a fix by the assignee.
- Review: Once there is a Zephyr pull request for the issue, the PR link will be added to a comment in the issue, and the issue moved to the Review state.
- Accepted: Indicates that this issue has been merged into the appropriate branch within Zephyr.
- Public: The embargo period has ended. The issue will be made publicly visible, the associ-

ated CVE updated, and the vulnerabilities page in the docs updated to include the detailed information.

The security advisories created are kept private, due to the sensitive nature of security reports. The issues are only visible to certain parties:

- Members of the PSIRT mailing list
- the reporter
- others, as proposed and ratified by the Zephyr Security Subcommittee. In the general case, this will include:
  - The code owner responsible for the fix.
  - The Zephyr release owners for the relevant releases affected by this vulnerability.

The Zephyr Security Subcommittee shall review the reported vulnerabilities during any meeting with more than three people in attendance. During this review, they shall determine if new issues need to be embargoed.

The guideline for embargo will be based on: 1. Severity of the issue, and 2. Exploitability of the issue. Issues that the subcommittee decides do not need an embargo will be reproduced in the regular Zephyr project bug tracking system.

Security sensitive vulnerabilities shall be made public after an embargo period of at most 90 days. The intent is to allow 30 days within the Zephyr project to fix the issues, and 60 days for external parties building products using Zephyr to be able to apply and distribute these fixes.

Fixes to the code shall be made through pull requests PR in the Zephyr project github. Developers shall make an attempt to not reveal the sensitive nature of what is being fixed, and shall not refer to CVE numbers that have been assigned to the issue. The developer instead should merely describe what has been fixed.

The security subcommittee will maintain information mapping embargoed CVEs to these PRs (this information is within the Github security advisories), and produce regular reports of the state of security issues.

Each issue that is considered a security vulnerability shall be assigned a CVE number. As fixes are created, it may be necessary to allocate additional CVE numbers, or to retire numbers that were assigned.

10.2.3 Vulnerability Notification

Each Zephyr release shall contain a report of CVEs that were fixed in that release. Because of the sensitive nature of these vulnerabilities, the release shall merely include a list of CVEs that have been fixed. After the embargo period, the vulnerabilities page shall be updated to include additional details of these vulnerabilities. The vulnerability page shall give credit to the reporter(s) unless a reporter specifically requests anonymity.

The Zephyr project shall maintain a vulnerability-alerts mailing list. This list will be seeded initially with a contact from each project member. Additional parties can request to join this list by filling out the form at the Vulnerability Registry. These parties will be vetted by the project director to determine that they have a legitimate interest in knowing about security vulnerabilities during the embargo period.

Periodically, the security subcommittee will send information to this mailing list describing known embargoed issues, and their backport status within the project. This information is intended to allow them to determine if they need to backport these changes to any internal trees.

When issues have been triaged, this list will be informed of:

- The Zephyr Project security advisory link (GitHub).
- The CVE number assigned.

- The subsystem involved.
- The severity of the issue.

After acceptance of a PR fixing the issue (merged), in addition to the above, the list will be informed of:

- The association between the CVE number and the PR fixing it.
- Backport plans within the Zephyr project.

10.2.4 Backporting of Security Vulnerabilities

Each security issue fixed within zephyr shall be backported to the following releases:

- The current Long Term Stable (LTS) release.
- The most recent two releases.

The developer of the fix shall be responsible for any necessary backports, and apply them to any of the above listed release branches, unless the fix does not apply (the vulnerability was introduced after this release was made). All recommendations for *vulnerability fixes* apply for backport pull requests (and associated issues). Additionally, it is recommended that the developer privately informs the responsible release manager that the backport pull request and issue are addressing a vulnerability.

Backports will be tracked on the security advisory.

10.2.5 Need to Know

Due to the sensitive nature of security vulnerabilities, it is important to share details and fixes only with those parties that have a need to know. The following parties will need to know details about security vulnerabilities before the embargo period ends:

- Maintainers will have access to all information within their domain area only.
- The current release manager, and the release manager for historical releases affected by the vulnerability (see backporting above).
- The Project Security Incident Response (PSIRT) team will have full access to information. The PSIRT is made up of representatives from platinum members, and volunteers who do work on triage from other members.
- As needed, release managers and maintainers may be invited to attend additional security meetings to discuss vulnerabilities.

10.3 Secure Coding

Traditionally, microcontroller-based systems have not placed much emphasis on security. They have usually been thought of as isolated, disconnected from the world, and not very vulnerable, just because of the difficulty in accessing them. The Internet of Things has changed this. Now, code running on small microcontrollers often has access to the internet, or at least to other devices (that may themselves have vulnerabilities). Given the volume they are often deployed at, uncontrolled access can be devastating[1].

This document describes the requirements and process for ensuring security is addressed within the Zephyr project. All code submitted should comply with these principles.

Much of this document comes from [**?**].

[1] An attack resulted in a significant portion of DNS infrastructure being taken down.

10.3.1 Introduction and Scope

This document covers guidelines for the Zephyr Project, from a security perspective. Many of the ideas contained herein are captured from other open source efforts.

We begin with an overview of secure design as it relates to Zephyr. This is followed by a section on *Secure development knowledge*, which gives basic requirements that a developer working on the project will need to have. This section gives references to other security documents, and full details of how to write secure software are beyond the scope of this document. This section also describes vulnerability knowledge that at least one of the primary developers should have. This knowledge will be necessary for the review process described below this.

Following this is a description of the review process used to incorporate changes into the Zephyr codebase. This is followed by documentation about how security-sensitive issues are handled by the project.

Finally, the document covers how changes are to be made to this document.

10.3.2 Secure Coding

Designing an open software system such as Zephyr to be secure requires adhering to a defined set of design standards. In [**?**], the following, widely accepted principles for protection mechanisms are defined to help prevent security violations and limit their impact:

- **Open design** as a design guideline incorporates the maxim that protection mechanisms cannot be kept secret on any system in widespread use. Instead of relying on secret, custom-tailored security measures, publicly accepted cryptographic algorithms and well established cryptographic libraries shall be used.
- **Economy of mechanism** specifies that the underlying design of a system shall be kept as simple and small as possible. In the context of the Zephyr project, this can be realized, e.g., by modular code [**?**] and abstracted APIs.
- **Complete mediation** requires that each access to every object and process needs to be authenticated first. Mechanisms to store access conditions shall be avoided if possible.
- **Fail-safe defaults** defines that access is restricted by default and permitted only in specific conditions defined by the system protection scheme, e.g., after successful authentication. Furthermore, default settings for services shall be chosen in a way to provide maximum security. This corresponds to the “Secure by Default” paradigm [**?**].
- **Separation of privilege** is the principle that two conditions or more need to be satisfied before access is granted. In the context of the Zephyr project, this could encompass split keys [**?**].
- **Least privilege** describes an access model in which each user, program, and thread, shall have the smallest possible subset of permissions in the system required to perform their task. This positive security model aims to minimize the attack surface of the system.
- **Least common mechanism** specifies that mechanisms common to more than one user or process shall not be shared if not strictly required. The example given in [**?**] is a function that should be implemented as a shared library executed by each user and not as a supervisor procedure shared by all users.
- **Psychological acceptability** requires that security features are easy to use by the developers in order to ensure their usage and the correctness of its application.

In addition to these general principles, the following points are specific to the development of a secure RTOS:

- **Complementary Security/Defense in Depth**: do not rely on a single threat mitigation approach. In case of the complementary security approach, parts of the threat mitigation are

performed by the underlying platform. In case such mechanisms are not provided by the platform, or are not trusted, a defense in depth [**?**] paradigm shall be used.

- **Less commonly used services off by default**: to reduce the exposure of the system to potential attacks, features or services shall not be enabled by default if they are only rarely used (a threshold of 80% is given in [**?**]). For the Zephyr project, this can be realized using the configuration management. Each functionality and module shall be represented as a configuration option and needs to be explicitly enabled. Then, all features, protocols, and drivers not required for a particular use case can be disabled. The user shall be notified if low-level options and APIs are enabled but not used by the application.
- **Change management**: to guarantee a traceability of changes to the system, each change shall follow a specified process including a change request, impact analysis, ratification, implementation, and validation phase. In each stage, appropriate documentation shall be provided. All commits shall be related to a bug report or change request in the issue tracker. Commits without a valid reference shall be denied.

10.3.3 Secure development knowledge

Secure designer

The Zephyr project must have at least one primary developer who knows how to design secure software.

This requires understanding the following design principles, including the 8 principles from [**?**]:

- economy of mechanism (keep the design as simple and small as practical, e.g., by adopting sweeping simplifications)
- fail-safe defaults (access decisions shall deny by default, and projects' installation shall be secure by default)
- complete mediation (every access that might be limited must be checked for authority and be non-bypassable)
- open design (security mechanisms should not depend on attacker ignorance of its design, but instead on more easily protected and changed information like keys and passwords)
- separation of privilege (ideally, access to important objects should depend on more than one condition, so that defeating one protection system won't enable complete access. For example, multi-factor authentication, such as requiring both a password and a hardware token, is stronger than single-factor authentication)
- least privilege (processes should operate with the least privilege necessary)
- least common mechanism (the design should minimize the mechanisms common to more than one user and depended on by all users, e.g., directories for temporary files)
- psychological acceptability (the human interface must be designed for ease of use - designing for "least astonishment" can help)
- limited attack surface (the set of the different points where an attacker can try to enter or extract data)
- input validation with whitelists (inputs should typically be checked to determine if they are valid before they are accepted; this validation should use whitelists (which only accept known-good values), not blacklists (which attempt to list known-bad values)).

Vulnerability Knowledge

A "primary developer" in a project is anyone who is familiar with the project's code base, is comfortable making changes to it, and is acknowledged as such by most other participants in the

project. A primary developer would typically make a number of contributions over the past year (via code, documentation, or answering questions). Developers would typically be considered primary developers if they initiated the project (and have not left the project more than three years ago), have the option of receiving information on a private vulnerability reporting channel (if there is one), can accept commits on behalf of the project, or perform final releases of the project software. If there is only one developer, that individual is the primary developer.

At least one of the primary developers **must** know of common kinds of errors that lead to vulnerabilities in this kind of software, as well as at least one method to counter or mitigate each of them.

Examples (depending on the type of software) include SQL injection, OS injection, classic buffer overflow, cross-site scripting, missing authentication, and missing authorization. See the CWE/SANS top 25 or OWASP Top 10 for commonly used lists.

A free class from the nonprofit OpenSecurityTraining2 for C/C++ developers is available at OST2_1001. It teaches how to prevent, detect, and mitigate linear stack/heap buffer overflows, non-linear out of bound writes, integer overflows, and other integer issues. The follow-on class, OST2_1002, covers uninitialized data access, race conditions, use-after-free, type confusion, and information disclosure vulnerabilities.

Zephyr Security Subcommittee

There shall be a "Zephyr Security Subcommittee", responsible for enforcing this guideline, monitoring reviews, and improving these guidelines.

This team will be established according to the Zephyr Project charter.

10.3.4 Code Review

The Zephyr project shall use a code review system that all changes are required to go through. Each change shall be reviewed by at least one primary developer that is not the author of the change. This developer shall determine if this change affects the security of the system (based on their general understanding of security), and if so, shall request the developer with vulnerability knowledge, or the secure designer to also review the code. Any of these individuals shall have the ability to block the change from being merged into the mainline code until the security issues have been addressed.

10.3.5 Issues and Bug Tracking

The Zephyr project shall have an issue tracking system (such as GitHub) that can be used to record and track defects that are found in the system.

Because security issues are often sensitive, this issue tracking system shall have a field to indicate a security issue. Setting this field shall result in the issue only being visible to the Zephyr Security Subcommittee. In addition, there shall be a field to allow the Zephyr Security Subcommittee to add additional users that will have visibility to a given issue.

This embargo, or limited visibility, shall only be for a fixed duration, with a default being a project-decided value. However, because security considerations are often external to the Zephyr project itself, it may be necessary to increase this embargo time. The time necessary shall be clearly annotated in the issue itself.

The list of issues shall be reviewed at least once a month by the Zephyr Security Subcommittee. This review should focus on tracking the fixes, determining if any external parties need to be notified or involved, and determining when to lift the embargo on the issue. The embargo should **not** be lifted via an automated means, but the review team should avoid unnecessary delay in lifting issues that have been resolved.

10.3.6 Modifications to This Document

Changes to this document shall be reviewed by the Zephyr Security Subcommittee, and approved by consensus.

10.4 Sensor Device Threat Model

This document describes a threat model for an IoT sensor device. Spelling out a threat model helps direct development effort, and can be used to help prioritize these efforts as well.

This device contains a sensor of some type (for example temperature, or a pressure in a pipe), which sends this data to an SoC running a microcontroller. This microcontroller connects to a cloud service, and relays this sensor data to this service. The cloud service is also able to send configuration data to the device, as well as software update images. A general diagram can be seen in Figure 1:

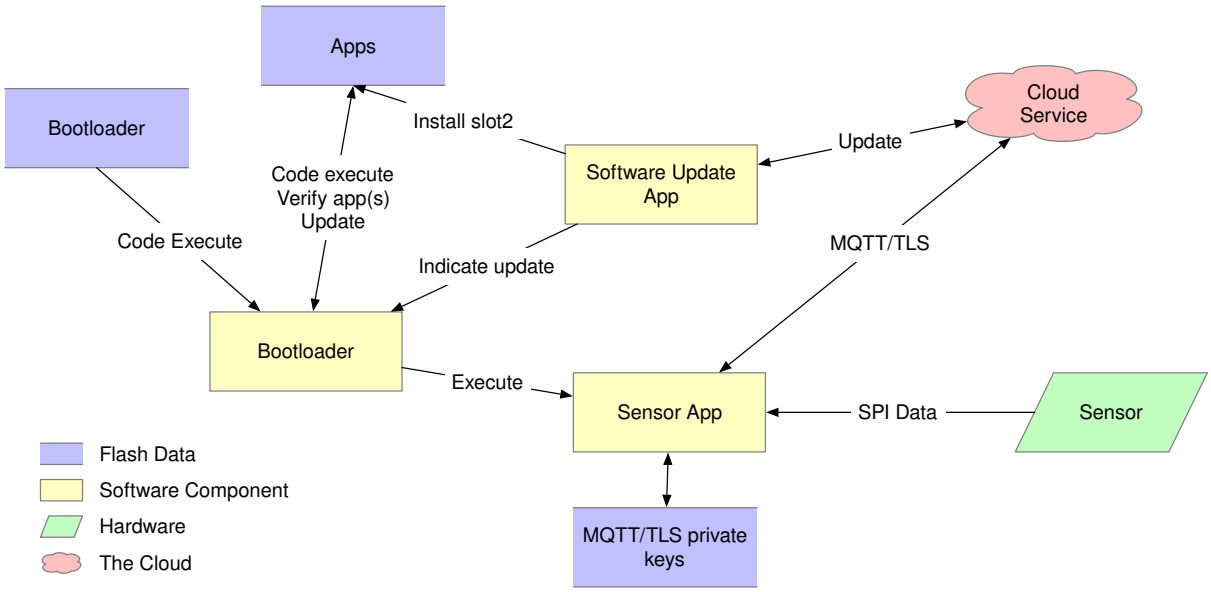


Fig. 3: Figure 1. Sensor General Diagram

In this sensor device, the sensor connects with the SoC via an SPI bus, and the SoC has a network interface that it uses to communicate with the cloud service. The particulars of these interfaces can impact the threat model in unexpected ways, and variants on this will need to be considered (for example, using a separate network interface SoC connected via some type of bus).

This model also focuses on communicating via the MQTT-over-TLS protocol, as this seems to be in wide use[1].

10.4.1 Assets

One aspect of the threat model to consider are assets involved in the operation of the device. The following list enumerates the assets included in this model:

1. **The bootloader**. This is a small code/data image contained in on-device flash that is the first code to run. In order to establish a root of trust, this image must be immutable. This

[1] See https://www.slideshare.net/kartben/iot-developer-survey-2018. As of this writing, the three major cloud IoT service providers, AWS IoT, Google Cloud IoT, and Microsoft Azure IoT all provide MQTT over TLS. Some feedback has suggested that some find difficulty with UDP protocols and routing issues on various networks.

model assumes that the SoC provides a mechanism to protect a region of the flash from future writes, and that this will be done after this image is programmed into the device, early in production [th-imboot].

2. **The application firmware image**. This asset consists of the remainder of the firmware run by the microcontroller. The distinction is made because this part of the image will need to be updated periodically as security vulnerabilities are discovered. Requirements for updates to this image are:

   a. The image shall only be replaced with an authorized image [th-authrepl].

   b. When an authorized replacement image is available, the update shall be done in a timely manner [th-timely-update].

   c. The image update shall be seen as atomic, meaning that when the image is run, the flash shall contain either the update image in its entirety, or the old image in its entirety [th-atomic-update].

3. **Root certificate list**. In order to authenticate the cloud service (server), the IoT device must have a list of root certificates that are allowed to sign the certificate on the server. For cloud-provider based services, this list will generally be provided by the service provider. Because the root certificates can expire, and possibly be revoked, this list will need to be periodically updated [th-root-certs], [th-root-check].

4. **Client secrets**. To authenticate the client to the service, the client must possess some kind of secret. This is generally a private key, usually either an RSA key or an EC private key. When establishing communication with the server, the device will use this secret either as part of the TLS establishment, or to sign a message used in the communication.

   This secret is generally generated by the service provider, or by software running elsewhere, and must be securely installed on the device. Policy may dictate that this secret be replaced periodically, which will require a way to update the client secret. Typically, the service will allow two or three active keys to allow this update to proceed while the old key is used.

   These secrets must be protected from read, and the smallest amount of code necessary shall have access to them. [th-secret-storage]

5. **Current date/time**. TLS certificate verification requires knowledge of the current date and time in order to determine if the current time falls within the certificate's current validity time. Also, token based client authentication will generally require the client to sign a message containing a time window that the token is valid. Certificate validation requires the device's notion of date and time to be accurate within a day or so. Token generation generally requires the time to be accurate within 5-10 minutes.

   It may be possible to approximate secure time by querying an external time server. Secure NTP is possibly beyond the capabilities of an IoT device. The main risks of having incorrect time are denial of service (the device rejects valid certificates), and the generation of tokens with invalid times. It could be possible to trick the device into generating tokens that are valid in the future, but the attacker would also have to spoof the server's certificate to be able to intercept this. [th-time]

6. **Sensor data**. The data received from the sensor itself, and delivered to the service shall be delivered without modification or tampering.

7. **Device configuration**. Various configuration data, such as the hostname of the service to connect to, the address of a time server, frequency and parameters of when sensor data is sent to the service, and other need to be kept by the device. This configuration data will need to be updated periodically as the configuration changes. Updates should be allowed only from authorized parties. [th-conf]

8. **Logs**. In order to assist with analysis of security issues, the device shall log information about security-pertinent events. IoT devices generally have limited storage, and as such, these logs need to be carefully selected. It may also be possible to send these log events

to the cloud service where they can be stored in a more resource-available environment. Types of events that should be logged include:

a. **Firmware image updates**. The system should log the download of new images, and when an image is successfully updated.

b. **Client secret changes**. Changes and new client secrets should be logged.

c. **Changes to the device configuration**.

[th-logs]

10.4.2 Communication

In addition to assets, the threat model also considers the locations where data or assets are communicated between entities of the system.

1. **Flash contents**. The flash device contains several regions. The contents of flash can be modified programmatically by the SoC's CPU.

   a. **The bootloader**. As described in the Assets section, the bootloader is a small section of the flash device containing the code initially run. This section shall be written early in the lifecycle of the device, and the flash device then configured to permanently disallow modification of this section. This configuration should also prevent modification via external interfaces, such as JTAG or SWD debuggers.

      The bootloader is responsible for verifying the signature of the application image as well as updating the application image from the update image when an update is needed.

      The bootloader shall verify the signature of the update image before installing it.

      The bootloader shall only accept an update image with a newer version number than the current image.

   b. **The application image**. The application image contains the code executed during normal operation of the device. Before running this image, the bootloader shall verify a digital signature of the image, to avoid running an image that has been tampered with. The flash/system shall be configured such that after the bootloader has completed, the CPU will be unable to write to the application image.

   c. **The update image**. This is an area of flash that holds a new version of the application image. This image will be downloaded and stored by the application during normal operation. When this has completed, the application can trigger a reboot, and the bootloader can install the new image.

   d. **Secret storage**. An area of the flash will be used to store client secrets. This area is written and read by a subset of the application image. The application shall be configured to protect this area from both reads and writes by code that does not need to have access to it, giving consideration to possible exploits found within a majority of the application code. Revealing the contents of the secrets would allow the attacker to spoof this device.

      Initial secrets shall be placed in the device during a provisioning activity, distinct from normal operation of the device. Later updates can be made under the direction of communication received over a secured channel to the service.

   e. **Configuration storage**. There shall be an area to store other configuration information. On resource-constrained devices, it is allowed for this to be stored in the same region as the secret storage, however, this adds additional code that has access to the secret storage area, and as such, more code that must be scrutinized.

   f. **Log storage**. The device may have an area of flash where log events can be written.

2. **Sensor/Actuator interface**. In this design, the sensor or actuator communicates with the SoC via a bus, such as SPI. The hardware design shall be made to make intercepting this bus difficult for an attack. Required techniques depend on the sensitivity and use of the sensor data, and can range from having the sensor mounted on the same PCB as the MCU to epoxy potting the entire device.

3. **Communication with cloud service**. Communication between the device, and the cloud service will be done over the general internet. As such, it shall be assumed that an attacker can arbitrarily intercept this channel and, for example, return spoofed DNS results or attempt man-in-the-middle attacks against communication with cloud services.

   The device shall use TLS for all communication with the cloud service [th-all-tls]. The TLS stack shall be configured to use only cipher suites that are generally considered secure[2], including forward secrecy. The communication shall be secured by the following:

   a. **Cipher suite selection**. The device shall only allow communication with generally agreed secure cipher suites [th-tls-ciphers].

   b. **Server certificate verification**. The server presented by the server shall be verified [th-root-check].

      i. **Naming**. The certificate shall name the host and service the cloud service server is providing. RFC6125 describes best practices for this. It is permissible for the device to require the certificate to be more restrictive than as described in this RFC, provided the service can use a certificate that can comply.

      ii. **Path validation**. The device shall verify that the certificate chain has a valid signature path from a root certificate contained within the device, to the certificate presented by the service. RFC4158 describes this is general. The device is permitted to require a more restricted path, provided the server certificate used complies with this restriction.

      iii. **Validity period**. The validity period of all presented certificates shall be checked against the device's best notion of the current time.

   c. **Client authentication**. The client shall authenticate itself to the service using a secret known only to that particular device. There are several options, and the technique used is generally mandated by the particular service provider being used [th-tls-client-auth].

      i. **TLS client certificates**. The TLS protocol allows the client to present a certificate, and assert its knowledge of the secret described by that certificate. Generally, these certificates will be stored within the service provider. These certificates can be self-signed, or signed by a CA. Since the service provider maintains a list of valid certificates (mapping them to a device identity), having these certificates signed by a CA does not add any additional security, but may be useful in the management of these certificates.

      ii. **Token-based authentication**. It is also possible for the client to authenticate itself using the *password* field of the MQTT CONNECT packet. However, the secret itself must not be transmitted in this packet. Instead, a token-based protocol, such as RFC7519's JSON Web Token (JWT) can be used. These tokens will generally have a small validity period (e.g. 1 hour), to prevent them from being reused if they are intercepted. The token shall not be sent until the device has verified the identity of the server.

   d. **Random/Entropy source**. Cryptographic communication requires the generation of secure pseudorandom numbers. The device shall use a modern, accepted cryptographic random-bit generator to generate these random numbers. It shall use either a Non-Deterministic Random Bit Generator (True RBG) implemented in hardware within the SoC, or a Deterministic Random Bit Generator (Pseudo RBG) seeded by

[2] As new exploits are discovered, what is considered secure can change. Organizations such as https://www.ssllabs.com/ provide information on current ideas of how TLS must be configured to be secure.

an entropy source within the SoC. Please see NIST SP 800-90A for information on approved RBGs and NIST SP 800-90B for information on testing a device's entropy source [th-entropy].

4. **Communication with the time service**. Ideally, the device shall contain hardware that maintains a secure time. However, most SoCs in use do not have support for this, and it will be necessary to consult an external time service. RFC4330 and referenced RFCs describe the Simple Network Time Protocol that can be used to query the current time from a network time server.
5. **Device lifecycle**. An IoT device will have a lifecycle from production to destruction and disposal of the device. Aspects of this lifecycle that impact security include initial provisioning, normal operation, re-provisioning, and destruction.
   a. **Initial provisioning**. During the initial provisioning stage, it is necessary to program the bootloader, an initial application image, a device secret, and initial configuration data [th-initial-provision]. In addition, the bootloader flash protection shall be installed. Of this information, only the device secret needs to differ per device. This secret shall be securely maintained, and destroyed in all locations outside of the device once it has been programmed [th-initial-secret].
   b. **Normal operation**. Normal operation includes the behavior described by the rest of this document.
   c. **Re-provisioning**. Sometimes it is necessary to re-provision a device, such as for a different application. One way to do this is to keep the same device secret, and replace the configuration data, as well as the cloud service data associated with the device. It is also possible to program a new device secret, but if this is done it shall be done securely, and the new secret destroyed externally once programmed into the device [th-reprovision].
   d. **Destruction**. To prevent the device secret from being used to spoof the device, upon decommissioning, the secret for a particular device shall be rendered ineffective [th-destruction]. Possibilities include:
      i. Hardware destruction of the device.
      ii. Securely wiping the flash area containing the secret[3].
      iii. Removing the device identity and certificate from the service.

10.4.3 Other Considerations

In addition to the above, network connected devices generally will need a way to configure them to connect to the network environment they are placed in. There are numerous ways of doing this, and it is important for these configuration methods to not circumvent the security requirements described above.

10.4.4 Threats

10.4.5 Notes

10.5 Hardening Tool

Before launching a product, it's crucial to ensure that your software is as secure as possible. This process, known as "hardening", involves strengthening the security of a system to protect it from potential threats and vulnerabilities.

[3] Note that merely erasing this flash area is unlikely to be sufficient.

At a high-level, hardening a Zephyr application can be seen as a two-fold process:

1. Disabling features and compilation flags that might lead to security vulnerabilities (ex. making sure that no "experimental" features are being used, disabling features typically used for debugging purposes such as assertions, shell, etc.).
2. Enabling optional features that can lead to improve security (ex. stack sentinel, hardware stack protection, etc.). Some of these features might be hardware-dependent.

To simplify this process, Zephyr offers a **hardening tool** designed to analyze an application's configuration against a set of hardening preferences defined by the **Security Working Group**. The tool looks at the KConfig options in the build target and provides tailored suggestions and recommendations to adjust security-related options.

10.5.1 Usage

Using west:

```
west build -b reel_board samples/hello_world
west build -t hardenconfig
```

Using CMake and ninja:

```
# Use cmake to configure a Ninja-based buildsystem:
cmake -Bbuild -GNinja -DBOARD=reel_board samples/hello_world

# Now run the build tool on the generated build system:
ninja -Cbuild hardenconfig
```

The output should be similar to the table below. For each configuration option set to a value that could lead to a security vulnerability, the table will propose a recommended value that should be used instead.

```
               name                          |   current   |  recommended   ||    check result
=============================================================================================================
CONFIG_BOOT_BANNER                           |      y      |       n        ||       FAIL
CONFIG_BUILD_OUTPUT_STRIPPED                 |      n      |       y        ||       FAIL
CONFIG_FAULT_DUMP                            |      2      |       0        ||       FAIL
CONFIG_HW_STACK_PROTECTION                   |      n      |       y        ||       FAIL
CONFIG_MPU_STACK_GUARD                       |      n      |       y        ||       FAIL
CONFIG_OVERRIDE_FRAME_POINTER_DEFAULT        |      n      |       y        ||       FAIL

```

10.6 Vulnerabilities

This page collects all of the vulnerabilities that are discovered and fixed in each release. It will also often have more details than is available in the releases. Some vulnerabilities are deemed to be sensitive, and will not be publicly discussed until there is sufficient time to fix them. Because the release notes are locked to a version, the information here can be updated after the embargo is lifted.

10.6.1 CVE-2017

CVE-2017-14199

Buffer overflow in `getaddrinfo()`.

- CVE-2017-14199
- Zephyr project bug tracker ZEPSEC-12
- PR6158 fix for 1.11.0

CVE-2017-14201

The shell DNS command can cause unpredictable results due to misuse of stack variables.

Use After Free vulnerability in the Zephyr shell allows a serial or telnet connected user to cause denial of service, and possibly remote code execution.

This has been fixed in release v1.14.0.

- CVE-2017-14201
- Zephyr project bug tracker ZEPSEC-17
- PR13260 fix for v1.14.0

CVE-2017-14202

The shell implementation does not protect against buffer overruns resulting in unpredictable behavior.

Improper Restriction of Operations within the Bounds of a Memory Buffer vulnerability in the shell component of Zephyr allows a serial or telnet connected user to cause a crash, possibly with arbitrary code execution.

This has been fixed in release v1.14.0.

- CVE-2017-14202
- Zephyr project bug tracker ZEPSEC-18
- PR13048 fix for v1.14.0

10.6.2 CVE-2019

CVE-2019-9506

The Bluetooth BR/EDR specification up to and including version 5.1 permits sufficiently low encryption key length and does not prevent an attacker from influencing the key length negotiation. This allows practical brute-force attacks (aka “KNOB”) that can decrypt traffic and inject arbitrary ciphertext without the victim noticing.

- CVE-2019-9506
- Zephyr project bug tracker ZEPSEC-20
- PR18702 fix for v1.14.0
- PR18659 fix for v2.0.0

10.6.3 CVE-2020

CVE-2020-10019

Buffer Overflow vulnerability in USB DFU of zephyr allows a USB connected host to cause possible remote code execution.

This has been fixed in releases v1.14.2, v2.2.0, and v2.1.1.

- CVE-2020-10019
- Zephyr project bug tracker ZEPSEC-25
- PR23460 fix for 1.14.x
- PR23457 fix for 2.1.x
- PR23190 fix in 2.2.0

CVE-2020-10021

Out-of-bounds write in USB Mass Storage with unaligned sizes

Out-of-bounds Write in the USB Mass Storage memoryWrite handler with unaligned Sizes.

See NCC-ZEP-024, NCC-ZEP-025, NCC-ZEP-026

This has been fixed in releases v1.14.2, and v2.2.0.

- CVE-2020-10021
- Zephyr project bug tracker ZEPSEC-26
- PR23455 fix for v1.14.2
- PR23456 fix for the v2.1 branch
- PR23240 fix for v2.2.0

CVE-2020-10022

UpdateHub Module Copies a Variable-Size Hash String Into a Fixed-Size Array

A malformed JSON payload that is received from an UpdateHub server may trigger memory corruption in the Zephyr OS. This could result in a denial of service in the best case, or code execution in the worst case.

See NCC-ZEP-016

This has been fixed in the below pull requests for main, branch from v2.1.0, and branch from v2.2.0.

- CVE-2020-10022
- Zephyr project bug tracker ZEPSEC-28
- PR24154 fix for main
- PR24065 fix for branch from v2.1.0
- PR24066 fix for branch from v2.2.0

CVE-2020-10023

Shell Subsystem Contains a Buffer Overflow Vulnerability In shell_spaces_trim

The shell subsystem contains a buffer overflow, whereby an adversary with physical access to the device is able to cause a memory corruption, resulting in denial of service or possibly code execution within the Zephyr kernel.

See NCC-ZEP-019

This has been fixed in releases v1.14.2, v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10023
- Zephyr project bug tracker ZEPSEC-29
- PR23646 fix for v1.14.2
- PR23649 fix for branch from v2.1.0
- PR23304 fix for v2.2.0

CVE-2020-10024

ARM Platform Uses Signed Integer Comparison When Validating Syscall Numbers

The arm platform-specific code uses a signed integer comparison when validating system call numbers. An attacker who has obtained code execution within a user thread is able to elevate privileges to that of the kernel.

See NCC-ZEP-001

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0,

- CVE-2020-10024
- Zephyr project bug tracker ZEPSEC-30
- PR23535 fix for v1.14.2
- PR23498 fix for branch from v2.1.0
- PR23323 fix for v2.2.0

CVE-2020-10027

ARC Platform Uses Signed Integer Comparison When Validating Syscall Numbers

An attacker who has obtained code execution within a user thread is able to elevate privileges to that of the kernel.

See NCC-ZEP-001

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0.

- CVE-2020-10027
- Zephyr project bug tracker ZEPSEC-35
- PR23500 fix for v1.14.2
- PR23499 fix for branch from v2.1.0
- PR23328 fix for v2.2.0

CVE-2020-10028

Multiple Syscalls In GPIO Subsystem Performs No Argument Validation

Multiple syscalls with insufficient argument validation

See NCC-ZEP-006

This has been fixed in releases v1.14.2, and v2.2.0, and in a branch from v2.1.0.

- CVE-2020-10028
- Zephyr project bug tracker ZEPSEC-32
- PR23733 fix for v1.14.2
- PR23737 fix for branch from v2.1.0
- PR23308 fix for v2.2.0 (gpio patch)

CVE-2020-10058

Multiple Syscalls In kscan Subsystem Performs No Argument Validation

Multiple syscalls in the Kscan subsystem perform insufficient argument validation, allowing code executing in userspace to potentially gain elevated privileges.

See NCC-ZEP-006

This has been fixed in a branch from v2.1.0, and release v2.2.0.

- CVE-2020-10058
- Zephyr project bug tracker ZEPSEC-34
- PR23748 fix for branch from v2.1.0
- PR23308 fix for v2.2.0 (kscan patch)

CVE-2020-10059

UpdateHub Module Explicitly Disables TLS Verification

The UpdateHub module disables DTLS peer checking, which allows for a man in the middle attack. This is mitigated by firmware images requiring valid signatures. However, there is no benefit to using DTLS without the peer checking.

See NCC-ZEP-018

This has been fixed in a PR against Zephyr main.

- CVE-2020-10059
- Zephyr project bug tracker ZEPSEC-36
- PR24954 fix on main (to be fixed in v2.3.0)
- PR24954 fix v2.1.0
- PR24954 fix v2.2.0

CVE-2020-10060

UpdateHub Might Dereference An Uninitialized Pointer

In updatehub_probe, right after JSON parsing is complete, objects[1] is accessed from the output structure in two different places. If the JSON contained less than two elements, this access would reference uninitialized stack memory. This could result in a crash, denial of service, or possibly an information leak.

Recommend disabling updatehub until such a time as a fix can be made available.

See NCC-ZEP-030

This has been fixed in a PR against Zephyr main.

- CVE-2020-10060
- Zephyr project bug tracker ZEPSEC-37
- PR27865 fix on main (to be fixed in v2.4.0)
- PR27865 fix for v2.3.0
- PR27865 fix for v2.2.0
- PR27865 fix for v2.1.0

CVE-2020-10061

Error handling invalid packet sequence

Improper handling of the full-buffer case in the Zephyr Bluetooth implementation can result in memory corruption.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10061
- Zephyr project bug tracker ZEPSEC-75
- PR23516 fix for v2.3 (split driver)
- PR23517 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23547 fix for branch from v2.2.0

CVE-2020-10062

Packet length decoding error in MQTT

CVE: An off-by-one error in the Zephyr project MQTT packet length decoder can result in memory corruption and possible remote code execution. NCC-ZEP-031

The MQTT packet header length can be 1 to 4 bytes. An off-by-one error in the code can result in this being interpreted as 5 bytes, which can cause an integer overflow, resulting in memory corruption.

This has been fixed in main for v2.3.

- CVE-2020-10062
- Zephyr project bug tracker ZEPSEC-84
- commit 11b7a37d for v2.3
- NCC-ZEP report (NCC-ZEP-031)

CVE-2020-10063

Remote Denial of Service in CoAP Option Parsing Due To Integer Overflow

A remote adversary with the ability to send arbitrary CoAP packets to be parsed by Zephyr is able to cause a denial of service.

This has been fixed in main for v2.3.

- CVE-2020-10063
- Zephyr project bug tracker ZEPSEC-55
- PR24435 fix in main for v2.3
- PR24531 fix for branch from v2.2
- PR24535 fix for branch from v2.1
- PR24530 fix for branch from v1.14
- NCC-ZEP report (NCC-ZEP-032)

CVE-2020-10064

Improper Input Frame Validation in ieee802154 Processing

- CVE-2020-10064
- Zephyr project bug tracker ZEPSEC-65
- PR24971 fix for v2.4
- PR33451 fix for v1.4

CVE-2020-10065

OOB Write after not validating user-supplied length (<= 0xffff) and copying to fixed-size buffer (default: 77 bytes) for HCI_ACL packets in bluetooth HCI over SPI driver.

- CVE-2020-10065
- Zephyr project bug tracker ZEPSEC-66
- This issue has not been fixed.

CVE-2020-10066

Incorrect Error Handling in Bluetooth HCI core

In hci_cmd_done, the buf argument being passed as null causes nullpointer dereference.

- CVE-2020-10066
- Zephyr project bug tracker ZEPSEC-67
- PR24902 fix for v2.4
- PR25089 fix for v1.4

CVE-2020-10067

Integer Overflow In is_in_region Allows User Thread To Access Kernel Memory

A malicious userspace application can cause a integer overflow and bypass security checks performed by system call handlers. The impact would depend on the underlying system call and can range from denial of service to information leak to memory corruption resulting in code execution within the kernel.

See NCC-ZEP-005

This has been fixed in releases v1.14.2, and v2.2.0.

- CVE-2020-10067
- Zephyr project bug tracker ZEPSEC-27
- PR23653 fix for v1.14.2
- PR23654 fix for the v2.1 branch
- PR23239 fix for v2.2.0

CVE-2020-10068

Zephyr Bluetooth DLE duplicate requests vulnerability

In the Zephyr project Bluetooth subsystem, certain duplicate and back-to-back packets can cause incorrect behavior, resulting in a denial of service.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10068
- Zephyr project bug tracker ZEPSEC-78
- PR23707 fix for v2.3 (split driver)
- PR23708 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23964 fix for v2.2.0

CVE-2020-10069

Zephyr Bluetooth unchecked packet data results in denial of service

An unchecked parameter in bluetooth data can result in an assertion failure, or division by zero, resulting in a denial of service attack.

This has been fixed in branches for v1.14.0, v2.2.0, and will be included in v2.3.0.

- CVE-2020-10069
- Zephyr project bug tracker ZEPSEC-81
- PR23705 fix for v2.3 (split driver)
- PR23706 fix for v2.3 (legacy driver)
- PR23091 fix for branch from v1.14.0
- PR23963 fix for branch from v2.2.0

CVE-2020-10070

MQTT buffer overflow on receive buffer

In the Zephyr Project MQTT code, improper bounds checking can result in memory corruption and possibly remote code execution. NCC-ZEP-031

When calculating the packet length, arithmetic overflow can result in accepting a receive buffer larger than the available buffer space, resulting in user data being written beyond this buffer.

This has been fixed in main for v2.3.

- CVE-2020-10070
- Zephyr project bug tracker ZEPSEC-85
- commit 0b39cbf3 for v2.3
- NCC-ZEP report (NCC-ZEP-031)

CVE-2020-10071

Insufficient publish message length validation in MQTT

The Zephyr MQTT parsing code performs insufficient checking of the length field on publish messages, allowing a buffer overflow and potentially remote code execution. NCC-ZEP-031

This has been fixed in main for v2.3.

- CVE-2020-10071
- Zephyr project bug tracker ZEPSEC-86
- commit 989c4713 fix for v2.3
- NCC-ZEP report (NCC-ZEP-031)

CVE-2020-10072

All threads can access all socket file descriptors

There is no management of permissions to network socket API file descriptors. Any thread running on the system may read/write a socket file descriptor knowing only the numerical value of the file descriptor.

- CVE-2020-10072
- Zephyr project bug tracker ZEPSEC-87
- PR25804 fix for v2.4
- PR27176 fix for v1.4

CVE-2020-10136

IP-in-IP protocol routes arbitrary traffic by default zephyrproject

- CVE-2020-10136
- Zephyr project bug tracker ZEPSEC-64

CVE-2020-13598

FS: Buffer Overflow when enabling Long File Names in FAT_FS and calling fs_stat

Performing fs_stat on a file with a filename longer than 12 characters long will cause a buffer overflow.

- CVE-2020-13598
- Zephyr project bug tracker ZEPSEC-88
- PR25852 fix for v2.4
- PR28782 fix for v2.3
- PR33577 fix for v1.4

CVE-2020-13599

Security problem with settings and littlefs

When settings is used in combination with littlefs all security related information can be extracted from the device using MCUmgr and this could be used e.g in bt-mesh to get the device key, network key, app keys from the device.

- CVE-2020-13599
- Zephyr project bug tracker ZEPSEC-57
- PR26083 fix for v2.4

CVE-2020-13600

Malformed SPI in response for eswifi can corrupt kernel memory

- CVE-2020-13600
- Zephyr project bug tracker ZEPSEC-91
- PR26712 fix for v2.4

CVE-2020-13601

Possible read out of bounds in dns read

- CVE-2020-13601
- Zephyr project bug tracker ZEPSEC-92
- PR27774 fix for v2.4
- PR30503 fix for v1.4

CVE-2020-13602

Remote Denial of Service in LwM2M do_write_op_tlv

In the Zephyr LwM2M implementation, malformed input can result in an infinite loop, resulting in a denial of service attack.

- CVE-2020-13602
- Zephyr project bug tracker ZEPSEC-56

- PR26571 fix for v2.4
- PR33578 fix for v1.4

CVE-2020-13603

Possible overflow in mempool

- Zephyr offers pre-built 'malloc' wrapper function instead.
- The 'malloc' function is wrapper for the 'sys_mem_pool_alloc' function
- sys_mem_pool_alloc allocates 'size + WB_UP(sizeof(struct sys_mem_pool_block))' in an unsafe manner.
- Asking for very large size values leads to internal integer wrap-around.
- Integer wrap-around leads to successful allocation of very small memory.
- For example: calling malloc(0xffffffff) leads to successful allocation of 7 bytes.
- That leads to heap overflow.
- CVE-2020-13603
- Zephyr project bug tracker ZEPSEC-111
- PR31796 fix for v2.4
- PR32808 fix for v1.4

10.6.4 CVE-2021

CVE-2021-3319

DOS: Incorrect 802154 Frame Validation for Omitted Source / Dest Addresses

Improper processing of omitted source and destination addresses in ieee802154 frame validation (ieee802154_validate_frame)

This has been fixed in main for v2.5.0

- CVE-2020-3319
- Zephyr project bug tracker GHSA-94jg-2p6q-5364
- PR31908 fix for main

CVE-2021-3320

Mismatch between validation and handling of 802154 ACK frames, where ACK frames are considered during validation, but not during actual processing, leading to a type confusion.

- CVE-2020-3320
- PR31908 fix for main

CVE-2021-3321

Incomplete check of minimum IEEE 802154 fragment size leading to an integer underflow.

- CVE-2020-3321
- Zephyr project bug tracker ZEPSEC-114

- PR33453 fix for v2.4

CVE-2021-3323

Integer Underflow in 6LoWPAN IPHC Header Uncompression
This has been fixed in main for v2.5.0

- CVE-2020-3323
- Zephyr project bug tracker GHSA-89j6-qpxf-pfpc
- PR 31971 fix for main

CVE-2021-3430

Assertion reachable with repeated LL_CONNECTION_PARAM_REQ.
This has been fixed in main for v2.6.0

- CVE-2021-3430
- Zephyr project bug tracker GHSA-46h3-hjcq-2jjr
- PR 33272 fix for main
- PR 33369 fix for 2.5
- PR 33759 fix for 1.14.2

CVE-2021-3431

BT: Assertion failure on repeated LL_FEATURE_REQ
This has been fixed in main for v2.6.0

- CVE-2021-3431
- Zephyr project bug tracker GHSA-7548-5m6f-mqv9
- PR 33340 fix for main
- PR 33369 fix for 2.5

CVE-2021-3432

Invalid interval in CONNECT_IND leads to Division by Zero
This has been fixed in main for v2.6.0

- CVE-2021-3432
- Zephyr project bug tracker GHSA-7364-p4wc-8mj4
- PR 33278 fix for main
- PR 33369 fix for 2.5

CVE-2021-3433

BT: Invalid channel map in CONNECT_IND results to Deadlock

This has been fixed in main for v2.6.0

- CVE-2021-3433
- Zephyr project bug tracker GHSA-3c2f-w4v6-qxrp
- PR 33278 fix for main
- PR 33369 fix for 2.5

CVE-2021-3434

L2CAP: Stack based buffer overflow in le_ecred_conn_req()

This has been fixed in main for v2.6.0

- CVE-2021-3434
- Zephyr project bug tracker GHSA-8w87-6rfp-cfrm
- PR 33305 fix for main
- PR 33419 fix for 2.5
- PR 33418 fix for 1.14.2

CVE-2021-3435

L2CAP: Information leakage in le_ecred_conn_req()

This has been fixed in main for v2.6.0

- CVE-2021-3435
- Zephyr project bug tracker GHSA-xhg3-gvj6-4rqh
- PR 33305 fix for main
- PR 33419 fix for 2.5
- PR 33418 fix for 1.14.2

CVE-2021-3436

Bluetooth: Possible to overwrite an existing bond during keys distribution phase when the identity address of the bond is known

During the distribution of the identity address information we don't check for an existing bond with the same identity address.This means that a duplicate entry will be created in RAM while the newest entry will overwrite the existing one in persistent storage.

This has been fixed in main for v2.6.0

- CVE-2021-3436
- Zephyr project bug tracker GHSA-j76f-35mc-4h63
- PR 33266 fix for main
- PR 33432 fix for 2.5
- PR 33433 fix for 2.4

- PR 33718 fix for 1.14.2

CVE-2021-3454

Truncated L2CAP K-frame causes assertion failure

For example, sending L2CAP K-frame where SDU length field is truncated to only one byte, causes assertion failure in previous releases of Zephyr. This has been fixed in master by commit 0ba9437 but has not yet been backported to older release branches.

This has been fixed in main for v2.6.0

- CVE-2021-3454
- Zephyr project bug tracker GHSA-fx88-6c29-vrp3
- PR 32588 fix for main
- PR 33513 fix for 2.5
- PR 33514 fix for 2.4

CVE-2021-3455

Disconnecting L2CAP channel right after invalid ATT request leads freeze

When Central device connects to peripheral and creates L2CAP connection for Enhanced ATT, sending some invalid ATT request and disconnecting immediately causes freeze.

This has been fixed in main for v2.6.0

- CVE-2021-3455
- Zephyr project bug tracker GHSA-7g38-3x9v-v7vp
- PR 35597 fix for main
- PR 36104 fix for 2.5
- PR 36105 fix for 2.4

CVE-2021-3510

Zephyr JSON decoder incorrectly decodes array of array

When using JSON_OBJ_DESCR_ARRAY_ARRAY, the subarray is has the token type JSON_TOK_LIST_START, but then assigns to the object part of the union. arr_parse then takes the offset of the array-object (which has nothing todo with the list) treats it as relative to the parent object, and stores the length of the subarray in there.

This has been fixed in main for v2.7.0

- CVE-2021-3510
- Zephyr project bug tracker GHSA-289f-7mw3-2qf4
- PR 36340 fix for main
- PR 37816 fix for 2.6

CVE-2021-3581

HCI data not properly checked leads to memory overflow in the Bluetooth stack

In the process of setting SCAN_RSP through the HCI command, the Zephyr Bluetooth protocol stack did not effectively check the length of the incoming HCI data. Causes memory overflow, and then the data in the memory is overwritten, and may even cause arbitrary code execution.

This has been fixed in main for v2.6.0

- CVE-2021-3581
- Zephyr project bug tracker GHSA-8q65-5gqf-fmw5
- PR 35935 fix for main
- PR 35984 fix for 2.5
- PR 35985 fix for 2.4
- PR 35985 fix for 1.14

CVE-2021-3625

Buffer overflow in Zephyr USB DFU DNLOAD

This has been fixed in main for v2.6.0

- CVE-2021-3625
- Zephyr project bug tracker GHSA-c3gr-hgvr-f363
- PR 36694 fix for main

CVE-2021-3835

Buffer overflow in Zephyr USB device class

This has been fixed in main for v3.0.0

- CVE-2021-3835
- Zephyr project bug tracker GHSA-fm6v-8625-99jf
- PR 42093 fix for main
- PR 42167 fix for 2.7

CVE-2021-3861

Buffer overflow in the RNDIS USB device class

This has been fixed in main for v3.0.0

- CVE-2021-3861
- Zephyr project bug tracker GHSA-hvfp-w4h8-gxvj
- PR 39725 fix for main

CVE-2021-3966

Usb bluetooth device ACL read cb buffer overflow

This has been fixed in main for v3.0.0

- Zephyr project bug tracker GHSA-hfxq-3w6x-fv2m
- PR 42093 fix for main
- PR 42167 fix for v2.7.0

10.6.5 CVE-2022

CVE-2022-0553

Possible to retrieve unencrypted firmware image

This has been fixed in main for v3.0.0

- Zephyr project bug tracker GHSA-wrj2-9vj9-rrcp
- PR 42424 fix for main

CVE-2022-1041

Out-of-bound write vulnerability in the Bluetooth Mesh core stack can be triggered during provisioning

This has been fixed in main for v3.1.0

- Zephyr project bug tracker GHSA-p449-9hv9-pj38
- PR 45136 fix for main
- PR 45188 fix for v3.0.0
- PR 45187 fix for v2.7.0

CVE-2022-1042

Out-of-bound write vulnerability in the Bluetooth Mesh core stack can be triggered during provisioning

This has been fixed in main for v3.1.0

- Zephyr project bug tracker GHSA-j7v7-w73r-mm5x
- PR 45066 fix for main
- PR 45135 fix for v3.0.0
- PR 45134 fix for v2.7.0

CVE-2022-1841

Out-of-Bound Write in tcp_flags

This has been fixed in main for v3.1.0

CVE-2023-4259

Buffer overflow vulnerabilities in the Zephyr eS-WiFi driver

- Zephyr project bug tracker GHSA-gghm-c696-f4j4

This has been fixed in main for v3.5.0

- PR 63074 fix for main
- PR 63750 fix for main

CVE-2023-4260

Off-by-one buffer overflow vulnerability in the Zephyr FS subsystem

- Zephyr project bug tracker GHSA-gj27-862r-55wh

This has been fixed in main for v3.5.0

- PR 63079 fix for main

CVE-2023-4262

Potential buffer overflow vulnerabilities in the Zephyr Mgmt subsystem

- Zephyr project bug tracker GHSA-56p9-5p3v-hhrc
- This issue has not been fixed.

CVE-2023-4263

Potential buffer overflow vulnerability in the Zephyr IEEE 802.15.4 nRF 15.4 driver.

- Zephyr project bug tracker GHSA-rf6q-rhhp-pqhf

This has been fixed in main for v3.5.0

- PR 60528 fix for main
- PR 61384 fix for 3.4
- PR 61216 fix for 2.7

CVE-2023-4264

Potential buffer overflow vulnerabilities in the Zephyr Bluetooth subsystem

- Zephyr project bug tracker GHSA-rgx6-3w4j-gf5j

This has been fixed in main for v3.5.0

- PR 58834 fix for main
- PR 60465 fix for main
- PR 61845 fix for main
- PR 61385 fix for 3.4

CVE-2023-4265

Two potential buffer overflow vulnerabilities in Zephyr USB code

- Zephyr project bug tracker GHSA-4vgv-5r6q-r6xh

This has been fixed in main for v3.4.0

- PR 59157 fix for main
- PR 59018 fix for main

CVE-2023-4424

bt: hci: DoS and possible RCE

- Zephyr project bug tracker GHSA-j4qm-xgpf-qjw3

This has been fixed in main for v3.5.0

- PR 61651 fix for main
- PR 61696 fix for 3.4
- PR 61695 fix for 3.3
- PR 61694 fix for 2.7

CVE-2023-5055

L2CAP: Possible Stack based buffer overflow in le_ecred_reconf_req()

- Zephyr project bug tracker GHSA-wr8r-7f8x-24jj

This has been fixed in main for v3.5.0

- PR 62381 fix for main

CVE-2023-5139

Potential buffer overflow vulnerability in the Zephyr STM32 Crypto driver.

- Zephyr project bug tracker GHSA-rhrc-pcxp-4453

This has been fixed in main for v3.5.0

- PR 61839 fix for main

CVE-2023-5184

Potential signed to unsigned conversion errors and buffer overflow vulnerabilities in the Zephyr IPM driver

- Zephyr project bug tracker GHSA-8x3p-q3r5-xh9g

This has been fixed in main for v3.5.0

- PR 63069 fix for main

CVE-2023-5563

The SJA1000 CAN controller driver backend automatically attempts to recover from a bus-off event when built with CONFIG_CAN_AUTO_BUS_OFF_RECOVERY=y. This results in calling k_sleep() in IRQ context, causing a fatal exception.

- Zephyr project bug tracker GHSA-98mc-rj7w-7rpv

This has been fixed in main for v3.5.0

- PR 63713 fix for main
- PR 63718 fix for 3.4
- PR 63717 fix for 3.3

CVE-2023-5753

Potential buffer overflow vulnerabilities in the Zephyr Bluetooth subsystem source code when asserts are disabled.

- Zephyr project bug tracker GHSA-hmpr-px56-rvww

This has been fixed in main for v3.5.0

- PR 63605 fix for main

CVE-2023-5779

Out of bounds issue in remove_rx_filter in multiple can drivers.

- Zephyr project bug tracker GHSA-7cmj-963q-jj47

This has been fixed in main for v3.6.0

- PR 64399 fix for main
- PR 64416 fix for 3.5
- PR 64415 fix for 3.4
- PR 64427 fix for 3.3
- PR 64431 fix for 2.7

CVE-2023-6249

Signed to unsigned conversion problem in esp32_ipm_send may lead to buffer overflow

- Zephyr project bug tracker GHSA-32f5-3p9h-2rqc

This has been fixed in main for v3.6.0

- PR 65546 fix for main

CVE-2023-6749

Potential buffer overflow due unchecked data coming from user input in settings shell.

- Zephyr project bug tracker GHSA-757h-rw37-66hw

This has been fixed in main for v3.6.0

- PR 66451 fix for main
- PR 66584 fix for 3.5

CVE-2023-6881

Potential buffer overflow vulnerability in Zephyr fuse file system.

- Zephyr project bug tracker GHSA-mh67-4h3q-p437

This has been fixed in main for v3.6.0

- PR 66592 fix for main

CVE-2023-7060

Missing Security Control in Zephyr OS IP Packet Handling

- Zephyr project bug tracker GHSA-fjc8-223c-qgqr

This has been fixed in main for v3.6.0

- PR 66645 fix for main
- PR 66739 fix for 3.5
- PR 66738 fix for 3.4
- PR 66887 fix for 2.7

10.6.7 CVE-2024

CVE-2024-1638

Bluetooth characteristic LESC security requirement not enforced without additional flags

- Zephyr project bug tracker GHSA-p6f3-f63q-5mc2

This has been fixed in main for v3.6.0

- PR 69170 fix for main

CVE-2024-3077

Bluetooth: Integer underflow in gatt_find_info_rsp. A malicious BLE device can crash BLE victim device by sending malformed gatt packet.

- Zephyr project bug tracker GHSA-gmfv-4vfh-2mh8

This has been fixed in main for v3.7.0

- PR 69396 fix for main

CVE-2024-3332

Bluetooth: DoS caused by null pointer dereference.

A malicious BLE device can send a specific order of packet sequence to cause a DoS attack on the victim BLE device.

- Zephyr project bug tracker GHSA-jmr9-xw2v-5vf4

This has been fixed in main for v3.7.0

- PR 71030 fix for main

10.7 Security standards and Zephyr

For a long period organizations were, more or less, left responsible to deal with cyber security on their own. This included how to assess the scale and impact of the problem and who to properly respond it.

Now, governments started looking how to regulate it and several regulations and enforcements are rapidly emerging, and consequently, security standards. These standards provide guidelines and outline requirements that products have to follow to achieve compliance.

This section aims to identify and assess which Zephyr project components are impacted by security standards requirements and provide the right information to enable organizations developing certifiable products using Zephyr project.

10.7.1 ETSI 303-645

ETSI EN 303 645, also known as "Cyber Security for Consumer Internet of Things: Baseline Requirements," is a standard developed by the European Telecommunications Standards Institute (ETSI).

The standard includes provisions for secure software updates, data protection, secure communication, and the minimization of exposed attack surfaces, among other things. It is part of a broader effort to address the challenges and risks associated with IoT devices.

Full version of the standard can be found here.

Terminology

Table 1: ETSI 303645 terminology

administrator	user who has the highest-privilege level possible for a user of the device, which can mean they are able to change any configuration related to the intended functionality.
associated services	digital services that, together with the device, are part of the overall consumer IoT product and that are typically required to provide the product's intended functionality.
authentication mechanism	method used to prove the authenticity of an entity.
authentication value	individual value of an attribute used by an authentication mechanism.
best practice cryptography	cryptography that is suitable for the corresponding use case and has no indications of a feasible attack with current readily available techniques.
constrained device	device which has physical limitations in either the ability to process data, the ability to communicate data, the ability to store data or the ability to interact with the user, due to restrictions that arise from its intended use.
consumer	natural person who is acting for purposes that are outside her/his trade, business, craft or profession.

continues on next page

Table 1 – continued from previous page

consumer IoT device	network-connected (and network-connectable) device that has relationships to associated services and are used by the consumer typically in the home or as electronic wearables.
critical security parameter	security-related secret information whose disclosure or modification can compromise the security of a security module.
debug interface	physical interface used by the manufacturer to communicate with the device during development or to perform triage of issues with the device and that is not used as part of the consumer-facing functionality
defined support period	minimum length of time, expressed as a period or by an end-date, for which a manufacturer will provide security updates.
device manufacturer	entity that creates an assembled final consumer IoT product, which is likely to contain the products and components of many other suppliers.
factory default	state of the device after factory reset or after final production/assembly.
initialization	process that activates the network connectivity of the device for operation and optionally sets authentication features for a user or for network access.
initialized state	state of the device after initialization.
IoT product	consumer IoT device and its associated services.
isolable	able to be removed from the network it is connected to, where any functionality loss caused is related only to that connectivity and not to its main function; alternatively, able to be placed in a self-contained environment with other devices if and only if the integrity of devices within that environment can be ensured
logical interface	software implementation that utilizes a network interface to communicate over the network via channels or ports.
manufacturer	relevant economic operator in the supply chain (including the device manufacturer).
network interface	physical interface that can be used to access the functionality of consumer IoT via a network.
owner	user who owns or who purchased the device.
personal data	Any information relating to an identified or identifiable natural person.
physical interface	physical port or air interface (such as radio, audio or optical) used to communicate with the device at the physical layer.
public security parameter	security related public information whose modification can compromise the security of a security module.
remotely accessible	intended to be accessible from outside the local network.
security module	set of hardware, software, and/or firmware that implements security functions.
security update	software update that addresses security vulnerabilities either discovered by or reported to the manufacturer.
sensitive security parameters	critical security parameters and public security parameters.
software service	software component of a device that is used to support functionality.
telemetry	data from a device that can provide information to help the manufacturer identify issues or information related to device usage.
unique per device	unique for each individual device of a given product class or type.
user	natural person or organization.

Provisions Assessment

The following table is a self-assessment using Table B.1 from ETSI EN 303 645, specifically focusing on the Zephyr RTOS as a component within IoT products.

According with ETSI 303 645, table B.1 provides a mechanism to give information about the implementation of the provisions presented in the standard. Zephyr has adopted the following notations used in the standard:

Table 2: ETSI 303645 Table B.1 notations

M	the provision is a mandatory requirement
R	the provision is a recommendation
M C	the provision is a mandatory requirement and conditional
R C	the provision is a recommendation and conditional
Y	The provision is supported by Zephyr
N	The provision is not supported by Zephyr
N/A	The provision is not applicable to Zephyr or it is product makers responsibility

Table 3: ETSI 303645 provisions assessment using table B.1

Provision	Description	Status	Support	Detail
Provision 5.1-1	Where passwords are used and in any state other than the factory default, all consumer IoT device passwords shall be unique per device or defined by the user.	M C	N/A	
Provision 5.1-2	Where pre-installed unique per device passwords are used, these shall be generated with a mechanism that reduces the risk of automated attacks against a class or type of device.	M C	N/A	
Provision 5.1-3	Authentication mechanisms used to authenticate users against a device shall use best practice cryptography, appropriate to the properties of the technology, risk and usage.	M	N/A	
Provision 5.1-4	Where a user can authenticate against a device, the device shall provide to the user or an administrator a simple mechanism to change the authentication value used.	M C	N/A	
Provision 5.1-5	When the device is not a constrained device, it shall have a mechanism available which makes brute-force attacks on authentication mechanisms via network interfaces impracticable.	M C	N	**TODO**
Provision 5.2-1	The manufacture shall make a vulnerability disclosure policy publicly available.	M	Y	*Vulnerability Management*
Provision 5.2-2	Disclosed vulnerabilities should be acted on in a timely manner.	R	Y	*Vulnerability Timeline*
Provision 5.2-3	Manufacturers should continually monitor for, identify and rectify security vulnerabilities within products and services they sell, produce, have produced and services they operate during the defined support period.	R	Y	Modules are covered
Provision 5.3-1	All software components in consumer IoT devices should be securely updatable.	R	Y	*Device firwmware upgrade*
Provision 5.3-2	When the device is not a constrained device, it shall have an update mechanism for the secure installation of updates.	M C	Y	*Device firwmware upgrade*

continues on next page

Table 3 – continued from previous page

Provision	Description	Status	Support	Detail
Provision 5.3-3	An update shall be simple for the user to apply.	M C	N/A	
Provision 5.3-4	Automatic mechanisms should be used for software updates.	R C	N/A	
Provision 5.3-5	The device should check after initialization, and then periodically, whether security updates are available.	R C	N/A	
Provision 5.3-6	If the device supports automatic updates and/or update notifications, these should be enabled in the initialized state and configurable so that the user can enable, disable, or postpone installation of security updates and/or update notifications.	R C	N/A	
Provision 5.3-7	The device shall use best practice cryptography to facilitate secure update mechanisms.	M C	Y	*West Sign*
Provision 5.3-8	Security updates shall be timely.	M C	N/A	
Provision 5.3-9	The device should verify the authenticity and integrity of software updates.	R C	Y	Functionality provided by *MCUboot <https://github.com/zephyrproject-rtos/mcuboot>*. Also see *Device Firwmware Upgrade*
Provision 5.3-10	Where updates are delivered over a network interface, the device shall verify the authenticity and integrity of each update via a trust relationship.	M	N/A	
Provision 5.3-11	The manufacturer should inform the user in a recognizable and apparent manner that a security update is required together with information on the risks mitigated by that update.	R C	N/A	
Provision 5.3-12	The device should notify the user when the application of a software update will disrupt the basic functioning of the device.	R C	N/A	Zephyr provides this information for its updates. Anyone using Zephyr in their products must check if they are affected
Provision 5.3-13	The manufacturer shall publish, in an accessible way that is clear and transparent to the user, the defined support period.	M	Y	Release Life Cycle and Maintenance

continues on next page

Table 3 – continued from previous page

Provision	Description	Status	Support	Detail
Provision 5.3-14	For constrained devices that cannot have their software updated, the rationale for the absence of software updates, the period and method of hardware replacement support and a defined support period should be published by the manufacturer in an accessible way that is clear and transparent to the user.	R C	N/A	
Provision 5.3-15	For constrained devices that cannot have their software updated, the product should be isolable and the hardware replaceable.	R C	N/A	
Provision 5.3-16	The model designation of the consumer IoT device shall be clearly recognizable, either by labelling on the device or via a physical interface.	M	N/A	
Provision 5.4-1	Sensitive security parameters in persistent storage shall be stored securely by the device.	M	N	There is not secure storage within Zephyr
Provision 5.4-2	Where a hard-coded unique per device identity is used in a device for security purposes, it shall be implemented in such a way that it resists tampering by means such as physical, electrical or software.	M C	N/A	
Provision 5.4-3	Hard-coded critical security parameters in device software source code shall not be used.	M	Y	*Hardening Tool*
Provision 5.4-4	Any critical security parameters used for integrity and authenticity checks of software updates and for protection of communication with associated services in device software shall be unique per device and shall be produced with a mechanism that reduces the risk of automated attacks against classes of devices.	M	N/A	
Provision 5.5-1	The consumer IoT device shall use best practice cryptography to communicate securely.	M	Y	
Provision 5.5-2	The consumer IoT device should use reviewed or evaluated implementations to deliver network and security functionalities, particularly in the field of cryptography.	R	Y	
Provision 5.5-3	Cryptographic algorithms and primitives should be updatable.	R	N	The whole image must be updated

continues on next page

Table 3 – continued from previous page

Provision	Description	Status	Support	Detail
Provision 5.5-4	Access to device functionality via a network interface in the initialized state should only be possible after authentication on that interface.	R	N/A	
Provision 5.5-5	Device functionality that allows security-relevant changes in configuration via a network interface shall only be accessible after authentication. The exception is for network service protocols that are relied upon by the device and where the manufacturer cannot guarantee what configuration will be required for the device to operate.	M	N/A	
Provision 5.5-6	Critical security parameters should be encrypted in transit, with such encryption appropriate to the properties of the technology, risk and usage.	R	Y	
Provision 5.5-7	The consumer IoT device shall protect the confidentiality of critical security parameters that are communicated via remotely accessible network interfaces.	M	Y	
Provision 5.5-8	The manufacturer shall follow secure management processes for critical security parameters that relate to the device.	M	N/A	
Provision 5.6-1	All unused network and logical interfaces shall be disabled.	M	Y	*Kconfig*
Provision 5.6-2	In the initialized state, the network interfaces of the device shall minimize the unauthenticated disclosure of security-relevant information.	M	Y	
Provision 5.6-3	Device hardware should not unnecessarily expose physical interfaces to attack.	R	Y	*Kconfig* and *Hardening Tool*
Provision 5.6-4	Where a debug interface is physically accessible, it shall be disabled in software.	M C	Y	*Hardening Tool*
Provision 5.6-5	The manufacturer should only enable software services that are used or required for the intended use or operation of the device.	R	Y	*Kconfig* and *Hardening Tool*
Provision 5.6-6	Code should be minimized to the functionality necessary for the service/device to operate.	R	Y	*Kconfig*

continues on next page

Table 3 – continued from previous page

Provision	Description	Status	Support	Detail
Provision 5.6-7	Software should run with least necessary privileges, taking account of both security and functionality.	R	Y	*Security Overview*
Provision 5.6-8	The device should include a hardware-level access control mechanism for memory.	R	Y	*Memory protection*
Provision 5.6-9	The manufacturer should follow secure development processes for software deployed on the device.	R	Y	*Security Overview* and *Coding guidelines*
Provision 5.7-1	The consumer IoT device should verify its software using secure boot mechanisms.	R	Y	Functionality provided by *MCUboot <https://github.com/zephyrproject-rtos/mcuboot>*. Also see *Security Overview*
Provision 5.7-2	If an unauthorized change is detected to the software, the device should alert the user and/or administrator to the issue and should not connect to wider networks than those necessary to perform the alerting function.	R	N	Zephyr does not provide runtime detection / notification.
Provision 5.8-1	The confidentiality of personal data transiting between a device and a service, especially associated services, should be protected, with best practice cryptography.	R	Y	
Provision 5.8-2	The confidentiality of sensitive personal data communicated between the device and associated services shall be protected, with cryptography appropriate to the properties of the technology and usage.	M	Y	
Provision 5.8-3	All external sensing capabilities of the device shall be documented in an accessible way that is clear and transparent for the user.	M	Y	*Sensing Subsystem*
Provision 5.9-1	Resilience should be built in to consumer IoT devices and services, taking into account the possibility of outages of data networks and power.	R	Y	
Provision 5.9-2	Consumer IoT devices should remain operating and locally functional in the case of a loss of network access and should recover cleanly in the case of restoration of a loss of power.	R	Y	

continues on next page

Table 3 – continued from previous page

Provision	Description	Status	Support	Detail
Provision 5.9-3	The consumer IoT device should connect to networks in an expected, operational and stable state and in an orderly fashion, taking the capability of the infrastructure into consideration.	R	Y	
Provision 5.10-1	If telemetry data is collected from consumer IoT devices and services, such as usage and measurement data, it should be examined for security anomalies.	R C	N/A	
Provision 5.11-1	The user shall be provided with functionality such that user data can be erased from the device in a simple manner.	M	N/A	
Provision 5.11-2	The consumer should be provided with functionality on the device such that personal data can be removed from associated services in a simple manner.	R	N/A	
Provision 5.11-3	Users should be given clear instructions on how to delete their personal data.	R	N/A	
Provision 5.11-4	Users should be provided with clear confirmation that personal data has been deleted from services, devices and applications.	R	N/A	
Provision 5.12-1	Installation and maintenance of consumer IoT should involve minimal decisions by the user and should follow security best practice on usability.	R	N/A	
Provision 5.12-2	The manufacturer should provide users with guidance on how to securely set up their device.	R	N/A	
Provision 5.12-3	The manufacturer should provide users with guidance on how to check whether their device is securely set up.	R	N/A	
Provision 5.13-1	The consumer IoT device software shall validate data input via user interfaces or transferred via Application Programming Interfaces (APIs) or between networks in services and devices.	M	Y	*Syscall verification* and *Coding guidelines*

continues on next page

Table 3 – continued from previous page

Provision	Description	Status	Support	Detail
Provision 6.1-1	The manufacturer shall provide consumers with clear and transparent information about what personal data is processed, how it is being used, by whom, and for what purposes, for each device and service. This also applies to third parties that can be involved, including advertisers.	M	N/A	
Provision 6.1-2	Where personal data is processed on the basis of consumers' consent, this consent shall be obtained in a valid way.	M C	N/A	
Provision 6.1-3	Consumers who gave consent for the processing of their personal data shall have the capability to withdraw it at any time.	M	N/A	
Provision 6.1-4	If telemetry data is collected from consumer IoT devices and services, the processing of personal data should be kept to the minimum necessary for the intended functionality.	R C	N/A	
Provision 6.1-5	If telemetry data is collected from consumer IoT devices and services, consumers shall be provided with information on what telemetry data is collected, how it is being used, by whom, and for what purposes.	M C	N/A	

Chapter 11

Safety

These documents describe the processes, developer guidelines and requirements for ensuring safety is addressed within the Zephyr project.

11.1 Zephyr Safety Overview

11.1.1 Introduction

This document is the safety documentation providing an overview over the safety-relevant activities and what the Zephyr Project and the Zephyr Safety Working Group / Committee try to achieve.

This overview is provided for people who are interested in the functional safety development part of the Zephyr RTOS and project members who want to contribute to the safety aspects of the project.

11.1.2 Overview

In this section we give the reader an overview of what the general goal of the safety certification is, what standard we aim to achieve and what quality standards and processes need to be implemented to reach such a safety certification.

11.1.3 Safety Document update

This document is a living document and may evolve over time as new requirements, guidelines, or processes are introduced.

1. Changes will be submitted from the interested party(ies) via pull requests to the Zephyr documentation repository.
2. The Zephyr Safety Committee will review these changes and provide feedback or acceptance of the changes.
3. Once accepted, these changes will become part of the document.

11.1.4 General safety scope

The general scope of the Safety Committee is to achieve a certification for the IEC 61508 standard and the Safety Integrity Level (SIL) 3 / Systematic Capability (SC) 3 for a limited source scope (see certification scope TBD). Since the code base is pre-existing, we use the route 3s/1s approach defined by the IEC 61508 standard.

Route 3s
Assessment of non-compliant development. Which is basically the route 1s with existing sources.

Route 1s
Compliant development. Compliance with the requirements of this standard for the avoidance and control of systematic faults in software.

Summarization IEC 61508 standard

The IEC 61508 standard is a widely recognized international standard for functional safety of electrical, electronic, and programmable electronic safety-related systems. Here's an overview of some of the key safety aspects of the standard:

1. **Hazard and Risk Analysis**: The IEC 61508 standard requires a thorough analysis of potential hazards and risks associated with a system in order to determine the appropriate level of safety measures needed to reduce those risks to acceptable levels.
2. **Safety Integrity Level (SIL)**: The standard introduces the concept of Safety Integrity Level (SIL) to classify the level of risk reduction required for each safety function. The higher the SIL, the greater the level of risk reduction required.
3. **System Design**: The IEC 61508 standard requires a systematic approach to system design that includes the identification of safety requirements, the development of a safety plan, and the use of appropriate safety techniques and measures to ensure that the system meets the required SIL.
4. **Verification and Validation**: The standard requires rigorous testing and evaluation of the safety-related system to ensure that it meets the specified SIL and other safety requirements. This includes verification of the system design, validation of the system's functionality, and ongoing monitoring and maintenance of the system.
5. **Documentation and Traceability**: The IEC 61508 standard requires a comprehensive documentation process to ensure that all aspects of the safety-related system are fully documented and that there is full traceability from the safety requirements to the final system design and implementation.

Overall, the IEC 61508 standard provides a framework for the design, development, and implementation of safety-related systems that aims to reduce the risk of accidents and improve overall safety. By following the standard, organizations can ensure that their safety-related systems are designed and implemented to the highest level of safety integrity.

11.1.5 Quality

Quality is a mandatory expectation for software across the industry. The code base of the project must achieve various software quality goals in order to be considered an auditable code base from a safety perspective and to be usable for certification purposes. But software quality is not an additional requirement caused by functional safety standards. Functional safety considers quality as an existing pre-condition and therefore the "quality managed" status should be pursued for any project regardless of the functional safety goals. The following list describes the quality goals which need to be reached to achieve an auditable code base:

1. Basic software quality standards

   a. *Coding Guidelines* (including: static code analysis, coding style, etc.)
   b. *Safety Requirements* and requirements tracing
   c. Test coverage
2. Software architecture design principles
   a. Layered architecture model
   b. Encapsulated components
   c. Encapsulated single functionality (if not fitable and manageable in safety)

Basic software quality standards - Safety view

In this chapter the Safety Committee describes why they need the above listed quality goals as pre-condition and what needs to be done to achieve an auditable code base from the safety perspective. Generally speaking, it can be said that all of these quality measures regarding safety are used to minimize the error rate during code development.

Coding Guidelines The coding guidelines are the basis to a common understanding and a unified ruleset and development style for industrial software products. For safety the coding guidelines are essential and have another purpose beside the fact of a unified ruleset. It is also necessary to prove that the developers follow a unified development style to prevent **systematic errors** in the process of developing software and thus to minimize the overall **error rate** of the complete software system.

Also the **IEC 61508 standard** sets a pre-condition and recommendation towards the use of coding standards / guidelines to reduce likelihood of errors.

Requirements and requirements tracing Requirements and requirement management are not only important for software development, but also very important in terms of safety. On the one hand, this specifies and describes in detail and on a technical level what the software should do, and on the other hand, it is an important and necessary tool to verify whether the described functionality is implemented as expected. For this purpose, tracing the requirements down to the code level is used. With the requirements management and tracing in hand, it can now be verified whether the functionality has been tested and implemented correctly, thus minimizing the systematic error rate.

Also the IEC 61508 standard highly recommends (which is like a must-have for the certification) requirements and requirements tracing.

Test coverage A high test coverage, in turn, is evidence of safety that the code conforms precisely to what it was developed for and does not execute any unforeseen instructions. If the entire code is tested and has a high (ideally 100%) test coverage, it has the additional advantage of quickly detecting faulty changes and further minimizing the error rate. However, it must be noted that different requirements apply to safety for test coverage, and various metrics must be considered, which are prescribed by the IEC 61508 standard for the SIL 3 / SC3 target. The following must be fulfilled, among other things:

- Structural test coverage (entry points) 100%
- Structural test coverage (statements) 100%
- Structural test coverage (branches) 100%

If the 100% cannot be reached (e.g. statement coverage of defensive code) that part needs to be described and justified in the documentation.

Software architecture design principles

To create and maintain a structured software product it is also necessary to consider individual software architecture designs and implement them in accordance with safety standards because some designs and implementations are not reasonable in safety, so that the overall software and code base can be used as auditable code. However, most of these software architecture designs have already been implemented in the Zephyr project and need to be verified by the Safety Committee / Safety Working Group and the safety architect.

Layered architecture model The **IEC 61508 standard** strongly recommends a modular approach to software architecture. This approach has been pursued in the Zephyr project from the beginning with its layered architecture. The idea behind this architecture is to organize modules or components with similar functionality into layers. As a result, each layer can be assigned a specific role in the system. This model has the advantage in safety that interfaces between different components and layers can be shown at a very high level, and thus it can be determined which functionalities are safety-relevant and can be limited. Furthermore, various analyses and documentations can be built on top of this architecture, which are important for certification and the responsible certification body.

Encapsulated components Encapsulated components are an essential part of the architecture design for safety at this point. The most important aspect is the separation of safety-relevant components from non-safety-relevant components, including their associated interfaces. This ensures that the components have no **repercussions** on other components.

Encapsulated single functionality (if not reasonable and manageable in safety) Another requirement for the overall system and software environment is that individual functionalities can be disabled within components. This is because if a function is absolutely unacceptable for safety (e.g. complete dynamic memory management), then these individual functionalities should be able to be turned off. The Zephyr Project already offers such a possibility through the use of Kconfig and its flexible configurability.

11.1.6 Processes and workflow

The diagram describes the rough process defined by the Safety Committee to ensure safety in the development of the Zephyr project. To ensure understanding, a few points need to be highlighted and some details explained regarding the role of the safety architect and the role of the safety committee in the whole process. The diagram only describes the paths that are possible when a change is related to safety.

1. On the main branch, the safety scope of the project should be identified, which typically represents a small subset of the entire code base. This subset should then be made auditable during normal development on “main”, which means that special attention is paid to quality goals (*Quality*) and safety processes within this scope. The Safety Architect works alongside the Technical Steering Committee (TSC) in this area, monitoring the development process to ensure that the architecture meets the safety requirements.
2. At this point, the safety architect plays an increasingly important role. For PRs/issues that fall within the safety scope, the safety architect should ideally be involved in the discussions and decisions of minor changes in the safety scope to be able to react to safety-relevant changes that are not conformant. If a pull request or issue introduces a significant and influential change or improvement that requires extended discussion or decision-making, the safety architect should bring it to the attention of the Safety Committee or the Technical Steering Committee (TSC) as appropriate, so that they can make a decision on the best course of action.

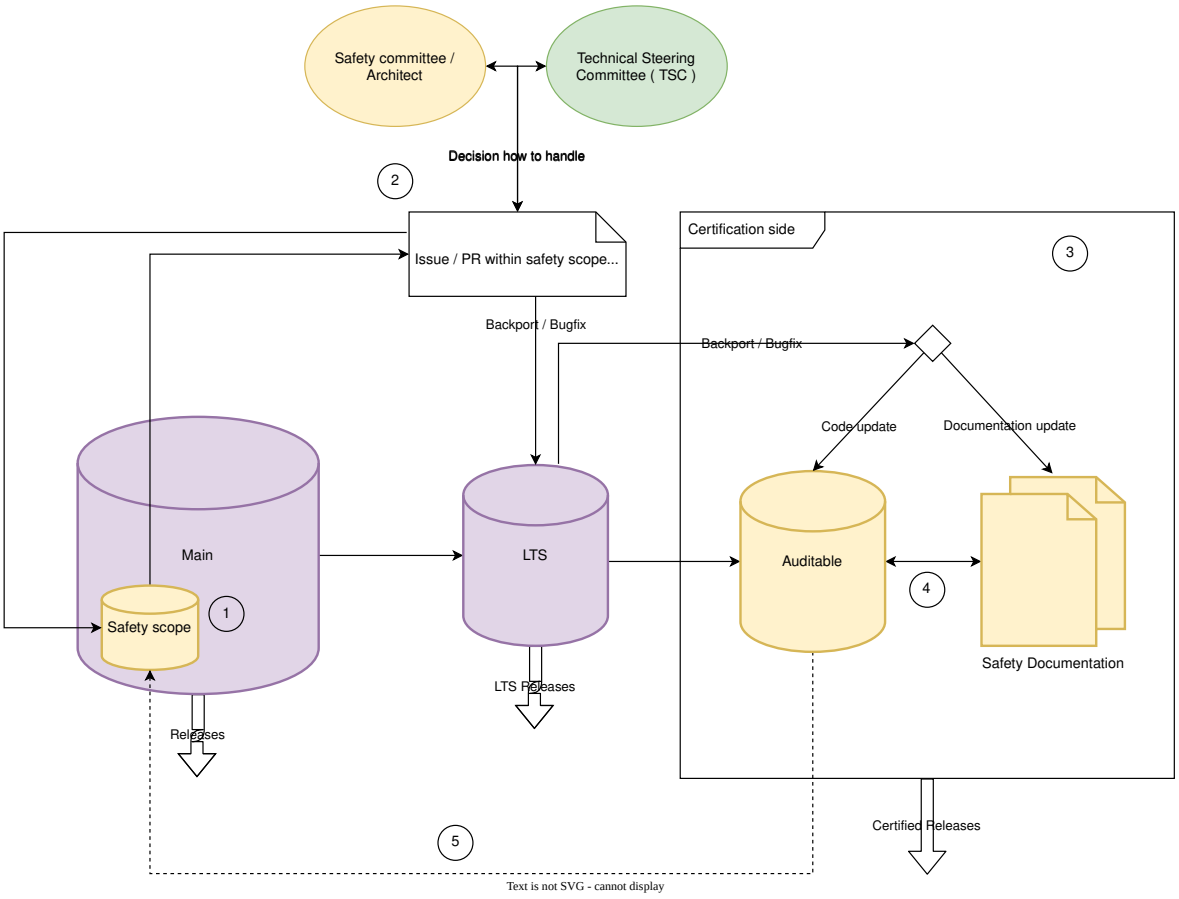

Fig. 1: Safety process and workflow overview

3. This section describes the certification side. At this point, the code base has to be in an "auditable" state, and ideally no further changes should be necessary or made to the code base. There is still a path from the main branch to this area. This is needed in case a serious bug or important change is found or implemented on the main branch in the safety scope, after the LTS and the auditable branch were created. In this case, the Safety Committee, together with the safety architect, must decide whether this bug fix or change should be integrated into the LTS so that the bug fix or change could also be integrated into the auditable branch. This integration can take three forms: First either as only a code change or second as only an update to the safety documentation or third as both.
4. This describes the necessary safety process required for certification itself. Here, the final analyses, tests, and documents are created and conducted which must be created and conducted during the certification, and which are prescribed by the certifying authority and the standard being certified. If the certification body approves everything at this stage and the safety process is completed, a safety release can be created and published.
5. This transition from the auditable branch to the main branch should only occur in exceptional circumstances, specifically when something has been identified during the certification process that needs to be quickly adapted on the "auditable" branch in order to obtain certification. In order to prevent this issue from arising again during the next certification, there needs to be a path to merge these changes back into the main branch so that they are not lost, and to have them ready for the next certification if necessary.

Important

Safety should not block the project and minimize the room to grow in any way.

Important

TODO: Find and define ways, guidelines and processes which minimally impact the daily work of the maintainers, reviewers and contributors and also the safety architect itself. But which are also suitable for safety.

11.2 Safety Requirements

11.2.1 Introduction

The safety committee leads the effort to gather requirements that reflect the **actual** state of the implementation, following the route 3s approach of the project's safety effort. The goal is **NOT** to create new requirements to request additional features for the project.

The requirements are gathered in the separate repository: Requirement repository

11.2.2 Guidelines

Below are the guidelines for the requirements repository and the expectations of the safety committee when adding requirements to the repository.

Scope

The scope of the requirements covers the KERNEL functionalities.

Consistency

Maintain consistency across all requirements. The language and choice of words shall be consistent. (See: *Syntax*)

Levels of requirements in the repository

System Requirements
: System requirements describe the behaviour of the Zephyr RTOS (= the system here). They describe the functionality of the Zephyr RTOS from a very high-level perspective, without going into details of the functionality itself. The purpose of the system requirements is to get an overview of the currently implemented features of the Zephyr RTOS. In other words a person writing these requirements usually has some knowledge of the Zephyr RTOS Project as the requirements are specific to an RTOS.

Software Requirements
: Software requirements refine the system-level requirements at a more granular level so that each requirement can be tested. These requirements define the specific actions the feature shall be able to execute and the behavior of the feature.

Requirement UID (Unique identifier) Handling

The tool used to manage requirements, strictDoc, is responsible for handling the Unique Identifier (UID) associated with each requirement. To manage UIDs, follow these steps:

1. Don't add a requirement UID and UID field for new requirements
2. After completing work on the new requirements execute: `strictDoc manage auto-uid .`
3. Establish links between the requirements with the new attributed UIDs if needed

After doing this, the requirements are ready and a pull request can be created. The CI in the PR will check if the requirements UIDs are valid or if there are duplicates in it. If there are duplicates in the PR, these need to be resolved by rebasing and re-executing the steps above.

Requirement Types

- Functional
- Non-Functional

Requirement title convention

Use short and succinct requirement titles.

Pull Request requirement repository

- Adhere to the *Contribution Guidelines* of the Zephyr Project.
  - As long as they are applicable to the requirements repository.
- Avoid creating large commits that contain both trivial and non-trivial changes.
- Avoid moving and changing requirements in the same commit.

Characteristics of a good requirement

- Unambiguous
- Verifiable (e.g. testable for functional requirements)
- Clear (concise, succinct, simple, precise)
- Correct
- Understandable
- Feasible (realistic, possible)
- Independent
- Atomic
- Necessary
- Implementation-free (abstract)

Characteristics of a set of requirements

- Complete
- Consistent
- Non redundant

Syntax

- Use of a recognized Requirements Syntax is recommended.
  - EARS is a good reference. Particularly if you are unfamiliar with requirements writing.
  - Other formats are accepted as long as the characteristics of a requirement from above are met.

Chapter 12

Glossary of Terms

API
: (Application Program Interface) A defined set of routines and protocols for building application software.

application
: The set of user-supplied files that the Zephyr build system uses to build an application image for a specified board configuration. It can contain application-specific code, kernel configuration settings, and at least one CMakeLists.txt file. The application's kernel configuration settings direct the build system to create a custom kernel that makes efficient use of the board's resources. An application can sometimes be built for more than one type of board configuration (including boards with different CPU architectures), if it does not require any board-specific capabilities.

application image
: A binary file that is loaded and executed by the board for which it was built. Each application image contains both the application's code and the Zephyr kernel code needed to support it. They are compiled as a single, fully-linked binary. Once an application image is loaded onto a board, the image takes control of the system, initializes it, and runs as the system's sole application. Both application code and kernel code execute as privileged code within a single shared address space.

architecture
: An instruction set architecture (ISA) along with a programming model.

board
: A target system with a defined set of devices and capabilities, which can load and execute an application image. It may be an actual hardware system or a simulated system running under QEMU. A board can contain one or more *SoCs*. The Zephyr kernel supports a variety of boards.

board configuration
: A set of kernel configuration options that specify how the devices present on a board are used by the kernel. The Zephyr build system defines one or more board configurations for each board it supports. The kernel configuration settings that are specified by the build system can be over-ridden by the application, if desired.

board name
: The human-readable name of a *board*. Uniquely and descriptively identifies a particular system, but does not include additional information that may be required to actually build a Zephyr image for it. See *Board terminology* for additional details.

board qualifiers
: The set of additional tokens, separated by a forward slash (/) that follow the *board name* (and optionally *board revision*) to form the *board target*. The currently accepted qualifiers are *SoC*, *CPU cluster* and *variant*. See *Board terminology* for additional details.

board revision
An optional version string that identifies a particular revision of a hardware system. This is useful to avoid duplication of board files whenever small changes are introduced to a hardware system. See *Multiple board revisions* and *Building for a board revision* for more information.

board target
The full string that can be provided to any of the Zephyr build tools to compile and link an image for a particular hardware system. This string uniquely identifies the combination of *board name*, *board revision* and *board qualifiers*. See *Board terminology* for additional details.

CPU cluster
A group of one or more *CPU cores*, all executing the same image within the same address space and in a symmetrical (SMP) configuration. Only *CPU cores* of the same *architecture* can be in a single cluster. Multiple CPU clusters (each of one or more cores) can coexist in the same *SoC*.

CPU core
A single processing unit, with its own Program Counter, executing program instructions sequentially. CPU cores are part of a *CPU cluster*, which can contain one or more cores.

device runtime power management
Device Runtime Power Management (PM) refers the capability of devices to save energy independently of the system power state. Devices will keep reference of their usage and will automatically be suspended or resumed. This feature is enabled via the `CONFIG_PM_DEVICE_RUNTIME` Kconfig option.

idle thread
A system thread that runs when there are no other threads ready to run.

IDT
(Interrupt Descriptor Table) a data structure used by the x86 architecture to implement an interrupt vector table. The IDT is used to determine the correct response to interrupts and exceptions.

ISR
(Interrupt Service Routine) Also known as an interrupt handler, an ISR is a callback function whose execution is triggered by a hardware interrupt (or software interrupt instructions) and is used to handle high-priority conditions that require interrupting the current code executing on the processor.

kernel
The set of Zephyr-supplied files that implement the Zephyr kernel, including its core services, device drivers, network stack, and so on.

power domain
A power domain is a collection of devices for which power is applied and removed collectively in a single action. Power domains are represented by *device*.

power gating
Power gating reduces power consumption by shutting off areas of an integrated circuit that are not in use.

SoC
A System on a chip, that is, an integrated circuit that contains at least one *CPU cluster* (in turn with at least one *CPU core*), as well as peripherals and memory.

SoC family
One or more *SoCs* or *SoC series* that share enough in common to consider them related and under a single family denomination.

SoC series
A number of different *SoCs* that share similar characteristics and features, and that the vendor typically names and markets together.

subsystem
A subsystem refers to a logically distinct part of the operating system that handles specific functionality or provides certain services.

system power state
System power states describe the power consumption of the system as a whole. System power states are represented by *pm_state*.

variant
In the context of *board qualifiers*, a variant designates a particular type or configuration of a build for a combination of *SoC* and *CPU cluster*. Common uses of the variant concept include introducing both secure and non-secure builds for platforms with Trusted Execution Environment support, or selecting the type of RAM used in a build.

west
A multi-repo meta-tool developed for the Zephyr project. See *West (Zephyr's meta-tool)*.

west installation
An obsolete term for a *west workspace* used prior to west 0.7.

west manifest
A YAML file, usually named `west.yml`, which describes projects, or the Git repositories which make up a *west workspace*, along with additional metadata. See *Basics* for general information and *West Manifests* for details.

west manifest repository
The Git repository in a *west workspace* which contains the *west manifest*. Its location is given by the *manifest.path configuration option*. See *Basics*.

west project
Each of the entries in a *west manifest*, which describe a Git repository that will be cloned and managed by west when working with the corresponding *west manifest repository*. Note that a west project is different from a *zephyr module*, although many projects are also modules. See *Projects* for additional information.

west workspace
A folder on your system with a `.west` subdirectory and a *west manifest repository* in it. You clone the Zephyr source code, as well as that of its *west projects* onto your system by creating a west workspace using the `west init` command. See *Basics*.

XIP
(eXecute In Place) a method of executing programs directly from long term storage rather than copying it into RAM, saving writable memory for dynamic data and not the static program code.

zephyr module
A Git repository containing a `zephyr/module.yml` file, used by the Zephyr build system to integrate the source code and configuration files of the module into a regular Zephyr build. Zephyr modules may be west projects, but they do not have to. See *Modules (External projects)* for additional details.

Bibliography

[a] Real Time Counter (RTC)

[b] Programmable Peripheral Interconnect (PPI)

[c] Distributed Programmable Peripheral Interconnect (DPPI)

[d] Software Interrupt (SWI)

[h] Accelerated Address Resolver (AAR)

[i] General Purpose Input Output (GPIO)

[j] GPIO tasks and events (GPIOTE)

[k] Temperature sensor (TEMP)

[l] Universal Asynchronous Receiver Transmitter (UART)

[m] Interprocess Communication peripheral (IPC)

[th-imboot] Must boot with an immutable bootloader.

[th-authrepl] Application image shall only be replaced with an authorized image.

[th-timely-update] Application updates shall be done in a timely manner.

[th-atomic-update] Application updates shall be atomic.

[th-root-certs] TLS must have a list of trusted root certificates.

[th-root-check] TLS must verify root certificate from server is valid.

[th-secret-storage] There must be a mechanism to securely store client secrets. The least amount of code necessary shall have access to these secrets.

[th-time] System must have moderately accurate notion of the current date/time.

[th-conf] The system must receive, and keep configuration data.

[th-logs] The system must log security-related events, and either store them locally, or send to a service.

[th-all-tls] All communications with the cloud service shall use TLS.

[th-tls-ciphers] TLS shall be configured to allow only generally agreed cipher suites (including forward secrecy).

[th-tls-client-auth] The device shall authenticate itself with the cloud provider using one of the methods described.

[th-entropy] The TLS layer shall use a modern, accepted cryptographic random-bit generator seeded by an entropy source within the SoC.

[th-initial-provision] The device shall have a per-device secret loaded before deployment.

[th-initial-secret] The initial secret shall be securely maintained, and destroyed in any external location as soon as the device is provisioned.

[th-reprovision] Reprovisioning a device shall be done securely.

[th-destruction] Upon decommissioning, the device secret shall be rendered ineffective.
